`SNVS – Status, Not in Valid State, J0 parameters can not be set for INNI ports`

Validation rule: Setting of INNI properties only possible if *portControl* is LOCKOUT

The system shall allow to change the following parameters only under the conditions:

1. if the port control is LOCKOUT while port class is INNI
2. together with the transition of port control from LOCKOUT to NORMAL while port class is INNI or
3. together with the transition of port class to INNI

The parameters are:

- *adminCost*
- *maxNNXCRate*
- *minNNXCRate*
- *neighborASTNNodeID*
- *neighborNodeID*
- *neighborPortID*
- *ndetmd*
- *propagationDelay*
- *srlgList*

Error code:

`SNVS – Status, Not in Valid State, only allowed for INNI port in lockout state`

Validation rule: Check of INNI parameters

It is not allowed to change one of the following parameters on a port with portClass = INNI, if NN cross-connections exist on that port:

- *neighborNodeID*
- *neighborPortID*
- *propagationDelay*
- *srlgList*
- *neighborASTNNodeID*
- *maxNNXCRate*
- *minNNXCRate*

Error code:

`SNVS – Status, Not in Valid State, no XCs allowed for change of iNNI parameters`

Validation rule: Setting of some INNI properties only possible, if no reservations wrt. M:N protecting connections existing

It is not allowed to change one of the following parameters on a port with *portClass* = INNI, if reservations w.r.t. M:N protecting NN connections on that port are existing:

- *neighborNodeID*
- *neighborPortID*
- *propagationDelay*
- *srlgList*
- *neighborASTNNodeID*
- *maxNNXCRate*
- *minNNXCRate*

Error code:

`SNVS – Status, Not in Valid State, no XC reservations allowed for change of iNNI parameters`

Validation rule: Removing of entries from *srlgList* not allowed if NN cross-connections exist

The system shall not allow to remove existing entries from the Shared Risk Link Group Identities List (*srlgList*) at a port with *portClass* INNI while NN cross-connections exist at the port.

Error code:

`SNVS – Status, Not in Valid State, no XCs allowed for removing of srlgList entries`

Validation rule: Removing of entries from *srlgList* not allowed if reservations wrt. M:N protecting connections exist

The system shall not allow to remove existing entries from the Shared Risk Link Group Identities List (*srlgList*) at a port with *portClass* INNI while reservations wrt. M:N protecting NN connections exist on that port.

Error code:

`SNVS – Status, Not in Valid State, no XC reservations allowed for removing of srlgList entries`

Validation rule: Some parameters not settable for ports of *ndetmd* AUTO

The following parameters is not changeable for ports with ndetmd AUTO:

- *neighborNodeID*
- *neighborPortID*
- *neighborASTNNodeID*

Error code: `SNVS – Status, Not in Valid State,` *`ndetmd`* `must not be AUTO`

Validation rule: Additional parameters required when setting *ndetmd* to MAN

Values for the following parameters must be given, if *ndetmd* is changed to MAN:

- *neighborNodeID*
- *neighborPortID*
- *neighborASTNNodeID*

Error code: `IDNV – Input, Data Not Valid, additional parameters required`

Validation rule: No setting of *neighborASTNNodeID* or *neighborNodeID* to corresponding IDs of local node

It is not allowed to configure parameters *neighborASTNNodeID* or *neighborNodeID* to corresponding values of the local node itself, i.e. it is not possible to configure a node to be its own ONNS neighbor.

Error code:

`IDNV – Input, Data Not Valid, node itself is not a valid neighbor`

Validation rule: No setting of duplicate *neighborASTNNodeID* and *neighborPortID* parameter combination

Setting of the parameters *neighborASTNNodeID* and *neighborPortID* is only possible, if the same combination of values does not already exist for a different INNI port in the system.

Error code:

`IDNV – Input, Data Not Valid, duplicate neighbor port information`

Validation rule: Setting of neighbor information to UNKNOWN

In order to set neighbor information to UNKNOWN, zero values must be set for all parameters *neighborASTNNodeID*, *neighborNodeID* and *neighborPortID* consistently. It is not possible to set zero value for only one or two of them.

Error code:

`IDNV – Input, Data Not Valid, zero values can only be set for all neighbor information consistently`

ONNS EDGE port related error codes (validation rules)

Validation rule: Setting of *portClass* to INNI or EDGE only possible, if no test access session active

It is not allowed to change *portClass* of a port to INNI or EDGE when a tributary related to this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to EDGE

It is not possible to change *portClass* to EDGE, if a cross connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Change the *portClass* to EDGE

It is not possible to change the *portClass* to EDGE, if there exist 1:N Broadcasts with N>2.

Error code:

`SNVS – Status, Not in Valid State, Broadcast with N greater 2 exists`

Validation rule: Setting of *portClass* from TRADITIONAL to EDGE

For setting *portClass* from TRADITIONAL to EDGE, the port must not be the protection port of a 1+1 MSP group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1+1 protection port`

Validation rule: Setting of *portClass* from TRADITIONAL to EDGE

For setting *portClass* from TRADITIONAL to EDGE, the port must not be the protection port of a 1:1 MSP group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1:1 protection port`

Validation rule: Change the *portClass* away from EDGE

It is not possible to change the *portClass* away from EDGE, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from EDGE

It is not possible to change the *portClass* away from EDGE, if the target of *portClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Setting of *portClass* from EDGE to TRADITIONAL only possible, if the tributaries on the port are not in use by ONNS:

For setting *portClass* from EDGE to TRADITIONAL the following must be fulfilled:

- No cross-connections of xconcls = NN may exist on any tributary of the port.
- *portControl* must be LOCKOUT.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Modify of EDGE parameters

It is possible to modify the EDGE related parameters only

1. if the *portControl* state is LOCKOUT
2. during the transition of the *portClass* to EDGE

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`SNVS – Status, Not in Valid State, only allowed for EDGE port in lockout state`

Validation rule: Complete and Consistent Setting of TNA Parameter required when configured to EDGE ports

When assigning TNA information to an EDGE port, a complete set for the following parameters must be given:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

For consistency reasons additionally the values for *networkTNAAddress* and *localLPID* must be different to their default values.

Error code:

`IDNV – Input, Data Not Valid, Consistent TNA parameter set required`

Validation rule: Consistent Parameters setting required when removing TNA information from EDGE ports

When removing TNA information from an EDGE port, the following parameters must all be set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`IDNV – Input, Data Not Valid, Consistent TNA parameter set required`

Validation rule: Modify of EDGE parameters

It is not possible to modify any of the EDGE related parameters, if there still exist any cross-connections for the EDGE port, which are of class NN and are assigned to ONNS connections associated to end-to-end network connections.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`SNVS – Status, Not in Valid State, NN Cross-connections associated to end-to-end network connections still existing`

Validation rule: TNA parameter disjointness between EDGE and UNI

It is not possible to set non-default TNA parameters for an EDGE port, if the desired value of *networkTNAAddress* is already assigned to any UNI port in the system.

Error code:
`IDNV – Input, Data Not Valid, No mixing of EDGE and UNI ports under one TNA`

This validation means, that UNI and EDGE ports is not mixed under one TNA.

Validation rule: TNA parameters already assigned on VCAT layer

It is not possible to set non-default TNA parameters for an EDGE port, if the desired value of *networkTNAAddress* already assigned as *networkTNAAddrVCAT* to any VCG in the system.

Error code:
`IDNV – Input, Data Not Valid, TNA already assigned to a VCG port`

Validation rule: Setting of TNA information only if ENNI Node exists

It is not possible to modify any of the EDGE related parameters to values different from their default values, if the ENNI node does not exist in the system.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code: `SNVS – Status, Not in Valid State, ENNI node must exist`

ONNS UNI port related error codes (validation rules)

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if *servcond* = OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if cross-connections on that port are still existing.

Error code:
`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to UNI only possible, if no LO cross-connection, substructure or conversion cross-connections exist

Check if LO cross-connections, substructure or conversion cross-connections exist which involve the port to be changed. If LO cross-connections, substructure or conversion cross-connections exist, the following error message is returned:

Error code:
`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if a tributary related to this port is used in a test access session. Either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if a cross-connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule: Change the *portClass* to UNI

It is not possible to change the *portClass* to UNI, if the port is the protection port of a 1+1 MSP/APS group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1+1 protection port`

Validation rule: Change the *portClass* to UNI

It is not possible to change the *portClass* to UNI, if the port is the protection port of a 1:1 MSP/APS group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a 1:1 protection port`

Validation rule: Change the *portClass* to UNI

It is not possible to change *portClass* to UNI, if UNI-N node is not enabled for the network element.

Error code: `SNVS – Status, Not in Valid State, UNI not enabled`

Validation rule: Check of UNI parameter

It is not possible to change the *portClass* to UNI, unless valid values for the following UNI parameters are given:

- *clientNodeI*
- *networkTNATyp*
- *networkTNAAddres*
- *localLPID*

Error code:

`IDNV - Input, Data Not Valid, UNI parameters must be different to their DEFAULT value`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:
`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI, if the target of *portClass* is different to TRADITIONAL.

Error code:
`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI, if there still exist any NN cross-connection on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Change the *portClass* away from UNI

It is not possible to change the *portClass* away from UNI, if the DCC-R (Section DCC) or DCC-M (Line DCC) on this port is assigned to the UNINode.

Error code:
`SNVS – Status, Not in Valid State, DCC must not be assigned to UNINode`

Validation rule: Check of parameters for UNI

It is not possible to modify the parameter *servcond* to OUTOFSERVICE for UNI ports.

Error code:
`SNVS – Status, Not in Valid State, can not change servcond for this port class`

Validation rule: Some parameter values not settable for ports of *portClass* UNI

The following parameter is not changeable to the value ADAPTIVE for ports with *portClass* UNI:

trbmd

Error code: `SNVS – Status, Not in Valid State, portClass must not be UNI`

Validation rule: Modify of UNI parameters

It is possible to modify the UNI related parameters only:

1. if the *portControl* state is LOCKOUT
2. during the transition of the *portClass* to UNI.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

Error code:

`SNVS – Status, Not in Valid State, only allowed for UNI port in lockout state`

Validation rule: Modify of UNI parameters

It is not possible to modify any of the UNI related parameters, if there still exist any cross-connection for the UNI port.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*
- *clientNodeID*

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Check of UNI parameters

It is not possible to set/configure the *clientNodeID* to the same value of the *uniNetworkNodeID*.

Error code:

`IDNV – Input, Data Not Valid, Client Node ID must differ from Network Node ID`

Validation rule: Check of UNI parameters

It is not possible to set the following UNI parameters to their default values, when *portClass* is equal to UNI or during setting *portClass* to UNI:

- *clientNodeID*
- *networkTNAAddress*
- *localLPID*

Error code:

`IDNV – Input, Data Not Valid, UNI parameters must be different to their DEFAULT values`

Validation rule: Network TNA Address Uniqueness per UNI client

It is not possible to set TNA parameters for a UNI port, if the desired value of *networkTNAAddress* is already assigned to another UNI port in the system, but different values of *clientNodeIDs* are associated to both ports.

Error code:

`IDNV – Input, Data Not Valid, TNA Address not allowed for the Client Node ID`

Validation rule: TNA parameter disjointness between EDGE and UNI

It is not possible to set TNA parameters for a UNI port if the desired value of *networkTNAAddress* is already assigned to any EDGE port in the system.

Error code:

`IDNV – Input, Data Not Valid, No mixing of EDGE and UNI ports under one TNA`

Validation rule: TNA parameters already assigned on VCAT layer

It is not possible to set TNA parameters for a UNI port if the desired value of *networkTNAAddress* is already assigned as *networkTNAAddrVCAT* to any VCG port in the system.

Error code:

`IDNV – Input, Data Not Valid, TNA already assigned to a VCG port`

ONNS ENNI PORT related error codes (validation rules)

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI, if *servcond* = OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, port is out of service`

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI, if cross-connections on that port are still existing.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Setting of *portClass* to ENNI only possible, if no LO cross-connection, substructure or conversion cross-connections exist

Check if LO cross-connections, substructure or conversion cross-connections exist which involve the port to be changed. If LO cross-connections, substructure or conversion cross-connections exist, the following error message is returned:

Error code:

`SNVS – SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections are still existing`

Validation rule: Change the *portClass* to ENNI

It is not possible to change *portClass* to ENNI, if a tributary related to this port is used in a test access session. Either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Change the *portClass* to ENNI

It is not possible to change the *portClass* to ENNI, if cross connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, cross connect loopback exists`

Validation rule: Change the *portClass* to ENNI

It is not possible to change the *portClass* to ENNI, if the port is any member of a 1:1 MSP/APS group.

Error code:

`SNVS – Status, Not in Valid State, Port must not be a member of a 1:1 protection group`

Validation rule: Check of ENNI parameters

It is not possible to change the *portClass* to ENNI, unless valid values for the following ENNI parameters are given:

- *remAdvNodeID* (if a corresponding level 1 routing model is defined)
- *localLinkID*
- *remLinkID*
- *remRAID*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Error code:

`IDNV – Input, Data Not Valid, Valid values for ENNI parameters required`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI, if *portControl* is NORMAL. First *portControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI, if the target of *portClass* is different to TRADITIONAL.

Error code:
`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI, if there still exist any NN cross-connection on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Change the *portClass* away from ENNI

It is not possible to change the *portClass* away from ENNI, if the DCC-R (Section DCC) or DCC-M (Line DCC) on this port is assigned to the ENNINode.

Error code:
`SNVS – Status, Not in Valid State, DCC must not be assigned to ENNINode`

Validation rule: Check of parameters for ENNI

It is not possible to modify the parameter *servcond* to OUTOFSERVICE for ENNI ports.

Error code:
`SNVS – Status, Not in Valid State, can not change servcond for this port class`

Validation rule: Some parameter values not settable for ports of portClass ENNI

The following parameter is not changeable to value AUTO for ports with *portClass* ENNI:

- *ndetmd*

Error code: `SNVS – Status, Not in Valid State, portClass must not be ENNI`

Validation rule: Modify of ENNI parameters

It is possible to modify the ENNI related parameters only:

- if the *portControl* state is LOCKOUT
- during the transition of the *portClass* to ENNI.

The parameters are:

- *remAdvNodeID*
- *localLinkID*
- *remLinkID*
- *remRAID*
- *adminCost*
- *srlgList*
- *linkResCls*
- *maxNNXCRate*

- *minNNXCRate*
- *neighborSigPCID*
- *neighborSigPCIPAddress*
- *remTID*

Error code:

`SNVS – Status, Not in Valid State, only allowed for ENNI port in lockout state`

Validation rule: Modify of ENNI parameters

It is not possible to modify any of the ENNI related parameters, if there still exist any cross-connection for the ENNI port.

The parameters are:

- *remAdvNodeID*
- *localLinkID*
- *remLinkID*
- *linkResCls*
- *maxNNXCRate*
- *minNNXCRate*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Unique setting of *localLinkID*

It is only allowed to set the parameter *localLinkID* to a value different from its default value, if this value is unique within the system.

Error code:

`IDNV – Input, Data Not Valid, local Link ID value must be unique`

Validation rule: Unique setting of *localLinkID* wrt. *localLPID*

It is only allowed to set the parameter *localLinkID* to a value different from its default value, if this value is not already assigned to parameter *localLPID* of any port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule: Check of ENNI parameters

It is not possible to set the following ENNI parameters to their default values if *portClass* is equal to ENNI or during the setting of *portClass* to ENNI:

- *remAdvNodeID* (if a corresponding level 1 routing model is defined)
- *localLinkID*
- *remLinkID*
- *remRAID*
- *neighborSigPCID*
- *neighborSigPCIPAddress*

Error code:

`IDNV – Input, Data Not Valid, ENNI Port Parameters must be different to their DEFAULT values`

References

GR-199-CORE (ED-*rr*)

ED-STM64 autonomous notifications

LOS for transmission port STM64 clears

If LOS is cleared and current port mode is AUTO, then *portmode* is updated (new value: MON). This update is reported via ED-STM64 notification with parameter pmode.

Change of neighbor node and neighbor port information

If *ndetmd* = AUTO a change of the attributes *neighborNodeID*, *neighborPortID* or *neighborASTNNodeID* is notified by the related ED-STM64 notification.

ED-STM64 notification

Output format

Syntax: **`ED-STM64`**:*aid*::*spec_block*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Type: AID.
   Range: SPortAID of ST-64 port.
   The keyword **`all`** is allowed up to shelf level.

Spec block parameters

1. **`adminCost`**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This parameter is supported by ports of *portClass* INNI.
   This parameter is supported by ports of *portClass* ENNI.
   Type: Numeric string.
   Range: 1(default)…65535
2. **`brstintvl`**– Bursty Interval
   The setting of this parameter is allowed when the related STM64 port is created, it is used when *sdfsmode* = BURST.
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **`brstthr`** – Bursty Error Threshold
   The setting of this parameter is allowed when the related STM64 port is created, it is used when *sdfsmode* = BURST.
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps.
   This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.

4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute "uniClientNodeID", as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
   This parameter is supported by ports of *portClass* UNI.
   Type: IPv4 format: Four dot separated numeric string.
   Range: Each numeric string: 0…255
   Default: 0.0.0.0
5. **`crstat`** – Constituent Rates Status list
   This parameter shows the rates of the port signals. For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.
   Type: numeric value set.
   Range: NX-NX-NX-…
   N is the number of Xs. X can be 3, 4, 4C, 16C or C64 representing VC3, VC4, VC4-4C, VC4-16C or VC-64C.
6. **`degthr`** – Signal Degrade Threshold
   The setting of this parameter is allowed when the related STM64 port is created, it is used when *sdfsmode* = POISSON.
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –5; –6; –7; –8; –9.
   Default: –6.
7. **`dexcthr`** – Excessive Degrade Threshold
   The setting of this parameter is allowed when the related STM64 port is created, it is used when *sdfsmode* = POISSON.
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –3; –4; –5.
   Default: –3.
8. **`exprstrc`** – Value of Expected J0
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.

Type: Hexadecimal digits
Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 89hex followed by 15 bytes 00hex

9. **`fec`** – FEC Enable
Forward Error Correction Enable. Enable to include the FEC information in the outgoing signal.
Type: Alphanumeric value set.
Range:
DISABLE (only) for:
   - OC192 / STM64 Intermediate Reach / Short Haul 1550 nm optics
   - OC192 / STM64 intermediate reach / SH passive WDM compatible optics
   - OC192 / STM64 Long Reach / Long Haul 1550 nm optics
   - OC192 / STM64 low cost intra office 1310 nm optics
   - OC192 / STM64 client ports (related to OTN ports)
   - OC768 / STM256 basis low cost intra office 1310 nm optics.

   ENABLE / DISABLE for:
   - OC192 / STM64 OLS800G compatible 80 colour optics
   - OC768 / STM256 Long Reach / Long Haul 1550 nm optics (80km)
   - OC768 / STM256 OLS Xtreme compatible 64 colour optics (extended L band)

   ENABLE (only) for:
   - OC192 / STM64 OLS Xtreme compatible 128 colour optics 40G.

   Default:
   DISABLE for:
   - OC192 / STM64 Intermediate Reach / Short Haul 1550 nm optics
   - OC192 / STM64 intermediate reach / SH 32 colour passive WDM compatible optics
   - OC192 / STM64 Long Reach / Long Haul 1550 nm optics
   - OC192 / STM64 low cost intra office 1310 nm optics
   - OC192 / STM64 client ports (related to OTN ports)
   - OC768 / STM256 basis low cost intra office 1310 nm optics.

   ENABLE for:
   - OC192 / STM64 OLS800G compatible 80 colour optics
   - OC192 / STM64 OLS Xtreme compatible 128 colour optics 40G
   - OC768 / STM256 Long Reach / Long Haul 1550 nm optics (80km)
   - OC768 / STM256 OLS Xtreme compatible 64 colour optics (extended L band)

10. **`femspm`** – Far-end Multiplex Section Enable
    Enable or disable of the performance monitoring of the multiplex section.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
11. **`frcdus`** – Force to DUS
    Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
    Type: Alphanumeric value set.
    Range:
    - ENABLE: (set a forced DUS/DNU)
    - DISABLE (default): (clear a forced DUS/DNU).
12. **`fsflpbkstat`** – Far Side Facililiy Loopback Status
    This parameter specifies the current far-side facility loopback status of the considered output *aid*.
    A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
    Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
    Type: Alphanumeric value set.
    Range:
    - YES
    - NO (default).
13. **`inputsig`** – Tributary Input Signal Rate List
    This parameter is a list of VCn rates across the port’s bandwidth.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 3, 4, 4C, 16C or C64 representing VC3, VC4, VC4-4C, VC4-16C or VC4-64C.
    Default: 644.
14. **`istd`** – Interface Standard
    Each synchronous optical interface can be set to SDH or SONET.
    Type: Alphanumeric value set.
    Range:
    - SONET
    - SDH.

    Default: As specified via *istddflt* on system level, see definition in “RTRV-EQPT (system): Retrieve Equipment (system)” (p. 3-2400).

15. **`linkResCls`** – Link Resource Class
    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set (4 bytes), every bit defining one link class
    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
    Default: 00 for each alphanumeric character
16. **`localLinkID`** – Local Link IDentity
    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
17. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: numeric value set.
    Range: 0 (default) to 4294967295
    The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

18. **maxNNXCRate** – Maximum NN Cross Connect Rate
    The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: VC3, VC4, VC44C, VC416C or VC464C (default)
19. **minNNXCRate** – Minimum NN Cross Connect Rate
    The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: VC3 (default), VC4, VC44C, VC416C or VC464C.
20. **msrei** – MS-REI mode
    Definition: An special extended MS REI mode is standardized for STM64/OC192 interfaces. To support the interworking with older STM64/OC192 interfaces the single byte mode (non-extended) should also be supported.
    Type: Alphanumeric value set.

    Range:

    - SINGLE
    - EXTENDED (default).
21. **ndetmd** – Neighbor Detection Mode
    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range:
    AUTO, MAN
    Default:
    For *portClass* = INNI: AUTO
    For *portClass* = ENNI: MAN

22. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
    This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
    neighborASTNNodeID is used by the ONNS application.
    Type: Four dot separated numeric string.
    Range: Each numeric string: 0…255.
    Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.
23. **`neighborPortID`** – Neighbor Port Id
    This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
    neighborPortID is used by the ONNS application.
    Type: Four dash separated numeric string.
    Range: Each numeric string: 0…255.
    Default: 0-0-0-0.
    Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.
24. **`neighborPortID`** – Neighbor Port Id
    This identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
    neighborPortID is introduced specifically for use by NN application.
    Type: Four dash separated numeric string.
    Range: Each numeric string: 0…255.
    Default: 0-0-0-0.
    Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

25. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

26. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

27. **`nemspm`** – MS Near-End PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

28. **`networkTNAType`** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkTNAType", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.

Range:

- IPV4 (default)
- IPV6
- NSAP

29. **`networkTNAAddress`** – Network TNA Address
The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkTNAAddress", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number:
0000000000000000000000000000000000000000…
FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of "no TNA Address provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

30. **`och`** – optical channel enable
    Enable or disable of the optical channel. If the optical channel is disabled the further optical channel parameters don't have any impact on transmission.
    Type: Alphanumeric value set.
    Range:
    - for ports on OP10 packs, which support to enable or disable OCH:: ENABLE: enable optical channel; DISABLE: disable optical channel
    - for ports on OP10 and OP40 packs, which cannot support OCH: DISABLE: disable optical channel
    - for ports on OP10 and OP40 packs, which only support OCH: ENABLE: enable optical channel
    - for client ports on packs which support OTN: DISABLE: disable, optical channel not applicable.

    Default:
    - for OP10 and OP40 packs, which cannot support OCH: DISABLE
    - for OP10 packs, which cannot support OCH: ENABLE
    - for OP10 and OP40 packs, which only support OCH: ENABLE
    - for client ports on packs which support OTN: DISABLE.
31. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
    This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
    Type: numeric value set.
    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):
    - STM-16/OC-48: 1 – 3072000
    - STM-64/OC-192: 1 – 12288000
    - STM-256/OC-768: 1 – 49152000.

    Default: The default values differ for SDH and SONET and the different rates:
    - STM16: 460800
    - STM64: 1843200
    - STM256: 7372800
    - SONET OC48: 2459
    - SONET OC192: 9835
    - SONET OC768: 39340.

32. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
    This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
    Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-16/OC-48: 1 – 3072000
    - STM-64/OC-192: 1 – 12288000
    - STM-256/OC-768: 1 – 49152000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM16: 460800
    - STM64: 1843200
    - STM256: 7372800
    - SONET OC48: 2459
    - SONET OC192: 9835
    - SONET OC768: 39340.

33. **`pmode`** – Port Mode
    This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
    Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start. The value AUTO is only supported for optical SDH/SONET ports, i.e. not supported for client ports.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

    Default:

    - AUTO: for optical SDH/SONET ports
    - NMON: for client ports-

34. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
    This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
    Type: numeric value set.
    Range (superset of allowed ranges for SDH and SONET):1 – 64000

Default: The default values differ for SDH and SONET and the different rates:

- SDH (all rates): 2400
- SONET OC48: 2392
- SONET OC192: 8554
- SONET OC768: 22776.

35. **`polynomial`** – Optical Channel Scrambling Polynomial
This parameter is used by the Wavewrapper scrambler on the optical channel. This parameter is relevant only if the optical channel is enabled (och = ENABLE).
Type: numeric value set.
Range: 1x7 + x + 1; 2x16 + x12 + x3 + x + 1.
Default: 2.

36. **`portClass`** – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: Alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

37. **`portControl`** – Port Control (PortAdministrative Mode)
The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
Type: Alphanumeric value set.
Range: NORMAL (default), LOCKOUT

38. **`propagationDelay`** – Propagation Delay
This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
propagationDelay is used by the ONNS application.
Type: Numeric string.
Range: 0(default) …255. The unit of this value is ″milliseconds″.

39. **`remAdvNodeID`** – Remote Advertised Node IDentity
The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is

not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

40. **remLinkID** – Remote Link IDentity
The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: numeric value set
Range: 0 (default) to 4294967295

41. **remRAID** – Remote Routing Area IDentity
The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

42. **remTID** – Remote TID
The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: TID or empty-string
Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
Default: empty string: ""

43. **`rsmstca`** – RS/MS TCA Profile Pointer
Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
Type: Alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.
44. **`rspm`** – RS PM Enable
Enable or disable regenerator section (section) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).
45. **`rstimca`** – RS TIM Consequent Action Enable
Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimca* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.
Range:
    - ENABLE (default): enable consequent action for TIM
    - DISABLE: disable consequent action for TIM.
46. **`rstimmon`** – RS TIM Monitor Enable
Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.
Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
47. **`sdhpn`** – SDH ASAP
This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET Alarm Severity Assignment Profile for the SONET ports (see definition of output parameter SONET in "RTRV-OC192: Retrieve OC192 port" (p. 3-2664)) to be compatible with current generation applications.
Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.

48. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
    The degraded state is detected in Burst or Poisson mode.
    Type: Alphanumeric value set.
    Range:
    - BURST (default)
    - POISSON.
49. **`servcond`** – Service Condition
    This parameter indicates its status concerning service involvement.
    Type: Alphanumeric value set.
    Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
50. **`srlgList`** – Shared Risk Link Group Identities List
    The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
    If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Ten numeric strings separated by dashes.
    Range: Each numeric string: 0…65535.
    Default: 0-0-0-0-0-0-0-0-0-0.
51. **`strcfmt`** – Format of incoming J0
    The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc).
    If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
    Type: Numeric string.
    Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

52. **`strcout`** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
Type: Hexadecimal digits.
Range:
    - 1 byte string
    - 16 bytes string
    - 64 bytes string dependent on the strcwfmt parameter.

    Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
    Default: 01Hex
53. **`strcwfmt`** – Format of outgoing J0
The write format of J0, the outgoing section trace (strcout).
If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
54. **`tcamd`** – TCA mode
This parameter shows the modus of the PM thresholding.
Two thresholding methods are applicable:
    - TR-only (lso known as the implicit reset method)
    - TR-RTR (lso known as the explicit reset method).

    Type: Alphanumeric value set.
    Range: TR or TRRTR (default).

55. **`trbmd`** – Tributary mode
If trbmd is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If trbmd is ADAPTIVE, then input *inputsig* has no effect.
Type: Alphanumeric value set.
Range: ADAPTIVE, FIXED
Default: The initial value is defined as the trbmddflt parameter on system level, see definition in RTRV-EQPT (system) command.

56. **`unequiposig`** – Unequipped Output Signal List
This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the *unequipped* signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for *tx* and *rx* side of the port are allowed.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 3, 4, 4C, 16C or C64 representing VC3, VC4, VC4-4C, VC4-16C or VC4-64C.

Example output

```
ED-STM64:UNITE-NE:1-1-#-#-1-1:123456:::INPUTSIG=644,UNEQUIPOSIG=644;

   UNITE-NE 00-11-28 08:00:00

```

ED-STS1: Edit STS1 tributary

The command **ED-STS1** is used to provision all parameters related to the tributary STS1.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: no

Input format

Command syntax: **ED-STS1**:*tid:aid:ctag:::spec_block*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   AID of an SONET tributary. The keyword **all** is allowed on slot, port and tributary level. The so called ″dynamic parameters″ is reported, if a **all** is used at the tributary level.

   The ″dynamic parameters″ are:

   - *ptrc*, *ptrcst*, *siglb*, *trailstate*.

   Type: AID
   Range: STS1NumAID.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **`brstintvl`**– Bursty Interval
   If the STS-1 tributary is related to a EC1 port, then the parameter *sdsfmode* is fixed to POISSON. As a consequence, the parameter *brstintvl* is settable but will never be used by the system in this case.
   Measurement period for determining bursty errors The setting of this parameter is used when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
2. **`brstthr`** – Bursty Error Threshold
   If the STS-1 tributary is related to a EC1 port, then the parameter *sdsfmode* is fixed to POISSON. As a consequence, the parameter *brstthr* is settable but will never be used by the system in this case.
   The values are set in percent for the degradation threshold. The setting of this parameter is used when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, 15, 20, 25, 30, … 50.
   Default: 30.
3. **`degthr`** – Signal Degrade Threshold
   The setting of this parameter are used when *sdsfmode* = POISSON
   Type: numeric value set.
   Range (as exponents of 10): –5; –6 (default); –7; –8; –9
4. **`dexcthr`** – Excessive Degrade Threshold
   The setting of this parameter are used when *sdsfmode* = POISSON. The values are set as exponent of 10.
   Type: numeric value set.
   Range (as exponent of 10) –3 (default); –4; –5.
   Limitation of STS1 related to EC1 ports: For STS1 tributaries related to EC1 ports, the only useful *dexcthr* value is -5. Only this value will lead to Excessive Bit Error alarms. The other values are kept for compatibility reasons.
5. **`exphptrc`** – Expected Path Trace (J1)
   The parameter *exphptrc* specifying the expected path trace is only relevant for the path trace supervision when the path trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex.
6. **`feppm`** – Far-End Path PM Enable
   It indicates whether this performance monitoring feature is enabled or disabled.
   Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

7. **hptimmon** – Path Trace Monitoring Enable (J1)
   Description: High order path trace (J1) identifier mismatch (TIM) monitor enable. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
8. **loca** – Ring A-node TID
   This parameter specifies the TID of the node at which the service is added to the BLSR ring. This parameter is required for the input of tributaries to be used by ONNS on ports of *portClass* = EDGE being members in BLSR/MS-SPRing protection groups. The *loca* parameter value is an empty string for all other tributaries.
   loca is introduced specifically for use related to ONNS application.
   Type: TID or empty-string.
   Range: Please refer to the TID definition in “RTRV-HDR: Retrieve header” (p. 3-2417) description.
   Default: empty string: "". This is displayed as \"\" in output direction.
9. **locz** – Ring Z-node TID
   This parameter specifies the TID of the node at which the service is dropped from the BLSR ring. This parameter is required for the output of tributaries to be used by ONNS on ports of *portClass* = EDG E being members in BLSR/MS-SPRing protection groups. The *locz* parameter value is an empty string for all other tributaries.
   locz is introduced specifically for use related to ONNS application.
   Type: TID or empty-string.
   Range: Please refer to the TID definition in the “RTRV-HDR: Retrieve header” (p. 3-2417) description.
   Default: empty string: "". This is displayed as \"\" in output direction.
10. **neppm** – Near-End Path PM Enable
    It indicates whether this performance monitoring feature is enabled or disabled.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
11. **pjepm** – Pointer Justification Event PM Enable
    It indicates whether this performance monitoring feature is enabled or disabled.
    Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

12. **`pmhpfeses`** – Performance Monitoring Path Far-End SES Threshold
This parameter describes the Path Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. When the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of ranges for SDH and SONET): 1-64000.
Default: 2400.
13. **`pmhpneses`** – Performance Monitoring Path Near-End SES Threshold
This parameter describes the Path Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. When the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of ranges for SDH and SONET): 1-64000.
Default: 2400.
14. **`pse`** – PDI-P Switching Enable
The PDI-P Switching Enable parameter indicates if the PDI-P contributes to the automatic path protection switch criteria.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).
15. **`ptca`** – Path TCA Profile Pointer
Type: Alphanumeric string.
Range: string with up to 24 characters.
Default: DEFAULT0.
16. **`ptrcrfmt`** – Path Trace Read Format (J1)
The read format of J1, the incoming path trace (ptrc).
Type: numeric string.
Range:
    - 2: for non-specific repeating byte
    - 16: for 16 byte specific string.
    - 64: for 64 byte string.
    Default: 2.
17. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
The degraded state is detected in BURST or POISSON mode.
Type: Alphanumeric value set.

Range:

- BURST
- POISSON (default).

18. **`tmonmd`** – Tributary Monitoring Mode
    This parameter indicates the mode of the tributary.
    Type: Alphanumeric value set.
    Range:
    - MON = alarm monitoring is taking place on the port.
    - NMON (default) = alarm monitoring is not occurring on the port.
19. **`tribsonetpn`** – Tributary Alarm Severity Assignment Profile
    This parameter points to a tributary ASAP profile name of type PATH for the designated AID.
    Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
    Range: String with a maximum of 24 characters.
    Default: DEFAULT.

Output format

If the ED-STS1 command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The command **`ED-STS1`** is also applicable to STS3c and other concatenated tributaries.

Even if the command is used for a concatenated signal, it can be applied to any of the tributaries (for example, to the second tributary of the concatenated signal). However, only the parameters pertaining to the first tributary of a concatenated signal are used by the software to determine system operation. If the signal were changed from a concatenated signal to non-concatenated, then the parameters for each of the tributaries would be used by the software.

The command allows to modify all attributes listed above as input spec-block parameters. The modification is reported by means of an ED-STS1 notification for tributary.

Change of J1 expected format - FM impact

When the expected J1 format (ptrcrfmt) is changed to 16 (16 byte specific string) while the TI Mismatch detection is enabled, then the TI Mismatch alarm is updated according to the provisioned ecpected J1 (exphptrc) and the currently received J1 (ptrc).

When the expected J1 format is changed away from 16, while the TI Mismatch alarm is active, then the TI Mismatch alarm is cleared.

Signal degrade/signal fail mode provisioning

Refer to the detailed behavior of the "ED-VC3: Edit VC3 tributary" (p. 3-1339) command for details on Signal Degrade/Signal Fail Mode Provisioning for tributaries.

Disabling of PM monitor

The disabling of a PM monitor shall have the following impacts w.r.t. existing PM registers:

1. stop PM counting
2. all current bins related to the PM monitor is deleted
3. all history bins related to the PM monitor is deleted

The term "PM monitor" has the same semantics as the term "PM package". The number of PM monitors is determined by means of the number of *pm enable attributes*.

PM monitors can be disabled explicitly by means of the *pm enable* attribute or are implicitly disabled as part of a port/tributary deletion.

Additional to the above listed impacts) the disabling of a PM monitor shall have the following impacts: the system has to clear all active TCA events of the deleted PM monitor if TCA mode TR-RTR was selected.

Disabling of PJE Monitor

The disabling of a pointer justification monitor shall have the following impacts w.r.t. existing PJE registers:

1. stop PJE counting
2. all current bins related to the PJE monitor is deleted
3. all history bins related to the PJE monitor is deleted

Example input/output

```
ED-STS1:UNITE-NE:1-1-#-#-3-1-1:123456:::tmonmd=MON,tribsonetpn=Default,degthr=-
      6,dexcthr=-3,ptrcrfmt=1,ptca=Default0,neppm=ENABLE,pmhpneses=30,pmhpfeses=30;

   UNITE-NE 00-10-14 14:59:09
M  123456 COMPLD
;
```

```
   UNITE-NE 00-10-14 14:59:09
A  592 REPT DBCHG
   ”TIME=14-59-09,DATE=00-10-14:ED-STS1:1-1-#-#-3-1-1::
      tmonmd=MON,tribsonetpn=Default,degthr=-6,dexcthr=-3,ptrcrfmt=1,

;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the ED-STS1 command.

Validation rule: ASAP profile exists

Check of the existence of the ASAP profile.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: TCA profile exists

Check of the existence of the TCA profile.

Error code: `IDNV – Input, Data Not Valid, TCA profile does not exist`

Validation rule: Maximum number of enabled PM monitors

Check that the number of enabled PM monitors is less than the maximum number of supported enabled PM monitors (2000) before a new PM monitor is enabled.

Error code:

`SSRE – Status, System Resources Exceeded, limit of PM monitors exceeded`

Since several monitor points can be enabled/disabled within one command, the **`ED`** command may only fail if the validation rule is not met after all PM enable attributes would have been updated as specified in the corresponding ED request.

Example: The **`ED`** command requests that 1 monitor point is enabled and 1 monitor points is disabled and currently 2000 packages are enabled. This command should complete.

Validation rule: Not more than one PJE PM monitor per port

Check that no PJE PM monitor is already enabled for any tributary of the port to which the addressed tributary belongs to.

Error code:

`SSRE – Status, System Resources Exceeded, limit of PJE counters exceeded`

Validation rule: Check CCB against *istd* of related port

Check wether the CCB fits to istd of the related port

Error code:

`ICNV – Input, Command Not Valid, Interface Standard does not match`

Validation rule (ONNS specific): *loca*, *locz* changes only allowed when *portClass* = EDGE and part of a BLSR/MS-SPRING group

Setting the *loca*, *locz* parameters away from the default value is only allowed when the related *portClass* = EDGE and the port is part of a BLSR/MS-SPRING protection group.

Error code:

`IDNV – Input, Data Not Valid, related portClass not EDGE or port not in BLSR/MS-SPRING group`

Validation rule (ONNS specific): *loca*, *locz* changes only allowed when tributary not involved in a cross-connection

Setting the *loca*, *locz* parameters are inhibited when the tributary is already input or output tributary of a cross-connection.

Error code:

`IDNV – Input, Data Not Valid, tributary already part of a cross-connection`

Validation rule (ONNS specific): Maximum number of tributaries with *loca*, *locz* entries must not exceed 100

It is checked that the maximum number of triburaries with loca, locz parameters set (i.e. having a value different from the default value) does not exceed 100.

Error code:

`SSRE – Status, System Resources Exceeded, limit of tribs with loca, locz exceeded`

Validation rule (ONNS specific): *hptimmon* changes to ENABLE only allowed when corresponding port is not of *portClass* INNI

Setting the *hptimmon* parameter to ENABLE is only allowed when the port the VC-3 is located on does not have the port class INNI.

Error code: `SNVS – Status, Not in Valid State, portClass must not be INNI`

ED-STS1 notification

Output format

Syntax: **ED-STS1**:*aid*::*spec_block*

Output parameters

Command parameters

1. **aid** – Access Identifier
   AID of an SONET tributary. The keyword **all** is allowed on slot, port and tributary level. The so called ″dynamic parameters″ is reported, if a **all** is used at the tributary level.
   The ″dynamic parameters″ are:
   - *ptrc*, *ptrcst*, *siglb*, *trailstate*.

   Type: AID
   Range: STS1NumAID.

Spec block parameters

1. **brstintvl**– Bursty Interval
   Measurement period for determining bursty errors The setting of this parameter is used when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
2. **brstthr** – Bursty Error Threshold
   The values are set in percent for the degradation threshold. The setting of this parameter is used when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, 15, 20, 25, 30, … 50.
   Default: 30.
3. **crslpbkrate** – Cross-connect loopback rate
   It is independent from the current interface standard and therefore both SDH and SONET values are allowed.
   The parameter *crslpbkrate* is not reported if the parameter *crlspbkstat* indicates that no loopback is set.
   Type: Alphanumeric value set.
   Range:
   - VC3
   - VC4
   - VC44C
   - VC416C
   - VC464C

- STS1
- STS3
- STS12
- STS48
- STS192

4. **`crslpbkstat`** – Cross-connect loopback status
   State of cross- connect loopback.
   Type: Alphanumeric value set.
   Range:
   - YES = Cross-connect loopback is provisioned
   - NO (default) = No cross-connect loopback is provisioned.
5. **`degthr`** – Signal Degrade Threshold
   The setting of this parameter are used when *sdsfmode* = POISSON
   Type: numeric value set.
   Range (as exponents of 10): –5; –6 (default); –7; –8; –9
6. **`dexcthr`** – Excessive Degrade Threshold
   The setting of this parameter are used when *sdsfmode* = POISSON. The values are set as exponent of 10.
   Type: numeric value set.
   Range (as exponent of 10) –3 (default); –4; –5.
7. **`exphptrc`** – Expected Path Trace (J1)
   The parameter *exphptrc* specifying the expected path trace is only relevant for the path trace supervision when the path trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex.
8. **`feppm`** – Far-End Path PM Enable
   It indicates whether this performance monitoring feature is enabled or disabled.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
9. **`hptimmon`** – Path Trace Monitoring Enable (J1)
   Description: High order path trace (J1) identifier mismatch (TIM) monitor enable. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
   Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

10. **loca** – Ring A-node TID
    This parameter specifies the TID of the node at which the service is added to the BLSR ring. This parameter is required for the input of tributaries to be used by ONNS on ports of *portClass* = EDGE being members in BLSR/MS-SPRing protection groups. The *loca* parameter value is an empty string for all other tributaries.
    loca is introduced specifically for use related to ONNS application.
    Type: TID or empty-string.
    Range: Please refer to the TID definition in "RTRV-HDR: Retrieve header" (p. 3-2417) description.
    Default: empty string: "". This is displayed as \"\" in output direction.
11. **locz** – Ring Z-node TID
    This parameter specifies the TID of the node at which the service is dropped from the BLSR ring. This parameter is required for the output of tributaries to be used by ONNS on ports of *portClass* = EDG E being members in BLSR/MS-SPRing protection groups. The *locz* parameter value is an empty string for all other tributaries.
    locz is introduced specifically for use related to ONNS application.
    Type: TID or empty-string.
    Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
    Default: empty string: "". This is displayed as \"\" in output direction.
12. **neppm** – Near-End Path PM Enable
    It indicates whether this performance monitoring feature is enabled or disabled.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
13. **pjepm** – Pointer Justification Event PM Enable
    It indicates whether this performance monitoring feature is enabled or disabled.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).

14. **`pmhpfeses`** – Performance Monitoring Path Far-End SES Threshold
This parameter describes the Path Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. When the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of ranges for SDH and SONET): 1-64000.
Default: 2400.
15. **`pmhpneses`** – Performance Monitoring Path Near-End SES Threshold
This parameter describes the Path Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. When the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of ranges for SDH and SONET): 1-64000.
Default: 2400.
16. **`pse`** – PDI-P Switching Enable
The PDI-P Switching Enable parameter indicates if the PDI-P contributes to the automatic path protection switch criteria.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).
17. **`ptca`** – Path TCA Profile Pointer
Type: Alphanumeric string.
Range: string with up to 24 characters.
Default: DEFAULT0.
18. **`ptrcrfmt`** – Path Trace Read Format (J1)
The read format of J1, the incoming path trace (ptrc).
Type: numeric string.
Range:
    - 2: for non-specific repeating byte
    - 16: for 16 byte specific string.
    - 64: for 64 byte string.
    Default: 2.
19. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
The degraded state is detected in BURST or POISSON mode.
Type: Alphanumeric value set.
Range:
    - BURST
    - POISSON (default).

If the tributary is related to a EC1 port, then the range is limited to: POISSON

20. **`substr`** – Substructured
    This parameter indicates if the tributary is substructured.
    Substructure for LO cross-connections:
    A HO tributary, which is sub structured for LO cross-connections, has a HO path termination associated which provides LO tributaries to be used for LO cross-connections.
    The parameter *substr* is set autonomously when LO cross-connections are created or deleted with ENT-CRS or DLT-CRS commands (see also the lower order cross-connection creation/deletion behavior description for the commands ENT-CRS and DLT-CRS).
    A sub structured HO tributary cannot be used to set up HO cross-connections. The parameter *substr* is set autonomously when the LO substructure is created or deleted using the **`ED-SUBS`** command.
    Substructure for conversion cross-connections:
    A HO tributary, which is sub structured for the LO side of a conversion cross-connection, has a HO path termination associated which provides LO tributaries to be used for conversion cross-connections.
    The parameter *substr* is set autonomously when an AU3/AU4 conversion cross-connection is created.
    A HO tributary, which is sub structured for conversion cross-connections, cannot be used to set up HO cross-connections.
    Type: Alphanumeric value set.
    Range:
    - YES: Automatically sub structured for LO cross-connections
    - MANSUB: Manually sub structured for LO cross-connections
    - CNVSUB: Automatically sub structured for the LO side of conversion cross-connections
    - NO (default): Not sub structured, not used for conversion cross-connections

    If the STS-1 tributary is related to a EC1 port, then no LO cross-connections are allowed. As a consequence, the parameter *substr* can only have the values CNV and NO in this case.
21. **`tmonmd`** – Tributary Monitoring Mode
    This parameter indicates the mode of the tributary.
    Type: Alphanumeric value set.

Range:

- MON = alarm monitoring is taking place on the port.
- NMON (default) = alarm monitoring is not occurring on the port.

22. **`tribsonetpn`** – Tributary Alarm Severity Assignment Profile
This parameter points to a tributary ASAP profile name of type PATH for the designated AID.
Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.

ED-SUBS: Create or delete the lower-order substructre at a higher-order tributary.

The **ED-SUBS** command:

- creates the lower order substructure and lower order tributaries at an STS1or VC4 tributary as preparation of the lower order cross-connection creation.
- deletes the lower order substructure and lower order tributaries to make the STS1or VC4 tributary usable for higher order cross-connections.

Note: This command is not applicable for the TransMUX card, this is restricted by the AID type.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: no

Input format

Command syntax: **ED-SUBS**-*modifier:tid:aid:ctag:::spec_block*;

Input parameters

Command parameters

1. **modifier**
   The modifier specifies the type of the high-order tributary which is going to be substructured.
   Type: Alphanumeric value set.
   Range: STS1, VC4
2. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **aid** – Access Identifier
   AID of an SDH or SONET tributary located on a I/O pack.
   Type: AID.
   Range: STS1NumAID
4. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

Spec bloc parameters

1. **`substr`** – Substructured
   The parameter substr specifies whether the tributary is substructured or de-substructured. The parameter *substr* is mandatory. A substructured HO tributary has a HO path termination associated which provides LO tributaries to be used for LO cross-connections. A substructured HO tributary cannot be used to set up HO cross-connections.
   Type: Alphanumeric value set.

   Range:

   - MANSUB to create the LO substructure
   - NO to delete the LO substructure.

Output format

If the **`ED-SUBS`** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section for the "RTRV-HDR: Retrieve header" (p. 3-2417) command.

Detailed behavior description

Update of HO tributary

The system shall update the parameter substr of the specified HO tributary to the value MANSUB. The parameter value change is notified via ED-STS1 or ED-VC3 Notification depending on the interface standard of the HO tributary.

Creation of HO Path Termination

If modifier has the value STS1, the system shall create one HO STS1 Path Termination Function with the default LO tributary structure of 28 VT1.5, i.e. the parameters inputsig and unequiposig set to the value 2811.

If modifier has the value VC4, the system shall create one HO VC4 Path Termination Function with the default LO tributary structure of 63 VC12, i.e. the parameters inputsig and unequiposig set to the value 6312.

The creation of the HO Path termination function is notified via ENT-PTF Notification.

Creation of LO Tributaries

If modifier has the value STS1, the system shall create 28 LO VT1.5 tributaries.

If modifier has the value VC4, the system shall create 63 LO VC12 tributaries.

The creation of the LO tributaries are notified via one ENT-LONIM Group Notification, i.e. using the AID ranging.

Deletion of LO Tributaries

The system shall delete all LO tributaries related to the HO tributary specified in the command.

The deletion of the LO tributaries are notified via one DLT-LONIM Group Notification, i.e. using the AID ranging.

Deletion of HO Path Termination

The system shall delete the HO Path Termination Function related to the HO tributary specified in the command.

The deletion of the HO Path Termination Function is notified via one DLT-PTF Notification.

Update of HO tributary

The system shall update the parameter substr of the specified HO tributary to the value NO. The parameter value change is notified via ED-STS1 or ED-VC3 Notification depending on the interface standard of the HO tributary.

Error responses

Note: In a system with provisioned LOXC40 pack, the following LO substructuring related TL1 commands are denied with wrong error codes:

- ED-SUBS command on an already substructured HO tributary is denied with wrong error code: SNVS – Status Not in Valid State, LOXC switch capacity Invalid
  `SNVS – Status Not in Valid State, LOXC switch capacity Invalid`
  The correct error code should be:
  `SNVS – Status Not in Valid State, HO tributary already substructured`
- ED-SUBS command on a HO tributary at a BLSR port is denied with wrong error code:
  `IDNC-Input Data Not Consistent, No BLSR Interworking with low-order traffic`
  The correct error code should be:
  `IDNC-Input Data Not Consistent, No BLSR/MS-SPRing Interworking with low-order traffic`
- De-provisioning of the LOXC40 pack with DLT-EQPT command while a HO tributary is substructured, is denied with wrong error code:
  `SNVS-Status, Circuit pack is in use`
  The correct error code should be:
  `SNVS-Status, Not In Valid State, LO cross-connections or substructure still exist`

Validation rule: Check CCB against istd

Check wether the CCB fits to *istd* of the related port.

Error code:

`ICNV – Input, Command Not Valid, Interface Standard does not match`

Validation rule: Entities must exist

Command processing shall verify that the HO tributary specified in the command exists.

Error code:

`IENE – Input, Entity Not Exists, Specified tributary/tributaries do not exist`

Validation rule: Command not allowed while conversion cross-connections exist

When the command is applied at a HO tributary, then the command processing shall verify that no AU3/AU4 conversion cross-connection exists at the HO tributary or at LO tributaries related to the HO tributary.

Error code:

`SNVS – Status, Not in Valid State, conversion cross-connections are still existing`

Validation rule: LO Substructure creation not allowed on already substructured tributaries

When an attempt is made to create the substructure at a HO tributary, the command processing shall verify that the high-order tributary specified in the command is not already substructured, i.e. that the parameter substr of the HO tributary has the value NO.

Error code:

`SNVS – Status, Not in Valid State, HO tributary already substructured`

Validation rule: Substructure deletion not allowed with LO cross-connections existing

When an attempt is made to delete the substructure at a HO tributary, the command processing shall verify that no LO cross-connections exist at LO tributaries related to the HO tributary.

Error code:

`SNVS – Status, Not in Valid State, lower order cross-connections are still existing`

Validation rule: Substructure deletion not allowed with LO cross-connect loopbacks existing

When an attempt is made to delete the substructure at a HO tributary, the command processing shall verify that no LO cross-connect loopbacks exist at LO tributaries related to the HO tributary.

Error code:

`SNVS – Status, Not in Valid State, lower order cross-connect loopbacks are still existing`

Validation rule: Substructure deletion not allowed with LO test access sessions existing

When an attempt is made to delete the substructure at a HO tributary, the command processing shall verify that no LO cross-connect loopbacks exist at LO tributaries related to the HO tributary.

Error code:

`SNVS – Status, Not in Valid State, lower order test access sessions are still existing`

Validation rule: Entities must fit LOXC interface standard

When an attempt is made to create the substructure at a HO tributary, the command processing shall verify that the specified modifier and the given aid's fit to the LOXC overall interface standard, i.e. to the value of the parameter lostd related to the active LOXC pack.

Error code:

`IDNV – Input, Data Not Valid, Low-order cross-connections of this interface standard not supported`

Validation rule: LO Substructure creation not allowed on already cross-connected tributaries

When an attempt is made to create the substructure at a HO tributary, the command processing shall verify that the high-order tributary specified in the command is not used in a HO cross-connection.

Error code: `SNVS – Status, Not in Valid State, HO cross-connection exists`

Validation rule: LO Substructure creation not allowed while loopback exists

When an attempt is made to create the substructure at a HO tributary, the command processing shall verify that no HO cross-connection loopback exists at the high-order tributary specified in the command.

Error code:

`SNVS – Status, Not in Valid State, Tributary has existing loopback`

Validation rule: LO Substructure creation not allowed while test session exists

When an attempt is made to create the substructure at a HO tributary, the command processing shall verify that no HO test access session exists at the high-order tributary specified in the command.

Error code:

```
SNVS – Status, Not in Valid State, Tributary used in test access session
```

Validation rule: HO tributary rate consistency

Command processing shall verify that the rate of the HO tributary specified in the command fits to the modifier parameter.

Error code:

```
IDNC – Input, Data Not Consistent, Specified Tributary does not support
the indicated rate
```

Validation rule: LO Substructure creation not allowed on ports in adaptive mode

When an attempt is made to create the substructure at a HO tributary, the command processing shall verify that the related port is in fixed mode.

Error code:

```
SNVS – Status, Not in Valid State, Tributary at port in adaptive mode
```

Validation rule: LO Substructure creation not allowed on BLSR/MS-SPRing ports

When an attempt is made to create the substructure at a HO tributary, the command processing shall verify that the related port is not involved in a BLSR or MS-SPRing protection group.

Error code:

```
DNC – Input, Data Not Consistent, No BLSR/MS-SPRing inter-working with
low-order traffic
```

Validation rule: LOXC pack with more than 0G switch capacity

It is not possible to create the substructure at a HO tributary, if there is no LOXC pack with more than 0 GBit/s low-order switch capacity.

Error code:

```
SNVS – Status, Not in Valid State, LOXC switch capacity invalid
```

Validation rule: Pack restrictions for LO substructure creation

Command processing shall verify that the specified HO tributary does not reside on one of the following packs:

- the OPT2G5 pack,
- the EP51 pack (DS3 and EC1 interfaces),
- the GE1 pack,
- the GE10PL1 pack.

Error code:

`IDNC – Input, Data Not Consistent, LO tributary not supported by that pack`

Validation rule: LO Substructure creation not allowed on INNI ports

When an attempt is made to create the substructure at a HO tributary, the command processing shall verify that the related port does not have the Port Class INNI.

Error code:

`IDNC – Input, Data Not Consistent, Tributaries must not be on ports of portClass INNI`

Validation rule: LO Substructure creation not allowed on UNI ports

When an attempt is made to create the substructure at a HO tributary, the command processing shall verify that the related port does not have the Port Class UNI.

Error code:

`IDNC – Input, Data Not Consistent, Tributaries must not be on ports of portClass UNI`

Validation rule: LO Substructure creation not allowed on ENNI ports

When an attempt is made to create the substructure at a HO tributary, the command processing shall verify that the related port does not have the Port Class ENNI.

Error code:

`IDNC – Input, Data Not Consistent, Tributaries must not be on ports of portClass ENNI`

ED-SYNCDATA: Synchronization of ONNS data

Overview

The ED-SYNCDATA-mod command is used to have ONNS data to be synchronized based on the result of audit operation. AUD-mod command is assumed to precede this data-sync request. The modifier of the ED-SYNCDATA-mod command indicates the scope of data to be synchronized.

ED-SYNCDATA-LOCAL

ED-SYNCDATA-LOCAL performs synchronization on ONNS data with the master data from local host NE. They are cross-connect map and port objects. Data-sync shall always be preceded by data-audit operation. Changes to ONNS data are made only if there is any discrepancy found via data-audit.

For mismatched port object cases, the following updates are made to ONNS data:

- port object exists only in ONNS data, but not in host NE data the corresponding port object is removed from NN data.
- port object exists only in host NE data, but not in NN data the corresponding port object is added to NN data.

For mismatched cross-connect cases, the following updates are made to NN data:

- NN owned cross-connect exists only in NN data, but not in host NE the corresponding NN cross-connect and its associated path information are removed from NN data
- NN owned cross-connect exists only in host NE data, but not in NN data the corresponding NN cross-connect is added to NN data with a dummy pathID
- non-NN owned cross-connect exists only in NN data, but not in host NE the corresponding cross-connect is removed from NN data
- non-NN owned cross-connect exists only in host NE data, but not in NN data the corresponding cross-connect is added to NN data with non-NN ownership.

NN should respond to the request in two steps: first, the result of data-audit with all the mismatched cases, and then a indication of the successfulness of the data-sync operation. The *dummy pathID* is an ID assigned by local node as a result of local data-sync operation (see ED-SYNCDATA-LOCAL command for details). It should be in pathID format and unique.

ED-SYNCDATA-PATH

EDSyncData-PATH modifies an ONNS path ID associated with local cross-connect data with valid path ID. Note that CONN data repository is not affected by this operation.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Abortable: No.

Input format

Command syntax of ED-SYNCDATA-LOCAL:
`ED-SYNCDATA-LOCAL:`*srcTid*:*srcAid*:*ctag*;

Command syntax of ED-SYNCDATA-PATH:
`ED-SYNCDATA-PATH:`*srcTid*:*srcAid*:*ctag*:*oldPthID*,*newPathID*;

Input parameters

Command parameters

1. **`srcTid`**
   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.
   Type: identifier, in addition the special character underscore “_” and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **`srcAid`**
   Source node ONNS application access identifier of the ONNS controller OS command interface port.
   Range: Source node access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn.
3. **`ctag`**
   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing “.”). It should be a unique value for each new command.

4. **`oldPathID`**
   Current Path Identifier from the local ONNS path data. Old path ID may be a dummy ID assigned as a result of local ONNS data synchronization.
   Type: character string of length up to 20.
   Range: nodeID-Index; nodeID (four dot separated numeric strings: each string 0..255) Index (Numeric string).
   Example: 135.13.196.203-43216
5. **`newPathID`**
   New Path Identifier which will replace the oldPathID.
   Type: character string of length up to 20.
   Range: nodeID-Index; nodeID (four dot separated numeric strings: each string 0..255) Index (Numeric string).
   Example: 135.13.196.203-43216

Output format

NN should respond to the request in two steps: first, if completed successfully, the result of data-audit with all the mismatched cases, and then a indication of the successfulness of the data-sync operation. The output format for the result of data-audit should be the same as the one for the response to **`AUD`** command.

```
   srcTid date time
M  ctag COMPLD
;
```

Whenever a modification is made to any ONNS path data as a consequence of ONNS data synchronization, autonomous TL1 notification message **`REPT-PTHCHG`** should be sent separately from a normal response to the request.

Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completion code* and their syntax are included in the “Output parameters” section of the “RTRV-PATH: Retrieve ONNS connection data” (p. 3-2698) command.

Example input/output

The following example shows a successful completion of a **`ED-SYNCDATA-LOCAL`** command for local data synchronization operation by the NE:

```
ED-SYNCDATA-LOCAL:LT-ONNS-789:snn:123456;

   LT-ONNS-789 2003-01-01 08:00:00
M  123456 COMPLD
;
```

Note that data-sync is preceded by data-audit. The result of this data-audit will be stored at NN and retrievable via the command **`RTRV-AUDLOG-LOCAL`**. The result of data-audit for this case (when the modifier LOCAL is used) should be in the same format as the output for the command **`AUD-LOCAL`**.

The following example shows a successful completion of a **`ED-SYNCDATA-PATH`** command for path ID modification on local ONNS data by the NE:

```
ED-SYNCDATA-PATH:LT-ONNS-789:snn:123456:135.13.18.23-00000,135.14.196.203-32165;

   LT-ONNS-789 2003-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Validation rule: ED-SYNCDATA-PATH not possible because of local data inconsistencies

The **`ED-SYNCDATA-PATH`** command is rejected in case of local data inconsistencies with the following error response:

Error code: `E660 – LDOS – Local Data Out of Sync`

ED-T3: Edit DS3 port

The command **ED-T3** is used to retrieve all parameters related to the electrical DS3 port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: No.

Input format

Command syntax:

ED-T3:*tid:aid:ctag:::spec_block;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   Access Identifier of a DS3 port.
   Type: AID
   Range: APortAID of DS3 port. The keyword **all** is allowed up to shelf level.
3. **ctag** – Correlation Tag
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).

Spec block parameters

1. **ds3pn** – DS3 ASAP
   DS3 Alarm Severity Assignment Profile. This parameter retrieves the ASAP profile name of type DS3 to which the designated AID points.
   Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
   Range: String with a maximum of 24 characters.
   Default: DEFAULT.
2. **eif** – Electrical Interface Type
   This parameter specifies the type of input to which the port is provisioned.
   Type: Alphanumeric value set.
   Range: DS3 (default), EC1
   The default value DS3 leaves the interface type unchanged, if the parameter is omitted.

3. **`fmt`** – Signal Format
   This parameter shows the format for the DS3 signal
   Type: Alphanumeric value set. A hyphen ("-") is allowed in the alphanumeric values additionally.
   Range:
   - C-BIT (default): C-bit parity channelized DS3 format
   - M23: M23 channelized DS3 format
   - UNFRAMED-CC: UNFRAMED and CLEAR-CHANNEL format
4. **`infepm`** – Incoming DS3 Far End Path PM Enable
   This parameter enables/disables the incoming DS3 far end path performance monitoring.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default).
5. **`inlnpm`** – Incoming DS3 Line PM Enable
   This parameter enables/disables the incoming DS3 line performance monitoring.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default).
6. **`inpm`** – Incoming DS3 Near End Path PM Enable
   This parameter enables/disables the incoming DS3 near end path performance monitoring.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default).
7. **`lbo`** – Line Build Out
   This parameter defines the cable length applicable for the DS3 port.
   Type: Alphanumeric value set.
   Range:
   - SHORT (default): 0 … 68.5 m (0 … 225 ft)
   - LONG: 68.5 … 137 m (225 … 450 ft).
8. **`outmntc`** – Outgoing Maintenance Signal
   This parameter determines whether an AIS, a DS3AIS or IDLE signal is transmitted in response to an unconnected input.
   Type: Alphanumeric value set.
   Range: AIS (default), DS3AIS, IDLE
9. **`outfepm`** – Outgoing DS3 Far End Path PM Enable
   This parameter enables/disables the outgoing DS3 far end path performance monitoring.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default).

10. **`outpm`** – Outgoing DS3 Near End Path PM Enable
This parameter enables/disables the outgoing DS3 near end path performance monitoring.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE (default).

11. **`pmode`** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

12. **`pmsesl`** – PM Threshold for SES – Line
PM Threshold (errors in a second) for declaring SES – Line.
Type: numeric value set.
Range: 1 … 8000
Default: 44

13. **`pmsesp`** – PM Threshold for SES – Path Incoming
PM Threshold (errors in a second) for declaring SES – Path in incoming direction.
Type: numeric value set.
Range: 1 … 8000
Default: 44

14. **`pmsespfe`** – PM Threshold for Far-End SES – Path Incoming
PM Threshold (errors in a second) for declaring Far-End SES – Path in incoming direction.
Type: numeric value set.
Range: 1 … 8000
Default: 44

15. **`pmsespfeout`** – PM Threshold (errors in a second) for declaring Far-End SES – Path in outgoing direction.
Type: numeric value set.
Range: 1 … 8000
Default: 44

16. **`pmsespout`** – PM Threshold for SES – Path Outgoing
PM Threshold (errors in a second) for declaring SES – Path in outgoing direction.
Type: numeric value set.
Range: 1 … 8000
Default: 44

17. **`sdthr`** – Signal Degrade Threshold
    Signal degrade threshold in a range from 10exp-3 to 10exp-9.
    Type: numeric value set.
    Range: (as exponents of 10): -4, -5 -6 (default), -7, -8, -9
18. **`servcond`** – Service Condition
    This parameter indicates its status concerning service involvement.
    Type: Alphanumeric value set.
    Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
19. **`tca`** – DS3 PM TCA
    The parameter tca assigns an DS3 PM TCA profile name to the designated AID.
    Type: Alphanumeric value set. A hyphen (“-”) is allowed in the name additionally.
    Range: String with a maximum of 24 characters, DEFAULT, DEFAULT0 (default).
20. **`vmr`** – Violation Monitoring Mode
    This parameter indicates the status of the DS3 P-bit parity violation monitoring and removal.
    Type: Alphanumeric value set. A hyphen (“-”) is allowed in the alphanumeric values additionally.
    Range: VMR, VM, NO-VM (default)
    .

Output format

If the **`ED-T3`** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section for the **`RTRV-HDR`** command.

Detailed behavior description

The command modifies the attributes (listed in the spec_block parameters part of this command) of the addressed port entity according to the parameters given with this command. The modification is reported by means of an **`ED-T3`** notification for port (except for parameter eif; see below).

Switching of interface type - Ignore other parameters

If additional parameters beside *eif* are specified with the **`ED-T3`** command, they will be ignored by the NE.

Switching of interface type - Impact on port and Tributary Entities

Setting *eif* to EC1 shall

- delete the STS-1 path termination entity related to the T3 port,
- delete the T3 port entity,
- create one EC1 port entity with the defined default values for the port parameters,
- create one STS-1 tributary with the defined default values for the tributary parameters.

The deletion and creation of ports and tributaries are notified via the appropriate DLT and ENT notifications.

Switching of interface type - Impact on Fault Management

Setting *eif* to EC1 shall

- clear all active alarms for the T3 port and the related path termination
- re-evaluate the alarm status after the creation of the EC1 port and the tributary
- raise all active alarms for the EC1 port and the tributary.

The clearing and raising of alarms are notified with the appropriate notifications.

Switching of interface type - Impact on Performance Monitoring

Setting *eif* to EC1 shall

- disable all active PM monitoring points for the T3 port and the path termination
- clear all current and history bins for the T3 port and the path termination.

Example input/output

The following example shows the successful execution of a **RTRV-T3** command. Not all output parameters are listed (missing ones indicated by …).

```
RTRV-T3:LT-UNITE:1-1-#-#-21-1:123456;

   LT-UNITE 00-11-27 08:00:00
M  123456 COMPLD
   ”1-1-#-#-21-1:cbitmis=NORMAL,eif=DS3,ptype=T3,fmt=C-BIT,.... sigmis=NORMAL,vmr=NO
      -VM”
;
```

Error responses

See definition in “RTRV-HDR: Retrieve header” (p. 3-2417) command error responses section for general validation rules. The error responses listed there also apply to the ED-T3 command.

Note: Wrong error code when changing interface type on EP51 while XC loopback exists.

If ED-T3 command is used to change a port on EP51 pack from DS3 to EC1, while a cross-connection loopback exists at the tributary related to the port, then the command is denied with the wrong error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

The correct error code should be:

`SNVS – Status, Not in Valid State,XC loopbacks still exist`

Validation rule: Check CCB against *ptype* and *eif*

Check wether the CCB fits to *ptype* and *eif*.

Error code:`IENE – Input, Entity Not Exists`

Validation rule: ASAP profile exists

Check of the existence of the ASAP profile.

Error code:`IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: TCA profile exists

Check of the existence of the TCA profile.

Error code: `IDNV – Input, Data Not Valid, TCA profile does not exist`

Validation rule: *servcond* must be disabled for facility loopback

Check that the servcond is not enabled when a facility loobackp is existing for this port.

Error code:

`SNVS – Status, Not in Valid State, Facility Loopback is active for this port`

Validation rule: maximum number of enabled PM monitors

Check that the number of enabled PM monitors is less than the maximum number of supported enabled PM monitors before a new PM monitor is enabled.

Error code:

`SSRE – Status, System Resources Exceeded, limit of PM monitors exceeded`

Validation rule: unframed clear-channel format not allowed with P-bit parity violation monitoring

Setting the DS3 signal format to Unframed Clear-Channel is only allowed, if the DS3 Violation Monitoring Mode parameter vmr has been set to NO-VM prior to this command or the parameter *vmr* is specified in this command with the value NO-VM.

Error code:

`SNVS – Status, Not in Valid State, Unframed Clear-Channel not allowed with P-bit parity violation monitoring`

Validation rule: P-bit parity violation monitoring not allowed with unframed clear-channel

Setting the DS3 Violation Monitoring Mode parameter vmr away from NO-VM is only allowed if the DS3 signal format has been set away from Unframed Clear-Channel prior to this command or if the parameter fmt is specified in this command with another value than UNFRAMED-CC.

Error code:

`SNVS – Status, Not in Valid State, P-bit parity violation monitoring not allowed with Unframed Clear-Channel`

Validation rule: DS3 path PM not allowed with unframed clear-channel

Setting the parameters *inpm* and *outpm* to ENABLE is only alowed if the DS3 signal format has been set away from Unframed Clear-Channel prior to this command or if the parameter *fmt* is specified in this command with another value than UNFRAMED-CC.

Error code:

`SNVS – Status, Not in Valid State, DS3 path PM not allowed with Unframed Clear-Channel`

Validation rule: unframed clear-channel not allowed with DS3 path PM

Setting the DS3 signal format to Unframed Clear-Channel is only allowed, if the DS3 path PM has been disabled prior to this command of if both parameters *inpm* and *outpm* are specified in this command with the value DISABLE.

Error code:

`SNVS – Status, Not in Valid State, Unframed Clear-Channel not allowed with DS3 path PM`

Validation rule: DS3AIS or IDLE not allowed with unframed clear-channel

Setting the parameter *outmntc* to DS3AIS or IDLE is not allowed if the DS3 signal format has been set to Unframed Clear-Channel prior to this command or if the parameter *fmt* is specified in this command with UNFRAMED-CC.

Error code:

`SNVS – Status, Not in Valid State, DS3AIS or IDLE not allowed with Unframed Clear-Channel`

Validation rule: no cross-connections for interface type change

Check that eif is not changed when a facility loopback is still on this port.

Error code:

`SNVS – Status, Not in Valid State, cross-connections still existing`

Validation rule: no conversion cross-connections for interface type change

Check that *eif* is not changed when conversion cross-connections are still on this port.

Error code:

`SNVS – Status, Not in Valid State, conversion cross-connections are still existing`

Validation rule: No facility loopbacks for interface type change

Check that *eif* is not changed when cross-connections are still on this port.

Error code:

`SNVS – Status, Not in Valid State, facility loopbacks still exist`

Validation rule: no XC loopbacks for interface type change

Check that *eif* is not changed when cross-connections loopback is still on this port.

Error code:

`SNVS – Status, Not in Valid State, a cross-connect loopback exists`

Validation rule: no test access session for interface type change

Check that *eif* is not changed when a tributary related to this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Check whether system is in maintenance condition

Check that eif is not changed when the system in is maintenance condition.

Error code:

`SNVS – Status, Not in Valid State, not in Maintenance Condition`

"RTRV-T3: Retrieve DS3 port" (p. 3-2968)

References

GR-199-CORE (RTRV-*rr*)

ED-T3 notification

Output format

Syntax

`ED-T3`:*aid::spec_block*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Type: AID
   Range: APortAID of DS3 port

Spec block parameters

1. **`ds3pn`** – DS3 ASAP
   DS3 Alarm Severity Assignment Profile. This parameter retrieves the ASAP profile name of type DS3 to which the designated AID points.
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: String with a maximum of 24 characters.
   Default: DEFAULT.
2. **`eif`** – Electrical Interface Type
   The parameter eif indicates the type of input the port has been provisioned to receive.
   Type: Alphanumeric value set.
   Range: DS3
3. **`fmt`** – Signal Format
   This parameter shows the format for the DS3 signal
   Type: Alphanumeric value set. A hyphen (“-”) is allowed in the alphanumeric values additionally.

   Range:
   - C-BIT (default): C-bit parity channelized DS3 format
   - M23: M23 channelized DS3 format
   - UNFRAMED-CC: UNFRAMED and CLEAR-CHANNEL format
4. **`fsflpbkstat`** – Far Side Facility Loopback Status
   This parameter specifies the current far-side facility loopback status of the considered output *aid*.
   A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
   Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
   Type: Alphanumeric value set.

Range:

- YES
- NO (default).

5. **`infepm`** – Incoming DS3 Far End Path PM Enable
   This parameter enables/disables the incoming DS3 far end path performance monitoring.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default).
6. **`inlnpm`** – Incoming DS3 Line PM Enable
   This parameter enables/disables the incoming DS3 line performance monitoring.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default).
7. **`inpm`** – Incoming DS3 Near End Path PM Enable
   This parameter enables/disables the incoming DS3 near end path performance monitoring.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default).
8. **`lbo`** – Line Build Out
   This parameter defines the cable length applicable for the DS3 port.
   Type: Alphanumeric value set.
   Range:
   - SHORT (default): 0 … 68.5 m (0 … 225 ft)
   - LONG: 68.5 … 137 m (225 … 450 ft).
9. **`lpbk`** – Loopback
   This parameter specifies the current near-side loopback status of the considered output *aid*.
   A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
   Type: Alphanumeric value set.
   Range:
   - YES
   - NO (default).
10. **`outmntc`** – Outgoing Maintenance Signal
    This parameter determines whether an AIS, a DS3AIS or IDLE signal is transmitted in response to an unconnected input.
    Type: Alphanumeric value set.
    Range: AIS (default), DS3AIS, IDLE

11. **`outfepm`** – Outgoing DS3 Far End Path PM Enable
    This parameter enables/disables the outgoing DS3 far end path performance monitoring.
    Type: Alphanumeric value set.
    Range: ENABLE, DISABLE (default).
12. **`outpm`** – Outgoing DS3 Near End Path PM Enable
    This parameter enables/disables the outgoing DS3 near end path performance monitoring.
    Type: Alphanumeric value set.
    Range: ENABLE, DISABLE (default).
13. **`pmode`** – Port Mode
    This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
    Type: Alphanumeric value set.
    Range:
    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.
14. **`pmsesl`** – PM Threshold for SES – Line
    PM Threshold (errors in a second) for declaring SES – Line
    Type: numeric value set.
    Range: 1 … 8000
    Default: 44
15. **`pmsesp`** – PM Threshold for SES – Path Incoming
    PM Threshold (errors in a second) for declaring SES – Path in incoming direction.
    Type: numeric value set.
    Range: 1 … 8000
    Default: 44
16. **`pmsespfe`** – PM Threshold for Far-End SES – Path Incoming
    PM Threshold (errors in a second) for declaring Far-End SES – Path in incoming direction.
    Type: numeric value set.
    Range: 1 … 8000
    Default: 44
17. **`pmsespfeout`** – PM Threshold (errors in a second) for declaring Far-End SES – Path in outgoing direction.
    Type: numeric value set.
    Range: 1 … 8000
    Default: 44

18. **`pmsespout`** – PM Threshold for SES – Path Outgoing
PM Threshold (errors in a second) for declaring SES – Path in outgoing direction.
Type: numeric value set.
Range: 1 … 8000
Default: 44
19. **`sdthr`** – Signal Degrade Threshold
Signal degrade threshold in a range from 10exp-3 to 10exp-9.
Type: numeric value set.
Range: (as exponents of 10): -4, -5 -6 (default), -7, -8, -9
20. **`servcond`** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
   - INSERVICE (default): Provisioning values for service are accepted
   - OUTOFSERVICE: Provisioning values for service are not accepted.
21. **`tca`** – DS3 PM TCA
The parameter tca assigns an DS3 PM TCA profile name to the designated AID.
Type: Alphanumeric value set. A hyphen (“-”) is allowed in the name additionally.
Range: String with a maximum of 24 characters, DEFAULT, DEFAULT0 (default).
22. **`vmr`** – Violation Monitoring Mode
This parameter indicates the status of the DS3 P-bit parity violation monitoring and removal.
Type: Alphanumeric value set. A hyphen (“-”) is allowed in the alphanumeric values additionally.
Range: VMR, VM, NO-VM (default)
.

```

ED-TCA-PROF: Edit TCA profile

General

The **ED-TCA-PROF** command allows the user to modify the existing performance monitoring threshold crossing alert (TCA) profile contents or the profile name. The system default profile names (Default and Default0) cannot be changed. For a general description of TCA profiles, refer to the **RTRV-TCA-PROF** command.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): PM3

Priority: 1

Abortable: No

Input format

Command syntax: **ED-TCA-PROF**:*tid::ctag::pftype,pfname:spec_block;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **ctag** – Correlation Tag
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **pftype** – Profile Type
   This indicates the type of PM TCA profile for the selected facility.
   Type: value set.
   Range: SECTION-LINE, RS-MS, HOVC, PATH, ENET, ODU, LOVC, LOPATH, DS3, DS1.
4. **pfname** – Profile Name
   This indicates the name of the PM TCA profile which was already established by the command **ENT-TCA-PROF**. If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested. If a valid profile name is inserted in this field, the output will display the parameters within the profile with their values. A *pfname* value will always uniquely identify an existing profile for a specified *pftype* value.
   NULL means, that the Profile Name is omitted.
   Type: Alphanumeric string.
   Range: This is an alphanumeric character string with a maximum of 24 characters.
   Default: If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested.

Spec block parameter

1. newname
   This parameter allows a new name to be assigned to the already established profile.
   Type: Alphanumeric string.
   Range: This is a alphanumeric character string with a maximum of 24 characters. Empty string is not allowed.

Spec block parameters - profile parameters of type SECTION-LINE

1. **qhcvsoc3**
   15-minute threshold for CV-S bin for OC-3.
   Type: Integer.
   Range: 0-57599100
   Default: 140.
2. **daycvsoc3**
   Day threshold for CV-S bin of OC-3.
   Type: Integer.
   Range: 0-4294967295
   Default: 1344.
3. **qhcvsoc12**
   15-minute threshold for CV-S bin for OC-12.
   Type: Integer.
   Range: 0-57599100
   Default: 560.
4. **daycvsoc12**
   Day threshold for CV-S bin for OC-12.
   Type: Integer.
   Range: 0-4294967295
   Default: 5376.
5. **qhcvsoc48**
   15-minute threshold for CV-S bin for OC-48.
   Type: Integer.
   Range: 0-57599100
   Default: 2240.
6. **daycvsoc48**
   Day threshold for CV-S bin for OC-48.
   Type: Integer.
   Range: 0-4294967295
   Default: 21504.
7. **qhcvsoc192**
   15-minute threshold for CV-S bin for OC-192.
   Type: Integer.
   Range: 0-57599100
   Default: 8960.

8. **daycvsoc192**
   Day threshold for CV-S bin for OC-192.
   Type: Integer.
   Range: 0-4294967295
   Default: 86016.
9. **qhcvsoc768**
   15-minute threshold for CV-S bin for OC-768.
   Type: Integer.
   Range: 0-57599100
   Default: 35840.
10. **daycvsoc768**
   Day threshold for CV-S bin for OC-768.
   Type: Integer.
   Range: 0-4294967295
   Default: 344064.
11. **qhcvsec1**
   15-minute threshold for CV-S bin for EC-1.
   Type: Integer.
   Range: 0-57599100
   Default: 47
12. **daycvsec1**
   Day threshold for CV-S bin of EC-1.
   Type: Integer.
   Range: 0-4294967295
   Default: 448
13. **qhess**
   15-minute threshold for ES-S bin.
   Type: Integer.
   Range: 0-900
   Default: 25.
14. **dayess**
   Day threshold for ES-S bin.
   Type: Integer.
   Range: 0-86400
   Default: 250.
15. **qhsess**
   15-minute threshold for SES-S bin.
   Type: Integer.
   Range: 0-810
   Default: 10.

16. **`daysess`**
Day threshold for ES-S bin.
Type: Integer.
Range: 0-77760
Default: 40.

17. **`qhsefss`**
15-minute threshold for SEFS-S bin.
Type: Integer.
Range: 0-900
Default: 5.

18. **`daysefss`**
Day threshold for SEFS-S bin.
Type: Integer.
Range: 0-86400
Default: 10.

19. **`qhcvloc3`**
15-minute threshold for CV-L and CV-LFE bin for OC-3.
Type: Integer.
Range: 0-172799100
Default: 140.

20. **`daycvloc3`**
Day threshold for CV-L bin and CV-LFE for OC-3.
Type: Integer.
Range: 0-4294967295
Default: 1344.

21. **`qhcvloc12`**
15-minute threshold for CV-L and CV-LFE bin for OC-12.
Type: Integer.
Range: 0-691199100
Default: 560.

22. **`daycvloc12`**
Day threshold for CV-L bin and CV-LFE for OC-12.
Type: Integer.
Range: 0-4294967295
Default: 5376.

23. **`qhcvloc48`**
15-minute threshold for CV-L and CV-LFE bin for OC-48.
Type: Integer.
Range: 0-4294967295
Default: 2240.

24. **`daycvloc48`**
    Day threshold for CV-L and CV-LFE bin for OC-48.
    Type: Integer.
    Range: 0-4294967295
    Default: 21504.
25. **`qhcvloc192`**
    15-minute threshold for CV-L and CV-LFE bin for OC-192.
    Type: Integer.
    Range: 0-4294967295
    Default: 8960.
26. **`daycvloc192`**
    Day threshold for CV-L and CV-LFE bin for OC-192.
    Type: Integer.
    Range: 0-4294967295
    Default: 86016.
27. **`qhcvloc768`**
    15-minute threshold for CV-L and CV-LFE bin for OC-768.
    Type: Integer.
    Range: 0-4294967295
    Default: 35840.
28. **`daycvloc768`**
    Day threshold for CV-L and CV-LFE bin for OC-768.
    Type: Integer.
    Range: 0-4294967295
    Default: 344064.
29. **`qhcvlec1`**
    15-minute threshold for CV-L and CV-LFE bin for EC-1.
    Type: Integer.
    Range: 0-57599100
    Default: 47
30. **`daycvlec1`**
    Day threshold for CV-L bin and CV-LFE for EC-1.
    Type: Integer.
    Range: 0-4294967295
    Default: 448
31. **`qhesl`**
    15-minute threshold for ES-L and ES-LFE bin.
    Type: Integer.
    Range: 0-900
    Default: 25.

32. **`dayesl`**
    Day threshold for ES-L and ES-LFE bin.
    Type: Integer.
    Range: 0-86400
    Default: 250.
33. **`qhfeccloc192`**
    15-minute threshold for FECC-L bin for OC-192.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 5184.
34. **`dayfeccloc192`**
    Day threshold for FECC-L bin for OC-192.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 497644.
35. **`qhfeccloc768`**
    15-minute threshold for FECC-L bin for OC-768.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 20736.
36. **`dayfeccloc768`**
    Day threshold for FECC-L bin for OC-768.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 1990656.
37. **`qhsesl`**
    15-minute threshold for SES-L and SES-LFE bin.
    Type: Integer.
    Range: 0-810
    Default: 10.
38. **`daysesl`**
    Day threshold for SES-L and SES-LFE bin.
    Type: Integer.
    Range: 0-77760
    Default: 40.

39. **qhuasl**
    15-minute threshold for UAS-L and UAS-LFE bin.
    Type: Integer.
    Range: 0-900
    Default: 10.

40. **dayuasl**
    Day threshold for UAS-L and UAS-LFE bin.
    Type: Integer.
    Range: 0-86400
    Default: 10.

Spec block parameters - profile parameters of type RS-MS

1. **qhrsnbbe**
   15-minute threshold for RS_N_BBE bin.
   Type: Integer.
   Range: 0-7199100
   Default: 9000.

2. **dayrsnbbe**
   Day threshold for RS_N_BBE bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.

3. **qhrsnes**
   15-minute threshold for RS_N_ES bin.
   Type: Integer.
   Range: 0-900
   Default: 180.

4. **dayrsnes**
   Day threshold for RS_N_ES bin.
   Type: Integer.
   Range: 0-86400
   Default: 1500.

5. **qhrsnses**
   15-minute threshold for RS_N_SES bin.
   Type: Integer.
   Range: 0-810
   Default: 15.

6. **dayrsnses**
   Day threshold for RS_N_SES bin.
   Type: Integer.
   Range: 0-77760
   Default: 20.

7. **qhrsnuas**
   15-minute threshold for RS_N_UAS bin.
   Type: Integer.
   Range: 0-900
   Default: 15.
8. **dayrsnuas**
   Day threshold for RS_N_UAS bin.
   Type: Integer.
   Range: 0-86400
   Default: 20.
9. **qhmsbbestm1**
   15-min threshold for MS_N_BBE and MS_F_BBE for stm1 bin.
   Type: Integer.
   Range: 0-172799100
   Default: 228000.
10. **daymsbbestm1**
   Day threshold for MS_N_BBE and MS_F_BBE for stm1 bin.
   Type: Integer.
   Range: 0-4294967295
   Default: 432000.
11. **qhmsbbestm4**
   15-min threshold for MS_N_BBE and MS_F_BBE for stm4 bin.
   Type: Integer.
   Range: 0-691199100
   Default: 912000.
12. **daymsbbestm4**
   Day threshold for MS_N_BBE and MS_F_BBE for stm4 bin.
   Type: Integer.
   Range: 00-4294967295
   Default: 1728000.
13. **qhmsbbestm16**
   15-min threshold for MS_N_BBE and MS_F_BBE for stm16 bin.
   Type: Integer.
   Range: 0-2764799100
   Default: 3648000.
14. **daymsbbestm16**
   Day threshold for MS_N_BBE and MS_F_BBE for stm16 bin.
   Type: Integer.
   Range: 0-4294967295
   Default: 6912000.

15. **qhmsbbestm64**
    15-min threshold for MS_N_BBE and MS_F_BBE for stm64 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 14592000.
16. **daymsbbestm64**
    Day threshold for MS_N_BBE and MS_F_BBE for stm64 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 27648000.
17. **qhmsbbestm256**
    15-min threshold for MS_N_BBE and MS_F_BBE for stm256 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 58368000.
18. **daymsbbestm256**
    Day threshold for MS_N_BBE and MS_F_BBE for stm256 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 110592000.
19. **qhmses**
    15-minute threshold for MS_N_ES and MS_F_ES bin.
    Type: Integer.
    Range: 0-900
    Default: 50.
20. **daymses**
    Day threshold for MS_N_ES and MS_F_ES bin.
    Type: Integer.
    Range: 0-86400
    Default: 150.
21. **qhmsnfeccstm64**
    15-minute threshold for MS-N-FECC bin forSTM-64.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 5184.
22. **daymsnfeccstm64**
    Day threshold for MS-N-FECC bin forSTM-64.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 497644.

23. **`qhmsnfeccstm256`**
    15-minute threshold for MS-N-FECC bin forSTM-256.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 20736.
24. **`daymsnfeccstm256`**
    Day threshold for MS-N-FECC bin forSTM-256.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 1990656.
25. **`qhmsses`**
    15-minute threshold for MS_N_SES and MS_F_SES bin.
    Type: Integer.
    Range: 0-810
    Default: 10.
26. **`daymsses`**
    Day threshold for MS_N_SES and MS_F_SES bin.
    Type: Integer.
    Range: 0-77760
    Default: 15.
27. **`qhmsuas`**
    15-min threshold for MS_N_UAS and MS_F_UAS for stm64 bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
28. **`daymsuas`**
    Day threshold for MS_N_UAS and MS_F_UAS for stm64 bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.

Spec block parameters - reset profile parameters of type RS-MS

1. **`qhrtrrsnbbe`**
   15-minute reset threshold for RS_N_BBE bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
2. **`dayrtrrsnbbe`**
   Day reset threshold for RS_N_BBE bin.
   Type: Integer.
   Range: 0-691113600
   Default: 4800.

3. **qhrtrrsnes**
   15-minute reset threshold for RS_N_ES bin.
   Type: Integer.
   Range: 0-900
   Default: 20.
4. **dayrtrrsnes**
   Day reset threshold for RS_N_ES bin.
   Type: Integer.
   Range: 0-86400
   Default: 150.
5. **qhrtrrsnses**
   15-minute reset threshold for RS_N_SES bin.
   Type: Integer.
   Range: 0-810
   Default: 0.
6. **dayrtrrsnses**
   Day reset threshold for RS_N_SES bin.
   Type: Integer.
   Range: 0-77760
   Default: 0.
7. **qhrtrrsnuas**
   15-minute reset threshold for RS_N_UAS bin.
   Type: Integer.
   Range: 0-900
   Default: 0.
8. **dayrtrrsnuas**
   Day reset threshold for RS_N_UAS bin.
   Type: Integer.
   Range: 0-86400
   Default: 0.
9. **qhrtrmsbbestm1**
   15-min threshold for MS_N_BBE and MS_F_BBE for stm1 bin.
   Type: Integer.
   Range: 0-172799100
   Default: 2400.
10. **dayrtrmsbbestm1**
   Day reset threshold for MS_N_BBE and MS_F_BBE for stm1 bin.
   Type: Integer.
   Range: 0-4294967295
   Default: 43200.

11. **qhrtrmsbbestm4**
15-min threshold for MS_N_BBE and MS_F_BBE for stm4 bin.
Type: Integer.
Range: 0-691199100
Default: 9600.
12. **dayrtrmsbbestm4**
Day reset threshold for MS_N_BBE and MS_F_BBE for stm4 bin.
Type: Integer.
Range: 0-4294967295
Default: 172800.
13. **qhrtrmsbbestm16**
15-min threshold for MS_N_BBE and MS_F_BBE for stm16 bin.
Type: Integer.
Range: 0-2764799100
Default: 38400.
14. **dayrtrmsbbestm16**
Day reset threshold for MS_N_BBE and MS_F_BBE for stm16 bin.
Type: Integer.
Range: 0-4294967295
Default: 691200.
15. **qhrtrmsbbestm64**
15-min threshold for MS_N_BBE and MS_F_BBE for stm64 bin.
Type: Integer.
Range: 0-4294967295
Default: 153600.
16. **dayrtrmsbbestm64**
Day reset threshold for MS_N_BBE and MS_F_BBE for stm64 bin.
Type: Integer.
Range: 0-4294967295
Default: 2764800.
17. **qhrtrmsbbestm256**
15-min threshold for MS_N_BBE and MS_F_BBE for stm256 bin.
Type: Integer.
Range: 0-4294967295
Default: 614400.
18. **dayrtrmsbbestm256**
Day reset threshold for MS_N_BBE and MS_F_BBE for stm256 bin.
Type: Integer.
Range: 0-4294967295
Default: 11059200.

19. **qhrtrmses**
    15-minute reset threshold for MS_N_ES and MS_F_ES bin.
    Type: Integer.
    Range: 0-900
    Default: 5.
20. **dayrtrmses**
    Day reset threshold for MS_N_ES and MS_F_ES bin.
    Type: Integer.
    Range: 0-86400
    Default: 15.
21. **qhrtrmsnfeccstm64**
    15-minute reset threshold for MS-N-FECC bin forSTM-64.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 0.
22. **dayrtrmsnfeccstm64**
    Day reset threshold for MS-N-FECC bin forSTM-64.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 0.
23. **qhrtrmsnfeccstm256**
    15-minute reset threshold for MS-N-FECC bin forSTM-256.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 0.
24. **dayrtrmsnfeccstm256**
    Day reset threshold for MS-N-FECC bin forSTM-256.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 0.
25. **qhrtrmsses**
    15-minute reset threshold for MS_N_SES and MS_F_SES bin.
    Type: Integer.
    Range: 0-810
    Default: 0.
26. **dayrtrmsses**
    Day reset threshold for MS_N_SES and MS_F_SES bin.
    Type: Integer.
    Range: 0-77760
    Default: 0.

27. **qhrtrmsuas**
15-min reset threshold for MS_N_UAS and MS_F_UAS.
Type: Integer.
Range: 0-900
Default: 0.
28. **dayrtrmsuas**
Day reset threshold for MS_N_UAS and MS_F_UAS.
Type: Integer.
Range: 0-86400
Default: 0.

Spec block parameters - profile parameters of type ODU

1. **qhodupbbeodu1**
15-minute threshold for ODU_N_BBE bin and ODU_F_BBE for ODU1P.
Type: Integer.
Range: 0-18377100
Default: 32000.
2. **dayodupbbeodu1**
Day threshold for ODU_N_BBE bin and ODU_F_BBE for ODU1P.
Type: Integer.
Range: 0-1764201600
Default: 61000.
3. **qhodupes**
15-minute threshold for ODU_N_ES and ODU_F_ES bin for ODU1P.
Type: Integer.
Range: 0-900
Default: 50.
4. **dayodupes**
Day threshold for ODU_N_ES and ODU_F_ES bin for ODU1P..
Type: Integer.
Range: 0-86400
Default: 150.
5. **qhodupses**
15-minute threshold for ODU_N_SES and ODU_F_SES bin for ODU1P.
Type: Integer.
Range: 0-810
Default: 10.
6. **dayodupses**
Day threshold for ODU_N_SES and ODU_F_SES bin for ODU1P.
Type: Integer.
Range: 0-77760
Default: 15.

7. **`qhodupuas`**
   15-minute threshold for ODU_N_UAS and ODU_F_UAS bin for ODU1P.
   Type: Integer.
   Range: 0-900
   Default: 15.
8. **`dayodupuas`**
   Day threshold for ODU_N_UAS and ODU_F_UAS bin for ODU1P.
   Type: Integer.
   Range: 0-86400
   Default: 20.

Spec block parameters - reset profile parameters of type ODU

1. **`qhrtrodupbbeodu1`**
   15-minute threshold for ODU_N_BBE bin and ODU_F_BBE for ODU1P.
   Type: Integer.
   Range: 0-18377100
   Default: 200.
2. **`dayrtrodupbbeodu1`**
   Day threshold for ODU_N_BBE bin and ODU_F_BBE for ODU1P.
   Type: Integer.
   Range: 0-1764201600
   Default: 4800.
3. **`qhrtrodupes`**
   15-minute threshold for ODU_N_ES and ODU_F_ES bin for ODU1P.
   Type: Integer.
   Range: 0-900
   Default: 5.
4. **`dayrtrodupes`**
   Day threshold for ODU_N_ES and ODU_F_ES bin for ODU1P.
   Type: Integer.
   Range: 0-86400
   Default: 15.
5. **`qhrtrodupses`**
   15-minute threshold for ODU_N_SES and ODU_F_SES bin for ODU1P.
   Type: Integer.
   Range: 0-810
   Default: 0.
6. **`dayrtrodupses`**
   Day threshold for ODU_N_SES and ODU_F_SES bin for ODU1P.
   Type: Integer.
   Range: 0-77760
   Default: 0.

7. **qhrtrodupuas**
   15-minute threshold for ODU_N_UAS and ODU_F_UAS bin for ODU1P.
   Type: Integer.
   Range: 0-900
   Default: 0.
8. **dayrtrodupuas**
   Day threshold for ODU_N_UAS and ODU_F_UAS bin for ODU1P.
   Type: Integer.
   Range: 0-86400
   Default: 0.

Spec block parameters - profile parameters of type HO-VC

1. **qhvcbbevc3**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC3 bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
2. **dayvcbbevc3**
   Day threshold for VC_N_BBE and VC_F_BBE for VC3 bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.
3. **qhvcbbevc4**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC4 bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
4. **dayvcbbevc4**
   Day threshold for VC_N_BBE and VC_F_BBE for VC4 bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.
5. **qhvcbbevc44c**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC44C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
6. **dayvcbbevc44c**
   Day threshold for VC_N_BBE and VC_F_BBE for VC44C bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.

7. **qhvcbbevc416c**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC416C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
8. **dayvcbbevc416c**
   Day threshold for VC_N_BBE and VC_F_BBE for VC416C bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.
9. **qhvcbbevc464c**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC464C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
10. **dayvcbbevc464c**
    Day threshold for VC_N_BBE and VC_F_BBE for VC464C bin.
    Type: Integer.
    Range: 0-691113600
    Default: 48000.
11. **qhvcesvc3**
    15-minute threshold for VC_N_ES and VC_F_ES VC3 bin.
    Type: Integer.
    Range: 0-900
    Default: 150.
12. **dayvcesvc3**
    Day threshold for VC_N_ES and VC_F_ES VC3 bin.
    Type: Integer.
    Range: 0-86400
    Default: 600.
13. **qhvcesvc4**
    15-minute threshold for VC_N_ES and VC_F_ES for VC4 bin.
    Type: Integer.
    Range: 0-900
    Default: 180.
14. **dayvcesvc4**
    Day threshold for VC_N_ES and VC_F_ES for VC4 bin.
    Type: Integer.
    Range: 0-86400
    Default: 1500.

15. **qhvcesvc44c**
15-minute threshold for VC_N_ES and VC_F_ES for VC4-4C bin.
Type: Integer.
Range: 0-900
Default: 180.
16. **dayvcesvc44c**
Day threshold for VC_N_ES and VC_F_ES for VC4-4C bin.
Type: Integer.
Range: 0-86400
Default: 1500.
17. **qhvcesvc416c**
15-minute threshold for VC_N_ES and VC_F_ES for VC4-16C bin.
Type: Integer.
Range: 0-900
Default: 180.
18. **dayvcesvc416c**
Day threshold for VC_N_ES and VC_F_ES for VC4-16C bin.
Type: Integer.
Range: 0-86400
Default: 1500.
19. **qhvcesvc464c**
15-minute threshold for VC_N_ES and VC_F_ES for VC4-64C bin.
Type: Integer.
Range: 0-900
Default: 180.
20. **dayvcesvc464c**
Day threshold for VC_N_ES and VC_F_ES for VC4-64C bin.
Type: Integer.
Range: 0-86400
Default: 1500.
21. **qhvcsesvc3**
15-minute threshold for VC_N_SES and VC_F_SES for VC3 bin.
Type: Integer.
Range: 0-810
Default: 15.
22. **dayvcsesvc3**
Day threshold for VC_N_SES and VC_F_SES for VC3 bin.
Type: Integer.
Range: 0-77760
Default: 20.

23. **qhvcsesvc4**
    15-minute threshold for VC_N_SES and VC_F_SES for VC4 bin.
    Type: Integer.
    Range: 0-810
    Default: 15.
24. **dayvcsesvc4**
    Day threshold for VC_N_SES and VC_F_SES for VC4 bin.
    Type: Integer.
    Range: 0-77760
    Default: 20.
25. **qhvcsesvc44c**
    15-minute threshold for VC_N_SES and VC_F_SES for VC44C bin.
    Type: Integer.
    Range: 0-810
    Default: 15.
26. **dayvcsesvc44c**
    Day threshold for VC_N_SES and VC_F_SES for VC44C bin.
    Range: 0-77760
    Default: 20.
27. **qhvcsesvc416c**
    15-minute threshold for VC_N_SES and VC_F_SES for VC416C bin.
    Type: Integer.
    Range: 0-810
    Default: 15.
28. **dayvcsesvc416c**
    Day threshold for VC_N_SES and VC_F_SES for VC416C bin.
    Type: Integer.
    Range: 0-77760
    Default: 20.
29. **qhvcsesvc464c**
    15-minute threshold for VC_N_SES and VC_F_SES for VC464C bin.
    Type: Integer.
    Range: 0-810
    Default: 15.
30. **dayvcsesvc464c**
    Day threshold for VC_N_SES and VC_F_SES for VC464C bin.
    Type: Integer.
    Range: 0-77760
    Default: 20.

31. **qhvcuasvc3**
    15-minute threshold for VC_N_UAS and VC_F_UAS for VC3 bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
32. **dayvcuasvc3**
    Day threshold for VC_N_UAS and VC_F_UAS for VC3 bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.
33. **qhvcuasvc4**
    15-minute threshold for VC_N_UAS and VC_F_UAS for VC4 bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
34. **dayvcuasvc4**
    Day threshold for VC_N_UAS and VC_F_UAS for VC4 bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.
35. **qhvcuasvc44c**
    15-minute threshold for VC_N_UAS and VC_F_UAS for VC44C bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
36. **dayvcuasvc44c**
    Day threshold for VC_N_UAS and VC_F_UAS for VC44C bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.
37. **qhvcuasvc416c**
    15-minute threshold for VC_N_UAS and VC_F_UAS for VC416C bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
38. **dayvcuasvc416c**
    Day threshold for VC_N_UAS and VC_F_UAS for VC416C bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.

39. **`qhvcuasvc464c`**
    15-minute threshold for VC_N_UAS and VC_F_UAS for VC464C bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
40. **`dayvcuasvc464c`**
    Day threshold for VC_N_UAS and VC_F_UAS for VC464C bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.
41. **`qhpjcpos`**
    15-minute threshold for positive PJC bin.
    Type: Integer.
    Range: 0-1800000
    Default: 30.
42. **`daypjcpos`**
    Day threshold for positive PJC bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.
43. **`qhpjcneg`**
    15-minute threshold for negative PJC bin.
    Type: Integer.
    Range: 0-1800000
    Default: 30.
44. **`daypjcneg`**
    Day threshold for positive PJC bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.

Spec block parameters - reset profile parameters of type HO-VC

1. **`qhrtrvcbbevc3`**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC3 bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
2. **`dayrtrvcbbevc3`**
   Day reset threshold for VC_N_BBE and VC_F_BBE for VC3 bin.
   Type: Integer.
   Range: 0-691113600
   Default: 4800.

3. **qhrtrvcbbevc4**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC4 bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
4. **dayrtrvcbbevc4**
   Day reset threshold for VC_N_BBE and VC_F_BBE for VC4 bin.
   Type: Integer.
   Range: 0-691113600
   Default: 4800.
5. **qhrtrvcbbevc44c**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC44C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
6. **dayrtrvcbbevc44c**
   Day reset threshold for VC_N_BBE and VC_F_BBE for VC44C bin.
   Type: Integer.
   Range: 0-691113600
   Default: 4800.
7. **qhrtrvcbbevc416c**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC416C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
8. **dayrtrvcbbevc416c**
   Day reset threshold for VC_N_BBE and VC_F_BBE for VC416C bin.
   Type: Integer.
   Range: 0-691113600
   Default: 4800.
9. **qhrtrvcbbevc464c**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC464C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
10. **dayrtrvcbbevc464c**
    Day reset threshold for VC_N_BBE and VC_F_BBE for VC464C bin.
    Type: Integer.
    Range: 0-691113600
    Default: 4800.

11. **qhrtrvcesvc3**
    15-minute reset threshold for VC_N_ES and VC_F_ES VC3 bin.
    Type: Integer.
    Range: 0-900
    Default: 10.
12. **dayrtrvcesvc3**
    Day reset threshold for VC_N_ES and VC_F_ES VC3 bin.
    Type: Integer.
    Range: 0-86400
    Default: 60.
13. **qhrtrvcesvc4**
    15-minute reset threshold for VC_N_ES and VC_F_ES for VC4 bin.
    Type: Integer.
    Range: 0-900
    Default: 20.
14. **dayrtrvcesvc4**
    Day reset threshold for VC_N_ES and VC_F_ES for VC4 bin.
    Type: Integer.
    Range: 0-86400
    Default: 150.
15. **qhrtrvcesvc44c**
    15-minute reset threshold for VC_N_ES and VC_F_ES for VC4-4C bin.
    Type: Integer.
    Range: 0-900
    Default: 20.
16. **dayrtrvcesvc44c**
    Day reset threshold for VC_N_ES and VC_F_ES for VC4-4C bin.
    Type: Integer.
    Range: 0-86400
    Default: 150.
17. **qhrtrvcesvc416c**
    15-minute reset threshold for VC_N_ES and VC_F_ES for VC4-16C bin.
    Type: Integer.
    Range: 0-900
    Default: 20.
18. **dayrtrvcesvc416c**
    Day reset threshold for VC_N_ES and VC_F_ES for VC4-16C bin.
    Type: Integer.
    Range: 0-86400
    Default: 150.

19. **qhrtrvcesvc464c**
15-minute reset threshold for VC_N_ES and VC_F_ES for VC4-64C bin.
Type: Integer.
Range: 0-900
Default: 20.
20. **dayrtrvcesvc464c**
Day reset threshold for VC_N_ES and VC_F_ES for VC4-64C bin.
Type: Integer.
Range: 0-86400
Default: 150.
21. **qhrtrvcsesvc3**
15-minute reset threshold for VC_N_SES and VC_F_SES for VC3 bin.
Type: Integer.
Range: 0-810
Default: 0.
22. **dayrtrvcsesvc3**
Day reset threshold for VC_N_SES and VC_F_SES for VC3 bin.
Type: Integer.
Range: 0-77760
Default: 0.
23. **qhrtrvcsesvc4**
15-minute reset threshold for VC_N_SES and VC_F_SES for VC4 bin.
Type: Integer.
Range: 0-810
Default: 0.
24. **dayrtrvcsesvc4**
Day reset threshold for VC_N_SES and VC_F_SES for VC4 bin.
Type: Integer.
Range: 0-77760
Default: 0.
25. **qhrtrvcsesvc44c**
15-minute reset threshold for VC_N_SES and VC_F_SES for VC44C bin.
Type: Integer.
Range: 0-810
Default: 0.
26. **dayrtrvcsesvc44c**
Day reset threshold for VC_N_SES and VC_F_SES for VC44C bin.
Type: Integer.
Range: 0-77760
Default: 0.

27. **qhrtrvcsesvc416c**
15-minute reset threshold for VC_N_SES and VC_F_SES for VC416C bin.
Type: Integer.
Range: 0-810
Default: 0.
28. **dayrtrvcsesvc416c**
Day reset threshold for VC_N_SES and VC_F_SES for VC416C bin.
Type: Integer.
Range: 0-77760
Default: 0.
29. **qhrtrvcsesvc464c**
15-minute reset threshold for VC_N_SES and VC_F_SES for VC464C bin.
Type: Integer.
Range: 0-810
Default: 0.
30. **dayrtrvcsesvc464c**
Day reset threshold for VC_N_SES and VC_F_SES for VC464C bin.
Type: Integer.
Range: 0-77760
Default: 0.
31. **qhrtrvcuasvc3**
15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC3 bin.
Type: Integer.
Range: 0-900
Default: 0.
32. **dayrtrvcuasvc3**
Day reset threshold for VC_N_UAS and VC_F_UAS for VC3 bin.
Type: Integer.
Range: 0-86400
Default: 0.
33. **qhrtrvcuasvc4**
15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC4 bin.
Type: Integer.
Range: 0-900
Default: 0.
34. **dayrtrvcuasvc4**
Day reset threshold for VC_N_UAS and VC_F_UAS for VC4 bin.
Type: Integer.
Range: 0-86400
Default: 0.

35. **qhrtrvcuasvc44c**
15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC44C bin.
Type: Integer.
Range: 0-900
Default: 0.
36. **dayrtrvcuasvc44c**
Day reset threshold for VC_N_UAS and VC_F_UAS for VC44C bin.
Type: Integer.
Range: 0-86400
Default: 0.
37. **qhrtrvcuasvc416c**
15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC416C bin.
Type: Integer.
Range: 0-900
Default: 0.
38. **dayrtrvcuasvc416c**
Day reset threshold for VC_N_UAS and VC_F_UAS for VC416C bin.
Type: Integer.
Range: 0-86400
Default: 0.
39. **qhrtrvcuasvc464c**
15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC464C bin.
Type: Integer.
Range: 0-900
Default: 0.
40. **dayrtrvcuasvc464c**
Day reset threshold for VC_N_UAS and VC_F_UAS for VC464C bin.
Type: Integer.
Range: 0-86400
Default: 0.
41. **qhrtrpjcpos**
15-minute reset threshold for positive PJC bin.
Type: Integer.
Range: 0-1800000
Default: 0.
42. **dayrtrpjcpos**
Day reset threshold for positive PJC bin.
Type: Integer.
Range: 0-172800000
Default: 0.

43. **`qhrtrpjcneg`**
    15-minute reset threshold for negative PJC bin.
    Type: Integer.
    Range: 0-1800000
    Default: 0.
44. **`dayrtrpjcneg`**
    Day reset threshold for negative PJC bin.
    Type: Integer.
    Range: 0-172800000
    Default: 0.

Spec block parameters - profile parameters of type PATH

1. **`qhcvpsts1`**
   15-minute threshold for CV-P and CV-PFE bin for STS1.
   Type: Integer.
   Range: 0-57599100
   Default: 15.
2. **`daycvpsts1`**
   Day threshold for CV-P and CV-PFE bin for STS1.
   Type: Integer.
   Range: 0-4294967295
   Default: 125.
3. **`qhcvpsts3c`**
   15-minute threshold for CV-P and CV-PFE bin for STS3C.
   Type: Integer.
   Range: 0-57599100
   Default: 25.
4. **`daycvpsts3c`**
   Day threshold for CV-P and CV-PFE bin for STS3C.
   Type: Integer.
   Range: 4294967295
   Default: 250.
5. **`qhcvpsts12c`**
   15-minute threshold for CV-P and CV-PFE bin for STS12C.
   Type: Integer.
   Range: 0-57599100
   Default: 75.
6. **`daycvpsts12c`**
   Day threshold for threshold for CV-P and CV-PFE bin for STS12C.
   Type: Integer.
   Range: 4294967295
   Default: 750.

7. **qhcvpsts48c**
   15-minute threshold for CV-P and CV-PFE bin for STS48C.
   Type: Integer.
   Range: 0-57599100
   Default: 300.
8. **daycvpsts48c**
   Day threshold for CV-P and CV-PFE bin for STS48C.
   Type: Integer.
   Range: 4294967295
   Default: 3000.
9. **qhcvpsts192c**
   Day threshold for CV-P and CV-PFE bin for STS192C.
   Type: Integer.
   Range: 0-57599100
   Default: 1200.
10. **daycvpsts192c**
   Day threshold for CV-P and CV-PFE bin for STS192C.
   Type: Integer.
   Range: 0-4294967295
   Default: 12000.
11. **qhespsts1**
   15-minute threshold for ES-P and ES-PFE bin for STS1.
   Type: Integer.
   Range: 0-900
   Default: 12.
12. **dayespsts1**
   Day threshold for ES-P and ES-PFE bin for STS1.
   Type: Integer.
   Range: 0-86400
   Default: 100.
13. **qhespsts3c**
   15-minute threshold for ES-P and ES-PFE bin for STS3C.
   Type: Integer.
   Range: 0-900
   Default: 20.
14. **dayespsts3c**
   Day threshold for ES-P and ES-PFE bin for STS3C.
   Type: Integer.
   Range: 0-86400
   Default: 200.

15. **qhespsts12c**
    15-minute threshold for ES-P and ES-PFE bin for STS12C.
    Type: Integer.
    Range: 0-900
    Default: 60.
16. **dayespsts12c**
    Day threshold for ES-P and ES-PFE bin for STS12C.
    Type: Integer.
    Range: 0-86400
    Default: 600.
17. **qhespsts48c**
    15-minute threshold for ES-P and ES-PFE bin for STS48C.
    Type: Integer.
    Range: 0-900
    Default: 240.
18. **dayespsts48c**
    Day threshold for ES-P and ES-PFE bin for STS48C.
    Type: Integer.
    Range: 0-86400
    Default: 2400.
19. **qhespsts192c**
    Day threshold for ES-P and ES-PFE bin for STS192C.
    Type: Integer.
    Range: 0-900
    Default: 240.
20. **dayespsts192c**
    Day threshold for ES-P and ES-PFE bin for STS192C.
    Type: Integer.
    Range: 0-86400
    Default: 9600.
21. **qhsesp**
    15-minute threshold for SES-P and SES-PFE bin.
    Type: Integer.
    Range: 0-810
    Default: 3.
22. **daysesp**
    Day threshold for SES-P and SES-PFE bin.
    Type: Integer.
    Range: 0-77760
    Default: 7.

23. **qhuasp**
    15-minute threshold for UAS-P and UAS-PFE bin.
    Type: Integer.
    Range: 0-900
    Default: 10.
24. **dayuasp**
    Day threshold for UAS-P and UAS-PFE bin.
    Type: Integer.
    Range: 0-86400
    Default: 10.
25. **qhppjcgen**
    15-minute threshold for PPJC-PGen bin.
    Type: Integer.
    Range: 0-1800000
    Default: 30.
26. **dayppjcgen**
    Day threshold for PPJC-PGen bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.
27. **qhnpjcgen**
    15-minute threshold for NPJC-PGen bin.
    Type: Integer.
    Range: 0-1800000
    Default: 30.
28. **daynpjcgen**
    Day threshold for NPJC-PGen bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.
29. **qhppjcgdet**
    15-minute threshold for PPJC-PDet bin.
    Type: Integer.
    Range: 0-1800000
    Default: 30.
30. **dayppjcdet**
    Day threshold for PPJC-PDet bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.

31. **`qhnpjcdet`**
    15-minute threshold for NPJC-PDet bin.
    Type: Integer.
    Range: 0-1800000
    Default: 30.
32. **`daynpjcdet`**
    Day threshold for NPJC-PDet bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.

Spec block parameters - profile parameters of type ENET

1. **`qhpdege`**
   15-minute threshold for PDE bin for GE.
   Type: Integer.
   Range: 0-183000000
   Default: 187500.
2. **`daypdege`**
   Day threshold for PDE bin for GE.
   Type: Integer.
   Range: 0-4294967295
   Default: 9000000.
3. **`qhpdevcg`**
   15-minute threshold for PDE bin for VCG.
   Type: Integer.
   Range: 0-183000000
   Default: 10.
4. **`daypdevcg`**
   Day threshold for PDE bin for VCG.
   Type: Integer.
   Range: 0-4294967295
   Default: 50.
5. **`qhedfe1ge`**
   15min EDFE for 1GbE Ethernet port.
   Type: Integer.
   Range: 0-1371951220
   Default: 1875000.
6. **`dayedfe1ge`**
   24 h EDFE for 1GbE Ethernet port.
   Type: Integer.
   Range: 0-4294967295
   Default: 9000000.

7. **`qhedfc1ge`**
   15min EDFC for 1GbE Ethernet port.
   Type: Integer.
   Range: 0-1371951220
   Default: 20.
8. **`dayedfc1ge`**
   24 h EDFC for 1GbE Ethernet port.
   Type: Integer.
   Range: 0-4294967295
   Default: 50.
9. **`qhedfe10ge`**
   15min EDFE for 10GbE Ethernet port.
   Type: Integer.
   Range: 0-2147483647
   Default: 18750000.
10. **`dayedfe10ge`**
    24 h EDFE for 10GbE Ethernet port.
    Type: Integer.
    Range: 0-4294967295
    Default: 90000000.
11. **`qhedfc10ge`**
    15min EDFC for 10GbE Ethernet port.
    Type: Integer.
    Range: 0-2147483647
    Default: 100.
12. **`dayedfc10ge`**
    24 h EDFC for 10GbE Ethernet port.
    Type: Integer.
    Range: 0-4294967295
    Default: 500.
13. **`qhedfe1gevcg`**
    15min EDFE for 1GbE VCG port.
    Type: Integer.
    Range: 0-1371951220
    Default: 10.
14. **`dayedfe1gevcg`**
    24 h EDFE for 1GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 50.

15. **`qhedfc1gevcg`**
    15min EDFC for 1GbE VCG port.
    Type: Integer.
    Range: 0-1371951220
    Default: 10.
16. **`dayedfc1gevcg`**
    24 h EDFC for 1GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 50.
17. **`qhedfe10gevcg`**
    15min EDFE for 10GbE VCG port.
    Type: Integer.
    Range: 0-2147483647
    Default: 100.
18. **`dayedfe10gevcg`**
    24 h EDFE for 10GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 500.
19. **`qhedfc10gevcg`**
    15min EDFC for 10GbE VCG port.
    Type: Integer.
    Range: 0-2147483647
    Default: 100.
20. **`dayedfc10gevcg`**
    24 h EDFC for 10GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 500.

Spec block parameters - reset profile parameters of type ENET

1. **`qhrtrpdege`**
   15-minute reset threshold for PDE bin for GE.
   Type: Integer.
   Range: 0-183000000
   Default: 937500.
2. **`dayrtrpdege`**
   Day reset threshold for PDE bin for GE.
   Type: Integer.
   Range: 0-4294967295
   Default: 4500000.

3. **`qhrtrpdevcg`**
   15-minute reset threshold for PDE bin for VCG.
   Type: Integer.
   Range: 0-183000000
   Default: 2.
4. **`dayrtrpdevcg`**
   Day reset threshold for PDE bin for VCG.
   Type: Integer.
   Range: 0-4294967295
   Default: 5.
5. **`qhrtredfe1ge`**
   15min reset threshold for EDFE of 1GbE Ethernet port.
   Type: Integer.
   Range: 0-1371951220
   Default: 937500.
6. **`dayrtredfe1ge`**
   24h reset threshold for EDFE of 1GbE Ethernet port.
   Type: Integer.
   Range: 0-4294967295
   Default: 4500000.
7. **`qhrtredfc1ge`**
   15min reset threshold for EDFC of 1GbE Ethernet port.
   Type: Integer.
   Range: 0-1371951220
   Default: 2.
8. **`dayrtredfc1ge`**
   24h reset threshold for EDFC of 1GbE Ethernet por.
   Type: Integer.
   Range: 0-4294967295
   Default: 5.
9. **`qhrtredfe10ge`**
   15min reset threshold for EDFE of 10GbE Ethernet port.
   Type: Integer.
   Range: 0-2147483647
   Default: 9375000
10. **`dayrtredfe10ge`**
    24h reset threshold for EDFE of 10GbE Ethernet port.
    Type: Integer.
    Range: 0-4294967295
    Default: 45000000.

11. **`qhrtredfc10ge`**
    15min reset threshold for EDFC of 10GbE Ethernet port.
    Type: Integer.
    Range: 0-2147483647
    Default: 20.
12. **`dayrtredfc10ge`**
    24h reset threshold for EDFC of 10GbE Ethernet port.
    Type: Integer.
    Range: 0-4294967295
    Default: 50.
13. **`qhrtredfe1gevcg`**
    15min reset threshold for EDFE of 1GbE VCG port.
    Type: Integer.
    Range: 0-1371951220
    Default: 2.
14. **`dayrtredfe1gevcg`**
    24h reset threshold for EDFE of 1GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 5.
15. **`qhrtredfc1gevcg`**
    15min reset threshold for EDFC of 1GbE VCG port.
    Type: Integer.
    Range: 0-1371951220
    Default: 2.
16. **`dayrtredfc1gevcg`**
    24h reset threshold for EDFC of 1GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 5.
17. **`qhrtredfe10gevcg`**
    15min reset threshold for EDFE of 10GbE VCG port.
    Type: Integer.
    Range: 0-2147483647
    Default: 20.
18. **`dayrtredfe10gevcg`**
    24h reset threshold for EDFE of 10GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 50.

19. **`qhrtredfc10gevcg`**
    15min reset threshold for EDFC of 10GbE VCG port.
    Type: Integer.
    Range: 0-2147483647
    Default: 20.
20. **`dayrtredfc10gevcg`**
    24h reset threshold for EDFC of 10GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 50.

Spec block parameters- profile parameters of type LOVC

1. **`qhvcbbevc12`**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC12 bin.
   Type: Integer.
   Range: 0-1799100
   Default: 9000.
2. **`dayvcbbevc12`**
   Day threshold for VC_N_BBE and VC_F_BBE for VC12 bin.
   Type: Integer.
   Range: 0-172713600
   Default: 12000.
3. **`qhvcbbelovc3`**
   15-minute threshold for VC_N_BBE and VC_F_BBE for lower order VC3 bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
4. **`dayvcbbelovc3`**
   Day threshold for VC_N_BBE and VC_F_BBE for lower order VC3 bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.
5. **`qhvcesvc12`**
   15-minute threshold for VC_N_ES and VC_F_ES for VC12 bin.
   Type: Integer.
   Range: 0-900
   Default: 120.
6. **`dayvcesvc12`**
   Day threshold for VC_N_ES and VC_F_ES for VC12 bin.
   Type: Integer.
   Range: 0-86400
   Default: 350.

7. **qhvceslovc3**
   15-minute threshold for VC_N_ES and VC_F_ES for lower order VC3 bin.
   Type: Integer.
   Range: 0-900
   Default: 150.
8. **dayvceslovc3**
   Day threshold for VC_N_ES and VC_F_ES for lower order VC3 bin.
   Type: Integer.
   Range: 0-86400
   Default: 600.
9. **qhvcsesvc12**
   15-minute threshold for VC_N_SES and VC_F_SES for VC12 bin.
   Type: Integer.
   Range: 0-810
   Default: 15.
10. **dayvcsesvc12**
    Day threshold for VC_N_SES and VC_F_SES for VC12 bin.
    Type: Integer.
    Range: 0-77760
    Default: 20.
11. **qhvcseslovc3**
    15-minute threshold for VC_N_SES and VC_F_SES for lower order VC3 bin.
    Type: Integer.
    Range: 0-810
    Default: 15.
12. **dayvcseslovc3**
    Day threshold for VC_N_SES and VC_F_SES for lower order VC3 bin.
    Type: Integer.
    Range: 0-77760
    Default: 20.
13. **qhvcuasvc12**
    15-minute threshold for VC_N_UAS and VC_F_UAS for VC12 bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
14. **dayvcuasvc12**
    Day threshold for VC_N_UAS and VC_F_UAS for VC12 bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.

15. **`qhvcuaslovc3`**
    15-minute threshold for VC_N_UAS and VC_F_UAS for lower order VC3 bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
16. **`dayvcuaslovc3`**
    Day threshold for VC_N_UAS and VC_F_UAS for lower order VC3 bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.

Spec block parameters- reset profile parameters of type LOVC

1. **`qhrtrvcbbevc12`**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC12 bin.
   Type: Integer.
   Range: 0-1799100
   Default: 50.
2. **`dayrtrvcbbevc12`**
   Day reset threshold for VC_N_BBE and VC_F_BBE for VC12 bin.
   Type: Integer.
   Range: 0-172713600
   Default: 1200.
3. **`qhrtrvcbbelovc3`**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for lower order VC3 bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
4. **`dayrtrvcbbelovc3`**
   Day reset threshold for VC_N_BBE and VC_F_BBE for lower order VC3 bin.
   Type: Integer.
   Range: 0-691113600
   Default: 4800.
5. **`qhrtrvcesvc12`**
   15-minute reset threshold for VC_N_ES and VC_F_ES for VC12 bin.
   Type: Integer.
   Range: 0-900
   Default: 5.
6. **`dayrtrvcesvc12`**
   Day reset threshold for VC_N_ES and VC_F_ES for VC12 bin.
   Type: Integer.
   Range: 0-86400
   Default: 35.

7. **`qhrtrvceslovc3`**
   15-minute reset threshold for VC_N_ES and VC_F_ES for lower order VC3 bin.
   Type: Integer.
   Range: 0-900
   Default: 10.
8. **`dayrtrvceslovc3`**
   Day reset threshold for VC_N_ES and VC_F_ES for lower order VC3 bin.
   Type: Integer.
   Range: 0-86400
   Default: 60.
9. **`qhrtrvcsesvc12`**
   15-minute reset threshold for VC_N_SES and VC_F_SES for VC12 bin.
   Type: Integer.
   Range: 0-810
   Default: 0.
10. **`dayrtrvcsesvc12`**
    Day reset threshold for VC_N_SES and VC_F_SES for VC12 bin.
    Type: Integer.
    Range: 0-77760
    Default: 0.
11. **`qhrtrvcseslovc3`**
    15-minute reset threshold for VC_N_SES and VC_F_SES for lower order VC3 bin.
    Type: Integer.
    Range: 0-810
    Default: 0.
12. **`dayrtrvcseslovc3`**
    Day reset threshold for VC_N_SES and VC_F_SES for lower order VC3 bin.
    Type: Integer.
    Range: 0-77760
    Default: 0.
13. **`qhrtrvcuasvc12`**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC12 bin.
    Type: Integer.
    Range: 0-900
    Default: 0.
14. **`dayrtrvcuasvc12`**
    Day reset threshold for VC_N_UAS and VC_F_UAS for VC12 bin.
    Type: Integer.
    Range: 0-86400
    Default: 0.

15. **qhrtrvcuaslovc3**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for lower order VC3 bin.
    Type: Integer.
    Range: 0-900
    Default: 0.

16. **dayrtrvcuaslovc3**
    Day reset threshold for VC_N_UAS and VC_F_UAS for lower order VC3 bin.
    Type: Integer.
    Range: 0-86400
    Default: 0.

Spec block parameters.- Profile Parameters of Type LOPATH

1. **qhcvvt1**
   15-minute threshold for CV-P and CV-PFE bin for VT1.
   Type: Integer.
   Range: 0-14399100
   Default: 75.

2. **daycvvt1**
   Day threshold for CV-P and CV-PFE bin for VT1.
   Type: Integer.
   Range: 0-1382313600
   Default: 750.

3. **qhesvt1**
   15-minute threshold for ES-P and ES-PFE bin for VT1.
   Type: Integer.
   Range: 0-900
   Default: 40.

4. **dayesvt1**
   Day threshold for ES-P and ES-PFE bin for VT1.
   Type: Integer.
   Range: 0-86400
   Default: 900.

5. **qhsesvt1**
   15-minute threshold for SES-P and SES-PFE bin for VT1.
   Type: Integer.
   Range: 0-810
   Default: 40.

6. **daysesvt1**
   Day threshold for SES-P and SES-PFE bin for VT1.
   Type: Integer.
   Range: 0-77760
   Default: 900.

7. **qhuasvt1**
   15-minute threshold for UAS-P and UAS-PFE bin for VT1.
   Type: Integer.
   Range: 0-900
   Default: 40.
8. **dayuasvt1**
   Day threshold for UAS-P and UAS-PFE bin for VT1.
   Type: Integer.
   Range: 0-86400
   Default: 900.

Command parameters - profile parameters of type DS3

1. **qhcvl**
   15-minute threshold for CV-L bin of DS3 Line.
   Type: Integer.
   Range: 0-7200000
   Default: 387.
2. **daycvl**
   Day threshold for CV-L bin of DS3 Line.
   Type: Integer.
   Range: 0- 691200000
   Default: 3865.
3. **qhesl**
   15-minute threshold for Es-L bin of DS3 Line.
   Type: Integer.
   Range: 0-900
   Default: 25.
4. **dayesl**
   Day threshold for ES-L bin of DS3 Line.
   Type: Integer.
   Range: 0-86400
   Default: 250.
5. **qhesal**
   15-minute threshold for ESA-L bin of DS3 Line.
   Type: Integer.
   Range: 0-900
   Default: 25.
6. **dayesal**
   Day threshold for ESB-L bin of DS3 Line.
   Type: Integer.
   Range: 0-86400
   Default: 250.

7. **qhesbl**
   15-minute threshold for ESB-L bin of DS3 Line.
   Type: Integer.
   Range: 0-900
   Default: 25.
8. **dayesbl**
   Day threshold for ESB-L bin of DS3 Line.
   Type: Integer.
   Range: 0-86400
   Default: 250.
9. **qhsesl**
   15-minute threshold for SES-L bin of DS3 Line.
   Type: Integer.
   Range: 0-810
   Default: 4.
10. **daysesl**
   Day threshold for SES-L bin of DS3 Line.
   Type: Integer.
   Range: 0-77760
   Default: 40.
11. **qhcvp**
   15-minute threshold for CV-P and CV-PFE bin of DS3 Path ingress and egress direction.
   Type: Integer.
   Range: 0-7200000
   Default: 382.
12. **daycvp**
   Day threshold for CV-P and CV-PFE bin of DS3 Path ingress and egress direction.
   Type: Integer.
   Range: 0-691200000
   Default: 3820.
13. **qhesp**
   15-minute threshold for ES-P and ES-PFE bin of DS3 Path ingress and egress direction.
   Type: Integer.
   Range: 0-900
   Default: 25.
14. **dayesp**
   Day threshold for ES-P and ES-PFE bin of DS3 Path ingress and egress direction.
   Type: Integer.
   Range: 0-86400
   Default: 250.

15. **qhesap**
    15-minute threshold for ESA-P and ESA-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-900
    Default: 25.
16. **dayesap**
    Day threshold for ESA-P and ESA-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 250.
17. **qhesbp**
    15-minute threshold for ESB-P and ESB-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-900
    Default: 25.
18. **dayesbp**
    Day threshold for ESB-P and ESB-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 250.
19. **qhsesp**
    15-minute threshold for SES-P and SES-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-810
    Default: 4.
20. **daysesp**
    Day threshold for SES-P and SES-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-77760
    Default: 40.
21. **qhuasp**
    15-minute threshold for UAS-P and UAS-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-900
    Default: 10.

22. **`dayuasp`**
    Day threshold for UAS-P and UAS-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 10.
23. **`qhsasp`**
    15-minute threshold for SAS-P and SAS-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-900
    Default: 2.
24. **`daysasp`**
    Day threshold for SAS-P and SAS-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 8.

Command parameters - profile parameters of type DS1

1. **`qhcvsfp`**
   15-minute threshold for CV-P bin of DS1 Path with SF format in egress direction.
   Type: Integer.
   Range: 0-16383
   Default: 72.
2. **`daycvsfp`**
   Day threshold for CV-P bin of DS1 Path with SF format in egress direction.
   Type: Integer.
   Range: 0- 1048575
   Default: 691.
3. **`qhcvesfp`**
   15-minute threshold for CV-P bin of DS1 Path with ESF format in egress direction.
   Type: Integer.
   Range: 0-16383
   Default: 13296.
4. **`daycvesfp`**
   Day threshold for CV-P bin of DS1 Path with ESF format in egress direction.
   Type: Integer.
   Range: 0-1048575
   Default: 132960.

5. **qhesp**
   15-minute threshold for ES-P bin of DS1 Path egress direction.
   Type: Integer.
   Range: 0-900
   Default: 65.
6. **dayesp**
   Day threshold for ES-P bin of DS1 Path egress direction.
   Type: Integer.
   Range: 0-86400
   Default: 648.
7. **qhsesp**
   15-minute threshold for SES-P bin of DS1 Path egress direction.
   Type: Integer.
   Range: 0-810
   Default: 10.
8. **daysesp**
   Day threshold for SES-P bin of DS1 Path egress direction.
   Type: Integer.
   Range: 0-86400
   Default: 250.
9. **qhuasp**
   15-minute threshold for UAS-P bin of DS1 Path egress direction.
   Type: Integer.
   Range: 0-900
   Default: 10.
10. **dayuasp**
    Day threshold for UAS-P bin of DS1 Path egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 10.
11. **qhsasp**
    15-minute threshold for SAS-P bin of DS1 Path egress direction.
    Type: Integer.
    Range: 0-900
    Default: 2.
12. **daysasp**
    Day threshold for SAS-P bin of DS1 Path egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 17.

Output format

If the NE fully complies with the ED-TCA-PROF request, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

Output parameters

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

TCA Profile modification

The command modifies the existing performance monitoring Threshold Crossing Alert (TCA) profile content or the profile name.

The modification of the TCA profile is reported by means of an ED-TCA-PROF notification.

Example input/output

The following example shows the successful completion of a ED-TCA-PROF command by the NE:

```
ED-TCA-PROF:UNITE-NE::123456::rs-ms,ATT:qhrsnes=10,qhrsnbbe=6;
   UNITE-NE 00-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **`ED-TCA-PROF`** command.

Validation rule: profile name does not exist

If the profile name specified does not exist.

Error code: `IDNV – Input, Data Not Valid, profile name does not exist`

Validation rule: profile name already exists

If the system receives a new profile name that already exists for that profile type, the following error response is returned.

Error code: `IEAE – Input, Entity Already Exists, duplicate profile name`

Validation rule: rename default profile name

If a user tries to change the system default profile name (Default / Default0), the following error response is returned.

Error code:

`IDNC – Input, Data Not Consistent, new name for default profile`

Validation rule: value change of default profile Default0

If a user tries to change values of the system default profile ″Default0″, the following error response is returned.

Error code:

`IDNC – Input, Data Not Consistent, value change not allowed for profile Default0`

ED-TCA-PROF notification

Output format

Command syntax: **`ED-TCA-PROF`**::*pftype*,*pfname*:*spec_block*

Output parameter

Command parameters

1. **`pftype`** – Profile Type
   This indicates the type of PM TCA profile for the selected facility.
   Type: value set.
   Range: SECTION-LINE, RS-MS, HOVC, PATH, ENET, ODU, LOVC, LOPATH, DS3, DS1.
2. **`pfname`** – Profile Name
   This indicates the name of the PM TCA profile which was already established by the command **`ENT-TCA-PROF`**. If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested. If a valid profile name is inserted in this field, the output will display the parameters within the profile with their values. A *pfname* value will always uniquely identify an existing profile for a specified *pftype* value.
   NULL means, that the Profile Name is omitted.
   Type: Alphanumeric string.
   Range: This is an alphanumeric character string with a maximum of 24 characters.
   Default: If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested.

Spec block parameter

1. **`newname`**
   This parameter allows a new name to be assigned to the already established profile.
   Type: Alphanumeric string.
   Range: This is a alphanumeric character string with a maximum of 24 characters.
   Empty string is not allowed.

Spec block parameters - profile parameters of type SECTION-LINE

1. **`qhcvsoc3`**
   15-minute threshold for CV-S bin for OC-3.
   Type: Integer.
   Range: 0-57599100
   Default: 140.
2. **`daycvsoc3`**
   Day threshold for CV-S bin of OC-3.
   Type: Integer.
   Range: 0-4294967295
   Default: 1344.

3. **qhcvsoc12**
   15-minute threshold for CV-S bin for OC-12.
   Type: Integer.
   Range: 0-57599100
   Default: 560.
4. **daycvsoc12**
   Day threshold for CV-S bin for OC-12.
   Type: Integer.
   Range: 0-4294967295
   Default: 5376.
5. **qhcvsoc48**
   15-minute threshold for CV-S bin for OC-48.
   Type: Integer.
   Range: 0-57599100
   Default: 2240.
6. **daycvsoc48**
   Day threshold for CV-S bin for OC-48.
   Type: Integer.
   Range: 0-4294967295
   Default: 21504.
7. **qhcvsoc192**
   15-minute threshold for CV-S bin for OC-192.
   Type: Integer.
   Range: 0-57599100
   Default: 8960.
8. **daycvsoc192**
   Day threshold for CV-S bin for OC-192.
   Type: Integer.
   Range: 0-4294967295
   Default: 86016.
9. **qhcvsoc768**
   15-minute threshold for CV-S bin for OC-768.
   Type: Integer.
   Range: 0-57599100
   Default: 35840.
10. **daycvsoc768**
    Day threshold for CV-S bin for OC-768.
    Type: Integer.
    Range: 0-4294967295
    Default: 344064.

11. **`qhcvsec1`**
    15-minute threshold for CV-S bin for EC-1.
    Type: Integer.
    Range: 0-57599100
    Default: 47
12. **`daycvsec1`**
    Day threshold for CV-S bin of EC-1.
    Type: Integer.
    Range: 0-4294967295
    Default. 448
13. **`qhess`**
    15-minute threshold for ES-S bin.
    Type: Integer.
    Range: 0-900
    Default: 25.
14. **`dayess`**
    Day threshold for ES-S bin.
    Type: Integer.
    Range: 0-86400
    Default: 250.
15. **`qhsess`**
    15-minute threshold for SES-S bin.
    Type: Integer.
    Range: 0-810
    Default: 10.
16. **`daysess`**
    Day threshold for ES-S bin.
    Type: Integer.
    Range: 0-77760
    Default: 40.
17. **`qhsefss`**
    15-minute threshold for SEFS-S bin.
    Type: Integer.
    Range: 0-900
    Default: 5.
18. **`daysefss`**
    Day threshold for SEFS-S bin.
    Type: Integer.
    Range: 0-86400
    Default: 10.

19. **qhcvloc3**
 15-minute threshold for CV-L and CV-LFE bin for OC-3.
 Type: Integer.
 Range: 0-172799100
 Default: 140.
20. **daycvloc3**
 Day threshold for CV-L bin and CV-LFE for OC-3.
 Type: Integer.
 Range: 0-4294967295
 Default: 1344.
21. **qhcvloc12**
 15-minute threshold for CV-L and CV-LFE bin for OC-12.
 Type: Integer.
 Range: 0-691199100
 Default: 560.
22. **daycvloc12**
 Day threshold for CV-L bin and CV-LFE for OC-12.
 Type: Integer.
 Range: 0-4294967295
 Default: 5376.
23. **qhcvloc48**
 15-minute threshold for CV-L and CV-LFE bin for OC-48.
 Type: Integer.
 Range: 0-2764799100
 Default: 2240.
24. **daycvloc48**
 Day threshold for CV-L and CV-LFE bin for OC-48.
 Type: Integer.
 Range: 0-4294967295
 Default: 21504.
25. **qhcvloc192**
 15-minute threshold for CV-L and CV-LFE bin for OC-192.
 Type: Integer.
 Range: 0-4294967295
 Default: 8960.
26. **daycvloc192**
 Day threshold for CV-L and CV-LFE bin for OC-192.
 Type: Integer.
 Range: 0-4294967295
 Default: 86016.

27. **`qhcvloc768`**
15-minute threshold for CV-L and CV-LFE bin for OC-768.
Type: Integer.
Range: 0-4294967295
Default: 35840.

28. **`daycvloc768`**
Day threshold for CV-L and CV-LFE bin for OC-768.
Type: Integer.
Range: 0-4294967295
Default: 344064.

29. **`qhcvlec1`**
15-minute threshold for CV-L and CV-LFE bin for EC-1.
Type: Integer.
Range: 0-57599100
Default: 47

30. **`daycvlec1`**
Day threshold for CV-L bin and CV-LFE for EC-1.
Type: Integer.
Range: 0-4294967295
Default: 448

31. **`qhesl`**
15-minute threshold for ES-L and ES-LFE bin.
Type: Integer.
Range: 0-900
Default: 25.

32. **`dayesl`**
Day threshold for ES-L and ES-LFE bin.
Type: Integer.
Range: 0-86400
Default: 250.

33. **`qhfeccloc192`**
15-minute threshold for FECC-L bin for OC-192.
Type: Integer.
Range: 0 – 4294967295
Default: 5184.

34. **`dayfeccloc192`**
Day threshold for FECC-L bin for OC-192.
Type: Integer.
Range: 0 – 4294967295
Default: 497644.

35. **`qhfeccloc768`**
    15-minute threshold for FECC-L bin for OC-768.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 20736.
36. **`dayfeccloc768`**
    Day threshold for FECC-L bin for OC-768.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 1990656.
37. **`qhsesl`**
    15-minute threshold for SES-L and SES-LFE bin.
    Type: Integer.
    Range: 0-810
    Default: 10.
38. **`daysesl`**
    Day threshold for SES-L and SES-LFE bin.
    Type: Integer.
    Range: 0-77760
    Default: 40.
39. **`qhuasl`**
    15-minute threshold for UAS-L and UAS-LFE bin.
    Type: Integer.
    Range: 0-900
    Default: 10.
40. **`dayuasl`**
    Day threshold for UAS-L and UAS-LFE bin.
    Type: Integer.
    Range: 0-86400
    Default: 10.

Spec block parameters - profile parameters of type RS-MS

1. **`qhrsnbbe`**
   15-minute threshold for RS_N_BBE bin.
   Type: Integer.
   Range: 0-7199100
   Default: 9000.
2. **`dayrsnbbe`**
   Day threshold for RS_N_BBE bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.

3. **qhrsnes**
   15-minute threshold for RS_N_ES bin.
   Type: Integer.
   Range: 0-900
   Default: 180.
4. **dayrsnes**
   Day threshold for RS_N_ES bin.
   Type: Integer.
   Range: 0-86400
   Default: 1500.
5. **qhrsnses**
   15-minute threshold for RS_N_SES bin.
   Type: Integer.
   Range: 0-810
   Default: 15.
6. **dayrsnses**
   Day threshold for RS_N_SES bin.
   Type: Integer.
   Range: 0-77760
   Default: 20.
7. **qhrsnuas**
   15-minute threshold for RS_N_UAS bin.
   Type: Integer.
   Range: 0-900
   Default: 15.
8. **dayrsnuas**
   Day threshold for RS_N_UAS bin.
   Type: Integer.
   Range: 0-86400
   Default: 20.
9. **qhmsbbestm1**
   15-min threshold for MS_N_BBE and MS_F_BBE for stm1 bin.
   Type: Integer.
   Range: 0-172799100
   Default: 228000.
10. **daymsbbestm1**
   Day threshold for MS_N_BBE and MS_F_BBE for stm1 bin.
   Type: Integer.
   Range: 0-4294967295
   Default: 432000.

11. **qhmsbbestm4**
    15-min threshold for MS_N_BBE and MS_F_BBE for stm4 bin.
    Type: Integer.
    Range: 0-691199100
    Default: 912000.
12. **daymsbbestm4**
    Day threshold for MS_N_BBE and MS_F_BBE for stm4 bin.
    Type: Integer.
    Range: 00-4294967295
    Default: 1728000.
13. **qhmsbbestm16**
    15-min threshold for MS_N_BBE and MS_F_BBE for stm16 bin.
    Type: Integer.
    Range: 0-2764799100
    Default: 3648000.
14. **daymsbbestm16**
    Day threshold for MS_N_BBE and MS_F_BBE for stm16 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 6912000.
15. **qhmsbbestm64**
    15-min threshold for MS_N_BBE and MS_F_BBE for stm64 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 14592000.
16. **daymsbbestm64**
    Day threshold for MS_N_BBE and MS_F_BBE for stm64 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 27648000.
17. **qhmsbbestm256**
    15-min threshold for MS_N_BBE and MS_F_BBE for stm256 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 58368000.
18. **daymsbbestm256**
    Day threshold for MS_N_BBE and MS_F_BBE for stm256 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 110592000.

19. **qhmses**
 15-minute threshold for MS_N_ES and MS_F_ES bin.
 Type: Integer.
 Range: 0-900
 Default: 50.
20. **daymses**
 Day threshold for MS_N_ES and MS_F_ES bin.
 Type: Integer.
 Range: 0-86400
 Default: 150.
21. **qhmsnfeccstm64**
 15-minute threshold for MS-N-FECC bin forSTM-64.
 Type: Integer.
 Range: 0 – 4294967295
 Default: 5184.
22. **daymsnfeccstm64**
 Day threshold for MS-N-FECC bin forSTM-64.
 Type: Integer.
 Range: 0 – 4294967295
 Default: 497644.
23. **qhmsnfeccstm256**
 15-minute threshold for MS-N-FECC bin forSTM-256.
 Type: Integer.
 Range: 0 – 4294967295
 Default: 20736.
24. **daymsnfeccstm256**
 Day threshold for MS-N-FECC bin forSTM-256.
 Type: Integer.
 Range: 0 – 4294967295
 Default: 1990656.
25. **qhmsses**
 15-minute threshold for MS_N_SES and MS_F_SES bin.
 Type: Integer.
 Range: 0-810
 Default: 10.
26. **daymsses**
 Day threshold for MS_N_SES and MS_F_SES bin.
 Type: Integer.
 Range: 0-77760
 Default: 15.

27. **qhmsuas**
    15-min threshold for MS_N_UAS and MS_F_UAS for stm64 bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
28. **daymsuas**
    Day threshold for MS_N_UAS and MS_F_UAS for stm64 bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.

Spec block parameters - reset profile parameters of type RS-MS

1. **qhrtrrsnbbe**
   15-minute reset threshold for RS_N_BBE bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
2. **dayrtrrsnbbe**
   Day reset threshold for RS_N_BBE bin.
   Type: Integer.
   Range: 0-691113600
   Default: 4800.
3. **qhrtrrsnes**
   15-minute reset threshold for RS_N_ES bin.
   Type: Integer.
   Range: 0-900
   Default: 20.
4. **dayrtrrsnes**
   Day reset threshold for RS_N_ES bin.
   Type: Integer.
   Range: 0-86400
   Default: 150.
5. **qhrtrrsnses**
   15-minute reset threshold for RS_N_SES bin.
   Type: Integer.
   Range: 0-810
   Default: 0.
6. **dayrtrrsnses**
   Day reset threshold for RS_N_SES bin.
   Type: Integer.
   Range: 0-77760
   Default: 0.

7. **`qhrtrrsnuas`**
   15-minute reset threshold for RS_N_UAS bin.
   Type: Integer.
   Range: 0-900
   Default: 0.
8. **`dayrtrrsnuas`**
   Day reset threshold for RS_N_UAS bin.
   Type: Integer.
   Range: 0-86400
   Default: 0.
9. **`qhrtrmsbbestm1`**
   15-min threshold for MS_N_BBE and MS_F_BBE for stm1 bin.
   Type: Integer.
   Range: 0-172799100
   Default: 2400.
10. **`dayrtrmsbbestm1`**
    Day reset threshold for MS_N_BBE and MS_F_BBE for stm1 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 43200.
11. **`qhrtrmsbbestm4`**
    15-min threshold for MS_N_BBE and MS_F_BBE for stm4 bin.
    Type: Integer.
    Range: 0-691199100
    Default: 9600.
12. **`dayrtrmsbbestm4`**
    Day reset threshold for MS_N_BBE and MS_F_BBE for stm4 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 172800.
13. **`qhrtrmsbbestm16`**
    15-min threshold for MS_N_BBE and MS_F_BBE for stm16 bin.
    Type: Integer.
    Range: 0-2764799100
    Default: 38400.
14. **`dayrtrmsbbestm16`**
    Day reset threshold for MS_N_BBE and MS_F_BBE for stm16 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 691200.

15. **qhrtrmsbbestm64**
    15-min threshold for MS_N_BBE and MS_F_BBE for stm64 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 153600.
16. **dayrtrmsbbestm64**
    Day reset threshold for MS_N_BBE and MS_F_BBE for stm64 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 2764800.
17. **qhrtrmsbbestm256**
    15-min threshold for MS_N_BBE and MS_F_BBE for stm256 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 614400.
18. **dayrtrmsbbestm256**
    Day reset threshold for MS_N_BBE and MS_F_BBE for stm256 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 11059200.
19. **qhrtrmses**
    15-minute reset threshold for MS_N_ES and MS_F_ES bin.
    Type: Integer.
    Range: 0-900
    Default: 5.
20. **dayrtrmses**
    Day reset threshold for MS_N_ES and MS_F_ES bin.
    Type: Integer.
    Range: 0-86400
    Default: 15.
21. **qhrtrmsnfeccstm64**
    15-minute reset threshold for MS-N-FECC bin forSTM-64.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 0.
22. **dayrtrmsnfeccstm64**
    Day reset threshold for MS-N-FECC bin forSTM-64.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 0.

23. **qhrtrmsnfeccstm256**
15-minute reset threshold for MS-N-FECC bin forSTM-256.
Type: Integer.
Range: 0 – 4294967295
Default: 0.

24. **dayrtrmsnfeccstm256**
Day reset threshold for MS-N-FECC bin forSTM-256.
Type: Integer.
Range: 0 – 4294967295
Default: 0.

25. **qhrtrmsses**
15-minute reset threshold for MS_N_SES and MS_F_SES bin.
Type: Integer.
Range: 0-810
Default: 0.

26. **dayrtrmsses**
Day reset threshold for MS_N_SES and MS_F_SES bin.
Type: Integer.
Range: 0-77760
Default: 0.

27. **qhrtrmsuas**
15-min reset threshold for MS_N_UAS and MS_F_UAS.
Type: Integer.
Range: 0-900
Default: 0.

28. **dayrtrmsuas**
Day reset threshold for MS_N_UAS and MS_F_UAS.
Type: Integer.
Range: 0-86400
Default: 0.

Spec block parameters - profile parameters of type ODU

1. **qhodupbbeodu1**
15-minute threshold for ODU_N_BBE bin and ODU_F_BBE for ODU1P.
Type: Integer.
Range: 0-18377100
Default: 32000.

2. **dayodupbbeodu1**
Day threshold for ODU_N_BBE bin and ODU_F_BBE for ODU1P.
Type: Integer.
Range: 0-1764201600
Default: 61000.

3. **`qhodupes`**
   15-minute threshold for ODU_N_ES and ODU_F_ES bin for ODU1P.
   Type: Integer.
   Range: 0-900
   Default: 50.
4. **`dayodupes`**
   Day threshold for ODU_N_ES and ODU_F_ES bin for ODU1P..
   Type: Integer.
   Range: 0-86400
   Default: 150.
5. **`qhodupses`**
   15-minute threshold for ODU_N_SES and ODU_F_SES bin for ODU1P.
   Type: Integer.
   Range: 0-810
   Default: 10.
6. **`dayodupses`**
   Day threshold for ODU_N_SES and ODU_F_SES bin for ODU1P.
   Type: Integer.
   Range: 0-77760
   Default: 15.
7. **`qhodupuas`**
   15-minute threshold for ODU_N_UAS and ODU_F_UAS bin for ODU1P.
   Type: Integer.
   Range: 0-900
   Default: 15.
8. **`dayodupuas`**
   Day threshold for ODU_N_UAS and ODU_F_UAS bin for ODU1P.
   Type: Integer.
   Range: 0-86400
   Default: 20.

Spec block parameters - reset profile parameters of type ODU

1. **`qhrtrodupbbeodu1`**
   15-minute threshold for ODU_N_BBE bin and ODU_F_BBE for ODU1P.
   Type: Integer.
   Range: 0-18377100
   Default: 200.
2. **`dayrtrodupbbeodu1`**
   Day threshold for ODU_N_BBE bin and ODU_F_BBE for ODU1P.
   Type: Integer.
   Range: 0-1764201600
   Default: 4800.

3. **qhrtrodupes**
   15-minute threshold for ODU_N_ES and ODU_F_ES bin for ODU1P.
   Type: Integer.
   Range: 0-900
   Default: 5.
4. **dayrtrodupes**
   Day threshold for ODU_N_ES and ODU_F_ES bin for ODU1P.
   Type: Integer.
   Range: 0-86400
   Default: 15.
5. **qhrtrodupses**
   15-minute threshold for ODU_N_SES and ODU_F_SES bin for ODU1P.
   Type: Integer.
   Range: 0-810
   Default: 0.
6. **dayrtrodupses**
   Day threshold for ODU_N_SES and ODU_F_SES bin for ODU1P.
   Type: Integer.
   Range: 0-77760
   Default: 0.
7. **qhrtrodupuas**
   15-minute threshold for ODU_N_UAS and ODU_F_UAS bin for ODU1P.
   Type: Integer.
   Range: 0-900
   Default: 0.
8. **dayrtrodupuas**
   Day threshold for ODU_N_UAS and ODU_F_UAS bin for ODU1P.
   Type: Integer.
   Range: 0-86400
   Default: 0.

Spec block parameters - profile parameters of type HO-VC

1. **qhvcbbevc3**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC3 bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
2. **dayvcbbevc3**
   Day threshold for VC_N_BBE and VC_F_BBE for VC3 bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.

3. **qhvcbbevc4**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC4 bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
4. **dayvcbbevc4**
   Day threshold for VC_N_BBE and VC_F_BBE for VC4 bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.
5. **qhvcbbevc44c**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC44C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
6. **dayvcbbevc44c**
   Day threshold for VC_N_BBE and VC_F_BBE for VC44C bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.
7. **qhvcbbevc416c**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC416C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
8. **dayvcbbevc416c**
   Day threshold for VC_N_BBE and VC_F_BBE for VC416C bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.
9. **qhvcbbevc464c**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC464C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
10. **dayvcbbevc464c**
    Day threshold for VC_N_BBE and VC_F_BBE for VC464C bin.
    Type: Integer.
    Range: 0-691113600
    Default: 48000.

11. **qhvcesvc3**
15-minute threshold for VC_N_ES and VC_F_ES VC3 bin.
Type: Integer.
Range: 0-900
Default: 150.
12. **dayvcesvc3**
Day threshold for VC_N_ES and VC_F_ES VC3 bin.
Type: Integer.
Range: 0-86400
Default: 600.
13. **qhvcesvc4**
15-minute threshold for VC_N_ES and VC_F_ES for VC4 bin.
Type: Integer.
Range: 0-900
Default: 180.
14. **dayvcesvc4**
Day threshold for VC_N_ES and VC_F_ES for VC4 bin.
Type: Integer.
Range: 0-86400
Default: 1500.
15. **qhvcesvc44c**
15-minute threshold for VC_N_ES and VC_F_ES for VC4-4C bin.
Type: Integer.
Range: 0-900
Default: 180.
16. **dayvcesvc44c**
Day threshold for VC_N_ES and VC_F_ES for VC4-4C bin.
Type: Integer.
Range: 0-86400
Default: 1500.
17. **qhvcesvc416c**
15-minute threshold for VC_N_ES and VC_F_ES for VC4-16C bin.
Type: Integer.
Range: 0-900
Default: 180.
18. **dayvcesvc416c**
Day threshold for VC_N_ES and VC_F_ES for VC4-16C bin.
Type: Integer.
Range: 0-86400
Default: 1500.

19. **qhvcesvc464c**
15-minute threshold for VC_N_ES and VC_F_ES for VC4-64C bin.
Type: Integer.
Range: 0-900
Default: 180.
20. **dayvcesvc464c**
Day threshold for VC_N_ES and VC_F_ES for VC4-64C bin.
Type: Integer.
Range: 0-86400
Default: 1500.
21. **qhvcsesvc3**
15-minute threshold for VC_N_SES and VC_F_SES for VC3 bin.
Type: Integer.
Range: 0-810
Default: 15.
22. **dayvcsesvc3**
Day threshold for VC_N_SES and VC_F_SES for VC3 bin.
Type: Integer.
Range: 0-77760
Default: 20.
23. **qhvcsesvc4**
15-minute threshold for VC_N_SES and VC_F_SES for VC4 bin.
Type: Integer.
Range: 0-810
Default: 15.
24. **dayvcsesvc4**
Day threshold for VC_N_SES and VC_F_SES for VC4 bin.
Type: Integer.
Range: 0-77760
Default: 20.
25. **qhvcsesvc44c**
15-minute threshold for VC_N_SES and VC_F_SES for VC44C bin.
Type: Integer.
Range: 0-810
Default: 15.
26. **dayvcsesvc44c**
Day threshold for VC_N_SES and VC_F_SES for VC44C bin.
Range: 0-77760
Default: 20.

27. **qhvcsesvc416c**
15-minute threshold for VC_N_SES and VC_F_SES for VC416C bin.
Type: Integer.
Range: 0-810
Default: 15.

28. **dayvcsesvc416c**
Day threshold for VC_N_SES and VC_F_SES for VC416C bin.
Type: Integer.
Range: 0-77760
Default: 20.

29. **qhvcsesvc464c**
15-minute threshold for VC_N_SES and VC_F_SES for VC464C bin.
Type: Integer.
Range: 0-810
Default: 15.

30. **dayvcsesvc464c**
Day threshold for VC_N_SES and VC_F_SES for VC464C bin.
Type: Integer.
Range: 0-77760
Default: 20.

31. **qhvcuasvc3**
15-minute threshold for VC_N_UAS and VC_F_UAS for VC3 bin.
Type: Integer.
Range: 0-900
Default: 15.

32. **dayvcuasvc3**
Day threshold for VC_N_UAS and VC_F_UAS for VC3 bin.
Type: Integer.
Range: 0-86400
Default: 20.

33. **qhvcuasvc4**
15-minute threshold for VC_N_UAS and VC_F_UAS for VC4 bin.
Type: Integer.
Range: 0-900
Default: 15.

34. **dayvcuasvc4**
Day threshold for VC_N_UAS and VC_F_UAS for VC4 bin.
Type: Integer.
Range: 0-86400
Default: 20.

35. **`qhvcuasvc44c`**
    15-minute threshold for VC_N_UAS and VC_F_UAS for VC44C bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
36. **`dayvcuasvc44c`**
    Day threshold for VC_N_UAS and VC_F_UAS for VC44C bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.
37. **`qhvcuasvc416c`**
    15-minute threshold for VC_N_UAS and VC_F_UAS for VC416C bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
38. **`dayvcuasvc416c`**
    Day threshold for VC_N_UAS and VC_F_UAS for VC416C bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.
39. **`qhvcuasvc464c`**
    15-minute threshold for VC_N_UAS and VC_F_UAS for VC464C bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
40. **`dayvcuasvc464c`**
    Day threshold for VC_N_UAS and VC_F_UAS for VC464C bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.
41. **`qhpjcpos`**
    15-minute threshold for positive PJC bin.
    Type: Integer.
    Range: 0-1800000
    Default: 30.
42. **`daypjcpos`**
    Day threshold for positive PJC bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.

43. **`qhpjcneg`**
15-minute threshold for negative PJC bin.
Type: Integer.
Range: 0-1800000
Default: 30.

44. **`daypjcneg`**
Day threshold for negative PJC bin.
Type: Integer.
Range: 0-172800000
Default: 2880.

Spec block parameters - reset profile parameters of type HO-VC

1. **`qhrtrvcbbevc3`**
15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC3 bin.
Type: Integer.
Range: 0-7199100
Default: 200.

2. **`dayrtrvcbbevc3`**
Day reset threshold for VC_N_BBE and VC_F_BBE for VC3 bin.
Type: Integer.
Range: 0-691113600
Default: 4800.

3. **`qhrtrvcbbevc4`**
15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC4 bin.
Type: Integer.
Range: 0-7199100
Default: 200.

4. **`dayrtrvcbbevc4`**
Day reset threshold for VC_N_BBE and VC_F_BBE for VC4 bin.
Type: Integer.
Range: 0-691113600
Default: 4800.

5. **`qhrtrvcbbevc44c`**
15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC44C bin.
Type: Integer.
Range: 0-7199100
Default: 200.

6. **`dayrtrvcbbevc44c`**
Day reset threshold for VC_N_BBE and VC_F_BBE for VC44C bin.
Type: Integer.
Range: 0-691113600
Default: 4800.

7. **qhrtrvcbbevc416c**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC416C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
8. **dayrtrvcbbevc416c**
   Day reset threshold for VC_N_BBE and VC_F_BBE for VC416C bin.
   Type: Integer.
   Range: 0-691113600
   Default: 4800.
9. **qhrtrvcbbevc464c**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC464C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
10. **dayrtrvcbbevc464c**
   dayrtrvcbbevc464c
   Type: Integer.
   Range: 0-691113600
   Default: 4800.
11. **qhrtrvcesvc3**
   15-minute reset threshold for VC_N_ES and VC_F_ES VC3 bin.
   Type: Integer.
   Range: 0-900
   Default: 10.
12. **dayrtrvcesvc3**
   Day reset threshold for VC_N_ES and VC_F_ES VC3 bin.
   Type: Integer.
   Range: 0-86400
   Default: 60.
13. **qhrtrvcesvc4**
   15-minute reset threshold for VC_N_ES and VC_F_ES for VC4 bin.
   Type: Integer.
   Range: 0-900
   Default: 20.
14. **dayrtrvcesvc4**
   Day reset threshold for VC_N_ES and VC_F_ES for VC4 bin.
   Type: Integer.
   Range: 0-86400
   Default: 150.

15. **qhrtrvcesvc44c**
15-minute reset threshold for VC_N_ES and VC_F_ES for VC4-4C bin.
Type: Integer.
Range: 0-900
Default: 20.
16. **dayrtrvcesvc44c**
Day reset threshold for VC_N_ES and VC_F_ES for VC4-4C bin.
Type: Integer.
Range: 0-86400
Default: 150.
17. **qhrtrvcesvc416c**
15-minute reset threshold for VC_N_ES and VC_F_ES for VC4-16C bin.
Type: Integer.
Range: 0-900
Default: 20.
18. **dayrtrvcesvc416c**
Day reset threshold for VC_N_ES and VC_F_ES for VC4-16C bin.
Type: Integer.
Range: 0-86400
Default: 150.
19. **qhrtrvcesvc464c**
15-minute reset threshold for VC_N_ES and VC_F_ES for VC4-64C bin.
Type: Integer.
Range: 0-900
Default: 20.
20. **dayrtrvcesvc464c**
Day reset threshold for VC_N_ES and VC_F_ES for VC4-64C bin.
Type: Integer.
Range: 0-86400
Default: 150.
21. **qhrtrvcsesvc3**
15-minute reset threshold for VC_N_SES and VC_F_SES for VC3 bin.
Type: Integer.
Range: 0-810
Default: 0.
22. **dayrtrvcsesvc3**
Day reset threshold for VC_N_SES and VC_F_SES for VC3 bin.
Type: Integer.
Range: 0-77760
Default: 0.

23. **qhrtrvcsesvc4**
    15-minute reset threshold for VC_N_SES and VC_F_SES for VC4 bin.
    Type: Integer.
    Range: 0-810
    Default: 0.
24. **dayrtrvcsesvc4**
    Day reset threshold for VC_N_SES and VC_F_SES for VC4 bin.
    Type: Integer.
    Range: 0-77760
    Default: 0.
25. **qhrtrvcsesvc44c**
    15-minute reset threshold for VC_N_SES and VC_F_SES for VC44C bin.
    Type: Integer.
    Range: 0-810
    Default: 0.
26. **dayrtrvcsesvc44c**
    Day reset threshold for VC_N_SES and VC_F_SES for VC44C bin.
    Type: Integer.
    Range: 0-77760
    Default: 0.
27. **qhrtrvcsesvc416c**
    15-minute reset threshold for VC_N_SES and VC_F_SES for VC416C bin.
    Type: Integer.
    Range: 0-810
    Default: 0.
28. **dayrtrvcsesvc416c**
    Day reset threshold for VC_N_SES and VC_F_SES for VC416C bin.
    Type: Integer.
    Range: 0-77760
    Default: 0.
29. **qhrtrvcsesvc464c**
    15-minute reset threshold for VC_N_SES and VC_F_SES for VC464C bin.
    Type: Integer.
    Range: 0-810
    Default: 0.
30. **dayrtrvcsesvc464c**
    Day reset threshold for VC_N_SES and VC_F_SES for VC464C bin.
    Type: Integer.
    Range: 0-77760
    Default: 0.

31. **`qhrtrvcuasvc3`**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC3 bin.
    Type: Integer.
    Range: 0-900
    Default: 0.
32. **`dayrtrvcuasvc3`**
    Day reset threshold for VC_N_UAS and VC_F_UAS for VC3 bin.
    Type: Integer.
    Range: 0-86400
    Default: 0.
33. **`qhrtrvcuasvc4`**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC4 bin.
    Type: Integer.
    Range: 0-900
    Default: 0.
34. **`dayrtrvcuasvc4`**
    Day reset threshold for VC_N_UAS and VC_F_UAS for VC4 bin.
    Type: Integer.
    Range: 0-86400
    Default: 0.
35. **`qhrtrvcuasvc44c`**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC44C bin.
    Type: Integer.
    Range: 0-900
    Default: 0.
36. **`dayrtrvcuasvc44c`**
    Day reset threshold for VC_N_UAS and VC_F_UAS for VC44C bin.
    Type: Integer.
    Range: 0-86400
    Default: 0.
37. **`qhrtrvcuasvc416c`**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC416C bin.
    Type: Integer.
    Range: 0-900
    Default: 0.
38. **`dayrtrvcuasvc416c`**
    Day reset threshold for VC_N_UAS and VC_F_UAS for VC416C bin.
    Type: Integer.
    Range: 0-86400
    Default: 0.

39. **`qhrtrvcuasvc464c`**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC464C bin.
    Type: Integer.
    Range: 0-900
    Default: 0.
40. **`dayrtrvcuasvc464c`**
    Day reset threshold for VC_N_UAS and VC_F_UAS for VC464C bin.
    Type: Integer.
    Range: 0-86400
    Default: 0.
41. **`qhrtrpjcpos`**
    15-minute reset threshold for positive PJC bin.
    Type: Integer.
    Range: 0-1800000
    Default: 0.
42. **`dayrtrpjcpos`**
    Day reset threshold for positive PJC bin.
    Type: Integer.
    Range: 0-172800000
    Default: 0.
43. **`qhrtrpjcneg`**
    15-minute reset threshold for negative PJC bin.
    Type: Integer.
    Range: 0-1800000
    Default: 0.
44. **`dayrtrpjcneg`**
    Day reset threshold for negative PJC bin.
    Type: Integer.
    Range: 0-172800000
    Default: 0.

Spec block parameters - profile parameters of type PATH

1. **`qhcvpsts1`**
   15-minute threshold for CV-P and CV-PFE bin for STS1.
   Type: Integer.
   Range: 0-57599100
   Default: 15.
2. **`daycvpsts1`**
   Day threshold for CV-P and CV-PFE bin for STS1.
   Type: Integer.
   Range: 0-4294967295
   Default: 125.

3. **`qhcvpsts3c`**
   15-minute threshold for CV-P and CV-PFE bin for STS3C.
   Type: Integer.
   Range: 0-57599100
   Default: 25.
4. **`daycvpsts3c`**
   Day threshold for CV-P and CV-PFE bin for STS3C.
   Type: Integer.
   Range: 4294967295
   Default: 250.
5. **`qhcvpsts12c`**
   15-minute threshold for CV-P and CV-PFE bin for STS12C.
   Type: Integer.
   Range: 0-57599100
   Default: 75.
6. **`daycvpsts12c`**
   Day threshold for threshold for CV-P and CV-PFE bin for STS12C.
   Type: Integer.
   Range: 4294967295
   Default: 750.
7. **`qhcvpsts48c`**
   15-minute threshold for CV-P and CV-PFE bin for STS48C.
   Type: Integer.
   Range: 0-57599100
   Default: 300.
8. **`daycvpsts48c`**
   Day threshold for CV-P and CV-PFE bin for STS48C.
   Type: Integer.
   Range: 4294967295
   Default: 3000.
9. **`qhcvpsts192c`**
   Day threshold for CV-P and CV-PFE bin for STS192C.
   Type: Integer.
   Range: 0-57599100
   Default: 1200.
10. **`daycvpsts192c`**
    Day threshold for CV-P and CV-PFE bin for STS192C.
    Type: Integer.
    Range: 0-4294967295
    Default: 12000.

11. **qhespsts1**
    15-minute threshold for ES-P and ES-PFE bin for STS1.
    Type: Integer.
    Range: 0-900
    Default: 12.
12. **dayespsts1**
    Day threshold for ES-P and ES-PFE bin for STS1.
    Type: Integer.
    Range: 0-86400
    Default: 100.
13. **qhespsts3c**
    15-minute threshold for ES-P and ES-PFE bin for STS3C.
    Type: Integer.
    Range: 0-900
    Default: 20.
14. **dayespsts3c**
    Day threshold for ES-P and ES-PFE bin for STS3C.
    Type: Integer.
    Range: 0-86400
    Default: 200.
15. **qhespsts12c**
    15-minute threshold for ES-P and ES-PFE bin for STS12C.
    Type: Integer.
    Range: 0-900
    Default: 60.
16. **dayespsts12c**
    Day threshold for ES-P and ES-PFE bin for STS12C.
    Type: Integer.
    Range: 0-86400
    Default: 600.
17. **qhespsts48c**
    15-minute threshold for ES-P and ES-PFE bin for STS48C.
    Type: Integer.
    Range: 0-900
    Default: 240.
18. **dayespsts48c**
    Day threshold for ES-P and ES-PFE bin for STS48C.
    Type: Integer.
    Range: 0-86400
    Default: 2400.

19. **`qhespsts192c`**
    Day threshold for ES-P and ES-PFE bin for STS192C.
    Type: Integer.
    Range: 0-900
    Default: 240.
20. **`dayespsts192c`**
    Day threshold for ES-P and ES-PFE bin for STS192C.
    Type: Integer.
    Range: 0-86400
    Default: 9600.
21. **`qhsesp`**
    15-minute threshold for SES-P and SES-PFE bin.
    Type: Integer.
    Range: 0-810
    Default: 3.
22. **`daysesp`**
    Day threshold for SES-P and SES-PFE bin.
    Type: Integer.
    Range: 0-77760
    Default: 7.
23. **`qhuasp`**
    15-minute threshold for UAS-P and UAS-PFE bin.
    Type: Integer.
    Range: 0-900
    Default: 10.
24. **`dayuasp`**
    Day threshold for UAS-P and UAS-PFE bin.
    Type: Integer.
    Range: 0-86400
    Default: 10.
25. **`qhppjcgen`**
    15-minute threshold for PPJC-PGen bin.
    Type: Integer.
    Range: 0-1800000
    Default: 30.
26. **`dayppjcgen`**
    Day threshold for PPJC-PGen bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.

27. **qhnpjcgen**
    15-minute threshold for NPJC-PGen bin.
    Type: Integer.
    Range: 0-1800000
    Default: 30.
28. **daynpjcgen**
    Day threshold for NPJC-PGen bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.
29. **qhppjcdet**
    15-minute threshold for PPJC-PDet bin.
    Type: Integer.
    Range: 0-1800000
    Default: 30.
30. **dayppjcdet**
    Day threshold for PPJC-PDet bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.
31. **qhnpjcdet**
    15-minute threshold for NPJC-PDet bin.
    Type: Integer.
    Range: 0-1800000
    Default: 30.
32. **daynpjcdet**
    Day threshold for NPJC-PDet bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.

Spec block parameters - profile parameters of type ENET

1. **qhpdege**
   15-minute threshold for PDE bin for GE.
   Type: Integer.
   Range: 0-183000000
   Default: 187500.
2. **daypdege**
   Day threshold for PDE bin for GE.
   Type: Integer.
   Range: 0-4294967295
   Default: 9000000.

3. **`qhpdevcg`**
   15-minute threshold for PDE bin for VCG.
   Type: Integer.
   Range: 0-183000000
   Default: 10.
4. **`daypdevcg`**
   Day threshold for PDE bin for VCG.
   Type: Integer.
   Range: 0-4294967295
   Default: 50.
5. **`qhedfe1ge`**
   15min EDFE for 1GbE Ethernet port.
   Type: Integer.
   Range: 0-1371951220
   Default: 1875000.
6. **`dayedfe1ge`**
   24 h EDFE for 1GbE Ethernet port.
   Type: Integer.
   Range: 0-4294967295
   Default: 9000000.
7. **`qhedfc1ge`**
   15min EDFC for 1GbE Ethernet port.
   Type: Integer.
   Range: 0-1371951220
   Default: 10.
8. **`dayedfc1ge`**
   24 h EDFC for 1GbE Ethernet port.
   Type: Integer.
   Range: 0-4294967295
   Default: 50.
9. **`qhedfe10ge`**
   15min EDFE for 10GbE Ethernet port.
   Type: Integer.
   Range: 0-2147483647
   Default: 18750000.
10. **`dayedfe10ge`**
    24 h EDFE for 10GbE Ethernet port.
    Type: Integer.
    Range: 0-4294967295
    Default: 90000000.

11. **qhedfc10ge**
    15min EDFC for 10GbE Ethernet port.
    Type: Integer.
    Range: 0-2147483647
    Default: 100.
12. **dayedfc10ge**
    24 h EDFC for 10GbE Ethernet port.
    Type: Integer.
    Range: 0-4294967295
    Default: 500.
13. **qhedfe1gevcg**
    15min EDFE for 1GbE VCG port.
    Type: Integer.
    Range: 0-1371951220
    Default: 10.
14. **dayedfe1gevcg**
    24 h EDFE for 1GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 50.
15. **qhedfc1gevcg**
    15min EDFC for 1GbE VCG port.
    Type: Integer.
    Range: 0-1371951220
    Default: 10.
16. **dayedfc1gevcg**
    24 h EDFC for 1GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 50.
17. **qhedfe10gevcg**
    15min EDFE for 10GbE VCG port.
    Type: Integer.
    Range: 0-2147483647
    Default: 100.
18. **dayedfe10gevcg**
    24 h EDFE for 10GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 500.

19. `qhedfc10gevcg`
15min EDFC for 10GbE VCG port.
Type: Integer.
Range: 0-2147483647
Default: 100.
20. `dayedfc10gevcg`
24 h EDFC for 10GbE VCG port.
Type: Integer.
Range: 0-4294967295
Default: 500.

Spec block parameters - reset profile parameters of type ENET

1. `qhrtrpdege`
15-minute reset threshold for PDE bin for GE.
Type: Integer.
Range: 0-183000000
Default: 937500.
2. `dayrtrpdege`
Day reset threshold for PDE bin for GE.
Type: Integer.
Range: 0-4294967295
Default: 4500000.
3. `qhrtrpdevcg`
15-minute reset threshold for PDE bin for VCG.
Type: Integer.
Range: 0-183000000
Default: 2.
4. `dayrtrpdevcg`
Day reset threshold for PDE bin for VCG.
Type: Integer.
Range: 0-4294967295
Default: 5.
5. `qhrtredfe1ge`
15min reset threshold for EDFE of 1GbE Ethernet port.
Type: Integer.
Range: 0-1371951220
Default: 937500.
6. `dayrtredfe1ge`
24h reset threshold for EDFE of 1GbE Ethernet port.
Type: Integer.
Range: 0-4294967295
Default: 4500000.

7. `qhrtredfc1ge`
   15min reset threshold for EDFC of 1GbE Ethernet port.
   Type: Integer.
   Range: 0-1371951220
   Default: 2.
8. `dayrtredfc1ge`
   24h reset threshold for EDFC of 1GbE Ethernet port.
   Type: Integer.
   Range: 0-4294967295
   Default: 5.
9. `qhrtredfe10ge`
   15min reset threshold for EDFE of 10GbE Ethernet port.
   Type: Integer.
   0-2147483647
   Default: 9375000.
10. `dayrtredfe10ge`
    24h reset threshold for EDFE of 10GbE Ethernet port.
    Type: Integer.
    Range: 0-4294967295
    Default: 45000000.
11. `qhrtredfc10ge`
    15min reset threshold for EDFC of 10GbE Ethernet port.
    Type: Integer.
    0-2147483647
    Default: 20.
12. `dayrtredfc10ge`
    24h reset threshold for EDFC of 10GbE Ethernet port.
    Type: Integer.
    Range: 0-4294967295
    Default: 50.
13. `qhrtredfe1gevcg`
    15min reset threshold for EDFE of 1GbE VCG port.
    Type: Integer.
    Range: 0-1371951220
    Default: 2.
14. `dayrtredfe1gevcg`
    24h reset threshold for EDFE of 1GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 5.

15. **qhrtredfc1gevcg**
    15min reset threshold for EDFC of 1GbE VCG port.
    Type: Integer.
    Range: 0-1371951220
    Default: 2.
16. **dayrtredfc1gevcg**
    24h reset threshold for EDFC of 1GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 5.
17. **qhrtredfe10gevcg**
    15min reset threshold for EDFE of 10GbE VCG port.
    Type: Integer.
    0-2147483647
    Default: 20.
18. **dayrtredfe10gevcg**
    24h reset threshold for EDFE of 10GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 50.
19. **qhrtredfc10gevcg**
    15min reset threshold for EDFC of 10GbE VCG port.
    Type: Integer.
    Range: 0-2147483647
    Default: 20.
20. **dayrtredfc10gevcg**
    24h reset threshold for EDFC of 10GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 50.

Spec block parameters- profile parameters of type LOVC

1. **qhvcbbevc12**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC12 bin.
   Type: Integer.
   Range: 0-1799100
   Default: 9000.
2. **dayvcbbevc12**
   Day threshold for VC_N_BBE and VC_F_BBE for VC12 bin.
   Type: Integer.
   Range: 0-172713600
   Default: 12000.

3. **qhvcbbelovc3**
15minute -threshold for VC_N_BBE and VC_F_BBE for lower order VC3 bin.
Type: Integer.
Range: 0-7199100
Default: 36000.
4. **dayvcbbelovc3**
Day threshold for VC_N_BBE and VC_F_BBE for lower order VC3 bin.
Type: Integer.
Range: 0-691113600
Default: 48000.
5. **qhvcesvc12**
15-minute threshold for VC_N_ES and VC_F_ES for VC12 bin.
Type: Integer.
Range: 0-900
Default: 120.
6. **dayvcesvc12**
Day threshold for VC_N_ES and VC_F_ES for VC12 bin.
Type: Integer.
Range: 0-86400
Default: 350.
7. **qhvceslovc3**
15-minute threshold for VC_N_ES and VC_F_ES for lower order VC3 bin.
Type: Integer.
Range: 0-900
Default: 150.
8. **dayvceslovc3**
Day threshold for VC_N_ES and VC_F_ES for lower order VC3 bin.
Type: Integer.
Range: 0-86400
Default: 600.
9. **qhvcsesvc12**
15-minute threshold for VC_N_SES and VC_F_SES for VC12 bin.
Type: Integer.
Range: 0-810
Default: 15.
10. **dayvcsesvc12**
Day threshold for VC_N_SES and VC_F_SES for VC12 bin.
Type: Integer.
Range: 0-77760
Default: 20.

11. **qhvcseslovc3**
    15-minute threshold for VC_N_SES and VC_F_SES for lower order VC3 bin.
    Type: Integer.
    Range: 0-810
    Default: 15.
12. **dayvcseslovc3**
    Day threshold for VC_N_SES and VC_F_SES for lower order VC3 bin.
    Type: Integer.
    Range: 0-77760
    Default: 20.
13. **qhvcuasvc12**
    15-minute threshold for VC_N_UAS and VC_F_UAS for VC12 bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
14. **dayvcuasvc12**
    Day threshold for VC_N_UAS and VC_F_UAS for VC12 bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.
15. **qhvcuaslovc3**
    15-minute threshold for VC_N_UAS and VC_F_UAS for lower order VC3 bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
16. **dayvcuaslovc3**
    Day threshold for VC_N_UAS and VC_F_UAS for lower order VC3 bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.

Spec block parameters- reset profile parameters of type LOVC

1. **qhrtrvcbbevc12**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC12 bin.
   Type: Integer.
   Range: 0-1799100
   Default: 50.
2. **dayrtrvcbbevc12**
   Day reset threshold for VC_N_BBE and VC_F_BBE for VC12 bin.
   Type: Integer.
   Range: 0-172713600
   Default: 1200.

3. **qhrtrvcbbelovc3**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for lower order VC3 bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
4. **dayrtrvcbbelovc3**
   Day reset threshold for VC_N_BBE and VC_F_BBE for lower order VC3 bin.
   Type: Integer.
   Range: 0-691113600
   Default: 4800.
5. **qhrtrvcesvc12**
   15-minute reset threshold for VC_N_ES and VC_F_ES for VC12 bin.
   Type: Integer.
   Range: 0-900
   Default: 5.
6. **dayrtrvcesvc12**
   Day reset threshold for VC_N_ES and VC_F_ES for VC12 bin.
   Type: Integer.
   Range: 0-86400
   Default: 35.
7. **qhrtrvceslovc3**
   15-minute reset threshold for VC_N_ES and VC_F_ES for lower order VC3 bin.
   Type: Integer.
   Range: 0-900
   Default: 10.
8. **dayrtrvceslovc3**
   Day reset threshold for VC_N_ES and VC_F_ES for lower order VC3 bin.
   Type: Integer.
   Range: 0-86400
   Default: 60.
9. **qhrtrvcsesvc12**
   15-minute reset threshold for VC_N_SES and VC_F_SES for VC12 bin.
   Type: Integer.
   Range: 0-810
   Default: 0.
10. **dayrtrvcsesvc12**
   Day reset threshold for VC_N_SES and VC_F_SES for VC12 bin.
   Type: Integer.
   Range: 0-77760
   Default: 0.

11. **qhrtrvcseslovc3**
    15-minute reset threshold for VC_N_SES and VC_F_SES for lower order VC3 bin.
    Type: Integer.
    Range: 0-810
    Default: 0.
12. **dayrtrvcseslovc3**
    Day reset threshold for VC_N_SES and VC_F_SES for lower order VC3 bin.
    Type: Integer.
    Range: 0-77760
    Default: 0.
13. **qhrtrvcuasvc12**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC12 bin.
    Type: Integer.
    Range: 0-900
    Default: 0.
14. **dayrtrvcuasvc12**
    Day reset threshold for VC_N_UAS and VC_F_UAS for VC12 bin.
    Type: Integer.
    Range: 0-86400
    Default: 0.
15. **qhrtrvcuaslovc3**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for lower order VC3 bin.
    Type: Integer.
    Range: 0-900
    Default: 0.
16. **dayrtrvcuaslovc3**
    Day reset threshold for VC_N_UAS and VC_F_UAS for lower order VC3 bin.
    Type: Integer.
    Range: 0-86400
    Default: 0.

Spec block parameters.- Profile Parameters of Type LOPATH

1. **qhcvvt1**
   15-minute threshold for CV-P and CV-PFE bin for VT1.
   Type: Integer.
   Range: 0-14399100
   Default: 75.
2. **daycvvt1**
   Day threshold for CV-P and CV-PFE bin for VT1.
   Type: Integer.
   Range: 0-1382313600
   Default: 750.

3. **`qhesvt1`**
   15-minute threshold for ES-P and ES-PFE bin for VT1.
   Type: Integer.
   Range: 0-900
   Default: 40.
4. **`dayesvt1`**
   Day threshold for ES-P and ES-PFE bin for VT1.
   Type: Integer.
   Range: 0-86400
   Default: 900.
5. **`qhsesvt1`**
   15-minute threshold for SES-P and SES-PFE bin for VT1.
   Type: Integer.
   Range: 0-810
   Default: 40.
6. **`daysesvt1`**
   Day threshold for SES-P and SES-PFE bin for VT1.
   Type: Integer.
   Range: 0-77760
   Default: 900.
7. **`qhuasvt1`**
   15-minute threshold for UAS-P and UAS-PFE bin for VT1.
   Type: Integer.
   Range: 0-900
   Default: 40.
8. **`dayuasvt1`**
   Day threshold for UAS-P and UAS-PFE bin for VT1.
   Type: Integer.
   Range: 0-86400
   Default: 900.

Command parameters - profile parameters of type DS3

1. **`qhcvl`**
   15-minute threshold for CV-L bin of DS3 Line.
   Type: Integer.
   Range: 0-7200000
   Default: 387.
2. **`daycvl`**
   Day threshold for CV-L bin of DS3 Line.
   Type: Integer.
   Range: 0- 691200000
   Default: 3865.

3. **`qhesl`**
   15-minute threshold for Es-L bin of DS3 Line.
   Type: Integer.
   Range: 0-900
   Default: 25.
4. **`dayesl`**
   Day threshold for ES-L bin of DS3 Line.
   Type: Integer.
   Range: 0-86400
   Default: 250.
5. **`qhesal`**
   15-minute threshold for ESA-L bin of DS3 Line.
   Type: Integer.
   Range: 0-900
   Default: 25.
6. **`dayesal`**
   Day threshold for ESB-L bin of DS3 Line.
   Type: Integer.
   Range: 0-86400
   Default: 250.
7. **`qhesbl`**
   15-minute threshold for ESB-L bin of DS3 Line.
   Type: Integer.
   Range: 0-900
   Default: 25.
8. **`dayesbl`**
   Day threshold for ESB-L bin of DS3 Line.
   Type: Integer.
   Range: 0-86400
   Default: 250.
9. **`qhsesl`**
   15-minute threshold for SES-L bin of DS3 Line.
   Type: Integer.
   Range: 0-810
   Default: 4.
10. **`daysesl`**
    Day threshold for SES-L bin of DS3 Line.
    Type: Integer.
    Range: 0-77760
    Default: 40.

11. **qhcvp**
    15-minute threshold for CV-P and CV-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-7200000
    Default: 382.
12. **daycvp**
    Day threshold for CV-P and CV-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-691200000
    Default: 3820.
13. **qhesp**
    15-minute threshold for ES-P and ES-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-900
    Default: 25.
14. **dayesp**
    Day threshold for ES-P and ES-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 250.
15. **qhesap**
    15-minute threshold for ESA-P and ESA-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-900
    Default: 25.
16. **dayesap**
    Day threshold for ESA-P and ESA-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 250.
17. **qhesbp**
    15-minute threshold for ESB-P and ESB-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-900
    Default: 25.

18. **dayesbp**
Day threshold for ESB-P and ESB-PFE bin of DS3 Path ingress and egress direction.
Type: Integer.
Range: 0-86400
Default: 250.

19. **qhsesp**
15-minute threshold for SES-P and SES-PFE bin of DS3 Path ingress and egress direction.
Type: Integer.
Range: 0-810
Default: 4.

20. **daysesp**
Day threshold for SES-P and SES-PFE bin of DS3 Path ingress and egress direction.
Type: Integer.
Range: 0-77760
Default: 40.

21. **qhuasp**
15-minute threshold for UAS-P and UAS-PFE bin of DS3 Path ingress and egress direction.
Type: Integer.
Range: 0-900
Default: 10.

22. **dayuasp**
Day threshold for UAS-P and UAS-PFE bin of DS3 Path ingress and egress direction.
Type: Integer.
Range: 0-86400
Default: 10.

23. **qhsasp**
15-minute threshold for SAS-P and SAS-PFE bin of DS3 Path ingress and egress direction.
Type: Integer.
Range: 0-900
Default: 2.

24. **daysasp**
Day threshold for SAS-P and SAS-PFE bin of DS3 Path ingress and egress direction.
Type: Integer.
Range: 0-86400
Default: 8.

Command parameters - profile parameters of type DS1

1. **`qhcvsfp`**
   15-minute threshold for CV-P bin of DS1 Path with SF format in egress direction.
   Type: Integer.
   Range: 0-16383
   Default: 72.
2. **`daycvsfp`**
   Day threshold for CV-P bin of DS1 Path with SF format in egress direction.
   Type: Integer.
   Range: 0- 1048575
   Default: 691.
3. **`qhcvesfp`**
   15-minute threshold for CV-P bin of DS1 Path with ESF format in egress direction.
   Type: Integer.
   Range: 0-16383
   Default: 13296.
4. **`daycvesfp`**
   Day threshold for CV-P bin of DS1 Path with ESF format in egress direction.
   Type: Integer.
   Range: 0-1048575
   Default: 132960.
5. **`qhesp`**
   15-minute threshold for ES-P bin of DS1 Path egress direction.
   Type: Integer.
   Range: 0-900
   Default: 65.
6. **`dayesp`**
   Day threshold for ES-P bin of DS1 Path egress direction.
   Type: Integer.
   Range: 0-86400
   Default: 648.
7. **`qhsesp`**
   15-minute threshold for SES-P bin of DS1 Path egress direction.
   Type: Integer.
   Range: 0-810
   Default: 10.
8. **`daysesp`**
   Day threshold for SES-P bin of DS1 Path egress direction.
   Type: Integer.
   Range: 0-86400
   Default: 250.

9. **qhuasp**
   15-minute threshold for UAS-P bin of DS1 Path egress direction.
   Type: Integer.
   Range: 0-900
   Default: 10.
10. **dayuasp**
    Day threshold for UAS-P bin of DS1 Path egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 10.
11. **qhsasp**
    15-minute threshold for SAS-P bin of DS1 Path egress direction.
    Type: Integer.
    Range: 0-900
    Default: 2.
12. **daysasp**
    Day threshold for SAS-P bin of DS1 Path egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 17.

Example output

The following example shows the successful completion of a ED-TCA-PROF command by the NE:

```
LT-UNITE 00-11-03 15:00:00
A  000 REPT DBCHG
   ″TIME=15-00-00,DATE=00-11-03:ED-TCA-PROF::RS-MS,DTAG: qhrsnes=10,qhrsnbbe=6″
;
```

ED-TMAT3: Edit asynchronous adjunct port of the TransMUX card

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: No.

Input format

Command syntax:

ED-TMAT3:*tid:aid:ctag:::spec_block;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   Type: AID
   Range: TMuxAPortAID
   The keyword **all** is not allowed.
   Default: None
3. **ctag** – Correlation Tag
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).

Spec block parameters

1. **ds3pn** – DS3 ASAP
   DS3 Alarm Severity Assignment Profile. This parameter retrieves the ASAP profile name of type DS3 to which the designated AID points.
   Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
   Range: String with a maximum of 24 characters.
   Default: DEFAULT.
2. **fmt** – Signal Format
   This parameter shows the format for the DS3 signal
   Type: Alphanumeric value set. A hyphen ("-") is allowed in the name additionally.
   Range:
   - C-BIT: C-bit parity channelized DS3 format
   - M23: M23 channelized DS3 format. M23 format contains seven DS2 signals, which contain DS1 signals.

   Default: C-BIT.

3. **`outfepm`** – Outgoing DS3 Far End Path PM Enable
   This parameter enables/disables the outgoing DS3 far end path performance monitoring.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE.
   Default: DISABLE.
4. **`outpm`** – Outgoing DS3 Near End Path PM Enable
   This parameter enables/disables the outgoing DS3 near end path performance monitoring.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE.
   Default: DISABLE.
5. **`pmode`** – Port Mode
   This parameter sets the mode of the port.
   Type: Alphanumeric value set.
   Range:
   - MON indicates that alarm monitoring is taking place on the port.
   - NMON means that alarm monitoring is not occurring on the port.

   Default: NMON.
6. **`servcond`** – Service Condition
   This parameter indicates its status concerning service involvement.
   Type: Alphanumeric value set.
   Range:
   - INSERVICE: Provisioning values for service are accepted
   - OUTOFSERVICE: Provisioning values for service are not accepted.

   Default: INSERVICE.
7. **`tca`** – DS3 PM TCA
   This parameter assigns a DS3 PM TCA profile name to the designated AID.
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: String with a maximum of 24 characters.
   - DEFAULT
   - DEFAULT0

   Default: DEFAULT0.

Output format

In response to a valid RTRV-TMAT3 command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

None.

Detailed behavior description

The command modified the attributes (listed in the spec_block parameters part of this command) of the addressed port entity according to the parameters given with this command. The modification are reported by means of an ED-TMAT3 notification for port.

Example input/output

```
ED-TMAT3:UNITE-NE:1-1-#-#-21-tma1:123456:::OUTPM=DISABLE;

   UNITE-NE 00-11-28 08:00:00
M  123456 COMPLD
;

   UNITE-NE 00-11-28 08:00:30
A  001 REPT DBCHG
   ”TIME=08-00-12,DATE=00-11-28:ED-TMAT3:1-1-#-#-21-1::OUTPM=disable:”
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **`ED-TMAT3`** command.

Validation rule: ASAP profile exists

Check of the existence of the ASAP profile.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: TCA profile exists

Check of the existence of the TCA profile.

Error code: `IDNV – Input, Data Not Valid, TCA profile does not exist`

Output format

Command syntax: **`ED-TMAT3`**:*aid*::*spec_block*;

Output parameters

Command parameters

1. **`aid`** – Access Identifier of a TransMUX asynchronous adjunct port.
   Type: AID
   Range: TMuxAPortAID
   The keyword **`all`** is allowed up to shelf level.
   Default: None.

Spec block parameters

1. **`ds3pn`** – DS3 ASAP
   DS3 Alarm Severity Assignment Profile. This parameter retrieves the ASAP profile name of type DS3 to which the designated AID points.
   Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
   Range: String with a maximum of 24 characters.
   Default: DEFAULT.
2. **`fmt`** – Signal Format
   This parameter shows the format for the DS3 signal
   Type: Alphanumeric value set. A hyphen ("-") is allowed in the name additionally.
   Range:
   - C-BIT: C-bit parity channelized DS3 format
   - M23: M23 channelized DS3 format. M23 format contains seven DS2 signals, which contain DS1 signals.

   Default: C-BIT.
3. **`outfepm`** – Outgoing DS3 Far End Path PM Enable
   This parameter enables/disables the outgoing DS3 far end path performance monitoring.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE.
   Default: DISABLE.
4. **`outpm`** – Outgoing DS3 Near End Path PM Enable
   This parameter enables/disables the outgoing DS3 near end path performance monitoring.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE.
   Default: DISABLE.

5. **pmode** – Port Mode
   This parameter sets the mode of the port.
   Type: Alphanumeric value set.
   Range:
   - MON indicates that alarm monitoring is taking place on the port.
   - NMON means that alarm monitoring is not occurring on the port.

   Default: NMON.
6. **servcond** – Service Condition
   This parameter indicates its status concerning service involvement.
   Type: Alphanumeric value set.
   Range:
   - INSERVICE: Provisioning values for service are accepted
   - OUTOFSERVICE: Provisioning values for service are not accepted.

   Default: INSERVICE.
7. **tca** – DS3 PM TCA
   This parameter assigns a DS3 PM TCA profile name to the designated AID.
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: String with a maximum of 24 characters.
   - DEFAULT
   - DEFAULT0

   Default: DEFAULT0.

Example input/output

```
ED-TMAT3:UNITE-NE:1-1-#-#-21-tma1:123456:::OUTPM=DISABLE;

   UNITE-NE 00-11-28 08:00:00
M  123456 COMPLD
;

   UNITE-NE 00-11-28 08:00:30
A  001 REPT DBCHG
   ”TIME=08-00-12,DATE=00-11-28:ED-TMAT3:1-1-#-#-21-tma1::outpm=disable:”
;
```

ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack

The command **ED-ULSDCC-L3** is used to set respectively modify values of layer 3 parameter in existing respectively created OSI stacks. Parameter in the area address field of NSAP respectively NET are to set respectively modify. Parameter in the SYSTEM field and SEL field of NSAP respectively NET are predefined. Further layer 3 parameter to set/modify are IS level, IS domain, RA prefix and RA destination node.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S4

Priority: 1

Abortable: No.

Input format

Command syntax: **ED-ULSDCC-L3**:*tid*::*ctag*::*osinode*:[*spec_block*];

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for input parameter syntax and description of this parameter.
3. **osinode**
   A 1675 LambdaUnite MSS NE can have up to 8 instances of the OSI stack. Node-1 is created by start up of the 1675 LambdaUnite MSS NE as default. Node 2-8 can be created and configured, see command "ENT-ULSDCC-L3: Create a further OSI node" (p. 3-1951).
   Type: AID.
   Range: osinode{1-8}.

Spec block parameters

1. **`autoencap`** – Auto Encapsulation
   The parameter *autoencap* is used to enable or disable the Auto Encapsulation function. The parameter is only supported for osinode1. The parameter shall be omitted for all other osinodes.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE.
   Default: DISABLE.
2. **`l3afi`** – NSAP/NET Authority and Format Identifier
   This parameter sets or retrieves the format for the rest of the address.
   Type: Hexadecimal number.
   Range: 10 – 99
   Default: 39. This value identifies the iso_dcc format.
3. **`l3idi`** – NSAP/NET initial Domain Identifier
   This parameter consists of two values:
   - a 3 semi-octet (3-digit hexadecimal) IDI part to specify the country code indicating the registration authority responsible for the allocation and assignment of the NSAP address.
   - a 1 semi-octet (1-digit hexadecimal) IDI pad part. The parameter is used for set and retrieve values.

   Type: Hexadecimal number.
   Range: 0000 – FFFF
   Default:
   SONET: IDI = 840; IDI pad = F
   SDH: IDI = 000; IDI pad = 0.
4. **`l3dfi`** – NSAP/NET DSP Format Identifier
   This parameter (2-digit hex) NSAP is used to set or retrieve the format for the rest of the address.
   Type: Hexadecimal number.
   Range: 00 – FF.
   Default: 80. This value represents the SONET DSP format.
5. **`l3org`** – NSAP/NET Organization Identifier
   This parameter of NSAP is used to set or retrieve the NSP (allocated Company Code).
   Type: Hexadecimal number.
   Range: 000000 – FFFFFF.
   Default: 000000.
6. **`l3res`** – NSAP/NET Reserved
   This NSAP part currently has not been assigned a specific purpose.
   Type: Hexadecimal number.
   Range: 0000 – FFFF.
   Default: 0000.

7. **`l3rd`** – NSAP/NET Routing Domain
This parameter of NSAP is used to set or retrieve a unique routing domain within an administrative domain. A standard for use has not been defined until now.
Type: Hexadecimal number.
Range: 0000 – FFFF.
Default: 0000.

8. **`l3area`** – NSAP/NET Area Identifier
This parameter of NSAP is used to set or retrieve the area. So NEs can be identified in the same area.
Type: Hexadecimal number.
Range: 0000 – FFFF.
Default: 0000.

9. **`l3isisnl`** – Layer 3 IS Level
This parameter indicates the network router type: ES-IS (level1, value L1), IS-IS (level2, value L2) and partition repair capability (value3).
Note: This parameter is not reported when output parameter *osinode* = scnnode.
Type: Alphanumeric string.
Range:
   - L1: this means level1, IS-IS, only allowed when parameter l3radesnode=0
   - L12: this means level2, IS-IS which contains also level1, ES-IS
   - L12PRC : this means partition repair capable (PRC) and contains also level1 and level2.

Default: L1.

10. **`l3domain`** – Layer3 IS Domain
Per node in a NE, a domain group must be specified. This will be done with this parameter which can be set and retrieved. All nodes in the NE with the same domain-number are interconnected and can communicate without the need for inter-domain routing via RA-PREFIX.
Note: This parameter is not reported when output parameter *osinode* = scnnode.
Type: Alphanumeric string.
Range:
   - 1 for osinode1
   - 1 – 2 for osinode2 to osinode8.

Default: 1.

11. **`l3raprefix`** – Layer3 Reachable Address Prefix
This value specifies an area address or a part of an area address representing an area address group. This parameter is needed when nodes in different routing domains (see *l3domain*) must communicate. The node must forward then CLNP PDUs to the RA-Destination-Node if the destination NSAPs of CLNP PDUs match with the PA-Prefix.
Note: This parameter is not reported when output parameter *osinode* = scnnode.
Type: Hexadecimal number.

Range:

- NONE,
- a string of 1 to 13 bytes: first byte (most significant): 10 – 99; rest: 0000 – FFFF.

The value represents an area address or a part of an area address beginning with AFI.
Default: empty string.

12. **l3radesnode** – Layer3 Reachable Address Destination Node
This parameter is in combination with parameter l3raprefix necessary. The value represents the destination node in the same NE. An internal connection over a domain-boundary is established between this node and the RA-Destination-Node, with IS-IS disabled over that connection.
Note: This parameter is not reported when output parameter *osinode* = scnnode.
Type: AID and digit value.
Range:
    - 0, osinode{2-8} for osinode1
    - 0, osinode1 for osinode2 to osinode 8.

    Value 0 indicates that functionality of RA-Prefix is disabled.
Default: 0.
13. **nsapthlev** – Number of OSI Nodes Threshold Level
This parameter indicates the NSAP count threshold level for monitoring the number of OSI nodes (NSAPs) for the level 1 area in which the OSI node specified by the osinode parameter is located. A threshold value of zero (0) indicates that NSAP threshold alarming is disabled. The parameter is omitted for the SCN node.
Type: Numeric string.
Range: 0 no alarming; 1 -250 threshold alarming.
Default: 0

Output format

If the **ED-ULSDCC-L3** is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The command sets or modifies the parameter of layer 3 in a node as specified in the spec_block of the command line. Result should be an update of the OSI stack.

Modification of any of the parameters *l3domain*, *l3afi*, *l3idi*, *l3dfi*, *l3org*, *l3res*, *l3rd*, *l3area*, *l3isisnl*, *autoencap* leads to a reset of the DCF controller and disconnection of management communication.

The update is reported by means of **ED-ULSDCC-L3** notification.

Example input/output

The following example shows the result of **ED-ULSDCC-L3**:

```
ED-ULSDCC-L3:NE-
      UNITE::4744843::osinode8:l3afi=39,l3idi=840F,l3dfi=80,l3org=100100,l3res=0000,l3rd=0020,l
   NE-UNITE 01-01-15 11:59:02
M  4744843 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **ENT-ULSDCC-L3** command.

Validation rule: *osinode* must be in the created state

The *osinode* parameter for which changes should be applied must be in the created state, i.e. the value must be either osinode1 or the node must be successfully created via **ENT-ULSDCC-L3**.

Error code:

`SNVS – Status, Not in Valid State, osinode not in created state`

Validation rule: Address area value – RA-prefix value

If an Address Area value will be changed and an existing RA-Prefix matches with the concerning part of the new Area Address the provisioning of the new NSAP Area Address must be rejected.

Error code:

`IDNV – Input, Data Not Valid, NSAP Area Addres matches with RA-Prefix`

Validation rule: RA-prefix value – Address area value

If a RA-Prefix will be changed respectively initiated and the value matches with the concerning part of the NSAP Area Address of this node the command must be rejected. The prefix should be specific enough, so that it matches not with NSAPs in both domains.

Error code:

`IDNV – Input, Data Not Valid, RA-Prefix matches with the NSAP Area Address`

Validation rule: *l3radesnode* value must be different from osinode

The command will be rejected when parameter *l3radesnode* is equal to the *osinode* parameter of the node.

Error code: `IDNV – Input, Data Not Valid, equal node IDs`

Validation rule: *l3domain* value must be different for current node and *l3radesnode*

If the value for the Domain Group (*l3domain* parameter) is equal for this node and the destination node (*l3radesnode* parameter) the command must be rejected.

Error code: `IDNV – Input, Data Not Valid, equal l3domain`

Validation rule: *l3radesnode* value and *l3isisnl* value

The *l3isisnl* parameter value L1 (Level1) is only allowed when *l3radesnode*=0

Error code: `IDNV – Input, Data Not Valid, constraint l3radesnode`

Validation rule: consistency of *l3radesnode* with *l3raprefix*

If the value for the RA Destination Node (l3radesnode parameter) is equal to 0 while the value of the RA Prefix (l3raprefix parameter) is not NONE the command must be rejected.

Error code:

`IDNV – Input, Data Not Valid, l3prefix and l3radesnode inconsistent`

Validation rule: *l3domain* can not be changed for *osinode1*

If *osinode* = osinode1 *l3domain* changes should be rejected.

Error code:

`IDNV – Input, Data Not Valid, can’t change l3domain for osinode1`

Validation rule: only one single node in a separate domain supported

The command is rejected when *l3domain* has an other value than 1 and there is already an other osinode which has a value other than 1 for *l3domain*.

Error code:

`IDNV – Input, Data Not Valid, only a single node in separate domain supported`

Validation rule: consistency *l3domain* with *l3radesnode* for nodes 2 to 8

The command is rejected when *l3domain* for osinode2 to osinode8 has a value of 1 and *l3radesnode* is not equal to 0.

Error code:
`IDNV – Input, Data Not Valid, inconsistency l3domain with l3radesnode`

Validation rule: *l3radesnode* must be in the created state

If the destination node (*l3radesnode* parameter) is not in the created state, the command must be rejected.

Error code:
`SNVS – Status, Not in Valid State, l3radesnode not in created stat`

Validation rule: Check for IP configuration of LAN1

If it is tried to set *autoencap* to ENABLE without a valid IP address and subnetwork mask configured for LAN port LAN1, then the command is denied.

Error code: `SNVS – Status, Not in Valid State, incomplete IP configuration`

Validation rule: Check if Auto Encapsulation is still in use by ES64U pack

If it is tried to set *autoencap* to DISABLE while there is an ES64U pack provisioned in the system with a capacity set to 20G, then the command is denied.

Error code:
`SNVS – Status, Not in Valid State, Auto Encapsulation still in use`

Validation rule: Check if manual MCN routes exist

If it is tried to set *autoencap* to DISABLE while there are still manual MCN routes provisioned for any of the LAN ports, then the command is denied.

Error code:
`SNVS – Status, Not in Valid State, Manual MCN routes still exist`

ED-ULSDCC-L3 notification

The command **ED-ULSDCC-L3** effects a communication SW-reset (protocol stack) and the management connection is lost. Therefore it cannot be guaranteed that a notification could be returned as described below.

Output format

The **ED-ULSDCC-L3** notification has the following specific syntax:

ED-ULSDCC-L3::*osinode*:*spec_block*

Output parameters

Command parameters

1. **osinode**
   A 1675 LambdaUnite MSS NE can have up to 8 instances of the OSI stack. Node-1 is created by start up of the 1675 LambdaUnite MSS NE as default. Node 2-8 can be created and configured, see command "ENT-ULSDCC-L3: Create a further OSI node" (p. 3-1951).
   Type: AID.
   Range: osinode{1-8}.

Spec block parameters

1. **autoencap** – Auto Encapsulation
   The parameter *autoencap* is used to enable or disable the Auto Encapsulation function. The parameter is only supported for osinode1. The parameter shall be omitted for all other osinodes.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE.
   Default: DISABLE.
2. **l3afi** – NSAP/NET Authority and Format Identifier
   This parameter sets or retrieves the format for the rest of the address.
   Type: Hexadecimal number.
   Range: 10 – 99
   Default: 39. This value identifies the iso_dcc format.
3. **l3idi** – NSAP/NET initial Domain Identifier

This parameter consists of two values:

- a 3 semi-octet (3-digit hexadecimal) IDI part to specify the country code indicating the registration authority responsible for the allocation and assignment of the NSAP address.
- a 1 semi-octet (1-digit hexadecimal) IDI pad part. The parameter is used for set and retrieve values.

Type: Hexadecimal number.
Range: 0000 – FFFF
Default:
SONET: IDI = 840; IDI pad = F
SDH: IDI = 000; IDI pad = 0.

4. **`l3dfi`** – NSAP/NET DSP Format Identifier
This parameter (2-digit hex) NSAP is used to set or retrieve the format for the rest of the address.
Type: Hexadecimal number.
Range: 00 – FF.
Default: 80. This value represents the SONET DSP format.
5. **`l3org`** – NSAP/NET Organization Identifier
This parameter of NSAP is used to set or retrieve the NSP (allocated Company Code).
Type: Hexadecimal number.
Range: 000000 – FFFFFF.
Default: 000000.
6. **`l3res`** – NSAP/NET Reserved
This NSAP part currently has not been assigned a specific purpose.
Type: Hexadecimal number.
Range: 0000 – FFFF.
Default: 0000.
7. **`l3rd`** – NSAP/NET Routing Domain
This parameter of NSAP is used to set or retrieve a unique routing domain within an administrative domain. A standard for use has not been defined until now.
Type: Hexadecimal number.
Range: 0000 – FFFF.
Default: 0000.
8. **`l3area`** – NSAP/NET Area Identifier
This parameter of NSAP is used to set or retrieve the area. So NEs can be identified in the same area.
Type: Hexadecimal number.
Range: 0000 – FFFF.
Default: 0000.

9. **l3isisnl** – Layer 3 IS Level
   This parameter indicates the network router type: ES-IS (level1, value L1), IS-IS (level2, value L2) and partition repair capability (value3).
   Note: This parameter is not reported when output parameter *osinode* = scnnode.
   Type: Alphanumeric string.
   Range:
   - L1: this means level1, IS-IS, only allowed when parameter l3radesnode=0
   - L12: this means level2, IS-IS which contains also level1, ES-IS
   - L12PRC : this means partition repair capable (PRC) and contains also level1 and level2.

   Default: L1.
10. **l3domain** – Layer3 IS Domain
    Per node in a NE, a domain group must be specified. This will be done with this parameter which can be set and retrieved. All nodes in the NE with the same domain-number are interconnected and can communicate without the need for inter-domain routing via RA-PREFIX.
    Note: This parameter is not reported when output parameter *osinode* = scnnode.
    Type: Alphanumeric string.
    Range:
    - 1 for osinode1
    - 1 – 2 for osinode2 to osinode8.

    Default: 1.
11. **l3raprefix** – Layer3 Reachable Address Prefix
    This value specifies an area address or a part of an area address representing an area address group. This parameter is needed when nodes in different routing domains (see *l3domain*) must communicate. The node must forward then CLNP PDUs to the RA-Destination-Node if the destination NSAPs of CLNP PDUs match with the PA-Prefix.
    Note: This parameter is not reported when output parameter *osinode* = scnnode.
    Type: Hexadecimal number.
    Range:
    - NONE,
    - a string of 1 to 13 bytes: first byte (most significant): 10 – 99; rest: 0000 – FFFF.

    The value represents an area address or a part of an area address beginning with AFI.
    Default: empty string.

12. **l3radesnode** – Layer3 Reachable Address Destination Node
This parameter is in combination with parameter l3raprefix necessary. The value represents the destination node in the same NE. An internal connection over a domain-boundary is established between this node and the RA-Destination-Node, with IS-IS disabled over that connection.
Note: This parameter is not reported when output parameter *osinode* = scnnode.
Type: AID and digit value.
Range:
    - 0, osinode{2-8} for osinode1
    - 0, osinode1 for osinode2 to osinode 8.

    Value 0 indicates that functionality of RA-Prefix is disabled.
Default: 0.
13. **nsapthlev** – Number of OSI Nodes Threshold Level
This parameter indicates the NSAP count threshold level for monitoring the number of OSI nodes (NSAPs) for the level 1 area in which the OSI node specified by the *osinode* parameter is located. A threshold value of zero (0) indicates that NSAP threshold alarming is disabled. The parameter is omitted for the SCN node.
Type: Numeric string.
Range: 0 no alarming; 1 -250 threshold alarming.
Default: 0

Example output

```
   NE-UNITE 01-01-13 01:57:42
A  000 REPT DBCHG
   ”TIME=01-47-43,DATE=01-01-13:ED-ULSDCC-L3::osinode8:
   l3afi=39,l3idi=840F,l3dfi=80,l3org=100100,l3res=0000,
   l3rd=0020,l3area=4711,l3isisnl=Ll2,l3domain=2,
   l3raprefix=,l3radesnode=0,nsapthlev=48”
;
```

ED-USER: Edit user

The **ED-USER** command modifies a user's own security parameters.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: No.

Input format

Command syntax: **ED-USER**:*tid*::*ctag*:::[*spec_block*];

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).

Spec block parameters

1. **screen** – Message Screening
   This parameter specifies what output messages are associated with the *uid*. This parameter is omitted if the user has none of these values. Any combination of these values may be specified using ampersand (&)
   Type: Alphanumeric string An '&' is also allowed for concatenation of values.
   Range:
   - DBCHG
     Data Base Change notifications – changes in creation of entities, in user provisionable parameters, in deletion of entities will be reported (data base changes). The user will receive **REPT DBCHG** messages.
     The value DBCHG shall always be used together with the value STCHG.
   - STCHG
     State Change notifications – report changes in user non-provisionable parameters (state changes). The user will receive **REPT DBCHG** messages.
     The value STCHG shall always be used together with the value DBCHG.
   - PSCHG
     Protection switch notifications – report protection switch changes. User will receive REPT EVT and REPT SW messages.
   - ALARMS
     Alarm notifications. The user will receive REPT ALM ENV, REPT ALM, and REPT EVT messages.

- ONNS

  ONNS Notifications. Database and state changes associated with entities managed by ONNS application and only issued when *xcsetup* = NN. The related ONNS TL1 notifications are REPT PTHCHG, REPT PTHEVT, REPT NNCHG, REPT NNEVT.
- OWN

  Responses to own commands. The user will receive no other notifications.

  Note: OWN will never be shown in conjunction with DBCHG, STCHG, PSCHG or ALARMS.
- NA

  Not applicable. This value is reserved for users with uidclass=MEMADMIN. The notification behavior is controlled in this case by the user class.

Default: OWN
If more than one value is set the values will be concatenated by '&'.
Example: DBCHG&STCHG&ALARMS

Output format

After receiving the **ED-USER** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

If the **ED-USER** command does not alter existing user security parameters, the NE provides a normal completion response.

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

This command updates the user data of the user *uid* (User ID) who requests the command. The value of *screen* (Message Screening) will be updated according the parameter value.

It will be reported via the corresponding ED-USER notification – see "ED-USER notification" (p. 3-1326) section.

The execution of an ED-USER command is entered in the Security Information Log.

When the **ED-USER** command is successfully executed, the user session is not terminated and is unaffected. It will continue to use the previous values. The changes will take effect the next time the user logs in.

Example input/output

The following example shows the successful completion of the **ED-USER** command by the NE:

ED-USER:LT-UNITE-123::123456:::screen=DBCHG&STCHG;

```
   sid date time
M  ctag DENY
   IIAC
   /* Input, Invalid ACcess identifier, unknown AID */
;
```

Error responses

Validation rule: screen value not allowed for *uid*

A user is not able to add a message type to their *screen* parameter list if:

- the message type was never added a security administrator or
- the message type has been removed by a security administrator

Error code:

`IDNV – Input, Data Not Valid, screen value was not set by security administrator`

Related TL1 messages

"RTRV-USER: Retrieve user" (p. 3-3059)

ED-USER notification

Output format

The **ED-USER** notification has the following specific syntax: **ED-USER**:*uid*::*spec_block*

Output parameters

Command parameters

1. **uid** – User Identifier
   This is the unique user login identifier for which the ACT-USER login command is intended. Grouping and/or ranging of *uid* values for the **ACT-USER** command are not allowed. Valid *uid* values for the **ACT-USER** command are case-sensitive alphanumeric strings which have been previously provisioned as valid login IDs in the NE.
   Type: Alphanumeric string (case-sensitive)
   Range: 1 – 10 characters
   The *uid* ALL is not allowed in any combination of upper or lower cases.
   Default: not applicable

Spec block parameters

1. **screen** – Message Screening
   This parameter specifies what output messages are associated with the *uid*. This parameter is omitted if the user has none of these values. Any combination of these values may be specified using ampersand (&)
   Type: Alphanumeric string An '&' is also allowed for concatenation of values.
   Range:
   - DBCHG
     Data Base Change notifications – changes in creation of entities, in user provisionable parameters, in deletion of entities will be reported (data base changes). The user will receive REPT DBCHG and REPT EVT FXFR messages.
   - STCHG
     State Change notifications – report changes in user non-provisionable parameters (state changes). The user will receive **REPT DBCHG** messages.
   - PSCHG
     Protection switch notifications – report protection switch changes. User will receive REPT EVT and REPT SW messages.
   - ALARMS
     Alarm notifications. The user will receive REPT ALM ENV, REPT ALM, and REPT EVT messages.
   - ONNS

ONNS Notifications. Database and state changes associated with entities managed by ONNS application and only issued when *xcsetup* = NN. The related ONNS TL1 notifications are REPT PTHCHG, REPT PTHEVT, REPT NNCHG, REPT NNEVT.

- OWN

  Responses to own commands. The user will receive no other notifications.

  Note: OWN will never be shown in conjunction with DBCHG, STCHG, PSCHG or ALARMS.

- NA

  Not applicable. This value is reserved for users with uidclass=MEMADMIN. The notification behavior is controlled in this case by the user class.

Default: OWN
If more than one value is set the values will be concatenated by ’&’.
Example: DBCHG&STCHG&ALARMS

Example output

The example shows a normal notification after an ED-USER command:

```
   LT-UNITE-123 00-01-01 08:00:50
A 815 REPT DBCHG
   ″TIME=08-00-12,DATE=00-01-01:ED-USER:nbguser1::
   screen=DBCHG&STCHG″
;
```

ED-USER-SECU: Edit user security

The **ED-USER-SECU** command is used by an administrator to edit the security parameters associated with a user.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S5

Priority: 1

Abortable: No.

Input format

Command syntax: **ED-USER-SECU**:*tid*:*uid*:*ctag*::,[*new_pid*],,[*upc*][:*spec_block*];

Input parameters

> **Important!** During a software download (CIT to NE) it may happen that the *Navis*® Optical EMS -NE connection get lost. This is caused by the *tmout* (Inactivity Timeout Period) parameter. A value of 0 will disable the timeout function (see Spec block parameters description below).

Note: The new setting becomes operational only after a new login.

Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **uid** – User ID
   ED-USER-SECU input
   Specifies the user ID (*uid*) name which should be edited.
3. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
4. **new_pid** – New Password ID
   This parameter specifies the new password ID for the addressed *uid*. This is an optional parameter and in the absence of a value the default is the current value. Password strings are transmitted in non-encrypted form in the **ACT-USER** command; are encrypted when stored in the NE; and are never transmitted from the NE.
   Type: character string (case-sensitive)
   Range: 6 to 10 legal characters. Valid passwords consist of at least two

non-alphabetic characters with at least one special character. The special character can be one of the required non-alpha characters. For example, TEST1+ is a valid password. The first character of a password must be a letter.
Default: For the two superusers the default password is: UNITE+01 for User ID LUC01 and UNITE+02 for User ID LUC02. For other users: not applicable.

5. **`upc`** – User Privilege Code List
   This parameter specifies the user privilege code UCFC/UCAL pair assigned to a user. Multiple UCFC/UCALs can be specified using single ampersands ('&'). If a user tries to operate a command with a privilege code higher than assigned to the user for the category of the command the command will be denied.
   Type: Alphanumeric string; for concatenation “&” is also allowed.
   Range: P***i***, M***i***, T***i***, S***i***, PM***i***, D***i***, C***i***, where ***i*** is an integer ranging from 0 to 5, with ***i*** = 0 implying that there is no authorization for the functional category. S0 is not allowed.
   Default: P1&M1&T1&S1&PM1&C0 except for super users: P5&M5&T5&S5&PM5&C5.
   Note: The system does not support commands for the D (DEBUG) category. Setting this privilege code does not have any effect on the system behavior and it will not be visible in output direction. It is only for compatibility.
   See also “List of user privilege codes” (p. 15-1).

Spec block parameters

1. **`alw_login`** – Allow Login
   This parameter displays the enable/disable state of a User ID.
   A User ID can be automatically disabled by the system when the time specified by parameter *usrage* (see “RTRV-NE-SECU: Retrieve NE security” (p. 3-2552)) expires or via the **`ED-USER-SECU`** command. A User ID can be enabled via the **`ED-USER-SECU`** command.
   If a User ID is disabled, logins with that User ID are denied.
   Type: Alphanumeric value set.
   Range:
   - YES: User ID is enabled
   - NO: User ID is disabled

   Default: YES

2. **`newuid`** – New UID
   This parameter allows to rename the 2 predefined super-users. It cannot be used to rename a non-super-user login. .
   uid the unique user login identifier for which the ACT-USER login command is intended. Grouping and/or ranging of *uid* values for the **`ACT-USER`** command are not allowed. Valid *uid* values for the **`ACT-USER`** command are case-sensitive alphanumeric strings which have been previously provisioned as valid login IDs in

the NE.
Type: Alphanumeric string (case-sensitive)
Range: 5 – 10 characters
The *uid* ALL is not allowed in any combination of upper or lower cases.
Default: not applicable

3. **`page`** – Password Aging Interval
   This parameter specifies the period in days after which the user has to change the password of their account. If the value is set to 0 then the password aging function is disabled.
   Type: Integer.
   Range: 0, 7-999 [days]
   Default: 90
4. **`screen`** – Message Screening
   This parameter specifies what output messages are associated with the *uid*. This parameter is omitted if the user has none of these values. Any combination of these values may be specified using ampersand (&)
   Type: Alphanumeric string. An '&' is also allowed for concatenation of values.
   Range:
   - DBCHG

     Data Base Change notifications – changes in creation of entities, in user provisionable parameters, in deletion of entities will be reported (data base changes). The user will receive **`REPT DBCHG`** messages.

     The value DBCHG shall always be used together with the value STCHG.
   - STCHG

     State Change notifications – report changes in user non-provisionable parameters (state changes). The user will receive **`REPT DBCHG`** messages.

     The value STCHG shall always be used together with the value DBCHG.
   - PSCHG

     Protection switch notifications – report protection switch changes. User will receive REPT EVT and REPT SW messages.
   - ALARMS

     Alarm notifications. The user will receive REPT ALM ENV, REPT ALM, and REPT EVT messages.
   - ONNS

     ONNS Notifications. Database and state changes associated with entities managed by ONNS application and only issued when *xcsetup* = NN. The related ONNS TL1 notifications are REPT PTHCHG, REPT PTHEVT, REPT NNCHG, REPT NNEVT.
   - OWN

     Responses to own commands. The user will receive no other notifications.

     Note: OWN will never be shown in conjunction with DBCHG, STCHG, PSCHG or ALARMS.
   - NA

Not applicable. This value is reserved for users with uidclass=MEMADMIN. The notification behavior is controlled in this case by the user class.

Default: OWN

If more than one value is set the values will be concatenated by ’&’.

Example: DBCHG&STCHG&ALARMS

Restriction: When *uidclass* is set to MEMADMIN, screen must be set to NA.

5. **`tmout`** – Inactivity Timeout Period

   If there are no messages between the user and the NE over the Timeout Period, the session is logged off. A value of 0 disables the timeout function.

   Type: Integer.

   Range: 0 – 999 [minutes]

   Default: 30

6. **`uidclass`** – UID Class

   This is the user class of a *uid*.

   Type: Alphanumeric value set.

   Range:

   - OTHER – This is the default class. For users in this class, command privileges and notifications are controlled only by their UPCs and their notification Registration List.
   - MEMADMIN – User class for memory administration users. All users of this class share the same atag counter for autonomous messages and are allowed to execute the command **`RTRV-AO`**.

   Default: OTHER

Output format

After receiving the **`ED-USER-SECU`** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

If the **`ED-USER-SECU`** command does not alter existing user security parameters, the NE provides a normal completion response. An example is when the *upc* of the *uid* is P3 and an ED-USER-SECU command is received which sets the *upc* to P3.

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

This command updates the user data of the user specified in the *uid* parameter. The values of *upc* (User Privilege Code List), *alw_login* (Allow Login), *screen* (Message Screening), *page* (Password Aging Interval), *tmout* (Inactivity Timeout Interval) will be updated according the parameter values. *new_pid* updates the *pid* (Password ID). *newuid* updates the uid (User ID).

It will be reported via the corresponding ED-USER-SECU notification – see "ED-USER-SECU notification" (p. 3-1335) section.

The NE always has two preinstalled users with full privileges in all functional categories. These two users will be referred to as super-user. The NE will not allow adding additional super-user type users. It will not be possible to remove either of the original super-user login IDs. An super-users's *upc* cannot be modified using the **ED-USER-SECU** command.

An existing non-super-user login ID (*uid*) cannot be renamed. It must be deleted and re-entered.

A superuser login ID (*uid*) can be renamed by a security administrator (privilege code S5 in category Security Administration).

The **ED-USER-SECU** command enables an Security Administrator to modify the password, user privilege code(s), and/or user security parameters of the non-administrative users. An Security Administrator may modify the password and/or user security parameters of the other Security Administrators including super-users (except the user privilege code).

If the *uid* is currently logged in when the **ED-USER-SECU** command is successfully executed, the user session identified by the *uid* is not terminated and is unaffected. It will continue to use the previous values. The changes will take effect the next time the user logs in.

Example input/output

The following example shows the successful completion of the **ED-USER-SECU** command by the NE:

```
ED-USER-SECU:LT-UNITE-123:nbguser1:123456::,pass13+,,P3&M3;&PM2:screen;=
   DBCHG&STCHG;,page=70,tmout=0,^alw_login=YES;
   sid date time
M  ctag DENY
   ICNV
   /* Input, Command Not Valid, extra AID */
;
```

This example shows how the superuser's *uid* can be changed:

```
ED-USER-SECU:LT-UNITE-123:LUC01:123456::,,,:newuid=Admin1;
```

```
   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Validation rule: Invalid *uid*

If the NE receives an ED-USER-SECU command with an invalid (unknown) *uid* value.

Error code: `IDNV – Input, Data Not Valid, invalid UID`

Validation rule: Invalid *upc*

If the NE receives an ED-USER-SECU command with a *upc* value=P5&M5&T5&S5&PM5 for a non-administrator login account or a upc=S0 or one super-user tries to make the other super-user a non-super-user.

Error code: `IDNV – Input, Data Not Valid, invalid UPC`

Validation rule: newuid has the same value of an existing *uid*

If the NE receives an ED-USER-SECU command from a user trying to change with the *newuid* the *uid* of the addressed user id to an existing *uid* different from the addressed user id.

Error code: `IDNV – Input, Data Not Valid, duplicate UID`

Validation rule: newuid defined for non superuser *uid*

If the NE receives an ED-USER-SECU command from a user trying to change the *uid* of a non super-user.

Error code: `IDNV – Input, Data Not Valid, newuid for non superuser`

Validation rule: disabling of superusers

If the NE receives an ED-USER-SECU command from a user trying to disabling *uid* of a super-user.

Error code: `IDNC – Input, Data Not Consistent`

Validation rule: Compatibility *screen*, *uidclass* parameter

If the network element receives an ED-USER-SECU command with uidclass=MEMADMIN and screen !=NA it shall reject the command with:

Error code:

`IDNV – Input, Data Not Valid, incompatible screen, uidclass parameters`

ED-USER-SECU notification

Output format

See definition of "REPT DBCHG: Report data base change" (p. 3-2118).

The **ED-USER-SECU** notification has the following specific syntax:

ED-USER-SECU:*uid*:,,[*upc*]:*spec_block*

Output parameters

Command parameters

1. **uid** – User ID
   This is the unique user login identifier for which the ACT-USER login command is intended. Grouping and/or ranging of *uid* values for the **ACT-USER** command are not allowed. Valid *uid* values for the **ACT-USER** command are case-sensitive alphanumeric strings which have been previously provisioned as valid login IDs in the NE.
   Type: Alphanumeric string (case-sensitive)
   Range: 1 – 10 characters
   The *uid* ALL is not allowed in any combination of upper or lower cases.
   Default: not applicable
   If the *uid* was changed via the **ENT-USER-SECU** command and a value of *newuid* is different from the old *uid* then the *uid* contains in the notification the value of old *uid*.
2. **upc** – User Privilege Code List
   This parameter specifies the user privilege code UCFC/UCAL pair assigned to a user. Multiple UCFC/UCALs can be specified using single ampersands ('&'). If a user tries to operate a command with a privilege code higher than assigned to the user for the category of the command the command will be denied.
   Type: Alphanumeric string; for concatenation "&" is also allowed.
   Range: P***i***, M***i***, T***i***, S***i***, PM***i***, D***i***, C***i***, where ***i*** is an integer ranging from 0 to 5, with ***i*** = 0 implying that there is no authorization for the functional category. S0 is not allowed.
   Default: P1&M1&T1&S1&PM1&C0 except for super users: P5&M5&T5&S5&PM5&C5.
   Note: The system does not support commands for the D (DEBUG) category. Setting this privilege code does not have any effect on the system behavior and it will not be visible in output direction. It is only for compatibility.
   See also "List of user privilege codes" (p. 15-1).

Spec block parameters

1. **alw_login** – Allow Login
   This parameter displays the enable/disable state of a User ID.
   A User ID can be automatically disabled by the system when the time specified by parameter *usrage* (see “RTRV-NE-SECU: Retrieve NE security” (p. 3-2552)) expires or via the **ED-USER-SECU** command. A User ID can be enabled via the **ED-USER-SECU** command.
   If a User ID is disabled, logins with that User ID are denied.
   Type: Alphanumeric value set.
   Range:
   - YES: User ID is enabled
   - NO: User ID is disabled

   Default: YES
2. **newuid** – New UID
   This parameter allows to rename the 2 predefined super-users. It cannot be used to rename a non-super-user login. .
   uid the unique user login identifier for which the ACT-USER login command is intended. Grouping and/or ranging of *uid* values for the **ACT-USER** command are not allowed. Valid *uid* values for the **ACT-USER** command are case-sensitive alphanumeric strings which have been previously provisioned as valid login IDs in the NE.
   Type: Alphanumeric string (case-sensitive)
   Range: 5 – 10 characters
   The *uid* ALL is not allowed in any combination of upper or lower cases.
   Default: not applicable
3. **page** – Password Aging Interval
   This parameter specifies the period in days after which the user has to change the password of their account. If the value is set to 0 then the password aging function is disabled.
   Type: Integer.
   Range: 0, 7-999 [days]
   Default: 90
4. **screen** – Message Screening
   This parameter specifies what output messages are associated with the *uid*. This parameter is omitted if the user has none of these values. Any combination of these values may be specified using ampersand (&)
   Type: Alphanumeric string An ’&’ is also allowed for concatenation of values.
   Range:
   - DBCHG

     Data Base Change notifications – changes in creation of entities, in user provisionable parameters, in deletion of entities will be reported (data base changes). The user will receive **REPT DBCHG** messages.
   - STCHG

State Change notifications – report changes in user non-provisionable parameters (state changes). The user will receive **REPT DBCHG** messages.

- PSCHG

  Protection switch notifications – report protection switch changes. User will receive REPT EVT and REPT SW messages.
- ALARMS

  Alarm notifications. The user will receive REPT ALM ENV, REPT ALM, and REPT EVT messages.
- ONNS

  ONNS Notifications. Database and state changes associated with entities managed by ONNS application and only issued when *xcsetup* = NN. The related ONNS TL1 notifications are REPT PTHCHG, REPT PTHEVT, REPT NNCHG, REPT NNEVT.
- OWN

  Responses to own commands. The user will receive no other notifications.

  Note: OWN will never be shown in conjunction with DBCHG, STCHG, PSCHG or ALARMS.
- NA

  Not applicable. This value is reserved for users with uidclass=MEMADMIN. The notification behavior is controlled in this case by the user class.

Default: OWN
If more than one value is set the values will be concatenated by ’&’.
Example: DBCHG&ALARMS

5. **tmout** – Inactivity Timeout Period
   If there are no messages between the user and the NE over the Timeout Period, the session is logged off. A value of 0 disables the timeout function.
   Type: Integer.
   Range: 0 – 999 [minutes]
   Default: 30
6. **uidclass** – UID Class
   This is the user class of a *uid*.
   Type: Alphanumeric value set.
   Range:
   - OTHER – This is the default class. For users in this class, command privileges and notifications are controlled only by their UPCs and their notification Registration List.
   - MEMADMIN – User class for memory administration users. All users of this class share the same atag counter for autonomous messages and are allowed to execute the command **RTRV-AO**.

   Default: OTHER

Example output

The example shows a normal notification after an ED-USER-SECU command:

```
   LT-UNITE-123 00-01-01 08:00:50
A 815 REPT DBCHG
   ”TIME=08-00-12,DATE=00-01-01:ED-USER-SECU:nbguser1:,,
   P3&M3&PM2:screen=DBCHG&STCHG,page=70,tmout=0,
   newuid=nbguser1,
   alw_login=YES”
;
```

This is an example notification in case of the user id was changed for a super-user:

```
   LT-UNITE-123 00-01-01 08:00:50
A 815 REPT DBCHG
   ”TIME=08-00-12,DATE=00-01-01:ED-USER:nbguser1::
   SCREEN=DBCHG&STCHG”
;
```

ED-VC3: Edit VC3 tributary

The command **ED-VC3** is used to provision all parameters related to the tributary VC3.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: no

Input format

Command syntax: **ED-VC3**:*tid:aid:ctag:::spec_block*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   AID of a SDH tributary. The keyword **all** is allowed on slot, port and tributary level. The so called ″dynamic parameters″ is reported, if a **all** is used at the tributary level.

   The ″dynamic parameters″ are:

   - *ptrc*, *ptrcst*, *siglb*, *trailstate*.
     Type: AID
     Range: STS1NumAID.
3. **ctag** – Correlation Tag
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **`brstintvl`**– Bursty Interval
   Measurement period for determining bursty errors The setting of this parameter is used when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
2. **`brstthr`** – Bursty Error Threshold
   The values are set in percent for the degradation threshold. The setting of this parameter is used when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, 15, 20, 25, 30, … 50.
   Default: 30.
3. **`degthr`** – Signal Degrade Threshold
   The setting of this parameter are used when *sdsfmode* = POISSON
   Type: numeric value set.
   Range (as exponents of 10): –5; –6 (default); –7; –8; –9
4. **`dexcthr`** – Excessive Degrade Threshold
   The setting of this parameter are used when *sdsfmode* = POISSON. The values are set as exponent of 10.
   Type: numeric value set.
   Range (as exponent of 10) –3 (default); –4; –5.
5. **`exphptrc`** – Expected Path Trace (J1)
   The parameter *exphptrc* specifying the expected path trace is only relevant for the path trace supervision when the path trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex.
6. **`feppm`** – Far-End Path PM Enable
   It indicates whether this performance monitoring feature is enabled or disabled.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
7. **`hptimmon`** – Path Trace Monitoring Enable (J1)
   Description: High order path trace (J1) identifier mismatch (TIM) monitor enable. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
   Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

8. **`loca`** – Ring A-node TID
   This parameter specifies the TID of the node at which the service is added to the BLSR ring. This parameter is required for the input of tributaries to be used by ONNS on ports of *portClass* = EDGE being members in BLSR/MS-SPRing protection groups. The *loca* parameter value is an empty string for all other tributaries.
   loca is introduced specifically for use related to ONNS application.
   Type: TID or empty-string.
   Range: Please refer to the TID definition in "RTRV-HDR: Retrieve header" (p. 3-2417) description.
   Default: empty string: "". This is displayed as \"\" in output direction.
9. **`locz`** – Ring Z-node TID
   This parameter specifies the TID of the node at which the service is dropped from the BLSR ring. This parameter is required for the output of tributaries to be used by ONNS on ports of *portClass* = EDG E being members in BLSR/MS-SPRing protection groups. The *locz* parameter value is an empty string for all other tributaries.
   locz is introduced specifically for use related to ONNS application.
   Type: TID or empty-string.
   Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
   Default: empty string: "". This is displayed as \"\" in output direction.
10. **`neppm`** – Near-End Path PM Enable
    It indicates whether this performance monitoring feature is enabled or disabled.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
11. **`pjepm`** – Pointer Justification Event PM Enable
    It indicates whether this performance monitoring feature is enabled or disabled.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).

12. **`pmhpfeses`** – Performance Monitoring Path Far-End SES Threshold
    This parameter describes the Path Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. When the interface standard is changed the current default value is not adapted automatically.
    Type: numeric value set.
    Range (superset of ranges for SDH and SONET): 1-64000.
    Default: 2400.
13. **`pmhpneses`** – Performance Monitoring Path Near-End SES Threshold
    This parameter describes the Path Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. When the interface standard is changed the current default value is not adapted automatically.
    Type: numeric value set.
    Range (superset of ranges for SDH and SONET): 1-64000.
    Default: 2400.
14. **`ptca`** – Path TCA Profile Pointer
    Type: Alphanumeric string.
    Range: string with up to 24 characters.
    Default: DEFAULT0.
15. **`ptrcrfmt`** – Path Trace Read Format (J1)
    The read format of J1, the incoming path trace (ptrc).
    Type: numeric string.
    Range:
    - 2: for non-specific repeating byte
    - 16: for 16 byte specific string.
    - 64: for 64 byte string.
      Default: 2.
16. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
    The degraded state is detected in BURST or POISSON mode.
    Type: Alphanumeric value set.
    Range:
    - BURST (default)
    - POISSON
17. **`tcamd`** – TCA mode
    This parameter shows the modus of the PM thresholding.
    Two thresholding methods are applicable:
    - TR-only (also known as the implicit reset method)
    - TR-RTR (also known as the explicit reset method).
      Type: Alphanumeric value set.
      Range: TR, TRRTR (default).

18. **tmonmd** – Tributary Monitoring Mode
    This parameter indicates the mode of the tributary.
    Type: Alphanumeric value set.
    Range:
    - MON = alarm monitoring is taking place on the port.
    - NMON (default) = alarm monitoring is not occurring on the port.
19. **tribsdhpn** – Tributary Alarm Severity Assignment Profile
    This parameter points to a tributary ASAP profile name of type PATH for the designated AID.
    Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
    Range: string with a maximum of 24 characters.
    Default: DEFAULT.

Output format

If the ED-VC3 command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The command **ED-VC3** is also applicable to VC4 tributaries. Even though a VC4 signal is not a concatenated VC3 signal in a strict sense, from a pointer processor viewpoint it can be considered to be comprised of three VC3 signals which have the properties of a concatenated signal. Thus, it is not necessary to have a separate ED-VC4 command. Similarly, ED-VC3 is also applicable to VC4-4C and other ″concatenated″ tributaries.

Even if the command is used for a concatenated signal, it can be applied to any of the tributaries (for example, to the second tributary of the concatenated signal). However, only the parameters pertaining to the first tributary of a concatenated signal are used by the software to determine system operation. If the signal were changed from a concatenated signal to non-concatenated, then the parameters for each of the tributaries would be used by the software.

The command allows to modify all attributes listed above as input spec-block parameters. The modification is reported by means of an ED-VC3 notification for tributary.

Change of J1 expected format - FM impact

When the expected J1 format (ptrcrfmt) is changed to 16 (16 byte specific string) while the TI Mismatch detection is enabled, then the TI Mismatch alarm is updated according to the provisioned ecpected J1 (exphptrc) and the currently received J1 (ptrc).

When the expected J1 format is changed away from 16, while the TI Mismatch alarm is active, then the TI Mismatch alarm is cleared.

Signal degrade/signal fail mode provisioning

If the attribute *sdsfmode* is changed then for all tributaries belonging to the same STS-12/VC4-4c group the attribute will also be changed according to value specified in the ED request.

A STS-12/VC4-4c group is composed of all tributaries whose Simple_STS1NumAID is in the range from (k*12) +1 to (k+1)*12 with k=0..63. The maximal value of k is derived from the port rate.

For efficiency reasons the notifications for tributaries are sent out as a single notification (so-called group notification) using a range over the aid which depends on the port rate of the associated port and the Simple_STS1NumAID for that STS-12/VC4-4c group;

i.e. the Simple_STS1NumAID field in the STS1NumAID is set to <M>&&-<N>

- with M is first STS-1/AU-3 number of the STS-12/VC4-4c group,
- with N is last STS-1/AU-3 number of the STS-12/VC4-4c group.

If additional parameters besides *sdsfmode* are changed within the ED request then it is also valid to split the autonomous reporting in up to 3 notifications:

- one group notification for all tributaries with smaller Simple_STS1NumAID as the one which is specified in the ED request.
- one single notification for the tributary which is specified in the ED request.
- one group notification for all tributaries with greater Simple_STS1NumAID as the one which is specified in the ED request.

Disabling of PM monitor

The disabling of a PM monitor shall have the following impacts w.r.t. existing PM registers:

1. stop PM counting
2. all current bins related to the PM monitor is deleted
3. all history bins related to the PM monitor is deleted

The term “PM monitor” has the same semantics as the term “PM package”. The number of PM monitors is determined by means of the number of *pm enable attributes*.

PM monitors can be disabled explicitly by means of the *pm enable* attribute or are implicitly disabled as part of a port/tributary deletion.

Additional to the above listed impacts (ID 52924) the disabling of a PM monitor shall have the following impacts: the system has to clear all active TCA events of the deleted PM monitor if TCA mode TR-RTR was selected.

Disabling of PJE Monitor

The disabling of a pointer justification monitor shall have the following impacts w.r.t. existing PM registers:

1. stop PJE counting
2. all current bins related to the PJE monitor is deleted
3. all history bins related to the PJE monitor is deleted

The term “PM monitor” has the same semantics as the term “PM package”. The number of PM monitors is determined by means of the number of *pm enable attributes*.

PM monitors can be disabled explicitly by means of the *pm enable* attribute or are implicitly disabled as part of a port/tributary deletion.

Additional to the above listed impacts (ID 52924) the disabling of a PM monitor shall have the following impacts: the system has to clear all active TCA events of the deleted PM monitor if TCA mode TR-RTR was selected.

Changing TCA mode from TR-RTR to TR-only

The change of tcamd from TR-RTR (also known as the explicit reset method) to TR-only (also known as the implicit reset method) has the impact, that all active TCA events of the related entity must be cleared.

Example input/output

```
ED-VC3:UNITE-NE:1-1-#-#-3-1-1:123456:::tmonmd=MON,tribsdhpn=Default,degthr=-
      6,dexcthr=-3,ptrcrfmt=1,ptca=Default0,neppm=ENABLE,pmhpneses=30,pmhpfeses=30;

   UNITE-NE 00-10-14 14:59:09
M  123456 COMPLD
;

   UNITE-NE 00-10-14 14:59:09
A  592 REPT DBCHG
   ”TIME=14-59-09,DATE=00-10-14:ED-VC3:1-1-#-#-3-1-1:: tmonmd=MON,tribsdhpn=Default,
degthr=-6,dexcthr=-

;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the ED-VC3 command.

Validation rule: ASAP profile exists

Check of the existence of the ASAP profile.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: TCA profile exists

Check of the existence of the TCA profile.

Error code: `IDNV – Input, Data Not Valid, TCA profile does not exist`

Validation rule: Maximum number of enabled PM monitors

Check that the number of enabled PM monitors is less than the maximum number of supported enabled PM monitors (2000) before a new PM monitor is enabled.

Error code:
`SSRE – Status, System Resources Exceeded, limit of PM monitors exceeded`

Since several monitor points can be enabled/disabled within one command, the **ED** command may only fail if the validation rule is not met after all PM enable attributes would have been updated as specified in the corresponding ED request.

Example: The **ED** command requests that 1 monitor point is enabled and 1 monitor points is disabled and currently 2000 packages are enabled. This command should complete.

Validation rule: Not more than one PJE PM monitor per port

Check that no PJE PM monitor is already enabled for any tributary of the port to which the addressed tributary belongs to.

Error code:
`SSRE – Status, System Resources Exceeded, limit of PJE counters exceeded`

Validation rule: Check CCB against *istd* of related port

Check wether the CCB fits to istd of the related port

Error code:
`ICNV – Input, Command Not Valid, Interface Standard does not match`

Validation rule (ONNS specific): *loca*, *locz* changes only allowed when *portClass* = EDGE and part of a BLSR/MS-SPRING group

Setting the *loca*, *locz* parameters away from the default value is only allowed when the related *portClass* = EDGE and the port is part of a BLSR/MS-SPRING protection group.

Error code:
`IDNV – Input, Data Not Valid, related portClass not EDGE or port not in BLSR/MS-SPRING group`

Validation rule (ONNS specific): *loca*, *locz* changes only allowed when tributary not involved in a cross-connection

Setting the *loca*, *locz* parameters are inhibited when the tributary is already input or output tributary of a cross-connection.

Error code:
`IDNV – Input, Data Not Valid, tributary already part of a cross-connection`

Validation rule (ONNS specific): Maximum number of tributaries with *loca*, *locz* entries must not exceed 100

It is checked that the maximum number of triburaries with loca, locz parameters set (i.e. having a value different from the default value) does not exceed 100.

Error code:
`SSRE – Status, System Resources Exceeded, limit of tribs with loca, locz exceeded`

Validation rule (ONNS specific): *hptimmon* changes to ENABLE only allowed when corresponding port is not of *portClass* INNI

Setting the *hptimmon* parameter to ENABLE is only allowed when the port the VC-3 is located on does not have the port class INNI.

Error code: `SNVS – Status, Not in Valid State, portClass must not be INNI`

ED-VC3 notification

Output format

Syntax: **`ED-VC3`**:*aid*::*spec_block*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   AID of a SDH tributary. The keyword **`all`** is not allowed on any level.
   Type: AID
   Range: STS1NumAID

Spec block parameters

1. **`brstintvl`**– Bursty Interval
   Measurement period for determining bursty errors The setting of this parameter is used when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
2. **`brstthr`** – Bursty Error Threshold
   The values are set in percent for the degradation threshold. The setting of this parameter is used when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, 15, 20, 25, 30, … 50.
   Default: 30.
3. **`degthr`** – Signal Degrade Threshold
   The setting of this parameter are used when sdsfmode=POISSON.
   Type: numeric value set.:
   Range (exponents of 10): -5, -6 (default), -7, -8, -9.
4. **`crslpbkrate`** – Cross-connect loopback Rate
   It is independent from the current interface standard and therefore both SDH and SONET values are allowed.
   The parameter *crslpbkrate* is not reported if the parameter *crlspbkstat* indicates that no loopback is set.
   Type: Alphanumeric value set.
   Range:
   - VC3
   - VC4
   - VC44C
   - VC416C
   - VC464C

- STS1
- STS3
- STS12
- STS48
- STS192

5. **`crslpbkstat`** – Cross-connect loopback status
   State of cross- connect loopback.
   Type: Alphanumeric value set.
   Range:
   - YES = Cross-connect loopback is provisioned
   - NO (default) = No cross-connect loopback is provisioned.
6. **`dexcthr`** – Excessive Degrade Threshold
   The setting of this parameter are used when *sdsfmode* = POISSON. The values are set as exponent of 10.
   Type: numeric value set.
   Range (as exponent of 10) –3 (default); –4; –5.
7. **`exphptrc`** – Expected Path Trace (J1)
   The parameter *exphptrc* specifying the expected path trace is only relevant for the path trace supervision when the path trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex.
8. **`feppm`** – Far-End Path PM Enable
   It indicates whether this performance monitoring feature is enabled or disabled.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
9. **`hptimmon`** – Path Trace Monitoring Enable (J1)
   Description: High order path trace (J1) identifier mismatch (TIM) monitor enable. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).

10. **loca** – Ring A-node TID
    This parameter specifies the TID of the node at which the service is added to the BLSR ring. This parameter is required for the input of tributaries to be used by ONNS on ports of *portClass* = EDGE being members in BLSR/MS-SPRing protection groups. The *loca* parameter value is an empty string for all other tributaries.
    loca is introduced specifically for use related to ONNS application.
    Type: TID or empty-string.
    Range: Please refer to the TID definition in "RTRV-HDR: Retrieve header" (p. 3-2417) description.
    Default: empty string: "". This is displayed as \"\" in output direction.
11. **locz** – Ring Z-node TID
    This parameter specifies the TID of the node at which the service is dropped from the BLSR ring. This parameter is required for the output of tributaries to be used by ONNS on ports of *portClass* = EDGE being members in BLSR/MS-SPRing protection groups. The *locz* parameter value is an empty string for all other tributaries.
    locz is introduced specifically for use related to ONNS application.
    Type: TID or empty-string.
    Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
    Default: empty string: "". This is displayed as \"\" in output direction.
12. **neppm** – Near-End Path PM Enable
    It indicates whether this performance monitoring feature is enabled or disabled.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
13. **pjepm** – Pointer Justification Event PM Enable
    It indicates whether this performance monitoring feature is enabled or disabled.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
14. **pmhpfeses** – Performance Monitoring Path Far-End SES Threshold
    This parameter describes the Path Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. When the interface standard is changed the current default value is not adapted automatically.
    Type: numeric value set.
    Range (superset of ranges for SDH and SONET): 1-64000.
    Default: 2400.

15. **pmhpneses** – Performance Monitoring Path Near-End SES Threshold
This parameter describes the Path Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. When the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of ranges for SDH and SONET): 1-64000.
Default: 2400.
16. **ptca** – Path TCA Profile Pointer
Type: Alphanumeric string.
Range: string with up to 24 characters.
Default: DEFAULT0.
17. **ptrcrfmt** – Path Trace Read Format (J1)
The read format of J1, the incoming path trace (ptrc).
Type: numeric string.
Range:
    - 2: for non-specific repeating byte
    - 16: for 16 byte specific string.
    - 64: for 64 byte string.
    Default: 2.
18. **sdsfmode** – Signal Degrade/Signal Fail Mode
The degraded state is detected in BURST or POISSON mode.
Type: Alphanumeric value set.
Range:
    - BURST (default)
    - POISSON
19. **substr** – Substructured
This parameter indicates if the tributary is substructured.
Substructure for LO cross-connections:
A HO tributary, which is sub structured for LO cross-connections, has a HO path termination associated which provides LO tributaries to be used for LO cross-connections.
The parameter *substr* is set autonomously when LO cross-connections are created or deleted with ENT-CRS or DLT-CRS commands (see also the lower order cross-connection creation/deletion behavior description for the commands ENT-CRS and DLT-CRS).
A sub structured HO tributary cannot be used to set up HO cross-connections. The parameter *substr* is set autonomously when the LO substructure is created or deleted using the **ED-SUBS** command.
Substructure for conversion cross-connections:
A HO tributary, which is sub structured for the LO side of a conversion cross-connection, has a HO path termination associated which provides LO tributaries to be used for conversion cross-connections.

The parameter *substr* is set autonomously when an AU3/AU4 conversion cross-connection is created.
A HO tributary, which is sub structured for conversion cross-connections, cannot be used to set up HO cross-connections.
Type: Alphanumeric value set.

Range:

- YES: Automatically sub structured for LO cross-connections
- MANSUB: Manually sub structured for LO cross-connections
- CNVSUB: Automatically sub structured for the LO side of conversion cross-connections
- NO (default): Not sub structured, not used for conversion cross-connections

20. **`tcamd`** – TCA mode
This parameter shows the modus of the PM thresholding.
Two thresholding methods are applicable:
    - TR-only (also known as the implicit reset method)
    - TR-RTR (also known as the explicit reset method).
Type: Alphanumeric value set.
Range: TR, TRRTR (default).
21. **`tmonmd`** – Tributary Monitoring Mode
This parameter indicates the mode of the tributary.
Type: Alphanumeric value set.
Range:
    - MON = alarm monitoring is taking place on the port.
    - NMON (default) = alarm monitoring is not occurring on the port.
22. **`tribsdhpn`** – Tributary Alarm Severity Assignment Profile
This parameter points to a tributary ASAP profile name of type PATH for the designated AID.
Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
Range: string with a maximum of 24 characters.
Default: DEFAULT.

Example output

```
ED-VC3:UNITE-NE:1-1-#-#-3-1-1:123456:::tmonmd=MON,tribsdhpn=Default,degthr=-

ED-VCG: Edit virtual concatenation group

The **ED-VCG** command modifies the properties of a virtual concatenation group.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: No

Input format

Command syntax: **ED-VCG***[-modifier]*:*tid:aid:ctag:::spec_block;*

Input parameters

Command parameters

1. **modifier**
The modifier specifies the type of the virtual concatenation group of the unit. Implicit, it indicates the transmission rate for which VCG related data is retrieved. The parameter modifier must be given if a virtual concatenation group on a GE10PL1 or ES64U pack is addressed. Otherwise this parameter has to be omitted.
Type: Alphanumeric value set.
Range: 1GEPL representing a 1 GE port on the GE10PL1 pack; 10GEPL representing a 10 GE port on the GE10PL1 pack, ES64U representing a VCG port at an ES64U subsystem.
2. **tid** – Target Identifier
See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **aid** – Access Identifier
This parameter specifies the virtual concatenation group (VCG) to be operated on.
Type: AID.
Range: VCGAID as defined in AID structure. The values
   - vall for Simple_VCGAID
   - usall for Simple_UnivSlotAID
   - all for Simple_UnivSlotAID
   - all for Simple_ShelfAID and
   - all for BayAID

   is excluded.
Default: For changing the *eportControl* parameter the 'ALL' qualifier for the port aid is allowed.
4. **ctag** – Correlation Tag
Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameter

1. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.
   This attribute replaces attribute "uniClientNodeID", as a more generic name seems reasonable for a possible extension of this attribute to other eport classes in future.
   This parameter is supported by ports of *eportClass* UNI.
   For *modifier* = ES64U, the parameter is visible with default values for retrieval, but it cannot be modified.
   Type: IPv4 format: Four dot separated numeric string
   Range: Each numeric string: 0…255
   Default: 0.0.0.0
   Restriction: For *modifier* = ES64U, the parameter cannot be modified.
2. **`cnprole`** – Customer/Network Port Role
   This parameter specifies whether the addressed port is used as a customer WAN port or a network WAN port.
   This parameter is not supported if the input parameter *modifier* = 1GEPL, *modifier* = 10GEPL or *modifier* = ES64U. If the parameter *cnprole* is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range: CUSTOMER, for a customer WAN port. NETWORK, for a network WAN port.
   Default: NETWORK.
3. **`dftpri`** – Default User Priority
   This parameter specifies the default user priority acc. the IEEE 802.1Q tagging scheme.
   This parameter is not supported if the input parameter *modifier* = 1GEPL, *modifier* = 10GEPL or *modifier* = ES64U. If the parameter *dftpri* is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range:
   - HIGH
   - LOW (default).
4. **`dftvlan`** – Default VLAN Identifier
   This parameter specifies the value of the VLAN identifier which is applied to frames (tagging) at LAN ingress (that means, from LAN into the Ethernet-port). This only applies to frames carrying no VLAN identifier, yet. This parameter is also used to provision the customer tag (CID) to be used in transparent tagging

mode.
This parameter is not supported if the input parameter *modifier* = 1GEPL, *modifier* = 10GEPL or *modifier* = ES64U. If the parameter *dftvlan* is not supported, then the parameter is omitted.
Type: Alphanumeric value set.

Range:

- 1, 2, 3, … 4092, 4093.
- UNAVAILABLE (default).

5. **`enetpn`** – Ethernet Alarm Severity Assignment Profile Name
This parameter points to an ASAP profile name of type ENET for the designated AID.
Ethernet port and VCG port have the same ASAP profile named ENET.
Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
Range: 1 … 24 characters length.
Default: DEFAULT.

6. **`enettca`** – Ethernet TCA Profile Name
This parameter specifies the name of the threshold crossing alert (TCA) profile used for the VCG.
This parameter is not supported if the input parameter *modifier* = ES64U.
If the parameter *enettca* is not supported, then the parameter is omitted.
Type: Alphanumeric string.
Range: 1 … 24 characters length.
Default: DEFAULT0.

7. **`eportClass`** – Ethernet Port Class
This identifies the Ethernet port class of the AID. *eportClass* is used to specify Ethernet ports for use by NN application.
For *modifier* = ES64U, the parameter is visible with default values for retrieval, but it cannot be modified.
Type: Alphanumeric value set.

Range: Depends on the *modifier*:

- if *modifier* is missing or is 1GEPL, then the value range is: TRADITIONAL, EDGE, UNI
- if *modifier* is 10GEPL, then the value range is: TRADITIONAL, EDGE
- if *modifier* is ES64U, then the value range is: TRADITIONAL

Default: Depends on system parameters Cross Connect Setup (*xcsetup*) and Port Class Default (*portclassdefault*):

- if *xcsetup* is TRADITIONAL, then the default value is TRADITIONAL
- if *xcsetup* is SWISS, then the value of *portclassdefault* is used as default value.
- if *modifier* is ES64U, then the default value is TRADITIONAL

Restriction: For *modifier* = ES64U the parameter cannot be modified.

8. **`eportControl`** – Ethernet Port Control (Ethernet Port Administrative Mode)
   This identifies the administrative mode of Ethernet ports of *eportlass* = EDGE or UNI. For Ethernet ports of other Ethernet port class this parameter is not relevant. *eportControl* is introduced specifically for use by NN application.
   For *modifier* = ES64U, the parameter is visible with default values for retrieval, but it cannot be modified.
   Type: Alphanumeric value set.
   Range: NORMAL (default), MAINT, LOCKOUT .
   Restriction: For *modifier* = ES64U the parameter cannot be modified.
9. **`htmr`** – Hold-Off Time
   The parameter *htmr* specifies the hold off time for the LCAS protection. If a tributary is configured to take part on transmission for the VCG and it goes to state faulty then this tributary is taken out of transmission by LCAS after the hold off time. This time is configured on group level, i.e. all tributaries have the same value for hold-off time. This parameter only affects NE behavior if lcasmd=ENABLE.
   For *modifier* = ES64U, the parameter is visible with default values for retrieval, but it cannot be modified.
   Type: numeric value set.
   Range: 0 (default), 100, 200, …, 9900, 10000 [milliseconds].
   Restriction: For *modifier* = ES64U the parameter cannot be modified.
10. **`inputsig`** – Tributary Input Signal Rate List
    This parameter specifies to which VCG tributaries an Ethernet signal will be mapped. This parameter can only be used (see also error responses) if: the input parameter *modifier* = 1GEPL or *modifier* = 10GEPL, and the current value of the VCG parameter *istd* = SONET, and the current value of the VCG parameter *vcat* = ENABLE.
    Restriction: For *modifier* = ES64U the parameter cannot be modified.
    Type: numeric string of the form NX
    - N specifies the count of container type X
    - X specifies the container type (or envelope).

    Range:
    - (N=7, X=3) or (N=21, X=1) if modifier = = 1GEPL
    - (N=64, X=3) or (N=192, X=1) if modifier = 10GEPL.

    Other inputsig parameter values can be set implicitly by changing the parameters *istd* and/or *vcat*.
11. **`istd`** – Interface Standard
    This parameter specifies the interface standard of this VCG. This value is applied for both input and output direction.
    For *modifier* = ES64U, *modifier* = ES64U or *modifier* = ES64U the parameter is visible with default values for retrieval, but it cannot be modified.
    Type: Alphanumeric value set.

Range:

- SDH
- SONET.

Default: *modifier*: 1GEPL, 10GEPL, or ES64U: The value is derived from the circuit pack parameter *istd*. no *modifier*: As derived from parameter *istddflt* specified at configuration management, section **RTRV-EQPT**.
Restriction: The parameter istd is only allowed if modifier is omitted.

12. **lcasmd** – LCAS Mode
    This parameter specifies the operation mode of the Link Capacity Adjustment Scheme for this VCG. This value is bidirectional.
    For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.
    Type: Alphanumeric value set.
    Range:
    - DISABLE
    - ENABLE

    Default:
    - *modifier* = ES64U: DISABLE
    - other or no *modifier*: ENABLE
13. **localLPID** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with an *eportClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view.
    Depending on the *eportClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkLPID”, as this attribute will not be exclusively valid any more for *eportClass* UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *eportClass* UNI.
    The parameter *localLPID* is used by ONNS for switching network connections on SONET/SDH layer.
    This parameter is supported by ports of *eportClass* UNI.
    This parameter is supported by ports of *eportClass* EDGE.
    For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.
    Type: numeric value set.
    Range: 0 to 4294967295.
    Default: 0.

14. **localLPIDVCAT** – Local Logical Port Identity on VCAT layer
    The *localLPIDVCAT* provides a unique logical identification of a single VCG port with an *eportClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *eportClass* value of the port, the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like, for example, *networkTNAAddrVCAT*.
    For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, that means it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.
    The parameter *localLPIDVCAT* is used by ONNS for switching network connections on VCAT layer.
    This parameter is supported by ports of *eportClass* UNI.
    This parameter is supported by ports of *eportClass* EDGE.
    For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.
    Type: numeric value set.
    Range: 0 to 4294967295.
    Default: 0.
15. **networkTNAType** – Network TNA Type
    The *networkTNAType* identifies the type of the Network TNA Address attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkTNAType”, as this attribute will not be exclusively valid any more for *eportClass* UNI only and thus a more generic name seems reasonable.
    The parameter *localLPIDVCAT* is used by ONNS for switching network connections on SONET/SDH layer.
    This parameter is supported by ports of *eportClass* UNI.
    This parameter is supported by ports of *eportClass* EDGE.
    For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.
    Type: Alphanumeric value set.
    Range: IPV4, IPV6, or NSAP
    Default: NSAP
    Restriction: For *modifier* = ES64U, this parameter is not editable.
16. **networkTNATypeVCAT** – Network TNA Type on VCAT level
    The *networkTNATypeVCAT* identifies the type of the Network TNA Address on VCAT level attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, that means, it can be retrieved and changed, but will internally not be

evaluated until *eportClass* is set to a value supporting it.
The parameter *networkTNATypeVCAT* is used by ONNS for switching network connections on VCAT layer.
This parameter is supported by ports of eportClass UNI.
This parameter is supported by ports of eportClass EDGE.
For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.
Type: Alphanumeric value set.
Range: IPV4, IPV6, or NSAP
Default: NSAP
Restriction: For *modifier* = ES64U, this parameter is not editable.

17. **`networkTNAAddress`** – Network TNA Address
The *networkTNAAddress* identifies the Network TNA Address attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.
The content depends on the given NetworkTNAType. For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAAddress”, as this attribute will not be exclusively valid any more for *eportClass* UNI only and thus a more generic name seems reasonable.
The parameter *networkTNAAddress* is used by ONNS for switching network connections on SONET/SDH layer.
This parameter is supported by ports of *eportClass* UNI.
This parameter is supported by ports of *eportClass* EDGE.
For *modifier* = ES64U, the parameter is visible with its default value for retrieval, but it cannot be modified.
Type:
networkTNAType = IPV4: Four dot separated numeric string (represents 4 Bytes)
networkTNAType = IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
networkTNATyp e= NSAP: Hexadecimal number (represents 20 Bytes)
Range:
IPV4: Each numeric string: 0…255
IPV6: Each hexadecimal number: 0000…FFFF
NSAP: Hexadecimal number:
0000000000000000000000000000000000000000 …
FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF
Examples:
IPV4: 129.12.3.178
IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:
IPV4: 0.0.0.0
IPV6: 0-0-0-0-0-0-0-0
NSAP: 0000000000000000000000000000000000000000
Restriction: For *modifier* = ES64U, this parameter is not editable.

18. **`networkTNAAddrVCAT`** – Network TNA Address on VCAT level
The *networkTNAAddrVCAT* identifies the Network TNA Address on VCAT level attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.
The content depends on the given *NetworkTNATypeVCAT*. For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, that means, it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.
The parameter *networkTNAAddrVCAT* is used by ONNS for switching network connections on VCAT layer.
This parameter is supported by ports of *eportClass* UNI.
This parameter is supported by ports of *eportClass* EDGE.
For *modifier* = ES64U, the parameter is visible with its default value for retrieval, but it cannot be modified.
Type:
networkTNAType = IPV4: Four dot separated numeric string (represents 4 bytes)
networkTNAType = IPV6: Eight dash separated hexadecimal number (represents 16 bytes)
networkTNAType = NSAP: Hexadecimal number (represents 20 Bytes)
Range:
IPV4: Each numeric string: 0…255
IPV6: Each hexadecimal number: 0000…FFFF
NSAP: Hexadecimal number:
0000000000000000000000000000000000000000 …
FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF
Default:
IPV4: 0.0.0.0
IPV6: 0-0-0-0-0-0-0-0
NSAP: 0000000000000000000000000000000000000000
Restriction: For *modifier* = ES64U, this parameter is not editable.

19. **`plcrthr`** – Threshold for Partial Loss of Capacity (Receive)
The parameter *plcrthr* specifies the acceptable limit of valid VCG members in receive direction (refer to the *outmbs* parameter of all related VCGTRIB entities) for which the PLCR alarm will not yet be raised. The PLCR alarm will be raised if the actual number of those VCG members is between [1 … (value of the *plcrthr* parameter – 1)] (if *plcrthr* ≥ 2). The PLCR alarm shall never be raised if *plcrthr* is set to 1.
The PLCR alarm will be cleared if the actual number of those VCG members is equal to or more than the value of the *plcrthr* parameter (or if the number of those VCG members is 0 – in this case the TLCR alarm will be raised instead). This

parameter is not supported if the input parameter *modifier* is omitted. If the parameter *plcrthr* is not supported, then the parameter is omitted.
For *modifier* = ES64U, the parameter is visible with its default value for retrieval, but it cannot be modified.
Type: numeric value set.
Range: 1, 2, 3, …, 192.
Default:

Modifier	Input signal structure	Default value
1GEPL	74	7
1GEPL	211	21
10GEPL	644, 1c64	64
10GEPL	1921, 1192	192
ES64U	n × 1	n

Restriction: For *modifier* = ES64U, this parameter is not editable.

20. **`plctthr`** – Threshold for Partial Loss of Capacity (Transmit)
The parameter *plctthr* specifies the acceptable limit of valid VCG members in transmit direction (refer to the *inmbs* parameter of all related VCGTRIB entities) for which the PLCT alarm will not yet be raised. The PLCT alarm will be raised if the actual number of those VCG members is between [1 … (value of the *plctthr* parameter – 1)] (if *plctthr* ≥ 2). The PLCR alarm shall never be raised if *plctthr* is set to 1.
The PLCT alarm will be cleared if the actual number of those VCG members is equal to or more than the value of the *plctthr* parameter (or if the number of those VCG members is 0 – in this case the TLCT alarm will be raised instead).
This parameter is not supported if the input parameter *modifier* is omitted. If the parameter *plctthr* is not supported, then the parameter is omitted.
For *modifier* = ES64U, the parameter is visible with its default value for retrieval, but it cannot be modified.
Type: numeric value set.
Range: 1, 2, 3, …, 192.
Default:

Modifier	Input signal structure	Default value
1GEPL	74	7
1GEPL	211	21
10GEPL	644, 1c64	64
10GEPL	1921, 1192	192
ES64U	n × 1	n

Restriction: For *modifier* = ES64U, this parameter is not editable.

21. **`stdis`** – Spanning Tree Protocol Disable
    This parameter allows to enable or disable the Spanning Tree Protocol for the given port. This parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
    This parameter is not supported if the input parameter *modifier* = 1GEPL, *modifier* = 10GEPL or *modifier* = ES64U.
    Type: Alphanumeric value set.
    Range: DISABLE, STP is disabled, that means, the port is not used to build the spanning tree. ENABLE (default), STP is enabled, that means, the port is used to build the spanning tree.
    As VCGs are by default network ports the default value is to enable STP.
22. **`stpcost`** – Spanning Tree Path Cost
    The parameter *stpcost* specifies the STP-related cost of the path egressing the given port.
    If the input parameter *modifier* is omitted, then this parameter is supported but applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
    This parameter is not supported if the input parameter *modifier* = 1GEPL, *modifier* = 10GEPL or *modifier* = ES64U.
    If the parameter *stpcost* is not supported, then the parameter is omitted.
    Type: Integer.
    Range: 1 to 200000000.
    Default: 20000.
    The default value depends on the provisioned VCG size. As currently only a fix size of 7 VC4s or 21 STS1s corresponding to approximately 1 Gbit is supported, the default value is as shown above.
23. **`stpp`** – Spanning Tree Port Priority
    The parameter *stpp* specifies the priority of the given port for the Spanning Tree Protocol. If the input parameter *modifier* = 1GE, then this parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
    If the input parameter *modifier* = 1GE, then this parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database. This parameter is not supported if the input parameter: *modifier* = ES64U.
    This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter *stpp* is not supported, then the parameter is omitted.
    Type: Integer.
    Range: 0 to 255.
    Default: 128.

24. **`tcamd`** – TCA mode

    This parameter shows the modus of the PM thresholding.

    Two thresholding methods are applicable:

    - TR-only (also known as the implicit reset method)
    - TR-RTR (also known as the explicit reset method)

    This parameter is not supported if the input parameter: *modifier* = ES64U.
    If the parameter *tcamd* is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range: TR, TRRTR.
    Default: TRRTR in SDH mode; TR in SONET mode.

25. **`vcat`** – Virtual Concatenation

    This parameter vcat specifies whether the Ethernet signal is mapped to a number of virtually concatenated tributaries (value = ENABLE) or into a contiguously concatenated tributaries (value = DISABLE). In the latter case, LCAS related parameters become insignificant (values set to default, values cannot be changed). This parameter is not supported if the input parameter *modifier* is omitted. If the parameter *vcat* is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.

    Range:

    - For *modifier* ES64U: ENABLE (default)
    - otherwise: DISABLE.
    - For *modifier* = ES64U the parameter *vcat* is visible for retrieval, but cannot be modified once the VCG is established.

26. **`vmode`** – VCG Monitoring Mode

    The parameter *vmode* specifies the monitoring mode for VCG. Alarms for this port will be reported if in mode MON otherwise not. There is no automatic mode.
    Type: Alphanumeric value set.

    Range:

    - MON, for monitored
    - NMON (default), for not monitored.

27. **`vpm`** – VCG Performance Monitoring

    The parameter *vpm* specifies whether the performance monitoring is enabled or disabled for this port.
    This parameter is not supported if the input parameter: *modifier* = ES64U.
    If the parameter *vpm* is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.

    Range:

    - DISABLE (default)
    - ENABLE.

28. **`vvidls`** – Valid VLAN Identifier List (static)
    This parameter specifies a list of all static VLAN identifiers allowed for this port. The list is ampersand grouped (& and &&). The list is packed by the NE and the management systems as good as possible by using ’&’ and ’&&’ . The vlan identifier of an incoming frame must be a member of this static VLAN Id list or the dynamic VLAN Id list *vvidlsd*. Frames tagged by a vlan identifier not member of these lists will be discarded. The port VLAN identifier (refer to parameter dftvlan of RTRV-EPORT Output Parameters) is not part of this list. This parameter is also used in transparent tagging mode to specify the list of valid customer tags (CIDs) for network ports (*cnprole* = NETWORK).
    This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U. If the parameter *vvidls* is not supported, then the parameter is omitted.
    Type: Alphanumeric string and the character ’&’.
    Range:
    - Value of each single member (valid VLAN identifier) in the list 1, 2, …, 4092, 4093
    - In case the list has no members (empty list) –1.

    Default: –1.
29. **`wtr`** – Wait To Restore Time
    The parameter *wtr* specifies the wait to restore time for the LCAS protection. If a tributary is configured to take part on transmission for the VCG and it recovers from a faulty state then this tributary is taken in again to transmission by LCAS after the wait-to-restore time. This time is configured on group level, i.e. all tributaries have the same value for the wait-to-restore time. This parameter only affects NE behavior if *lcasmd* = ENABLED.
    For *modifier* = ES64U the parameter is visible with default values for retrieval, but cannot be modified.
    Type: Alphanumeric value set.
    Range: 0, 1, 2, …, 59, 60 [minutes].
    Default: 0.
    Restriction: For *modifier* = ES64U, this parameter is not editable.

Output format

If the NE fully complies with the **`ED-VCG`** request, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The **ED-VCG** shall generate a **REPT DBCHG** message.

The command modifies the attributes (listed in the spec_block parameters part of this command) of the addressed port entity according to the parameters given with this command.

The modification is reported by means of an **ED-VCG** notification.

Impact on *eportControl* when changing *eportClass*

When *eportClass* is changed, *eportControl* is set to NORMAL unless a different value is explicitly specified in the command changing the *eportClass*.

Impact on port parameter settings while *eportClass* is TRADITIONAL

When eportClass has the value TRADITIONAL for an Ethernet port, setting of the following parameter is accepted, but shall have no impact until eportClass is changed away from TRADITIONAL: *eportControl*

Generic ONNS specific behavior - Impact on ONNS related port parameters when not supported by actual *portClass*

Specific behaviors or validations apply for changing or setting ONNS parameters of a port with respect to the actual value of the parameter *portClass*. These is verified first.

In any other case, when an ONNS related port parameter is not supported by the actual *portClass* value of a port, setting of this parameters for this port is accepted, but shall have no impact until *eportClass* is changed to a value where this parameter is supported.

At the moment the *eportClass* is changed to a value where this parameter is supported, the current value of this parameter is considered.

Impact on EDGE related port parameter settings, when *eportClass* is set to EDGE

When the *eportClass* is changed to EDGE, the following parameters of the EDGE parameter set are set to their default values unless all of these parameters are specified in the same command with values different from the default values:

- *networkTNAAddress*
- *localLPID*

Impact on VCAT layer parameter settings, when *eportClass* is set to EDGE

When the *eportClass* is changed to EDGE, the following VCAT layer related parameters are set to their default values:

- *networkTNATypeVCAT*
- *networkTNAAddrVCAT*
- *localLPIDVCAT*

Impact on EDGE related port parameter settings, if *eportClass* is changed away from EDGE

When *eportClass* is changed away from EDGE, the following parameters are set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Impact on UNI related port parameter settings, when *eportClass* is set to UNI

When the *eportClass* is changed to UNI, the following parameters of the UNI parameter set is set to their default values, unless different values are specified in the command setting the *eportClass* to UNI:

- *networkTNATypeVCAT*

The following parameters of the UNI parameter set are mandatory and is set different to their default values:

- *networkTNAAddressVCAT*
- *clientNodeIDVCAT*
- *localLPIDVCAT*

This is covered by corresponding validation rules.

Impact on port parameter settings, when *eportClass* is changed to UNI

When *eportClass* is changed to UNI, the following parameters are set to their default value:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Impact on UNI related port parameter settings, if *eportClass* is changed away from UNI

When *eportClass* is changed away from UNI, the following parameters are set to their default values:

- *networkTNAType*
- *networkTNAAddress*

- *clientNodeID*
- *localLPID*

Impact on VCAT layer related port parameter settings, when *eportClass* is changed away from UNI

When *eportClass* is changed away from UNI, the following parameters are set to their default values:

- *networkTNATypeVCAT*
- *networkTNAAddrVCAT*
- *localLPIDVCAT*

Behavior due to interface standard change

A change of istd is only possible if the VCG port has no cross-connections. A change of *istd* is not dependent from pending alarms or active performance monitoring for the individual tributaries.

A change of *istd* shall set default values for the parameters:

- cnprole, dftpri, dftvlan, enettca, htmr, lcasmd, stdis, stpcost, stpp, tcamd, vmode, vpm, wtr.

A change of istd shall set the parameter vvidls to default (empty list), if the GE pack works not in backward compatible mode (*vlantagmd* = BCMD). If the GE pack works in backward compatible mode (*vlantagmd* = BCMD), then the parameter *vvidls* is not reset to an empty list (VRTSW does not exists, so the *vvidls* is set indirectly by EPORT configuration).

Update affected entities

A change of the value of the parameter lcasmd shall trigger the report of the corresponding tributary changes via a ED-VCGTRIB notification.

A change of the value of the parameter istd shall trigger the deletion of all tributaries of this VCG port and the creation of tributaries for this VCG port with the default values according the new value of *istd*. The deletion is reported by a DLT-VCGTRIB notification. The creation is reported by an ENT-VCGTRIB notification. The deletion of the objects leads to a clearance of pending alarms for these objects. The generation of objects with a different istd generates new alarms for these objects if the alarm condition is still present.

Switching of interface standard - ignore other parameters

If additional parameters beside istd are specified with the ED-rr command they will be ignored by the NE. This simple approach has the advantage that all ambiguous situations are avoided and it is not necessary to implement an order or follow a certain sequence when evaluating the parameters.

Example for *istd* change from SONET to SDH

```
ED-VCG:LT-UNITE:1-1-#-#-2-V3:654321:::istd=SDH;
```

```
   LT-UNITE 00-11-11 11:11:00
M  654321 COMPLD
;
```

```
   LT-UNITE 00-11-11 11:11:05
A  001 REPT DBCHG
   "TIME=11-11-02,DATE=00-11-11:ED-VCG:1-1-#-#-2-V3::istd=SDH"
;
```

```
   LT-UNITE 00-11-11 11:11:06
A  003 REPT DBCHG
   "TIME=11-11-02,DATE=00-11-11:DLT-VCGTRIB:1-1-#-#-2-V3-1&&-21"
;
```

```
   LT-UNITE 00-11-11 11:11:08
A  005 REPT DBCHG
   "TIME=11-11-05,DATE=00-11-11:ENT-VCGTRIB-VC:1-1-#-#-2-V3-1&-4&-7&-10&-13&-16&-
      19::brstintvl=7,brstthr=30,degthr=-6,dexcthr=-
      3,hptimais=ENABLE,exphptrc=89000000000000000000000000000000,hptimmon=DISABLE,inmbs=DIS
;
```

Implicit Enabling/Disabling of GVRP when Enabling/Disabling STP for a port

When enabling/disabling STP for a network port via parameter stdis GVRP is implicitly enabled/disabled for this port (if enabled via parameter gvrpmode of the virtual switch).

This requirement is only applicable if the input parameter *modifier* = 1GE.

Group notifications for VCG tributaries

For efficiency reasons the notifications for VCG tributaries are sent out as a single notification (so-called group notification) using a range over the aid which depends on the used mapping of the associated vcg port, i.e. the Simple_VCGNumAID field in the VCGNumAID is set to

- 1&&-<N> for non-sequential range
- 1&-4 .. &-<N> for non-sequential range

with N is maximal legal VCG tributary number.

Example:

The AID field in a group notification for a VCG tributaries related to VCG port 1 for a GE1 pack in slot 1 looks like:

1-1-#-#-1-v1-1&&-21 (for STS-1/VC-3 mapping) 1-1-#-#-1-v1-1&-4&-7&-10&-13&-16&-19 (for STS-3c/VC-4 mapping)

Disabling of PM monitor

Two different scenario are relevant w.r.t. disabling of PM monitors in the context of this command:

1. set the ’pm enable’ attribute to disable – affects VCG PM monitors
2. change interface standard – affects VCGTRIB PM monitors due to deletion.

The disabling of a PM monitor shall have the following impacts w.r.t. existing PM registers:

1. Stop PM counting
2. All current bins related to the PM monitor is deleted
3. All history bins related to the PM monitor is deleted

The term “PM monitor” has the same semantics as the term “PM package”. The number of PM monitors is determined by means of the number of ’pm enable attributes’. PM monitors can be disabled explicitly by means of the ’pm enable’ attribute or are implicitly disabled as part of a port/tributary deletion. Additional to the above listed impacts the disabling of a PM monitor shall have the following impacts: the system has to clear all active TCA events of the deleted PM monitor if TCA mode TR-RTR was selected .

Applicability of requirements in this section

Following behavior is only applicable for *modifier* = 1GEPL or *modifier* = 10GEPL:

Note that for the OPT2G5 pack, the modifier ″TRANS″ is applicable. However, due to the different parameter set, this has been documented in a separate chapter starting with ID 68300.

Exclusive parameter in a ED-VCG command

If the spec_block of the **`ED-VCG`** command contains the parameter inputsig then no other spec_block parameter is accepted at the same time. Multiple parameter sets within the spec_block including the inputsig parameter is rejected.

Conditions for a parameter change

The system shall only accept value changes of the parameter inputsig if:

- none of the related VCGTRIB entities has been cross-connected,
- all of the related VCGTRIB entities have input membership (inmbs) or output membership (outmbs) disabled,
- if the current value of the parameter *istd* = SONET, and
- if the current value of the parameter *vcat* = ENABLE.

Restricted set of inputsig parameter values

Although the value range of the parameter inputsig may represent more values, the system shall only accept modifications in cases:

- modifier = 1GEPL: Changes to the values 73 and 211 are allowed,
- modifier = 10GEPL: Changes to the values 643 and 1921 are allowed.

Automatic adaptation of the parameter *unequiposig*

If the parameter inputsig has been successfully modified then the parameters unequiposig is set to the same value automatically. The modification of the parameters inputsig and unequiposig (implicitly) is notified by a single ED-VCG notification.

No Automatic creation/deletion of VCGTRIB entities

If the parameter inputsig has been successfully modified then the related VCGTRIB entities is not created or deleted. There shall neither a DLT-VCGTRIB notification nor an ENT-VCGTRIB notification be reported. This implies that there is always the maximum number of related VCGTRIB entities existing. However, some VCGTRIB entities may be insignificant. Modifications of those entities will be stored in the database but have no effect to the transmission signals.

Clear and probable raise of related VCGTRIB alarms

If the parameter inputsig has been successfully modified then all alarms of the related VCGTRIB entities are cleared. New alarms for still significant VCGTRIB entities are generated if the alarm condition is still present for the changed transmission rate.

Exclusive parameter in a ED-VCG command

If the spec_block of the **`ED-VCG`** command contains the parameter vcat then no other spec_block parameter is accepted at the same time. Multiple parameter sets within the spec_block including the vcat parameter is rejected.

Conditions for a parameter change

The system shall only accept value changes of the parameter vcat if: the input parameter *modifier* = 10GEPL, and none of the related VCGTRIB entities has been cross-connected.

Automatic set of default values

If the parameter vcat has been successfully set to DISABLE, then the related default values for the following parameters are set: *htmr*, *lcasmd*, *plcrthr*, *plctthr*, *wtr*.

The system shall not allow to change these parameters, while vcat is set to DISABLE.

Automatic set of values for parameter *inputsig* and *unequiposig*

If the parameter vcat has been successfully modified then the parameters inputsig and unequiposig is set as follows:

- *vcat* = ENABLE: 644 (if the current value of the parameter istd = SDH
- *vcat* = ENABLE: 1921 (if the current value of the parameter istd = SONET)
- *vcat* = DISABLE: 1C64 (if the current value of the parameter istd = SDH)
- *vcat* = DISABLE: 1192 (if the current value of the parameter istd = SONET).

Notification of Automatic Changes

The automatic update of implicitly changed parameters are notified by a single ED-VCG notification.

No Automatic creation/deletion of VCGTRIB entities

If the parameter vcat has been successfully modified then the related VCGTRIB entities is not created or deleted although their significance will change. There shall neither a DLT-VCGTRIB notification nor an ENT-VCGTRIB notification be reported. This implies that there is always the maximum number of related VCGTRIB entities existing. Even if the parameter vcat represents a mapping into contiguous concatenated tributaries, the configuration for those will be controlled by a VCGTRIB entity (name misleading). However, some VCGTRIB entities may be insignificant. Modifications of those entities will be stored in the database but have no effect to the transmission signals. Details about he significance can be obtained in the introduction of the chapter Ethernet Port, in particular in ID 71843.

Clear and probable raise of related VCGTRIB alarms

If the parameter vcat has been successfully modified then all alarms of the related VCGTRIB entities are cleared. New alarms for still significant VCGTRIB entities are generated if the alarm condition is still present for the changed transmission rate.

Automatic set of parameter values for VCGTRIB entities

If the parameter vcat has been successfully modified from the value ENABLE to DISABLE or DISABLE to ENABLE, then the following parameters of all related VCGTRIB entities are set to default values: *inmbs*, *outmbs*. The automatic update of the implicitly changed parameters inmbs and outmbs as well as the consequently changing status parameters inmbst and outmbst is notified by ED-VCGTRIB notifications. All other parameters of VCGTRIB entities keep their values although they may become insignificant.

No side effects for VCGTRIB entities

If the parameter lcasmd has been successfully modified then the related VCGTRIB entities is not influenced although some of their parameters may become insignificant. In this case, a modification of those parameters will be stored in the database but will have no effect on the transmission signal. The motivation is to keep LCAS settings while LCAS can be disabled e.g. for test purposes.

Changing the *vpm* parameter

The disabling of a PM monitor shall have the following impacts w.r.t. existing PM registers:

1. Stop PM counting
2. All current bins related to the PM monitor is deleted
3. All history bins related to the PM monitor is deleted.

The number of PM monitors is determined by means of the number of ’pm enable attributes’. PM monitors can be disabled explicitly by means of the ’pm enable’ attribute or are implicitly disabled as part of a port/tributary deletion. Additional to the above listed impacts the disabling of a PM monitor shall have the following impacts: the system has to clear all active TCA events of the deleted PM monitor if TCA mode TR-RTR was selected.

Specific behavior of the ES64U pack

The **ENT-VCG** command generates a **REPT DBCHG** message for the creation of the VCG together with a **REPT DBCHG** message for the creation of the VCG tributaries (**ENT-VCGTRIB** notification).

The command establishes a virtual concatenation group together with the virtual concatenation group tributaries belonging to it according to the parameters given with this command. The virtual concatenation group tributary number range is from 1 up to the number of tributaries given by the parameter *inputsig*.

The modification is reported by means of an **ENT-VCG** notification and grouped notifications for VCG tributaries.

Group notification for VCG tributaries

For efficiency reasons the notifications for VCG tributaries shall be sent out as a single notification (so-called group notification) using a range over the AID which depends on the used mapping of the associated VCG port, i.e. the *Simple_VCGNumAID* field in the *VCGNumAID* is set to

- 1&&-***<N>*** for sequential range
- 1&-4…&-***<N>*** for non-sequential range

where ***<N>*** is the maximal legal VCG tributary number.

Example:

The AID field in a group notification for a VCG tributaries related to VCG port 1 for a GE1 pack in slot 1 looks like:

1-1-#-#-1-v1-1&&-21 (for STS-1/VC-3 mapping)

1-1-#-#-1-v1-1&-4&-7&-10&-13&-16&-19 (for STS-3c/VC-4 mapping)

Example input/output

```
ED-VCG:LT-UNITE:1-1-#-#-1-V1:123456:::vmode=NMON;

   LT-UNITE 00-11-11 11:11:00
M  123456 COMPLD
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **ED-VCG** command.

Validation rule: command only allowed for VCG on GE*n* or ES64U circuit packs

If the command is not applied to a VCG on a GE*n* or ES64U pack, then the command is denied.

Error code: `IENE – Input, Entity Not Exists`

Validation rule: *modifier* mandatory for the GE10PL1 and ES64U circuit pack

The system shall verify that the modifier parameter is provided by the command if the related slot has been successfully provisioned with a GE10PL1 and ES64U circuit pack.

Error code:

```
IDNC – Input, Data Not Consistent, modifier is required for this
circuit pack type
```

Validation rule: *modifier* consistent with given port-rate

The system shall verify that a given modifier parameter is consistent with the rate of the port (given by the input aid parameter). Refer to the Range definition of the input parameter modifier of the **RTRV-VCG** command for applicable combinations.

Error code:

```
IDNC – Input, Data Not Consistent, modifier is inconsistent with
existing port rate
```

Validation rule: crossconnection - interface standard change

Check that the interface standard is not changed if there is still a cross-connection applied to any tributary of the whole VCG port. Whole port means all tributaries of a port independent of there configured membership.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections are still existing`

Validation rule: no loopbacks for interface standard change

Check that the interface standard parameter (istd) is not changed when cross-connection loopback is still on this port.

Error code: `SNVS – Status, Not in Valid State, a loopback is existing`

Validation rule: no test access session for *istd* change

Check that *istd* is not changed when a tributary related to this port is used in a test access session either as tributary under test or as test access tributary.

Error code: `SNVS – Status, Not in Valid State, test access session exists`

Validation rule: ASAP profile exists

Check of the existence of the ASAP profile.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: TCA profile exists

Check of the existence of the TCA profile.

Error code: `IDNV – Input, Data Not Valid, TCA profile does not exist`

Validation rule: ’ALL’ qualifier used for wrong parameters

The ALL qualifier for the port aid is only allowed for changing the *portControl* parameter.

Error code:

`IDNC – Input, Data Not Consistent, ’ALL’ qualifier for port aid not allowed`

Validation rule: Maximum number of enabled PM monitors

Check that the number of enabled PM monitors is less than the maximum number of supported enabled PM monitors (2000) before a new PM monitor is enabled.

Error code:

`SSRE – Status, System Resources Exceeded, limit of PM monitors exceeded.`

Since several monitor points can be enabled/disabled within one command, the **`ED`** command may only fail if the validation rule is not met after all PM enable attributes would have been updated as specified in the corresponding ED request.

Example: The **ED** command requests that 1 monitor point is enabled and 1 monitor points is disabled and currently 2000 packages are enabled. This command should complete.

ONNS specific validation rule - *eportClass* only settable when *xcsetup* = SWISS

Modification of the *eportClass* parameter is only allowed when xcsetup = SWISS.

Error code: `SNVS – Status, Not in Valid State, SwiSS not enabled`

Validation rule (ONNS specific): No interface standard change when in use by ONNS

For a 1GEPL or 10GEPL VCG, a modification of the interface standard parameter (*istd*) is not allowed, if this VCG is used by ONNS, i.e if its *eportClass* is different from TRADITIONAL.

Error code: `SNVS – Status, Not in Valid State, SwiSS access possible`

Validation rule: No configuration of unsupported VCG tributary structure for EDGE or UNI 1GEPL VCG

If *eportClass* of a 1GEPL VCG is EDGE or UNI, it is not allowed to configure a tributary structure that is not supported for *eportClass*.

For the tributary structures only the following values of *inputsig* are supported:

- SDH: *inputsig* = 74
- SONET: *inputsig* = 211

Changes to other values shall lead to the following error code.

Error code:

`SNVS – Status, Not in Valid State, Unsupported VCG tributary structure for actual eportClass`

Validation rule: No configuration of unsupported VCG tributary structure for EDGE 10GEPL VCG

If *eportClass* of a 10GEPL VCG is EDGE, it is not allowed to configure a tributary structure, that is not supported for this *eportClass*.

Allowed combinations of parameters *inputsig* and *vcat* are:

- SDH: *inputsig* = 644 and *vcat* = ENABLE
- SONET: *inputsig* = 643 and *vcat* = ENABLE

Changes to other combinations shall lead to the following error code.

Error code:

`SNVS – Status, Not in Valid State, Unsupported VCG tributary structure for actual eportClass`

Validation rule (ONNS specific): Unique setting of *localLPID*

It is only allowed to set the parameter *localLPID* to a value different from its default value if this value is unique within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule (ONNS specific): Unique setting of *localLPID* wrt. *localLinkID*

It is only allowed to set the parameter *localLPID* to a value different from its default value if this value is not already assigned to parameter *localLinkID* of any ENNI port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule (ONNS specific): *localLPID* already assigned to VCG port as *localLPIDVCAT*

It is only allowed to set the parameter *localLPID* to a value different from its default value if this value is not already assigned to parameter *localLPIDVCAT* of any VCG port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule (ONNS specific): *localLPIDVCAT* already assigned to other VCG port

It is only allowed to set the parameter *localLPIDVCAT* to a value different from its default value if this value is not already assigned to the parameter *localLPIDVCAT* of any other VCG port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule (ONNS specific): *localLPIDVCAT* already assigned to other EDGE or SONET/SDH UNI port

It is only allowed to set the parameter *localLPIDVCAT* to a value different from its default value if this value is not already assigned to the parameter *localLPID* of any other port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule (ONNS specific): Unique setting of *localLPIDVCAT* wrt. *localLinkID*

It is only allowed to set the parameter *localLPIDVCAT* to a value different from its default value if this value is not already assigned to the parameter *localLinkID* of any ENNI port within the system.

Error code: `IDNV – Input, Data Not Valid, local LPID value must be unique`

Validation rule (ONNS specific): Check of TNA parameters

It is not possible to set/configure the *networkTNAType* and *networkTNAAddress* to not matching value pairs.

Error code:

`IDNV – Input, Data Not Valid, TNA Type and TNA Address do not match`

Validation rule (ONNS specific): Check of VCAT layer TNA parameters

It is not possible to set/configure the *networkTNATypeVCAT* and *networkTNAAddrVCAT* to not matching value pairs.

Error code:

`IDNV – Input, Data Not Valid, TNA Type and TNA Address do not match`

Validation rule (ONNS specific): Modify of TNA parameters

It is not possible to modify any of the TNA related parameters, if there still exist any cross-connections for the VCG, which are of class NN and are assigned to ONNS connections associated to end-to-end network connections.

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`SNVS – Status, Not in Valid State, NN Cross-connections associated to end-to-end network connections still existing`

Validation rule (ONNS specific): Modify of TNA parameters on VCAT layer

It is not possible to modify any of the VCAT layer related TNA related parameters, if there still exist any cross-connections for the VCG, which are of class NN and are assigned to ONNS connections associated to end-to-end network connections.

The parameters are:

- *networkTNATypeVCAT*
- *networkTNAAddrVCAT*
- *localLPIDVCAT*

Error code:

`SNVS – Status, Not in Valid State, NN Cross-connections associated to end-to-end network connections still existing`

Validation rule (ONNS specific): Modify of TNA parameters

It is possible to modify the TNA related parameters only

1. if the *eportControl* state is LOCKOUT
2. during the transition of the *eportClass* to a value supporting these parameters

The parameters are:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`SNVS – Status, Not in Valid State, only allowed for EDGE port in lockout state`

Validation rule (ONNS specific): Modify of TNA parameters on VCAT layer

It is possible to modify the VCAT layer related TNA related parameters only

1. if the *eportControl* state is LOCKOUT
2. during the transition of the *eportClass* to a value supporting these parameters

The parameters are:

- *networkTNATypeVCAT*
- *networkTNAAddrVCAT*
- *localLPIDVCAT*

Error code:

`SNVS – Status, Not in Valid State, only allowed for EDGE port in lockout state`

Validation rule (ONNS specific): Setting of *eportClass* to EDGE only possible, if no test access session actve

It is not allowed to change eportClass of a VCG port to EDGE when a VCG tributary related to this port is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Setting of eportClass of a 1GEPL VCG to EDGE only possible, if the configured tributary structure is supported

It is not allowed to change *eportClass* of a 1GEPL VCG to EDGE if the existing tributary structure (configured via *inputsig* parameter) for the corr. VCG is not supported for *eportClass* EDGE and no supported tributary structure is given together with setting the *eportClass* to EDGE.

For EDGE 1GEPL VCGs only the following tributary structures are supported

- SDH: 74
- SONET: 211

Changes to other values shall lead to the following error code.

Error code:

`SNVS – Status, Not in Valid State, Unsupported VCG tributary structure for actual eportClass`

Validation rule: Setting of eportClass of a 10GEPL VCG to EDGE only possible, if the configured tributary structure is supported

It is not allowed to change *eportClass* of a 10GEPL VCG to EDGE if the existing tributary structure (configured via *istd*, *inputsig*, and *vcat* parameters) for the corr. VCG is not supported for *eportClass* EDGE.

For EDGE 10GEPL VCGs only the following combinations are supported:

- SDH - 644 - ENABLE
- SONET - 643 - ENABLE

Error code:

`SNVS – Status, Not in Valid State, Unsupported VCG tributary structure for actual eportClass`

Validation rule (ONNS specific): Setting of *eportClass* from EDGE to TRADITIONAL only possible, if the VCG tributaries on the port are not in use by ONNS

For setting *eportClass* from EDGE to TRADITIONAL the following must be fulfilled:

1. No cross-connections with *xconcls* NN must exist on any VCG tributary of the VCG.
2. *eportControl* must be LOCKOUT

Error code: `SNVS – Status, Not in Valid State, VCG is still in use`

Validation rule (ONNS specific): Change the *eportClass* away from EDGE

It is not possible to change the *eportClass* away from EDGE, if *eportControl* is NORMAL. First *eportControl* must be set to LOCKOUT

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule (ONNS specific): Change the *portClass* away from EDGE

It is not possible to change the *eportClass* away from EDGE, if the target of *eportClass* is different to TRADITIONAL.

Error code:

`SNVS – Status, Not in Valid State, Port Class must be TRADITIONAL`

Validation rule (ONNS specific): Complete and Consistent Setting of TNA Parameter required when configured to EDGE VCGs

When assigning TNA information different from the default values to an EDGE VCG, then a complete set for the following parameters must be given:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

For consistency reasons, additionally the values for *networkTNAAddress* and *localLPID* must be different to their default values.

Error code:

`IDNV – Input, Data Not Valid, Consistent TNA parameter set required`

Validation rule (ONNS specific): Consistent Parameters setting required when removing TNA information from EDGE VCGs

When removing TNA information from an EDGE VCG, the following parameters must all be set to their default values:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`IDNV – Input, Data Not Valid, Consistent TNA parameter set required`

Validation rule (ONNS specific): No Support of VCAT related TNA Parameters for EDGE VCGs

While the *eportClass* of a VCG is EDGE or during *eportClass* transition towards EDGE, it is not allowed to set any of the following parameters different to their default values:

- *networkTNATypeVCAT*
- *networkTNAAddrVCAT*
- *localLPIDVCAT*

Error code:

`IDNV – Input, Data Not Valid, No support of VCAT TNA parameter set for EDGE VCGs`

Validation rule: (ONNS specific): TNA parameters on SDH/SONET layer already assigned on VCAT layer

It is not possible to set non-default TNA parameters on SDH/SONET layer for an EDGE VCG if the desired value of *networkTNAAddress* is already assigned as *networkTNAAddressVCAT* to any VCG in the system.

Error code: `IDNV – Input, Data Not Valid, given TNA already exists`

Validation rule: TNA parameter disjointness between EDGE and UNI

It is not possible to set non-default TNA parameters on SDH/SONET layer for an EDGE VCG, if the desired value of networkTNAAddress is already assigned to any UNI port in the system.

Error code:

`IDNV – Input, Data Not Valid, TNA Address already assigned to UNI port`

This validation means, that UNI and EDGE ports shall not be mixed under one TNA.

Validation rule (ONNS specific): Change the *eportClass* to UNI

It is not possible to change *eportClass* to UNI, if cross-connections on that port are still existing.

Error code:

`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule (ONNS specific): Change the *eportClass* to UNI

It is not possible to change *eportClass* to UNI, if a tributary related to this port is used in a test access session. Either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule (ONNS specific): Change the *eportClass* to UNI

It is not possible to change *eportClass* to UNI, if a cross-connect loopback exists for any tributary related to this port.

Error code:

`SNVS – Status, Not in Valid State, a cross connect loopback exists`

Validation rule (ONNS specific): Change the *eportClass* to UNI

It is not possible to change *eportClass* to UNI, if UNI-N node is not enabled for the NE.

Error code: `SNVS – Status, Not in Valid State, UNI not enabled`

Validation rule: TNA parameters on VCAT layer already assinged to other VCG port

It is not possible to change TNA parameters on VCAT layer (*networkTNAAddrVCAT* and *networkTNATypeVCAT*) for a VCG port, if already a TNA with identical values is assigned to another VCG port on VCAT layer.

Error code: `SNVS – Status, Not in Valid State, given TNA already exists`

Validation rule: TNA parameters on VCAT layer already assigned to other UNI or EDGE port

It is not possible to change TNA parameters on VCAT layer for a UNI VCG port if already a TNA with identical values (Network TNA Type and Network TNA Address) assigned to another UNI or EDGE port on SDH/SONET layer exists in the system.

Error code: `SNVS – Status, Not in Valid State, given TNA already exists`

Validation rule: Setting of *eportClass* of a 1GEPL VCG to UNI only possible, if the configured tributary structure is supported

It is not allowed to change *eportClass* of a 1GEPL VCG to UNI, if the tributary structure configured via *istd* and *inputsig* parameters for the corr. VCG is not supported for *eportClass* UNI and no supported tributary structure is given together with setting the *eportClass* to UNI.

For UNI 1GEPL VCGs only the following tributary structures are supported:

- SDH – 74
- SONET – 211.

Error code:

`SNVS – Status, Not in Valid State, Unsupported VCG tributary structure for actual eportClass`

Validation rule: Change the *eportClass* to UNI

It is not possible to change *eportClass* to UNI if UNI-N node is not enabled for the network element.

Error code: `SNVS – Status, Not in Valid State, UNI not enabled`

Validation rule: Check of UNI parameters

It is not possible to change *eportClass* to UNI unless values different from the default values are given for the following UNI parameters

- *clientNodeID*
- *networkTNAAddrVCAT*
- *localLPIDVCAT*

Error code:

`IDNV – Input, Data Not Valid, UNI parameters must be different to their DEFAULT values`

Validation rule: Change the *eportClass* away from UNI

It is not possible to change *eportClass* to UNI if *eportControl* is NORMAL. First *eportControl* must be set to LOCKOUT.

Error code:

`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Change the *eportClass* away from UNI

It is not possible to change the *eportClass* away from UNI, if the target of *eportClass* is different to TRADITIONAL.

Error code:
`SNVS – Status, Not in Valid State, target Port Class must be TRADITIONAL`

Validation rule: Change the *eportClass* away from UNI

It is not possible to change the *eportClass* away from UNI, if there still exist any cross-connection on any tributary of the port.

Error code: `SNVS – Status, Not in Valid State, Port is still in use`

Validation rule: Modify of UNI parameters

It is not possible to modify UNI related parameters, if the UNI port is not in *eportControl* state LOCKOUT.

The parameters are:

- *clientNodeID*

Error code:
`SNVS – Status, Not in Valid State, Port must be in LOCKOUT mode`

Validation rule: Modify of UNI parameters

It is not possible to modify UNI related parameters, if there still exist any cross-connection for the UNI port.

The parameters are:

- *clientNodeID*

Error code:
`SNVS – Status, Not in Valid State, Cross-connections still existing`

Validation rule: Check of UNI parameters

It is not possible to set/configure the *clientNodeID* to the same value of the *uniNetworkNodeID*.

Error code:
`IDNV – Input, Data Not Valid, Client Node ID must differ from Network Node ID`

Validation rule: Check of UNI parameters

It is not possible to change the *eportClass* to UNI, unless valid values different from the default values are given for the following UNI parameters:

- *clientNodeID*
- *networkTNAAddrVCAT*
- *localLPIDVCAT*

Error code:

`IDNV – UNI parameters must be different to their DEFAULT values`

Validation rule: Check of UNI parameters

It is not possible to change the *eportClass* to UNI, unless valid values for the following UNI parameters are given: *clientNodeID*, *networkTNAType*, *networkTNAAddress* and *localLPID*.

Error code:

`IDNV – Input, Data Not Valid, Valid values for UNI parameters required`

Validation rule: Check of UNI parameters

It is not possible to set/configure the *clientNodeID* to the same value of the *uniNetworkNodeID*.

Error code:

`IDNV – Input, Data Not Valid, Client Node ID must differ from Network Node ID`

Validation rule: Check of UNI parameters

It is not possible to set the following UNI parameters to their default values, if *eportClass* is equal to UNI or during setting *eportClass* to UNI:

- *clientNodeID*
- *networkTNAAddrVCAT*
- *localLPIDVCAT*

Error code:

`IDNV – Input, Data Not Valid, UNI port parameters must be different to their DEFAULT values`

Validation rule: Check of SONET/SDH layer parameters

It is not possible to set the following SONET/SDH layer related parameters different to their default values, when *eportClass* is equal to UNI or during setting *eportClass* to UNI:

- *networkTNAType*
- *networkTNAAddress*
- *localLPID*

Error code:

`IDNV – Input, Data Not Valid, No support of TNA parameter set for UNI VCGs`

Validation rule: TNA parameters on VCAT layer already assigned on SDH/SONET layer

It is not possible to set TNA parameters on VCAT layer for a UNI VCG, if the desired value of *networkTNAAddressVCAT* is already assigned as *networkTNAAddress* to any port in the system.

Error code: `SNVS – Status, Not in Valid State, given TNA already exists`

Validation rule: Uniqueness of TNA parameters on VCAT layer per UNI VCG

It is not possible to set TNA parameters on VCAT layer for a UNI VCG, if the desired value of *networkTNAAddressVCAT* is already assigned to a different UNI VCG in the system.

Error code: `SNVS – Status, Not in Valid State, given TNA already exists`

Applicability of requirements in this section

Following behavior is only applicable if the parameter *modifier* has been omitted:

Validation rule: Command only allowed for VCG on Gigabit Ethernet Packs

If the command is not applied to a VCG on a Gigabit Ethernet pack, then the command is denied.

Error code: `IENE – Input, Entity Not Exists`

Validation rule: Parameter modification not allowed in backward compatible mode

No modification of the following parameters are allowed if the VLAN tagging mode *vlantagmd* of the pack, to which the specified VCG port belongs to, is set to backward compatible mode (BCMD): *cnprole*, *stdis*, *dftpri*, *dftvlan*, *stpp*, *stpcost*, *rstpmd*, *vvidls*.

Error code:

```
SNVS – Status, Not in Valid State, Modification not allowed in Backward
Compatible Mode
```

Validation rule: Default VLAN ID is already assigned for this system

The default VLAN ID of a Customer port cannot have the same value as the default VLAN Id of another Customer port in the system or any other instantiated VLAN in the system, except for the value 4094.

Error code:

```
IDNC – Input, Data Not Consistent, Default VLAN ID is already assigned
for this System
```

Applicability of this section

The following behavior is only applicable if the input parameter *modifier* is

- 1GEPL or
- 10GEPL

Note that for the OPT2G5 pack, the modifier “TRANS” is applicable.

Validation rule: No other spec_block parameters

If the parameter *inputsig* is modified then any attempts to change other spec_block parameters within the same command shall lead to a rejection of the whole command:

Error code:

`IDNV – Input, Data Not Valid, parameter inputsig must be set individually`

Validation rule: Not allowed for SDH

If the parameter *inputsig* is modified and the current value of the parameter *istd* = SDH, then the command is rejected:

Error code:

`SNVS – Status, Not in Valid State, Not allowed for SDH interface standard`

Validation rule: Not allowed if virtual concatenation mode disabled

If the parameter *inputsig* is modified and the current value of the parameter *vcat* = DISABLE, then the command is rejected:

Error code:

`SNVS – Status, Not in Valid State, Not allowed if VCAT disabled`

Validation rule: Not allowed if a member is cross-connected

If the parameter *inputsig* is modified and at least one related VCGTRIB is cross-connected, then the command is rejected:

Error code:

`SNVS – Status, Not in Valid State, cross-connections are still existing`

Validation rule: Not allowed if a member is looped

If the parameter *inputsig* is modified and at least one related VCGTRIB is looped-back, then the command is rejected:

Error code: `SNVS – Status, Not in Valid State, a loopback is existing`

Validation rule: Not allowed if involved in test access

If the parameter *inputsig* is modified and at least one related VCGTRIB is involved in a test access session, then the command is rejected:

Error code:

`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Not allowed if a member is enabled

If the parameter *inputsig* is modified and the input membership or output membership of at least one related VCGTRIB is enabled, then the command is rejected:

Error code:

`SNVS – Status, Not in Valid State, VCG members are still enabled`

Validation rule: Improper Value

If the parameter *inputsig* is modified but the value does not match the defined subset, then the command is rejected:

Error code:

`IDRG – Input, Data Range Error, Value not supported for this modifier and istd`

Validation rule: Ethernet Port Class EDGE not allowed for 10 GE ports

The system shall not allow to set the Ethernet Port Class (parameter eportClass) to EDGE for a 10 GE port (modifier = 10GEPL).

Error code:

`IDNV – Input, Data Not Valid, Port Class not allowed for 10 GE ports`

Validation rule: Ethernet Port Class UNI not allowed for 10 GE ports

The system shall not allow to set the Ethernet Port Class (parameter eportClass) to UNI for a 10 GE port (modifier = 10GEPL).

Error code:

`IDNV – Input, Data Not Valid, Port Class not allowed for 10 GE ports`

Validation rule: Not allowed to change istd for VCG ports on a GE10PL1 pack

The system does not allow to modify the parameter *istd* for VCG ports on a GE10PL1 pack.

Error code:

`IDNV – Input, Data Not Valid, Interface Standard cannot be modified`

The GE10PL1 circuit pack allows only one common interface standard setting for all VCGs on the pack. The interface standard can be changed via the circuit pack parameter istd. A change of the circuit pack interface standard shall update all existing VCG ports on the GE10PL1 pack.

Validation rule: No other spec_block parameters

If the parameter vcat is modified then any attempts to change other spec_block parameters within the same command shall lead to a rejection of the whole command:

Error code:

`IDNV – Input, Data Not Valid, parameter vcat must be set individually`

Validation rule: Not allowed for 1 GE interfaces

If the parameter vcat is modified and the input parameter modifier = 1GEPL, then the command is rejected:

Error code:
`SNVS – Status, Not in Valid State, Not allowed for 1 GE interfaces`

Validation rule: Not allowed if a member is cross-connected

If the parameter vcat is modified and at least one related VCGTRIB is cross-connected, then the command is rejected:

Error code:
`SNVS – Status, Not in Valid State, cross-connections are still existing`

Validation rule: Not allowed if a member is looped

If the parameter vcat is modified and at least one related VCGTRIB is looped-back, then the command is rejected:

Error code: `SNVS – Status, Not in Valid State, a loopback is existing`

Validation rule: Not allowed if involved in test access

If the parameter vcat is modified and at least one related VCGTRIB is involved in a test access session, then he command is rejected:

Error code:
`SNVS – Status, Not in Valid State, a test access session exists`

Validation rule: Parameter modification restrictions while vcat is set to DISABLE

While the parameter vcat is set to DISABLE the system shall not allow to change the parameters: *htmr*, *lcasmd*, *plcrthr*, *plctthr*, *wtr*

Error code:
`SNVS – Status, Not in Valid State, Virtual concatenation is disabled`

Related TL1 Messages

"RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3078)

ED-VCG notification

Output format

The **ED-VCG** notification has the following specific syntax:

ED-VCG*[-modifier]:aid::spec_block;*

Output parameters

Command parameters

1. **modifier**
   The modifier specifies the type of the virtual concatenation group of the unit. Implicit, for the 1GEPL, 10GEPL application it indicates the transmission rate for which VCG related data will be notified. For the ES64U application the transmission rate is defined by the user with the **ENT-VCG** command and input parameter *inputsig*.
   The parameter *modifier* must be given if a virtual concatenation group on a GE10PL1 or an ES64U pack shall be notified. Otherwise this parameter has to be omitted.
   Type: Alphanumeric value set.
   Range: 1GEPL representing a 1 GE port on the GE10PL1 pack; 10GEPL representing a 10 GE port on the GE10PL1 pack, ES64U representing a VCG port at an ES64U subsystem.
2. **aid** – Access Identifier
   This parameter specifies the virtual concatenation group (VCG) to be operated on.
   Type: AID.

   Range: VCGAID as defined in AID structure. The values

   - *vall* for Simple_VCGAID and
   - *usall* for Simple_UnivSlotAID
   - *all* for Simple_UnivSlotAID
   - *all* for Simple_ShelfAID and
   - *all* for BayAID

   are excluded.

Spec block parameters

1. **clientNodeID** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.
   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other eport classes in future.

This parameter is supported by ports of *eportClass* UNI.
For *modifier* = ES64U the parameter is visible with default values for retrieval, but cannot be modified.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

2. **`cnprole`** – Customer/Network Port Role
   This parameter specifies whether the addressed port is used as a customer WAN port or a network WAN port.
   This parameter is not supported if the input parameter *modifier* = 1GEPL, *modifier* = 10GEPL or *modifier* = ES64U. If the parameter *cnprole* is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range: CUSTOMER, for a customer WAN port. NETWORK, for a network WAN port.
   Default: NETWORK.
3. **`dftpri`** – Default User Priority
   This parameter specifies the default user priority acc. the IEEE 802.1Q tagging scheme.
   This parameter is not supported if the input parameter *modifier* = 1GEPL, *modifier* = 10GEPL or *modifier* = ES64U. If the parameter *dftpri* is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range:
   - HIGH
   - LOW (default).
4. **`dftvlan`** – Default VLAN Identifier
   This parameter specifies the value of the VLAN identifier which is applied to frames (tagging) at LAN ingress (that means, from LAN into the Ethernet-port). This only applies to frames carrying no VLAN identifier, yet. This parameter is also used to provision the customer tag (CID) to be used in transparent tagging mode.
   This parameter is not supported if the input parameter *modifier* = 1GEPL, *modifier* = 10GEPL or *modifier* = ES64U. If the parameter *dftvlan* is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range:
   - 1, 2, 3, … 4092, 4093.
   - UNAVAILABLE (default).

5. **`enetpn`** – Ethernet Alarm Severity Assignment Profile Name
   This parameter points to an ASAP profile name of type ENET for the designated AID.
   Ethernet port and VCG port have the same ASAP profile named ENET.
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: 1 … 24 characters length.
   Default: DEFAULT.
6. **`enettca`** – Ethernet TCA Profile Name
   This parameter specifies the name of the threshold crossing alert (TCA) profile used for the VCG.
   This parameter is not supported if the input parameter *modifier* = ES64U.
   If the parameter *enettca* is not supported, then the parameter is omitted.
   Type: Alphanumeric string.
   Range: 1 … 24 characters length.
   Default: DEFAULT0.
7. **`eportClass`** – Ethernet Port Class
   This identifies the Ethernet port class of the AID. *eportClass* is used to specify Ethernet ports for use by NN application.
   For *modifier* = ES64U, the parameter is visible with default values for retrieval, but it cannot be modified.
   Type: Alphanumeric value set.
   Range: Depends on the *modifier*:
   - if *modifier* is missing or is 1GEPL, then the value range is: TRADITIONAL, EDGE, UNI
   - if *modifier* is 10GEPL, then the value range is: TRADITIONAL, EDGE
   - if *modifier* is ES64U, then the value range is: TRADITIONAL

   Default: Depends on system parameters Cross Connect Setup (*xcsetup*) and Port Class Default (*portclassdefault*):
   - if *xcsetup* is TRADITIONAL, then the default value is TRADITIONAL
   - if *xcsetup* is SWISS, then the value of *portclassdefault* is used as default value.
   - if *modifier* is ES64U, then the default value is TRADITIONAL

   Restriction: For *modifier* = ES64U the parameter cannot be modified.
8. **`eportControl`** – Ethernet Port Control (Ethernet Port Administrative Mode)
   This identifies the administrative mode of Ethernet ports of *eportlass* = EDGE or UNI. For Ethernet ports of other Ethernet port class this parameter is not relevant. *eportControl* is introduced specifically for use by NN application.
   For *modifier* = ES64U, the parameter is visible with default values for retrieval, but it cannot be modified.
   Type: Alphanumeric value set.
   Range: NORMAL (default), MAINT, LOCKOUT .
   Restriction: For *modifier* = ES64U the parameter cannot be modified.

9. **`htmr`** – Hold-Off Time
   The parameter *htmr* specifies the hold off time for the LCAS protection. If a tributary is configured to take part on transmission for the VCG and it goes to state faulty then this tributary is taken out of transmission by LCAS after the hold off time. This time is configured on group level, i.e. all tributaries have the same value for hold-off time. This parameter only affects NE behavior if lcasmd=ENABLE.
   For *modifier* = ES64U, the parameter is visible with default values for retrieval, but it cannot be modified.
   Type: numeric value set.
   Range: 0 (default), 100, 200, ..., 9900, 10000 [milliseconds].
   Restriction: For *modifier* = ES64U the parameter cannot be modified.
10. **`inputsig`** – Tributary Input Signal Rate List
    This parameter reports the tributary structure of the VCG port in input direction. This will implicitly give the maximum capacity of the VCG port, too. The tributary structure depends on interface standard specified for this VCG by *istd* . For definition of *istd* refer to the "Output parameters" section in "RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3078).
    If the input parameter *modifier* = 1GEPL or *modifier* = 10GEPL, then the possible tributary structures depends on interface standard specified for this VCG by istd and on the virtual concatenation mode *vcat*. For definitions of *istd* and *vcat* refer to the "Output parameters" section in "RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3078)..
    Type: numeric string of the form ***NX***
    - ***N*** specifies the count of container type ***X***
    - ***X*** specifies the container type (or envelope).

    Range:

Values	Modifier	Interface standard	Virtual concatenation	Represented signal structure
N = 7, ***X*** = 4	omitted	SDH	not applicable	7 × VC4
N = 7, ***X*** = 4	1GEPL	SDH	ENABLE	7 × VC4
N = 64, ***X*** = 4	10GEPL	SDH	ENABLE	64 × VC4
N = 1, ***X*** = c64	10GEPL	SDH	DISABLE	1 × VC4-64C
N = 21, ***X*** = 1	omitted	SONET	not applicable	21 × STS-1
N = 21, ***X*** = 1	1GEPL	SONET	ENABLE	21 × STS-1
N = 7, ***X*** = 3	1GEPL	SONET	ENABLE	7 × STS-3C
N = 192, ***X*** = 1	10GEPL	SONET	ENABLE	192 × STS-1
N = 64, ***X*** = 3	10GEPL	SONET	ENABLE	64 × STS-3C
N = 1, ***X*** = 192	10GEPL	SONET	DISABLE	1 × STS-192C

Range: Depends on the *modifier*:

- if *modifier* is ES64U, then the value combination of ″N″ and ″X″ is according the following rules:
  istd=SONET
  X = 1 (for STS-1)
  N $\in$ {1, 2, … 192}
- if *modifier* is ES64U, then the parameter *inputsig* is visible for retrieval, but cannot be modified once the VCG is established.

Default:

- modifier = omitted, Interface Standard=SDH, Default Value = 74
- modifier = 1GEPL, Interface Standard=SDH, Default Value = 74
- modifier = 10GEPL, Interface Standard=SDH, Default Value = 644
- modifier = omitted, Interface Standard=SONET, Default Value = 211
- modifier = 1GEPL, Interface Standard=SONET, Default Value = 211
- modifier = 10GEPL, Interface Standard=SONET, Default Value = 1921

Default in case of System Default *portClass* EDGE: In case of the *portclassdefault* EDGE, i.e. VCGs are created with *eportClass* EDGE, the default values for *unequiposig* is as in table above with the following exception:
For *modifier* = GE10PL and *Interface Standard* = SONET, the default value is 643.
For *modifier* = ES64U this parameter is always defined by the **ENT-VCG** command.

11. **istd** – Interface Standard
    This parameter specifies the interface standard of this VCG. This value is applied for both input and output direction.
    For *modifier* = ES64U, *modifier* = ES64U or *modifier* = ES64U the parameter is visible with default values for retrieval, but it cannot be modified.
    Type: Alphanumeric value set.
    Range:
    - SDH
    - SONET.

    Default: *modifier*: 1GEPL, 10GEPL, or ES64U: The value is derived from the circuit pack parameter *istd*. no *modifier*: As derived from parameter *istddflt* specified at configuration management, section **RTRV-EQPT**.
    Restriction: The parameter istd is only allowed if modifier is omitted.
12. **lcasmd** – LCAS Mode
    This parameter specifies the operation mode of the Link Capacity Adjustment Scheme for this VCG. This value is bidirectional.
    For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.
    Type: Alphanumeric value set.

Range:

- DISABLE
- ENABLE

Default:

- *modifier* = ES64U: DISABLE
- other or no *modifier*: ENABLE

13. **localLPID** – Local Logical Port IDentity
The *localLPID* provides a unique logical identification of a single port with an *eportClass* value used by the ONNS application and supporting this specific parameter.
This identification is from the local NEs point-of-view.
Depending on the *eportClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkLPID”, as this attribute will not be exclusively valid any more for *eportClass* UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *eportClass* UNI.
The parameter *localLPID* is used by ONNS for switching network connections on SONET/SDH layer.
This parameter is supported by ports of *eportClass* UNI.
This parameter is supported by ports of *eportClass* EDGE.
For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.
Type: numeric value set.
Range: 0 to 4294967295.
Default: 0.

14. **localLPIDVCAT** – Local Logical Port Identity on VCAT layer
The *localLPIDVCAT* provides a unique logical identification of a single VCG port with an *eportClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
Depending on the *eportClass* value of the port, the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like, for example, *networkTNAAddrVCAT*.
For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, that means it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.
The parameter *localLPIDVCAT* is used by ONNS for switching network connections on VCAT layer.
This parameter is supported by ports of *eportClass* UNI.
This parameter is supported by ports of *eportClass* EDGE.

For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.
Type: numeric value set.
Range: 0 to 4294967295.
Default: 0.

15. **`networkTNAType`** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkTNAType", as this attribute will not be exclusively valid any more for *eportClass* UNI only and thus a more generic name seems reasonable.
The parameter *localLPIDVCAT* is used by ONNS for switching network connections on SONET/SDH layer.
This parameter is supported by ports of *eportClass* UNI.
This parameter is supported by ports of *eportClass* EDGE.
For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.
Type: Alphanumeric value set.
Range: IPV4, IPV6, or NSAP
Default: NSAP
Restriction: For *modifier* = ES64U, this parameter is not editable.

16. **`networkTNATypeVCAT`** – Network TNA Type on VCAT level
The *networkTNATypeVCAT* identifies the type of the Network TNA Address on VCAT level attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, that means, it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.
The parameter *networkTNATypeVCAT* is used by ONNS for switching network connections on VCAT layer.
This parameter is supported by ports of eportClass UNI.
This parameter is supported by ports of eportClass EDGE.
For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.
Type: Alphanumeric value set.
Range: IPV4, IPV6, or NSAP
Default: NSAP
Restriction: For *modifier* = ES64U, this parameter is not editable.

17. **`networkTNAAddress`** – Network TNA Address
    The *networkTNAAddress* identifies the Network TNA Address attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.
    The content depends on the given NetworkTNAType. For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.
    This attribute replaces attribute "uniNetworkTNAAddress", as this attribute will not be exclusively valid any more for *eportClass* UNI only and thus a more generic name seems reasonable.
    The parameter *networkTNAAddress* is used by ONNS for switching network connections on SONET/SDH layer.
    This parameter is supported by ports of *eportClass* UNI.
    This parameter is supported by ports of *eportClass* EDGE.
    For *modifier* = ES64U, the parameter is visible with its default value for retrieval, but it cannot be modified.
    Type:
    networkTNAType = IPV4: Four dot separated numeric string (represents 4 Bytes)
    networkTNAType = IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
    networkTNATyp e= NSAP: Hexadecimal number (represents 20 Bytes)
    Range:
    IPV4: Each numeric string: 0…255
    IPV6: Each hexadecimal number: 0000…FFFF
    NSAP: Hexadecimal number:
    0000000000000000000000000000000000000000 …
    FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF
    Examples:
    IPV4: 129.12.3.178
    IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
    NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF
    Default:
    IPV4: 0.0.0.0
    IPV6: 0-0-0-0-0-0-0-0
    NSAP: 0000000000000000000000000000000000000000
    Restriction: For *modifier* = ES64U, this parameter is not editable.
18. **`networkTNAAddrVCAT`** – Network TNA Address on VCAT level
    The *networkTNAAddrVCAT* identifies the Network TNA Address on VCAT level attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.
    The content depends on the given *NetworkTNATypeVCAT*. For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, that means, it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.

The parameter *networkTNAAddrVCAT* is used by ONNS for switching network connections on VCAT layer.
This parameter is supported by ports of *eportClass* UNI.
This parameter is supported by ports of *eportClass* EDGE.
For *modifier* = ES64U, the parameter is visible with its default value for retrieval, but it cannot be modified.
Type:
networkTNAType = IPV4: Four dot separated numeric string (represents 4 bytes)
networkTNAType = IPV6: Eight dash separated hexadecimal number (represents 16 bytes)
networkTNAType = NSAP: Hexadecimal number (represents 20 Bytes)
Range:
IPV4: Each numeric string: 0…255
IPV6: Each hexadecimal number: 0000…FFFF
NSAP: Hexadecimal number:
0000000000000000000000000000000000000000 …
FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF
Default:
IPV4: 0.0.0.0
IPV6: 0-0-0-0-0-0-0-0
NSAP: 0000000000000000000000000000000000000000
Restriction: For *modifier* = ES64U, this parameter is not editable.

19. **plcrthr** – Threshold for Partial Loss of Capacity (Receive)
The parameter *plcrthr* specifies the acceptable limit of valid VCG members in receive direction (refer to the *outmbs* parameter of all related VCGTRIB entities) for which the PLCR alarm will not yet be raised. The PLCR alarm will be raised if the actual number of those VCG members is between [1 … (value of the *plcrthr* parameter – 1)] (if *plcrthr* ≥ 2). The PLCR alarm shall never be raised if *plcrthr* is set to 1.
The PLCR alarm will be cleared if the actual number of those VCG members is equal to or more than the value of the *plcrthr* parameter (or if the number of those VCG members is 0 – in this case the TLCR alarm will be raised instead). This parameter is not supported if the input parameter *modifier* is omitted. If the parameter *plcrthr* is not supported, then the parameter is omitted.
For *modifier* = ES64U, the parameter is visible with its default value for retrieval, but it cannot be modified.
Type: numeric value set.
Range: 1, 2, 3, …, 192.
Default:

Modifier	Input signal structure	Default value
1GEPL	74	7
1GEPL	211	21

Modifier	Input signal structure	Default value
10GEPL	644, 1c64	64
10GEPL	1921, 1192	192
ES64U	n × 1	n

Restriction: For *modifier* = ES64U, this parameter is not editable.

20. **`plctthr`** – Threshold for Partial Loss of Capacity (Transmit)
    The parameter *plctthr* specifies the acceptable limit of valid VCG members in transmit direction (refer to the *inmbs* parameter of all related VCGTRIB entities) for which the PLCT alarm will not yet be raised. The PLCT alarm will be raised if the actual number of those VCG members is between [1 … (value of the *plctthr* parameter – 1)] (if *plctthr* ≥ 2). The PLCR alarm shall never be raised if *plctthr* is set to 1.
    The PLCT alarm will be cleared if the actual number of those VCG members is equal to or more than the value of the *plctthr* parameter (or if the number of those VCG members is 0 – in this case the TLCT alarm will be raised instead).
    This parameter is not supported if the input parameter *modifier* is omitted. If the parameter *plctthr* is not supported, then the parameter is omitted.
    For *modifier* = ES64U, the parameter is visible with its default value for retrieval, but it cannot be modified.
    Type: numeric value set.
    Range: 1, 2, 3, …, 192.
    Default:

Modifier	Input signal structure	Default value
1GEPL	74	7
1GEPL	211	21
10GEPL	644, 1c64	64
10GEPL	1921, 1192	192
ES64U	n × 1	n

Restriction: For *modifier* = ES64U, this parameter is not editable.

21. **`stdis`** – Spanning Tree Protocol Disable
    This parameter allows to enable or disable the Spanning Tree Protocol for the given port. This parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
    This parameter is not supported if the input parameter *modifier* = 1GEPL, *modifier* = 10GEPL or *modifier* = ES64U.

Type: Alphanumeric value set.
Range: DISABLE, STP is disabled, that means, the port is not used to build the spanning tree. ENABLE (default), STP is enabled, that means, the port is used to build the spanning tree.
As VCGs are by default network ports the default value is to enable STP.

22. **`stpcost`** – Spanning Tree Path Cost
    The parameter *stpcost* specifies the STP-related cost of the path egressing the given port.
    If the input parameter *modifier* is omitted, then this parameter is supported but applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
    This parameter is not supported if the input parameter *modifier* = 1GEPL, *modifier* = 10GEPL or *modifier* = ES64U.
    If the parameter *stpcost* is not supported, then the parameter is omitted.
    Type: Integer.
    Range: 1 to 200000000.
    Default: 20000.
    The default value depends on the provisioned VCG size. As currently only a fix size of 7 VC4s or 21 STS1s corresponding to approximately 1 Gbit is supported, the default value is as shown above.

23. **`stpp`** – Spanning Tree Port Priority
    The parameter *stpp* specifies the priority of the given port for the Spanning Tree Protocol. If the input parameter *modifier* = 1GE, then this parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
    If the input parameter *modifier* = 1GE, then this parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database. This parameter is not supported if the input parameter: *modifier* = ES64U.
    This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter *stpp* is not supported, then the parameter is omitted.
    Type: Integer.
    Range: 0 to 255.
    Default: 128.

24. **`tcamd`** – TCA mode
    This parameter shows the modus of the PM thresholding.

Two thresholding methods are applicable:

- TR-only (also known as the implicit reset method)
- TR-RTR (also known as the explicit reset method)

This parameter is not supported if the input parameter: *modifier* = ES64U.
If the parameter *tcamd* is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range: TR, TRRTR.
Default: TRRTR in SDH mode; TR in SONET mode.

25. **`unequiposig`** – Unequipped Tributary Output Signal Rate List
The parameter *unequiposig* specifies the tributary structure and the capacity of the VCG port in output direction. As long as there is no cross-connection applied the specified tributaries are occupied by an unequipped signal. The parameter will implicitly give the maximum capacity of the VCG port, too.
If the input parameter *modifier* is omitted, then the tributary structure depends on interface standard specified for this VCG by *istd* . For the definition of *istd* refer to the “Output parameters” section of “RTRV-VCG: Retrieve virtual concatenation group” (p. 3-3078).
If the input parameter *modifier* = 1GEPL or *modifier* = 10GEPL, then the range of possible tributary structures depends on interface standard specified for this VCG by *istd* and on the virtual concatenation mode *vcat*. For definitions of *istd* and *vcat* refer to the “Output parameters” section of “RTRV-VCG: Retrieve virtual concatenation group” (p. 3-3078). The signal will be immediately terminated on the unit. So no unequipped signal is visible to the outside world.
If the input parameter: *modifier* = ES64U, then the parameter *unequiposig* is set automatically according to the value of the *inputsig* parameter.
For *modifier* = ES64U, the parameter *unequiposig* is only retrievable and cannot be changed because it follows always the value of the *inputsig* parameter.
Type: numeric string of the form ***NX***

- ***N*** specifies the count of container type ***X***
- ***X*** specifies the container type (or envelope).

Range:

Values	Modifier	Interface standard	Virtual concatenation mode	Represented signal structure
N = 7, ***X*** = 4	omitted	SDH	not applicable	7 × VC4
N = 7, ***X*** = 4	1GEPL	SDH	ENABLE	7 × VC4
N = 64, ***X*** = 4	10GEPL	SDH	ENABLE	64 × VC4
N = 1, ***X*** = c64	10GEPL	SDH	DISABLE	1 × VC4-64C
N = 21, ***X*** = 1	omitted	SONET	not applicable	21 × STS-1

Values	Modifier	Interface standard	Virtual concatenation mode	Represented signal structure
N = 21, ***X*** = 1	1GEPL	SONET	ENABLE	21 × STS-1
N = 7, ***X*** = 3	1GEPL	SONET	ENABLE	7 × STS-3C
N = 192, ***X*** = 1	10GEPL	SONET	ENABLE	192 × STS-1
N = 64, ***X*** = 3	10GEPL	SONET	ENABLE	64 × STS-3C
N = 1, ***X*** = 192	10GEPL	SONET	DISABLE	1 × STS-192C

For *modifier* = ES64U, the same value set is applicable as for the parameter *inputsig*.
Default:

Modifier	Interface Standard	Default Value
omitted	SDH	74
1GEPL	SDH	74
10GEPL	SDH	644
omitted	SONET	211
1GEPL	SONET	211
10GEPL	SONET	1921
ES64U	SONET	not applicable

Default in case of System Default *portClass* EDGE: In case of the *portclassdefault* EDGE, that means, VCGs are created with *eportClass* EDGE, the default values for *unequiposig* is as in table above with the following exception:
For *modifier* = GE10PL and *Interface Standard* = SONET, the default value is 643.

26. **`vcat`** – Virtual Concatenation
This parameter vcat specifies whether the Ethernet signal is mapped to a number of virtually concatenated tributaries (value = ENABLE) or into a contiguously concatenated tributaries (value = DISABLE). In the latter case, LCAS related parameters become insignificant (values set to default, values cannot be changed). This parameter is not supported if the input parameter *modifier* is omitted. If the parameter *vcat* is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range:
- For *modifier* ES64U: ENABLE (default)
- otherwise: DISABLE.
- For *modifier* = ES64U the parameter *vcat* is visible for retrieval, but cannot be modified once the VCG is established.

27. **vmode** – VCG Monitoring Mode
    The parameter *vmode* specifies the monitoring mode for VCG. Alarms for this port will be reported if in mode MON otherwise not. There is no automatic mode.
    Type: Alphanumeric value set.
    Range:
    - MON, for monitored
    - NMON (default), for not monitored.
28. **vpm** – VCG Performance Monitoring
    The parameter *vpm* specifies whether the performance monitoring is enabled or disabled for this port.
    This parameter is not supported if the input parameter: *modifier* = ES64U. If the parameter *vpm* is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range:
    - DISABLE (default)
    - ENABLE.
29. **vvidls** – Valid VLAN Identifier List (static)
    This parameter specifies a list of all static VLAN identifiers allowed for this port. The list is ampersand grouped (& and &&). The list is packed by the NE and the management systems as good as possible by using '&' and '&&' . The vlan identifier of an incoming frame must be a member of this static VLAN Id list or the dynamic VLAN Id list *vvidlsd*. Frames tagged by a vlan identifier not member of these lists will be discarded. The port VLAN identifier (refer to parameter dftvlan of RTRV-EPORT Output Parameters) is not part of this list. This parameter is also used in transparent tagging mode to specify the list of valid customer tags (CIDs) for network ports (*cnprole* = NETWORK).
    This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U. If the parameter *vvidls* is not supported, then the parameter is omitted.
    Type: Alphanumeric string and the character '&'.

Range:

- Value of each single member (valid VLAN identifier) in the list 1, 2, …, 4092, 4093
- In case the list has no members (empty list) –1.

Default: –1.

30. **`wtr`** – Wait To Restore Time
The parameter *wtr* specifies the wait to restore time for the LCAS protection. If a tributary is configured to take part on transmission for the VCG and it recovers from a faulty state then this tributary is taken in again to transmission by LCAS after the wait-to-restore time. This time is configured on group level, i.e. all tributaries have the same value for the wait-to-restore time. This parameter only affects NE behavior if *lcasmd* = ENABLED.
For *modifier* = ES64U the parameter is visible with default values for retrieval, but cannot be modified.
Type: Alphanumeric value set.
Range: 0, 1, 2, …, 59, 60 [minutes].
Default: 0.
Restriction: For *modifier* = ES64U, this parameter is not editable.

Example output

```

ED-VCG-TRANS: Edit virtual concatenation group for fully transparent application

The **`ED-VCG-TRANS`** command modifies the properties of a virtual concatenation group for fully transparent applications.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: No.

Input format

Command syntax: **`ED-VCG-TRANS`***:tid:aid:ctag:::spec_block;*

Input parameters

Command parameters

1. **`tid`** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **`aid`** – Access Identifier
   This parameter specifies the VCG to be operated on.
   Type: AID.
   Range: VCGAID as defined in AID structure. The values
   - *vall* for Simple_VCGAID
   - *usall* for Simple_UnivSlotAID
   - *all* for Simple_UnivSlotAID
   - *all* for Simple_ShelfAID and
   - *all* for BayAID

   is excluded.
3. **`ctag`** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

Spec block parameters

1. **`camd`** – Consequent Action Mode
   This parameter specifies the mode of the consequent action to be executed in egress direction (to the synchronous port) on detected signal fail conditions (dPLM, AI_TSF or detected generic AIS) on the ODU layer
   Type: Alphanumeric value set.
   Range: GENERICAIS (default), MSAIS, LASEROFF
2. **`enetpn`** – Ethernet Alarm Severity Assignment Profile Name
   This parameter points to an ASAP profile name of type ENET for the designated AID.
   Some VCG related alarms have to be referenced via the ASAP profile named ENET.
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: 1 … 24 characters length.
   Default: DEFAULT.
3. **`fevpm`** – Far End VCG Performance Monitoring
   The parameter fevpm specifies whether the far end performance monitoring is enabled or disabled for this port. For the fully transparent application performance monitoring is actually done on the ODUkP layer. This parameter enables/disable therefore far end PM on the ODUkP layer.
   Type: Alphanumeric value set.
   Range: DISABLE (default), ENABLE
4. **`istd`** – Interface Standard
   This parameter specifies the interface standard of this VCG. This value is applied for both input and output direction.
   Type: Alphanumeric value set.
   Range:
   - SDH
   - SONET.

   Default: As derived from parameter *istddflt* specified at configuration management, section System RTRV-EQPT.
5. **`nevpm`** – Near End VCG Performance Monitoring
   This parameter specifies whether the near end performance monitoring is enabled or disabled for this port. For the fully transparent application performance monitoring is actually done on the ODUkP layer. This parameter enables/disable therefore near end PM on the ODUkP layer.
   Type: Alphanumeric value set.
   Range: DISABLE (default), ENABLE

6. **`pmvcgfeses`** – Performance Monitoring VCG Far-End SES Threshold
   This parameter describes the ODUkP Far-End SES threshold value. It indicates the number of errored blocks per second to declare a second as severely errored. The default value is defined in G.8201 for OTN. If the interface standard is changed the current default value is not changed.
   Type: numeric value set.
   Range (the range depends on the ODUkP rate): ODU1P: 1 – 20420
   Default: ODU1P: 3064
   G.8201 defines block based PM on the ODUkP layer.
7. **`pmvcgneses`** – Performance Monitoring VCG Near-End SES Threshold
   This parameter describes the VCG (actually ODUkP) Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severly errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
   Type: numeric value set.
   Range (the range depends on the ODUkP rate): ODU1P: 1 – 20420
   Default: ODU1P: 3064
   G.8201 defines block based PM on the ODUkP layer.
8. **`tcamd`** – TCA mode
   This parameter shows the modus of the PM thresholding.
   Two thresholding methods are applicable: TR-only, (also known as the implicit reset method). TR-RTR, (also known as the explicit reset method).
   Type: Alphanumeric value set.
   Range: TR, TRRTR.
   Default: TRRTR in SDH mode; TR in SONET mode.
9. **`transpn`** – Transparent Alarm Severity Assignment Profile Name
   This parameter points to a ASAP profile name of type TRANSPARENCY for the designated AID.
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: 1 … 24 characters length
   Default: DEFAULT.
10. **`transtca`** – Transparent TCA Profile Name
    The parameter transtca specifies the name of the threshold crossing alert (TCA) profile used for the VCG..
    Type: Alphanumeric string.
    Range: 1 … 24 characters length
    Default: DEFAULT0
11. **`vmode`** – VCG Monitoring Mode
    This parameter wtr specifies the monitoring mode for VCG. Alarms for this port will be reported if in mode MON otherwise not. There is no automatic mode.
    Type: Alphanumeric value set.
    Range: MON: for monitored; NMON (default): for not monitored.

Output format

If the NE fully complies with the **ED-VCG-TRANS** request, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The command modifies the attributes (listed in the spec_block parameters part of this command) of the addressed port entity according to the parameters given with this command. The modification is reported by means of an **ED-VCG-TRANS** notification for port (except for parameter *istd*; see below).

Switching of interface standard - Ignore other parameters

If additional parameters beside istd are specified with the **ED-VCG-TRANS** command they will be ignored by the NE. This simple approach has the advantage that all ambiguous situations are avoided and it is not necessary to implement an order or follow a certain sequence when evaluating the parameters.

Switching of interface standard - FM impact

The change of the interface standard of a port from SDH to SONET shall have the following impact related to Fault Management:

- All SDH alarms related to that VCG port is cleared
- The corresponding SONET alarms are raised.

Switching of interface standard - Impact on port parameters

Switching of interface standard

The switching of *istd* should not result in an deletion and recreation of the VCG port. NE internally there are no differences between SDH and SONET.

Switching of interface standard I

In detail the following attributes are influenced by switching of the *istd* from SDH to SONET

- *inputsig* is set to the default value
- *istd* is set to SONET
- *pmvcgfeses* is set to the default value for a SONET port
- *pmvcgneses* is set to the default value for a SONET port

- *transtca* is set to the default value for a SONET port
- *tcamd* is set to the default value for a SONET port
- *unequiposig* is set to its default value.

In detail the following attributes are influenced by switching of the istd from SONET to SDH

- *inputsig* is set to the default value
- *istd* is set to SDH
- *pmvcgfeses* is set to the default value for a SDH port
- *pmvcgneses* is set to the default value for a SDH port
- *transtca* is set to the default value for a SDH port
- *tcamd* is set to the default value for a SDH port
- *unequiposig* is set to its default value.

All other port parameters remain unchanged.

Switching of interface standard - Side effects on tributaries

The switching of *istd* should not result in a deletion and recreation of the tributaries of a VCG port. NE internally there are no differences between SDH and SONET.

In detail the following side-effects apply to the related tributary attributes when switching the *istd* from SDH to SONET:

- *ptca* is set to the default value for a SONET tributary
- *tcamd* is set to the default value for a SONET tributary
- *pmhpneses* is set to the default value for an SONET tributary
- *pmhpfeses* is set to the default value for an SONET tributary
- *sdsfmode* is set to the default value for an SONET tributary
- *hptimais* is set to the default value for an SONET tributary.

In detail the following side-effects apply to the related tributary attributes when switching the istd from SONET to SDH:

- *ptca* is set to the default value for a SDH tributary
- *tcamd* is set to the default value for a SDH tributary
- *pmhpneses* is set to the default value for an SDH tributary
- *pmhpfeses* is set to the default value for an SDH tributary
- *sdsfmode* is set to the default value for an SDH tributary
- *hptimais* is set to the default value for an SDH tributary.

Currently (in this release) not applicable parameters to be ignored.

Switching of interface standard - notification behavior for port attributes

When changing the interface standard istd using the **ED-VCG-TRANS** command all resulting parameter changes are reported by ED-VCG-TRANS notifications. This is valid for the parameter istd itself as well as for all other parameters which might change as a consequence of changing the interface standard.

Switching of interface standard - notification behavior for tributary attributes

When changing the interface standard istd using the **ED-VCG-TRANS** command all resulting tributary parameter changes are reported by ED-VCGTRIB notifications.

Switching of interface standard - notification behavior for active TCA events

If the changing of the interface standard istd to SONET includes a change of tcamd from TR-RTR to TR-only (SONET default value), then all active TCA events of the related entities must be cleared.

Switching of interface standard - PM impact

The change of interface standard for the VCG shall have the following impacts w.r.t. existing PM registers:

- All current bins related to the port is reset.
- All history bins related to the port shall remain unchanged.
- All current bins related to tributaries being a member of the VCG port is reset.
- All history bins related to tributaries being a member of the VCG port shall remain unchanged.

Retrieving the bins after switching the interface standard may result in a strange reporting behavior:

- When switching the interface standard to SONET the periods before the switch contain SDH-related parameters and values even though the port is addressed as a SONET port.
- When switching the interface standard to SDH the periods before the switch contain SONET-related parameters and values even though the port is addressed as a SDH port.

Disabling of PM Monitor

The disabling of a PM monitor shall have the following impacts w.r.t. existing PM registers:

- Stop PM counting
- All current bins related to the PM monitor is deleted
- All history bins related to the PM monitor is deleted
- All active TCA events related to the deleted PM monitor have to be cleared if the TCA mode TR-RTR was selected.

The term “PM monitor” has the same semantics as the term “PM package”. The number of PM monitors is determined by means of the number of ’pm enable attributes’.

PM monitors can be disabled explicitly by means of the ’pm enable’ attribute or are implicitly disabled as part of a port/tributary deletion.

Changing TCA mode from TR-RTR to TR-only

The change of *tcamd* from TR-RTR (also known as the explicit reset method) to TR-only (also known as the implicit reset method) has the impact, that all active TCA events of the related entity must be cleared.

Group Notification for VCG tributaries

For efficiency reasons the notifications for VCG tributaries are sent out as a single notification (so-called group notification) using a range over the aid which depends on the used mapping of the associated VCG port, i.e. the Simple_VCGNumAID field in the VCGNumAID is set to

1. 1&&-<N> for sequential range
2. 1&-4 .. &-<N> for non-sequential range

with N is maximal legal VCG tributary number. Example:

The AID field in a group notification for a VCG tributaries related to VCG port 1 for a GE1 pack in slot 1 looks like:

1-1-#-#-1-v1-1&&-21 (for STS-1/VC-3 mapping) 1-1-#-#-1-v1-1&-4&-7&-10&-13&-16&-19 (for STS-3c/VC-4 mapping).

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **`ED-VCG-TRANS`** command, too.

Validation rule: Command only allowed for VCG on Transparent Packs

If the command is not applied to a VCG on a transparent pack, then the command is denied.

Error code: `IENE – Input, Entity Not Exists`

Validation rule: crossconnection - interface standard change

Check that the interface standard parameter (istd) is not changed if there is still a cross-connection applied to any tributary of the whole VCG port.

Error code:

`SNVS – Status, Not in Valid State, cross-connections are still existing`

Validation rule: no loopbacks for interface standard change

Check that the interface standard parameter (istd) is not changed when cross-connection loopback is applied to any tributary of the whole VCG port.

Error code: `SNVS – Status, Not in Valid State, a loopback is existing`

Validation rule: ASAP profile exists

Check of the existence of the ASAP profile.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: TCA profile exists

Check of the existence of the TCA profile.

Error code: `IDNV – Input, Data Not Valid, TCA profile does not exist`

ED-VCG-TRANS notification

Output format

The **ED-VCG-TRANS** notification uses the general format of a REPT DBCHG notification.

Syntax

ED-VCG-TRANS*:aid::spec_block;*

Output parameters

Command parameters

1. **aid** – Access Identifier
   This parameter specifies the VCG to be operated on.
   Type: AID.
   Range: VCGAID as defined in AID structure. The values *vall* for Simple_VCGAID and *usall* for Simple_UnivSlotAID is accepted.

Spec block parameters

1. **camd** – Consequent Action Mode
   This parameter specifies the mode of the consequent action to be executed in egress direction (to the synchronous port) on detected signal fail conditions (dPLM, AI_TSF or detected generic AIS) on the ODU layer
   Type: Alphanumeric value set.
   Range: GENERICAIS (default), MSAIS, LASEROFF
2. **enetpn** – Ethernet Alarm Severity Assignment Profile Name
   This parameter points to a tributary ASAP profile name of type ENET for the designated AID.
   Some VCG related alarms have to be referenced via the ASAP profile named ENET.
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: 1 … 24 characters length.
   Default: DEFAULT.
3. **fevpm** – Far End VCG Performance Monitoring
   The parameter fevpm specifies whether the far end performance monitoring is enabled or disabled for this port. For the fully transparent application performance monitoring is actually done on the ODUkP layer. This parameter enables/disable therefore far end PM on the ODUkP layer.
   Type: Alphanumeric value set.
   Range: DISABLE (default), ENABLE
4. **istd** – Interface Standard
   This parameter specifies the interface standard of this VCG. This value is applied for both input and output direction.
   Type: Alphanumeric value set.

Range:

- SDH
- SONET.

Default: As derived from parameter *istddflt* specified at configuration management, section System RTRV-EQPT.

5. **`nevpm`** – Near End VCG Performance Monitoring
This parameter specifies whether the near end performance monitoring is enabled or disabled for this port. For the fully transparent application performance monitoring is actually done on the ODUkP layer. This parameter enables/disable therefore near end PM on the ODUkP layer.
Type: Alphanumeric value set.
Range: DISABLE (default), ENABLE

6. **`pmvcgfeses`** – Performance Monitoring VCG Far-End SES Threshold
This parameter describes the ODUkP Far-End SES threshold value. It indicates the number of errored blocks per second to declare a second as severely errored. The default value is defined in G.8201 for OTN. If the interface standard is changed the current default value is not changed.
Type: numeric value set.
Range (the range depends on the ODUkP rate): ODU1P: 1 – 20420
Default: ODU1P: 3064
G.8201 defines block based PM on the ODUkP layer.

7. **`pmvcgneses`** – Performance Monitoring VCG Near-End SES Threshold
This parameter describes the VCG (actually ODUkP) Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severly errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (the range depends on the ODUkP rate): ODU1P: 1 – 20420
Default: ODU1P: 3064
G.8201 defines block based PM on the ODUkP layer.

8. **`tcamd`** – TCA mode
This parameter shows the modus of the PM thresholding.
Two thresholding methods are applicable: TR-only, (also known as the implicit reset method). TR-RTR, (also known as the explicit reset method).
Type: Alphanumeric value set.
Range: TR, TRRTR.
Default: TRRTR in SDH mode; TR in SONET mode.

9. **`transpn`** – Transparent Alarm Severity Assignment Profile Name
   This parameter points to a ASAP profile name of type TRANSPARENCY for the designated AID.
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: 1 … 24 characters length
   Default: DEFAULT.
10. **`transtca`** – Transparent TCA Profile Name
    The parameter transtca specifies the name of the threshold crossing alert (TCA) profile used for the VCG..
    Type: Alphanumeric string.
    Range: 1 … 24 characters length
    Default: DEFAULT0
11. **`vmode`** – VCG Monitoring Mode
    This parameter wtr specifies the monitoring mode for VCG. Alarms for this port will be reported if in mode MON otherwise not. There is no automatic mode.
    Type: Alphanumeric value set.
    Range: MON: for monitored; NMON (default): for not monitored.

Example output

```
   LT-UNITE 00-11-11 11:11:00
A  001 REPT DBCHG
   ″TIME=11-10-30,DATE=00-11-11:ED-VCG-TRANS:1-1-#-#-1-V1::vmode=MON″
;
```

ED-VCGTRIB: Edit virtual concatenation group tributary

The **ED-VCGTRIB** command modifies the properties of a virtual concatenation group tributary.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: No

Input format

Command syntax: **ED-VCGTRIB**-*modifier:tid:aid:ctag:::spec_block;*

Input parameters

Command parameters

1. **modifier**
   This parameter specifies the type of the tributary.
   Type: Alphanumeric value set.
   Range: STS, VC, STST, VCT.
   To distinguish the fully transparent application from the GE***n***/ES64U application, a letter "T" is appended.
2. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
3. **aid** – Access Identifier
   The access identifier specifies the VCG tributary whose attributes are to be modified.
   Type: AID
   Range: VCGNumAID as defined in AID structure. The values
   - *all* for Simple_VCGNumAID
   - *vall* for Simple_VCGAID
   - *usall* for Simple_UnivSlotAID
   - *all* for Simple_UnivSlotAID
   - *all* for Simple_ShelfAID and
   - *all* for BayAID

   is excluded.
4. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **`brstintvl`**- Bursty Interval
   This parameter specifies the measurement period for degraded defect if *sdsfmode* is set to BURST. If *sdsfmode* is not set to BURST then *brstintvl* has no affect to NE behavior.
   Type: Integer..
   Range: 2, 3, …, 10 [seconds].
   Default: 7 [seconds].
2. **`brstthr`** – Bursty Error Threshold
   This parameter specifies the degradation threshold for degraded defect if *sdsfmode* is set to BURST. If *sdsfmode* is not set to BURST then *brstthr* has no affect to NE behavior.
   Type: Integer.
   Range: 5, 10, 15, … 50 [%].
   Default: 30 [%].
3. **`degthr`** – Signal Degrade Threshold
   This parameter specifies the exponent to base 10 for building the degraded threshold level. The degraded threshold level is used for building the degraded defect if *sdsfmode* is set to POISSON. If *sdsfmode* is not set to POISSON then *degthr* has no affect to NE behavior. For the definition of *sdsfmode* refer to the Output parameters section.
   The parameter *degthr* is not allowed for modifiers STST and VCT and for VCG tributaries located on GE10PL1 or ES64U circuit packs.
   Type: Integer.
   Range: –5, –6, –7, –8, –9, that means, range is 10^{-9} to 10^{-5}.
   Default: -6
4. **`dexcthr`** – Excessive Degrade Threshold
   This parameter specifies the exponent to base 10 for building the excessive threshold level. The excessive threshold level is used for building the excessive bit error defect if *sdsfmode* is set to POISSON. If *sdsfmode* is not set to POISSON then *dexcthr* has no affect to NE behavior. For the definition of *sdsfmode* refer to the Output parameters section.
   The parameter dexcthr is not allowed for modifiers STST and VCT and for VCG tributaries located on GE10PL1 or ES64Ucircuit packs.
   Type: Integer.
   Range: –3, –4, –5 i.e. range is 10^{-5} to 10^{-3}.
   Default: -3.
5. **`exphptrc`** – Expected HP trace identifier
   This parameter specifies the Expected Higher Order Path Trace Identifier (J1). The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is only useful if *ptrcrfmt* is set to 16.
   For VCG tributaries located on ES64U packs, this parameter shall be visible with default values for retrieval but cannot be modified.

Type: Hexadecimal number without a preceding “H”.
Range: length, 32 hexadecimal digits; value, specific string acc. ITU/ETSI mode 1.
Default: 89000000000000000000000000000000.
This parameter is not allowed for VCG tributaries located on ES64U packs.
This specification is necessary due to hardware restrictions of the Gauss device.

6. **feppm** – Far End Path PM Enable
   This parameter specifies whether the performance monitoring for the far end is enabled or disabled for this tributary.
   The parameter *feppm* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.
   For VCG tributaries located on ES64U packs, this parameter cannot be modified but will be reported with default values since performance monitoring on VCGTRIB level is not supported.
   Type: Alphanumeric value set.
   Range: DISABLE, ENABLE.
   Default: DISABLE.
   This parameter is not allowed for VCG tributaries located on ES64U packs.

7. **hptimais** – HP Trace Identifier Mismatch AIS Insertion
   This parameter specifies if a detected TIM will cause AIS insertion. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
   Type: Alphanumeric value set.
   Range: DISABLE , ENABLE.
   Default: The default value depends on interface standard specified by istd for the VCG owning this tributary. For definition of *istd* refer to “RTRV-VCG: Retrieve virtual concatenation group” (p. 3-3078) Output parameters. DISABLE, if *istd* = SONET; ENABLE, if *istd* = SDH.

8. **hptimmon** – HP Trace Identifier Mismatch Monitor
   This parameter specifies if the mode of the TIM detection. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
   Type: Alphanumeric value set.
   Range: DISABLE (default), ENABLE.

9. **inmbs** – Input Membership
   This parameter specifies if the tributary shall take part to the transmission of its owning VCG in input direction. Input direction in this case means from the LCAS source on the GE1 pack to the cross-connect pack XC***n***. The addressing scheme of the tributaries by using VCGNumAIDs is ensuring that only legal AIDs are used. So no consideration about the “illegal” tributaries (for example, 1-1-#-#-1-1-3 for VC-4) is necessary. The parameter *inmbs* is only valid for modifiers different from STST and VCT, that means, is omitted in the command response for STST and

VCT.
The system shall not evaluate the parameter *inmbs* if the parameter *vcat* of the related VCG is set to DISABLE. The parameter is retrievable.
Type: Alphanumeric value set.
Range: DISABLE , ENABLE.
Default:

- for modifiers STST or VCT: ENABLE
- for all other modifiers: DISABLE.

The VCG for GE***n*** and ES64U has as default the size 0, that means, it has no member. So the default for the parameter above for VCGTRIB needs to be DISABLE so that the user may decide explicitly if one tributary shall take part to the transmission.

10. **`neppm`** – Near End Path PM Enable
This parameter specifies whether the performance monitoring for the near end is enabled or disabled for this tributary.
The parameter *neppm* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.
For VCG tributaries located on ES64U packs, this parameter cannot be modified but will be reported with default values since performance monitoring on VCGTRIB level is not supported.
Type: Alphanumeric value set.
Range:
    - DISABLE (default)
    - ENABLE.

    This parameter is not allowed for VCG tributaries located on ES64U packs.

11. **`outmbs`** – Output Membership
This parameter specifies if the tributary shall take part to the transmission of its owning VCG in output direction. Output direction in this case means from the cross-connect pack XCn to the LCAS sink on the GE***n*** pack. The parameter *outmbs* is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.
The system shall not evaluate the parameter *outmbs* if the parameter *vcat* of the related VCG is set to DISABLE. The parameter is retrievable.
Type: Alphanumeric value set.
Range:
    - DISABLE
    - ENABLE.

    The VCG for GE***n*** and ES64U has as default the size 0, that means, it has no member. So the default for the parameter above for VCGTRIB needs to be DISABLE so that the user may decide explicitly if one tributary shall take part to the transmission.

12. **`pmhpfeses`** – PM HP Far End SES Threshold
    This parameter specifies the Higher Order Path Far End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the far end. The behavior depends on interface standard specified by *istd* for the VCG owning this tributary. For definition of *istd* refer to the output parameters section of "RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3078). If *istd* is not set to SDH then *pmhpfeses* has no affect to NE behavior.
    The parameter *pmhpfeses* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.
    For VCG tributaries located on ES64U packs, this parameter can be modified although it has currently no effect as performance monitoring on VCGTRIB level is not supported.
    Type: Integer.
    Range: 1, 2, 3, …, 63998, 63999, 64000, includes SDH/SONET range.
    Default: 2400.
13. **`pmhpneses`** – PM HP Near End SES Threshold
    This parameter specifies the Higher Order Path Near End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the near end. The behavior depends on interface standard specified by *istd* for the VCG owning this tributary. For definition of *istd* refer to the output parameters section of "RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3078). If *istd* is not set to SDH then *pmhpneses* has no affect to NE behavior.
    The parameter *pmhpneses* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.
    For VCG tributaries located on ES64U packs, this parameter can be modified although it has currently no effect as performance monitoring on VCGTRIB level is not supported.
    Type: Integer.
    Range: 1, 2, 3, …, 63998, 63999, 64000, includes SDH/SONET range.
    Default: 2400.
14. **`ptca`** – Path TCA Profile Pointer
    This parameter specifies the name of the threshold crossing alert (TCA) profile used for this tributary.
    The parameter *ptca* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.
    For VCG tributaries located on ES64U packs, this parameter can be modified although it has currently no effect as performance monitoring on VCGTRIB level is not supported.
    Type: Alphanumeric string.
    Range: 1 … 24 characters.
    Default: DEFAULT0.

15. **`ptpn`** – Path Terminating ASA Profile Name
    This parameter points to a tributary ASAP profile name *pfname* for the designated AID.
    Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
    Range: 1 … 24 characters.
    Default: DEFAULT.
16. **`ptrcrfmt`** – Path Trace Read Format
    This parameter specifies the format of the path trace (J1 byte) to be received (sink).
    The parameter is not allowed for VCG tributaries located on GE10PL1 packs.
    The parameter is not allowed for VCG tributaries located on ES64U packs. This specification is necessary due to hardware restrictions of the Gauss device.
    Type: numeric string.
    Range:
    - 2, for non-specific repeating byte
    - 16, for 16 byte specific string
    - 64, for 64 byte string.

    Default: 2.
17. **`ptrcwfmt`** – Path Trace Write Format
    This parameter specifies the format of the path trace (J1 byte) to be sent (source).
    The parameter is not allowed for VCG tributaries located on GE10PL1 packs.
    The parameter is not allowed for VCG tributaries located on ES64U packs. This specification is necessary due to hardware restrictions of the Gauss device.
    Type: numeric string.
    Range:
    - 2, for non-specific repeating byte
    - 16, for 16 byte specific string
    - 64, for 64 byte string.

    Default: 2.
18. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
    This parameter specifies the determination mode of degraded defect for transmission.
    The parameter *sdsfmode* is not allowed for modifiers STST and VCT and for VCG tributaries located on GE10PL1 or ES64U circuit packs.
    Type: Alphanumeric value set.
    Range: BURST or POISSON.
    Default: For VCG tributaries located on a GE10PL1 pack, the default is: BURST. For VCG tributaries located on other packs, the default value depends on interface standard specified by *istd* for the VCG owning this tributary. For definition of *istd* refer to **`RTRV-VCG`** Output Parameters. POISSON, if *istd* = SONET; BURST, if *istd* = SDH

19. **tcamd** – TCA mode
    This parameter is only available for SDH mode. This means the modifier must be VC. The parameter shows the modus of the PM thresholding. Two thresholding methods are applicable for SDH: TR-only (also known as the implicit reset method), TR-RTR (also known as the explicit reset method). For SONET the parameter *tcamd* does not exist. SONET ports only support ″TR-only″ mode. Thus the mode must be internally set to ″TR-only″.
    The parameter *tcamd* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.
    For VCG tributaries located on ES64U packs, this parameter can be modified although it has currently no effect as performance monitoring on VCGTRIB level is not supported.
    Type: Alphanumeric value set.
    Range: TR, TRRTR.
    Default: SDH mode: TRRTR. SONET mode: TR (internal). For SONET the parameter tcamd does not exist. SONET ports only support ″TR-only″ mode. Thus the mode must be internally set to ″TR-only″.
20. **tmonmd** – Tributary Monitoring Mode
    This parameter specifies the monitoring mode for the tributary.
    For VCG tributaries located on ES64U packs, this parameter can be modified although it has currently no effect.
    Type: Alphanumeric value set.
    Range: MON or NMON (default).
21. **trc** – Outgoing Path Trace
    This parameter specifies the path trace (J1) to be sent (source). For the 16 byte path trace format the following syntactical rule is applied: The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is irrelevant if the format is non-specific repeating byte (*ptrcwfmt* = 2).
    For VCG tributaries located on ES64U packs, this parameter shall be visible with default values for retrieval, but cannot be modified.
    Type: Hexadecimal number without a preceding “H”.
    Range: the range depends on the parameter ptrcwfmt specified in **RTRV-VCGTRIB** Output parameters length
    - 32, hexadecimal digits, if *ptrcwfmt* = 16
    - 128, hexadecimal digits, if *ptrcwfmt* = 64
    - value: specific string acc. ITU/ETSI mode 1, if *ptrcwfmt* = 16; 64 byte string, if *ptrcwfmt* = 16.

Default: Depending on the default value of *ptrcwfmt*:

- 00hex, if *ptrcwfmt* = 2.
- 89hex followed by 15 bytes 00hex, if *ptrcwfmt* = 16.
- 64 bytes 00hex, if *ptrcwfmt* = 64.

The parameter is not allowed for VCG tributaries located on ES64U packs.
This specification is necessary due to hardware restrictions of the Gauss device.

22. **tslmmon** – Trail Signal Label Mismatch Monitor
This parameter specifies the mode of the TSL mismatch detection.
For VCG tributaries located on ES64U packs, this parameter shall be visible with default values for retrieval, but cannot be modified.
Type: Alphanumeric value set.
Range:
    - DISABLE
    - ENABLE (default).

The parameter is not allowed for VCG tributaries located on ES64U packs.
This specification is necessary due to hardware restrictions of the Gauss device.

Output format

If the NE fully complies with the **ED-VCGTRIB** request, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The **ED-VCGTRIB** generates a **REPT DBCHG** message.

The command modifies the attributes (listed in the spec_block parameters part of this command) of the addressed tributary entity according to the parameters given with this command.

The parameters *brstintvl*, *brstthr*, *degthr* and *dexcthr* is modifiable also if they are not meaningful at the moment. The modification is reported by means of an ED-VCGTRIB notification.

Dependencies

brstintvl and *brstthr* are only meaningful if sdfsmode is set to BURST. *degthr* and *dexcthr* are only meaningful if sdfsmode is set to POISSON.

Update affected entities

A change of the value of one of the parameters *inmbs* and *outmbs* shall trigger the report of *inmbst* and *outmbst* of the corresponding VCGTRIB via an autonomous notification.

Update affected entities - *hptimais* for VCG tributaries of a transparent VCG

If the value of hptimais is changed for one VCG tributary of a transparent VCG (modifiers STST and VCT), then the parameter hptimais are updated to the same value for all VCG tributaries of the same transparent VCG. The update of *hptimais* is notified via ED-VCGTRIB notifications for each VCG tributary.

Supply outgoing J1 trace value and format together

When changing the format of the outgoing J1 trace *ptrcwfmt*, the parameter trc specifying the outgoing J1 trace shall always be supplied within the same TL1-command to always have a consistent set of trace format and value. When the format of the outgoing J1 trace *ptrcwfmt* is set to 2 (non-specific repeating byte) then the outgoing J1 trace (mandatory parameter trc) specified in the command is ignored.

Change of J1 expected format - FM impact

When the expected J1 format (*ptrcrfmt*) is changed to 16 (16 byte specific string) while the TI Mismatch detection is enabled, then the TI Mismatch alarm is updated according to the provisioned ecpected J1 (exphptrc) and the currently received J1 (ptrc). When the expected J1 format is changed away from 16, while the TI Mismatch alarm is active, then the TI Mismatch alarm is cleared.

Not applicable parameters for the modifiers STST and VCT

For the command modifiers STST and VCT the following parameters is not alterable:

- **`brstintvl`**
- **`brstthr`**
- **`degthr`**
- **`dexcthr`**
- **`feppm`**
- **`inmbs`**
- **`inmbst`**
- **`neppm`**
- **`outmbs`**
- **`outmbst`**
- **`pmhpfeses`**
- **`pmhpneses`**
- **`ptca`**

- **sdsfmode**
- **tcamd**

See also the invalid declaration of these parameters for **RTRV-VCGTRIB** for these modifiers.

Disabling of PM Monitor

The disabling of a PM monitor shall have the following impacts w.r.t. existing PM registers:

- Stop PM counting
- All current bins related to the PM monitor is deleted
- All history bins related to the PM monitor is deleted

The term “PM monitor” has the same semantics as the term “PM package”. The number of PM monitors is determined by means of the number of ’pm enable attributes’.

PM monitors can be disabled explicitly by means of the ’pm enable’ attribute or are implicitly disabled as part of a port/tributary deletion.

Additional to the above listed impacts the disabling of a PM monitor shall have the following impacts: the system has to clear all active TCA events of the deleted PM monitor if TCA mode TR-RTR was selected .

Changing TCA mode from TR-RTR to TR-only

The change of tcamd from TR-RTR (also known as the explicit reset method) to TR-only (also known as the implicit reset method) has the impact, that all active TCA events of the related entity must be cleared.

Threshold settings for all VCG tributaries related to one VCG

Setting one of the parameters *brstintvl*, *brstthr*, *degthr*, *dexcthr*, *sdsfmode* for one VCG Tributary causes that this parameter is set to the same value for all other VCG tributaries related to the same VCG. The respective notifications are sent.

Refer to the parameter definitions in “RTRV-VCGTRIB: Retrieve virtual concatenation group tributary ” (p. 3-3109) for the restrictions using the modifiers STST and VCT.

64 byte path trace setting on GE10PL1 pack for all VCG tributaries related to one VCG

Setting the outgoing path trace (ptrc) for the first VCG tributary of a VCG on a GE10PL1 pack, while the outgoing path trace format (ptrcwfmt) is set to 64 byte format, shall set the outgoing path trace of all VCG tributaries of the VCG to the same value as the first VCG tributary.

Example input/output

```
ED-VCGTRIB-VC:LT-UNITE:1-1-#-#-1-v1-1:123456:::tmonmd=NMON;

   LT-UNITE 00-11-11 11:11:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **`ED-VCGTRIB`** command.

Validation rule: Check *modifier* against circuit pack type

If the command is applied

- with *modifier* = VC or STS to a VCG Tributary on a Transparent pack or
- with *modifier* = VCT or STST to a VCG Tributary on a GE***n*** or ES64U pack, then the command is denied.

Error code: `IENE – Input, Entity Not Exists`

Validation rule: ASAP profile exists

Check of the existence of the ASAP profile.

Error code: `IDNV – Input, Data Not Valid, ASAP profile does not exist`

Validation rule: TCA profile exists

Check of the existence of the TCA profile.

Error code: `IDNV – Input, Data Not Valid, TCA profile does not exist`

Validation rule: supply of transmitted path trace

Check that a transmit path trace (trc) is supplied, too, if the path trace mode is changed.

Error code:

`IDNC – Input, Data, Not Consistent, a new trc must also be supplied for a path trace mode change`

Validation rule: transmitted path trace length

Check that a length of the transmit path trace (*trc*) fits to the length given by path trace mode, i.e. write format (*ptrcwfmt*).

Error code:

`IDNC – Input, Data, Not Consistent, trc length must match the given path trace mode`

Validation rule: Path trace monitoring on GE10PL1 only for first VCG tributary of a VCG

If the VCG tributary is located on a GE10PL1 pack, then the system shall only allow to set the parameters hptimmon and hptimais to ENABLE only for the first VCG tributary of a VCG. I.e. only for VCG tributary AID number = 1.

Error code:
`SDNC – Status, Data Not Consistent, Not allowed on GE10PL1 pack`

Validation rule: Path trace not supported on ES64U

If the VCG tributary is located on an ES64U pack, then the system does not allow to set the parameters *exphptrc*, *ptrcrfmt*, *ptrcwfmt*, and *trc*.

This validation rule is necessary due to hardware restrictions.

Error code: `SDNC – Status, Data Not Consistent, Not allowed on ES64U pack`

Validation rule: Trail signal label mismatch monitor not supported on ES64U

If the VCG tributary is located on an ES64U pack, then the system does not allow to set the parameter *tslmmon*

This validation rule is necessary due to hardware restrictions.

Error code: `SDNC – Status, Data Not Consistent, Not allowed on ES64U pack`

Validation rule:

If the VCG tributary is located on an ES64U pack, then the system does not allow to set the parameters *feppm* and *neppm*.

Error code: `SDNC – Status, Data Not Consistent, Not allowed on ES64U pack`

Validation rule: 64 byte path trace setting on GE10PL1 only for first VCG tributary of a VCG

If the VCG tributary is located on a GE10PL1 pack and the parameter *ptrcwfmt* has the value 64, then the system shall only allow to set the parameter *trc* only for the first VCG tributary of a VCG. I.e. only for VCG tributary AID number = 1.

Error
code:`SDNC – Status, Data Not Consistent, Not allowed on GE10PL1 pack`

Validation rule: Maximum number of enabled PM monitors

Check that the number of enabled PM monitors is less than the maximum number of supported enabled PM monitors (2000) before a new PM monitor is enabled.

Error code:
`SSRE – Status, System Resources Exceeded, limit of PM monitors exceeded`.

Since several monitor points can be enabled/disabled within one command, the **`ED`** command may only fail if the validation rule is not met after all PM enable attributes would have been updated as specified in the corresponding ED request.

Example: The **`ED`** command requests that 1 monitor point is enabled and 1 monitor points is disabled and currently 2000 packages are enabled. This command should complete.

Validation rule: Correct state of tributary for being added (Sink)

Check that the tributary to be added for transmission in sink direction is in the inactive state (NA, not applicable).

Error code: `ICNV – Input, Command Not Valid, outmbst not NA`

For the detailed description of the LCAS protocol refer to SRD_Data_VirtualConcatenation. Only applicable for modifiers different from STST and VCT.

Validation rule: Correct state of tributary for being added (Source)

Check that the tributary to be added for transmission in source direction is in the inactive state (NA, not applicable).

Error code: `ICNV – Input, Command Not Valid, inmbst not NA`

For the detailed description of the LCAS protocol refer to SRD_Data_VirtualConcatenation. Only applicable for modifiers different from STST and VCT.

Validation rule: LCAS failure of protocol present in sink direction

Check if a tributary is going to be added for transmission under active LCAS that no failure of the LCAS protocol is present in receive direction.

Error code:

`ICNV – Input, Command Not Valid, Protocol Failure in Receive Direction`

For the detailed description of the LCAS protocol refer to SRD_Data_VirtualConcatenation. Only applicable for modifiers different from STST and VCT.

Validation rule: LCAS failure of protocol present in source direction

Check if a tributary is going to be added for transmission under active LCAS that no failure of the LCAS protocol is present in transmit direction.

Error code:

`ICNV – Input, Command Not Valid, Protocol Failure in Transmit Direction`.

For the detailed description of the LCAS protocol refer to SRD_Data_VirtualConcatenation.

Only applicable for modifiers different from STST and VCT.

Validation rule: Enabling of inmbs and outmbs not allowed while vcat disabled

The system shall not allow to set the Input Membership or Output Membership (inmbs or outmbs) to ENABLE for a VCG Tributary while the Virtual Concatenation (vcat) of the related VCG is set to DISABLE.

Error code:

`SNVS – Status, Not in Valid State, Not allowed if VCAT disabled`

Check CCB against istd of related VCG

See definition of Error responses in "RTRV-VCGTRIB: Retrieve virtual concatenation group tributary " (p. 3-3109).

Related TL1 messages

ED-VCGTRIB notification

Output format

The **ED-VCGTRIB** notification uses the general format of a REPT DBCHG (Report Database Change) notification.

The **ED-VCGTRIB** notification has the following specific syntax:

ED-VCGTRIB:*aid,aidtype::spec_block;*

Output parameters

Command parameters

1. **aid** – Access Identifier
   This parameter specifies the VCG tributary whose attributes are reported.
   Type: AID.
   Range: VCGNumAID as defined in AID structure with exception of value all.
2. **aidtype** – Access Identifier Type
   This parameter specifies the type of the tributary.
   Type: Alphanumeric value set.
   Range: STS, VC, STST, VCT.
   To distinguish the fully transparent application from a GE application, a letter ″T″ is appended. There is no distinction between VCGTRIB entities of the GE1 pack from the GE10PL1 pack needed. In particular, the transmission rate in case the parameter *modifier* = STS needs to be derived from the parameters inputsig and unequiposig of the related VCG entity.

Spec block parameters

1. **brstintvl**- Bursty Interval
   This parameter specifies the measurement period for degraded defect if *sdsfmode* is set to BURST. If *sdsfmode* is not set to BURST then *brstintvl* has no affect to NE behavior.
   Type: Integer..
   Range: 2, 3, …, 10 [seconds].
   Default: 7 [seconds].
2. **brstthr** – Bursty Error Threshold
   This parameter specifies the degradation threshold for degraded defect if *sdsfmode* is set to BURST. If *sdsfmode* is not set to BURST then *brstthr* has no affect to NE behavior.
   Type: Integer.
   Range: 5, 10, 15, … 50 [%].
   Default: 30 [%].

3. **`crslpbkstat`** – Cross-connect Loopback Status
   This parameter reports the configuration of the cross-connection loopback of this tributary. For changing the loopback operation refer to “OPR-LPBK: Operate cross-connection loopback” (p. 3-2035).
   Type: Alphanumeric value set.
   Range: YES, for enabled loopback; NO, for disabled loopback.
   Default: NO.
4. **`degthr`** – Signal Degrade Threshold
   This parameter specifies the exponent to base 10 for building the degraded threshold level. The degraded threshold level is used for building the degraded defect if *sdsfmode* is set to POISSON. If *sdsfmode* is not set to POISSON then *degthr* has no affect to NE behavior. For the definition of *sdsfmode* refer to the Output parameters section.
   The parameter *degthr* is not allowed for modifiers STST and VCT and for VCG tributaries located on GE10PL1 or ES64U circuit packs.
   Type: Integer.
   Range: –5, –6, –7, –8, –9, that means, range is 10^{-9} to 10^{-5}.
   Default: -6
5. **`dexcthr`** – Excessive Degrade Threshold
   This parameter specifies the exponent to base 10 for building the excessive threshold level. The excessive threshold level is used for building the excessive bit error defect if *sdsfmode* is set to POISSON. If *sdsfmode* is not set to POISSON then *dexcthr* has no affect to NE behavior. For the definition of *sdsfmode* refer to the Output parameters section.
   The parameter dexcthr is not allowed for modifiers STST and VCT and for VCG tributaries located on GE10PL1 or ES64Ucircuit packs.
   Type: Integer.
   Range: –3, –4, –5 i.e. range is 10^{-5} to 10^{-3}.
   Default: -3.
6. **`exphptrc`** – Expected HP trace identifier
   This parameter specifies the Expected Higher Order Path Trace Identifier (J1). The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is only useful if *ptrcrfmt* is set to 16.
   For VCG tributaries located on ES64U packs, this parameter shall be visible with default values for retrieval but cannot be modified.
   Type: Hexadecimal number without a preceding “H”.
   Range: length, 32 hexadecimal digits; value, specific string acc. ITU/ETSI mode 1.
   Default: 89000000000000000000000000000000.
   This parameter is not allowed for VCG tributaries located on ES64U packs.
   This specification is necessary due to hardware restrictions of the Gauss device.

7. **feppm** – Far End Path PM Enable
   This parameter specifies whether the performance monitoring for the far end is enabled or disabled for this tributary.
   The parameter *feppm* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.
   For VCG tributaries located on ES64U packs, this parameter cannot be modified but will be reported with default values since performance monitoring on VCGTRIB level is not supported.
   Type: Alphanumeric value set.
   Range: DISABLE, ENABLE.
   Default: DISABLE.
   This parameter is not allowed for VCG tributaries located on ES64U packs.
8. **hptimais** – HP Trace Identifier Mismatch AIS Insertion
   This parameter specifies if a detected TIM will cause AIS insertion. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
   Type: Alphanumeric value set.
   Range: DISABLE , ENABLE.
   Default: The default value depends on interface standard specified by istd for the VCG owning this tributary. For definition of *istd* refer to "RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3078) Output parameters. DISABLE, if *istd* = SONET; ENABLE, if *istd* = SDH.
9. **hptimmon** – HP Trace Identifier Mismatch Monitor
   This parameter specifies if the mode of the TIM detection. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
   Type: Alphanumeric value set.
   Range: DISABLE (default), ENABLE.
10. **inmbs** – Input Membership
    This parameter specifies if the tributary shall take part to the transmission of its owning VCG in input direction. Input direction in this case means from the LCAS source on the GE1 pack to the cross-connect pack XC***n***. The addressing scheme of the tributaries by using VCGNumAIDs is ensuring that only legal AIDs are used. So no consideration about the "illegal" tributaries (for example, 1-1-#-#-1-1-3 for VC-4) is necessary. The parameter *inmbs* is only valid for modifiers different from STST and VCT, that means, is omitted in the command response for STST and VCT.
    The system shall not evaluate the parameter *inmbs* if the parameter *vcat* of the related VCG is set to DISABLE. The parameter is retrievable.
    Type: Alphanumeric value set.
    Range: DISABLE , ENABLE.

Default:

- for modifiers STST or VCT: ENABLE
- for all other modifiers: DISABLE.

The VCG for GE***n*** and ES64U has as default the size 0, that means, it has no member. So the default for the parameter above for VCGTRIB needs to be DISABLE so that the user may decide explicitly if one tributary shall take part to the transmission.

11. **inmbst** – Input Member Status

This parameter reports the status of the tributary related to its VCG membership in input direction. The parameter *inmbst* is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.
Type: Alphanumeric value set.

Range:

- for modifiers STST or VCT always ACTIVE is reported
- for all other modifiers:
- NA, for not applicable, i.e. if the trib. is no member of the VCG or if virtual concatenation is disabled
- ADD, the tributary is in the LCAS state ″Wait-for-Add″, ″Add″ or ″Wait-for-ACK″
- ACTIVE, the tributary is member of the VCG and working
- FAILED, the tributary is member of the VCG but taken off by LCAS (incoming failed condition for the sink tributary)
- UNAVAILABLE, for not available, i.e. the trib. is member of the VCG but the current data is not retrievable for any reason.

  The state FAILED can only be reported if *lcasmd* is set to ENABLE for the VCG owning this tributary. For parameter *lcasmd* refer to the Output parameters section of “RTRV-VCG: Retrieve virtual concatenation group” (p. 3-3078).

  For VCG tributaries located on ES64U packs only ″NA″ will be reported.

12. **neppm** – Near End Path PM Enable

This parameter specifies whether the performance monitoring for the near end is enabled or disabled for this tributary.
The parameter *neppm* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.
For VCG tributaries located on ES64U packs, this parameter cannot be modified but will be reported with default values since performance monitoring on VCGTRIB level is not supported.
Type: Alphanumeric value set.

Range:

- DISABLE (default)
- ENABLE.

This parameter is not allowed for VCG tributaries located on ES64U packs.

13. **`outmbs`** – Output Membership
    This parameter specifies if the tributary shall take part to the transmission of its owning VCG in output direction. Output direction in this case means from the cross-connect pack XCn to the LCAS sink on the GE***n*** pack. The parameter *outmbs* is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.
    The system shall not evaluate the parameter *outmbs* if the parameter *vcat* of the related VCG is set to DISABLE. The parameter is retrievable.
    Type: Alphanumeric value set.
    Range:
    - DISABLE
    - ENABLE.

    The VCG for GE***n*** and ES64U has as default the size 0, that means, it has no member. So the default for the parameter above for VCGTRIB needs to be DISABLE so that the user may decide explicitly if one tributary shall take part to the transmission.
14. **`outmbst`** – Output Member Status
    This parameter reports the status of the tributary related to its VCG membership in output direction. The parameter *outmbst* is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.
    Type: Alphanumeric value set.
    Range:
    - for modifiers STST or VCT always ACTIVE is reported, for all other modifiers:
    - NA, for not applicable, i.e. if the trib. is no member of the VCG or if virtual concatenation is disabled
    - ADD, the tributary is in the LCAS state ″Wait-for-Add″ or ″Wait-for-Data″
    - ACTIVE, the tributary is member of the VCG and working
    - FAILED, the tributary is member of the VCG but not working due to a failure condition. Includes period during ″Hold-Off″.
    - WTR, failure condition has cleared, tributary is in wait to restore condition.
    - UNAVAILABLE, for not available, i.e. the trib. is member status is not retrievable for any reason.

      The state WTR can only be reported if lcasmd is set to ENABLE for the VCG owning this tributary. For parameter lcasmd refer to RTRV-VCG Output Parameters. For a detailed explanation of the ADD state in the LCAS protection scheme, please refer to SRD_DATA_Virtual_Concatenation.
      For VCG tributaries located on ES64U packs only ″NA″ will be reported.
15. **`pmhpfeses`** – PM HP Far End SES Threshold
    This parameter specifies the Higher Order Path Far End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the far end. The behavior depends on interface standard specified by *istd* for the VCG owning this

tributary. For definition of *istd* refer to the output parameters section of "RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3078). If *istd* is not set to SDH then *pmhpfeses* has no affect to NE behavior.
The parameter *pmhpfeses* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.
For VCG tributaries located on ES64U packs, this parameter can be modified although it has currently no effect as performance monitoring on VCGTRIB level is not supported.
Type: Integer.
Range: 1, 2, 3, …, 63998, 63999, 64000, includes SDH/SONET range.
Default: 2400.

16. **pmhpneses** – PM HP Near End SES Threshold
This parameter specifies the Higher Order Path Near End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the near end. The behavior depends on interface standard specified by *istd* for the VCG owning this tributary. For definition of *istd* refer to the output parameters section of "RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3078). If *istd* is not set to SDH then *pmhpneses* has no affect to NE behavior.
The parameter *pmhpneses* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.
For VCG tributaries located on ES64U packs, this parameter can be modified although it has currently no effect as performance monitoring on VCGTRIB level is not supported.
Type: Integer.
Range: 1, 2, 3, …, 63998, 63999, 64000, includes SDH/SONET range.
Default: 2400.

17. **ptca** – Path TCA Profile Pointer
This parameter specifies the name of the threshold crossing alert (TCA) profile used for this tributary.
The parameter *ptca* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.
For VCG tributaries located on ES64U packs, this parameter can be modified although it has currently no effect as performance monitoring on VCGTRIB level is not supported.
Type: Alphanumeric string.
Range: 1 … 24 characters.
Default: DEFAULT0.

18. **ptpn** – Path Terminating ASA Profile Name
This parameter points to a tributary ASAP profile name *pfname* for the designated AID.
Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
Range: 1 … 24 characters.
Default: DEFAULT.

19. **`ptrcrfmt`** – Path Trace Read Format
    This parameter specifies the format of the path trace (J1 byte) to be received (sink).
    The parameter is not allowed for VCG tributaries located on GE10PL1 packs.
    The parameter is not allowed for VCG tributaries located on ES64U packs. This specification is necessary due to hardware restrictions of the Gauss device.
    Type: numeric string.

    Range:

    - 2, for non-specific repeating byte
    - 16, for 16 byte specific string
    - 64, for 64 byte string.

    Default: 2.

20. **`ptrcwfmt`** – Path Trace Write Format
    This parameter specifies the format of the path trace (J1 byte) to be sent (source).
    The parameter is not allowed for VCG tributaries located on GE10PL1 packs.
    The parameter is not allowed for VCG tributaries located on ES64U packs. This specification is necessary due to hardware restrictions of the Gauss device.
    Type: numeric string.

    Range:

    - 2, for non-specific repeating byte
    - 16, for 16 byte specific string
    - 64, for 64 byte string.

    Default: 2.

21. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
    This parameter specifies the determination mode of degraded defect for transmission.
    The parameter *sdsfmode* is not allowed for modifiers STST and VCT and for VCG tributaries located on GE10PL1 or ES64U circuit packs.
    Type: Alphanumeric value set.
    Range: BURST or POISSON.
    Default: For VCG tributaries located on a GE10PL1 pack, the default is: BURST.
    For VCG tributaries located on other packs, the default value depends on interface standard specified by *istd* for the VCG owning this tributary. For definition of *istd* refer to **`RTRV-VCG`** Output Parameters. POISSON, if *istd* = SONET; BURST, if *istd* = SDH

22. **`tcamd`** – TCA mode
    This parameter is only available for SDH mode. This means the modifier must be VC. The parameter shows the modus of the PM thresholding. Two thresholding methods are applicable for SDH: TR-only (also known as the implicit reset method), TR-RTR (also known as the explicit reset method). For SONET the parameter *tcamd* does not exist. SONET ports only support ″TR-only″ mode. Thus the mode must be internally set to ″TR-only″.
    The parameter *tcamd* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.

For VCG tributaries located on ES64U packs, this parameter can be modified although it has currently no effect as performance monitoring on VCGTRIB level is not supported.
Type: Alphanumeric value set.
Range: TR, TRRTR.
Default: SDH mode: TRRTR. SONET mode: TR (internal). For SONET the parameter tcamd does not exist. SONET ports only support ″TR-only″ mode. Thus the mode must be internally set to ″TR-only″.

23. **`tmonmd`** – Tributary Monitoring Mode
This parameter specifies the monitoring mode for the tributary.
For VCG tributaries located on ES64U packs, this parameter can be modified although it has currently no effect.
Type: Alphanumeric value set.
Range: MON or NMON (default).

24. **`trc`** – Outgoing Path Trace
This parameter specifies the path trace (J1) to be sent (source). For the 16 byte path trace format the following syntactical rule is applied: The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is irrelevant if the format is non-specific repeating byte (*ptrcwfmt* = 2).
For VCG tributaries located on ES64U packs, this parameter shall be visible with default values for retrieval, but cannot be modified.
Type: Hexadecimal number without a preceding “H”.
Range: the range depends on the parameter ptrcwfmt specified in **`RTRV-VCGTRIB`** Output parameters length

- 32, hexadecimal digits, if *ptrcwfmt* = 16
- 128, hexadecimal digits, if *ptrcwfmt* = 64
- value: specific string acc. ITU/ETSI mode 1, if *ptrcwfmt* = 16; 64 byte string, if *ptrcwfmt* = 16.

Default: Depending on the default value of *ptrcwfmt*:

- 00hex, if *ptrcwfmt* = 2.
- 89hex followed by 15 bytes 00hex, if *ptrcwfmt* = 16.
- 64 bytes 00hex, if *ptrcwfmt* = 64.

The parameter is not allowed for VCG tributaries located on ES64U packs.
This specification is necessary due to hardware restrictions of the Gauss device.

25. **`tslmmon`** – Trail Signal Label Mismatch Monitor
This parameter specifies the mode of the TSL mismatch detection.
For VCG tributaries located on ES64U packs, this parameter shall be visible with default values for retrieval, but cannot be modified.
Type: Alphanumeric value set.

Range:

- DISABLE
- ENABLE (default).

The parameter is not allowed for VCG tributaries located on ES64U packs. This specification is necessary due to hardware restrictions of the Gauss device.

Example output

```
   LT-UNITE 00-11-11 11:11:00
A  001 REPT DBCHG
   ″TIME=11-10-30,DATE=00-11-11:ED-VCGTRIB:1-1-#-#-1-V1-1,STS::outmbs=ENABLE″
;
```

ED-VRTSW: Edit virtual switch

The **ED-VRTSW** command modifies the properties of a virtual switch.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: No

Input format

Command syntax: **Ed-VRTSW**:*tid*:*aid*:*ctag*::*vrtswid*:*spec_block*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and the description of this parameter.
2. **aid** – Access Identifier
   The access identifier specifies the slot containing a GE1 pack.
   Type: AID.
   Range: UnivSlotAID as defined in AID structure.
   The values
   - all and
   - usall for Simple_UnivSlotAID
   is accepted.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and the description of this parameter.
4. **vrtswid** – Virtual Switch Identifier
   This parameter identifiers the instance of the virtual switch.
   - A Virtual Switch ID is unique within a single circuit pack. When creating a new Virtual Switch, the system automatically assigns a unique ID to it.
   - There will be one virtual switch per physical switch, implicitly all LAN ports and all WAN ports on the physical switch are part of the single virtual switch. The ID of this virtual switch is fixed to 1. A future release may support multiple virtual switches per physical switch.
   Type: Integer.
   Range: 1 – Currently this is the only allowed value.
   Default: 1.

Spec block parameters

1. **`ethertype`** – VLAN tag protocol ID
   This parameter specifies the VLAN tag protocol ID necessary for interworking purposes. This parameter is used to control whether the virtual switch operates in IEEE802.1Q tagging mode (i.e. set to 0x8100) or in transparent tagging mode (i.e. set to value different to 0x8100).
   Type: Hexadecimal value.
   Range: 0x0600 .. 0xFFFF.

   The following values have a specific meaning:

   - 0x8100: virtual switch operates in IEEE802.1Q tagging mode
   - any other value: virtual switch operates in transparent tagging mode.

   Default: 0x8100.
2. **`gvrpmode`** – GVRP mode
   The parameter *gvrpmode* allows to control the dynamic VLAN registration mode.
   Type: Alphanumeric value set.
   Range: ENABLED, GVRP is enabled. DISABLED (default), GVRP is disabled.
3. **`stbrpriority`** – Spanning tree bridge priority
   This parameter specifies the priority of the bridge to be used by the Spanning Tree Protocol.
   Type: Integer.
   Range: 0 to 65535.
   The stepping as recommended by the standard (steps of 4096 starting at 0) should be implemented by the management system. The NE will accept any value in the range described above. This has the consequence, that also the range restriction ″0 to 61440″ is not done by the NE.
   Default: 32768.
4. **`stfdtm`** – Spanning Tree forward delay timer
   The parameter *stfdtm* specifies the rSTP-related bridge forward delay timer. This parameter is relevant for both rSTP and STP.
   Type: Integer.
   Range: 1 .. 255.
   Default: 15.

5. **`sthellotm`** – Spanning Tree hello timer
   The parameter *sthellotm* specifies the rSTP-related bridge hello timer. This parameter is relevant for both rSTP and STP.
   Type: Integer.
   Range: 1 .. 225.
   Default: 2.
6. **`stmaxage`** – Spanning Tree maximum age timer
   The parameter *stmaxage* specifies the rSTP-related maximum PDU transmission delay timer. This parameter is relevant for both rSTP and STP.
   Type: Integer.
   Range: 1 .. 255.
   Default: 20.

Output format

If the NE fully complies with the ED-VRTSW request, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are described in the Output parameter section of.

Detailed behavior description

The **`ED-VRTSW`** command generates a REPT DBCHG message.

The command modifies the attributes (listed in the spec_block parameters part of this command) of the addressed virtual switch entity according to the parameters given with this command.

The modification is reported by means of an ED-VRTSW notification.

Effect of *ethertype* on virtual switch operation mode

Setting the parameter *ethertype* to a value different from 0x8100 implicitly changes the mode of operation of the virtual switch to transparent tagging.

Reset to default values when changing *ethertype*

When changing ethertype to a value different from 0x8100 the parameter vvidls of all EPORTs and VCGs with cnprole=CUSTOMER is set to its default value.

Example input/output

```
ED-VRTSW:LT-UNITE:1-1-#-#-
      1:123457::1:ethertype=0x8100,gvrpmode=DISABLED,stbrpriority=28672,stfdtm=20,sthellotm=
```

```
   LT-UNITE 00-11-11 11:11:00
M  123457 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **ED-EPORT** command.

Related TL1 messages

- “RTRV-VRTSW: Retrieve virtual switch” (p. 3-3125)

ED-VRTSW notification

Output format

The **ED-VRTSW** notification uses the general format of a REPT DBCHG (Report Database Change) notification.

Command syntax: **ED-VRTSW***:aid:vrtswid:spec_block;*

Output parameters

Command parameters

1. **aid** – Access Identifier
   This parameter specifies the slot containing a GE1 pack to be operated on.
   Type: AID.
   Range: UnivSlotAID as defined in AID structure with the exception of the value all and usall.
2. **vrtswid** – Virtual Switch Identifier
   This parameter identifiers the instance of the virtual switch.
   - A Virtual Switch ID is unique within a single circuit pack. When creating a new Virtual Switch, the system automatically assigns a unique ID to it.
   - There will be one virtual switch per physical switch, implicitly all LAN ports and all WAN ports on the physical switch are part of the single virtual switch. The ID of this virtual switch is fixed to 1. A future release may support multiple virtual switches per physical switch.

   Type: Integer.
   Range: 1 – Currently this is the only allowed value.
   Default: 1.

Spec block parameters

1. **ethertype** – VLAN tag protocol ID
   This parameter specifies the VLAN tag protocol ID necessary for interworking purposes. This parameter is used to control whether the virtual switch operates in IEEE802.1Q tagging mode (i.e. set to 0x8100) or in transparent tagging mode (i.e. set to value different to 0x8100).
   Type: Hexadecimal value.
   Range: 0x0600 .. 0xFFFF.

The following values have a specific meaning:

- 0x8100: virtual switch operates in IEEE802.1Q tagging mode
- any other value: virtual switch operates in transparent tagging mode.

Default: 0x8100.

2. **`gvrpmode`** – GVRP mode
   The parameter *gvrpmode* allows to control the dynamic VLAN registration mode.
   Type: Alphanumeric value set.
   Range: ENABLED, GVRP is enabled. DISABLED (default), GVRP is disabled.
3. **`rstpmd`** – Rapid Spanning Tree Protocol Mode
   This parameter allows to enable or disable the Rapid Spanning Tree Protocol for the given virtual switch.
   Type: Alphanumeric value set.
   Range: DISABLE (rSTP is disabled, i.e. the virtual switch only supports normal STP (IEEE802.1D)); ENABLE (rSTP is enabled, i.e. the virtual switch also supports rSTP (IEEE802.1w)).
   Default: DISABLE
4. **`stbrpriority`** – Spanning tree bridge priority
   This parameter specifies the priority of the bridge to be used by the Spanning Tree Protocol.
   Type: Integer.
   Range: 0 to 65535.
   The stepping as recommended by the standard (steps of 4096 starting at 0) should be implemented by the management system. The NE will accept any value in the range described above. This has the consequence, that also the range restriction ″0 to 61440″ is not done by the NE.
   Default: 32768.
5. **`stfdtm`** – Spanning Tree forward delay timer
   The parameter *stfdtm* specifies the rSTP-related bridge forward delay timer. This parameter is relevant for both rSTP and STP.
   Type: Integer.
   Range: 1 .. 255.
   Default: 15.

6. **sthellotm** – Spanning Tree hello timer
   The parameter *sthellotm* specifies the rSTP-related bridge hello timer. This parameter is relevant for both rSTP and STP.
   Type: Integer.
   Range: 1 .. 225.
   Default: 2.
7. **stmaxage** – Spanning Tree maximum age timer
   The parameter *stmaxage* specifies the rSTP-related maximum PDU transmission delay timer. This parameter is relevant for both rSTP and STP.
   Type: Integer.
   Range: 1 .. 255.
   Default: 20.

Example output

```
   LT-UNITE 00-11-11 11:11:00
A  001 REPT DBCHG
   ”TIME=11-10-30,DATE=00-11-11:ED-VRTSW:1-1-#-#-1:1:gvrpmode=DISABLED”

```

ENT-ASAP-PROF: Enter alarm severity assignment profile

The **`ENT-ASAP-PROF`** command is used to create a new ASAP and to define the name of the ASAP.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 1

Abortable: No

Input format

Command syntax: **`ENT-ASAP-PROF`**:*tid*::*ctag*::*pftype*,*pfname*;

Input parameters

Command parameters

1. **`tid`** – Target Identifier
   See definition of “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **`ctag`** – Correlation Tag
   See definition of “RTRV-HDR: Retrieve header” (p. 3-2417).
3. **`pftype`** – Profile Type
   This parameter indicates the type of the ASAP (ASAP type).
   Type: Alphanumeric value set. A hyphen (“-”) is allowed for the alphanumeric values additionally.
   Range:
   - DCN: Data Communications Network
   - DS1: DS1 asynchronous signals
   - DS3: DS3 asynchronous ports
   - ENET: Ethernet
   - ENV: Environmental (Miscellaneous Discrete)
   - EQUIP-PROT: Equipment with Protection State Dependence
   - EQUIP-UNPROT: Equipment unprotected
   - MS-SPRing-BLSR: MS-SPRing and Bilateral Switched Ring protection switch
   - MSP-APS: Automatic protection switch
   - PATH: Path MSA/NIM related
   - PATHTERM: Path Termination
   - PORT: SDH/SONET ports
   - SNCP-UPSR: Sub-Network Connection Protection and Unidirectional Path Switched Ring

- TIMING: System Timing
- TRANSPARENCY: Fully Transparent Service

Default Value: There is no default value. The *pftype* does not change.

4. **pfname** – ASAP Profile Name
This parameter indicates the name of the ASAP. The ASAP name distinguishes ASAPs of the same ASAP type specified by pftype. That means the same name can be used for several ASAP types.
Type: alphanumeric character string. A hyphen (“-”) is allowed in the name additionally.
Range: length 1-24 characters.
For predefined ASAPs is the value of *pfname* ″DEFAULT″, but it is no default name in general.

Output format

The following example shows the successful completion of the **ENT-ASAP-PROF** command by the NE:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

This command creates a new ASAP of ASAP type *pftype* and profile name *pfname*. All ASAP parameters defined for the specific *pftype* will have default values; that means, the values are derived from the actual values of the default ASAP (with name DEFAULT).

The maximum total number of ASAPs in an NE includes the predefined “DEFAULT” ASAPs. (Note: The maximum number of ASAPs is defined per system not per *pftype*.)

The modification is reported via the **ENT-ASAP-PROF** notification.

Example input/output

The following example shows the successful completion of the **ENT-ASAP-PROF** command by the NE:

```
ENT-ASAP-PROF:LT-UNITE-123::123456::ENET,att;

   LT-UNITE 00-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **`ENT-ASAP-PROF`** command.

Validation rule: Duplicate *pfname*

The *pfname* is already used for the specified *pftype*.

Error code: `IEAE – Input, Entity Already Exists, duplicate profile name`

Validation rule: Maximum number of profiles

The maximum number of profiles is exceeded.

Error code:
`SSRE – Status, System Resources Exceeded, limit of profiles exceeded`

- “RTRV-ASAP-ASGNMT: Retrieve ASAP assignment” (p. 3-2244).

ENT-ASAP-PROF notification

Output format

Syntax: The **ENT-ASAP-PROF** notification has the following specific syntax:

ENT-ASAP-PROF::*pftype*,*pfname*:*spec_block*

Output parameters

Command parameters

1. **pftype** – Profile Type
   This parameter indicates the type of the ASAP (ASAP type).
   Type: Alphanumeric value set. A hyphen (“-”) is allowed for the alphanumeric values additionally.
   Range:
   - DCN: Data Communications Network
   - DS1: DS1 asynchronous signals
   - DS3: DS3 asynchronous ports
   - ENET: Ethernet
   - ENV: Environmental (Miscellaneous Discrete)
   - EQUIP-PROT: Equipment with Protection State Dependence
   - EQUIP-UNPROT: Equipment unprotected
   - MS-SPRing-BLSR: MS-SPRing and Bilateral Switched Ring protection switch
   - MSP-APS: Automatic protection switch
   - OTN: OTN ports.
   - PATH: Path MSA/NIM related
   - PATHTERM: Path Termination
   - PORT: SDH/SONET ports
   - SCN: SCN
   - SNCP-UPSR: Sub-Network Connection Protection and Unidirectional Path Switched Ring

- TIMING: System Timing
- TRANSPARENCY: Fully Transparent Service

Default Value: There is no default value. The *pftype* does not change.

2. **`pfname`** – ASAP Profile Name
This parameter indicates the name of the ASAP. The ASAP name distinguishes ASAPs of the same ASAP type specified by pftype. That means the same name can be used for several ASAP types.
Type: alphanumeric character string. A hyphen (“-”) is allowed in the name additionally.
Range: length 1-24 characters.
For predefined ASAPs is the value of *pfname* ″DEFAULT″, but it is no default name in general.

Spec block parameters

1. Alarm Severity Profile parameters
The spec block contains ASAP parameters. Each ASAP parameter defines for a probable cause (*condtype*) the assigned severity which will be reported when the alarm appears. If for one specific probable cause a service affecting (sa) or non service affecting (nsa) alarm can be reported then for each the sa-alarm and nsa-alarm an ASAP parameter exists.
The severity indicates the urgency of an alarm. The severity of a sa-alarm must be more urgent that of a nsa-alarm for the same *condtype*.
The description of the ASAP parameters, the relation to the profile types and the default values are described in: “Alarms, events, ASAPs” (p. 6-4).
All parameters have the same type and value range.
Type: Alphanumeric value set.
Range:

- CR – Critical (ITU / Telcordia)
- MJ – Major (ITU / Telcordia)
- MN – Minor (ITU / Telcordia)
- NA – Warning (ITU) / Not-Alarmed (Telcordia)
- NR – Non-Alarmed (ITU) / Not-Reported (Telcordia).

Example: Concrete ASAP parameters are *sa_eqpt* and *nsa_eqpt*. Both refers to the probable cause (*condtype*) EQPT and ASAP type EQUIPPROT. *sa_eqpt* contains the assigned severity for the service affecting alarm of probable cause EQPT and *nsa_eqpt* for the non service affecting alarm. *sa_eqpt* can have the concrete value CR and *nsa_eqpt* MN.

Example output

The example shows a normal notification after an ENT-ASAP-PROF command:

```
   LT-UNITE-123 00-01-01 08:00:50
A 815 REPT DBCHG
```

```
”TIME=08-00-12,DATE=00-01-01:ENT-ASAP-PROF::ENET,att:sa_vcg_loa=MJ,nsa_vcg_
    loa=MN,sa_vcg_ssf=MJ,nsa_vcg_ssf=MN,sa_vcg_plm=MN,nsa_vcg_plm=NA,sa_gfp_
    lof=CR,nsa_gfp_lof=MJ,sa_lan_los=CR,nsa_lan_los=MJ,sa_lan_anm=MN,nsa_lan_
    anm=NA”
;
```

ENT-BANNER

The **ENT-BANNER** command can be initiated by a user to provision a proprietary notice to enhance system security. The intent is to warn would be intruders against illegal intrusion into the system.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S5

Priority: 1

Abortable: No

Input format

Command syntax: **ENT-BANNER** :*tid*::*ctag*:::*spec_block;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Target Identifier. Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and the description of this parameter.
2. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).

Spec block parameters

1. **line1** – Line 1 of the Customer Provisionable Banner.
   Setting line1 to an empty string will suppress the output of the Customer Provisionable Banner in the response to the **ACT-USER** command.
   Type: text string
   Range: 2 … 62 characters, case-sensitive. The beginning and ending double quotes are included.
   Default: none. The initial value is an empty string.
2. **line 2** … line 11 – Line 2 (…Line 11) of the Customer Provisionable Banner.
   Type: text string
   Range: 2 … 62 characters, case-sensitive. The beginning and ending double quotes are included.
   Default: none. The initial value is an empty string.

Output format

After receiving the **ENT-BANNER** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
```

```
;
```

The NE returns the successful completion response even if none of the parameter values are modified using the **ENT-BANNER** command.

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output Parameter section for the **RTRV-HDR** command.

Detailed behavior description

The command shall update the specified lines of the Customer Provisionable Banner with the text strings provided in the command. If an empty string is specified for a line, then the content of the line is set to an empty string. All lines which are not specified shall remain unchanged.

Banner Display Control

If *line1* is set to an empty string, then the Customer Provisionable Banner is not displayed in the response to the ACT-User command. Setting *line1* to an empty string does not affect *line2 … line11*. The content of *line2 … line11* can still be retrieved with RTRV-BANNER and changed with ENT-BANNER.

Notification behavior

The **ENT-BANNER** command shall generate an ENT-BANNER Notification containing all lines which are specified in the command, independent whether the line has been changed or not.

Example input/output

The following example shows the successful completion of the **ENT-BANNER** command by the NE:

ENT-BANNER:LT-UNITE-123::123456:::line1=″This^is^line^1^of^the^banner″;

```
   LT-UNITE-123 04-12-23 08:01:00
M  123456 COMPLD
;
```

ENT-BANNER notification

Output format

See definition of REPT DBCHG – Report Database Change.

Command syntax: **ENT-BANNER** :::*spec_block;*

Output parameters

Spec block parameters

1. **line1** – Line 1 of the Customer Provisionable Banner.
   Setting line1 to an empty string will suppress the output of the Customer Provisionable Banner in the response to the **ACT-USER** command.
   Type: text string
   Range: 2 … 62 characters, case-sensitive. The beginning and ending double quotes are included.
   Default: none. The initial value is an empty string.
2. **line 2** … line 11 – Line 2 (…Line 11) of the Customer Provisionable Banner.
   Type: text string
   Range: 2 … 62 characters, case-sensitive. The beginning and ending double quotes are included.
   Default: none. The initial value is an empty string.

Example output

The example shows a normal notification after an ENT-BANNER command:

```
   LT-UNITE-123 00-01-01 08:00:50
A 815 REPT DBCHG
   ″TIME=08-01-12,DATE=04-12-23:ENT-BANNER:::line1=\″This is line 1 of the banner\″″
;
```

Error response

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **ENT-BANNER** command.

ENT-CONN: Establish network connections with TNA address parameters

Overview

The **ENT-CONN** command is used to establish one Network Connection between two TNAs in the network. This connection can go through one or multiple network domains.

ENT-CONN creates a Network Connection with specified connection bandwidth between ingress and egress ports connected to the network using TNA addresses on a ONNS controlled NE node.

ENT-CONN shall set up a Network Connection from source *srcTNAAddress*, *srcLogPortID*, *srcLabel* to destination *destTNAAddress*, *destLogPortID*, *destLabel*.

REPT CONNCHG is generated

The **ENT-CONN** command shall generate a **REPT CONNCHG** message.

A REPT PTHCHG notification is generated

The **ENT-CONN** command shall indirectly generate a **REPT PTHCHG** message.

Note

In case setup or deletion of many network connections over several domains are running and reboots of ingress or egress nodes in affected domains occur at the same time, some remain network connection segments may be left over.

Orphan network connection pieces can be identified by applying “RTRV-CONN: Retrieve data relevant for network connections” (p. 3-2294) or “RTRV-PATH: Retrieve ONNS connection data” (p. 3-2698) commands to affected ingress nodes. Such pieces then can be removed by applying a forced deletion via “DLT-PATH: Delete ONNS path connection” (p. 3-222) in one or all domains affected.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: NA

Abortable: No

Input format

Command syntax:
ENT-CONN:*srcTid:srcAid:ctag:[callID]:servLevel:dir:bandwidth:protType:srcTNAType, srcTNAAddress,srcLogicalPortID,srcLabel:destTNAType,destTNAAddress, destLogicalPortID,destLabel:specBlock;*

Input parameters

Command parameters

1. **`srcTid`**
   Target identifier of the source node is the logical name of the Host NE. ONNS uses the same unique *tid* used by Host NE. See also the definition of *tid* in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **`srcAid`**
   Source node ONNS application access identifier *srcAid* of the ONNS controller OS command interface port.
   Type: AID.
   Range: snn
   Default: n/a
3. **`ctag`**
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   See also the definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: Alphanumeric string
   Range: The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ″.″). It should be a unique value for each new command.
4. **`callID`**
   The *callID* indicates a call of a logical call / connection separation (call capability). This *callID* can be a operator specific identity of Type = 0x01 (source transport network element address is 4 bytes).
   Type: Alphanumeric value set (12 bytes). The first 4 bytes describe the source transport network element address and the following 8 bytes the local identifier.
   Range: string with 24 hexadecimal numbers (0 .. F).
5. **`servLevel`**
   The service level is mapping the connection type of an ONNS connection segment of the Network Connection. The values of the connection type are representing a mapping of the ONNS parameters *connectionClass*, *disjointness* and *grpSetupType* (for Ethernet connections).
   Type: Numeric string.
   Range: 0..255
6. **`dir`**

Path Direction Topology:

- Unidirectional A-Z (1WAY) or
- Bidirectional (2WAY)

For connections of *protectionClass* MBYNWRK and MBYNPRT only the path direction topology Bidirectional (2WAY) is supported.
Type: Value set.
Range: 1WAY (default) or 2WAY

7. **`bandwidth`**
   Specifies the bandwidth of the network connection to be setup.
   Type: Alphanumeric value set.
   Range: STS1, STS3, STS12, STS48, STS192.
   Default: None.

8. **`protType`**
   The *protType* defines the requested protection of advertised abstract links (interdomain as well as intradomain).
   protType is the requested setup parameter (via **`ENT-CONN`**) and is only visible at the source node if requested.
   Type: Alphanumeric value set.
   Range:
   - 0x1: only unprotected links shall be considered for routing
   - 1+1: only 1+1 MSP protected links shall be considered for routing)
   - N/A: all links shall be considered for routing, irr. of their protection type

9. **`srcTNAType`**
   srcTNAType specifies the address type of the source TNA address.
   Type: Alphanumeric value set.
   Range:
   - SRCIPV4TNAADDR source: TNA address is a IPv4 address
   - SRCIPV6TNAADDR source: TNA address is a IPv6 address
   - SRCNSAPTNAADDR source: TNA address is a NSAP address

10. **`srcTNAAddress`**
    srcTNAAddress depends on the previous *sourceTNAtype* parameter and is one of:
    - srcIPv4TNAAddress (when *srcTNAtype* = SRCIPV4TNAADDR)
    - srcIPv6TNAAddress (when *srcTNAtype* = SRCIPV6TNAADDR)
    - srcNSAPTNAAddress (when *srcTNAtype* = SRCNSAPTNAADDR)

11. **`srcLogicalPortID`**
    Logical Port Identifier related to the TNA address. *srcLogicalPortID* is the requested setup parameter (via ENT-CONN or UNI) and is only visible on the source node of the Network Connection.
    Type: numeric value set
    Range: 0 to 4294967295

12. **srcLabel**
    The source label specifies together with the source logical port ID the associated ingress *connPoint* for the network connection to be set up. The *srcLabel* is defined in KLM notation.
    Type: Character string.
    Range:
    Generalized Label: five dash separated numeric strings representing S#,U#,K#,L#,M# with:
    - S #0..65535
    - U #0..15
    - K #0
    - L #0
    - M #0

    Example for an STS-12c connection service on a OC48 link which starts at timeslot 25: 9-0-0-0-0.
13. **destTNAType**
    destTNAType specifies the address type of the destination TNA address.
    Type: Alphanumeric value set.
    Range:
    - DESTIPV4TNAADDR destination: TNA address is a IPv4 address
    - DESTIPV6TNAADDR destination: TNA address is a IPv6 address
    - DESTNSAPTNAADDR destination: TNA address is a NSAP address
14. **destTNAAddress**
    destTNAAddress depends on the previous *destTNAtype* parameter and is one of:
    - destIPv4TNAAddress (when *destTNAtype* = DESTIPV4TNAADDR)
    - destIPv6TNAAddress (when *destTNAtype* = DESTIPV6TNAADDR)
    - destNSAPTNAAddress (when *destTNAtype* = DESTNSAPTNAADDR)
15. **destLogicalPortID** – Logical Port Identifier related to the TNA address
    srcLogicalPortID is the requested setup parameter (via **ENT-CONN** or UNI) and is only visible on the source node of the network connection.
    Type: Numeric value set.
    Range: 0 to 4294967295.
    Default: None.
16. **destLabel**
    The destination label specifies together with the destination logical port ID the associated egress *connPoint* for the network connection to be set up. The *destLabel* is defined in KLM notation.
    Type: Character string.
    Range:

Generalized Label: five dash separated numeric strings representing S#,U#,K#,L#,M# with:

- S #0..65535
- U #0..15
- K #0
- L #0
- M #0

Example for an STS-12c connection service on a OC48 link which starts at timeslot 25: 9-0-0-0-0.

Spec Block Parameters

1. **`exclLinkResCls`**
   The exclude list of *linkResCls* is used to exclude interdomain links from the interdomain routing calculation. *exclLinkResCls* is the requested setup parameter (via ENT-CONN) and is only visible at the source node of the Network Connection.
   Type: Alphanumeric value set (4 bytes), every bit defining one link class
   Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
2. **`inclLinkResCls`**
   The include list of *linkResCls* is used to define interdomain links which has to be included for interdomain routing calculation. *inclLinkResCls* is the requested setup parameter (via ENT-CONN) and is only visible at the source node of the Network Connection.
   Type: Alphanumeric value set (4 bytes), every bit defining one link class
   Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF

Output format

Normal system response format to ENT-CONN

If the **`ENT-CONN`** request is accepted by the system, the following normal completion response format below is returned:

```
   srcTid date time
M  ctag COMPLD
   ″CallID=callID″
;
```

Output parameters

Command parameters

1. **srcTid**
   Target identifier of the source node is the logical name of the Host NE. ONNS uses the same unique *tid* used by Host NE. See also the definition of *tid* in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **date**
   Date. The date parameter is set to the date when the output message is generated.
   Type: Value set.
   Range:
   YY-MM-DD, where
   - YY=00-99,
   - MM=01-12,
   - DD=01-31

   Default: current date
3. **time**
   Time. The time parameter is set to the time when the output message is generated. See also time in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: Value set.
   Range:
   HH:MM:SS, where
   - HH=00-23,
   - MM=00-59,
   - SS=00-59

   Default: current time
4. **ctag**
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   See also the definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: Alphanumeric string
   Range: The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ″.″). It should be a unique value for each new command.

5. **`completion code`**
   Standard TL1 completion code result.
   Type: Value set.

   Range:

   - COMPLD (default): for success
   - DENY: in case of errors

6. **`callID`**
   The *callID* is generated by the system, if it is not set by the management sytem in the **`ENT-CONN`** command.
   The *callID* indicates a call of a logical call / connection separation (call capability).
   This *callID* can be a operator specific identity of Type = 0x01 (source transport network element address is 4 bytes).
   Type: Alphanumeric value set (12 bytes). The first 4 bytes describe the source transport network element address and the following 8 bytes the local identifier.
   Range: string with 24 hexadecimal numbers (0 .. F).

Example input/output

Input/output example for ENT-CONN

The example shows an accepted ENT-CONN command for a bidirectional connection setup:

```
ENT-CONN:LT-NN-
      789:snn:653456:A123B3EF1345A123B3EF1345:0:2WAY:STS12c:0x1:SRCIPV4TNAADDR,
135.13.3.119,1019,9-0-0-0-0:DESTIPV4TNAADDR,135.225.43.128,2,4-0-0-0-0:;

   LT-NN-789 2002-07-18 08:00:00
M  653456 COMPLD
   ″CallID=A123B3EF1345A123B3EF1345″
;
```

Error responses

Validation rule: Input Parameter Source TNA Address not valid

If the value for the input parameter *srcTNAAddress* is not valid, the following error response is returned:

Error code: `IDNV – Input, Data Not Valid, invalid Source TNA Address`

This validation is especially applied in case input parameter *srcTNAAddress* does not address a network TNA address information (that is, does not address a TNA information for the SDH/SONET layer). **`ENT-CONN`** is currently not allowed to be executed on Ethernet Private Line (EPL) layer, that is, with addressing TNA information on corresponding layer.

Validation rule: Input Parameter Destination TNA Address not valid

If the value for the input parameter *destTNAAddress* is not valid, the following error response is returned:

Error code: `IDNV – Input, Data Not Valid, invalid Destination TNA Address`

Validation rule: Input Parameter Source Logical Port ID not valid

If the value for the input parameter *srcLogicalPortID* is not valid, the following error response is returned:

Error code: `IDNV – Input, Data Not Valid, invalid Source LPID`

Validation rule: Labels and bandwidth not matching

If the value for the input parameters *srcLabel*, *destLabel*, and *bandwidth* is not matching, the following error response is returned:

Error code:
`IDNV – Input, Data Not Valid, Labels and Bandwidth are not matching`

Note that a value "0-0-0-0-0" for the *srcLabel* is not allowed, while such a value for the *destLabel* is accepted. This validation is thus not be applied in the latter case.

Validation rule: Input Parameter Service Level not valid

If the value for the input parameter *servLevel* is not valid, the following error response is returned:

Error code: `IDNV – Input, Data Not Valid, invalid Service Level`

Validation rule: Inconsistent Tributary Mode of Ingress Port

The following error response shall be returned, if

- for the setup of an adaptive rate network connection the ingress port selected by source TNA address and source logical port information has fixed tributary mode or
- for the setup of a fixed rate network connection the ingress port selected by source TNA address and source logical port information has adaptive tributary mode

Error code:
`SNVS – Status, Not in Valid State, Inconsistent Input Tributary Mode`

ENT-CRS: Enter cross-connection

The ENT-CRS-*modifier* command can be initiated by a user to establish a cross-connection between tributaries in the NE.

The *modifier* in the **ENT-CRS** command indicates the cross-connection rate of the tributary for which the command is applied to. There is no difference if the rate is specified as a SONET rate (STS1, STS3,..) or as SDH-rate (VC3, VC4, …) for the establishment of the cross-connection i.e. the **ENT-CRS**-<*sonet-rate*> yields to the same (with the exception mentioned next) physical and logical behavior as **ENT-CRS**-<*sdh-rate*>. No check is made if the *modifier* matches the interface-standard of the port i.e. if the port is provisioned as SONET (resp. SDH) and the *rate* is a SONET (resp. SDH) rate. The only difference between entering a cross-connection via SONET- or SDH-rate as modifier is that a **RTRV-CRS**-*modifier* will return the same output parameter *rate* as was used when entering the cross-connection.

AU3/AU4 conversion cross-connections are cross-connections between HO an LO tributaries, i.e. between tributaries of different rates. Two different modifiers are defined for conversion cross-connections, one for HO input tributary to LO output tributary and another for LO input tributary to HO output tributary. The input and output tributary rates must fit to the modifier. On the HO side of the conversion cross-connection, STS1 (SONET) and VC3 (SDH) tributaries are considered as equivalent rates.

The number of HO-cross-connections from the same tributary is restricted to 10. This allows 1:N broadcast with N ≤ 10. The number of LO-cross-connections or conversion cross-connections from the same tributary is restricted to two i.e. bridging (1:2) is possible but no broadcast 1:N, N>2.

See section Error response concerning not supported/allowed combinations of input/output for cross-connections.

Physical preconditions prior to establishing a cross-connection

Please note that (for the **ENT-CRS** command processing) it is not necessary that the packs necessary for establishing traffic (i.e. the switch and the optical-packs OP***n*** or GE***n***) are physically present and operable; Instead it is sufficient that those packs are pre-/provisioned and the corresponding logical entities are created in the database of the NE.

Note for ES64U

Interworking between the ES64U and the GE1 Gigabit Ethernet units or electrical I/O port units (EP51 or EP155) is not supported.

Properties

Command syntax:
ENT-CRS-*modifier*:*tid*:*in_aid*,*out_aid*:*ctag*::[*cct*][,*in_aid2*][:*spec_block*];

Input parameters

Command parameters

1. **modifier**
   This parameter indicates the cross-connection rate on which the **ENT-CRS** command acts on.
   For detailed description please refer to the "RTRV-CRS: Retrieve cross-connection" (p. 3-2306) command.
   Type: Alphanumeric value set.
   Range:
   - LOVC12
   - LOVC3
   - VC3
   - VC4
   - VC44C
   - VC416C
   - VC464C
   - LOVT1
   - STS1
   - STS3
   - STS12
   - STS48
   - STS192
   - AU3TU3
   - TU3AU3.
2. **tid** – Target Identifier
   Target Identifier. Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and the description of this parameter.

3. **`in_aid`** – Input Access Identifier
   This parameter specifies the source of the cross-connection.
   In case of a 1-way cross-connection the source of a cross-connection is unambiguous. In this case the cross-connection will be retrieved by the RTRV-CRS, which has the identical *in_aid*.
   In case of a 2-way cross-connection the source is not defined (the source could be the *in_aid* or the *out_aid* of the cross-connection). In this case both aids (*in_aid* or *out-aid*) of the cross-connection can be used as the *in_aid* parameter of the **`RTRV-CRS`** command. The **`RTRV-CRS`** command will then return the *in_aid* – parameter used in the **`RTRV-CRS`** command as the *in_aid* of the RTRV-CRS reply.
   Example:
   ENT-CRS-VC4:NEname:1-1-#-#-1-1-1,1-1-#-#-2-1-1:123456:2way;
   RTRV-CRS-VC4:NEname:1-1-#-#-2-1-1:123457;
   M 123457 COMPLD ″1-1-#-#-1-1-,1-1-#-#-2-1-1:vc4….. ;
   Type: GenTribAID or GenLOTribAID.
   Range: No use of the *all* or *usall* or *vall* values within the in_aid is allowed.
4. **`out_aid`** – Output Identifier
   This parameter specifies the tributary which is the sink of the cross-connection.
   Type: GenTribAID or GenLOTribAID.
   Range: No use of the **`all`** value within the *out_aid* is allowed.
5. **`ctag`** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows “0” as valid *ctag*, which is an extension to GR-831.
6. **`cct`** – cross-connection Topology
   This parameter specifies the topology of the cross-connection to be established via the **`ENT-CRS`** command.

   The topology defines

   - the number of legs of the cross-connection
   - whether both legs belong to the same tributary
   - whether a path protection is included.

The following values are possible:

- 1WAY: the cross-connection consists of one leg given by the *in_aid* to the *out_aid*
- 2WAY: the cross-connection consists of two legs given by the *in_aid* to the *out_aid* and the return leg given by the *out_aid* to the *in_aid*
- 1WAYPPROT: the cross-connection consist of one leg (the worker leg) given by *in_aid* to *out_aid* and another leg (the protection leg) given by *in_aid2* to the *out_aid*. The path selector function is associated with the tributary of *out_aid*.

Type: Alphanumeric value string.

Range:

- 1WAY
- 2WAY (default)
- 1WAYPPROT.

7. **`in_aid2`** – Input Access Identifier 2
   This parameter is applicable to path-protected cross-connections only and specifies the source of the protection leg.
   Thus *in_aid* and *out_aid* specify the working leg while *in_aid2* and *out_aid* specify the protection leg of a path-protected cross-connection. For non path-protected cross-connection the parameter *in_aid2* must be omitted.
   Both input aids (*in_aid* and *in_aid2*) have to be related to ports with the same interface mode being either SDH or SONET. This is due to different switch criteria for SONET and SDH.
   Type: STS1NumAID, TMuxAPTNumAID, or GenLOTribAID.
   STS1NumAID are used for high-order tributaries on e.g. OP***n***, EP***n*** packs; TMuxAPTNumAID are used for asynchronous high-order tributaries on TransMUX packs, GenLOTribAID are used for low-order tributaries on e.g. OP***n***, EP155.
   Range: No use of the *all* or *usall* or *vall* values within the *in_aid2* is allowed.
   Default: None (a valid value is needed on case of a path-protected cross-connection – no default is defined).

Spec block parameters

1. **`htmr`** – Hold Off Timer
   This parameter specifies the value of the hold-off timer for automatic protection switching. This parameter is applicable to path-protected cross-connections only and is omitted for non path-protected cross-connections.
   Type: numeric string [ms]

Range:

- For high order path protection groups, the range is: 0 – 99 ms in 1 ms steps and 100 – 10000 ms in 100 ms steps
- For low order path protection groups, the range is: 0, 25, 50, 75 ms (thus in steps of 25 ms) and 100 – 10000 ms in 100 ms steps.

2. **loca** – Location-a
   This parameter specifies the TID of the node at which service is added to the BLSR. This parameter is required for BLSR THROUGH, INTER-BLSR and DROP connections, if the Automatic Squelch Map Calculation function is disabled. The parameter *loca* can be specified for BLSR THROUGH, INTER-BLSR and DROP connections while the Automatic Squelch Map Calculation function is enabled to do a User Override. The *loca* parameter value has to be omitted for ADD, non-BLSR connections.
   A 2way cross-connection is considered to be a DROP if the *out_aid* is a non BLSR high-order tributary.
   For lower-order cross-connections the parameter *loca* is the TID of that ring node in the direction towards the specified input tributary (upstream), where the HO path termination source function resides. If there is no such function in an upstream ring node then *loca* is the TID of the node where the related HO circuit is first added to the ring. Refer to the figure “Lower-order cross-connections” (p. 3-2322) for further explanation.
   At the lower-order side of a conversion cross-connection, the same rules for *loca* is applicable as for lower-order cross-connections.
   Additional information are given for this parameter in the RTRV-CRS section with respect to:
   - figure illustrating BLSR connections,
   - inter-ring cross-connections with collapsed nodes,
   - extra traffic handling.

   Type: TID
   Range: 1 to 20 characters. Needs to be the same as defined in RTRV-HDR.
3. **loca2** – Location-a-2
   This parameter specifies the TID associated with *in_aid2* of the protection leg of a path-protected cross-connection.
   For the syntax, range and default definition please refer to *loca* description.
   Please note that *loca2* parameter is omitted if no *in_aid2* has been specified or for non-BLSR cross-connection.
   A 2way cross-connection is considered to be a DROP if the out_aid is a non BLSR high order tributary. Additional information are given for this parameter in the **RTRV-CRS** command.
   The loca2 parameter value has to be omitted for low-order cross-connections in general.

Currently, path protected LO cross-connections with input tributaries from MS-SPRing/BLSR ports are not supported. As a consequence, the parameter *loca2* needs not to be specified for a LO cross-connection.
Type: TID
Range: 1 to 20 characters. Needs to be the same as defined in RTRV-HDR.

4. **`locz`** – Location-z
   This parameter specifies the TID of the node at which service is dropped from the BLSR. This parameter is required for BLSR THROUGH, INTER-BLSR and ADD connections, if the Automatic Squelch Map Calculation function is disabled.
   The parameter *locz* can be specified for BLSR THROUGH, INTER-BLSR and ADD connections while the Automatic Squelch Map Calculation function is enabled to do a User Override. The *locz* parameter value has to be omitted for DROP and non-BLSR connections.
   A 2way cross-connection is considered to be a ADD if the in_aid is a non BLSR high-order tributary.
   For lower-order cross-connections the parameter *locz* is the TID of that ring node in the direction towards the specified output tributary (downstream), where the HO path termination sink function resides. If there is no such function in a downstream ring node then *locz* is the TID of the node, where the related HO circuit is last dropped from the ring. Refer to the figure "Lower-order cross-connections" (p. 3-2322)for further explanation.
   At the lower-order side of a conversion cross-connection, the same rules for *locz* is applicable as for lower-order cross-connections.
   Additional information are given for this parameter in the RTRV-CRS section with respect to:
   - figure illustrating BLSR connections,
   - inter-ring cross-connections with collapsed nodes,
   - extra traffic handling.

   Type: TID
   Range: 1 to 20 characters. Needs to be the same as defined in RTRV-HDR.
5. **`omode`** – Output Mode
   This parameter specifies the output mode of the cross-connection:
   - for a 1-way cross-connection the output is clearly defined by the destination (*out_aid*)
   - for a 2-way cross-connection the output is defined as the source-to-destination direction (*in_aid* to *out_aid*)
   - NORM: this is the normal output i.e. the signal from the *in_aid* is passed through to the *out_aid*;

- IDLE/UNEQ: this mode outputs an unequipped signal;
- AIS: this mode outputs an AIS signal.

omode and adaptive-mode: In case a SONET-port is provisioned to adaptive-mode setting the *omode* to IDLE/UNEQ or AIS will be lead to transmitting the corresponding signal (UNEQ or AIS) on STS1 base for all the STS1 tributary comprising the STS-N signal. Thus for an output of an STS3 cross-connection, if either AIS or IDLE/UNEQ is selected each of the 3 STS1 will output the AIS or IDLE/UNEQ signal. When switching the *omode* back to NORM the original STS3 cross-connection-signal will re-appear again.
omode in case of path-protected cross-connection: In case of a path-protected cross-connection the *omode* affects the output of the path selector and is thus not setable on a per leg base. In other words the *omode* insertion is done after (downstream direction) the selector function.
Type: Alphanumeric value set.

Range:

- NORM (default)
- IDLE/UNEQ
- AIS

6. **`ppgname`** – Path protection group name
This parameter is a user-defined string that identifies a path protection group. This parameter is applicable to path-protected cross-connections only and is omitted for non path-protected cross-connections.
Note: Storage and retrieval of the *ppgname* is case sensitive, but the actual use of the *ppgname* to determine the corresponding protection group is case insensitive.
For details please refer to parameter *ppgname* in "RTRV-PROTN-GRP: Retrieve protection group" (p. 3-2759).
Default: NULL.

7. **`rme`** – Revertive Mode Enable
This parameter specifies whether the path protection operates in revertive-mode (rme=ENABLE) or non-revertive-mode (rme=DISABLE).
This parameter is applicable to path-protected cross-connections only and is omitted for non path-protected cross-connections.
Type: Alphanumeric value set.

Range:

- ENABLE, DISABLE: in case of *protype* = 1+1
- ENABLE: in case of *protype* = 1xNOPT
- ENABLE is not valid for protocol = 1+1_OPTM

Default:

- DISABLE: in case of protype = 1+1
- ENABLE: in case of protype = 1xNOPT (i.e. protection type 1:1)

The protocol = OPTM can only be choosen in case of protype = 1+1, thus default is DISABLE then.

8. **`rtnomode`** – Return Output Mode
   The parameter *rtnomode* (return output mode) is only applicable for 2way cross-connection and is omitted for 1way and path-protected cross-connections.
   Type: Alphanumeric value set.
   Range: NORM (default), IDLE/UNEQ, AIS

   Note the default values:

   - For a 1way cross-connection the default value is NOT-APPLICABLE, but the parameter must be omitted in the **`ENT-CRS`** command.
   - For a 2way cross-connection the default value is: NORM.
9. **`snctype`** – SNCP Type
   This parameter is used to specify the SNCP mode i.e. the switch criteria used for automatic protection switching. This parameter is mandatory for path-protected cross-connections and only applicable to them. The parameter is omitted for non path-protected cross-connections.
   The parameter specifies the type of the path protection w.r.t. switch criterias used by the protection state machine. The value SNCI (Inherent) is used if server signal fail is used as switch criteria. The value SNCN (Non-Instrusive) is used if server signal fail and defects supervised by a non-intrusive path monitor are used as switch criteria The value NA is used if one of the tributary inputs is related to a port operating in SONET mode.
   Type: Alphanumeric value set.
   Range: SNCI, SNCN, NA
10. **`wtr`** – Wait To Restore Time
    This parameter specifies the value of the wait-to-restore time for automatic protection switching. This parameter is applicable to path-protected cross-connections only and is omitted for non path-protected cross-connections.
    Type: numeric string (minute)
    Range: 0 – 60
11. **`xcappl`** – cross-connection application
    This parameter is a numeric value which indicates the application for which the cross-connection is used in the context of compound cross-connection topologies. The parameter is not further processed in the NE, but only stored (when establishing or modifying the cross-connection) and returned when retrieving the cross-connection.
    The numeric values are assigned to appropriate text strings (see Range below) and the manager should display these value in case of a RTRV-CRS.

    As a possible assignment proposal the following may serve:

    - 0) Unknown
    - 1) 1-Way Point-to-Point
    - 2) 1-Way Path-Protected
    - 3) 1-Way Adjunct Path-Protected
    - 4) 1-Way Conversion Cross-Connection

- 10) 2-Way Point-to-Point
- 11) 2-Way Conversion Cross-Connection
- 20) UPSR (or SNCP Ring) Add, Drop
- 21) UPSR (or SNCP) Ring-to-Ring, Single Node Interconnection, Same NE
- 22) UPSR (or SNCP) Drop, 1-Way Broadcast
- 23) UPSR (or SNCP Ring) Add, Drop connection (Broadcast)
- 30) Logical Ring (or SNCP) Add, Drop
- 40) Ring Interworking, Drop-and-Continue, BLSR (or MS-SPRing) Primary Node
- 41) Ring Interworking, Drop-and-Continue, BLSR (or MS-SPRing) Primary Nodes in same NE
- 42) Ring Interworking, Dual Transmit, BLSR (or MS-SPRing) Terminating Node
- 50) Ring Interworking, Drop-and-Continue, UPSR (or SNCP Ring)
- 51) Ring Interworking, Drop-and-Continue, UPSR (or SNCP Ring) Nodes in same NE
- 60) 1-Way Broadcast -- note: this is with N greater than or equal to 2.

Type: numerical value set.
Range: {0, 1, 2,…, 255}.
Default: The default value is 0.

12. **`xcnum`** – cross-connection number
This parameter is a 12 digit number, identifying each leg in a specific compound cross-connection. (Compound cross-connection are a composition of several atomic cross-connection in order to form complex scenarios like e.g. described in ″Example input/output″ section of the **`RTRV-CRS`** command like UPSR, DRI etc.). Like the *xcappl* parameter the *xcnum* parameter is not further processed in the NE, but only stored (when establishing or modifying the cross-connection) and returned when retrieving the cross-connection. It may be used by a manager to characterize and group cross-connections belonging to complex cross-connection topology (e.g. compound cross-connections as used in ring interworking scenarios).
Type: numeric value set (12 digit).
Range: 000000000000 .. 999999999999.
Default: The default value is 000000000000.

Output format

If the **`ENT-CRS`** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are described in the Output parameter section of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

Behavior cct=1WAY, 2WAY

Cross-connections can be established via the ENT-CRS-mod command between tributaries of type:

- STS1-tribs: Tribs related to SDH/SONET ports (i.e. ports of OP***n*** packs) – the AID for these tribs being specified as STS1NumAID (refer to the AID definition) or
- VCG-tribs: Tribs related to VCG-ports (i.e. (logical) ports of GE***n*** pack – please refer to [7], [8], [9, [10] for details) – the AID for these tribs being specified as VCGNumAID (refer to the AID definition).
- PTFs: High-oder path terminations related to asynchronous ports or adjunct ports - the AID for the PTFs are specified as STS1NumAID or TMuxAPTNumAID
- LO tribs: Low-rder tributaries related to HO tributaries of SDH/SONET ports or HO terminations of adjunct ports - the AID for LO tribs are specified as LONumAID or TMuxSLONumAID

Between STS1-tribs, cross-connections can be established for all the specified SDH/SONET rate (i.e. VC3/STS1, VC4/STS3, VC44c/STS12, VC416c/STS48, VC464c/STS192).

AIf a VCG trib, PTF or LO trib is involved in a cross-connection then only the cross-connection rates are possible, which fit to the rate of the VCG trib, PTF or LO trib.

Behavior cct=1WAYPROT

Path-protected cross-connections can be established via the ENT-CRS-mod command between tributaries of type:

- STS1-tribs: Tribs related to SDH/SONET ports – the AID for these tribs being specified as STS1NumAID
- VCG-tribs: Tribs related to VCG-ports – the AID for these tribs being specified as VCGNumAID
- PTFs: High order path terminations related to asynchronous ports or adjunct ports - the AID for the PTFs are specified as STS1NumAID or TMuxAPTNumAID
- LO tribs: Low order tributaries related to HO tributaries of SDH/SONET ports or HO terminations of adjunct ports - the AID for LO tribs are specified as LONumAID or TMuxSLONumAID

For *in_aid* and *in_aid2* only VCG tribs are not allowed.

All path protection group related parameters are only used in the context of ENT-CRS command in order to provide appropriate defaults for different applications (from operator perspective). Retrieval, modification and reporting for these parameters is within entity protection group.

When establishing a cross-connection a entity of type cross-connection is created with the parameter values as

- specified in the **ENT-CRS** command.

Additionally when establishing a path-protected cross-connection a protection entity is created with the parameter values as

- specified in the **ENT-CRS** command,
- (for those parameter not part of ENT-CRS command) with the default-values.

Updated affected entities: General

In case of establishing a path-protected cross-connection the command creates in addition an entity of type protection group (of type PATHDRI) with

- the attributes as entered in the **ENT-CRS** command and
- for those attributes not given by the command by its default values.

This creation is reported by means of an ENT-PROTN-GRP notification – refer to this notification for further details.

In case the *repleg* state is changed by establishing a cross-connection an ED-CRS notification is used to notify the updated *repleg* value.

Updated affected entities: 1-way cross-connection, not resulting in a 2 way cross-connection

In case a 1-way cross-connection is established where no ″equivalent return-leg″ (see below) is already existing one instance of type cross-connection is created with the entered parameter. This is reported by means of an ENT-CRS notification.

An ″equivalent return-leg″ means: when entering a 1-way cross-connection with rate N from in_trib to out_trib a return-leg would be given by

- a 1-way cross-connection from out_trib to in_trib
- with the same rate N
- and in (case of BLSR only) the same *loca* and *locz* values

Example:

ENT-CRS-vc4:NEname:1-1-#-#-3-4-1,1-1-#-#-7-3-1:586::1way:;

REPT DBCHG:

ENT-CRS-VC4:1-1-#-#-3-4-1,1-1-#-#-7-3-1:1WAY,:omode=NORM,xcappl=0, xcnum=000000000000,loca=\″\″,locz=\″\″,repleg=1WAY

Updated affected entities: 1-way cross-connection, resulting in a 2-way cross-connection

In case a 1-way cross-connection is established where an ″equivalent return-leg″ (see below) is already existing one instance of type cross-connection is created with the entered parameter and the repleg-parameter ″2-way″. This is reported by means of an ENT-CRS notification.

Furthermore as stated above the *repleg* status is updated for the already existing leg (i.e. in_aid, out_aid are flipped w.r.t. ENT request) and reported via an ED-CRS notification.

An ″equivalent return-leg″ means: when entering a 1-way cross-connection with rate N from in_trib to out_trib a return-leg would be given by

- a 1-way cross-connection from *out_trib* to *in _trib*
- with the same *rate* N
- and (in case of BLSR only) the same *loca* and *locz* values

Example (Precondition is specified in previous example):

ENT-CRS-vc4:NEname:1-1-#-#-7-3-1,1-1-#-#-3-4-1:587::1way:;

REPT DBCHG:

ENT-CRS-VC4:1-1-#-#-7-3-1,1-1-#-#-3-4-1:1WAY,:omode=NORM,xcappl=0, loca=\″\″,locz=\″\″,repleg=2WAY,rtnxcappl=0,xcnum=000000000000, rtnxcnum=000000000000, rtnomode=NORM

REPT DBCHG:

ED-CRS-VC4:1-1-#-#-3-4-1,1-1-#-#-7-3-1::repleg=2WAY:

Note that in the considered case the ENT-CRS notification for the 2-way cross-connection contains the same information as if it would result directly from an ENT-CRS with the *cct*=2WAY, i.e. the ENT-CRS notification for a *repleg*=2WAY cross-connection is independent from the way it is created (either direct cia *cct*=2WAY or via two separated 1-way cross-connections) and it thus also contains the *rtnxcappl*, *rtnxcnum*, *rtnomode* parameters.

Updated affected entities: 2-way cross-connection

In case a 2-way cross-connection is established one instance of type cross-connection is created with the entered parameter and the *repleg*=2WAY.

This is reported by means of an ENT-CRS notification.

Example:

ENT-CRS-vc4:UNITE-NE:1-1-#-#-3-1-1,1-1-#-#-2-1-7:584::2way:;

REPT DBCHG:

ENT-CRS-VC4:1-1-#-#-3-1-1,1-1-#-#-2-1-7:2WAY,:omode=NORM,xcappl=0, xcnum=000000000000,rtnomode=NORM,loca=\″\″,locz=\″\″,repleg=2WAY,rtnxcappl=0, rtnxcnum=000000000000

Updated affected entities: path-protected cross-connection

In case a path-protected cross-connection is established two instances of type cross-connection is created (one for each leg) with the entered parameters and *repleg*=1WAYPSW and *repleg*=1WAYPSP, respectively.

Furthermore one instance of type protection group is created and notified via an ENT-PROTN-GRP notification.

For details on protection group and the related notifications please refer to the protection group section.

Example (path-protected SDH cross-connection i.e. no adaptive mode for non-BLSR):

ENT-CRS-vc3:NameOfNE:1-1-#-#-1-1-1,1-1-#-#-34-1-1:123456::1WAYPPROT,1-1-#-#-2-1-1:ppgname=\″name1\″,rme=ENABLE,snctype=SNCI,htmr=300,wtr=10;

`REPT DBCHG`:

ENT-CRS-VC3:1-1-#-#-1-1-1,1-1-#-#-34-1-1:1WAYPPROT,1-1-#-#-2-1-1: omode=NORM,xcnum=000000000000,xcappl=0,loca=\″\″,locz=\″\″,repleg=1WAYPSW

`REPT DBCHG`:

ENT-CRS-VC3:1-1-#-#-2-1-1,1-1-#-#-34-1-1:1WAYPPROT,1-1-#-#-1-1-1: omode=NORM,xcnum=000000000000,xcappl=0,loca=\″\″,locz=\″\″,repleg=1WAYPSP

`REPT DBCHG`:

ENT-PROTN-GRP:1-1-#-#-15-1-1::PATHDRI:ppgname=\″name1\″, dripathpn=DEFAULT,htmr=300,protn=1-1-#-#-2-1-1,wkg=1-1-#-#-01-1-1, rme=ENABLE,snctype=SNCI,wtr=10,htmr=300,<CML-BLOCK>

Identification of VCG tributaries:

The system shall allow to create cross-connections at VCG tributaries using the AID format of an AU-3/STS-1 Tributary. I.e. the VCG number specified in the port field of the AID is allowed with or without the leading ″v″.

ONNS specific behavior - Behavior for *xconcls*

A cross-connection which is created via ENT-CRS shall have implicitly set the *xconcls* parameter to TRADITIONAL, see "RTRV-CRS: Retrieve cross-connection" (p. 3-2306)
.

The only way to explicitly set the *xconcls* parameter is via the **`ED-NNCRS`** command.

ONNS specific behavior - Behavior for tributaries belonging to EDGE ports in a BLSR/MS-SPRING group

When a cross-connection of type *xconcls* = TRADITIONAL is created where a tributary belongs to a port with *portClass* = EDGE, which is part of a BLSR/MS-SPRING group, then any *loca*, *locz* parameter with a value different from the default value is copied from the tributary into the corresponding *loca*, *locz* parameter of the cross-connection.

The *loca*/*locz* parameter in the tributary is reset to its default value. This are notified by means of an ED-STS1 (*istd*=SONET) or ED-VC3 (*istd* = SDH) notification.

Low-order cross-connection specific behavior - Auto-substructuring of HO NIM entities (VC3, STS1)

If the first low-order tributary contained in a dedicated high-order tributary gets connected and the high-order tributary is not yet substructured (substr==NO), then the high-order tributary shall get automatically substructured as follows resulting in the initial setup of the related parameters:

ENT-CRS-PTF::PTF::PTF::

modifier inputsig unequiposig ptfstd

LOVC3 6312 6312 SDH

LOVC12 6312 6312 SDH

LOVT1 2811 2811 SONET

The auto-substructuring is executed on VC4 or STS1 granularity.

Resulting creations of HPT and LONIM entities are notified (by ENT-PTF and ENT-LONIM notifications). The substructure and the related PTF and LONIM objects are bidirectionally created independent from the topology of the cross-connect request.

If a cross-connection at LOVC3 rate causes the auto-substructuring of a HO NIM entity then first the creation of the default substructure (6312) will be reported. After then, an auto-reconfiguration of the PTF substrcuture will take place as described in ID 69853 in order to adapt the affected third to the LOVC3 in the needed direction(s).

Example:

If the following cross-connection is entered: ENT-CRS-LOVC3::1-1-#-#-1-1-1-1,1-1-#-#-2-1-1-22:::1WAY;

Then this causes following notifications:

ED-VC3:1-1-#-#-1-1-1::substr=YES;

ED-VC3:1-1-#-#-2-1-1::substr=YES;

ENT-PTF-HOVC4:1-1-#-#-1-1-1::inputsig=6312,unequiposig=6312,…

ENT-PTF-HOVC4:1-1-#-#-2-1-1::inputsig=6312,unequiposig=6312,…

ENT-LONIM-LOVC:1-1-#-#-1-1-1-1&&-63::pmlpfeses=600,pmlpneses=600,…

ENT-LONIM-LOVC:1-1-#-#-2-1-1-1&&-63::pmlpfeses=600,pmlpneses=600,…

ED-PTF-HOVC4:1-1-#-#-1-1-1::inputsig=13-4212;

ED-PTF-HOVC4:1-1-#-#-2-1-1::unequiposig=2112-13-2112;

ED-LONIM-LOVC:1-1-#-#-1-1-1-1::pmlpfeses=2400,pmlpneses=2400;

Low-order cross-connection specific behavior - Auto-configuration of the HO NIM entity

During the auto-substructuring of a HO NIM as required in ID 69850, the following parameter values are automatically configured:

substr is set to YES.

This are notified with a ED-rr notification.

Low-order cross-connection specific behavior - Auto-configuration of the PTF entity

During the auto-creation of a PTF entity as consequence of the auto-substructuring as required in ID 69850, all parameter is set to default. Although such a requirement is not needed to be stated as this is implicit behavior of entity creations, this has been made since the original single-step-approach had foreseen to copy parameters from the related HO NIM entity. WIth the reduced single-step-approach, this idea has been discarded (probably postponed).

Low-order cross-connection specific behavior - Auto-configuration of LO NIM entities

During the auto-creation of a LONIM entities as consequence of the auto-substructuring as required in ID 69850, all related parameters are set to the default value.

Low-order cross-connection specific behavior - Auto-reconfiguration of the PTF substructure (SDH only)

If the first cross-connection of a third of a substructured VC4 tributary gets connected then a mismatching substructure level is automatically corrected for that third and in the required direction.

The changing HPT parameter inputsig and/or unequiposig is notified (by a ED-PTF notification).

The parameter of the first LONIM entity of that third is set to default values according to the newly represented transmission rate except for the parameters:

neppm, *feppm*, *tcamd* and *ptca*.

Any changed parameters in this context is notified in a single ED-LONIM notification. The remaining 20 other entities of that third of the PTF remain untouched.

Low-order cross-connection specific behavior - Example - Performance monitoring handling

Assuming that a VC4 signal had been initially substructured to 63 times VC12 due to 63 bidirectional LOVC12 cross-connections. For all 63 LONIM entities PM had been enabled for both, far end and near end.

Later the operator removes the first 21 LOVC12 cross-connection and establishes a bidirectional LOVC3 cross-connection instead. Following notifications are to be generated:

ED-PTF-HOVC::1-1-#-#-39-16-1::inputsig=13-4212,unequiposig=13-4212;

ED-LONIM-LOVC::1-1-#-#-39-16-1-1::pmlpfeses=2400,pmlpneses=2400;

Note that performance monitoring commences without interruption using the new default SES threshold values but keeping the previously configured TCA mode and TCA profile (the appropriate rate values are included in the TCA profile). The current bins (for 15 min and 24 hours) are declared as being suspect.

Note also that for LONIM entities addressed by 1-1-#-#-39-16-2&&-20 no notification will be sent as they remain untouched. However, the PM data cannot be retrieved from those entities.

Low-order cross-connection specific behavior - Example - Performance monitoring handling

If low-order signals of a VC4 tributary get connected with different rates (VC3 or VC12) in opposit direction for the same timeslots then the values of inputsig and unequiposig will differ:

1. Initial 1WAY connection may cause both direction to be set to the same value

ENT-CRS-LOVC12::1-1-#-#-1-1-1-1,1-1-#-#-2-1-1-1:::1WAY;

PTF::inputsig[1-1-#-#-1-1-1] = 6312,unequiposig=6312;

PTF::inputsig[1-1-#-#-2-1-1] = 6312,unequiposig=6312;

2. An opposit 1WAY connection may cause one direction to be adapted

ENT-CRS-LOVC3::1-1-#-#-2-1-1-1,1-1-#-#-1-1-1-1:::1WAY;

PTF::inputsig[1-1-#-#-1-1-1] = 6312,unequiposig=13-4212;

PTF::inputsig[1-1-#-#-2-1-1] = 13-4212,unequiposig=6312;

Possibly established performance monitoring between the first and second command for both directions of the LO-VC12 signal (saying for slot 1 and 2 in input direction) would be deleted after the second command for the LONIM 1-1-#-#-2-1-1-1 (thus for slot 2).

Low-order cross-connection specific behavior - Example - Opposit unidirectional cross-connections

If low-order signals of a VC4 tributary get connected with different rates (VC3 or VC12) in opposit direction for the same timeslots then the values of inputsig and unequiposig will differ:

1. Initial 1WAY connection may cause both direction to be set to the same value

ENT-CRS-LOVC12::1-1-#-#-1-1-1-1,1-1-#-#-2-1-1-1:::1WAY;

PTF::inputsig[1-1-#-#-1-1-1] = 6312,unequiposig=6312;

PTF::inputsig[1-1-#-#-2-1-1] = 6312,unequiposig=6312;

2. An opposit 1WAY connection may cause one direction to be adapted

ENT-CRS-LOVC3::1-1-#-#-2-1-1-1,1-1-#-#-1-1-1-1:::1WAY;

PTF::inputsig[1-1-#-#-1-1-1] = 6312,unequiposig=13-4212;

PTF::inputsig[1-1-#-#-2-1-1] = 13-4212,unequiposig=6312;

Possibly established performance monitoring between the first and second command for both directions of the LO-VC12 signal (saying for slot 1 and 2 in input direction) would be deleted after the second command for the LONIM 1-1-#-#-2-1-1-1 (thus for slot 2).

Low-order cross-connection specific behavior - Restricted interface standard for low-order cross-connections

The system shall only accept low-order cross-connection requests if the provided modifier (representing a specific interface standard) matches to the supported interface standard of the whole LOXC pack.

With the reduced single-step-approach, the supported interface standard of the LOXC pack will be determined during activation of its switch capacity. This implies that only one interface standard can be supported at a time.

Conversion cross-connection specific behavior - Auto-substructuring of the HO NIM entity related to the LO side

If the first low-order tributary contained in a dedicated high-order tributary gets connected and the high-order tributary is not yet substructured (*substr*==NO), then the high-order tributary shall get automatically substructured. This results in the creation of a HO PTF with the following parameter values:

- **inputsig**:33
- **unequiposig**:33
- **ptfstd**:SDH

The auto-substructuring is executed on VC4 granularity.

Resulting creations of HPT and 63 LONIM entities are notified (by ENT-PTF and ENT-LONIM notifications). The HPT is created together with all 63 LONIM entities (similar as for LO cross-connections).

Because of the fixed inputsig/unequiposig value 33, only the LONIMs 1, 22 and 43 are usable for conversion cross-connections. Example of the notification behavior caused by the auto-substructuring:

If the following cross-connection is entered:

ENT-CRS-AU3TU3::1-1-#-#-1-1-1,1-1-#-#-2-1-1-22:::1WAY;

Then this causes following notifications:

- ED-STS1:1-1-#-#-1-1-1::substr=CNV;
- ED-VC3:1-1-#-#-2-1-1::substr=CNVSUB;
- ENT-PTF-HOVC4:1-1-#-#-2-1-1::inputsig=33,unequiposig=33,…
- ENT-LONIM-LOVC:1-1-#-#-2-1-1-1&&-63::pmlpfeses=2400,pmlpneses=2400,…

Conversion cross-connection specific behavior - Auto-configuration of the HO NIM entity related to the LO side

During the auto-substructuring of a HO NIM as required in ID 73009, the following parameter values are automatically configured:

- *substr* is set to CNVSUB

This are notified with a ED-VC3 notification.

Conversion cross-connection specific behavior - Auto-configuration of the HO NIM entity related to the HO side

When a higher-order tributary gets connected, then the following parameter values of the HO NIM is automatically configured:

- *substr* is set to CNV

This are notified with a ED-rr notification.

No LO substructure is created at the HO NIM entity related to the HO side of a conversion cross-connection. This means also, that no HO PTF and no LONIMs are created at the HO side of a conversion cross-connection.

Conversion cross-connection specific behavior - Creation of 2-Way conversion cross-connections

In the case of a 2-Way conversion cross-connection, the modifier shall define the type of tributaries usable as input and output tributaries.

A 2-Way conversion cross-connection provides the conversion function in both directions, HO STS1/VC3 to LO VC3 and LO VC3 to HO STS1/VC3. The *modifier* value may imply a specific conversion direction. However, the modifier does only define the tributary types in this case.

Example input/output

Example 1

A non-BLSR 1-way cross-connection with rate vc4 between an OP10G (2.vc4) in slot 01 and an OP2G5 in slot 34 (3.port 3.VC4) will be established by:

```
ENT-CRS-VC4:UNITE-NE:1-1-#-#-1-1-4,1-1-#-#-34-3-7:123456::1WAY;
```

```
   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

Example 2

A 2-way Drop-cross-connection with rate vc44c between an OP10G (2.vc4-4c) in slot10 and an OP10G in slot 17 (1.vc4-4c) will be established – the OP10G in slot10 being in the BLSR.

```
ENT-CRS-STS12:UNITE-NE:1-1-#-#-10-1-13,1-1-#-#-17-1-1:123456::2WAY:LOCA=NE-in-RING;
```

```
   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

Example 3

A SDH path-protected cross-connection consisting of

- a working leg (1-1-#-#-10-1-1 -> 1-1-#-#-34-1-13) and
- a protection leg (1-1-#-#-11-1-1 -> 1-1-#-#-34-1-13) is established. None of the affected tributaries is in an BLSR.

The path protection is specified by

- a name (*ppgname*=″Pathprot.Gr.Name.1″),
- the sncp-type (*snctype* = SNCI),
- the hold-off-timer-value (*htmr*=3000, i.e. 3 sec) and
- the wait-to-restore time (*wtr*=10, i.e. 10min).

```
ENT-CRS-STS12:UNITE-NE:1-1-#-#-10-1-1,1-1-#-#-34-1-13:123456::1WAYPPROT,1-1-#-#-11-1
      -1:ppgname=″Pathprot.Gr.Name.1″,rme=DISABLE,snctype=SNCI,htmr=3000,wtr=10;
```

```
   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

Example 4

A 1-way low-order cross-connection with rate VC3 between an OP10G (3rd VC3 in 2nd VC4) in slot 01 and an OP2G5 in slot 34 (2nd VC3 in 3rd VC4 of port 3) will be established by:

```
ENT-CRS-LOVC3:UNITE-NE:1-1-#-#-10-1-4-43,1-1-#-#-34-3-7-22:\
123456::1WAY;

   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

Example 5

A 2-way low-order cross-connection with rate VT1.5 between an OP10G (last VT1.5 in the 4th VT group of the 2nd STS1) in slot 01 and an OP2G5 in slot 34 (last VT1.5 in the last VT group in 3rd STS1 of port 3) will be established by:

```
ENT-CRS-LOVT1:UNITE-NE:1-1-#-#-10-1-2-15,1-1-#-#-34-3-3-28:\
123456::2WAY;

   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

Error responses

Validation rule: Entities must exist for HO cross-connections

Cross-connection command processing verifies that the logical high-order tributaries specified in the high-order cross-connection command do exist.

Error code:

`IENE – Input Entity Not Exists, Specified tributary/tributaries do not exist`

Validation rule: HO tributary must exist for conversion cross-connection

When creating a conversion cross-connection, the command processing shall verify that the HO STS1/VC3 tributary specified in the command exists.

Error code:

`IENE – Input, Entity Not Exists, Specified tributary/tributaries do not exist`

Validation rule: No HO cross-connections while LO cross-connections or LO substructure exist

If an attempt is made to create HO cross-connections while LO cross-connections or LO substructure exist at the HO tributaries, then the command is denied.

Error code:

`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: No conversion-cross-connections while LO cross-connections or LO substructure exist

If an attempt is made to create conversion cross-connections while LO cross-connections or LO substructure exist at the HO tributaries, then the command is denied.

Error code:

`SNVS – Status, Not in Valid State, LO cross-connections or substructure still exist`

Validation rule: No LO cross-connections while conversion cross-connections exist

If an attempt is made to create LO cross-connections, while a conversion cross-connection exists at the HO tributary or at a LO tributary related to the same HO tributary, which is used for the LO cross-connection, then the command is denied.

Error code:

`SNVS – Status, Not in Valid State, conversion cross-connections are still existing`

Validation rule: Entities must fit LOXC interface standard

Cross-connection command processing shall verify that the specified modifier and the given aid's must fit to the LOXC overall interface standard, i.e. the value of the parameter lostd related to the active LOXC pack.

Error code:

`IDNV – Input, Data Not Valid, Low-order cross-connections of this interface standard not supported`

Validation rule: Conversion cross-connections only with LOXC interface standard SDH

The system shall allow to create conversion cross-connections only if the LOXC interface standard is set to SDH. If the LOXC interface standard is not SDH, then the command is denied.

Error code:

`IDNV – Input, Data Not Valid, Conversion cross-connections not supported with current LO interface standard`

Validation rule: LO cross-connections not at HO tributaries used in HO cross-connections

If the network element receives a ENT-CRS command with low-order tributaries relating to a HO tributary which is involved in a HO cross-connection, the following error response is returned:

Error code: `SNVS – Status, Not in Valid State, HO cross-connection exists`

Validation rule: LO tributaries must be creatable for conversion cross-connections

When creating a conversion cross-connection, the command processing shall verify that the low-order tributary specified in the command exists or can be properly created.

A tributary boundary check is included, i.e. only the LO tributary numbers 1, 22, 43 are allowed.

Error code:

`IENE – Input, Entity Not Exists, Specified low-order tributary/ tributaries do not exist/cannot be created (possibly connected at high-order level)`

Validation rule: Entities must be adaptable for LO cross-connections

Cross-connection command processing shall verify that the low-order tributaries specified in the low-order cross-connection command can be properly created by adaptation of the existing substructure. For modifier LOVC3 a tributary boundary check is included, i.e. only the LO tributary numbers 1, 22, 43 are allowed.

Error code:

`IENE – Input, Entity Not Exists, Substructure cannot be adapted`

Examples:

Assuming the following low-order cross-connections have been established:

ENT-CRS-LOVC12::1-1-#-#-1-1-1-22,1-1-#-#-2-1-1-22:::1WAY;

ENT-CRS-LOVC3::1-1-#-#-1-1-1-43,1-1-#-#-2-1-1-43:::1WAY;

The following subsequent cross-connection is invalid:

ENT-CRS-LOVC12::1-1-#-#-1-1-1-44,1-1-#-#-2-1-1-44:::1WAY;

Validation rule: Entities must fit to the interface standard

Cross-connection command processing shall verify that the low-order tributaries specified in the low-order cross-connection command have the same interface standard as the high-order tributary they are contained in.

Error code:

`IENE – Input, Entity Not Exists, Not for this interface standard`

Examples:

Assuming the following low-order cross-connections have been established:

ENT-CRS-VC12::1-1-#-#-1-1-1-22,1-1-#-#-2-1-1-22:::1WAY;

ENT-CRS-VC3::1-1-#-#-1-1-1-43,1-1-#-#-2-1-1-43:::1WAY;

The following subsequent cross-connection is invalid:

ENT-CRS-VT1::1-1-#-#-1-1-1-1,1-1-#-#-2-1-1-1:::1WAY;

Validation rule: Only those parameter present which are needed

Cross-connection command processing verifies according to the given context only those parameter are present which are needed for that context. This means that e.g.

- for entering a 1-way cross-connection the *rtnomode* must not be present
- for entering a non path-protected cross-connection the *ppgname, htmr, wtr, snctype, rme* parameter must not be present.
- for entering a non-BLSR or BLSR-ADD cross-connection the *loca* parameter must not be present
- for entering a non-BLSR or BLSR-DROP cross-connection the *locz* parameter must not be present
- for entering a non-BLSR and unprotected cross-connection the *loca2* parameter must not be present
- for entering a low-order cross-connection the *loca2* and *ppgname* parameters must not be present.

Error code:

`IDNV – Input Data Not Valid, Parameter(s) present which are not allowed`

Validation rule: Both legs must have same rate

Cross-connection command processing verifies that each logical AID specified in the command is consistent with the cross-connection rate. Consistency implies the following condition:

The rate of a new cross-connection from an input tributary that is in use for an existing cross-connection must match the rate of that existing cross-connection.

This can happen if to an existing leg with rate n a further leg is tried to establish with rate $m \neq n$.

Error code:

```
IDNC – Input, Data, Not Consistent, Bridging rate is not compliant with
existing leg
```

Validation rule: AID boundary and rate consistency

Cross-connection command processing shall verify that each logical AID in the command specifying a HO tributary is consistent with the cross-connection rate. Consistency implies the following condition:

- the boundary of the specified tributary is consistent with the specified rate.
- STS-1/VC-3 payloads can start at any position
- the HO side of AU3TU3/TU3AU3 conversion cross-connections can be at any position
- the first (STS-1 equivalent) tributary of an STS-3/VC-4 rate cross-connection must be on a mod3 + 1 boundary (1, 4 , 7, …).
- the first STS-1 of an STS-12/VC-4-4c rate cross-connection must be on a mod12 + 1 boundary (1, 13, 25, …).
- the first STS-1 of an STS-48/VC-4-16c rate cross-connection must be on a mod48 + 1 boundary (1, 49, 97, …).
- the first STS-1 of an STS-192/VC-4-64c rate cross-connection must be on a mod192 + 1 boundary (1, 193, 385, …).

Error code:

```
IDNC – Input, Data, Not Consistent, Tributary boundary is inconsistent
with the indicated rate
```

Validation rule: Tributary provisioning and rate consistency

For fixed rate tributaries, cross-connection command processing verifies that

- if the port identified by logical input AID is provisioned to operate in the fixed signal rate mode, as determined by the tributary mode parameter, then the specified cross-connection rate is equivalent to the provisioned signal rate of the input tributary, as determined by the tributary input signal rate parameter.
- if the port identified by logical output AID is provisioned to operate in the fixed signal rate mode, as determined by the tributary mode parameter, then the specified cross-connection rate is equivalent to the provisioned signal rate of the output tributary, as determined by the tributary unequipped output signal rate parameter. Note that in both cases it does not matter whether the connected tributaries are SONET (STS1/STS3/…) or SDH (VC3/VC4/..) signals with the same transmission rate.

Error code:

```
IDNC – Input, Data, Not Consistent, Specified Tributary does not
support the indicated rate
```

Example:

Assuming an STM-16 (SDH) port named A with 1-1-#-#-1-1 has an input structure of 44-34C.

Assuming an OC-48 (SONET) port named B with 1-1-#-#-2-1 has an output structure of 163.

Both ports (A and B) work in fixed mode (port A since it is SDH, port B since configured).

Following TL1 commands could be sent to connect two tributaries unidirectionally:

- ENT-CRS-VC4::1-1-#-#-1-1-16,1-1-#-#-2-1-48::1WAY:…
- ENT-CRS-STS3::1-1-#-#-1-1-16,1-1-#-#-2-1-48::1WAY:…

Note: In case of adaptive rate no consistency check is required.

Validation rule: Restrictions for LOXC cross-connection rates

For low-order cross-connections, cross-connection command processing shall verify that the rates of the HO tributaries fit to the *modifier* parameter as follows:

- LOVT1 requires STS1 HO tributaries,
- LOVC3 and LOVC12 require VC4 HO tributaries.

Error code:

```
IDNC – Input, Data Not Consistent, Specified Tributary does not support
the indicated rate
```

The existence of an STS1 HO tributary at a SONET port can be verified by checking the *inputsig*, *unequiposig* and *istd* parameters of the related port. Example: If the first HO tributary of a port needs to be successfully checked then the related port parameters should read as follows:

- *inputsig* starting with N1-… (N1 is a number of STS1 signals),
- *unequiposig* starting with N1-… (N1 is a number of STS1 signals),
- *istd* equals SONET.

The existence of a VC4 HO tributary at an SDH port can be verified by checking the *inputsig*, *unequiposig* and *istd* parameters of the related port. Example: If the first HO tributary of a port needs to be successfully checked then the related port parameters should read as follows:

- *inputsig* starting with N4-… (N4 is a number of VC4 signals),
- *unequiposig* starting with N4-… (N4 is a number of VC4 signals),
- *istd* equals SDH.

Validation rule: Pack restrictions for LOXC cross-connection sources

For low-order cross-connections, cross-connection command processing shall verify that any input or output AID shall not reside:

- the OPT2G5 pack,
- the EP51 pack (DS3 and EC1 interfaces),
- the GE1 pack,

- the GE10PL1 pack,
- the ES64U pack

Error code:

`IDNC – Input, Data Not Consistent, LO tributary not supported by that pack`

Validation rule: Pack restrictions for conversion cross-connection sources

For conversion cross-connections, cross-connection command processing shall verify that any input or output AID shall not reside:

- the OPT2G5 pack,
- the GE1 pack,
- the GE10PL1 pack,
- the ES64U pack,
- the TransMUX pack

Error code:

`IDNC – Input, Data Not Consistent, conversion cross-connection not supported by that pack`

Validation rule: Restrictions for LO path protection

If a low-order path protection is created, where the specified input tributaries are already used as input tributaries for another, already existing path protection, then the cross-connection command processing shall verify that:

- the specified working input tributary (in-aid) is also the working input tributary of the existing path protection AND
- the specified protection input tributary (in-aid2) is also the protection input tributary of the existing path protection

Error code: `SNVS – Status, Not in Valid State`

Validation rule: XC pack is (pre-)provisioned

Cross-connection command processing shall verify that at least one XC pack is pre-provisioned or provisioned.

Error code: `SNVS – Status, Not in Valid State, XC Pack not provisioned`

This is also valid for LO cross-connections.

This is also valid for conversion cross-connections.

Validation rule: LOXC pack with more than 0G switch capacity

It is not possible to establish low-order cross-connections if there is no LOXC pack with more than 0 GBit/s low-order switch capacity.

Error code:

`SNVS – Status, Not in Valid State, LOXC switch capacity invalid`

Validation rule: LOXC pack with more than 0G switch capacity for conversion cross-connections

It is not possible to establish conversion cross-connections if there is no LOXC pack with more than 0 GBit/s low-order switch capacity.

Error code:

`SNVS – Status, Not in Valid State, LOXC switch capacity invalid`

Validation rule: No conversion cross-connections with LOXC/1

When creating conversion cross-connections, the command processing shall verify that the low-order switching pack currently used by the system is not of type LOXC/1.

Error code:

`SNVS – Status, Not in Valid State, conversion cross-connections not allowed with LOXC/1`

Validation rule: No lower order TransMUX cross-connections when LO switch capacity is lower than 40G

When creating lower-order TransMUX cross-connections, the command processing shall verify that the low-order switching capacity of the LOXC pack in the system is greater or equal to 40 Gbit/s.

Error code:

`SNVS – SNVS – Status, Not in Valid State, LOXC switch capacity invalid`

Validation rule: Rate must not exceed half of the port rate (2f-BSLR only)

Cross-connection command processing verifies that in case of a 2f-BLSR that the cross-connection rate does not exceed half the rate of the related port.

Note that this validation rule only applies in case of adaptive mode because for fixed-rate such a payload violation would already been denied in the context of the ED-*rr* command.

Error code:

`IDNC – Input, Data, Not Consistent, 2f-BSLR rate exceeds half of the port rate`

Validation rule: path-protected cross-connection has unique input AIDs

Cross-connection command processing verifies that for path-protected cross-connections the two input tributaries are unique i.e. the in_aid has to be different from in_aid2.

Error code:

`IDNV – Input Data Not Vaild, Both input tributaries are identical`

Validation rule: path-protected cross-connection has inputs from ports with same interface standards

Cross-connection command processing denies requests to establish path-protected cross-connections where the ports of the logical input tributaries are not provisioned for the same standard, either SONET or SDH – this is due to different switching criteria.

Error code:

`SNVS – Status, Not in Valid State, Different interface standards for input tributaries`

Validation rule: No path-protected conversion cross-connection

Cross-connection command processing shall deny requests to establish pathprotected conversion cross-connections, i.e. *modifier* = AU3TU3 or TU3AU3.

Error code:

`IDNC – Input, Data Not Consistent, pathprotected conversion cross-connections not allowed`

Validation rule: No trib of any MSP port as *in_aid* for LO path-protected cross-connection

Cross-connection command processing shall verify that for lower order pathprotected cross-connections no tributary is used as *in_aid* or *in_aid2* where the related port is a member of a 1+1 or 1:1 multiplex section/line protection group.

Error code:

`SNVS – Status, Not in Valid State, trib of MSP 1+1/1x1 port as input-trib in pathprotected LO crossconnection`

Validation rule: No trib of any MSP 1x1 protection port as *in_aid* for HO pathprotected cross-connection

Cross-connection command processing shall verify that for higher order pathprotected cross-connections no tributary is used as *in_aid* or *in_aid2* where the related port is used as protection port of a 1:1 multiplex section/line protection group.

Error code:

`SNVS – Status, Not in Valid State, trib of 1x1 protection port as input-trib in pathprotected crossconnection`

Validation rule: No tributary of an MS-SPRing/BLSR port for conversion cross-connection

Cross connection command processing shall verify that for conversion cross-connections no tributary at an MS-SPRing/BLSR port is used for the HO or LO side of a conversion cross-connection.

Error code:
`IDNC – Input, Data Not Consistent, No trib of MS-SPRing/BLSR port allowed for conversion cross-connection`

Validation rule: No multiple added XCs for MS-SPRing TOP

Cross-connection command processing shall verify that for pathprotected cross-connections the output tributary and one of the two input tributaries are not a worker tributary of an port being a member of a BLSR/MS-SPRing protection group operating in TOP mode (i.e. protnmode = ’SHORTENED’ or ’TOPEX’).

Error code:
`SNVS – Status, Not in Valid State, multiple added XCs for MS-SPRing TOP`

Validation rule: Path-protected crossconnection: missing parameters

Cross-connection command processing shall deny requests to establish path-protected cross-connections if one of the mandatoy parameters *htmr*, *rme*, *snctype* or *wtr* is missing.

Error code: `IPMS -Input, Parameter MiSsing, <parameter name> is missing`

Validation rule: No Spare capacity for HO cross-connection legs on LOXC

Cross-connection command processing shall deny requests to establish low-order cross-connections or conversion cross-connections if a newly to be substructured HO tributary cannot be connected to the LO switch matrix .

Error code: `SARB – Status, All Resources Busy, LOXC capacity exhausted`

Validation rule: No cross-connection loopback existing

Cross-connection command processing denies commands requesting a cross-connection to a tributary with an existing cross-connection loopback.

Error code:
`SNVS – Status, Not in Valid State, Tributary has existing loopback`

Note: There is no command validation concerning facility loopback i.e. the cross-connection establishing is possible even with a facility loopback present.

Validation rule: No test access session

Cross-connection command processing shall deny commands requesting a cross-connection to a tributary which is used in a test access session either as tributary under test or as test access tributary. The denial of the cross-connection request is independent whether the direction of the tributary (input or output) is used in the test access session or not.

Error code:
`SNVS – Status, Not in Valid State, Tributary used in test access session`

With this validation rule it is not allowed to add a 1-way cross-connection at a tributary where already another 1-way cross-connection exists in the other direction. This shall avoid cross-connection topology conversions.

Validation rule: Restrict number of cross-connection using same input tributary

Cross-connection command processing verifies that the number of cross-connections originating from the same tributary is restricted as defined for the specific release.

Error code:

`SNVS – Status, Not in Valid State, Too many cross-connection originating from same tributary`

Validation rule: TIDs consistent with existing cross-connection

Cross-connection command processing verifies that for each leg of the cross-connection for which the logical input AID is used in any pre-existing cross-connection that the source TID is identical to that associated with the pre-existing cross-connection. This hold for BLSR cross-connections where both legs of a bridge must originate from the same NE.

Error code:

`SNVS – Status, Not in Valid State, TID inconsistent with existing cross-connection`

Validation rule: Output not in use

Cross-connection command processing verifies that logical output AID is not in use as a destination for an existing cross-connection.

Error code:

`SNVS – Status, Not in Valid State, Output is already crossconnected`

Validation rule: 2 Fiber BLSR/MS-SPRing protection access (Extra Traffic)

Cross-connection command processing shall allow commands requesting higher order or lower order cross-connections to the protection tributaries of a port being a member of a 2 Fiber BLSR/MS-SPRing protection group only if the port rate is OC48/STM16 or OC192/STM64.

Error code:

`SNVS – Status, Not in Valid State, Command refers to protection tributaries of a BLSR/MS-SPRing protection`

Validation rule: 4 Fiber BLSR/MS-SPRing protection access (Extra Traffic)

Cross-connection command processing shall allow commands requesting higher order or lower order cross-connections to the protection tributaries of a port being a member of a 4 Fiber BLSR/MS-SPRing protection group only if the related protection group has the parameter *protnmode* set to TOPEX.

Error code:

`SNVS – Status, Not in Valid State, Command refers to protection tributaries of a BLSR/MS-SPRing protection`

Validation rule: No connections between BLSR/MS-SPRing working and protection tribs

Cross-connection command processing shall deny commands requesting higher order or lower order cross-connections between working tributaries and the protection tributaries which belong to the same or different BLSR/MS-SPRing protection group.

Error code:

`IDNC – Input, Data Not Consistent, Connections between BLSR/MS-SPRing working and protection tributaries are not allowed`

Validation rule: No low-order path protection with input tributaries from BLSR/MS-SPRing ports

Cross-connection command processing shall deny commands requesting low-order path-protected cross-connections having at least one input tributary at a BLSR/MS-SPRing port.

Error code:

`IDNC – Input, Data Not Consistent, No low-order path protection with input tributaries from BLSR/MS-SPRing ports`

Validation rule: No low-order path protection with input tributaries from the protection bandwidth of 2-fiber MS-SPRing/BLSR protection

Cross-connection command processing shall deny commands requesting low-order path protected cross-connections having at least one input tributary (in_aid or in_aid2) within the protection bandwidth of 2-fiber MS-SPRing/BLSR protection.

Error code:

`IDNC – Input, Data Not Consistent, No low-order path protection with input tributaries from protection bandwidth of 2-fiber MS-SPRing/BLSR protection`

Validation rule: Corresponding *loca*/*loca2*/*locz* information is missing

Cross-connection command processing shall deny commands requesting cross-connections to worker tributaries on ports in BLSR/MS-SPRing groups, which have Automatic Squelch Map Calculation disabled, if corresponding loca/loca2/locz information is missing in the command.

Error code:

`IDNC – Input, Data Not Consistent, Corresponding loca/locz information is missing`

Validation rule: Consistent *loca*/*loca2*/*locz* for all low-order cross-connections using the same HO PTF at an MS-SPRing port

Cross-connection command processing shall deny the creation of a lower-order cross-connection at an MS-SPRing port, if the *loca*/*loca2*/*locz* information specified in the command does not match the *loca*/*loca2*/*locz* values of already existing low-order cross-connections using the same HO PTF at the MS-SPRing port or if both input tributaries of a lower-order path protected cross-connection use the same HO PTF and *loca*/*loca2* are specified in the command with different values.

Error code:

`IDNC – Input, Data Not Consistent, Inconsistent loca/locz information`

Validation rule: Consistent loca/locz for all conversion cross-connections using the same HO PTF at an MS-SPRing port

Cross-connection command processing shall deny commands, if a conversion cross-connection is created at an MS-SPRing port, and the *loca/locz* information specified in the command does not match the *loca/locz* values of already existing conversion cross-connections using the same HO PTF at the MS-SPRing port.

Error code:

`IDNC – Input, Data Not Consistent, Inconsistent loca/locz information`

Validation rule: loca/locz information only retrievable for EXTRA TRAFFIC

Cross-connection command processing shall deny commands, if affected tributaries belong to EXTRA TRAFFIC and *loca*/*locz* information is specified in the command. The *loca*/*locz* information is automatically created for EXTRA TRAFFIC by the NE.

Error code:

```
SNVS – Status, Not in Valid State, Command refers to protection
tributaries of a BLSR/MS-SPRing protection
```

Validation rule: SNC Type Compliance

Cross-connection command processing verifies the following when establishing a higher-order path-protected cross-connection:

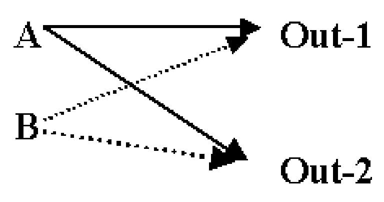
If there are any existing HO path protection groups that are *co-located* to the HO cross-connection to be established, then the SNC protection type parameter in the **`ENT-CRS`** command has the same value as the SNC protection type attribute of all of the *co-located* path protection groups.

A path protection group P is defined for this requirement to be *co-located* to a cross-connection C if any of the logical input tributaries of the cross-connections belonging to P are logical input tributaries of C – see the example below.

Error code:

```
IDNC – Input, Data, Not Consistent, SNC Type not compliant with
existing path-protected cross-connection
```

As an example consider the figure below: A path-protected cross-connection A, B $\rightarrow$ Out-1 may be established with the SNC-Type of e.g. SNCI; If then establishing another path-protected cross-connection A, B $\rightarrow$ Out-2, which has a common tributary (here tributary A) with the former path-protected cross-connection, the SNC-Type of this new one has to be SNCI as well.



Legend: see Fig in the RTRV-CRS section

Validation rule: No VCG-trib as *in_aid* (for path-protected cross-connection)

Cross-connection command processing shall verify that for path-protected cross-connection no VCG-trib is used as *in_aid* or *in_aid2*.

Error code:

`IDNC – Input Data Not Consistent, VGC-trib as input-trib in pathprotected crosconnection`

Validation rule: No OPT2G5 related trib as *in_aid* (for pathprotected cross-connection)

Cross-connection command processing verifies that for path-protected cross-connection no tributary from OPT2G5 is used as *in_aid* or *in_aid2*. The case of path-protected cross-connection in conjunction with OPT2G5 only makes sense for both input-tribs *(in_aid* and *in_aid2*) being non-OPT2G5 STS-tribs and the *out_aid* being a tributary on the OPT2G5 pack..

Error code:

`IDNC – Input, Data Not Consistent, no OPT2G5-trib as input-trib in pathprotected crossconnection`

Validation rule: Maximum number of *ppgnames* exceeded

Cross-connection command processing verifies that for path-protected cross-connection the maximum number of ppgnames is not exceeded if a new (not already used *as ppgname* for another protection group) is specified.

Error code:

`SSRE – Status, System Resources Exceeded, limit of ppgnames exceeded`

Validation rule (ONNS specific): Tributaries must not belong to ports of *portClass* INNI

Cross-connection command processing shall verify, that all affected input and output tributaries do not belong to ports of *portClass* INNI.

Error code:

`SNVS – Status, Not in Valid State, Tributaries must not be on ports of portClass INNI`

Validation rule (ONNS specific): LO Tributaries must not belong to ports of *portClass* INNI

For low-order cross-connections, cross-connection command processing shall verify, that all affected input and output tributaries do not belong to ports of *portClass* INNI.

Error code:

`IDNC – Input, Data Not Consistent, Tributaries must not be on ports of portClass INNI`

Validation rule (ONNS specific): Tributaries must not belong to ports of *portClass* UNI

Cross-connection command processing shall verify, that all affected input and output tributaries do not belong to ports of *portClass* UNI.

Error code:

`SNVS – Status, Not in Valid State, Tributaries must not be on ports of portClass UNI`

Validation rule (ONNS specific): LO Tributaries must not belong to ports of *portClass* UNI

For low-order cross-connections, cross-connection command processing shall verify, that all affected input and output tributaries do not belong to ports of *portClass* UNI.

Error code:

`SNVS – Status, Not in Valid State, Tributaries must not be on ports of portClass UNI`

Validation rule (ONNS specific): Tributaries must not belong to ports of *portClass* ENNI

Cross-connection command processing shall verify, that all affected input and output tributaries do not belong to ports of *portClass* ENNI.

Error code:

`SNVS – Status, Not in Valid State, Tributaries must not be on ports of portClass ENNI`

Validation rule (ONNS specific): LO Tributaries must not belong to ports of ***portClass*** ENNI

For low-order cross-connections, cross-connection command processing shall verify, that all affected input and output tributaries do not belong to ports of *portClass* ENNI.

Error code:

`SNVS – Status, Not in Valid State, Tributaries must not be on ports of portClass ENNI`

Validation rule (ONNS specific): Restrict number of crossconnection using same input tributary on EDGE port

Cross-connection command processing shall verify that the number of cross-connections originating from the same tributary is restricted to two, if the affected port is of port class EDGE.

Error code:

`SNVS – Status, Not in Valid State, Port Class must not be EDGE or INNI`

Validation rule (ONNS specific): TRADITIONAL and NN cross-connections not on the same tributary

Cross connection command processing shall verify, that there is no cross-connection of xconcls NN at any of the tributaries specified in the command. The validation rule is only applied for tributaries at EDGE ports which are specified in the command.

Error code:

`SNVS – Status, Not in Valid State, Cross Connection of xconcls NN exists`

ENT-CRS notification

Output format

Syntax: **ENT-CRS**-*modifier*:*in_aid*,*out_aid*:*cct*,[*in_aid2*]:*spec-block*;

Output parameters

Command parameters

1. **modifier**
   This parameter indicates the cross-connection rate on which the **ENT-CRS** command acts on.
   For detailed description please refer to the "RTRV-CRS: Retrieve cross-connection" (p. 3-2306) command.
   Type: Alphanumeric value set.
   Range:
   - LOVC12
   - LOVC3
   - VC3
   - VC4
   - VC44C
   - VC416C
   - VC464C
   - LOVT1
   - STS1
   - STS3
   - STS12
   - STS48
   - STS192
   - AU3TU3
   - TU3AU3
2. **in_aid** – Input Access Identifier
   The parameter *in_aid* (Input Access Identifier) specifies the tributary which is the source of the cross-connection.
   In case of a 1way cross-connection this parameter specifies the source of the cross-connection.
   In case of a 2way cross-connection this parameter is identical to the one used as input parameter (please refer also to the description of the input parameter *in_aid* of the **RTRV-CRS** command).
   In case that a wildcard AID has been used to retrieve 2way cross-connections, then either of the input/output AIDs of the cross-connections will be returned as *in_aid*

in the response. For conversion cross-connections the returned *in_aid* is independent, whether the wildcard AID in RTRV-CRS specifies a HO or LO tributary.
In case of a path-protected cross-connection this parameter may specify either the source of the working leg or the source of the protection leg – the distinction is made via the spec-block parameter *repleg* (see below).
If *in_aid* specifies the working-leg part than *in_aid2* (see below) specifies the protection-leg part and vice versa.
Type: GenTribAID or GenLOTribAID. STS1NumAID are used for high-order tributaries on e.g. OP***n***, EP***n*** packs, VCGNumAID are used for high-order tributaries on e.g. GE***n***, OPT2G5 packs, GenLOTribAID are used for low-order tributaries on I/O packs e.g. OP***n***, EP155.
Range: (**`all`** values shall never occur as part of an output parameter)

3. **`out_aid`** – Output Identifier
   This parameter specifies the tributary which is the sink of the cross-connection.
   Type: GenTribAID or GenLOTribAID.
   Range: No use of the **`all`** or **`usall`** or **`vall`** values within the *out_aid* is allowed.
4. **`cct`** – cross-connection Topology
   This parameter specifies the topology of the cross-connection to be established via the **`ENT-CRS`** command.

   The topology defines

   - – the number of legs of the cross-connection
   - – whether both legs belong to the same tributary
   - – whether a path protection is included.

   The following values are possible:

   - 1WAY: the cross-connection consists of one leg given by the *in_aid* to the *out_aid*
   - 2WAY: the cross-connection consists of two legs given by the *in_aid* to the *out_aid* and the return leg given by the *out_aid* to the *in_aid*
   - 1WAYPPROT: the cross-connection consist of one leg (the worker leg) given by *in_aid* to *out_aid* and another leg (the protection leg) given by *in_aid2* to the *out_aid*. The path selector function is associated with the tributary of *out_aid*.

   Type: Alphanumeric value string.

   Range:

   - 1WAY
   - 2WAY (default)
   - 1WAYPPROT.
5. **`in_aid2`** – Second Input Access Identifier
   This parameter is applicable to and is present for path-protected cross-connections only and specifies either the source of the protection leg or the source of the working leg.

This depends on the value of the *repleg* parameter:

- E.g. for the combination: *in_aid* = IN1, *out_aid* = OUT, *in_aid2* = IN2 and *repleg*=1WAYPSW the worker leg is given by IN1 -> OUT and the protection leg is given by IN2 -> OUT;
- for the combination: *in_aid* = IN1, *out_aid* = OUT, *in_aid2* = IN2 and *repleg*=1WAYPSP the worker leg is given by IN2 -> OUT and the protection leg is given by IN1 -> OUT.

Thus *in_aid* and *out_aid* specify one leg of the legpair of a path-protected cross-connection, while *in_aid2* and *out_aid* specify the second leg.
Type: STS1NumAID, TMuxAPTNumAID, or GenLOTribAID.
STS1NumAID are used for high-order tributaries on e.g. OP***n***, EP***n*** packs; TMuxAPTNumAID are used for asynchronous high-order tributaries on TransMUX packs, GenLOTribAID are used for low-order tributaries on e.g. OP***n***, EP155.
Note: Using VCGNumAID (when using e.g. GE***n*** packs) is NOT applicable as those packs can not be the input to a path-protected cross-connection. Therefore specific AID types are mentioned instead of GenTribAID.
Range: n.a. (**`all`** and **`usall`** values shall never occur as part of an output parameter).

Spec block parameters

1. **`loca`** – Location-a

   This parameter specifies the TID of the node at which service is added to the BLSR.
   This parameter is required for BLSR THROUGH, INTER-BLSR and DROP connections.
   The *loca* parameter value is an empty string for ADD and non-BLSR connections.
   A 2way cross-connection is considered to be a DROP if the out_aid is a non BLSR tributary.
   For description of a 2way scenario see RTRV-CRS command.
   Inter Ring Cross-connections with collapsed node: Note that beside the above described THROUGH case there can be also another situation where both *loca* and *locz* are different from the empty string: If two rings are interconnected in a collapsed node then *loca* refers to the (add-node of the) ring where the signal is dropped from, and *locz* refers to the (drop-node of the) ring where the signal is added to. In such cases the cross-connection cannot be provisioned as bidirectional, thus the information is still unambiguous.
   A note to the loca2 parameter: Although *loca2* (Location-a-2) is a parameter which is used in the **`ENT-CRS`** command, *loca2* is not retrieved explicitly. This is due to the fact that for path-protected cross-connections – and only for those this *loca2* is applicable – the retrieval will be on a leg-basis and not on a leg-pair basis. In other words: If a path-protected cross-connection is retrieved two entries will be sent, one for the working leg (incl. the *loca* and *locz* parameter) and one for the protection leg (incl. the *loca* parameter and the same *locz* parameter, and in this case the *loca* returned is the *loca2* as entered when establishing the path-protected cross-connection).

The parameter *loca* is also required for EXTRA TRAFFIC connections. (In contrast to incoming references from other commands to this whole chapter it is exclusively applicable for the command **RTRV-CRS**). For extra traffic the value will be generated automatically and thus it is only retrievable. For information about the automatic generation of *loca* refer to the parameter *sqfa*.
For lower-order cross-connections the parameter *loca* is the TID of that ring node in the direction towards the specified input tributary (upstream), where the HO path termination source function resides. If there is no such function in an upstream ring node then loca is the TID of the node where the related HO circuit is first added to the ring. The picture "Lower-order cross-connections" (p. 3-2322)shows an example of a LO path through a part of a ring. The LO path is added to/dropped from the ring in NE-1 and NE-2. 2-way cross-connections are considered to be either an Add or a Drop connection depending whether the input or the output tributary is at the ring port. In NE-3 there is a HO through connection, which contains the LO path. In NE-3 there is no HO path termination. In NE-4 there is a LO through connection. Consequently, there are HO path terminations in NE-4.

The fact that loca refers to the HO path terminations has the following consequences:

- All LO cross-connections through the same HO path termination at the MS-SPRing port have the same loca value.
- Any LO through-connection will be treated as add/drop. loca will identify the node of the through connection, and not the node where the LO service is added to the ring.

At the lower-order side of a conversion cross-connection, the same rules for *loca* is applicable as for lower-order cross-connections.
Type: TID or empty-string (default)
Range: 1 to 20 characters. Needs to be the same as defined in RTRV-HDR.

2. **locz** – Location-z
This parameter *locz* (Location-z) specifies the TID of the node at which service is dropped from the BLSR. This parameter is required for BLSR THROUGH, INTER-BLSR and ADD connections. The *locz* parameter value has to be omitted for DROP and non-BLSR connections.
A 2way cross-connection is considered to be a ADD if the in_aid is a non BLSR tributary.
Refer to figure "2-way scenario" (p. 3-2322)in the RTRV-CRS section for further explanation.
locz is also required for EXTRA TRAFFIC connections.
For extra traffic the value will be generated automatically and thus it is only retrievable. For information about the automatic generation of locz refer to the parameter *sqfz*.
For lower-order cross-connections the parameter *locz* is the TID of that ring node

in the direction towards the specified output tributary (downstream), where the HO path termination sink function resides. If there is no such function in a downstream ring node then *locz* is the TID of the node, where the related HO circuit is last dropped from the ring. Refer to figure "Lower-order cross-connections" (p. 3-2322) in the RTRV-CRS section for further explanation.

The fact that locz refers to the HO path terminations has the following consequences:

- All LO cross-connections through the same HO path termination at the MS-SPRing port have the same *locz* value.
- Any LO through-connection will be treated as add/drop. *locz* will identify the node of the through connection, and not the node where the LO service is dropped from the ring.

At the lower-order side of a conversion cross-connection, the same rules for *locz* is applicable as for lower-order cross-connections.
Type: TID or empty-string (default)
Range: 1 to 20 characters. Needs to be the same as defined in RTRV-HDR.

3. **`omode`** – Output Mode

   This parameter specifies the output mode of the cross-connection:

   - for a 1-way cross-connection the output is clearly defined by the destination (*out_aid*)
   - for a 2-way cross-connection the output is defined as the source-to-destination direction (*in_aid* to *out_aid*)
   - NORM: this is the normal output i.e. the signal from the *in_aid* is passed through to the *out_aid*;
   - IDLE/UNEQ: this mode outputs an unequipped signal;
   - AIS: this mode outputs an AIS signal.

   Type: Alphanumeric value set.

   Range:

   - NORM (default)
   - IDLE/UNEQ
   - AIS

4. **`onnsConnControl`** – ONNS Connection Control
   This parameter indicates for cross-connections of *xconcls* NN, whether the ONNS connection a cross-connection is assigned to is controlled by ONNS directly or by an external control (setup via UNI or eNNI or as SPC connection).
   For cross-connections of *xconcls* TRADITIONAL the value UNKNOWN is reported for this parameter.
   The value UNKNOWN shall also be reported for cross-connections of *xconcls* NN, the onnsConnControl of which cannot be determined.
   Type: Alphanumeric value set.

Range:

- UNKNOWN
- ONNS
- EXT

5. **`onnsPathID`** – ONNS Path Identity
   This parameter indicates for cross-connections of *xconcls* NN the path ID of the ONNS path a cross-connection is assigned to.
   For cross-connections of *xconcls* TRADITIONAL an empty string is reported for this parameter.
   Type: Character string of length up to 20 or empty string.
   Range:
   nodeID-Index
   - nodeID: four dot separated numeric strings: each string 0..255
   - Index: Numeric string 0-65535

   Example: 29.13.196.203-65111
   Default: empty string
6. **`repleg`** – Reported Leg Pair
   This parameter provides compact information about the leg(s) of cross-connections and is derived, as shown in the table below, from a combination of the following elementary parameter:
   - atomic cross-connection topology
   - leg status
   - path-protected group working leg (if applicable i.e. being part of a protection group).

Atomic cross-connection Topology	Path Protection Leg Role	Leg Status	Reported Legpair (*repleg*)
point-to-point	n.a.	1-way	1WAY
point-to-point	n.a.	2-way	2WAY
path-protected	W	1-way	1WAYPSW
path-protected	P	1-way	1WAYPSP

Atomic cross-connection topology:

Two atomic cross-connection topologies are supported:

- Point to point: The point to point cross-connection consists of one leg only, which is defined by its source-trib (*in_aid*) and its destination-trib (*out_aid*) and its particular transmission rate.
- path-protected: The path-protected cross-connection consists of a path protection group with two legs, a working leg and a protection leg – the declaration of working respectively protection is made when establishing the cross-connection (ENT-CRS command).

The two legs are defined by two input tributaries and one output tributary – thus one input tributary and the output tributary form the working leg while the other input tributary and the output tributary form the protection leg.

Note that:

both input tributaries must belong to ports with the same interface standard (either SONET or SDH), due to different switch criteria;

both legs must be at the same cross-connection rate.

Leg status:

The leg status indicates whether a leg is monitored and reported as a 1-way cross-connection or a leg pair i.e. a 2-way cross-connection.

1-way: The leg status for a path-protected cross-connection is always defined as 1-way.

2-way: The leg status for a (non path-protected) cross-connection is set to 2-way if all the following conditions are fulfilled: there are 2 cross-connections in opposite direction between the same tributaries; both of these cross-connections have the same rate (independent if the SONET or SDH rate was used when establishing i.e. VC3 is equivalent to STS1, VC4 is equivalent to STS3 etc); the source and destination TIDs do match i.e. the source TID of one leg is the destination TID of the other leg and vice versa (this condition of course holds only in case of BLSR cross-connections).

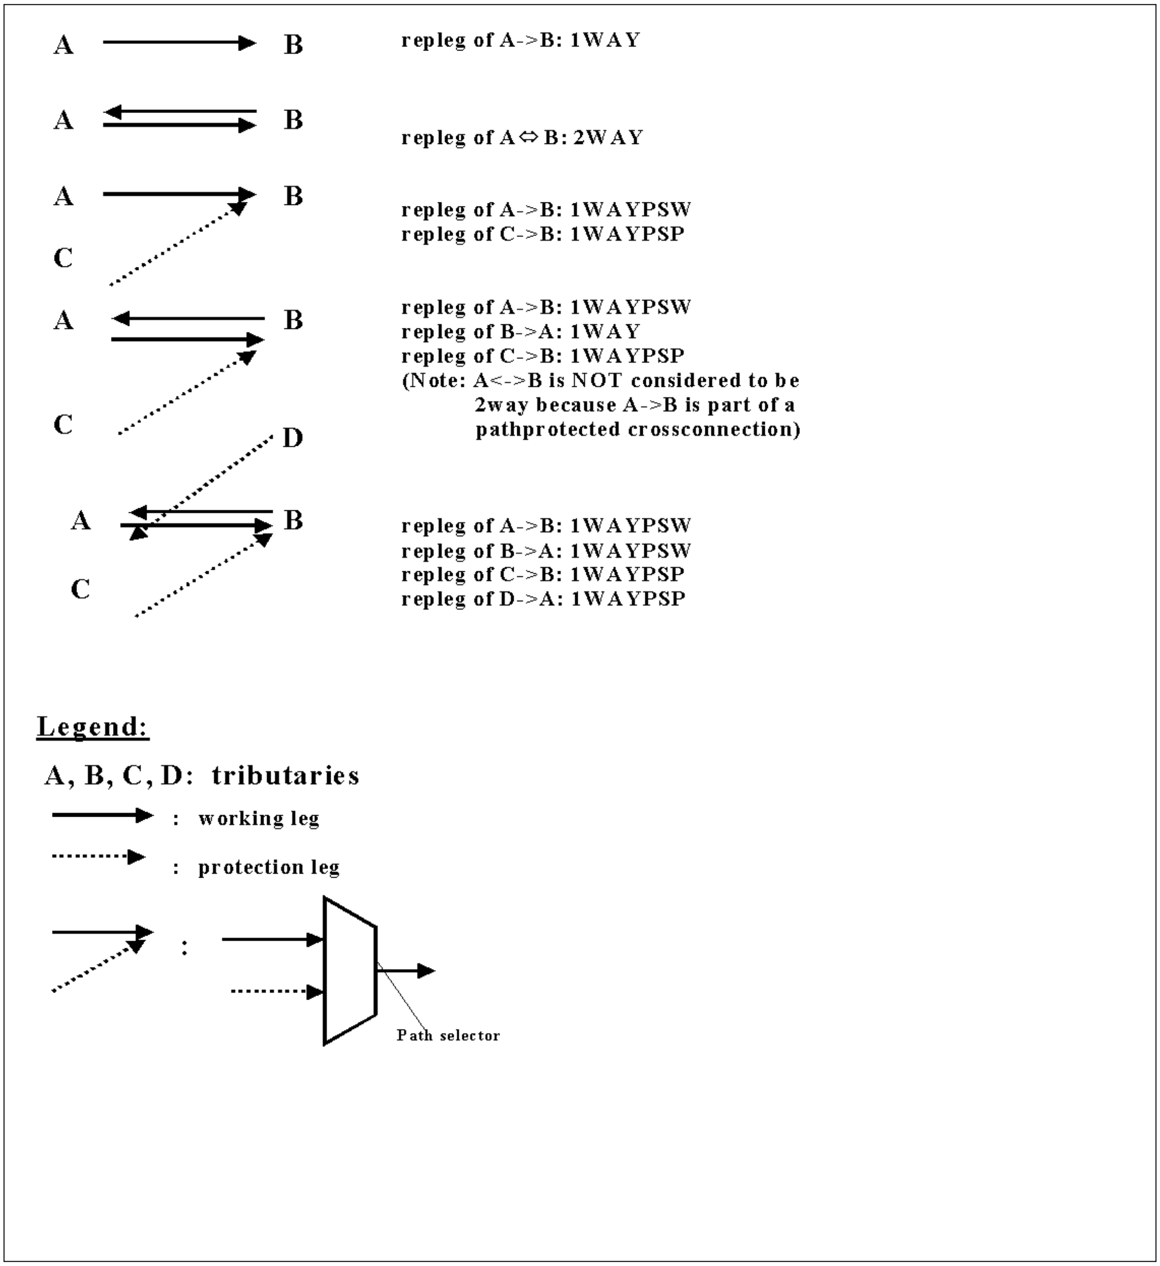
Note that the criteria for a 2-way leg-pair do not depend on whether the two legs were set up at the same time, nor on whether either leg was set up as part of a 2-way cross-connection topology

Path Protection leg role:

This indicates if the leg of a path protection group is defined as the working (W) leg or the protection (P) leg.

1WAYPSW and 1WAYPSP stands for 1-way path switched working and 1-way path switched protection respectively.

The following figure shows examples for the *repleg* parameter for several cross-connection configurations including compound cross-connection.



Range:

- 1WAY
- 2WAY
- 1WAYPSW
- 1WAYPSP.

The values 1WAYPAP and 1WAYPAW are not supported in the initial release.

7. **`rtnomode`** – Return Output Mode
   The parameter *rtnomode* (return output mode) is only applicable for 2way cross-connection and is omitted for 1way and path-protected cross-connections.
   Type: Alphanumeric value set.
   Range: NORM (default), IDLE/UNEQ, AIS
8. **`rtnxcappl`** – Return cross-connection application
   This parameter is a numeric value which indicates the application for which the return cross-connection is used in the context of compound cross-connection topologies.
   - for a 1-way cross-connection this parameter is not applicable and will thus be omitted.
   - for a 2-way cross-connection the parameter is present.

   Type: same as *xcappl*.
   Range: same as *xcappl*.
   Default: The default value is 0.
9. **`rtnxcnum`** – Return cross-connection number
   This parameter is a multiple-digit number identifying the cross-connection number for the return direction (destination to source i.e. *out_aid* to *in_aid*) of a 2-way cross-connection.
   - for a 1-way cross-connection this parameter is not applicable and will thus be omitted.
   - for a 2-way cross-connection the parameter is present.

   Type: same as *xcnum*.
   Range: same as *xcnum*.
   Default: The default value is 000000000000.
10. **`xcappl`** – cross-connection application
    This parameter is a numeric value which indicates the application for which the cross-connection is used in the context of compound cross-connection topologies.
    The parameter is not further processed in the NE, but only stored (when establishing or modifying the cross-connection) and returned when retrieving the cross-connection.
    The numeric values are assigned to appropriate text strings (see Range below) and the manager should display these value in case of a "RTRV-CRS: Retrieve cross-connection" (p. 3-2306).

    As a possible assignment proposal the following may serve:
    - 0) Unknown
    - 1) 1-Way Point-to-Point
    - 2) 1-Way Path-Protected
    - 3) 1-Way Adjunct Path-Protected
    - 4) 1-Way Conversion Cross-Connection
    - 10) 2-Way Point-to-Point
    - 11) 2-Way Conversion Cross-Connection
    - 20) UPSR (or SNCP Ring) Add, Drop

- 21) UPSR (or SNCP) Ring-to-Ring, Single Node Interconnection, Same NE
- 22) UPSR (or SNCP) Drop, 1-Way Broadcast
- 23) UPSR (or SNCP Ring) Add, Drop connection (Broadcast)
- 30) Logical Ring (or SNCP) Add, Drop
- 40) Ring Interworking, Drop-and-Continue, BLSR (or MS-SPRing) Primary Node
- 41) Ring Interworking, Drop-and-Continue, BLSR (or MS-SPRing) Primary Nodes in same NE
- 42) Ring Interworking, Dual Transmit, BLSR (or MS-SPRing) Terminating Node
- 50) Ring Interworking, Drop-and-Continue, UPSR (or SNCP Ring)
- 51) Ring Interworking, Drop-and-Continue, UPSR (or SNCP Ring) Nodes in same NE
- 60) 1-Way Broadcast -- note: this is with N greater than or equal to 2.

Type: numerical value set.
Range: {0, 1, 2,…, 255}.
Default: The default value is 0.

11. **`xcnum`** – cross-connection number
This parameter is a 12 digit number, identifying each leg in a specific compound cross-connection. (Compound cross-connection are a composition of several atomic cross-connection in order to form complex scenarios like e.g. described in ″Example input/output″ section of the **`RTRV-CRS`** command like UPSR, DRI etc.).
Like the *xcappl* parameter the *xcnum* parameter is not further processed in the NE, but only stored (when establishing or modifying the cross-connection) and returned when retrieving the cross-connection. It may be used by a manager to characterize and group cross-connections belonging to complex cross-connection topology (e.g. compound cross-connections as used in ring interworking scenarios).
Type: numeric value set (12 digit).
Two digits for the bay, one digit for the shelf, two digits for the slot, two digit for the port, three digits for the high-order tributary, and two digits for the low-order tributary.
Range: 000000000000 .. 999999999999.
Default: The default value is 000000000000.

12. **`xconcls`** – cross-connection class
This parameter identifies, whether the cross-connection has been setup in the TRADITIONAL way by an operator via the **`ENT-CRS`** command or via the NN application as part of an ENT-PATH command. This parameter therefore also indicates who is the owner of the cross-connection and can modify or delete it.
Type: Alphanumeric value set.
Range: TRADITIONAL, NN.
For low order cross-connections, the value range is limited to TRADITIONAL.

Example output

```
LT-UNITE-123 00-01-01 08:00:50
A 815 REPT DBCHG
```

```
   ”TIME=08-00-12,DATE=00-01-01:ENT-CRS-VC4:1-1-#-#-1-1-1,\
    1-1-#-#-2-1-1:2WAY:lpbkstat=NO,omode=NORM,repleg=2WAY,\
    rtnomode=NORM,rtnxcappl=20,rtnxcnum=123456789012,\
    xconcls=TRADITIONAL,xcappl=20,xcnum=123456789012”
;
```

ENT-CRS-FECOM: Enter transparent DCC cross-connection

The **ENT-CRS-FECOM** command can be initiated by the users to establish a transparent DCC cross-connection.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 3

Abortable: No.

Input format

Command syntax: **ENT-CRS-FECOM**:*tid:port_aid1,port_aid2,dcctype:ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for input parameter syntax and description of this parameter.
3. **port_aid1** – DCC port 1
   This parameter indicates one (first) optical port AID of an OP***n*** circuit pack which is used together with dcctype to identify the DCC channel which is involved in a transparent DCC cross-connection.
   Type: AID
   Range: SPortAID. The keyword **all** is allowed not.
4. **port_aid2** – DCC port 2
   This parameter indicates one (second) optical port AID of an OP***n*** circuit pack which is used together with dcctype to identify the DCC channel which is involved in a transparent DCC cross-connection.
   Type: AID.
   Range: SPortAID. The keyword **all** is allowed not.
5. **dcctype**
   This parameter specifies whether the LINE/MS or SECTION/RS transparent DCC cross-connection parameters of the OP***n*** port is reported by the command.
   Type: Alphanumeric value set.
   Range: LINE, SECTION.

Output format

In response to a valid ENT-CRS-FECOM command, the following output is returned:

```
    sid date time
 M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The **ENT-CRS-FECOM** command establishes a transparent DCC cross-connection. The transparent DCC cross-connection will be established between *port_aid1* and *port_aid2* for the specified dcctype. The System supports only bidirectional transparent DCC cross-connections.

Update affected entities

The established bidirectional transparent DCC cross-connection will be reported via ENT-CRS-FECOM notification reporting the established transparent DCC cross-connection.

The update of the *dccstat* parameter of the two involved DCC channels will be reported via ED-FECOM notification for each port reporting the changed *dccstat* = TRANSPARENT and *scn_dccstat* = TRANSPARENT and *uni_dccstat* = TRANSPARENT and *enni_dccstat* = TRANSPARENT.

Example input/output

The following example shows ENT-CRS-FECOM commands where two transparent DCC cross-connections are established one for *dcctype* = SECTION and one for *dcctype* = LINE:

```
ENT-CRS-FECOM:NE-UNITE:1-1-#-#-1-1,1-1-#-#-2-1,LINE:12345;
    NE-UNITE 00-12-24 12:00:00
 M  123456 COMPLD
;
ENT-CRS-FECOM:NE-UNITE:1-1-#-#-1-1,1-1-#-#-2-1,SECTION:12345;
    NE-UNITE 00-12-24 12:00:00
 M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **ENT-CRS-FECOM** command.

Validation rule: Different port AIDs

The AIDs of *port_aid1* and *port_aid2* must specify different ports.

Error code:

`IDNC – Input, Data Not Consistent, port_aid1 and port_aid2 not different`

Validation rule: Maximum of DCC CCs exceeded with CTL/- or CTL/2

Operating on a CTL/- or CTL/2, the maximum number of bidirectional transparent DCC cross-connections is limited to 25.

Error code:

`SSRE – Status, System Resources Exceeded, limit of transparent DCC cross-connections exceeded`

Validation rule: Maximum of DCC CCs exceeded with CTL/3

Operating on a CTL/3 the maximum number of bidirectional transparent DCC cross-connections limited by the following equation: 2 * (nr. of enabled transparent MS/RS-DCC channels) + (nr. of enabled non-transparent MS/RS-DCC channels) + (nr. of internally used DCC channels) ≤ 180.

Error code:

`SSRE – Status, System Resources Exceeded, limit of transparent DCC cross-connections exceeded`

Validation rule: DCC channels enabled

One of the DCC channels is already enabled for DCC overhead processing.

Error code: `SNVS – Status, Not in Valid State, DCC channel already enabled`

Validation rule: DCC protection

One of the DCC channels is occupied the MSP/APS protection of DCC channels.

Error code:

`SNVS – Status, Not in Valid State, DCC channel occupied by MSP/APS DCC protection`

Validation rule: No DCC on transparent ports

The system shall not allow to use DCC on Transparent Ports, i.e. on ports with a rate of STM16T or OC48T.

Error code:

`IDNV – Input, Data Not Valid, DCC on Transparent Ports not allowed`

Validation rule: No DCC on DS3 ports

The system shall not allow to use DCC on DS3 Ports, i.e. on ports with a rate of T3.

Error code: `IDNV – Input, Data Not Valid, DCC on DS3 Ports not allowed`

Validation rule: No DCC on EC1 ports

The system shall not allow to use DCC on EC1 Ports.

Error code: `IDNV – Input, Data Not Valid, DCC on EC1 Ports not allowed`

ENT-CRS-FECOM notification

General

Command syntax: **`ENT-CRS-FECOM`**:*port_aid1,port_aid2,dcctype*

Output parameters

Command parameters

1. **`port_aid1`** – DCC port 1
   This parameter indicates one (first) optical port AID of an OP***n*** circuit pack which is used together with dcctype to identify the DCC channel which is involved in a transparent DCC cross-connection.
   Type: AID
   Range: SPortAID. The keyword **`all`** is allowed not.
2. **`port_aid2`** – DCC port 2
   This parameter indicates one (second) optical port AID of an OP***n*** circuit pack which is used together with dcctype to identify the DCC channel which is involved in a transparent DCC cross-connection.
   Type: AID.
   Range: SPortAID. The keyword **`all`** is allowed not.
3. **`dcctype`**
   This parameter specifies whether the LINE/MS or SECTION/RS transparent DCC cross-connection parameters of the OP***n*** port is reported by the command.
   Type: Alphanumeric value set.
   Range: LINE, SECTION.

Example output

The following example shows ENT-CRS-FECOM notifications reporting established transparent DCC cross-connections:

```
   UNITE-NE 00-12-24 12:00:00
 A  000 REPT DBCHG
   "TIME=12:00:00,DATE=00-12-24:ENT-CRS-FECOM:1-1-#-#-1-1,1-1-#-2-1,LINE"
;
   UNITE-NE 00-12-24 12:00:00
 A  000 REPT DBCHG
   "TIME=12:00:00,DATE=00-12-24:ENT-CRS-FECOM:1-1-#-#-1-1,1-1-#-2-1,SECTION"
;
```

ENT-EC1 notification

Output format

Command syntax:

ENT-EC1:*aid::spec_block;*

Output parameters

Command parameters

1. **aid** – Access Identifier
Type: AID
Range: EC1 port AID

Spec block parameters

1. **crstat** – Constituent Rates Status list
This parameter shows the rates of the port signal.
Type: numeric value set
Range: 11 (1 xSTS1)
2. **eif** – Electrical Interface Type
This parameter indicates the type of input the port has been provisioned to receive.
Type: Alphanumeric value set.
Range: EC1
3. **felpm** – Far-end Line PM Enable
Enable or disable of the performance monitoring of the multiplex section/line.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE (default)
4. **frcdus** – Force to DUS
Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message "do not use" will be transmitted from that optical interface.
Type: Alphanumeric value set.
Range: ENABLE: set a forced DUS/DNU; DISABLE (default): clear a forced DUS/DNU
5. **fsflpbkstat** – Far Side Facility Loopback Status
This parameter specifies the current far-side facility loopback status of the considered output aid.
A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback exististing for the aid.
Note: not both loopbacks (lpbk and fsflpbkstat) can be set to YES at the same time.
Type: Alphanumeric value set.
Range: YES, NO (default).

6. **`inputsig`** – Tributary Input Signal Rate List
   This parameter is a list of STSn rates across the port's bandwidth.
   Type: numeric value set
   Range: 11 (1 xSTS1)
7. **`istd`** – Interface Standard
   Interface standard of the synchronous EC1 interface.
   Type: Alphanumeric value set.
   Range: SONET
8. **`lbo`** – Line Build Out
   This parameter defines the cable length applicable for the EC1 port.
   Type: Alphanumeric value set.
   Range:
   - SHORT (default): 0 … 68.5 m (0 … 225 ft)
   - LONG: 68.5 … 137 m (225 … 450 ft).
9. **`lpbk`** – Loopback
   This parameter specifies the current near-side loopback status of the considered output aid.
   A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback exististing for the port.
   Type: Alphanumeric value set.
   Range: YES, NO (default)
10. **`nelpm`** – Near-End Line PM Enable
    Enable or disable near-end multiplex section (near-end line) performance monitoring.
    Type: Alphanumeric value set.
    Range: ENABLE, DISABLE (default)
11. **`pmmsfeses`** – Performance Monitoring Line Far-End SES Threshold
    This parameter describes the Line Far-End SES threshold value. It indicates the number of code violations per second to declare a second as severly errored.
    Type: numeric value set.
    Range: 1 – 6400.
    Default: 51
12. **`pmmsneses`** – Performance Monitoring Line Near-End SES Threshold
    This parameter describes the Line Far-End SES threshold value. It indicates the number of code violations per second to declare a second as severly errored.
    Type: numeric value set
    Range: 1 – 6400.
    Default: 51
13. **`pmode`** – Port Mode
    This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
    Type: Alphanumeric value set.

Range:

- AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
- MON indicates that alarm monitoring is taking place on the port.
- NMON means that alarm monitoring is not occurring on the port.

14. **`pmrsneses`** – Performance Monitoring Section Near-End SES Threshold
    This parameter describes the Section Near-End SES threshold value. It indicates the number of code violations per second to declare a second as severly errored.
    Type: numeric value set.
    Range: 1 … 64000
    Default: 52
15. **`portClass`** – Port Class
    This identifies the port class of the AID.
    Type: Alphanumeric value set.
    Range: TRADITIONAL
16. **`portControl`** – Port Control
    This identifies the administrative mode of the EC1 port. This parameter is not relevant for EC1 ports, because the portClass is always TRADITIONAL. The parameter can only be retrieved but not changed.
    Type: Alphanumeric value set.
    Range: NORMAL (default), LOCKOUT
17. **`ptype`** – Port Type
    This identifies the port type of the AID.
    Type: Alphanumeric value set.
    Range: EC1
18. **`sdthr`** – Signal Degrade Threshold
    Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when sdsfmode=POISSON.
    Type: numeric value set.
    Range: (as exponents of 10): -5 -6 (default), -7, -8, -9
19. **`servcond`** – Service Condition
    This parameter indicates its status concerning service involvement.
    Type: Alphanumeric value set.
    Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
20. **`sfthr`** – Signal Failure Threshold
    Retrieving of the excessive degrade/signal failure threshold in exponent of 10. This parameter is available when sdsfmode=POISSON
    Type: numeric value set
    Range: (as exponents of 10): -3 (default), -4, -5

21. **`sltca`** – Section and Line TCA Profile Pointer
Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
Type: Alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.
22. **`sonet`** – SONET ASAP
SONET Alarm Severity Assignment Profile. This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH Alarm Severity Assignment Profile for SDH ports of corresponding line rate (see RTRV-STM4, output parameter sdhpn) to be compatible with current generation applications.
Type: Alphanumeric string
Range: String with a maximum of 24 characters. A hyphen ("-") is allowed in the name additionally.
Default: DEFAULT.
23. **`spm`** – Section PM Enable
Enable or disable regenerator section (section) performance monitoring.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE (default).
24. **`strcfmt`** – Format of incoming J0
The read format of J0, the incoming section trace (strc).
Type: Numeric string.
Range: 1 for specific repeating byte (SONET)
25. **`strcout`** – Value of outgoing J0
This identifies the section trace message to be transmitted.
Type: Hexadecimal digits
Range: 1 byte string, One byte is expressed as two hexadecimal digits (example value: 6D).
Default: 01Hex
26. **`strcwfmt`** – Format of outgoing J0
The write format of J0, the outgoing section trace (*strcout*).
Type: Numeric string.
Range: 1 for specific repeating byte (SONET)

27. **trbmd** – Tributary mode
This parameter indicates the tributary mode of the port. In the case of EC1 port, the only possible value is FIXED.
Type: Alphanumeric value set.
Range: FIXED

28. **unequiposig** – Unequipped Output Signal List
Tributary Unequipped Output Signal Rate List.
This parameter is a list of STSn rates across the port's bandwidth. It determines the rate(s) of the "unequipped" signal that will be transmitted if there is no cross-connection.
Type: numeric value set
Range: 11 (1 x STS1)

Example Output

```
   UNITE-NE 04-12-23 08:00:30
A  001 REPT DBCHG
   ″TIME=08-00-12,DATE=04-12-23:ENT-EC1:1-1-#-#-21-1:: eif=EC1,ptype=EC1,sfthr=-
      3,sdthr=-6, pmode=MON,..... pmmsneses=51,pmrsneses=52″
;
```

ENT-ENNIMANROUTE: Enter manual route to the E-NNI node

The **ENT-ENNIMANROUTE** command is used on ASON domain border NEs, that means, NEs that have ENNI interfaces to other ASON domains, to enter (add) manual routes to other ASON domains into the forwarding table of the E-NNI node.

There are two types of manual routes:

- manual routes to neighboring signaling controllers
- manual routes to neighboring routing controllers

The command modifier is used to distinguish these two types of manual routes.

Note that this command cannot be used to enter manual routes to neighboring signaling controllers that are connected via point-to-point interfaces, as these manual routes are implicitely added upon port provisioning.

Refer to the Example Input/Output section for provisioning examples.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S4

Priority: 1

Abortable: No.

Input format

Command syntax: **ENT-ENNIMANROUTE**-modifier*:tid::ctag:::[spec_block];*

Input parameters

Command parameters

1. **`modifier`**
   The parameter modifier indicates whether the manual route is used to reach a signaling controller (SC) or a routing controller (RC) subnet.
   Type: Alphanumeric value set.
   Range: SC or RC
2. **`tid`** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **`ctag`** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters.
   Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

Spec block parameters

1. **`neighborSIGPCIPAddress`** – Neighbor Signaling Controller IP Address
   This parameter is used to indicate the IP address of a neighboring signaling controller that is connected via a LAN interface.
   The term "neighbor" refers to logical neighborship. The neighboring SC is not necessarily a physical neighbor.
   The IP address and ID of a signaling controller connected via a point-to-point interfaces is provisioned as part of port provisioning.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   The values 0.0.0.0, 1.1.1.1 and 127.0.0.1 are not allowed.
   Optional parameter: This parameter must be present if the command modifier has the value *SC* and must not be present if the command modifier has the value *RC*.
2. **`neighborSIGPCID`** – Neighbor Signaling Controller Identifier
   This parameter is used to indicate the identifier of a neighboring signaling controller that is connected via a LAN interface.
   The IP address and ID of a signaling controller connected via a point-to-point interfaces is provisioned as part of port provisioning.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   Optional parameter: This parameter must be present if the command modifier has the value *SC* and must not be present if the command modifier has the value *RC*.

3. **`neighborRCIPAddress`** – Neighbor Route Controller IP Address
   This parameter is used to indicate the IP address of a neighboring route controller.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   The values 0.0.0.0, 1.1.1.1 and 127.0.0.1 are not allowed.
   Optional parameter: This parameter must be present if the command modifier has the value *RC* and must not be present if the command modifier has the value *SC*.
4. **`neighborRCIPSubnetMask`** – Neighbor Route Controller IP Subnet Mask
   This parameter is used to indicate the subnet mask of the IP subnet of a neighboring route controller.
   The IP subnet that can be reached via the manual route is described by the tuple neighborRCIPAddress + neighborRCIPSubnetMask.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   Optional parameter: This parameter must be present if the command modifier has the value *RC* and must not be present if the command modifier has the value *SC*.
5. **`lan_nh_ifipad`** – Next Hop Interface IP Address for LAN Interfaces
   This parameter is used to indicate the interface IP address of the next hop of a manual route using a LAN. This parameter is insignificant for point-to-point interfaces.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   The values 0.0.0.0, 1.1.1.1 and 127.0.0.1 are not allowed.
   Optional parameter: This parameter must be present if the interface refered by *if_id* is a LAN.
6. **`if_id`** – interface id
   This parameter is used to indicate the interface associated with the manual route.
   Type: AID
   Range: SPortAID or LanPort AID (the keyword “all” is not used)
7. **`dcctype`** – DCC type
   This parameter is used to further specify the DCC type, in case the *if_id* refers to a DCC channel.
   Type: Alphanumeric value set.
   Range: LINE or SECTION
   Optional parameter: This parameter must be present if the interface *if_id* is a DCC. It must not be present, if the interface *if_id* is no DCC.

Output format

If the **`ENT-ENNIMANROUTE`** is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section for the "RTRV-HDR: Retrieve header" (p. 3-2417) command.

Detailed behavior description

The **ENT-ENNIMANROUTE** command shall add a manual route entry to the E-NNI node. The update of the manual routes are notified with ENT-ENNIMANROUTE Notifications.

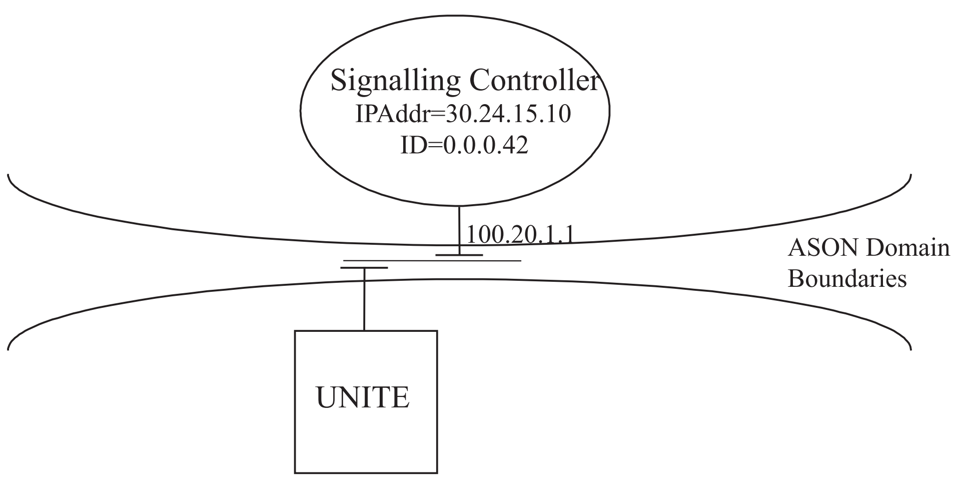
Example input/output

```
ENT-ENNIMANROUTE-RC:LT-UNITE::123456:::neighborRCIPAddress=95.22.10.1,
      neighborRCIPSubnetMask=255.255.255.0, lan_nh_ifipad=100.20.1.1, if_id=1-1-
      lan2;

   LT-UNITE 06-10-09 08:00:00
M  123456 COMPLD
;
```

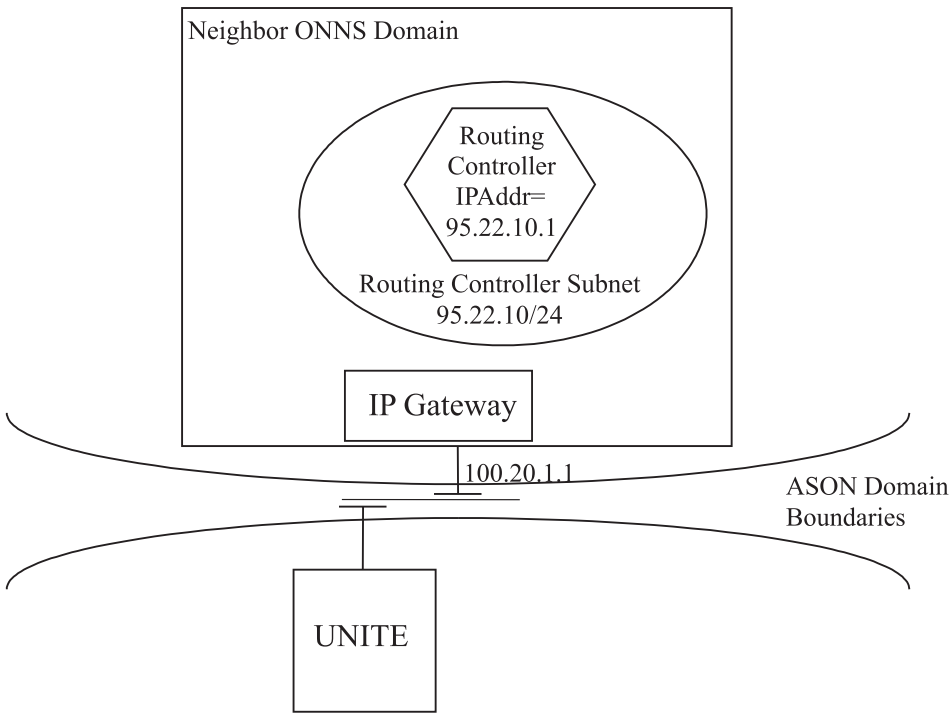
Signaling Controller Provisioning Example

```
ENT-ENNIMANROUTE-SC:LT-
UNITE::123456:::neighborSIGPCIPAddress=30.24.15.10,
neighborSIGPCID=0.0.0.42, lan_nh_ifipad=100.20.1.1,
if_id=1-1-lan2;
```



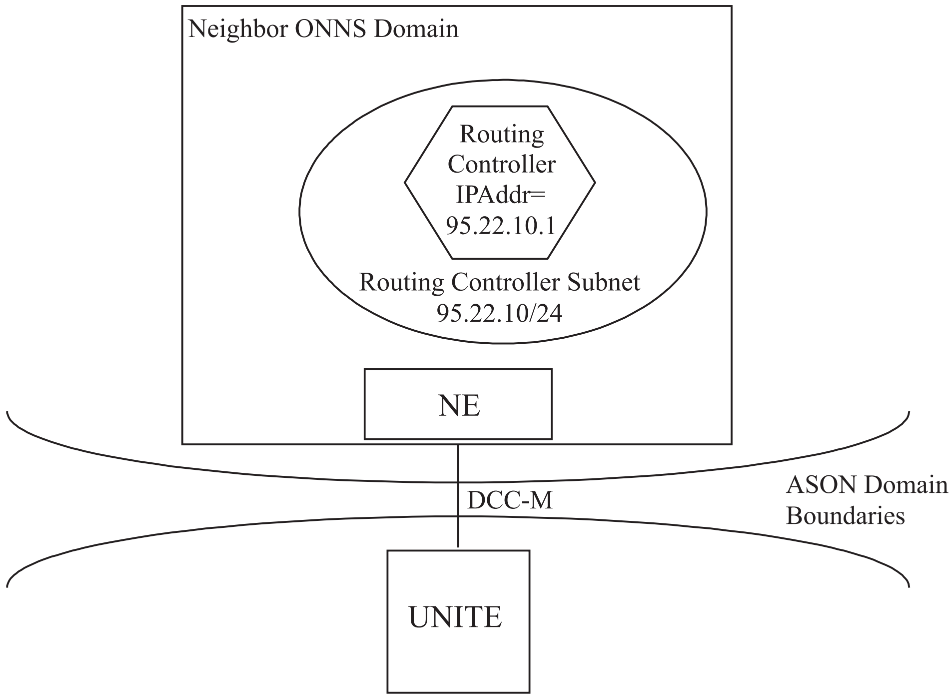
Routing Controller Provisioning Example P2MP

```
ENT-ENNIMANROUTE-RC:LT-
UNITE::123456:::neighborRCIPAddress=95.22.10.1,
neighborRCIPSubnetMask=255.255.255.0,
lan_nh_ifipad=100.20.1.1, if_id=1-1-lan2;
```



Routing Controller Provisioning Example P2P

```
ENT-ENNIMANROUTE-RC:LT-
UNITE::123456:::neighborRCIPAddress=95.22.10.1,
neighborRCIPSubnetMask=255.255.255.0, if_id=1-1-#-#-5-3,
dcctype=LINE;
```



Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **ENT-ENNIMANROUTE** command.

Validation rule: Parameter Combinations

The command is rejected if the combination of modifier and parameters is not one of the following:

- modifier==SC and if is a LAN and list of parameters is: *neighborSIGPCIPAddress*, *neighborSIGPCID*, *lan_nh_ifipad*, *if_id*
- modifier==RC and interface is a LAN and list of parameters is: *neighborRCIPAddress*, *neighborRCIPSubnetMask*, *lan_nh_ifipad*, *if_id*
- modifier==RC and interface is a point-to-point interface and list of parameters is: *neighborRCIPAddress*, *neighborRCIPSubnetMask*, *if_id*, *dcctype*

Error code:

`IDNV – Input, Data Not Valid, Combination of Modifier/Parameters not allowed`

Validation rule: Not allowed to use LAN1 for E-NNI

If LAN1 is specified in the AID, then the command is denied.

Error code: `IDNV – Input, Data Not Valid, LAN1 not allowed for ENNI`

Validation rule: LAN port not used for E-NNI

If the LAN port specified in the AID is not in use for E-NNI, i.e. is not assigned to the enninode, then the command is denied.

Error code:

`SNVS – Status, Not in Valid State, LAN port not in use for ENNI`

Validation rule: DCC port not used for E-NNI

If the DCC specified in the AID is not in use for E-NNI, i.e. is not assigned to the enninode, then the command is denied.

Error code: `SNVS – Status, Not in Valid State, DCC not in use for ENNI`

Validation rule: No duplicate Manual Route entries

The command is denied, if a duplicate manual route entry is entered.

A manual route is considered to be duplicate if one of the following conditions is fulfilled:

- an entry with identical *neighborSIGPCIPAddress*, *neighborSIGPCID*, and *if_id* is already provisioned
- an entry with identical *neighborRCIPAddress*, *neighborRCIPSubnetMask*, and *if_id* is already provisioned, where *if_id* refers to a LAN interface
- an entry with identical *neighborRCIPAddress*, *neighborRCIPSubnetMask*, *if_id*, and *dcctype* is already provisioned, where *if_id* refers to a DCC

Error code:

`IDNV – Input, Data Not Valid, Manual route entry already exists`

Note that the *lan_nh_ifipad* is by intention not considered, as it is not allowed to have more than one gateway to one destination on one and the same LAN.

Validation rule: Check if limit of 20 Manual Routes per LAN port exceeded

The addition of a manual route entry for a LAN port is denied, if already 20 manual route entries exist for the LAN port.

Error code:

`SSRE – Status, System Resources Exceeded, limit of manual route entries exceeded`

Validation rule: Check if limit of 64 Manual Routes per ENNI Node exceeded

The addition of a manual route entry is denied, if already 64 manual route entries exist for the ENNI node.

Error code:

`SSRE – Status, System Resources Exceeded, ENNI limit of manual route entries exceeded`

This requirement is independent from the type of interface (LAN or point-to-point).

Validation rule: No more than one LAN connected to same next hop

The command is rejected if the provided *lan_nh_ifipad* is already provisioned for any other LAN interface.

Error code:

`IDNV – Input, Data Not Valid, Next Hop IP Address already assigned to other LAN`

This requirement prevents a configuration as shown below, which is desirable, but currently not supported:

ENT-ENNIMANROUTE notification

Output format

The **ENT-ENNIMANROUTE** notification has the following specific syntax:

ENT-ENNIMANROUTE-modifier*:::spec_block*

Output parameters

Command parameters

1. **modifier**
   The **ENT-ENNIMANROUTE** command is used on ASON domain border NEs, i.e. NEs that have ENNI interfaces to other ASON domains, to enter (add) manual routes to other ASON domains into the forwarding table of the E-NNI node.
   There are two types of manual routes:
   - manual routes to neighboring signaling controllers
   - manual routes to neighboring routing controllers

   The command modifier is used to distinguish these two types of manual routes.
   Note that this command cannot be used to enter manual routes to neighboring signaling controllers that are connected via point-to-point interfaces, as these manual routes are implicitely added upon port provisioning.
   Refer to the Example Input/Output section for provisioning examples.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S4

Priority: 1

Abortable: No.

Input format

Command syntax: **ENT-ENNIMANROUTE**-modifier*:tid::ctag:::[spec_block];*

Input parameters

Command parameters

1. **`modifier`**
   The parameter modifier indicates whether the manual route is used to reach a signaling controller (SC) or a routing controller (RC) subnet.
   Type: Alphanumeric value set.
   Range: SC or RC
2. **`tid`** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **`ctag`** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters.
   Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

Spec block parameters

1. **`neighborSIGPCIPAddress`** – Neighbor Signaling Controller IP Address
   This parameter is used to indicate the IP address of a neighboring signaling controller that is connected via a LAN interface.
   The term "neighbor" refers to logical neighborship. The neighboring SC is not necessarily a physical neighbor.
   The IP address and ID of a signaling controller connected via a point-to-point interfaces is provisioned as part of port provisioning.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   The values 0.0.0.0, 1.1.1.1 and 127.0.0.1 are not allowed.
   Optional parameter: This parameter must be present if the command modifier has the value *SC* and must not be present if the command modifier has the value *RC*.
2. **`neighborSIGPCID`** – Neighbor Signaling Controller Identifier
   This parameter is used to indicate the identifier of a neighboring signaling controller that is connected via a LAN interface.
   The IP address and ID of a signaling controller connected via a point-to-point interfaces is provisioned as part of port provisioning.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   Optional parameter: This parameter must be present if the command modifier has the value *SC* and must not be present if the command modifier has the value *RC*.

3. **`neighborRCIPAddress`** – Neighbor Route Controller IP Address
   This parameter is used to indicate the IP address of a neighboring route controller.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   The values 0.0.0.0, 1.1.1.1 and 127.0.0.1 are not allowed.
   Optional parameter: This parameter must be present if the command modifier has the value *RC* and must not be present if the command modifier has the value *SC*.
4. **`neighborRCIPSubnetMask`** – Neighbor Route Controller IP Subnet Mask
   This parameter is used to indicate the subnet mask of the IP subnet of a neighboring route controller.
   The IP subnet that can be reached via the manual route is described by the tuple neighborRCIPAddress + neighborRCIPSubnetMask.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   Optional parameter: This parameter must be present if the command modifier has the value *RC* and must not be present if the command modifier has the value *SC*.
5. **`lan_nh_ifipad`** – Next Hop Interface IP Address for LAN Interfaces
   This parameter is used to indicate the interface IP address of the next hop of a manual route using a LAN. This parameter is insignificant for point-to-point interfaces.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   The values 0.0.0.0, 1.1.1.1 and 127.0.0.1 are not allowed.
   Optional parameter: This parameter must be present if the interface refered by *if_id* is a LAN.
6. **`if_id`** – interface id
   This parameter is used to indicate the interface associated with the manual route.
   Type: AID
   Range: SPortAID or LanPort AID (the keyword “all” is not used)
7. **`dcctype`** – DCC type
   This parameter is used to further specify the DCC type, in case the *if_id* refers to a DCC channel.
   Type: Alphanumeric value set.
   Range: LINE or SECTION
   Optional parameter: This parameter must be present if the interface *if_id* is a DCC. It must not be present, if the interface *if_id* is no DCC.

Output format

If the **`ENT-ENNIMANROUTE`** is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section for the "RTRV-HDR: Retrieve header" (p. 3-2417) command.

Detailed behavior description

The **ENT-ENNIMANROUTE** command shall add a manual route entry to the E-NNI node. The update of the manual routes are notified with ENT-ENNIMANROUTE Notifications.

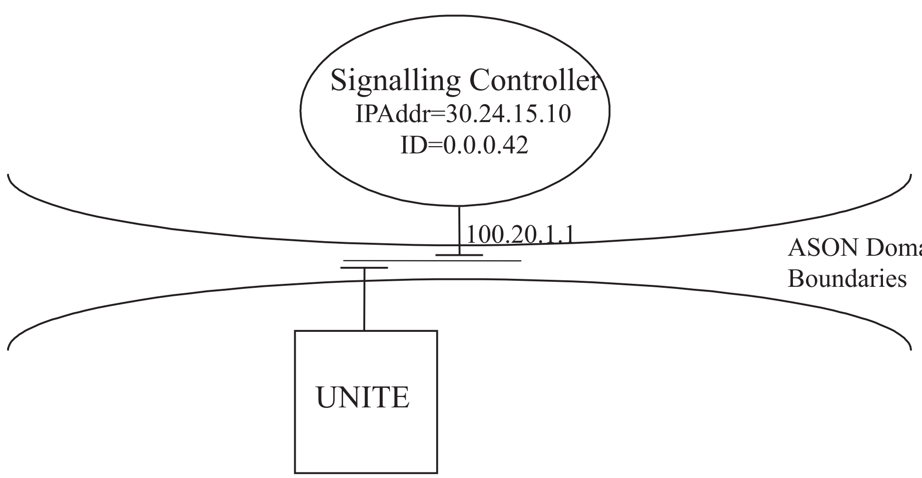
Example input/output

```
ENT-ENNIMANROUTE-RC:LT-UNITE::123456:::neighborRCIPAddress=95.22.10.1,
      neighborRCIPSubnetMask=255.255.255.0, lan_nh_ifipad=100.20.1.1, if_id=1-1-
      lan2;

   LT-UNITE 06-10-09 08:00:00
M  123456 COMPLD
;
```

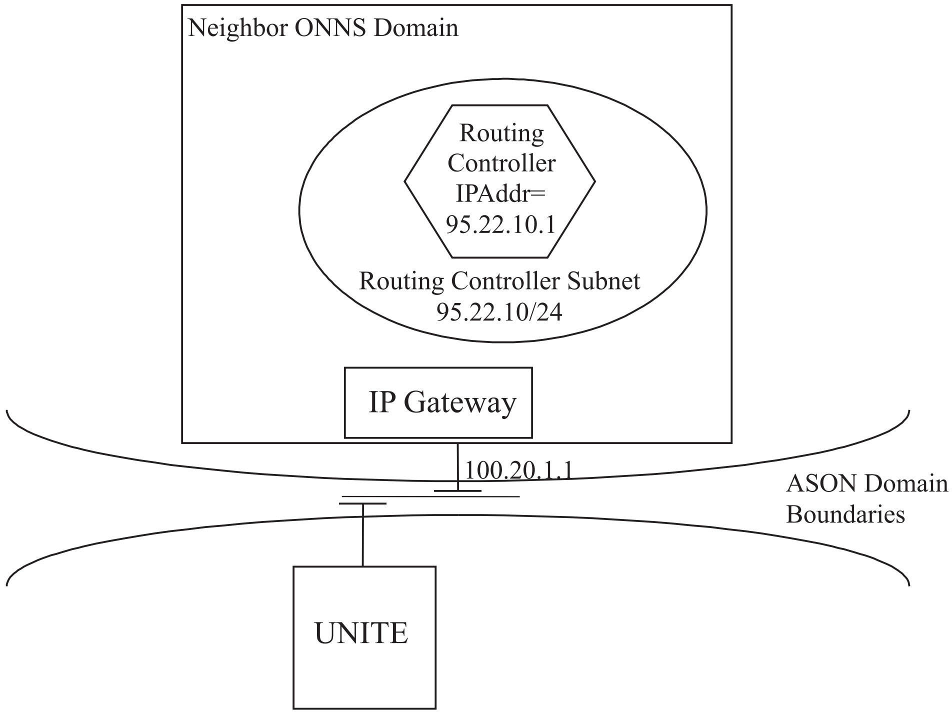
Signaling Controller Provisioning Example

```
ENT-ENNIMANROUTE-SC:LT-
UNITE::123456:::neighborSIGPCIPAddress=30.24.15.10,
neighborSIGPCID=0.0.0.42, lan_nh_ifipad=100.20.1.1,
if_id=1-1-lan2;
```



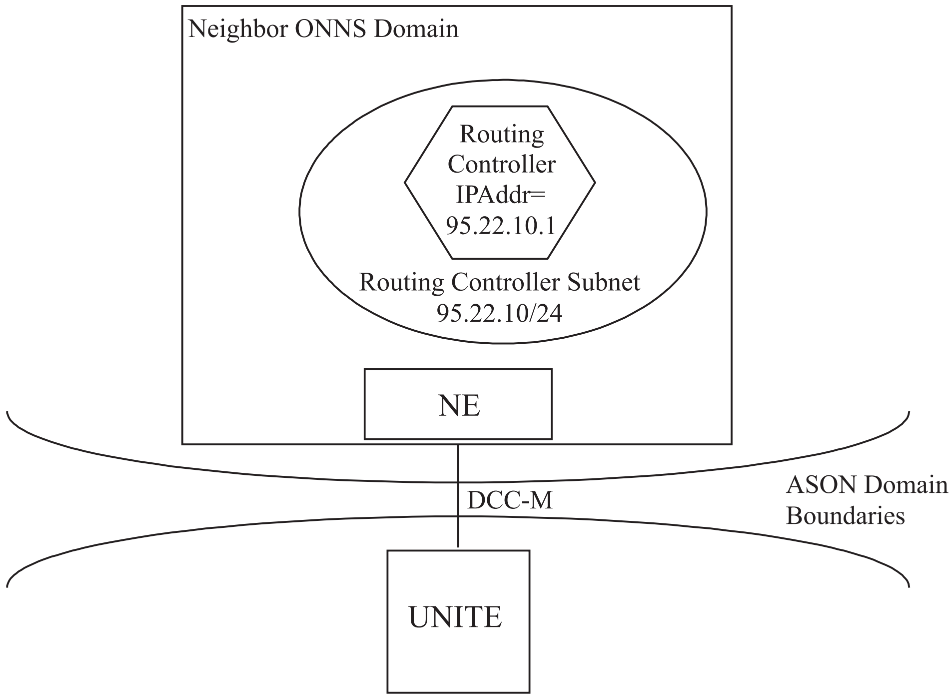
Routing Controller Provisioning Example P2MP

```
ENT-ENNIMANROUTE-RC:LT-
UNITE::123456:::neighborRCIPAddress=95.22.10.1,
neighborRCIPSubnetMask=255.255.255.0,
lan_nh_ifipad=100.20.1.1, if_id=1-1-lan2;
```



Routing Controller Provisioning Example P2P

```
ENT-ENNIMANROUTE-RC:LT-
UNITE::123456:::neighborRCIPAddress=95.22.10.1,
neighborRCIPSubnetMask=255.255.255.0, if_id=1-1-#-#-5-3,
dcctype=LINE;
```



Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **ENT-ENNIMANROUTE** command.

Validation rule: Parameter Combinations

The command is rejected if the combination of modifier and parameters is not one of the following:

- modifier==SC and if is a LAN and list of parameters is: *neighborSIGPCIPAddress*, *neighborSIGPCID*, *lan_nh_ifipad*, *if_id*
- modifier==RC and interface is a LAN and list of parameters is: *neighborRCIPAddress*, *neighborRCIPSubnetMask*, *lan_nh_ifipad*, *if_id*
- modifier==RC and interface is a point-to-point interface and list of parameters is: *neighborRCIPAddress*, *neighborRCIPSubnetMask*, *if_id*, *dcctype*

Error code:

`IDNV – Input, Data Not Valid, Combination of Modifier/Parameters not allowed`

Validation rule: Not allowed to use LAN1 for E-NNI

If LAN1 is specified in the AID, then the command is denied.

Error code: `IDNV – Input, Data Not Valid, LAN1 not allowed for ENNI`

Validation rule: LAN port not used for E-NNI

If the LAN port specified in the AID is not in use for E-NNI, i.e. is not assigned to the enninode, then the command is denied.

Error code:

`SNVS – Status, Not in Valid State, LAN port not in use for ENNI`

Validation rule: DCC port not used for E-NNI

If the DCC specified in the AID is not in use for E-NNI, i.e. is not assigned to the enninode, then the command is denied.

Error code: `SNVS – Status, Not in Valid State, DCC not in use for ENNI`

Validation rule: No duplicate Manual Route entries

The command is denied, if a duplicate manual route entry is entered.

A manual route is considered to be duplicate if one of the following conditions is fulfilled:

- an entry with identical *neighborSIGPCIPAddress*, *neighborSIGPCID*, and *if_id* is already provisioned
- an entry with identical *neighborRCIPAddress*, *neighborRCIPSubnetMask*, and *if_id* is already provisioned, where *if_id* refers to a LAN interface
- an entry with identical *neighborRCIPAddress*, *neighborRCIPSubnetMask*, *if_id*, and *dcctype* is already provisioned, where *if_id* refers to a DCC

Error code:

`IDNV – Input, Data Not Valid, Manual route entry already exists`

Note that the *lan_nh_ifipad* is by intention not considered, as it is not allowed to have more than one gateway to one destination on one and the same LAN.

Validation rule: Check if limit of 20 Manual Routes per LAN port exceeded

The addition of a manual route entry for a LAN port is denied, if already 20 manual route entries exist for the LAN port.

Error code:

`SSRE – Status, System Resources Exceeded, limit of manual route entries exceeded`

Validation rule: Check if limit of 64 Manual Routes per ENNI Node exceeded

The addition of a manual route entry is denied, if already 64 manual route entries exist for the ENNI node.

Error code:

`SSRE – Status, System Resources Exceeded, ENNI limit of manual route entries exceeded`

This requirement is independent from the type of interface (LAN or point-to-point).

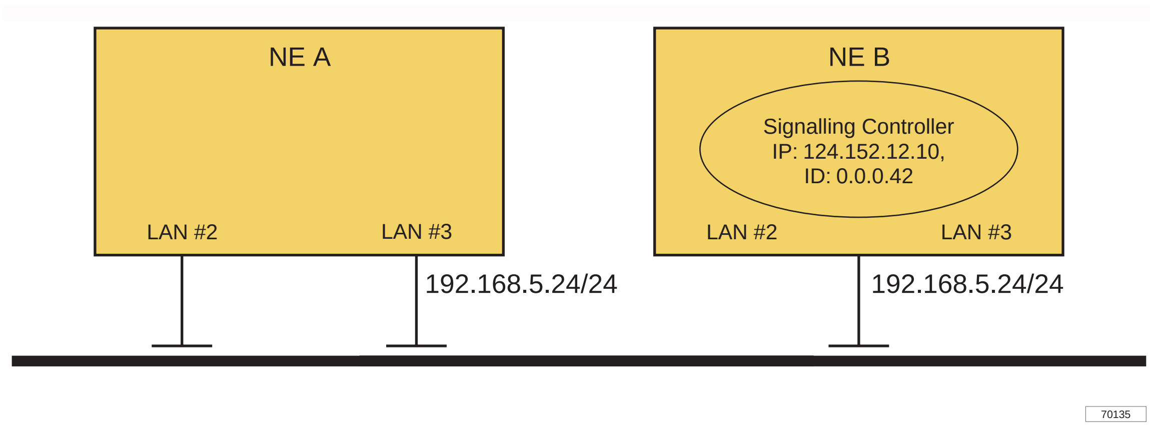
Validation rule: No more than one LAN connected to same next hop

The command is rejected if the provided *lan_nh_ifipad* is already provisioned for any other LAN interface.

Error code:

`IDNV – Input, Data Not Valid, Next Hop IP Address already assigned to other LAN`

This requirement prevents a configuration as shown below, which is desirable, but currently not supported:



Related TL1 messages

- “RTRV-MANROUTE-LAN: Retrieve manual route at LAN port” (p. 3-2516)
- “DLT-MANROUTE-LAN: Delete manual route at LAN port” (p. 3-203)

ENT-EPORT notification

Output format

The **ENT-EPORT** notification uses the general format of a **REPT DBCHG** (Report Database Change) notification.

Syntax:

ENT-EPORT-modifier*:aid::spec_block;*

Output parameters

Command parameters

1. **aid** – Access Identifier
   This parameter specifies the Ethernet port to be operated on.
   Type: AID
   Range: EPortAID as defined in AID structure. The usage of the following values are excluded
   - *all* in the BayAID definition
   - *all* in the Simple_ShelfAID definition
   - *usall* in the Simple_UnivSlotAID definition
   - *all* in the Simple_UnivSlotAID definition
   - *all* in the Simple_EPortAID definition.
2. **modifier**
   This parameter specifies the type of the Ethernet port at the LAN side of the unit.
   Type: Alphanumeric value set.
   Range:
   - 1GE representing a 1 GE port on a GE1 pack
   - 1GEPL representing a 1 GE port on a GE10PL1 pack
   - 10GEPL representing a 10 GE ports on a GE10PL1 pack.

Spec block parameters

1. **`autoneg`** – Auto Negotiation Mode
   This parameter controls auto-negotiation process to be enabled or disabled. This parameter is not supported if the input parameter *modifier* = 1GE or 10GEPL. If the parameter *autoneg* is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range: ENABLE (default); DISABLE.
2. **`cnprole`** – Customer/Network Port Role
   This parameter specifies whether the addressed port is used as a customer LAN port or a network LAN port.
   This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter cnprole is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range: CUSTOMER (default), for a customer LAN port; NETWORK, for a network LAN port.
3. **`dftpri`** – Default User Priority
   This parameter specifies the default user priority acc. the IEEE 802.1Q tagging scheme.
   This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter cnprole is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range:
   - HIGH
   - LOW (default).
4. **`dftvlan`** – Default VLAN Identifier
   This parameter specifies the value of the VLAN identifier which is applied to frames (tagging) at LAN ingress (i.e. from LAN into the Ethernet-port). This only applies to frames carrying no VLAN identifier, yet. This parameter is also used to provision the customer tag (CID) to be used in transparent tagging mode.
   This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter cnprole is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range:
   - 1, 2, 3, … 4092, 4093
   - UNAVAILABLE (default).

   To express the state UNAVAILABLE system internally the invalid VLAN ID 4094 is used.

5. **`droppause`** – Drop Incoming Pause Frames
   This parameter controls whether incoming pause frames are dropped (value = ENABLE) or not (value = DISABLE). This parameter is not supported if the input parameter *modifier* = 1GE. If the parameter droppause is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range: ENABLE (default), DISABLE
   Default: DEFAULT.
6. **`enetpn`** – Ethernet Alarm Severity Assignment Profile
   This parameter points to an ASAP profile name of type ENET for the designated AID.
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: 1 … 24 characters length.
   Default: DEFAULT.
7. **`enettca`** – Ethernet TCA Profile
   This parameter specifies the name of the threshold crossing alert (TCA) profile used for Ethernet ports.
   Type: Alphanumeric string
   Range: 1 … 24 characters length
   Default: DEFAULT0
8. **`epmode`** – Ethernet Port Monitoring Mode
   This parameter specifies the monitoring mode of the Ethernet port. Alarms for this port will be reported if in state MON otherwise not. The configuration of epmode will change from AUTO to MON if a valid signal is applied to that port.
   Type: Alphanumeric value set.
   Range:
   - AUTO (default), for automatic
   - MON, for monitored
   - NMON, for not monitored.
9. **`eppm`** – Ethernet Port Performance Monitoring
   This parameter specifies whether the performance monitoring is enabled or disabled for this port.
   Type: Alphanumeric value set.
   Range:
   - DISABLE (default)
   - ENABLE
10. **`fcmd`** – Flow Control Mode
    This parameter specifies the configuration for the pause operation of this port. If the input parameter modifier = 1GE, then the parameter fcmd is supported only in case that the bridge operates in backward-compatible mode (vlantagmd = BCMD).
    Type: Alphanumeric value set.

Range:

- AUTO, for auto-negotiate
- DISABLE, for pause mode bidirectionally disabled
- ASYMTOPARTNER, for pause mode having receive disabled, transmit enabled
- ASYMTOLOCAL, for pause mode having transmit disabled, receive enabled
- SYM, for pause mode bidirectionally enabled.

Restrictions: If the parameter *fcmd* is not supported, then the parameter is omitted.
The values ASYMTOPARTNER, ASYMTOLOCAL and SYM is not supported if the input parameter *modifier* = 1GE.
The values ASYMTOPARTNER, ASYMTOLOCAL and SYM is not supported if the input parameter *modifier* = 1GEPL and the parameter *autoneg* = ENABLE. The value AUTO is notsupported if the input parameter *modifier* = 1GEPL and the parameter *autoneg* = DISABLE.
The value AUTO is not supported, if the input parameter *modifier* = 10GEPL.
Possible combinations of the parameters *modifier*, *autoneg*, *vlantagmd* (parameter of the referring circuit pack entity, see "RTRV-EQPT (CP): Retrieve equipment (circuit pack)" (p. 3-2375) for definition) and *fcmd* are as follows:

Input parameter *modifier*	**In-/output parameter *autoneg***	**In-/output parameter *vlantagmd***	**In-/output parameter *fcmd***
1GE	not supported	BCMD	AUTO, DISABLE
		other than BCMD	not supported
1GEPL	ENABLE	not supported	AUTO, DISABLE
	DISABLE		DISABLE, ASYMTOPARTNER, ASYMTOLOCAL, SYM
10GEPL	not supported	not supported	DISABLE, ASYMTOPARTNER, ASYMTOLOCAL, SYM

Default:

- AUTO (for *modifier* 1GE or 1GEPL)
- SYM (for *modifier* 10GEPL).

11. **`fsflpbkstat`** – Far Side Facility Loopback Status
This parameter reports the configuration of the far-side facility loopback of this port. A far-side loopback means that the signal on the outgoing port is looped to the incoming port (Tx -> Rx). For GE1 there is only this type of facility loopback.
Type: Alphanumeric value set.
Range:
    - YES, for enabled loopback
    - NO (default), for disabled loopback.

12. **`rcf_htmr`** – Remote Client Fail Hold Off Timer
    The parameter specifies the hold-off time for applying the LPT consequent action to disable the laser at the LAN port. The hold-off timer is only applicable if there is a strict one-to-one relationship between the LAN port in question and its related WAN port.
    This parameter is not supported if the input parameter *modifier* = 1GE. If the parameter *rcf_htmr* is not supported, then the parameter is omitted.
    Type: numeric string [ms].
    Range: 0 … 2000 ms in 100 ms steps
    Default: 0.
13. **`rcf_linkdown`** – Link Pass Through Mode
    This parameter controls the consequent action (to switch-off the laser upon receipt of a client signal fail [CSF] indication) to be enabled or disabled. This parameter is not supported if the input parameter *modifier* = 1GE. If the parameter rcf_linkdown is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range: ENABLE (default), DISABLE.
14. **`rptmode`** – Repeater Mode
    This parameter sets the bridge device for this LAN port into the repeater mode (promiscuous mode), valid for a point to point connection between one LAN and one WAN port. Operating in repeater mode imposes some restrictions. See detailed behavior section.
    If the input parameter *modifier* = 1GE, then the parameter rptmode is meaningful only if in case that the bridge operates in backward-compatible mode (*vlantagmd* = BCMD).
    This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter cnprole is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).
15. **`servcond`** – Service Condition
    This parameter specifies the service condition for this port. Some configuration possibilities like loopbacks may be dependent on the state of *servcond*.
    Type: Alphanumeric value set.

    Range:

    - INSERVICE (default)
    - OUTOFSERVICE.

16. **`stdis`** – Spanning Tree Protocol Disable
    This parameter allows to enable or disable the Spanning Tree Protocol for the given port. If the input parameter modifier = 1GE, then this parameter is meaningful only if the port is a network port (cnprole = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
    This parameter is not supported if the input parameter *modifier* = 1GEPL, or modifier = 10GEPL. If the parameter stdis is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range:
    - DISABLE, STP is disabled, i.e. the port is not used in the spanning tree protocol
    - ENABLE (default), STP is enabled, i.e. the port is used in the spanning tree protocol.
17. **`stpcost`** – Spanning Tree Path Cost
    The parameter *stpcost* specifies the STP-related cost of the path egressing the given port.
    If the input parameter *modifier* is omitted, then this parameter is supported but applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
    This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL.
    If the parameter *stpcost* is not supported, then the parameter is omitted.
    Type: Integer.
    Range: 1 to 200000000.
    Default: 20000.
    The default value depends on the provisioned VCG size. As currently only a fix size of 7 VC4s or 21 STS1s corresponding to approximately 1 Gbit is supported, the default value is as shown above.
18. **`stpp`** – Spanning Tree Port Priority
    This parameter specifies the priority of the given port for the Spanning Tree Protocol. If the input parameter *modifier* = 1GE, then this parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
    This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter stpcost is not supported, then the parameter is omitted.
    Type: Integer.
    Range: 0 to 255.

The stepping as recommended by the standard (steps of 16 starting at 0) should be implemented by the management system. The NE will accept any value in the range described above. This has the consequence, that also the range restriction ″0 to 240″ is not done by the NE.
Default: 128.

19. **`tcamd`** – TCA mode
This parameter shows the modus of the PM thresholding. Two thresholding methods are applicable: TR-only. (also known as the implicit reset method), TR-RTR. (also known as the explicit reset method).
Type: Alphanumeric value set.
Range: TR, TRRTR (default).

20. **`vrtswid`** – Virtual Switch Identifier
This parameter identifiers the instance of the virtual switch.
    - A Virtual Switch ID is unique within a single circuit pack. When creating a new Virtual Switch, the system automatically assigns a unique ID to it.
    - There will be one virtual switch per physical switch, implicitly all LAN ports and all WAN ports on the physical switch are part of the single virtual switch. The ID of this virtual switch is fixed to 1. A future release may support multiple virtual switches per physical switch.

    Type: Integer.
    Range: 1 – Currently this is the only allowed value.
    Default: 1.

21. **`vvidls`** – Valid VLAN Identifier List (static)
This parameter specifies a list of all static VLAN identifiers allowed for this port. The list is ampersand grouped (& and &&). The list is packed by the NE and the management systems as good as possible by using ’&’ and ’&&’ . The vlan identifier of an incoming frame must be a member of this static VLAN Id list or the dynamic VLAN Id list *vvidlsd*. Frames tagged by a vlan identifier not member of these lists will be discarded. The port VLAN identifier (refer to parameter dftvlan of RTRV-EPORT Output Parameters) is not part of this list. This parameter is also used in transparent tagging mode to specify the list of valid customer tags (CIDs) for network ports (cnprole = NETWORK).
This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter vvidls is not supported, then the parameter is omitted.
Type: Alphanumeric string and the character ’&’.

Range:

- Value of each single member (valid VLAN identifier) in the list 1, 2, …, 4092, 4093
- In case the list has no members (empty list) -1.

The length of the list is limited only by the usual system limitations like e.g. TL1 line length. The number of entries in this list is limited to 64 by some NE-internal restrictions. Ranging and grouping by using the operators ’&’ and ’&&’ has no impact on the number of entries, it only reduces the length of the list being transported to/from CIT/EMS.
Default: -1.
Example 1:
vvidls=-1. The list has no members (empty list).
Example 2:
vvidls=3&5&40&&45. This list has the members 3, 5, 40, 41, 42, 43, 44 and 45.
Example 3:
vvidls=1&&4093 This list has the members 1,2, 3, …, 4092, 4093.

Example Output

```
   LT-UNITE 00-11-11 11:11:00
A  001 REPT DBCHG
   ”TIME=11-10-30,DATE=00-11-11:ENT-EPORT-1GE:1-1-#-#-2-3::\
    cnprole=CUSTOMER,dftpri=LOW,dftvlan=UNAVAILABLE,enetpn=DEFAULT,\
    enettca=DEFAULT,epmode=AUTO,eppm=DISABLE,fcmd=AUTO,\
    fsflpbkstat=NO,rptmode=DISABLE,rstpmd=ENABLE,\

    tcamd=TR,vrtswid=1,vvidls=-1”
;
```

ENT-EQPT (CP) notification

Output format

Syntax: **`ENT-EQPT`**:*aid*::*spec_block*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   The AID of an equipment.
   Type: AID
   Range:
   - CpAID ::= SlotAID-cp for circuit pack in any slot
   - LoxcAID::=UnivSlotAID-loxc for LOXC pack in universal slots.

   The keyword **`usall`** is not allowed for Simple_UnivSlotAID.
   The keyword **`xcall`** is not allowed for Simple_XCSlotAID.
   The keyword **`ctlall`** is not allowed for Simple_CTLSlotAID.
   The keyword **`all`** is not allowed for Simple_SlotAID.

Spec block parameters

1. **`dcn_ipad`** – DCN IP address for CLI/SNMP
   DCN IP address for CLI/SNMP management of the card.
   This parameter is relevant only for circuit packs of type ES64U (that means, *nvmname* = ES64U). The parameter shall be omitted for other packs.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 … 255.
   The values 0.0.0.0, 1.1.1.1, 127.0.0.1, and 224.0.0.0 to 255.255.255.255 are excluded.
   Default: Empty string.
2. **`eqptpn`** – Equipment ASAP Profile Name
   The name of the current ASAP profile of type EQUIP-UNPROT of the circuit pack. This parameter is reported for a CpAID , PowerAID, EciAID, TimingInterfaceAID and LoxcAID.
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: up to 24 characters.
   Default: DEFAULT.
3. **`eqptprotpn`** – Protected Equipment ASAP Profile Name
   The name of the current ASAP profile of type EQUIP-PROT for the equipment.
   Option: This parameter is only reported for a CpAID, LoxcAID or PowerAID..
   Type: Alphanumeric string.
   Range: up to 24 characters. A hyphen (“-”) is allowed in the name additionally.
   Default: DEFAULT

4. **`es64ucap`** – ES64U capacity
   Switch capacity of the ES64U pack.
   This parameter is relevant only for circuit packs of type ES64U (that means, *nvmname* = ES64U). The parameter shall be omitted for other packs.
   Type: Value set.
   Range:
   - 0 – ES64U in suspended state, initial value after ES64U CP creation.
   - 20 – ES64U active or member of equipment protection group, capacity 20 Gbit/s.

   Default: 0.
5. **`opstate`** – Operational State
   Each circuit pack has a retrievable attribute indicating whether circuit pack is operational for the system internal communication.
   Type: Alphanumeric value set.
   Range:
   - OS_ENABLED
   - OS_DISABLED (default)
   - OS_SYNCHING.
6. **`loswcap`** – LOXC switch capacity
   Switch capacity of the LOXC pack. This parameter is relevant only for circuit packs of type LOXC, thus the parameter shall be omitted for other packs.
   Type: value set.
   Range, if *nvmname* = LOXC
   - 0: LOXC in suspended state, initial value after LOXC CP creation
   - 15: LOXC active or member of equipment protection group, switch capacity 15 Gbit/s.

   Range, if *nvmname* = LOXC40G2S or LOXC40G3S:
   - 0: LOXC in suspended state, initial value after LOXC CP creation
   - 15: LOXC active or member of equipment protection group, switch capacity 15 Gbit/s
   - 40: LOXC active or member of equipment protection group, switch capacity 40 Gbit/s

   Default: 0.
7. **`lostd`** – LO tributary standard
   LO tributary standard supported by the LOXC pack. This parameter is relevant only for circuit packs of type LOXC (i.e. nvmname = LOXC).
   Type: Value set.

Range:

- SDH: LOXC supports SDH LO tributaries (VC3, VC12)
- SONET: LOXC supports SONET LO tributaries (VT1.5)
- UNDEFINED (default): no LO tributaries (loswcap = 0)

LO VC3 tributaries provided with lostd=SDH support LO cross-connections and AU3/AU4 conversion cross-connections.

8. **`tmuxcap`** – TransMUX capacity
   Switch capacity of the TransMUX pack.
   This parameter is relevant only for circuit packs of type TransMUX (that means, *nvmname* = TransMUX), thus the parameter shall be omitted for other packs.
   Type: Value set.
   Range:
   - 0: TransMUX in suspended state, initial value after TransMUX CP creation.
   - 2G5: TransMUX active or member of equipment protection group, capacity 2.5 Gbit/s

   Default: 0
9. **`istd`** – Interface Standard of the Circuit Pack
   Interface standard supported by the circuit pack. This parameter is supported on GE10PL1 and ES64U circuit packs. On the circuit packs, the parameter *istd* defines the interface standard of the virtual concatenation groups.
   Option: If the parameter *istd* is not supported, then the parameter is omitted.
   Type: Value set.
   Range:
   - for GE10PL1: SDH or SONET
   - for ES64U: SONET or UNDEFINED (ES64U not used, *es64ucap* = 0)

   Default:
   - for GE10PL1: The default is derived from the system parameter *istddflt*.
   - for ES64U: UNDEFINED.

Example output

```
   UNITE-NE 00-11-14 08:00:30
A  001 REPT DBCHG
   ”TIME=08-00-12,DATE=00-11-14:ENT-EQPT:1-1-#-#-1-
      cp:::eqptpn=DEFAULT,eqptprotpn=DEFAULT,opstate=OS_ENABLE”;
```

ENT-EQPT (slot): Enter equipment (slot)

The **ENT-EQPT** command pre-provisions a slot for a dedicated circuit pack.

The CTL can not be pre-provisioned. It is always auto-provisioned.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: No.

Input format

Command syntax: **ENT-EQPT***:tid:aid:ctag:::[spec_block];*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   The AID of a slot.
   Type: AID
   Range: SlotAID
   The keyword **usall** is not allowed for Simple_UnivSlotAID.
   The keyword **xcall** is not allowed for Simple_XCSlotAID.
   The keyword **ctlall** is not allowed for Simple_CTLSlotAID.
   The keyword **all** is not allowed for Simple_SlotAID, Simple_UnivSlotAID, Simple_XCSlotAID, Simple_CTLSlotAID.
   The keyword **all** is not allowed on bay/shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **`nvmname`** – Circuit Pack Name
   This parameter specifies the name of the provisioned circuit pack of the slot. If no circuit pack is provisioned the default value is reported.
   Type: value set.
   Range: 12 character.
   Default: UNDEFINED.
2. **`nvmqual`** – Circuit Pack Qualifier
   This parameter specifies the qualifier of the provisioned circuit pack of the slot. If no circuit pack is provisioned the value UNDEF is reported.
   Type: value set.
   Range: 7 characters.
   The allowed values are:
   - UNDEF (default)
   - EXTD
   - all values as defined in SRD_ConfigurationManagement

   Note: The TL1-representation of the functional qualifier follows the following rules:
   - alphanumeric characters or the special character '-' only
   - special characters like '/' and '.' to be omitted.

Output format

If the **`ENT-EQPT`** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The command preprovisions a slot for a dedicated circuit pack. The following attributes of the slot entity is updated due to that operation:

1. *nvmname* as specified in the command input
2. *nvmqual* as specified in the command input.

The command is only allowed if the slot is not provisioned (*nvmname/nvmqual* = UNDEFINED/UNDEF).

The update is reported by means of an **`ED-EQPT`** notification for that slot.

Behavior of *actlname* during provisioning

When a slot is provisioned for a dedicated circuit pack, then the actlname of the provisioned slot is updated and only contain the functional names of circuit packs which are allowed for reprovisioning. The parameter actlname shall at least contain the functional name of the provisioned circuit pack, independent if reprovisioning is supported for the provisioned circuit pack.

Behavior of preprovisioning of multislot circuit packs

The attribute *actlname* of the neighbor slots which are also covered by a multislot circuit pack (e.g. OP40, LOXC40G2S, LOXC40G3S) is modified and set to empty (i.e. the output contains one row with *actlname*=″″, see also Example Input/output section of RTRV-EQPT(slot)).

The attributes *nvmname*, *nvmqual* of the neighbor slots which are also covered by a multislot circuit pack (e.g. OP40, LOXC40G3S) is modified and set to *nvmname*, EXTD.

The update is reported by means of an **ED-EQPT** notification for those slots.

Behavior of preprovisioning on multislot circuit packs

The attribute *actlname* of the neighbor slot which can not be used anymore by a multislot circuit pack (the physical slot of e.g. an OP40 or LOXC40G2S, LOXC40G3S) is modified and all multislot CPs are removed.

The update is reported by means of an **ED-EQPT** notification for this slot.

Changes for neighbor slots when provisioning double-density circuit packs

When provisioning the first LOXC pack the attribute *actlname* of slots which are allowed to carry LOXC packs is modified according to defined rules. The update is reported by means of an **ED-EQPT** notification for the affected slots.

Changes for neighbor slots when provisioning an LOXC40G3S pack

If the system parameter *swmaxcap* is set to LXC320 or LXC160, the provisioning of a 3-slot LOXC40G3S pack in slot n shall clear the acceptable CP name list of the neighbor slot n-3. The update is reported by means of an **ED-EQPT** notification for slot n-3.

Changes for slots allowing to carry any type of LOXC pack when provisioning an LOXC pack

When provisioning the first LOXC pack, the attribute *actlname* of slots which are allowed to carry LOXC packs is modified. The update is reported by means of an **ED-EQPT** notification for the affected slots.

Changes for slots allowing to carry a TransMUX pack when provisioning a TransMUX pack

When provisioning the TransMUX pack, the attribute *actlname* of slots which are allowed to carry TransMUX packs is modified. The update is reported by means of an **`ED-EQPT`** notification for the affected slots.

Changes for slots allowing to carry a ES64U pack when provisioning a ES64U pack

When provisioning the ES64U pack, the attribute *actlname* of slots which are allowed to carry ES64U packs is modified. The update is reported by means of an **`ED-EQPT`** notification for the affected slots.

Update affected entities

The command creates in addition a set of entities of different types depending on the value of *nvmname* of command input as follows.

1. One instance of type circuit pack is created. This is reported by means of an ENT-EQPT notification for circuit pack.
2. Some instances of port STM-16 are created if *nvmname* of command equals *OP2G5* and attribute *istddflt* of the node equals *SDH*. This is reported by means of ENT-STM16 notification for port. The number of port instances to be created depends on the capabilities of the actual circuit pack.
3. Some instances of port OC-48 are created if *nvmname* of command equals *OP2G5* and attribute *istddflt* of the node equals *SONET*. This is reported by means of ENT-OC48 notification for port. The number of port instances to be created depends on the capabilities of the actual circuit pack.
4. One instance of port STM-64 is created if *nvmname* of command equals *OP10* and attribute *istddflt* of the node equals *SDH*. This is reported by means of ENT-STM64 notification for port.
5. One instance of port OC-192 is created if *nvmname* of command equals *OP10* and attribute *istddflt* of the node equals *SONET*. This is reported by means of ENT-OC192 notification for port.
6. One instance of port STM-256 is created if *nvmname* of command equals *OP40* and attribute *istddflt* of the node equals *SDH*. This is reported by means of ENT-STM256 notification for port.
7. One instance of port OC-768 is created if *nvmname* of command equals *OP40* and attribute *istddflt* of the node equals *SONET*. This is reported by means of ENT-OC768 notification for port.
8. 48, 192, 768 VC3 tributaries are created for each to the previously created SDH port according to the port rate. This is reported by means of ENT-VC3 notification for tributary.
9. 48, 192, 768 STS1 tributaries are created for each to the previously created SONET port according to the port rate. This is reported by means of ENT-STS1 notification for tributary.

10. Two dcc channels entities are created (one per type section/dccr and one type line/dccm) for each previously created SDH/SONET port. This is reported by means of ENT-FECOM notification for dcc channel.
11. One instance of 1+1 equipment protection group of type 'EQPTSWFBR' is created if nvmname of command equals *XC320* and another *XC320* circuit pack exists already. This is reported by means of ENT-PROTNGRP notification for 1+1 equipment protection group. The initial protection state is reported by means of a protection switch notification for the 1+1 equipment protection group.

Update affected entities – GE1

The command creates in addition a set of entities of different types depending on the value of *nvmname* of command input as follows.

1. One instance of type circuit pack is created. This is reported by means of an **`ENT-EQPT`** notification for circuit pack.
2. Four instances of entity EPORT are created if *nvmname* of command equals *GE1*. This are reported by means of ENT-EPORT notification.
3. Four instances of entity VCG are created if *nvmname* of command equals *GE1*. This are reported by means of ENT-VCG notification.
4. 7 VC-4 tributaries are created for each to the previously created VCG if attribute *istddflt* of the node equals 'SDH'. This is reported by means of ENT-VCGTRIB notification.
5. 21 STS-1 tributaries are created for each to the previously created VCG if attribute *istddflt* of the node equals 'SONET'. This is reported by means of ENT-VCGTRIB notification.

Update affected entities – GE10PL1

The command shall create in addition a set of entities of different types depending on the value of nvmname of command input as follows:

1. One instance of type circuit pack is created. This is reported by means of an **`ENT-EQPT`** notification for circuit pack.
2. Nine instances of type socket is created (one for each socket contained on the circuit pack). This are reported by means of ENT-EQPT notifications for sockets.

Update affected entities - Port Entities of OP155

In addition to the rules listed in ID 17111 the command shall create the following entities if nvmname equals OP155:

- Some instances of port STM-1 are created if the attribute *istddflt* of the node equals SDH. This is reported by means of ENT-STM1 notification for port. The number of port instances to be created depends on the capabilities of the actual circuit pack.
- Some instances of port OC-3 are created if the attribute *istddflt* of the node equals SONET. This is reported by means of ENT-OC3 notification for port. The number of port instances to be created depends on the capabilities of the actual circuit pack.

- 3 VC3 tributaries are created for each of the previously created SDH ports. This is reported by means of ENT-VC3 notifications for tributary.
- 3 STS1 tributaries are created for each of the previously created SONET port. This is reported by means of ENT-STS1 notifications for tributary.

Update affected entities - Port Entities of EP155

In addition to the rules listed in ID 17111 the command shall create the following entities if nvmname equals EP155:

- 8 STM-1E port instances of the actual circuit pack is created. This are reported by means of ENT-STM1E notification for port.
- 1 VC4 tributary is created for each of the previously created SDH ports. This are reported by means of ENT-VC3 notifications for tributary.

Update affected entities - OPLB

The command shall create following entities:

- One instance of type circuit pack is created. This is reported by means of an **`ENT-EQPT`** notification for circuit pack.
- One instance of type socket is created for each socket contained on the circuit pack one. This are reported by means of ENT-EQPT notifications for sockets.

Update affected entities - OP2G5D

The command shall create following entities:

- One instance of type circuit pack is created. This is reported by means of an **`ENT-EQPT`** notification for circuit pack.
- One instance of type socket is created for each socket contained on the circuit pack one. This are reported by means of ENT-EQPT notifications for sockets.

Update affected entities - OPT2G5

The command creates the following entities:

- One instance of type circuit pack is created. This is reported by means of an **`ENT-EQPT`** notification for circuit pack.
- Three instances of type socket is created (one for each socket contained on the circuit pack). This are reported by means of ENT-EQPT notifications for sockets.
- Three instances of entity VCG-TRANS is created. This are reported by means of ENT-VCG-TRANS notification.
- 17 VC-4 tributaries are created for the previously created VCG-TRANS if the attribute istddflt of the node equals ’SDH’. This are reported by means of ENT-VCGTRIB notification.
- 17 STS-3c tributaries are created for the previously created VCG-TRANS if the attribute istddflt of the node equals ’SONET’. This are reported by means of ENT-VCGTRIB notification.

Update affected entities - OP10D

The command creates the following entities:

- One instance of type circuit pack is created. This is reported by means of an **ENT-EQPT** notification for circuit pack.
- One instance of type socket is created for each socket contained on the circuit pack. This are reported by means of ENT-EQPT notifications for sockets.

Update affected entities - LOXC

The command creates the following entities:

- One instance of type circuit pack is created. This is reported by means of an **ENT-EQPT** notification for circuit pack.

Update affected entities - EP51

The command creates the following entities:

- One instance of type circuit pack is created. This is reported by means of an **ENT-EQPT** notification for circuit pack.
- 36 instances of port T3 is created. This are reported by means of **ENT-T3** notification for port.
- 1 STS1 path termination is created for each of the previously created T3 ports. This are reported by means of ENT-PTF-STS notifications.

Update affected entities - TransMUX

The command creates the following entities:

- The instance of type circuit pack is created. This is reported by means of an **ENT-EQPT** notification for circuit pack.

Update affected entities - ES64U

The command creates the following entities:

- The instance of type circuit pack is created. This is reported by means of an **ENT-EQPT** notification for circuit pack.

Update affected entities - OP10XTTC and OP10XTTL

The command creates the following entities:

- One instance of type circuit pack is created. This is reported by means of an **ENT-EQPT** notification for circuit pack.
- One OTN port of type OTU2 is created. This are reported by means of an ENT-OTU2 notification for OTN port.
- One instance of port STM-64 is created if the parameter istddflt of the system equals ’SDH’. The parameter otnclient of the STM-64 port is set to YES. This are reported by means of an ENT-STM64 notification for port.

- One instance of port OC-192 is created if the parameter istddflt of the system equals 'SONET'. The parameter otnclient of the OC-192 port is set to YES. This are reported by means of an ENT-OC192 notification for port.
- 192 VC3 tributaries are created for previously created SDH port. This are reported by means of an ENT-VC3 group notification for tributary.
- 192 STS1 tributaries are created for the previously created SONET port. This are reported by means of an ENT-STS1 group notification for tributary.
- Two DCC channels entities are created (one per type section/dccr and one type line/dccm) for the previously created SDH/SONET port. This are reported by means of ENT-FECOM notifications for dcc channels.

Group notification for STS-1/AU-3 tributaries

For efficiency reasons the notifications for tributaries are sent out as a single notification (so-called group notification) using a range over the aid which depends on the port rate of the associated port, i.e. the Simple_STS1NumAID field in the STS1NumAID is set to:

1&&-<N> with N is maximal legal STS-1/AU-3 number.

AID range for group notification: See STS-1/AU-3 Tributaries AID w.r.t. range for legal STS-1/AU-3 number.

Example: The AID field in a group notification for a tributaries related to port 1 for a OP10 pack in slot 1 looks like: 1-1-#-#-1-1-1&&-192.

Group notification for VCG tributaries

For efficiency reasons the notifications for VCG tributaries are sent out as a single notification (so-called group notification) using a range over the aid which depends on the used mapping of the associated VCG port, i.e. the Simple_VCGNumAID field in the VCGNumAID is set to:

- 1&&-<N> for sequential range
- 1&-4 .. &-<N> for non-sequential range.

with N is maximal legal VCG tributary number.

AID range for group notification: See VCG tributaries AID w.r.t. range for legal VCG number and sequential/non-sequential aid range.

Example: The AID field in a group notification for a VCG tributaries related to VCG port 1 for a GE1 pack in slot 1 looks like: 1-1-#-#-1-v1-1&&-21 (for STS-1/VC-3 mapping) 1-1-#-#-1-v1-1&-4&-7&-10&-13&-16&-19 (for STS-3c/VC-4 mapping).

Example input/output

```
ENT-EQPT:UNITE-NE:1-1-#-#-1:123456:::nvmname=OP10,nvmqual=1.5LR1;

   UNITE-NE 98-01-01 08:00:00
M  123456 COMPLD
```

;

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **ENT-EQPT** command.

Validation rule: Slot must not be provisioned

It should be checked whether the slot is still auto or preprovisioned. Only a unprovisioned slot can be preprovisioned for a dedicated circuit pack. To preprovision a slot the *nvmname/nvmqual* is UNDEFINED/UNDEF (=unprovisioned).

Error code: `IDNV – Input, Data Not Valid, Slot still provisioned`

Validation rule: Parameter *nvmname* must be specified

The system shall check that the parameter *nvmname* is specified in the command.

Error code: `IDNV – Input, Data Not Valid`

Validation rule: Check whether CP is acceptable

Check of the circuit pack type which is allowed for the slot.

Consistency is checked at two levels:

- between *actlname*/*actlqual* with *nvmname*/*nvmqual* at system level
- between actlname with nvmname at slot level.

Error code:
`EATN – Status, incorrect equipage, unrecognized CP for this slot`

Validation rule: Check whether system is maintenance condition

Preprovisioning is not allowed, when the system in maintenance condition (see “RTRV-EQPT (system): Retrieve Equipment (system)” (p. 3-2400)).

Error code:
`SNVS – Status, Not in Valid State, not in Maintenance Condition`

Validation rule: Reject Request for CTL slots

If *ctlw* or *ctlp* is specified as Simple_CTLSlotAID the command is rejected.

Error code: `IENE – Input, Entity Not Exists`

GR-199-CORE

ENT-EQPT (socket): Enter equipment (socket)

The **ENT-EQPT** command preprovisions a socket for a dedicated module.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: No.

Input format

Command syntax: **ENT-EQPT**:*tid*:*aid*:ctag:::*[spec_block];*

Input parameters

Command parameters

1. **tid** – Target Identifier
Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
The AID of a socket.
Type: AID.
Range: SocketAID. The keywords *all* / *usall* / *scall* shall are not allowed on any level.
3. **ctag** – Correlation Tag
Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **nvmname** – Provisioned Module Name
This parameter specifies the name of the provisioned module of the socket. If no module is provisioned the default value is reported.
Type: value set.
Range: 12 character.
Default: UNDEFINED.
2. **nvmqual** – Provisioned Module Qualifier
This parameter specifies the qualifier of the provisioned module of the slot. If no module is provisioned the default value is reported..
Type: value set.
Range: 7 characters.
Default: UNDEF.

Note: The TL1-representation of the functional qualifier shall follow the rules as defined in SRD_ConfigurationManagement:

- alphanumeric characters or the special character ’-’ only
- special characters like ’/’ and ’.’ to be omitted.

Output format

If the **ENT-EQPT** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The command shall preprovision a socket for a dedicated module.

The following attributes of the socket entity is updated due to that operation:

- *nvmname* as specified in the command input
- nvmqual as specified in the command input.

The command is only allowed if the socket is unprovisioned (nvmname/nvmqual = UNDEFINED/UNDEF).

The update is reported by means of an **ED-EQPT** notification for that socket.

Update acceptable modules list

If the command leads to a change of the Acceptable Modules List (list of actlname/actlqual), then the change is reported by means of an **ED-EQPT** notification. Since the creation of the module is not reported no ENT-EQPT notification for a module entity will be reported.

Update affected entities

The command creates in addition a set of entities of different types depending on the value of *nvmname* of command input as follows.

- One instances of port STM-16 is created if *nvmname* of command equals ’OM2G5’ and attribute *istddflt* of the node equals ’SDH’. This are reported by means of ENT-STM16 notification for port.
- One instances of port OC-48 is created if *nvmname* of command equals ’OM2G5’ and attribute *istddflt* of the node equals ’SONET’. This are reported by means of ENT-OC48 notification for port.

- One instance of port STM-64 is created if *nvmname* of command equals ’OM10’ and attribute *istddflt* of the node equals ’SDH’. This are reported by means of ENT-STM64 notification for port.
- One instance of port OC-192 is created if *nvmname* of command equals ’OM10’ and attribute *istddflt* of the node equals ’SONET’. This are reported by means of ENT-OC192 notification for port.
- One instance of port STM-4 is created if *nvmname* of command equals ’OM622’ and attribute *istddflt* of the node equals ’SDH’. This are reported by means of ENT-STM4 notification for port.
- One instance of port OC-12 is created if *nvmname* of command equals ’OM622’ and attribute *istddflt* of the node equals ’SONET’. This are reported by means of ENT-OC12 notification for port.
- One instance of port STM-1 is created if *nvmname* of command equals ’OM155’ and attribute *istddflt* of the node equals ’SDH’. This are reported by means of ENT-STM1 notification for port.
- One instance of port OC-3 is created if *nvmname* of command equals ’OM155’ and attribute *istddflt* of the node equals ’SONET’. This are reported by means of ENT-OC3 notification for port.
- 3, 12, 48, 192 VC3 tributaries are created for each to the previously created SDH port according to the port rate. This are reported by means of ENT-VC3 notification for tributary.
- 3, 12, 48, 192 STS1 tributaries are created for each to the previously created SONET port according to the port rate. This are reported by means of ENT-STS1 notification for tributary.
- Two dcc channels entities are created (one per type section/dccr and one type line/dccm) for each previously created SDH/SONET port. This are reported by means of ENT-FECOM notification for dcc channel.

Update affected entities - OPT2G5

If the socket resides on a OPT2G5 circuit pack, then the following entities are created:

- One instance of port STM-16T is created if the attribute istddflt of the node equals ’SDH’. This are reported by means of ENT-STM16T notification for port.
- One instance of port OC-48 is created if the attribute istddflt of the node equals ’SONET’. This are reported by means of ENT-OC48T notification for port.

Update affected entities - GE10PL1

If the socket resides on a GE10PL1 circuit pack, then the following entities are created:

- One instance of 1 Gb Ethernet port is created if nvmname of the command equals ’OMGE1’. This are reported by means of ENT-EPORT notification for Ethernet port.
- One instance of 10 Gb Ethernet port is created if nvmname of the command equals ’OMX10’. This are reported by means of ENT-EPORT notification for Ethernet port.
- One instance of entity VCG is created for the previously created Ethernet port. If another VCG already exists on the GE10PL1 pack, then the interface standard for the VCG to be created shll be derived from the existing VCG. Otherwise, if no VCG exixts on the GE10PL1 pack, the interface standard for the VCG to be created shll be derived from the system’s interface standard default. The creation of the VCG is reported by means of ENT-VCG notification.
- 21 VC-3 tributaries are created for the previously created VCG if the interface standard of the VCG equals ’SDH’ and the VCG is related to a 1 GbE port. This are reported by means of ENT-VCGTRIB notification.
- 21 STS-1 tributaries are created for the previously created VCG if the interface standard of the VCG equals ’SONET’ and the VCG is related to a 1 GbE port. This are reported by means of ENT-VCGTRIB notification.
- 192 VC-3 tributaries are created for the previously created VCG if the interface standard of the VCG equals ’SDH’ and the VCG is related to a 10 GbE port. This are reported by means of ENT-VCGTRIB notification.
- 192 STS-1 tributaries are created for the previously created VCG if the interface standard of the VCG equals ’SONET’ and the VCG is related to a 10 GbE port. This are reported by means of ENT-VCGTRIB notification.

Group notification for STS-1/AU-3 tributaries

For efficiency reasons the notifications for tributaries are sent out as a single notification (so-called group notification) using a range over the aid which depends on the port rate of the associated port, i.e. the Simple_STS1NumAID field in the STS1NumAID is set to:

- 1&&-<N>

with N is maximal legal STS-1/AU-3 number.

Example:

The AID field in a group notification for a tributaries related to port 1 for a OP10 pack in slot 1 looks like: 1-1-#-#-1-1-1&&-192.

Example input/output

This example shows an ENT-EQPT command for pre provisioning of a socket:

```
ENT-EQPT:UNITE-NE:1-1-#-#-5-sc2:123456:::nvmname=OM2G5,nvmqual=13LR1;

   UNITE-NE 98-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **ENT-EQPT** command.

Validation rule: Socket must not be provisioned

It should be check whether the socket is still auto or preprovisioned. Only a unprovisioned slot can be preprovisioned for a dedicated module. To preprovision a socket the nvmname/nvmqual is UNDEFINED/UNDEF (=unprovisioned).

Error code: `IDNV – Input, Data Not Valid, Socket still provisioned`

Validation rule: Parameter *nvmname* must be specified

The system shall check that the parameter *nvmname* is specified in the command.

Error code: `IDNV – Input, Data Not Valid`

Validation rule: Check whether system is maintenance condition

Pre-provisioning is not allowed, when the system in maintenance condition. (See “RTRV-EQPT (system): Retrieve Equipment (system)” (p. 3-2400).)

Error code:

`SNVS – Status, Not in Valid State, not in Maintenance Condition`

Validation rule: Equipage Status and Inventory Data of Module must be accessible

If the equipage status or inventory data of a module is not accessible (e.g. due to the parent pack being in recovery) pre-provisioning of the socket is not allowed.

Error code: `SNVS – Status, Not in Valid State, unknown module equipage`

Validation rule: Module must be plugged out

It is checked whether no module is plugged in. This implies that also no unexpected module is plugged in.

Error code:

`SNVS – Status, Not in Valid State, the module is not plugged out`

Validation rule: Module must be part of acceptable module list

It is checked whether the module to be pre-provisioned is part of the acceptable module list (parameters *actlname*, *actlqual* of the addressed socket).

Error code:
`ENRE – Equipage, Not Recognized Equipage, unrecognized module for this socket`

GR-199-CORE

ENT-EQPT (socket) notification

Output format

Syntax: **ENT-EQPT**:*aid*::*spec_block*

Output parameters

Command parameters

1. **aid** – Access Identifier
   The AID of a socket.
   Type: AID.
   Range: SocketAID. The keyword *usall* or *all* is allowed for Simple_UnivSlotAID. The keyword *scall* is allowed for Simple_SocketAID. The keyword **all** is not allowed on bay/shelf level.

Spec block parameters

1. **eqptpn** – Equipment ASAP Profile Name
   The name of the current ASAP profile of type EQUIP-PROT on socket level.
   Type: Alphanumeric string.
   Range: up to 24 characters. A hyphen (“-”) is allowed in the name additionally.
   Default: DEFAULT.
2. **nvmname** – Provisioned Module Name
   This parameter specifies the name of the provisioned module of the socket. If no module is provisioned the default value is reported.
   Type: value set.
   Range: 12 character.
   Default: UNDEFINED.
3. **nvmqual** – Provisioned Module Qualifier
   This parameter specifies the qualifier of the provisioned module of the slot. If no module is provisioned the default value is reported..
   Type: value set.
   Range: 7 characters.
   Default: UNDEF.

   Note: The TL1-representation of the functional qualifier shall follow the rules as defined in SRD_ConfigurationManagement:

   - alphanumeric characters or the special character ’-’ only
   - special characters like ’/’ and ’.’ to be omitted.

Example output

The following examples shows the case after pre-provisioning of slot 5 socket 2:

```
A 001 REPT DBCHG
  ”TIME=08-00-12,DATE=00-11-14:ENT-EQPT:1-1-#-#-5-
     sc2::nvmname=OM2G5,nvmqual=15LR1,eqptpn=PROFILE1”
```

```
;
```

ENT-FECOM: Enter DCC channel related parameters

The **ENT-FECOM** command allows to enable or disable a DCC channel for a specific OSI node, the SCN node, the UNI node or the E-NNI node. It can also be used to modify the type of LAPD service of an existing DCC channel, which is used for MCN.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S3

Priority: 1

Abortable: No.

Input format

Command syntax: **ENT-FECOM**:*tid*::*ctag*::*port*[,*dcctype*]:[*spec_block*];

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for input parameter syntax and description of this parameter.
3. **port**
   This parameter indicates the port AID of a circuit pack which is used together with *dcctype* to identify the DCC channel.
   Type: AID.
   Range: SPortAID; the keyword **all** is not allowed.
4. **dcctype**
   This parameter specifies whether the LINE/MS or SECTION/RS DCC of the *port* is affected by the command.
   Type: Alphanumeric value set.
   Range:
   - LINE
   - SECTION.

   Default: SECTION if *dccstat* is set to ENABLE. No default (i.e. parameter is mandatory) if *scn_dccstat* or *uni_dccstat* is ENABLE.

Spec block parameters

1. **`dccstat`**
   This parameter indicates whether communication over the DCC channel is enabled or disabled.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
   Note: One and only one of the parameters *dccstat*, *scn_dccstat*, *uni_dccstat* or *enni_dccstat* must be present in the command.
2. **`lapdmode`**
   This parameter indicates the type of LAPD service. Modes are AITS and UITS. Starting with R2.0 this parameter is also used to determine the service for the LinkID protocol.
   If the DCC channel is involved in a transparent DCC connection or if either *scn_dccstat* or *uni_dccstat* is set to ENABLE, or *enni_dccstat* is set to ENABLE, this parameter has no meaning and will not be reported.
   Type: Alphanumeric value set..
   Range:
   - UITS (default)
   - AITS.
3. **`lapdrl`**
   This parameter indicates the LAPD role. This parameter is also used to determine the service for the LinkID protocol.
   If the DCC channel is involved in a transparent DCC connection or if either *scn_dccstat* or *uni_dccstat* is set to ENABLE, or *enni_dccstat* is set to ENABLE, this parameter has no meaning and will not be reported.
   Type: Alphanumeric value set.
   Range:
   - USER-SIDE (default)
   - NETWORK-SIDE.
4. **`osinode`**
   Assignment of a DCC channel to an MCN node in the NE. This parameter must be supplied when dcc_stat = ENABLED and not the default osinode1 is used, in all other cases it is omitted.
   An NE can have up to 8 instances of the OSI stack. Node-1 is default and has a NSAP. Nodes 2-8 have a NET and no SEL (NSAP = NET + SEL, for NET: SEL=00). Nodes 2-8 can be created and configured, see "ENT-ULSDCC-L3: Create a further OSI node" (p. 3-1951).
   Type: AID.
   Range: osinode{1-8}
   Default: osinode1.

5. **`scn_dccstat`**
   This parameter indicates whether the DCC channel is used for communication over the SCN.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default).
   Note: One and only one of the parameters *dccstat*, *scn_dccstat*, *uni_dccstat* or *enni_dccstat* must be present in the command.
6. **`uni_dccstat`**
   This parameter indicates whether the DCC channel is used for UNI communication.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE.
   Note: One and only one of the parameters *dccstat*, *scn_dccstat*, *uni_dccstat* or *enni_dccstat* must be present in the command.
7. **`enni_dccstat`**
   This parameter indicates whether the DCC channel is used for E-NNI communication.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE.
   Note: One and only one of the parameters *dccstat*, *scn_dccstat*, *uni_dccstat* or *enni_dccstat* must be present in the command.

Output format

If the **`ENT-FECOM`** command is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The **`ENT-FECOM`** command can assign a DCC channel to a specified node and enable or disable it. Furthermore the type of LAPD service can be set respectively modified for UITS (default) or AITS.

The update is reported by means of **`ED-FECOM`** notification.

It seems to be odd that an ENT command leads to an ED notification. The rationale behind that is as follows: **`ENT-FECOM`** has edit semantics, but it wasn’t going to be changed into an ED command due to backward compatibility to CG. The notification behavior was, however, clean-up. Additional **DLT-FECOM**, **ENT-FECOM** notification are defined to notify the deletion/creation of DCC channels upon CP deletion/creation or MSP DCC slaving enabled/disabled.

Note: If *scn_node* is set to ENABLED, the channel is implicitely assigned to the SCN node.

Note: If *uni_node* is set to ENABLED, the channel is implicitely assigned to the UNI node.

Note: If *enni_node* is set to ENABLED, the channel is implicitly assigned to the E-NNI node.

The re-assignment of a dedicated DCC channel from an osinode to the scnnode or vice versa is not supported within one command execution.

A re-assignment from *osinode* to *scnnode* means: Set from *dccstat* = ENABLE to *scn_dccstat*={ENABLE|DISABLE}.

A re-assignment from *scnode* to *osinode* means: Set from *scn_dccstat* = ENABLE to *dccstat*={ENABLE|DISABLE}.

The re-assignment can be achieved in three steps:

- disable the channel for the old node
- change associated port type
- enable the channel for a new node.

The re-assignment of a dedicated DCC channel from an osinode or the scnnode to the uninode or vice versa is not supported within one command execution.

A re-assignment from osinode or scnnode to uninode means: *uni_dccstat* is specified in the command while either *dccstat* or *scn_dccstat* is set to ENABLE.

A re-assignment from uninode to osinode or scnnode means: *dccstat* or *scn_dccstat* is specified in the command while *uni_dccstat* is set to ENABLE.

The re-assignment can be achieved in two steps:

- disable the channel for the old node
- enable the channel for a new node.

The re-assignment of a dedicated DCC channel from an osinode or the scnnode or the uninode to the enninode or vice versa is not supported within one command execution.

A re-assignment from osinode or scnnode or uninode to enninode means: *enni_dccstat* is specified in the command while either *dccstat* or *scn_dccstat* or *uni_dccstat* is set to ENABLE.

A re-assignment from enninode to uninode or osinode or scnnode means: *dccstat* or *scn_dccstat* or *uni_dccstat* is specified in the command while *enni_dccstat* is set to ENABLE.

The re-assignment can be achieved in three steps:

- disable the channel for the old node
- change associated port type
- enable the channel for a new node.

When *dccstat* is set from DISABLED to ENABLED, the system shall apply the default values for all spec block parameters except *scn_dccstat* and *uni_dccstat* which are not specified in the command.

In contrast to the general pre-provisioning concept, it is not possible to change any parameter when not one of *dccstat*, *scn_dccstat*, *uni_dccstat*, or *enni_dccstat* is set to ENABLED.

It is possible to specify additional parameters in the command, which is used to set *dccstat* to DISABLE. The parameter values are changed as specified, but when one of *dccstat*, *scn_dccstat*, *uni_dccstat*, or *enni_dccstat* is set to ENABLE, all spec block parameters are set to default values again.

Example input/output

The following example shows the result of ENT-FECOM:

```
ENT-FECOM:NE-UNITE::123456::1-1-#-#-5-
      1,line:dccstat=enable,lapdmode=AITS,osinode=osinode5;
   LT-UNITE 00-12-24 12:00:00
M  123456 COMPLD
;
```

The following example shows the result of ENT-FECOM command which enables a DCC channel for the SCN:

```
ENT-FECOM:NE-UNITE::123456::1-1-#-#-5-1,line:scn_dccstat=ENABLE;
   LT-UNITE 00-12-24 12:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **ENT-FECOM** command.

Validation rule: Check for that either *dccstat*, *scn_dccstat*, *uni_dccstat*, or *enni_dccstat* is present

The command is rejected when none of the parameters *dccstat*, *scn_dcnstat*, *uni_dccstat*, or *enni_dccstat* is present.

Error code: `IDNV – Input, Data Not Valid`

Validation rule: Check for enabled DCC channels

The command is rejected when any other parameter than *dccstat*, *scn_dccstat*, *uni_dccstat*, or *enni_dccstat* is changed and one of the parameters *scn_dccstat*, *uni_dccstat*, or *enni_dccstat* is set to DISABLE with the command. The validation is not applied, if *dccstat* is set to DISABLE.

Error code: `SNVS – Status, Not in Valid State`

Validation rule: Single occurence of *dccstat*, *scn_dccstat*, *uni_dccstat*, or *enni_dccstat* parameter

The command is rejected when more than one parameter of *dccstat*, *scn_dccstat*, *uni_dccsstat*, or *enni_dccsstat* is present in the command.

Error code:

`IDNC – Input, Data Not Consistent, only one of dccstat, scn_dccstat, uni_dccstat, or enni_dccstat allowed`

Validation rule: Implicit status change of *dccstat*, *scn_dccstat*, *uni_dccstat*, or *enni_dccstat*

Only the actually enabled channel can be set to disabled, i.e. the command is rejected:

- when *dccstat* = ENABLE it is not allowed to set *scn_dccstat*, *uni_dccstat*, or *enni_dccstat* to DISABLE,
- when *scn_dccstat* = ENABLE it is not allowed to set *dccstat*, *uni_dccstat*, or *enni_dccstat* to DISABLE,
- when *uni_dccstat* = ENABLE it is not allowed to set *dccstat*, *scn_dccstat*, or *enni_dccstat* to DISABLE,
- when *enni_dccstat* = ENABLE it is not allowed to set *dccstat*, *scn_dccstat*, or *uni_dccstat* to DISABLE.

Error code:

`SNVS – Status, Not in Valid State, implicit channel re-assignment`

Validation rule: Check for parameter osinode

The command is rejected when *dccstat* is set to ENABLED and *osinode* is not in the created state. This means a value for parameter *osinode* other than osinode1 is used in the command, which was not used for creation of a node via ENT-ULSDCC-L3 before.

Error code: `ENEQ – Equipage, Not EQuipped osinode`

Validation rule: DCC Protection

A port cannot be specified when it is protecting part of a 1+1 MSP group and DCC protection switching is enabled.

Error code: `SNVS – Not in Valid State, part of 1+1 MSP protection`

When DCC protection switching is enabled, the RS/MS DCC channel objects of the protection port are deleted and not available.

Validation rule: Check for DCC Protection

Disabling of RS-DCC/MS-DCC is rejected when RS-DCC/MS-DCC protection dcc is enabled.

Error code: `SNVS – Not in Valid State, DCC protection available`

Validation rule: DCC for 2 fiber BLSR/MS-SPRING

DCC-disabling on a port of a 2-fiber BLSR/MS-SPRING protection group is denied if no other DCC channel is available on that port although automatic ring discovery is enabled.

Error code: `SNVS – Not in Valid State, DCC needed for BLSR/MS-SPRING`

Validation rule: Worker port for 4 fiber BLSR/MS-SPRING

DCC-disabling on the port of the worker line of a symmetric span of a 4-fiber BLSR/MS-SPRING protection group is denied if no other DCC channel is available on that port although automatic ring discovery is enabled.

Error code: `SNVS – Not in Valid State, DCC needed for BLSR/MS-SPRING`

Validation rule: Protection port for 4 fiber BLSR/MS-SPRING

DCC-disabling on the port of the protection line of an asymmetric span of a 4-fiber BLSR/MS-SPRING protection group is denied if no other DCC channel is available on that port although automatic ring discovery is enabled.

Error code: `SNVS – Not in Valid State, DCC needed for BLSR/MS-SPRING`

Validation rule: Check for service condition

Enable DCC termination is not possible if port is in out-of-service state.

Error code: `SDNC – Status, Data Not Consistent, port is out-of-service`

Validation rule: Transparent DCC cross-connection

The DCC channel is not ENABLED or DISABLED if it is used in a transparent DCC cross-connection. *dccstat*, *scn_dccstat*, *uni_dccstat* and *enni_dccstat* cannot be changed until the existing transparent DCC cross-connection is deleted.

Error code:

```
SNVS – Status, Not in Valid State, DCC channel used in transparent DCC
cross-connection
```

Validation rule: Independent use of DCC channel for MCN, SCN, UNI, or E-NNI

The command is rejected when another channel than the actual enabled channel is set to enabled, i.e.:

- when *dccstat* = ENABLE it is not allowed to set *scn_dccstat*, *uni_dccstat* or *enni_dccstat* to ENABLE,
- when *scn_dccstat* = ENABLE it is not allowed to set *dccstat*, *uni_dccstat* or *enni_dccstat* to ENABLE,
- when *uni_dccstat* = ENABLE it is not allowed to set *dccstat*, *scn_dccstat* or *enni_dccstat* to ENABLE,
- when *enni_dccstat* = ENABLE it is not allowed to set *dccstat*, *scn_dccstat* or *uni_dccstat* to ENABLE.

Error code:

```
SNVS – Status, Not in Valid State, DCC channel can not be assigned to
more than one of MCN, SCN, UNI and E-NNI at the same time
```

Validation rule: Maximum number of channels assigned to MCN on CTL/-

Operating on a CTL/- the system can support up to 64 DCC interfaces. It is checked that the max number of 64 DCC interfaces for MCN (i.e. dccstat=ENABLE) is not exceeded.

Error code:

```
SSRE – Status, System Resources Exceeded, overall limit of DCC channels
exceeded
```

Validation rule: Maximum number of channels assigned to MCN, SCN, UNI, and E-NNI on CTL/2

Operating on a CTL/2, the system can support up to 64 DCC interfaces. It is checked that the max number of 64 DCC interfaces for MCN, SCN, UNI, or E-NNI (i.e. *dccstat* = ENABLE or *scn_dccstat* = ENABLE or *uni_dccstat* = ENABLE or *enni_dccstat* = ENABLE) is not exceeded.

Error code:

```
SSRE – Status, System Resources Exceeded, overall limit of DCC channels
exceeded
```

Validation rule: Maximum number of channels assigned to MCN, SCN, UNI, and E-NNI on CTL4

Operating on a CTL/4T or CTL/4S, the system can support up to 64 DCC interfaces. It is checked that the max number of 64 DCC interfaces for MCN, SCN, UNI, or E-NNI (i.e. *dccstat* = ENABLE or *scn_dccstat* = ENABLE or *uni_dccstat* = ENABLE or *enni_dccstat* = ENABLE) is not exceeded.

Error code:

`SSRE – Status, System Resources Exceeded, overall limit of DCC channels exceeded`

Validation rule: Maximum number of channels assigned to MCN, SCN, UNI, and E-NNI on CTL/3

Operating on a CTL/3 the system can support up to 180 DCC interfaces according to the following rule:

2 * (number of enabled transparent MS/RS-DCC channels) + (number of enabled non-transparent MS/RS-DCC channels) + (number of internally used MS/RS-DCC channels) ≤ 180. It is checked that this rule is not violated.

Error code:

`SSRE – Status, System Resources Exceeded, overall limit of DCC channels exceeded`

Internally used DCC channels for ES64U pack:

Each unprotected ES64U pack provisioned with a capacity of 20G and each equipment protected pair of ES64U packs in the system uses 1 DCC-M.

Validation rule: No DCC on transparent ports

The system shall not allow to use DCC on Transparent Ports, i.e. on ports with a rate of STM16T or OC48T.

Error code:

`IDNV – Input, Data Not Valid, DCC on Transparent Ports not allowed`

Validation rule: No DCC on DS3 ports

The system shall not allow to use DCC on DS3 Ports, i.e. on ports with a rate of T3.

Error code: I`DNV – Input, Data Not Valid, DCC on DS3 Ports not allowed`

Validation rule: No DCC on EC1 ports

The system shall not allow to use DCC on EC1 Ports.

Error code: I`DNV – Input, Data Not Valid, DCC on EC1 Ports not allowed`

Validation rule (SCN specific): Check for provisioned SCN IP address

The command is rejected when scn_dccstat=ENABLED and no IP address has been configured for the SCN via ENT-ULS (ip_ad_astn).

Error code:

`SNVS – Status, Not in Valid State, no SCN IP address provisioned`

Validation rule (SCN specific): Check combination of *osinode* parameter with *scn_dccstat*

The command is rejected when *scn_dccstat* = ENABLED and a value for parameter *osinode* is supplied.

Error code:

`SDNC – Status, Data Not Consistent, invalid combination of osinode parameter with dccstat, scn_dccstat`

Validation rule (SCN specific): Check whether ONNS is enabled

The command is rejected when *scn_dccstat* = ENABLE in the command, while ONNS has not been enabled (system parameter *xcsetup* not set to SWISS).

Error code: `SNVS – Status, Not in Valid State, SwiSS not enabled`

Validation rule (SCN specific): RS-DCC not allowed for SCN

The command is rejected if *scn_dccstat* = ENABLED and *dcctype* = SECTION..

Error code:

`IDNV – Input, Data Not Valid, DCC type SECTION not allowed for SCN`

Validation rule (SCN specific): Check consistency of input parameters with *portClass* I

The command is rejected, if *scn_dccstat* = ENABLED and the port is not of *portClass* INNI.

Error code: `IDNV – Input, Data Not Valid, portClass must be INNI`

Validation rule (SCN specific): Invalid input parameters

The command is rejected, if scn_dccstat=ENABLED and a value for *lapdmode* or a value for *lapdrl* is given.

Error code:

`IDNV – Input, Data Not Valid, provisioning of lapdmode and lapdrl not possible`

Validation rule (SCN specific): Prevent that both DCCs of a port are assigned to the SCN

The command is rejected, if it is tried to set *scn_dccstat* = ENABLED for a specific port and *dcctype* and for the same port *scn_dccstat* is already ENABLED for the other *dcctype*.

Error code:

`IDNV – Input, Data Not Valid, not possible to assign both channels to SCN`

Validation rule (SCN specific): Prevent that both DCCs of a port are assigned to the MCN, when *portClass* = INNI

The command is rejected, if *portClass* = INNI for port and it is tried to set *dccstat* = ENABLED for a specific port and *dcctype* and for the same port *dccstat* is already ENABLED for the other *dcctype*.

Error code:

`IDNV – Input, Data Not Valid, not possible for NNI port to assign both channels to MCN`

Validation rule (SCN specific): Maximum number of channels assigned to SCN

The scnnode can support up to 64 DCC interfaces. It is checked that the max number of 64 DCC interfaces for scnnode (i.e. *scn_dccstat* = ENABLED) is not exceeded.

Error code:

`SSRE – Status, System Resources Exceeded, allowed limit of SCN DCC channels exceeded`

Validation rule (UNI/E-NNI specific): Check combination of osinode parameter with *uni_dccstat / enni_dccstat*

The command is rejected when any of the following expressions is true:

- *uni_dccstat* = ENABLED and (*enni_dccstat* = ENABLED or a value for parameter osinode is supplied),
- *enni_dccstat* = ENABLED and (*uni_dccstat* = ENABLED or a value for parameter osinode is supplied),
- *scn_dccstat* = ENABLED and (*uni_dccstat* = ENABLED or *enni_dccstat* = ENABLED or a value for parameter osinode is supplied),
- *dccstat* = ENABLED and (*scn_dccstat* = ENABLED or *uni_dccstat* = ENABLED or *enni_dccstat* = ENABLED).

Error code:

`SDNC – Status, Data Not Consistent, invalid combination of osinode parameter with dccstat, scn_dccstat, uni_dccstat, enni_dccstat`

Validation rule (UNI/E-NNI specific): Check consistency of input parameters with *portClass*

The command is rejected, if *uni_dccstat* = ENABLED and the port is not of *portClass* UNI.

Error code: `IDNV – Input, Data Not Valid, portClass must be UNI`

Validation rule (UNI/E-NNI specific): Check consistency of input parameters with *portClass*

The command is rejected, if *enni_dccstat* = ENABLED and the port is not of *portClass* UNI.

Error code: `IDNV – Input, Data Not Valid, portClass must be ENNI`

Validation rule (UNI/E-NNI specific): E-NNI Node must be created

The command is rejected, if *enni_dccstat* = ENABLED and the E-NNI node is not created by provisioning of the sigPCIP_Address in **`ENT-ULS`**.

Error code: `SNVS – Status, Not in Valid State, E-NNI Node not created`

Validation rule (UNI/E-NNI specific): Prevent that both DCCs of a port are assigned to UNI

The command is rejected, if it is tried to set *uni_dccstat* = ENABLED for a specific port and *dcctype* and for the same port *uni_dccstat* is already ENABLED for the other *dcctype*.

Error code:

`IDNV – Input, Data Not Valid, not possible to assign both channels to UNI`

Validation rule (UNI/E-NNI specific): Prevent that both DCCs of a port are assigned to E-NNI

The command is rejected, if it is tried to set *enni_dccstat* = ENABLED for a specific port and *dcctype* and for the same port *enni_dccstat* is already ENABLED for the other *dcctype*.

Error code:

`IDNV – Input, Data Not Valid, not possible to assign both channels to E-NNI`

Validation rule (UNI/E-NNI specific): Maximum number of channels assigned to UNI

The uninode can support up to 64 DCC interfaces. It is checked that the max number of 64 DCC interfaces for uninode (i.e. *uni_dccstat* = ENABLED) is not exceeded.

Error code:

`SSRE – Status, System Resources Exceeded, allowed limit of DCC channels exceeded`

Validation rule (UNI/E-NNI specific): Maximum number of channels assigned to E-NNI

The enninode can support up to 64 DCC interfaces. It is checked that the max number of 64 DCC interfaces for enninode (i.e. *enni_dccstat* = ENABLED) is not exceeded.

Error code:

`SSRE – Status, System Resources Exceeded, allowed limit of DCC channels exceeded`

Validation rule (UNI/E-NNI specific): Can't disable DCC if associated node has manual routes via this DCC

Disabling a DCC, although the associated node has manual routes via this DCC is rejected.

Error code: `SNVS – Status, Not in Valid State, Manual routes exist`

Validation rule (UNI/E-NNI specific): ENNI node must be created

If the ENNI Node is not created (by provisioning of the *sigPCIP_Address* in ENT-ULS), then the command is denied.

Error code: `SNVS – Status, Not in Valid State, ENNI Node not created`

ENT-FECOM notification

Output format

Note: In contrast to RTRV-FECOM this notification will also be sent when dccstat=DISABLE, which is the default value after creation of a DCC channel.

The **ENT-FECOM** notification has the following specific syntax:

ENT-FECOM::*port*,*dcctype*:*spec_block*

Output parameters

Command parameters

1. **port**
   This parameter indicates the port AID of a circuit pack which is used together with *dcctype* to identify the DCC channel.
   Type: AID.
   Range: SPortAID; the keyword **all** is not allowed.
2. **dcctype**
   This parameter specifies whether the LINE/MS or SECTION/RS DCC of the *port* is affected by the command.
   Type: Alphanumeric value set.
   Range:
   - LINE
   - SECTION.

   Default:
   - SECTION if dccstat is set to ENABLE
   - no default (i.e. parameter is mandatory) if *scn_dccstat* or *uni_dccstat* is ENABLE.

Spec block parameters

1. **dccprottp**
   This parameter reports the protection type of the DCC channel. 0X1 means the port is not involved in a protection group or DCC protection switching is disabled. 1+1 means DCC protection switching is enabled: In these case only the active worker line is shown.
   Type: Alphanumeric value set.
   Range: 0X1 (default), 1+1.
2. **dccstat**
   This parameter indicates whether communication over the DCC channel is enabled or disabled.
   Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

Note: One and only one of the parameters *dccstat*, *scn_dccstat*, *uni_dccstat*, or *enni_dccstat* must be present in the command.

3. **`lapdmode`**
   This parameter indicates the type of LAPD service. Modes are AITS and UITS. Starting with R2.0 this parameter is also used to determine the service for the LinkID protocol.
   If the DCC channel is involved in a transparent DCC connection or if either *scn_dccstat* or *uni_dccstat* or *enni_dccstat* is set to ENABLE, this parameter has no meaning and will not be reported.
   Type: Alphanumeric value set..
   Range:
   - UITS (default)
   - AITS.
4. **`lapdrl`**
   This parameter indicates the LAPD role. This parameter is also used to determine the service for the LinkID protocol. If the DCC channel is involved in a transparent DCC connection or if either *scn_dccstat* or *uni_dccstat* or *enni_dccstat* is set to ENABLE, this parameter has no meaning and will not be reported.
   Type: Alphanumeric value set.
   Range:
   - USER-SIDE (default)
   - NETWORK-SIDE.
5. **`osinode`**
   Assignment of a DCC channel to an MCN node in the NE. This parameter must be supplied when dcc_stat = ENABLED and not the default osinode1 is used, in all other cases it is omitted.
   An NE can have up to 8 instances of the OSI stack. Node-1 is default and has a NSAP. Nodes 2-8 have a NET and no SEL (NSAP = NET + SEL, for NET: SEL=00). Nodes 2-8 can be created and configured, see "ENT-ULSDCC-L3: Create a further OSI node" (p. 3-1951).
   Type: AID.
   Range: osinode{1-8}
   Default: osinode1.

6. **scn_dccstat**
   This parameter indicates whether the DCC channel is used for communication over the SCN.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default).
   Note: One and only one of the parameters *dccstat*, *scn_dccstat*, *uni_dccstat*, or *enni_dccstat* must be present in the command.
7. **uni_dccstat**
   This parameter indicates whether the DCC channel is used for UNI communication.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default).
   Note: One and only one of the parameters *dccstat*, *scn_dccstat*, *uni_dccstat* or *enni_dccstat* must be present in the command.
8. **enni_dccstat**
   This parameter indicates whether the DCC channel is used for E-NNI communication.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE.
   Note: One and only one of the parameters *dccstat*, *scn_dccstat*, *uni_dccstat*, or *enni_dccstat* must be present in the command.

Example output

```
   NE-UNITE 00-11-03 01:00:00
A  000 REPT DBCHG
   ”TIME=01-00-00,DATE=00-12-13:ENT-FECOM::1-1-#-#-5-
      2,line:dccprottp=0X1,dccstat=DISABLE,lapdmode=UITS,osinode=osinode1”
;
```

ENT-FECOM-LAN: Enter LAN related parameters

The **ENT-FECOM-LAN** command allows manually enable or disable IP or OSI on this LAN and set related parameters. It can also be used to modify parameters when IP or OSI is enabled.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S4

Abortable: No.

Input format

Command syntax: **ENT-FECOM_LAN**:*tid*:*aid*:*ctag*:::[*spec_block*];

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   This parameter indicates the LAN port AID.
   Type: AID.
   Range: LanPort AID with one exception: the keyword **lanall** is not allowed.
3. **ctag** – Correlation Tag
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for input parameter syntax and description of this parameter.

Spec block parameters

If a LAN interface is being changed, all parameters not set explicitly in the command line will remain the actual values, except the parameter osinode, which is changed to the default value if the parameter is omitted.

1. **ip_ad** – IP Address
   This parameter indicates the assigned IP address for the LAN interface.
   The IP-address includes both, a router address and a HOST address. The HOST address that will will be used for FTP depends on the LAN interface where the related TCP connection request originates.
   Note: Setting of ip_ad comes only into effect when ip_lanstat is ENABLE and

must be consistent with ip_snm (see also validation rules).
Type: 32-bit IPv4 address: Four dot separated numeric strings.
Range: For first numeric string: 0 .. 223 For second to fourth numeric string: 0 .. 255.
The values 0.0.0.0 and 1.1.1.1 are not allowed.

2. **ip_lanstat** – IP-LAN Status
This parameter indicates whether IP communication over the external LAN channel is enabled or disabled. Note: Enabling has no effect if *lanstat* is disabled for that interface.
Type: Alphanumeric value set.
Range: ENABLE or DISABLE for LAN1, LAN2, LAN3
Default: DISABLE for LAN1, LAN2, LAN3.

3. **ip_snm** – IP Mask
Note: Setting of *ip_snm* comes only into effect when *ip_lanstat* is ENABLE and must be consistent with *ip_ad* (see also validation rules).
This parameter indicates the assigned IP subnet mask (32-bit IPv4) for the LAN interface. The full IP-address is needed as host-address. Each LAN needs its own IP-address and IP-mask, indicating that all IP-addresses that match the prefix (Unmasked part) are grouped as the subnet-ID for this LAN-subnet.
If the LAN interface is used for UNI, then the parameter ip_snm is used to define a subnet for multiple UNI-Cs which belong to the same customer.
Type: 32-bit IPv4 address: Four dot separated numeric strings or empty string. The empty string value is used as indication for an invalid/undefined IP subnet mask.
Range: For each numeric string: 0 .. 255.
Default: For LAN1, LAN2 and LAN3: empty string.

4. **isis_stat** – (I) IS-IS Status
This parameter indicates whether (integrated) IS-IS is enabled or disabled on the LAN port specified by the input *aid*.
Note: Enabling has no effect if lanstat is disabled for that interface.
Type: Alphanumeric value set.
Range: ENABLE (default), DISABLE.

5. **lanrpri** – LAN Designated Router Priority
This parameter sets the relative priority for the node in the election for designed router on this LAN. There is a separate election for each separate LAN to which the node is connected. A higher value indicates a higher probability to be selected as designated router. A designated router is selected per area (between the nodes on that LAN with the same area address) and for the Level-2 nodes on the LAN.
Note: When *osinode* = scnnode modification of this parameter has no effect.
Note: When *osinode* = uninode this parameter has no effect
Note: When *osinode* = enninode this parameter has no effect.
Type: numeric string.
Range: 1 – 127.
Default: 64.

6. **`lanstat`** – LAN Status
   This parameter indicates whether physical communication over the external channel is enabled or disabled.
   Note: Disabling of an interface also affects usage of protocols over this interface, see *lan_stat* and *osi_stat*.
   Type: Alphanumeric value set.
   Range: ENABLE for lan1; ENABLE, DISABLE for lan2, lan3:
   Default: ENABLE for lan1 and lan2; DISABLE for lan3.
7. **`lantlss`** – LAN TARP Storm Suppression
   This parameter indicates the enhanced TARP propagation rules that suppress TARP LAN storms.
   Note: When *osinode* = uninode this parameter has no effect.
   Note: When *osinode* = enninode this parameter has no effect.
   Type: Alphanumeric value set.

   Range:

   - ENABLE (default)
   - DISABLE.
8. **`osinode`**
   The parameter *osinode* is always considered in the command. This means, that the parameter will be changed to the default value if it is not specified.
   Assignment of LAN port to an OSI-node, the SCN node, the UNI node, or the E-NNI node in the NE. A UNITE NE can have up to 8 instances of the OSI stack, has one SCN node, one UNI node, and one E-NNI node.
   Node-1 is the default and has a NSAP. Nodes 2-8 have a NET and no SEL (NSAP = NET + SEL, for NET: SEL=00).
   Node 1 is always present. The SCN node is created when the ASTN IP address is configured, the UNI node is created when the UNI IP address is configured, the SC node (ENNI node) is created when the SC IP address and the SC ID is configured. Node 2-8 can be created and configured, see command **`ENT-ULSDCC-L3`**.
   Type: AID.
   Range: For LAN1: osinode1 (fixed value).
   For LAN2 and LAN3: osinode{1-8} | scnnode | uninode | enninode.
   Note: If this parameter is set to scnnode or uninode or enninode, then *lanstat* and ip_lanstat must be ENABLED.
9. **`osi_lanstat`** – OSI LAN Status
   This parameter indicates whether OSI communication over the external channel is enabled or disabled.
   Type: Alphanumeric value set.
   Range: ENABLE for LAN1, LAN2, LAN3

Output format

If the ENT-FECOM-LAN is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The command set the condition of a LAN interface respectively or modify concerning parameters. Result should be an update of the parameters for the specified LAN interface as set in the spec_block of the command line.

The update is reported by means of ENT-FECOM-LAN notification.

Modification of the parameters *ip_ad*, *ip_snm*, *lantlss*, *isis_stat* leads to a reset of the DCF controller.

Setting lanstat to disabled shall implicitely set the following parameters to disabled:

- *osi_lanstat*
- *ip_lanstat*.

as changing *isis_stat* results in a reboot of the DCF there is no implicit change of this attribute.

After a LAN port has been assigned to the UNI node (*osinode* = uninode), the manual route entries for the LAN port is empty.

Example input/output

The following example shows the result of **ENT-FECOM-LAN**:

```
ENT-FECOM-LAN:NE-UNITE:1-1-lan2:123456:::ip_lanstat=enable,ip_ad=135.248.206.64,ip_
      snm=255.255.0.0,lanstat=enable,osinode=osinode8;
   NE-UNITE 00-12-23 11:59:00
M  123456 COMPLD
;
```

The following example shows the result of **ENT-FECOM-LAN**:

```
ENT-FECOM-LAN:NE-UNITE:1-1-lan2:123456:::ip_lanstat=enable,ip_ad=135.248.206.64,ip_
      snm=255.255.0.0,lanstat=enable,osinode=enninode;
   NE-UNITE 00-12-23 11:59:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **ENT-FECOM-LAN** command.

Validation rule: parameter *osinode*

The command is rejected when a OSI node is not in a created state. This means a value for parameter osinode is used in the command, which is different from osinode1 or scnnode and was not used for creation of a node via ENT-ULSDCC-L3 before.

Error code: `ENEQ – Equipage, Not EQuipped, osinode`

Validation rule: Can’t disable LAN1

If it is tried to set *lanstat*, or *osi_lanstat* to DISABLE for LAN1, the command will be rejected.

Error code: `SNVS – Status, Not in Valid State, LAN1 can not be disabled`

Validation rule: Can’t enable *lanstat* when *ip_lanstat* and *osi_lanstat* are DISABLED

If it is tried to set *lanstat* = ENABLE for a specific LAN, while both *osi_lanstat* and *ip_lanstat* are set to DISABLE for the same LAN, the command will be rejected.

Error code: `IDNC – Input, Data, Not Consistent`

Validation rule: Can’t enable *ip_lanstat* and/or *osi_lanstat* when lanstat is disabled

If it is tried to set osi_lanstat=ENABLE and/or ip_lanstat=ENABLE without setting lanstat=ENABLE and *lanstat* is currently disabled, then the command will be rejected.

Error code: `IDNC – Input, Data, Not Consistent`

Validation rule: Check IP configuration

If it is tried to set *ip_lanstat* to ENABLE for a LAN (LAN1, LAN2, LAN3) without a valid IP address *ip_ad* and subnetwork mask *ip_snm*, the command is denied. Valid means:

- any 32 bit IPv4 address in the range of 0.0.0.0 to 255.255.255.255.

Error code: `SNVS – Status, Not in Valid State, invalid IP configuration`

The validation rule does not cover the configuration rules for IP networks. These rules may be different for each network. In many networks the following rules are applicable:

- ip_ad must not be a multicast group address or reserved special case address, i.e. in the range of 0.0.0.0 to 223.255.255.255.
- ip_snm is in a format of one or more ’1’ bits, followed by zero or more ’0’ bits (i.e. all ’1’ are near the most significant bit, all ’0’ are near the least significant bit).

Additionally the following constraints between ip_ad and ip_snm must be true:

- (ip_ad AND ip_snm) is not equal to 0. This means that the Subnet ID is not 0.
- ((ip_ad AND ip_snm) OR NOT ip_snm) is not equal to 255.255.255.255. This means that the Subnet ID shall not consist of all 1s.
- (ip_ad AND NOT ip_snm) is not equal to 0. This means that the Host ID is not 0.
- ((ip_ad AND NOT ip_snm) OR IP_mask) is not equal to 255.255.255.255. This means that the Host ID shall not consist of all 1s.
- (ip_ad AND 255.0.0.0) is not equal to 127.0.0.0. This means that the IP address is not the (reserved) loopback address.

The AND, OR, NOT operations above are meant as bitwise logical operations on all 32 bits of *ip_ad*, *ip_snm*.

Validation rule: only *osinode1*, *scnnode, uninode* and *enninode* supports IP

If it is tried to set *ip_lanstat* to ENABLE while the LAN port is assigned to OSI node 2…8, the command is rejected.

Error code:
`SNVS – Status, Not in Valid State, Assigned Node not allowed for IP`

Validation rule: Assignmet of OsiNode without IP support

If it is tried to (re-)assign a LAN port to OsiNode2 til OsiNode8, then *ip_lanstat* must be set to disabled.

Error code:
`SNVS – Status, Not in Valid State, Assigned Node not allowed for IP`

Validation rule: only osinode1 for LAN 1

If it is tried to assign another osinode as osinode1 for LAN1, the command is rejected.

Error code:
`IDNV – Input Data Not Valid, osinode cannot be changed for LAN1`

Validation rule: all or no traffic for SCN node

For the SCN node it is only allowed to have all – lanstat, ip_lanstat, osi_lanstat and isis_stat – either enabled or disabled. Any attempt to set (any combination of) lanstat, ip_lanstat, osi_lanstat or isis_stat that would result in a violation of this rule is rejected with.

Error code: `IDNC – Input, Data Not Consistent`

Validation rule: can't enable *isis_lanstat* without enabling *osi_lanstat*

If it is tried to set isis_lanstat to enabled without also enabling osi_lanstat while osi_lanstat is disabled , the command is rejected with.

Error code: `IDNC – Input, Data Not Consistent`

Validation rule: check of the maintenance condition

The system must be in maintenance condition (MCOND=YES) for change of:

- *ip_ad*
- *ip_snm*
- *ip_lanstat*
- *osinode*
- *isis_stat*
- *osi_lanstat*
- *lanstat*
- *lantlss*
- *lanrpri*

Note: *lanpri* is independent of the maintenance condition.

Error code:

`SNVS – Status, Not in Valid State, Not in Maintenance Condition`

Validation rule: IP disabling while T-TD or FTTD is enabled

If it is tried to set *ip_lanstat* to DISABLE on all LAN ports while either *tl1tcpipgw* or *ftamftpgw* is set to ENABLE, the command is rejected.

Error code:

```
SNVS – Status, Not in Valid State, cannot disable IP on all LAN ports
while T-TD or FTTD is enabled
```

Validation rule: Can't assign LAN to *scnnode* when no ASTN IP address is provisioned

Setting *osinode* = scnnode is only allowed when a valid ASTN IP address is provisioned (see ip_ad_astn in ENT/RTRV-ULS).

Error code:

`SNVS – Status, Not in Valid State, no SCN IP address provisioned`

The necessary pre-condition that the SwiSS application is enabled is checked.

Validation rule: Can't assign LAN to *uninode* or *enninode* when no ASTN IP address is provisioned

Setting *uninode* = ENABLED or setting *enninode* = ENABLED is only allowed when a valid ASTN IP address is provisioned (see *ip_ad_astn* in ENT/RTRV-ULS).

Error code:

`SNVS – Status, Not in Valid State, no SCN IP address provisioned`

The necessary pre-condition that the SwiSS application is enabled is checked.

Validation rule: Can’t assign LAN to SCN Node when T-TD or FTTD is enabled and no other LAN port with IP configuration is available

Setting *osinode* = scnnode for LAN2 or LAN3 while T-TD or FTTD is enabled is not allowed if there is no other LAN port with valid IP configuration which is assigned to *osinode1*.

Error code:
`SNVS – Status, Not in Valid State, no other LAN port with IP enabled for T-TD or FTTD available`

Validation rule: Can’t assign same IP address to several LANs

Setting the IP address of a LAN is rejected if this IP address is already assigned to another LAN of the NE.

Error code: `IDNC – Input, Data, Not Consistent`

Validation rule: IP address already used for an active ES64U pack

Setting the IP address of a LAN port is rejected if this IP address is already assigned to an active ES64U pack in the system. An ES64U pack shall be considered as active if its switch capacity is >0.

Error code: `IDNV – Input, Data Not Valid, IP Address already used`

Validation rule: Check for IP default router LAN

Assigning a LAN to SCN node is rejected if this LAN is used as IP default router LAN.

Error code: `SNVS – Status, Not in Valid State, wrong IP configuration`

Validation rule: IP disabling while used as IP Default Router LAN

Setting *ip_lanstat* to DISABLE is rejected if this LAN is used as IP default router LAN (see RTRV-ULS).

Error code:
`SNVS – Status, Not in Valid State, LAN is in use for Default Router`

Validation rule: IP disabling while manual MCN routes exist

If it is tried to set *ip_lanstat* to DISABLE while there are still manual MCN routes provisioned for the LAN port, the the command is denied.

Error code:
`SNVS – Status, Not in Valid State, Manual MCN routes still exist`

Validation rule: Assignment to SCN/UNI/ENNI Node while manual MCN routes exist

If it is tried to assign the LAN port to the SCN Node or the UNI Node or the ENNI Node while there are still manual MCN routes provisioned for the LAN port, then the command is denied.

Error code:
`SNVS – Status, Not in Valid State, Manual MCN routes still exist`

Validation rule: *isis_stat* must be DISABLE for uninode and ennimode

When parameter *osinode* has the value *uninode* or *ennimode*, parameter *isis_stat* must have the fixed value DISABLE.

Error code: `SNVS – Status, Not in Valid State`

Validation rule: *lanstat* must be ENABLE for uninode and ennimode

When parameter *osinode* has the value *uninode* or *ennimode*, parameter *lanstat* must have the fixed value ENABLE.

Error code: `SNVS – Status, Not in Valid State`

Validation rule: *ip_lanstat* must be ENABLE for uninode and ennimode

When parameter *osinode* has the value *uninode* or *ennimode*, parameter *ip_lanstat* must have the fixed value ENABLE.

Error code: `SNVS – Status, Not in Valid State`

Validation rule: *osi_lanstat* must be ENABLE for uninode

When parameter *osinode* has the value *uninode*, parameter *osi_lanstat* must have the fixed value ENABLE.

Error code: `SNVS – Status, Not in Valid State`

Validation rule: *osi_lanstat* must be ENABLE for enninode

When parameter *osinode* has the value *enninode*, parameter *osi_lanstat* must have the fixed value ENABLE.

Error code: `SNVS – Status, Not in Valid State`

Validation rule: Can’t assign LAN to uninode when no ASTN and UNI IP address is provisioned

Setting *osinode* = uninode is only allowed when valid ASTN and UNI IP addresses are provisioned (see *ip_ad_astn* and *ip_ad_uni* in ENT/RTRV-ULS) and the SwiSS application is enabled (*xcsetup* = NN in ED/RTRV-EQPT).

Error code:
`SNVS – Status, Not in Valid State, no SCN IP address provisioned`

Validation rule: Can’t assign LAN to enninode when no ASTN and E-NNI IP address is provisioned

Setting *osinode* = enninode is only allowed when valid ASTN and E-NNI IP addresses are provisioned (see *ip_ad_astn* and *sigPCIP_Address* in ENT/RTRV-ULS) and the SwiSS application is enabled (*xcsetup* = NN in ED/RTRV-EQPT).

Error code:

`SNVS – Status, Not in Valid State, no SCN/ENNI IP address provisioned`

Validation rule: Can’t assign LAN to UNI Node or E-NNI Node when T-TD or FTTD is enabled and no other LAN port with IP configuration is available

Setting *osinode* to uninode or enninode for LAN2 or LAN3 while T-TD or FTTD is enabled is not allowed if there is no other LAN port with valid IP configuration which is assigned to osinode1.

Error code:

`SNVS – Status, Not in Valid State, no other LAN port with IP enabled for T-TD or FTTD available`

Validation rule: Can’t de-assign LAN from a node if manual routes exist

Setting *osinode* away from a node, although the node has manual routes via the LAN is rejected.

Error code: `SNVS – Status, Not in Valid State, Manual routes exist`

Related TL1 messages

- “RTRV-FECOM-LAN: Retrieve LAN channel related parameters” (p. 3-2413)

ENT-FECOM-LAN notification

Output format

The ENT-FECOM-LAN notification uses the general format of a **REPT DBCHG** (Report Database Change) notification.

Syntax: The ENT-FECOM-LAN notification has the following specific syntax:

ENT-FECOM-LAN:*aid*::*spec_block*

Output parameters

Command parameters

1. **aid** – Access Identifier
   This parameter indicates the LAN port AID.
   Type: AID.
   Range: LanPort AID with one exception: the keyword **lanall** is not allowed.

Spec block parameters

1. **ip_ad** – IP Address
   This parameter indicates the assigned IP address for the LAN interface.
   The IP-address includes both, a router address and a HOST address. The HOST address that will will be used for FTP depends on the LAN interface where the related TCP connection request originates.
   Note: Setting of ip_ad comes only into effect when ip_lanstat is ENABLE and must be consistent with ip_snm (see also validation rules).
   Type: 32-bit IPv4 address: Four dot separated numeric strings.
   Range: For first numeric string: 0 .. 223 For second to fourth numeric string: 0 .. 255.
   The values 0.0.0.0 and 1.1.1.1 are not allowed.
2. **ip_lanstat** – IP-LAN Status
   This parameter indicates whether IP communication over the external LAN channel is enabled or disabled. Note: Enabling has no effect if *lanstat* is disabled for that interface.
   Type: Alphanumeric value set.
   Range: ENABLE or DISABLE for LAN1, LAN2, LAN3
   Default: DISABLE for LAN1, LAN2, LAN3.
3. **ip_snm** – IP Mask
   This parameter indicates the assigned IP subnet mask (32-bit IPv4) for the LAN interface. The full IP-address is needed as host-address. Each LAN needs its own IP-address and IP-mask, indicating that all IP-addresses that match the prefix (Unmasked part) are grouped as the subnet-ID for this LAN-subnet.
   If the LAN interface is used for UNI, then the parameter *ip_snm* is used to define a

subnet for multiple UNI-Cs which belong to the same customer.
Type: 32-bit IPv4 address: Four dot separated numeric strings or empty string or empty string
Range: For each numeric string: 0 .. 255.
Default: For LAN1, LAN2 and LAN3: empty string.

4. **`isis_stat`** – (I) IS-IS Status
   This parameter indicates whether (integrated) IS-IS is enabled or disabled on the LAN port specified by the input *aid*.
   Type: Alphanumeric value set.
   Range: ENABLE (default), DISABLE.

5. **`lanrpri`** – LAN Designated Router Priority
   This parameter sets the relative priority for the node in the election for designed router on this LAN. There is a separate election for each separate LAN to which the node is connected. A higher value indicates a higher probability to be selected as designated router. A designated router is selected per area (between the nodes on that LAN with the same area address) and for the Level-2 nodes on the LAN.
   Note: When *osinode* = scnnode modification of this parameter has no effect.
   Note: When *osinode* = uninode this parameter has no effect.
   Note: When *osinode* = enninode this parameter has no effect.
   Type: numeric string.
   Range: 1 – 127.
   Default: 64.

6. **`lanstat`** – LAN Status
   This parameter indicates whether physical communication over the external channel is enabled or disabled.
   Type: Alphanumeric value set.
   Range: ENABLE for lan1; ENABLE, DISABLE for lan2, lan3:
   Default: ENABLE for lan1 and lan2; DISABLE for lan3.

7. **`osinode`**
   Assignment of LAN port to an OSI-node, the SCN node, the UNI node, or the E-NNI node in the NE. A UNITE NE can have up to 8 instances of the OSI stack, has one SCN node, one UNI node, and one E-NNI node.
   Node-1 is the default and has a NSAP. Nodes 2-8 have a NET and no SEL (NSAP = NET + SEL, for NET: SEL=00).
   Node 1 is always present. The SCN node is created when the ASTN IP address is configured, the UNI node is created when the UNI IP address is configured, the SC node (ENNI node) is created when the SC IP address and the SC ID is configured. Node 2-8 can be created and configured, see command **`ENT-ULSDCC-L3`**.

Type: AID.
Range: For LAN1: osinode1 (fixed value).
For LAN2 and LAN3: osinode{1-8} | scnnode | uninode | enninode.
Note: If this parameter is set to *scnnode* or *uninode* or *enninode*, then *lanstat* and *ip_lanstat* must be ENABLED.

8. **`osi_lanstat`** – OSI LAN Status
   This parameter indicates whether OSI communication over the external channel is enabled or disabled.
   Type: Alphanumeric value set.
   Range: ENABLE for LAN1, LAN2, LAN3

Example output

```
   NE-UNITE 00-11-03 01:59:00
A  000 REPT DBCHG
   ”TIME=02-00-59,DATE=00-12-23:ENT-FECOM-LAN:1-1-lan2::ip_lanstat=ENABLE,ip_
      ad=135.248.206.64,ip_
      snm=255.255.0.0,lanstat=ENABLE,lanrpri=64,lantlss=ENABLE,osinode=osinode5”
;
```

ENT-IP-MAP: Enter TCP/IP map

The **ENT-IP-MAP** command can be used to create entries in the IP map.

The **ENT-IP-MAP** command allows to enter a manager IP address and its application context ID to provide T-TD access to the NE via one of the LANs assigned to node 1. To map multiple managers the command has to be executed for each manager. The *tl1tcpipgw* parameter in the **ED-NE** command enables or disables the mapping feature.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S3

Priority: 1

Abortable: No.

Input format

Command syntax: **ENT-IP-MAP**:*tid::ctag:::spec_block;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for input parameter syntax and description of this parameter.

Spec block parameters

1. **ip** – IP Address
   This parameter is used to set or retrieve the IP address(es) of the manager(s) of the NE.
   Type: IPv4 address: four dot separated numeric strings.
   Values: IPv4 address: Each numeric string: 0 .. 255. Number of entries: Mmaximum of 20 entries allowed.
   Default: null.
2. **acid** – Application Context ID
   This parameter is used to set or retrieve the application context ID to be assigned to a particular manager IP address.
   Type: Alphanumeric string of length 0 .. 23.
   Range: TL1MAINTENANCE, TL1MEMORYADMINISTRATION, TL1TEST, TL1OTHER1, TL1PEERCOMM.
   Default: TL1PEERCOMM.
   Although acid is a mandatory parameter it will not be evaluated in the NE. The parameter is present for backward compatibility.

Output format

If the ENT-IP-MAP request is successful, the following normal completion message is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The command shall set the parameters as specified for the input spec_block parameters.

Example input/output

The following example shows the result of an ENT-IP-MAP command:

```
ENT-IP-MAP:LT-UNITE::123456:::acid=TL1MEMORYADMINISTRATION,
ip=198.78.46.8;

   LT-UNITE 00-11-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **ENT-IP-MAP** command.

Validation rule: Check for correct IP configuration

The adding of an entry to the IP map is only allowed if there is already a valid IP configuration (ip_ad – IP address of LAN, ip_snm – subnet mask of LAN) provisioned for at least one LAN port.

Error code: `SNVS – Status, Not in Valid State, incomplete IP configuration`

Validation rule: Check for duplicate entries

The adding of an entry to the IP map is not allowed, if the IP address is already contained in one of the existing entries.

Error code: `IDNV – Input, Data Not Valid, duplicate IP Map entry`

Validation rule: Check if limit of 20 IP MAP entries exceeded

The adding of an entry to the IP map is not allowed, if the IP map contains already 20 entries.

Error code:
`SSRE – Status, System Resources Exceeded, limit of IP-MAP entries exceeded`

Related TL1 messages

ENT-IP-MAP notification

Output format

The **ENT-IP-MAP** command shall not generate a REPT DBCHG notification. This is due to a potential security hazard: any listening manager who receives this notification could otherwise fake its own IP address to get access to the T-TD.

ENT-LONIM notification

Output format

Command syntax:

ENT-LONIM-*modifier*:*aid*::*spec_block*,

Output parameters

Command parameters

1. **modifier**
   The modifier specifies the type of the low-order tributary. The purpose is to distinguish between: – SDH/SONET tributaries.
   Type: Alphanumeric value set.
   Range:
   - LOVC
   - LOVT
   - DS1
2. **aid** – Access Identifier
   The access identifier specifies a low-order tributary to be operated on.
   Type: AID
   Range:
   - GenLOTribAID
   - DS1NumAID

   The following values are not used:
   - *all*, *usall* in Simple_UnivSlotAID,
   - *all* in Simple_SPortAID, Simple_TMuxAPortAID, Simple_TMuxSPortAID
   - *all* in Simple_PTNumAID, Simple_TMuxAPTNumAID, Simple_TMuxSPTNumAID
   - *all* in Simple_LONumAID, Simple_DS1NumAID, Simple_TMuxSLONumAID

   No wildcards are allowed.

Spec Block Parameters

1. **crslpbkstat** – Cross-connect Loopback Status
   This parameter shall report the configuration of the cross-connection loopback of this tributary. For changing the loopback operation refer to "OPR-LPBK: Operate cross-connection loopback" (p. 3-2035).
   The parameter is not supported for the following modifiers:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.

Range:

- YES: for enabled loopback
- NO: for disabled loopback.

Default: NO.

2. **degthr** – Signal Degrade Threshold
This parameter specifies the exponent to base 10 for building the degraded threshold level. Note that only the POISSON mode is supported by HW for low-order tributaries. Therefore this parameter will be always valid (i.e. in contrast to RTRV-VCGTRIB, RTRV-VC3, RTRV-STS1).
The parameter is not supported for the following modifiers:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
Type: Integer.
Range: –5, –6, –7, –8, –9; that means, the range is 10^{-9} to 10_{-5}.
Default: –6.
3. **dexcthr** – Excessive Degrade Threshold
This parameter specifies the exponent to base 10 for building the excessive threshold level. Note that only the POISSON mode is supported by HW for low-order tributaries. Therefore this parameter will be always valid (in contrast to **RTRV-VCGTRIB**, **RTRV-VC3**, **RTRV-STS1**).
This parameter is not supported for the following modifiers:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
Type: Integer.
Range (as exponents of 10): –3; –4; –5, that means, the range is 10^{-5} to 10^{-3}.
Default: –3.
4. **explptrc** – Expected LO Path Trace Identifier
This parameter specifies the Expected Low Order Path Trace Identifier (J1 or J2). The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is only useful if *ptrcrfmt* is set to 16.
This parameter is not supported for the following modifiers:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
Type: Hexadecimal number without a preceding “H”.
Range: length: 32 hexadecimal; digits: value specific string acc. ITU/ETSI mode 1
Default: 89000000000000000000000000000000
5. **feppm** – Far End Path PM Enable
This parameter specifies whether the performance monitoring for the far end is enabled or disabled for this tributary.

This parameter is not supported for the following modifiers:

- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Alphanumeric value set
Range: DISABLE (default), ENABLE.

6. **`fmt`** – Digital Signal Format for DS1
   This parameter is used to specify the digital signal format expected to be received from the DS1 at the specified port(s). The TransMUX circuit pack supports DS1 path PM; it does not support DS1 line PM.
   The parameter is only supported for modifier:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range:
   - SF: Super Frame, supports near-end DS1 path and line PM only.
   - ESF: Extended Super Frame, supports near-end and far-end DS1 path and line PM.

   Default: ESF.
7. **`lonimpn`** – LO NIM ASAP Profile Name
   This parameter points to a tributary ASAP profile name *pfname* for the designated AID.
   The ASAP type depends on the *modifier*:
   - for LOVC/LOVT modifier, an ASAP of type PATH is required
   - for DS1 modifier, an ASAP of type DS1 is required

   Type: Alphanumeric string. A hyphen (“ – -”) is allowed in the name additionally.
   Range: 1 to 24 characters
   Default: DEFAULT.
8. **`lptimmon`** – LO Path Trace Identifier Mismatch Monitor
   This parameter specifies if the mode of the TIM detection. This parameter is relevant only if the related trace read format ptrcrfmt is set to 16 (16-byte specific-string mode).
   This parameter is not supported for the following modifiers:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range: DISABLE, ENABLE.
   Default: DISABLE.
9. **`neppm`** – Near End Path PM Enable
   This parameter specifies whether the performance monitoring for the near end is enabled or disabled for this tributary.

This parameter is not supported for the following modifiers:

- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range: DISABLE, ENABLE.
Default: DISABLE.

10. **`outpm`** – Outgoing Near End Path PM Enable
The parameter *outpm* specifies whether the performance monitoring for the near end in outgoing direction is enabled or disabled for this tributary.

The parameter is only supported for modifier:

- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range: DISABLE, ENABLE
Default: DISABLE.

11. **`pmlpfeses`** – PM LO Path Far End SES Threshold
This parameter specifies the Low Order Path Far End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the far end.
The behavior depends on *modifier* and the transmission rate of this low-order tributary. For modifiers which include more than one transmission rate, the transmission rate can be derived from the parameter *inputsig* of the related PTF entity.

The parameter is not supported for modifier:

- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Integer.
Range:

The range depends on the tributary type in input direction, which can be derived from *inputsig* of the related PTF:

- 1, 2, 3, …, 7998, 7999, 8000 (if the entity represents a LO-VC3 tributary)
- 1, 2, 3, …, 1998, 1999, 2000 (if the entity represents a VC12 tributary)
- 1, 2, 3, …, 3998, 3999, 4000 (if the entity represents a VT1.5 tributary)

Default: The default value depends on the tributary type in input direction, which can be derived from *inputsig* of the related PTF: 2400 (if the entity represents a LO-VC3 tributary); 600 (if the entity represents a VC12 or VT1.5 tributary).

12. **`pmlpfeses`** – PM LO Path Far End SES Threshold
    This parameter specifies the Low Order Path Far End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the far end.
    The behavior depends on *modifier* and the transmission rate of this low-order tributary. For modifiers which include more than one transmission rate, the transmission rate can be derived from the parameter *inputsig* of the related PTF entity.

    The parameter is not supported for modifier:

    - DS1

    Option: If the parameter is not supported, then the parameter is omitted.
    Type: Integer.
    Range:

    The range depends on the tributary type in input direction, which can be derived from *inputsig* of the related PTF:

    - 1, 2, 3, …, 7998, 7999, 8000 (if the entity represents a LO-VC3 tributary)
    - 1, 2, 3, …, 1998, 1999, 2000 (if the entity represents a VC12 tributary)
    - 1, 2, 3, …, 3998, 3999, 4000 (if the entity represents a VT1.5 tributary)
    - 1, 2, 3, …, 7998, 7999, 8000 (if the entity represents a DS1 tributary)

    Default: The default value depends on the tributary type in input direction, which can be derived from *inputsig* of the related PTF: 2400 (if the entity represents a LO-VC3 tributary); 600 (if the entity represents a VC12 or VT1.5 tributary), 1544 (if the entity represents a DS1 tributary).
13. **`ptca`** – Path TCA Profile Pointer
    The parameter *ptca* specifies the name of the threshold crossing alert (TCA) profile used for this tributary.

    The TCA Profile type depends on the modifier.

    - for LOVC *modifier*, a TCA Profile of type LOVC is required
    - for LOVT *modifier*, a TCA Profile of type LOPATH is required
    - for DS1 *modifier*, a TCA Profile of type DS1 is required

    Type: Alphanumeric string.
    Range: 1 … 24 characters.
    Default: DEFAULT0.
14. **`ptrcrfmt`** – Path Trace Read Format
    This parameter specifies the format of the path trace (J1 or J2 byte) to be received (sink).

    The parameter is not supported for modifier:

    - DS1

    Option: If the parameter is not supported, then the parameter is omitted.
    Type: Numeric string.

Range:

- 2 (default), for non-specific repeating byte
- 16, for 16-byte specific string
- 64, for 64-byte string (only applicable if the entity represents a LO-VC3 tributary).

To check whether the entity represents a LO-VC3 tributary or not, the parameter *inputsig* of the related PTF entity must be checked.

15. **tcamd** – TCA mode

    This parameter is only available for SDH mode and will therefore only be reported if the output parameter *aidtype* is LOVC. The parameter shows the modus of the PM thresholding.

    Two thresholding methods are applicable for SDH:

    - TR-only. (also known as the implicit reset method)
    - TR-RTR. (also known as the explicit reset method).

    For SONET the parameter *tcamd* is not supported. SONET ports only support "TR-only" mode. Thus the mode must be internally set to ″"TR-only".

    The parameter is not supported for the following modifiers:

    - DS1
    - LOVT

    Option: If the parameter is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range: TR, TRRTR

    Default:

    - SDH mode: TRRTR
    - SONET mode: TR (internal).

    For SONET the parameter *tcamd* is not supported. SONET ports only support "TR-only" mode. Thus the mode must be internally set to ″"TR-only".

16. **tmonmd** – Tributary Monitoring Mode

    This parameter specifies the monitoring mode for the tributary.
    Type: Alphanumeric value set.
    Range: MON, NMON.
    Default: NMON.

Example output

Example of an **ENT-LONIM** notification when creating a SDH substructure:

```
   LT-UNITE 00-11-11 11:11:00
A  001 REPT DBCHG
   ″TIME=11-10-30,DATE=00-11-11:ENT-LONIM-LOVC:\
    1-1-#-#-39-16-1-1&&-63::\
    crslbkstat=NO,degthr=-6,dexcthr=-3,\
    explptrc=89000000000000000000000000000000,feppm=DISABLE,\
    lptimmon=DISABLE,lonimpn=DEFAULT,neppm=DISABLE,pmlpfeses=600,\
```

```
    pmlpneses=600,ptca=DEFAULT0,ptrcrfmt=1,tcamd=TRRTR,tmonmd=NMON"
;
```

Example of an **ENT-LONIM** notification when creating a SONET substructure:

```
   LT-UNITE 00-11-11 11:11:00
A  001 REPT DBCHG
   "TIME=11-10-30,DATE=00-11-11:ENT-LONIM-LOVT:1-1-#-#-39-16-3-1&&-28::\
    crslbkstat=NO,degthr=-6,dexcthr=-3,\
    explptrc=890000000000000000000000000000000,feppm=DISABLE,\
    lptimmon=DISABLE,lonimpn=DEFAULT,neppm=DISABLE,pmlpfeses=600,\
    pmlpneses=600,ptca=DEFAULT0,ptrcrfmt=1,tmonmd=NMON"
;
```

Example of an **ENT-LONIM** notification for creation of DS1 tributaries at a TransMUX port:

```
   UNITE-NE 08-03-01 11:11:00
A  001 REPT DBCHG
   "TIME=11-10-50,DATE=08-03-01:ENT-LONIM-DS1:\
    1-1-#-#-15-tma1-1-d1&&-d28::fmt=SF,lonimpn=DEFAULT,\
    outpm=ENABLE,pmlpneses=1544,ptca=DEFAULT0,tmonmd=NMON"
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **RTRV-LONIM** command, too.

Validation rule: Check LONIM::modifier against PTF::istd

If the command is applied with a modifier which does not match to the interface standard parameter istd of the owning PTF entity then the command is denied.

Error code: `IENE – Input, Entity Not Exists`

Following combinations are allowed: *modifier istd*:

LOVC, SDH LOVT, SONET ALL, SDH or SONET.

Validation rule: Check *aid* and *dyn* consistency

If the command is applied with an aid parameter containing wildcards (all at any position) and the dyn parameter is set to YES then the command is denied.

Error code: `IDRG – Input, Data Range Error`

Example: Given the aid refers to 1-1-#-#-39-16-1-all and the dyn parameter is set to YES then the command will be rejected.

ENT-LOPTF notification

Output format

Syntax: **ENT-LOPTF**:-*modifier*:*aid*::*spec_block*

Output parameters

Command parameters

1. **modifier**
   The modifier specifies the type of the low-order tributary.
   Type: Alphanumeric value set.
   Range: TMSVT.
2. **aid** – Access Identifier
   The access identifier specifies the low-order tributary whose attributes are reported.
   Type: AID
   Range: TMuxSLONumAID.

   The following values are not used:

   - **all**, **usall** for Simple_UnivSlotAID
   - **all** for Simple_UnivSlotAID
   - **all** for Simple_TMuxSPTNumAID
   - **all** for Simple_TMuxSLONumAID

   No wildcards are allowed.
   Default: None.

Spec block parameters

1. **degthr** – Signal Degrade Threshold
   This parameter specifies the exponent to base 10 for building the degraded threshold level. Note that only the POISSON mode is supported by HW for low-order tributaries. Therefore this parameter will be always valid (in contrast to **RTRV-VCGTRIB**, **RTRV-VC3**, **RTRV-STS1**).

   This parameter is not supported for the following modifiers:

   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Integer.
   Range (as exponents of 10): –5; –6; –7; –8; –9, that means, the range is 10^{-9} to 10^{-5}.
   Default: –6.
2. **dexcthr** – Excessive Degrade Threshold
   This parameter specifies the exponent to base 10 for building the excessive threshold level. Note that only the POISSON mode is supported by HW for low-order tributaries. Therefore this parameter will be always valid (in contrast to **RTRV-VCGTRIB**, **RTRV-VC3**, **RTRV-STS1**).

This parameter is not supported for the following modifiers:

- DS1

Option: If the parameter is not supported, then the parameter is omitted.
Type: Integer.
Range (as exponents of 10): –3; –4; –5, that means, the range is 10^{-5} to 10^{-3}.
Default: –3.

3. **`explptrc`** – Expected LO Path Trace Identifier
This parameter specifies the Expected Low Order Path Trace Identifier (J1 or J2). The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is only useful if *ptrcrfmt* is set to 16.

   This parameter is not supported for the following modifiers:

   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Hexadecimal number without a preceding "H".
   Range: length: 32 hexadecimal digits; value: specific string acc. ITU/ETSI mode 1.
   Default: 89000000000000000000000000000000

4. **`lopn`** – LO ASA Profile Name
This parameter points to a tributary ASAP profile name *pfname* for the designated AID. For *modifier* = TMSVT, an ASAP profile of type *PATHTERM* is required.
Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
Range: 1 to 24 characters.
Default: DEFAULT.

5. **`lptimais`** – LO Trace Identifier Mismatch AIS Insertion
This parameter specifies whether a detected TIM will cause AIS insertion. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte specific-string mode).
Type: Alphanumeric value set.

   Range:

   - DISABLE
   - ENABLE

   Default: The default value depends on interface standard:

   - SONET: DISABLE.

6. **`lptimmon`** – LO Path Trace Identifier Mismatch Monitor
This parameter specifies the mode of the TIM detection. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte specific-string mode).

   This parameter is not supported for the following modifiers:

   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.

Range:

- DISABLE
- ENABLE

Default: DISABLE

7. **`ptrcrfmt`** – Path Trace Read Format
   The parameter *ptrcrfmt* specifies the format of the path trace (J1 or J2 byte) to be received (sink).
   The parameter is not supported for the following modifiers:
   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.
   Type: Numeric string.
   Range:
   - 2: for non-specific repeating byte
   - 16: for 16-byte specific string
   - 64: for 64-byte string.

   To check whether the entity represents a LO-VC3 tributary or not, the parameter *inputsig* of the related PTF entity must be checked.
   Default: 2.
8. **`ptrcwfmt`** – Path Trace Write Format
   This parameter specifies the format of the path trace (J2 byte) to be sent (source).
   Type: Numeric string.
   Range:
   - 2: for non-specific repeating byte
   - 16: for 16-byte specific string

   Default: 2.
9. **`tmonmd`** – Tributary Monitoring Mode
   This parameter specifies the monitoring mode for the tributary.
   Type: Alphanumeric value set.
   Range:
   - MON
   - NMON

   Default: NMON.
10. **`trc`** – Outgoing Path Trace
    This parameter specifies the path trace (J2) to be sent (source). For the 16-byte path trace format, the following syntactical rule is applied: The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is irrelevant if the format is non-specific repeating byte (*ptrcwfmt* = 2).
    Type: Hexadecimal number without a preceding “H”.

Range: The range depends on the parameter *ptrcwfmt* specified in **RTRV-PTF** output parameters

- length: 32 hexadecimal digits.
- value: specific string acc. ITU/ETSI mode 1.

Default: 00.

Example input/output

Example of an **ENT-LOPTF** notification:

```
   UNITE-NE 08-03-01 11:11:00
A  001 REPT DBCHG
   ″TIME=11-10-50,DATE=08-03-01:ENT-LOPTF-TMSVT:1-1-#-#-39-tms16-1-1&&-28::\
    degthr=-6,dexcthr=-3,explptrc=89000000000000000000000000000000,\

;
```

ENT-MANROUTE-LAN: Enter manual route at LAN port

The **ENT-MANROUTE_LAN** command is used to enter manual routes at LAN ports, which are used as UNI control channels.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S4

Priority: 1

Abortable: No.

Input format

Command syntax: **ENT-MANROUTE_LAN**:*tid*:*aid*:*ctag*:::[*spec_block*];

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   This parameter indicates the LAN port AID.
   Type: AID.
   Range: LanPort AID.
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*.

Spec block parameters

1. **ip_ad** – destination IP Address
   This parameter is used to indicate the destination IP address to which a manual route is created. This is the LAN i/f address of UNI-C
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   The values 0.0.0.0 and 1.1.1.1 are not allowed.
2. **ip_ad_uni** – Node ID of UNI-C
   This parameter is used to indicate the router ID of the UNI-C to which a manual route is created.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255. The values 0.0.0.0 and 1.1.1.1 are not allowed.

3. **`ip_snm`** – IP Mask
   This parameter is used to indicate the subnet mask of the destination IP address to which a manual route is created.
   Type: Four dot separated numeric strings
   Range: For each numeric string: 0 .. 255.
4. **`osinode`**
   This parameter is used toindicate the OSI node assigned to the LAN port.
   Type: AID.
   Range: uninode.

Output format

If the **`ENT-MANROUTE-LAN`** is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The **`ENT-MANROUTE-LAN`** command shall add a manual route entry for a LAN port, which is used as control channel for UNI.

The update of the manual routes are notified with ENT-MANROUTE-LAN notifications.

Example input/output

The following example shows the result of ENT-MANROUTE-LAN:

```
ENT-MANROUTE-LAN:LT-UNITE:1-1-lan2:123456:::ip_ad=135.168.90.4,ip_ad_
      uni=135.168.90.4,ip_snm=255.255.0.0,osinode=uninode;

   LT-UNITE 06-06-30 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **`ENT-FECOM-LAN`** command.

Validation rule: Not allowed to use LAN1 for UNI

If LAN1 is specified in the AID, then the command is denied.

Error code: `IDNV – Input, Data Not Valid, LAN1 not allowed for UNI`

Validation rule: LAN port not used for UNI

If the LANport specified in the AID is not in use for UNI, i.e. is not assigned to the uninode, then the command is denied.

Error code: `SNVS – Status, Not in Valid State, LAN port not in use for UNI`

Validation rule: No duplicate Manual Route entries

The command is denied, if a manual route entry regardless of the LAN port already exists which has the same values in the parameters *ip_ad* and *ip_ad_uni*.

Error code:
`IDNV – Input, Data Not Valid, Manual route entry already exists`

Validation rule: Check if limit of 20 Manual Routes per LAN port exceeded

The addition of a manual route entry for a LAN port is denied, if already 20 manual route entries exist for the LAN port.

Error code:
`SSRE – Status, System Resources Exceeded, limit of manual route entries exceeded`

ENT-MANROUTE-LAN notification

Output format

Command syntax: **ENT-MANROUTE_LAN**:*aid*:::*spec_block*;

Output parameters

Command parameters

1. **aid** – Access Identifier
   This parameter indicates the LAN port AID.
   Type: AID.
   Range: LanPort AID.

Spec block parameters

1. **ip_ad** – destination IP Address
   This parameter is used to indicate the destination IP address to which a manual route is created. This is the LAN i/f address of UNI-C
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   The values 0.0.0.0 and 1.1.1.1 are not allowed.
2. **ip_ad_uni** – Node ID of UNI-C
   This parameter is used to indicate the router ID of the UNI-C to which a manual route is created.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255. The values 0.0.0.0 and 1.1.1.1 are not allowed.
3. **ip_snm** – IP Mask
   This parameter is used to indicate the subnet mask of the destination IP address to which a manual route is created.
   Type: Four dot separated numeric strings
   Range: For each numeric string: 0 .. 255.
4. **osinode**
   This parameter is used toindicate the OSI node assigned to the LAN port.
   Type: AID.
   Range: uninode.

Example output

The following example shows the result of **ENT-MANROUTE-LAN**:

```
   NE-UNITE 06-06-30 08:59:00
A  000 REPT DBCHG
   ”TIME=08-59-00,DATE=06-06-30:ENT-MANROUTE-LAN:1-1-lan2::ip_ad=135.248.206.64, ip_
      ad_uni=135.248.206.64,ip_snm=255.255.0.0, osinode=uninode”
;
```

ENT-MANROUTE-MCN: Enter manual IP route for management communication

The **ENT-MANROUTE_MCN** command is used to enter manual IP routes for management communication.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S4

Priority: 1

Abortable: Yes.

Input format

Command syntax: **ENT-MANROUTE_MCN**:*tid*:*aid*:*ctag*:::[*spec_block*];

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   This parameter indicates the LAN port AID.
   Type: AID.
   Range: LanPort AID.
   The keyword "lanall" is allowed for Simple_LANPortAID.
   Default: Omitting this field has the same effect as the keyword "lanall", that means, the report will display the manual MCN route entries of all possible LAN ports assigned to the MCN.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **`dest_ipad`** – Destination IP Address
   The IP address of an IP node which can be reached via one of the LAN ports.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 … 255. The values 0.0.0.0, 1.1.1.1, and 127.0.0.1 are not allowed.
   Default: None.
2. **`dest_ipmask`** – Destination IP Subnet Mask
   The IP subnet mask of the IP node which can be reached via the LAN port.
   Type: Four dot separated numeric strings
   Range: Each numeric string: 0 … 255.
   Default: None.
3. **`nexthop_ipad`** – Next Hop IP Address
   The IP address of the next hop routing node via which the Destination IP Address can be reached.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 … 255. The value 0.0.0.0 is used if the IP node defined by *dest_ipad* is connected to the LAN port directly. The values 1.1.1.1 and 127.0.0.1 are not allowed.
   Default: None.

Output format

If the **`ENT-MANROUTE-MCN`** request is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The **`ENT-MANROUTE-MCN`** command adds a manual MCN IP route entry for the system. The update of the manual routes is notified with **`ENT-MANROUTE-MCN`** notifications.

Example input/output

The following example shows the result of an **`ENT-MANROUTE-MCN`** command:

```
ENT-MANROUTE-MCN:UNITE-NE:1-1-lan2:123456:::dest_ipad=192.168.90.4,dest_
      ipmask=255.255.255.0,nexthop_ipad=192.168.2.45;
```

```
   UNITE-NE 08-06-20 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **ENT-MANROUTE-MCN** command.

Validation rule: Auto Encapsulation must be enabled

The command is denied, if the Auto Encapsulation function is not enabled.

Error code:

`SNVS – Status, Not in Valid State, Auto Encapsulation not enabled`

Validation rule: Only osinode1 supports Auto Encapsulation

The command is denied, if the specified LAN port is not assigned to osinode1.

Error code:

`IDNC – Input, Data Not Consistent, Assigned Node not allowed for Auto Encapsulation`

Validation rule: IP communication must be enabled for LAN port

The command is denied, if the IP communication is not enabled for the specified LAN port (parameter *ip_lanstat* not set to ENABLE).

Error code:

`SNVS – Status, Not in Valid State, IP communication not enabled for LAN port`

Validation rule: No duplicate Manual MCN IP Route entries

The command is denied, if a manual MCN IP route entry already exists which has the same value in the parameter *dest_ipad*.

Error code:

`IDNV – Input, Data Not Valid, Next Hop IP Address already assigned to other LAN`

Validation rule: No more than one LAN connected to same next hop

The command is denied if the provided *nexthop_ipad* is already provisioned for any other LAN interface.

Error code:

`IDNV – Input, Data Not Valid, Next Hop IP Address already assigned to other LAN`

Validation rule: Check if limit of 20 Manual MCN IP Routes exceeded

The addition of a manual MCN IP route entry is denied, if already 20 manual route entries exist in the system.

Error code:

`SSRE – Status, System Resources Exceeded, limit of manual route entries exceeded`

ENT-MANROUTE-MCN notification

Output format

Command syntax: **`ENT-MANROUTE_MCN`**:*aid*:::*spec_block*;

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   This parameter indicates the LAN port AID.
   Type: AID.
   Range: LanPort AID.
   The keyword “lanall” is allowed for Simple_LANPortAID.
   Default: Omitting this field has the same effect as the keyword “lanall”, that means, the report will display the manual MCN route entries of all possible LAN ports assigned to the MCN.

Spec block parameters

1. **`dest_ipad`** – Destination IP Address
   The IP address of an IP node which can be reached via one of the LAN ports.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 … 255. The values 0.0.0.0, 1.1.1.1, and 127.0.0.1 are not allowed.
   Default: None.
2. **`dest_ipmask`** – Destination IP Subnet Mask
   The IP subnet mask of the IP node which can be reached via the LAN port.
   Type: Four dot separated numeric strings
   Range: Each numeric string: 0 … 255.
   Default: None.
3. **`nexthop_ipad`** – Next Hop IP Address
   The IP address of the next hop routing node via which the Destination IP Address can be reached.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 … 255. The value 0.0.0.0 is used if the IP node defined by *dest_ipad* is connected to the LAN port directly. The values 1.1.1.1 and 127.0.0.1 are not allowed.
   Default: None.

      ipad=192.168.90.4,nexthop_ipad=192.168.2.4,nexthop_ipmask=255.255.255.0”
```

;

ENT-OC3 notification

Output format

Syntax: **`ENT-OC3`**:*aid*::*spec_block*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Type: AID.
   Range: OC3 port AID.

Spec block parameters

1. **`adminCost`**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This parameter is supported by ports of *portClass* INNI.
   This parameter is supported by ports of *portClass* ENNI.
   Type: Numeric string.
   Range: 1(default)…65535
2. **`brstintvl`**– Bursty Interval
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **`brstthr`** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.
4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems

reasonable for a possible extension of this attribute to other port classes in future.
This parameter is supported by ports of *portClass* UNI.
Type: IPv4 format: Four dot separated numeric string.
Range: Each numeric string: 0…255
Default: 0.0.0.0

5. **`crstat`** – Constituent Rates Status list
This parameter shows the rates of the port signals. It is the pointer processor setup if adaptive mode (*trbmd* = ADAPTIVE) is selected.
When switching *trbmd* from FIXED to ADAPTIVE or when creating a port newly *crstat* inherits the current value of *inputsig* until the system delivers an up-to-date value from the pointer processor. If no value is available from the pointer processor the latest known value is retained.
For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 1 or 3 representing STS1 or STS3C.

6. **`exprstrc`** – Value of Expected J0
Expected regenerator section trace identifier.
The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
Type: Hexadecimal digits
Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 89hex followed by 15 bytes 00hex

7. **`felpm`** – Far-end Line PM Enable
Enable or disable of the performance monitoring of the multiplex section.
Type: Alphanumeric value set.
Range:
   - ENABLE
   - DISABLE (default).

8. **`frcdus`** – Force to DUS
Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
Type: Alphanumeric value set.
Range:
   - ENABLE , set a forced DUS/DNU
   - DISABLE (default), clear a forced DUS/DNU

9. **`fsflpbkstat`** – Far Side Facililiy Loopback Status
   This parameter specifies the current far-side facility loopback status of the considered output *aid*.
   A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
   Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
   Type: Alphanumeric value set.
   Range:
   - YES
   - NO (default).
10. **`inputsig`** – Tributary Input Signal Rate List
    This parameter is a list of STSn rates across the port's bandwidth.
    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then *inputsig* is setable and retrievable as in fixed mode but does not influence the port behavior.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 1 or 3 representing STS1 or STS3C.
    Default: 31.
    Example: An O-3 signal might be represented by 31 which implies 3 STS1's or 13 which implies 1 STS3C.
11. **`istd`** – Interface Standard
    Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter istddflt.
    Type: Alphanumeric value set.
    Range: SDH.
    Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).
12. **`linkResCls`** – Link Resource Class
    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set (4 bytes), every bit defining one link class
    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
    Default: 00 for each alphanumeric character

13. **`localLinkID`** – Local Link IDentity
    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
14. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: numeric value set.
    Range: 0 (default) to 4294967295
    The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.
15. **`lpbk`** – Loopback
    This parameter specifies the current near-side loopback status of the considered output *aid*.
    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
    Type: Alphanumeric value set.
    Range:
    - YES
    - NO (default).

16. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
    The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1 or STS3 (default)
17. **`minNNXCRate`** – Minimum NN Cross Connect Rate
    The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1 (default) or STS3.
18. **`ndetmd`** – Neighbor Detection Mode
    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range:
    AUTO, MAN
    Default:
    For *portClass* = INNI: AUTO
    For *portClass* = ENNI: MAN
19. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
    This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.

20. **`neighborNodeID`** – Neighbor Node Id
This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

21. **`neighborPortID`** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.
Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

22. **`neighborSigPCID` –** Neighbor Signaling PC IDentity
The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

23. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

24. **`nelpm`** – Near-End Line PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

25. **`networkTNAType`** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.
Range:
    - IPV4 (default)
    - IPV6
    - NSAP

26. **networkTNAAddress** – Network TNA Address

The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter is supported by ports of *portClass* UNI.

This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number: 0000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

27. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
    This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
    Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-1/OC-3: 1 – 192000.

    Default: The default values differ for SDH and SONET:

    - STM1: 28800
    - OC3: 154.

28. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
    This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
    Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-1/OC-3: 1 – 192000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM1: 28800
    - OC3: 154.

29. **`pmode`** – Port Mode
    This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
    Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

30. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of allowed ranges for SDH and SONET):1 – 64000.
Default: The default values differ for SDH and SONET and the different rates:
    - STM1: 2400
    - OC3: 155.
31. **`portClass`** – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: Alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.
32. **`portControl`** – Port Control (PortAdministrative Mode)
The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
Type: Alphanumeric value set.
Range: NORMAL (default), LOCKOUT
33. **`propagationDelay`** – Propagation Delay
This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
propagationDelay is used by the ONNS application.
Type: Numeric string.
Range: 0(default) …255. The unit of this value is ″milliseconds″.
34. **`remAdvNodeID`** – Remote Advertised Node IDentity
The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until both these conditions are fulfilled.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

35. **`remLinkID`** – Remote Link IDentity
    The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
36. **`remRAID`** – Remote Routing Area IDentity
    The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
    The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
37. **`remTID`** – Remote TID
    The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: TID or empty-string
    Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
    Default: empty string: *""*
38. **`rstimca`** – RS TIM Consequent Action Enable
    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
    Type: Alphanumeric value set.

Range:

- ENABLE: enable consequent action for TIM
- DISABLE (default): disable consequent action for TIM.

39. **`rstimmon`** – RS TIM Monitor Enable
Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.
Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
40. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
The degraded state is detected in Burst or Poisson mode.
Type: Alphanumeric value set.
Range:
    - BURST
    - POISSON (default).
41. **`sdthr`** – Signal Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –5; –6; –7; –8; –9.
Default: –6.
42. **`servcond`** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
43. **`sfthr`** – Signal Failure Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –5; –6; –7; –8; –9.
Default: –6.

44. **sltca** – Section and Line TCA Profile Pointer
Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
Type: Alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.

45. **sonet** – SONET ASAP
SONET Alarm Severity Assignment Profile. This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH ASAP for SDH ports of corresponding line rate (see "RTRV-STM4: Retrieve STM4 port" (p. 3-2881), output parameter *sdhpn*) to be compatible with current generation applications.
Type: Alphanumeric string.
Range: String with a maximum of 24 characters. A hyphen ("-") is allowed in the name additionally.
Default: DEFAULT.

46. **spm** – Section PM Enable
Enable or disable regenerator section (section) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

47. **srlgList** – Shared Risk Link Group Identities List
The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.

48. **`strcfmt`** – Format of incoming J0
    The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
    Type: Numeric string.
    Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
49. **`strcout`** – Value of outgoing J0
    This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
    If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
    Type: Hexadecimal digits.
    Range:
    - 1 byte string
    - 16 bytes string
    - 64 bytes string.

    Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
    Default: 01Hex
50. **`strcwfmt`** – Format of outgoing J0
    The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
    Type: Numeric string.
    Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

51. **`trbmd`** – Tributary mode
    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* and *unequiposig* have no effect. See definition of output parameter *trbmd* in "RTRV-STM16: Retrieve STM16 port" (p. 3-2899) for SDH equivalent.
    Type: Alphanumeric value set.
    Range:
    - ADAPTIVE
    - FIXED.

    Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400) command.
52. **`unequiposig`** – Unequipped Output Signal List
    This parameter is a list of STSn rates across the port's bandwidth. It determines the rate(s) of the "unequipped" signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need to have the identical setting. Mixed rates for tx and rx side of the port are allowed. If *trbmd* is ADAPTIVE, then *unequiposig* is settable and retrievable as in fixed mode but does not influence the port behavior.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 1 or 3 representing STS1 or STS3C.
    Default: 3 1 = all STS1.
53. **`z0outmode`** – Mode of outgoing Z0 byte insertion
    The Z0 insertion is configurable to support interworking with old SONET equipment for STS-M interfaces (M=3, 12, 48).
    Type: Alphanumeric value set.
    Range:
    - FIXEDCC (default): for inserting the fixed value CChex
    - STSID: for inserting the STS-Id of the current frame.

Example output

```
   UNITE-NE 00-11-28 08:00:30
A  001 REPT DBCHG
   ″TIME=08-00-12,DATE=00-11-28:ENT-OC3:1-1-#-#-1-1::servcond=ENABLE,
      sdsfmode=POISSON,sdthr=-
      6,brstthr=30,....,istd=SONET,inputsig=31,unequiposig=31″
;
```

ENT-OC12 notification

Output format

Syntax: **`ENT-OC12`**:*aid*::*spec_block*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Type: AID.
   Range: OC-12 port AID.

Spec block parameters

1. **`adminCost`**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This parameter is supported by ports of *portClass* INNI.
   This parameter is supported by ports of *portClass* ENNI.
   Type: Numeric string.
   Range: 1(default)…65535
2. **`brstintvl`**– Bursty Interval
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **`brstthr`** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.
4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems

reasonable for a possible extension of this attribute to other port classes in future. This parameter is supported by ports of *portClass* UNI.
Type: IPv4 format: Four dot separated numeric string.
Range: Each numeric string: 0…255
Default: 0.0.0.0

5. **crstat** – Constituent Rates Status list
This parameter shows the rates of the port signals. It is the pointer processor setup if adaptive mode (*trbmd* = ADAPTIVE) is selected.
When switching *trbmd* from FIXED to ADAPTIVE or when creating a port newly *crstat* inherits the current value of *inputsig* until the system delivers an up-to-date value from the pointer processor. If no value is available from the pointer processor the latest known value is retained.
For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 1, 3 or 12 representing STS1, STS3C or STS12C.

6. **exprstrc** – Value of Expected J0
Expected regenerator section trace identifier.
The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
Type: Hexadecimal digits
Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 89hex followed by 15 bytes 00hex

7. **felpm** – Far-end Line PM Enable
Enable or disable of the performance monitoring of the multiplex section.
Type: Alphanumeric value set.
Range:
   - ENABLE
   - DISABLE (default).

8. **frcdus** – Force to DUS
Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
Type: Alphanumeric value set.
Range:
   - ENABLE , set a forced DUS/DNU
   - DISABLE (default), clear a forced DUS/DNU

9. **fsflpbkstat** – Far Side Facililiy Loopback Status
   This parameter specifies the current far-side facility loopback status of the considered output *aid*.
   A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
   Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
   Type: Alphanumeric value set.
   Range:
   - YES
   - NO (default).
10. **inputsig** – Tributary Input Signal Rate List
    This parameter is a list of STSn rates across the port's bandwidth.
    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then *inputsig* is settable and retrievable as in fixed mode but does not influence the port behavior.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 1, 3 or 12 representing STS1, STS3C or STS12C.
    Default: 121.
    Example:
    An OC12 signal might be represented by 31-33 which implies 3 STS1's, 3 STS3C's.
11. **istd** – Interface Standard
    Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter istddflt.
    Type: Alphanumeric value set.
    Range: SDH.
    Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).
12. **linkResCls** – Link Resource Class
    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set (4 bytes), every bit defining one link class
    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
    Default: 00 for each alphanumeric character

13. **`localLinkID`** – Local Link IDentity
    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
14. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: numeric value set.
    Range: 0 (default) to 4294967295
    The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.
15. **`lpbk`** – Loopback
    This parameter specifies the current near-side loopback status of the considered output *aid*.
    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
    Type: Alphanumeric value set.
    Range:
    - YES
    - NO (default).

16. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
    The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1, STS3 or STS12 (default)
17. **`minNNXCRate`** – Minimum NN Cross Connect Rate
    The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1 (default), STS3 or STS12.
18. **`ndetmd`** – Neighbor Detection Mode
    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range:
    AUTO, MAN
    Default:
    For *portClass* = INNI: AUTO
    For *portClass* = ENNI: MAN
19. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
    This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.

20. **`neighborNodeID`** – Neighbor Node Id
This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

21. **`neighborPortID`** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.
Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

22. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

23. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

24. **`nelpm`** – Near-End Line PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

25. **`networkTNAType`** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.
Range:
    - IPV4 (default)
    - IPV6
    - NSAP

26. **`networkTNAAddress`** – Network TNA Address

The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter is supported by ports of *portClass* UNI.

This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number:
  0000000000000000000000000000000000000000…
  FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

27. **pmmsfeses** – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-4/OC-12: 1 – 768000.

    Default: The default values differ for SDH and SONET:

    - STM4: 115200
    - OC12: 615.

28. **pmmsneses** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-4/OC-12: 1 – 768000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM4: 115200
    - OC3: 615.

29. **pmode** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

30. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
    This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
    Type: numeric value set.
    Range (superset of allowed ranges for SDH and SONET):1 – 64000.
    Default: The default values differ for SDH and SONET and the different rates:
    - STM4: 2400
    - OC12: 616.
31. **`portClass`** – Port Class
    This parameter identifies the port class of the AID.
    In which role the port is used by the ONNS application is specified by this parameter *portClass*.
    Type: Alphanumeric value set.
    Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
    Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.
32. **`portControl`** – Port Control (PortAdministrative Mode)
    The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
    Type: Alphanumeric value set.
    Range: NORMAL (default), LOCKOUT
33. **`propagationDelay`** – Propagation Delay
    This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
    propagationDelay is used by the ONNS application.
    Type: Numeric string.
    Range: 0(default) …255. The unit of this value is ″milliseconds″.
34. **`remAdvNodeID`** – Remote Advertised Node IDentity
    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until both these conditions are fulfilled.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

35. **remLinkID** – Remote Link IDentity
The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: numeric value set
Range: 0 (default) to 4294967295

36. **remRAID** – Remote Routing Area IDentity
The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

37. **remTID** – Remote TID
The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: TID or empty-string
Range: Please refer to the TID definition in the “RTRV-HDR: Retrieve header” (p. 3-2417) description.
Default: empty string: *""*

38. **rstimca** – RS TIM Consequent Action Enable
Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
Type: Alphanumeric value set.

Range:

- ENABLE: enable consequent action for TIM
- DISABLE (default): disable consequent action for TIM.

39. **`rstimmon`** – RS TIM Monitor Enable
Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.
Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
40. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
The degraded state is detected in Burst or Poisson mode.
Type: Alphanumeric value set.
Range:
    - BURST
    - POISSON (default).
41. **`sdthr`** – Signal Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –5; –6; –7; –8; –9.
Default: –6.
42. **`servcond`** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
43. **`sfthr`** – Signal Failure Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –5; –6; –7; –8; –9.
Default: –6.

44. **`sltca`** – Section and Line TCA Profile Pointer
Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
Type: Alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.

45. **`sonet`** – SONET ASAP
SONET Alarm Severity Assignment Profile. This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH ASAP for SDH ports of corresponding line rate to be compatible with current generation applications.
Type: Alphanumeric string.
Range: String with a maximum of 24 characters. A hyphen (“-”) is allowed in the name additionally.
Default: DEFAULT.

46. **`spm`** – Section PM Enable
Enable or disable regenerator section (section) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

47. **`srlgList`** – Shared Risk Link Group Identities List
The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.

48. **`strcfmt`** – Format of incoming J0
    The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
    Type: Numeric string.
    Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
49. **`strcout`** – Value of outgoing J0
    This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
    If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
    Type: Hexadecimal digits.
    Range:
    - 1 byte string
    - 16 bytes string
    - 64 bytes string.

    Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
    Default: 01Hex
50. **`strcwfmt`** – Format of outgoing J0
    The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
    Type: Numeric string.
    Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

51. **`trbmd`** – Tributary mode
If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* and *unequiposig* have no effect. See definition of output parameter *trbmd* in "RTRV-STM16: Retrieve STM16 port" (p. 3-2899) for SDH equivalent.
Type: Alphanumeric value set.
Range:
    - ADAPTIVE
    - FIXED.

    Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400) command.
52. **`unequiposig`** – Unequipped Output Signal List
This parameter is a list of STSn rates across the port's bandwidth. It determines the rate(s) of the "unequipped" signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need to have the identical setting. Mixed rates for tx and rx side of the port are allowed. If *trbmd* is ADAPTIVE, then *unequiposig* is settable and retrievable as in fixed mode but does not influence the port behavior.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 1, 3 or 12 representing STS1, STS3C or STS12C.
Default: 121 = all STS1 (fixed).
53. **`z0outmode`** – Mode of outgoing Z0 byte insertion
The Z0 insertion is configurable to support interworking with old SONET equipment for STS-M interfaces (M=3, 12, 48).
Type: Alphanumeric value set.
Range:
    - FIXEDCC (default): for inserting the fixed value CChex
    - STSID: for inserting the STS-Id of the current frame.

Example output

```
   UNITE-NE 00-11-28 08:00:30
A  001 REPT DBCHG
   "TIME=08-00-12,DATE=00-11-28:ENT-OC12:1-1-#-#-1-1::servcond=ENABLE,
      sdsfmode=POISSON,sdthr=-
      6,brstthr=30,....,istd=SONET,inputsig=121,unequiposig=121"
;
```

ENT-OC48 notification

Output format

Syntax: **`ENT-OC48`**:*aid*::*spec_block*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Type: AID.
   Range: OC-48 port AID.

Spec block parameters

1. **`adminCost`**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This parameter is supported by ports of *portClass* INNI.
   This parameter is supported by ports of *portClass* ENNI.
   Type: Numeric string.
   Range: 1(default)…65535
2. **`brstintvl`**– Bursty Interval
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **`brstthr`** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.
4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems

reasonable for a possible extension of this attribute to other port classes in future. This parameter is supported by ports of *portClass* UNI.
Type: IPv4 format: Four dot separated numeric string.
Range: Each numeric string: 0…255
Default: 0.0.0.0

5. **`crstat`** – Constituent Rates Status list
   This parameter shows the rates of the port signals. It is the pointer processor setup if adaptive mode (*trbmd* = ADAPTIVE) is selected.
   When switching *trbmd* from FIXED to ADAPTIVE or when creating a port newly *crstat* inherits the current value of *inputsig* until the system delivers an up-to-date value from the pointer processor. If no value is available from the pointer processor the latest known value is retained.
   For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.
   Type: numeric value set.
   Range: NX-NX-NX-…
   N is the number of Xs. X can be 1, 3, 12, 48 representing STS1, STS3C, STS12C, STS48C.

6. **`exprstrc`** – Value of Expected J0
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex

7. **`felpm`** – Far-end Line PM Enable
   Enable or disable of the performance monitoring of the multiplex section.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).

8. **`frcdus`** – Force to DUS
   Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
   Type: Alphanumeric value set.
   Range:
   - ENABLE , set a forced DUS/DNU
   - DISABLE (default), clear a forced DUS/DNU

9. **fsflpbkstat** – Far Side Facililiy Loopback Status
   This parameter specifies the current far-side facility loopback status of the considered output *aid*.
   A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
   Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
   Type: Alphanumeric value set.

   Range:

   - YES
   - NO (default).

10. **inputsig** – Tributary Input Signal Rate List
    This parameter is a list of STSn rates across the port's bandwidth.
    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then *inputsig* is settable and retrievable as in fixed mode but does not influence the port behavior.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 1, 3, 12 or 48 representing STS1, STS3C, STS12C or STS48C.
    Default: 481.
    Example: An OC-48 signal might be represented by 91-13-112-241 which implies 9 STS1's, 1 STS3C, 1 STS12C, 24 STS1's.

11. **istd** – Interface Standard
    Each synchronous optical interface can be set to SDH or SONET.
    Type: Alphanumeric value set.
    Range: SONET, SDH.
    Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).

12. **linkResCls** – Link Resource Class
    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set (4 bytes), every bit defining one link class
    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
    Default: 00 for each alphanumeric character

13. **`localLinkID`** – Local Link IDentity
    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
14. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute "uniNetworkLPID", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: numeric value set.
    Range: 0 (default) to 4294967295
    The default value shall have the meaning of "no localLPID provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.
15. **`lpbk`** – Loopback
    This parameter specifies the current near-side loopback status of the considered output *aid*.
    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
    Type: Alphanumeric value set.
    Range:
    - YES
    - NO (default).

16. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
    The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1, STS3, STS12 or STS48 (default)
17. **`minNNXCRate`** – Minimum NN Cross Connect Rate
    The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1 (default), STS3, STS12 or STS48.
18. **`ndetmd`** – Neighbor Detection Mode
    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range:
    AUTO, MAN
    Default:
    For *portClass* = INNI: AUTO
    For *portClass* = ENNI: MAN
19. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
    This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.

20. **`neighborNodeID`** – Neighbor Node Id
    This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
    neighborNodeID is used by the ONNS application.
    Type: Four dot separated numeric string.
    Range: Each numeric string: 0…255.
    Default: 0.0.0.0
    If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

21. **`neighborPortID`** – Neighbor Port Id
    This identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd = MAN.
    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
    neighborPortID is introduced specifically for use by NN application.
    Type: Four dash separated numeric string.
    Range: Each numeric string: 0…255.
    Default: 0-0-0-0.
    Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

22. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
    The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

23. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

24. **`nelpm`** – Near-End Line PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

25. **`networkTNAType`** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkTNAType", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.
Range:
    - IPV4 (default)
    - IPV6
    - NSAP

26. **`networkTNAAddress`** – Network TNA Address

The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute "uniNetworkTNAAddress", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter is supported by ports of *portClass* UNI.

This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number:
  0000000000000000000000000000000000000000…
  FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of "no TNA Address provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

27. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):
    - STM-16/OC-48: 1 – 3072000
    - STM-64/OC-192: 1 – 12288000
    - STM-256/OC-768: 1 – 49152000.

    Default: The default values differ for SDH and SONET and the different rates:
    - STM16: 460800
    - STM64: 1843200
    - STM256: 7372800
    - SONET OC48: 2459
    - SONET OC192: 9835
    - SONET OC768: 39340.
28. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):
    - STM-16/OC-48: 1 – 3072000
    - STM-64/OC-192: 1 – 12288000
    - STM-256/OC-768: 1 – 49152000.

    Default: The default values differ for SDH and SONET and the different rates:
    - STM16: 460800
    - STM64: 1843200
    - STM256: 7372800
    - SONET OC48: 2459
    - SONET OC192: 9835
    - SONET OC768: 39340.

29. **`pmode`** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.
Range:
    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.
30. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of allowed ranges for SDH and SONET):1 – 64000
Default: The default values differ for SDH and SONET and the different rates:
    - SDH (all rates): 2400
    - SONET OC48: 2392
    - SONET OC192: 8554
    - SONET OC768: 22776.
31. **`portClass`** – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: Alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.
32. **`portControl`** – Port Control (PortAdministrative Mode)
The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
Type: Alphanumeric value set.
Range: NORMAL (default), LOCKOUT

33. **`propagationDelay`** – Propagation Delay
    This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
    propagationDelay is used by the ONNS application.
    Type: Numeric string.
    Range: 0(default) …255. The unit of this value is ″milliseconds″.
34. **`remAdvNodeID`** – Remote Advertised Node IDentity
    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition:
    The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
35. **`remLinkID`** – Remote Link IDentity
    The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
36. **`remRAID`** – Remote Routing Area IDentity
    The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
    The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0

37. **`remTID`** – Remote TID
    The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: TID or empty-string
    Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
    Default: empty string: ""
38. **`rstimca`** – RS TIM Consequent Action Enable
    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
    Type: Alphanumeric value set.
    Range:
    - ENABLE: enable consequent action for TIM
    - DISABLE (default): disable consequent action for TIM.
39. **`rstimmon`** – RS TIM Monitor Enable
    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
    Type: Alphanumeric value set.
    Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
40. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
    The degraded state is detected in Burst or Poisson mode.
    Type: Alphanumeric value set.
    Range:
    - BURST
    - POISSON (default).
41. **`sdthr`** – Signal Degrade Threshold
    Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
    Type: numeric value set.
    Range (as exponents of 10): –5; –6; –7; –8; –9.
    Default: –6.

42. **`servcond`** – Service Condition
    This parameter indicates its status concerning service involvement.
    Type: Alphanumeric value set.
    Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
43. **`sfthr`** – Signal Failure Threshold
    Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
    Type: numeric value set.
    Range (as exponents of 10): –5; –6; –7; –8; –9.
    Default: –6.
44. **`sltca`** – Section and Line TCA Profile Pointer
    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
    Type: Alphanumeric string.
    Range: String with maximum of 24 characters.
    Default: DEFAULT0.
45. **`sonet`** – SONET ASAP
    This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH Alarm Severity Assignment Profile for SDH ports to be compatible with current generation applications.
    Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
    Range: String with a maximum of 24 characters.
    Default: DEFAULT.
46. **`spm`** – Section PM Enable
    Enable or disable regenerator section (section) performance monitoring.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
47. **`srlgList`** – Shared Risk Link Group Identities List
    The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
    If less than the max. number of identities are provisioned, the remaining ones are

set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.

48. **`strcfmt`** – Format of incoming J0
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
Type: Numeric string.
Range:
- 1: for specific repeating byte (SONET)
- 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

49. **`strcout`** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
Type: Hexadecimal digits.
Range:
- 1 byte string
- 16 bytes string
- 64 bytes string.

Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 01Hex

50. **`strcwfmt`** – Format of outgoing J0
The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
Type: Numeric string.

Range:

- 1: for specific repeating byte (SONET)
- 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

51. **`trbmd`** – Tributary mode
If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* and *unequiposig* have no effect. See definition of output parameter *trbmd* in "RTRV-STM16: Retrieve STM16 port" (p. 3-2899) for SDH equivalent.
Type: Alphanumeric value set.
Range:
    - ADAPTIVE
    - FIXED.

    Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400) command.

52. **`unequiposig`** – Unequipped Output Signal List
This parameter is a list of STSn rates across the port's bandwidth. It determines the rate(s) of the *unequipped* signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need to have the identical setting. Mixed rates for *tx* and *rx* side of the port are allowed. If *trbmd* is ADAPTIVE, then *unequiposig* is settable and retrievable as in fixed mode but does not influence the port behavior.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 1, 3, 12 or 48 representing STS1, STS3C, STS12C or STS48C.
Default: 481 = all STS1 (fixed).

53. **`z0outmode`** – Mode of outgoing Z0 byte insertion
The Z0 insertion is configurable to support interworking with old SONET equipment for STS-M interfaces (M=3, 12, 48).
Type: Alphanumeric value set.
Range:
    - FIXEDCC (default): for inserting the fixed value CChex
    - STSID: for inserting the STS-Id of the current frame.

Example output

```
   UNITE-NE 00-11-28 08:00:30
A  001 REPT DBCHG
```

```
   "TIME=08-00-12,DATE=00-11-28:ENT-OC48:1-1-#-#-1-1::servcond=ENABLE,
      sdsfmode=POISSON,sdthr=-
      6,brstthr=30,....,istd=SONET,inputsig=481,unequiposig=481"
;
```

ENT-OC48T notification

Output format

Syntax

`ENT-OC48T`*:aid::spec_block*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Type: AID.
   Range: OC-48 port AID.

Spec block parameters

1. **`exprstrc`** – Value of Expected J0
   For ENT-OC48T Notification this parameter refers to the incoming (ingress) direction.
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
2. **`exprstrcout`** – Value of Expected J0 in outgoing direction
   Expected regenerator section trace identifier in outgoing (egress) direction.
   The parameter expstrcout specifying the expected path trace is only relevant for the section trace supervision in outgoing direction when the related trace read format strcfmtout is set to 16 (16-byte-specific-string mode).
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex

3. **`fsflpbkstat`** – Far Side Facility Loopback Status
   This parameter specifies the current far-side facility loopback status of the considered output *aid*.
   A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
   Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
   Type: Alphanumeric value set.

   Range:

   - YES
   - NO (default).

4. **`istd`** – Interface Standard
   Each synchronous optical interface can be set to SDH or SONET.
   Type: Alphanumeric value set.
   Range: SONET.
   Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).

5. **`lpbk`** – Loopback
   This parameter specifies the current near-side loopback status of the considered output *aid*.
   A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
   Type: Alphanumeric value set.

   Range:

   - YES
   - NO (default).

6. **`pmode`** – Port Mode
   This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
   Type: Alphanumeric value set.

   Range:

   - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
   - MON indicates that alarm monitoring is taking place on the port.
   - NMON means that alarm monitoring is not occurring on the port.

7. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
   For ENT-OC48T Notification this parameter refers to the incoming (ingress) direction.
   This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET.
   Type: numeric value set.
   Range (superset of allowed ranges for SDH and SONET):1 – 64000
   Default: The default values differ for SDH and SONET and the different rates:
   - SDH (all rates): 2400
   - SONET OC48: 2392
   - SONET OC192: 8554
   - SONET OC768: 22776.
8. **`pmrsneses`**out – Performance Monitoring Section/RS Near-End SES Threshold in Outgoing Direction
   This parameter describes the Section/RS Near-End SES threshold value for the outgoing (egress) direction. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severly errored. The default value depends on the interface standard and may differ between SDH and SONET.
   Type: numeric value set
   Range (superset of allowed ranges for SDH and SONET): 1 – 64000
   Default:
   The default values differ for SDH and SONET and the different rates:
   - SDH (all rates): 2400
   - SONET OC48: 2392
9. **`rstimmon`** – RS TIM Monitor Enable
   For ENT-OC48T Notification this parameter refers to the incoming (ingress) direction.
   Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
   This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
   Type: Alphanumeric value set.
   Range:
   - ENABLE: enable TIM Monitor
   - DISABLE (default): disable TIM Monitor

10. **rstimmon**out – RS TIM Monitor Enable in Outgoing direction
Regenerator Section Trace Identifier Mismatch Monitor enable (J0) in outgoing (egress) direction. This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
Type: Alphanumeric value set.
Range: ENABLE – enable TIM Monitor, DISABLE (default) – disable TIM Monitor

11. **servcond** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.

12. **sltca** – Section and Line TCA Profile Pointer
Definition of the section and line threshold crossing alarm profile pointer.
Type: Alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.

13. **sonet** – SONET ASAP
This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH Alarm Severity Assignment Profile for SDH ports (*sdhpn*) to be compatible with current generation applications.
Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.

14. **spm** – Section PM Enable
For ENT-OC48T this parameter refers to the incoming (ingress) direction.
Enable or disable regenerator section (section) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

15. **spmout** – Section PM Enable in Outgoing Direction
Enable or disable section performance monitoring for the outgoing (egress) direction.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE (default).

16. **strcfmt** – Format of incoming J0
    For ENT-OC48T this parameter refers to the incoming (ingress) direction.
    The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
    Type: Numeric string.
    Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
17. **strcfmtout** – Format of outgoing J0
    The read format of J0 in outgoing (egress) direction, the outgoing section trace (*strcout*) and the expected section trace (*exprstrcout*).
    Type: Numeric string.
    Range:
    - 1, for specific repeating byte (SONET)
    - 2 (default), for non-specific repeating byte (ITU/ETSI mode 2)
    - 16, for 16 byte specific string (ITU/ETSI mode 1)
    - 64, for 64 byte string (SONET).

Example output

```
   UNITE-NE 00-11-20 8:01:03
A  611 REPT DBCHG
   ”Time=8-00-30,DATE=00-11-20:DLT-OC48T:1-1-#-#-4-1
;
```

ENT-OC192 notification

Output format

Syntax: **ENT-OC192**:*aid*::*spec_block*

Output parameters

Command parameters

1. **aid** – Access Identifier
   Access Identifier of the OC192 port.
   Type: AID.
   Range: SPortAID of OC192 port.
   The keyword **all** is not allowed.

Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This parameter is supported by ports of *portClass* INNI.
   This parameter is supported by ports of *portClass* ENNI.
   Type: Numeric string.
   Range: 1(default)…65535
2. **brstintvl**– Bursty Interval
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **brstthr** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.
4. **clientNodeID** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
This parameter is supported by ports of *portClass* UNI.
Type: IPv4 format: Four dot separated numeric string.
Range: Each numeric string: 0…255
Default: 0.0.0.0

5. **`crstat`** – Constituent Rates Status list
This parameter shows the rates of the port signals. It is the pointer processor setup if adaptive mode (*trbmd* = ADAPTIVE) is selected.
When switching *trbmd* from FIXED to ADAPTIVE or when creating a port newly *crstat* inherits the current value of *inputsig* until the system delivers an up-to-date value from the pointer processor. If no value is available from the pointer processor the latest known value is retained.
For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the tributary input rate signal list.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 1, 3, 12, 48, 192 representing STS1, STS3C, STS12C, STS48C, STS192C.

6. **`exprstrc`** – Value of Expected J0
Expected regenerator section trace identifier.
The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
Type: Hexadecimal digits
Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 89hex followed by 15 bytes 00hex

7. **`fec`** – FEC Enable
Forward Error Correction Enable. Enable to include the FEC information in the outgoing signal.
Type: Alphanumeric value set.
Range:
DISABLE (only) for:
   - OC192 / STM64 Intermediate Reach / Short Haul 1550 nm optics
   - OC192 / STM64 intermediate reach / SH 32 colour passive WDM compatible optics
   - OC192 / STM64 Long Reach / Long Haul 1550 nm optics
   - OC192 / STM64 low cost intra office 1310 nm optics

- OC192 / STM64 client ports (related to OTN ports)
- Basic OC768 / STM256 low cost intra office (2 km).

ENABLE / DISABLE for:

- OC192 / STM64 OLS800G compatible 80 colour optics
- OC192 / STM64 OLS Xtreme compatible 128 colour optics 40G
- OC768 / STM256 Long Reach / Long Haul 1550 nm optics with strong FEC (80km)
- OC768 / STM256 OLS Xtreme compatible 64 colour optics (extended L band)

Default:

DISABLE (only) for:

- OC192 / STM64 Intermediate Reach / Short Haul 1550 nm optics
- OC192 / STM64 intermediate reach / SH 32 colour passive WDM compatible optics
- OC192 / STM64 Long Reach / Long Haul 1550 nm optics
- OC192 / STM64 client ports (related to OTN ports)
- OC192 / STM64 low cost intra office 1310 nm optics
- Basic OC768 / STM256 low cost intra office (2 km).

ENABLE / DISABLE for:

- OC192 / STM64 OLS800G compatible 80 colour optics
- OC192 / STM64 OLS Xtreme compatible 128 colour optics 40G
- OC768 / STM256 Long Reach / Long Haul 1550 nm optics with strong FEC (80km)
- OC768 / STM256 OLS Xtreme compatible 64 colour optics (extended L band)

8. **`felpm`** – Far-end Line PM Enable
   Enable or disable of the performance monitoring of the multiplex section.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
9. **`frcdus`** – Force to DUS
   Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
   Type: Alphanumeric value set.
   Range:
   - ENABLE , set a forced DUS/DNU
   - DISABLE (default), clear a forced DUS/DNU

10. **fsflpbkstat** – Far Side Facililiy Loopback Status
This parameter specifies the current far-side facility loopback status of the considered output *aid*.
A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
Type: Alphanumeric value set.
Range:
    - YES
    - NO (default).
11. **inputsig** – Tributary Input Signal Rate List
This parameter is a list of STSn rates across the port's bandwidth.
If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then *inputsig* is settable and retrievable as in fixed mode but does not influence the port behavior.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 1, 3, 12, 48, 192 representing STS1, STS3C, STS12C, STS48C or STS192C.
Default: 1921.
12. **istd** – Interface Standard
Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter istddflt.
Type: Alphanumeric value set.
Range: SDH.
Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).
13. **linkResCls** – Link Resource Class
The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set (4 bytes), every bit defining one link class
Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
Default: 00 for each alphanumeric character

14. **`localLinkID`** – Local Link IDentity
    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
15. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute "uniNetworkLPID", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: numeric value set.
    Range: 0 (default) to 4294967295
    The default value shall have the meaning of "no localLPID provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.
16. **`lpbk`** – Loopback
    This parameter specifies the current near-side loopback status of the considered output *aid*.
    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
    Type: Alphanumeric value set.
    Range:
    - YES
    - NO (default).

17. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
    The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1, STS3, STS12, STS48 or STS192 (default)
18. **`minNNXCRate`** – Minimum NN Cross Connect Rate
    The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range: STS1 (default), STS3, STS12, STS48 or STS192.
19. **`msrei`** – MS-REI mode
    Definition: An special extended MS REI mode is standardized for STM64/OC192 interfaces. To support the interworking with older STM64/OC192 interfaces the single byte mode (non-extended) should also be supported.
    Type: Alphanumeric value set.
    Range:
    - SINGLE
    - EXTENDED (default).
20. **`ndetmd`** – Neighbor Detection Mode
    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* INNI.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set.
    Range:
    AUTO, MAN
    Default:
    For *portClass* = INNI: AUTO
    For *portClass* = ENNI: MAN

21. **neighborASTNNodeID** – Neighbor ASTN Node Id
This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.

22. **neighborNodeID** – Neighbor Node Id
This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

23. **neighborPortID** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.
Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

24. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
    The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
25. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
    The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: IPv4 format: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
26. **`nelpm`** – Near-End Line PM Enable
    Enable or disable near-end multiplex section (near-end line) performance monitoring.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
27. **`networkTNAType`** – Network TNA Type
    The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: Alphanumeric value set.

Range:

- IPV4 (default)
- IPV6
- NSAP

28. **`networkTNAAddress`** – Network TNA Address
The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkTNAAddress", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number:
0000000000000000000000000000000000000000…
FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of "no TNA Address provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

29. **`och`** – optical channel enable
    Enable or disable of the optical channel. If the optical channel is disabled the further optical channel parameters don't have any impact on transmission.
    Type: Alphanumeric value set.
    Range:
    - for ports on OP10 packs, which support to enable or disable OCH: ENABLE: enable optical channel; DISABLE: disable optical channel
    - for ports on OP10 and OP40 packs, which cannot support OCH: DISABLE: disable optical channel
    - for ports on OP10 and OP40 packs, which only support OCH: ENABLE: enable optical channel
    - for client ports on packs which support OTN: DISABLE: disable, optical channel not applicable.

    Default:
    - for OP10 packs, which cannot support OCH: DISABLE
    - for OP40 packs, which cannot support OCH: DISABLE
    - for OP40 packs, which only support OCH: ENABLE
    - for client ports on packs which support OTN: DISABLE.
30. **`otnclient`** – OTN Client Port
    This parameter indicates whether the port is an OTN Client Port or an optical SDH/SONET port.
    Type: Alphanumeric value set.
    Range:
    - YES for OTN client port
    - NO for optical SDH/SONET port.
31. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
    This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
    Type: numeric value set.
    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):
    - STM-16/OC-48: 1 – 3072000
    - STM-64/OC-192: 1 – 12288000
    - STM-256/OC-768: 1 – 49152000.

    Default: The default values differ for SDH and SONET and the different rates:
    - STM16: 460800
    - STM64: 1843200

- STM256: 7372800
- SONET OC48: 2459
- SONET OC192: 9835
- SONET OC768: 39340.

32. **pmmsneses** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):
    - STM-16/OC-48: 1 – 3072000
    - STM-64/OC-192: 1 – 12288000
    - STM-256/OC-768: 1 – 49152000.

    Default: The default values differ for SDH and SONET and the different rates:
    - STM16: 460800
    - STM64: 1843200
    - STM256: 7372800
    - SONET OC48: 2459
    - SONET OC192: 9835
    - SONET OC768: 39340.

33. **pmode** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.
Range:
    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start. The value AUTO is only supported for optical SDH/SONET ports, i.e. not supported for client ports.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

    Default:
    - AUTO for optical SDH/SONET ports
    - NMON for client ports.

34. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of allowed ranges for SDH and SONET):1 – 64000
Default: The default values differ for SDH and SONET and the different rates:
    - SDH (all rates): 2400
    - SONET OC48: 2392
    - SONET OC192: 8554
    - SONET OC768: 22776.
35. **`polynomial`** – Optical Channel Scrambling Polynomial
This parameter is used by the Wavewrapper scrambler on the optical channel. This parameter is relevant only if the optical channel is enabled (och = ENABLE).
Type: numeric value set.
Range: 1x7 + x + 1; 2x16 + x12 + x3 + x + 1.
Default: 2.
36. **`portClass`** – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: Alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.
37. **`portControl`** – Port Control (PortAdministrative Mode)
The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
Type: Alphanumeric value set.
Range: NORMAL (default), LOCKOUT
38. **`propagationDelay`** – Propagation Delay
This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
propagationDelay is used by the ONNS application.
Type: Numeric string.
Range: 0(default) …255. The unit of this value is ″milliseconds″.

39. **`remAdvNodeID`** – Remote Advertised Node IDentity
    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition:
    The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
40. **`remLinkID`** – Remote Link IDentity
    The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
41. **`remRAID`** – Remote Routing Area IDentity
    The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
    The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
42. **`remTID`** – Remote TID
    The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* ENNI.
Type: TID or empty-string
Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
Default: empty string: ""

43. **rstimca** – RS TIM Consequent Action Enable
Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
Type: Alphanumeric value set.
Range:
    - ENABLE: enable consequent action for TIM
    - DISABLE (default): disable consequent action for TIM.
44. **rstimmon** – RS TIM Monitor Enable
Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.
Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
45. **sdsfmode** – Signal Degrade/Signal Fail Mode
The degraded state is detected in Burst or Poisson mode.
Type: Alphanumeric value set.
Range:
    - BURST
    - POISSON (default).
46. **sdthr** – Signal Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –5; –6; –7; –8; –9.
Default: –6.
47. **servcond** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.

48. **`sfthr`** – Signal Failure Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –5; –6; –7; –8; –9.
Default: –6.

49. **`sltca`** – Section and Line TCA Profile Pointer
Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
Type: Alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.

50. **`sonet`** – SONET ASAP
This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH Alarm Severity Assignment Profile for SDH ports (*sdhpn*) to be compatible with current generation applications.
Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.

51. **`spm`** – Section PM Enable
Enable or disable regenerator section (section) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

52. **`srlgList`** – Shared Risk Link Group Identities List
The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.

53. **`strcfmt`** – Format of incoming J0
    The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
    Type: Numeric string.
    Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
54. **`strcout`** – Value of outgoing J0
    This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
    If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
    Type: Hexadecimal digits.
    Range:
    - 1 byte string
    - 16 bytes string
    - 64 bytes string.

    Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
    Default: 01Hex
55. **`strcwfmt`** – Format of outgoing J0
    The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
    Type: Numeric string.
    Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

56. **`trbmd`** – Tributary mode
If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* and *unequiposig* have no effect. See definition of output parameter *trbmd* in "RTRV-STM16: Retrieve STM16 port" (p. 3-2899) for SDH equivalent.
Type: Alphanumeric value set.
Range:
    - ADAPTIVE
    - FIXED.

    Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400) command.
57. **`unequiposig`** – Unequipped Output Signal List
This parameter is a list of STSn rates across the port's bandwidth. It determines the rate(s) of the *unequipped* signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need to have the identical setting. Mixed rates for tx and rx side of the port is allowed. If *trbmd* is ADAPTIVE, then *unequiposig* is settable and retrievable as in fixed mode but does not influence the port behavior.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 1, 3, 12, 48 or 192 representing STS1, STS3C, STS12C, STS48C or STS192C.
Default: 1921 = all STS1 (fixed).

Example output

```
   UNITE-NE 00-11-28 08:00:30
A  001 REPT DBCHG
   "TIME=08-00-12,DATE=00-11-28:ENT-OC192:1-1-#-#-1-1::servcond=ENABLE,
      sdsfmode=POISSON,sdthr=-6,brstthr=30,....,istd=SONET,
inputsig=1921,unequiposig=1921"
;
```

ENT-OTU2 notification

Output format

Command syntax: **`ENT-OTU2`**:*aid::spec_block*;

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Access Identifier of an OTU2 port.
   Type: AID
   Range: OTNPortAID of OTU2 port.
   The keyword ″otall″ is not allowed.

Spec block parameters

1. **`expotutti`** – Expected OTU TTI
   Expected OTU trail trace identifier. The parameter indicates the Source Point Access Identifier (SAPI) of the expected OTU TTI.
   Type: Hexadecimal string (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).
   Range: 15 byte hexadecimal string
   Default: 15 bytes each with value 00.
2. **`fectype`** – FEC Type
   Forward error correction type.
   Type: Alphanumeric value set.
   Range: RS_FEC, V_FEC (default).
3. **`ochpm`** – OCH PM Enable
   Enable or disable optical channel performance monitoring.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default).
4. **`opwind`** – Optical Window
   Optical window (L-Band, C-Band) supported by the port.
   Type: Alphanumeric value set.
   Range: BAND_L for L-Band, BAND_C for C-Band.
5. **`opwl`** – Optical Wavelength
   Optical Wavelength in nanometers.
   Type: numeric value set
   Range:
   - 35 wavelengths in C-Band (1554.537 … 1568.362), i.e:

1554.537, 1554.940, 1555.343, 1555.747, 1556.151, 1556.555, 1556.959, 1557.363, 1557.768, 1558.173, 1558.578, 1558.983, 1559.389, 1559.794, 1560.200, 1560.606, 1561.013, 1561.419, 1561.828, 1562.233, 1562.640, 1563.047, 1563.455, 1563.863, 1564.271, 1564.679, 1565.087, 1565.496, 1565.905, 1566.314, 1566.723, 1567.133, 1567.542, 1567.952, 1568.362

- 93 wavelengths in L-Band (1568.773 … 1607.466), i.e:

  1568.773, 1569.183, 1569.594, 1570.005, 1570.416, 1570.828, 1571.239, 1571.651, 1572.063, 1572.476, 1572.888, 1573.301, 1573.714, 1574.127, 1574.540, 1574.954, 1575.368, 1575.782, 1576.196, 1576.610, 1577.025, 1577.440, 1577.855, 1578.270, 1578.686, 1579.102, 1579.518, 1579.934, 1580.350, 1580.767, 1581.184, 1581.601, 1582.018, 1582.436, 1582.854, 1583.271, 1583.690, 1584.108, 1584.527, 1584.946, 1585.365, 1585.784, 1586.203, 1586.623, 1587.043, 1587.463, 1587.884, 1588.304, 1588.725, 1589.146, 1589.568, 1589.989, 1590.411, 1590.833, 1591.255, 1591.678, 1592.100, 1592.523, 1592.946, 1593.369, 1593.793, 1594.217, 1594.641, 1595.065, 1595.489, 1595.914, 1596.339, 1596.764, 1597.189, 1597.615, 1598.041, 1598.467, 1598.893, 1599.320, 1599.746, 1600.173, 1600.600, 1601.028, 1601.455, 1601.883, 1602.311, 1602.740, 1603.168, 1603.597, 1604.026, 1604.455, 1604.885, 1605.314, 1605.744, 1606.174, 1606.605, 1607.035, 1607.466

6. **`otnasap`** – OTN ASAP
   OTN Alarm Severity Assignment Profile. This parameter retrieves the ASAP profile name of type OTN to which the designated AID points.
   Type: Alphanumeric string A hyphen (“-”) is allowed in the name additionally.
   Range: DEFAULT.
7. **`otutimca`** – OTU TIM Consequent Action Enable
   OTU Trail Trace Identifier Mismatch consequent action enable. The parameter *otutimca* shall enable or disable the TIM consequent action. In addition, to the TIM consequent action also the TIM detection is enabled or disabled.
   Type: Alphanumeric value set.
   Range: ENABLE: enable consequent action for TIM (default), DISABLE: disable consequent action for TIM.
8. **`pmode`** – Port Mode
   This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
   Type: Alphanumeric value set.
   Range:
   - AUTO (default):
     indicates that, when a signal is detected at the port, then alarm monitoring will start.
   - MON:
     indicates that alarm monitoring is taking place on the port.
   - NMON:
     means that alarm monitoring is not occurring on the port.

9. **`ptype`** – Port Type
   This parameter identifies the port type of the AID.
   Type: Alphanumeric value set.
   Range: OTU2
   `txenable` – Optical Output Enable
   Optical output enabling.
   Type: Alphanumeric value set.
   Range:
   - DISABLE (default): optical output disabled
   - ENABLE: optical output enabled.
10. **`votutti`** – Value of outgoing OTU TTI
    Value of the transmitted OTU Trail Trace Identifier. The parameter indicates the Source Point Access Identifier (SAPI) of the transmitted OTU TTI.
    Type: Hexadecimal string (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).
    Range: 15 byte SAPI (Source Access Point Identifier).
    Default: 15 bytes each with value 00.

Example input/output

```
   UNITE-NE 06-06-30 08:00:30
A  001 REPT DBCHG
   ″TIME=08-00-12,DATE=06-06-30:ENT-OTU2:1-1-#-#-1-1::
      expotutti=000000000000000000000000000000,fectype=V_
      FEC,ochpm=ENABLE,opwind=BAND_
      L,opwl=1569.183,otuasap=DEFAULT,otutimca=DISABLE,pmode=MON,ptype=OTU2,txenable=ENABLE,vot
;
```

ENT-OUC: Enter ONNS to UPSR/SNCP constructs

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 3

Abortable: No.

Input format

Command syntax:

ENT-OUC:*tid:wrk_aid,prt_aid:ctag::[ouc_dir][:spec_block];*

NOTE: The time between ONNS path creation (see "ENT-PATH: Create ONNS path connection" (p. 3-1701)) and executing the **ENT-OUC** command should be more than five seconds.

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **wrk_aid** – Working Tributary Access Identifier
   This parameter specifies the working tributary of the OUC.
   Type: STS1NumAID
   Range: n.a. (**all** values shall never occur as part of an output parameter)
3. **prt_aid** – Protection Tributary Access Identifier
   Protection Tributary Access Identifier. Specifies the protection tributary of the OUC.
   Type: STSNumAID
   Range: n.a. (**all** values shall never occur as part of an output parameter)
4. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.
5. **ouc_dir** – OUC Directionality
   Directionality of the OUC
   Type: Alphanumeric value set.

Range:

- BIDIR (default)
- UNIDIR-ADD
- UNIDIR-DROP.

Spec block parameters

1. **`htmr`** – Hold Off Timer
   This parameter specifies the hold-off time for automatic protection switching used by the protection state machine of the path protection groups created via OUC creation.
   Type: numeric string [ms]
   Range: 0 -.. 99 ms in 1 ms steps and 100 ..- 10000 ms in100 ms steps
   Default: 0
2. **`rme`** – Revertive Mode Enable
   This parameter specifies, whether revertive or non-revertive mode is used as operation mode of the protection groups created via OUC creation. The value ENABLE is used if the protection operates in revertive mode. The value DISABLE is used if the protection operates in non-revertive mode.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default).
3. **`snctype`** – SNCP Type
   This parameter specifies the type of the path protection w.r.t. switch criterias used by the protection state machine of the path protection groups created via OUC creation.
   The value SNCI (Inherent) is used if server signal fail is used as switch criteria.
   The value SNCN (Non-Instrusive) is used if server signal fail and defects supervised by a non-intrusive path monitor are used as switch criteria
   The value NA is used if the tributary inputs are related to ports operating in SONET mode.
   Type: Alphanumeric value set.
   Range: SNCI, SNCN, NA
   Default:
   - SNCN, if affected tributaries are related to ports operating in SDH mode
   - NA, if affected tributaries are related to ports operating in SONET mode.
4. **`wtr`** – Wait To Restore Time
   This parameter specifies the wait to restore time used by the protection state machine operating in revertive mode of the path protection groups created via OUC creation.
   Type: numeric string [minute]
   Range: 0 – 60.
   Default: 5

Output format

If the **ENT-OUC** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

When setting up an OUC via ENT-OUC immediately after having setup the underlying ONNS connection via ENT-PATH, there should be a waiting time of at least 5 seconds between both these commands. If there is not enough time between both commands, the **ENT-OUC** command might be denied with "SNVS – Status, Not in Valid State, No matching NN cross-connection existing on working tributary" and would need to be repeated in such a case.

Example input/output

A bidirectional OUC between working tributary 4 of a 10G SDH EDGE port in slot 01 and protection tributary 7 of 2G5 SDH EDGE port 3 in slot 34 will be established by:

```
ENT-OUC:UNITE-NE:1-1-#-#-1-1-4,1-1-#-#-34-3-7:123456::BIDIR:
htmr=3000,rme=ENABLE,snctype=SNCI,wtr=10;

   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

A unidirectional drop OUC between working tributary 4 of 2G5 SONET EDGE port 1 in slot 10 and protection tributary 7 of 2G5 SONET EDGE port 3 in slot 34 will be established by the following command: (note that spec block parameter *snctype* can be omitted in the SONET case and spec block parameter *wtr* can be omitted due to *rme* being DISABLE)

```
ENT-OUC:UNITE-NE:1-1-#-#-10-1-4,1-1-#-#-34-3-7:123456::UNIDIR-
      DROP:htmr=3000,rme=DISABLE;

   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

A unidirectional add OUC between working tributary 2 of a 10G SONET EDGE port in slot 10 and protection tributary 3 of 2G5 SONET EDGE port 3 in slot 34 will be established by the following command: (note that for a UNIDIR-ADD OUC no path protection group from the EDGE tribs towards the INNI trib(s) is needed and thus none will be created. A UNIDIR-ADD OUC just consists of one-way point-to-point cross-connections and possible path-protected cross-connections from the INNI trib(s) to the EDGE tribs)

```
ENT-OUC:UNITE-NE:1-1-#-#-10-1-2,1-1-#-#-34-3-3:123456::UNIDIR-ADD;
```

```
   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

Error responses

Validation rule: Tributaries must exist

OUC command processing shall verify the tributaries specified in the command do exist.

Error code:

`IENE – Input, Entity Not Exists, Specified tributary/tributaries do not exist`

Validation rule: Tributaries must belong to ports of *portClass* EDGE

OUC command processing shall verify, that both affected tributaries belong to ports of *portClass* EDGE.

Error code:

`SNVS – Status, Not in Valid State, Tributaries must be on ports of portClass EDGE`

Validation rule: Tributaries must belong to ports of equal interface standards

OUC command processing shall deny requests to establish OUCs where the ports of the tributaries are not provisioned for the same standard, either SONET or SDH – this is due to different switching criteria.

Error code:

`SNVS – Status, Not in Valid State, Different interface standards for working and protection tributaries`

Validation rule: Tributaries must not belong to ports of tributary mode ADAPTIVE

OUC command processing shall deny requests to establish OUCs where one or both ports of the tributaries are provisioned for the tributary mode ADAPTIVE.

Error code:

`SNVS – Status, Not in Valid State, port(s) for OUC in adaptive mode`

Validation rule: Tributaries must not be VCG tributaries

OUC command processing shall verify, that both affected tributaries are no VCG tributaries.

Error code:

```
IDNC – Input, Data Not Consistent, VCG-trib as input-trib in
pathprotected crossconnection
```

Validation rule: SNC Type must comply with interface standard of affected EDGE ports

OUC command processing shall deny requests to establish OUCs when a value for parameter SNC Type is given, that does not comply with the interface standard of the affected EDGE ports.

Error code:

```
SNVS – Status, Not in Valid State, Parameter value for SNC Type not
compliant to interface standard of working and protection tributaries
```

Validation rule: NN connection of matching directionality must exist on working tributary

OUC command processing shall deny requests to establish OUCs, if on the working tributary given no NN connection exists, which is of the same directionality as the OUC requested.

Error code:

```
SNVS – Status, Not in Valid State, No matching NN cross-connection
existing on working tributary
```

This means, that on a bidirectional NN connection only a bidirectional OUC can be established, while it would be possible to establish two different unidirectional OUCs on two unidirectional NN connections using the same tributary.

Validation rule: No interfering cross-connection or OUC must exist on protection tributary

OUC command processing shall deny requests to establish OUCs, if on the protection tributary given any cross-connection and/or OUC already exists interfering with the directionality of the OUC requested.

Error code:

```
SNVS – Status, Not in Valid State, Interfering cross-connection
existing on protection tributary
```

This means, that the protection tributary must not be blocked by any cross-connection at all if a bidirectional OUC is requested, and that it must not be blocked by a unidirectional add (drop) cross-connection, if a unidirectional add (drop) OUC is requested. A unidirectional add (drop) OUC would be allowed, if e.g. the tributary is blocked only by a unidirectional drop (add) cross-connection.

To be blocked by a cross-connection means for a tributary, that there must not be a cross-connection existing directly on that trib, that the trib must not be part of a cross-connection of higher bandwidth and that no ″part″ of the trib must be blocked by a cross-connection of smaller bandwidth.

Normally a protection tributary being blocked by an OUC is obviously also blocked by the cross-connections associated to this OUC. During creation of an OUC, however, there is a certain period of time, where the OUC alredy exists while the associated cross-connections do not exist yet. Also in these cases this validation will be applied, i.e. in case of creating two OUCs allocating the same protection tributary quick order, the creation of the second OUC will be rejected with this validation.

Validation rule: No OUC must already exist on working tributary to different protection tributary

OUC command processing shall deny requests to establish OUCs, if on the working tributary an OUC already exists to a different protection tributary.

Error code:

`SNVS – Status, Not in Valid State, OUC to different protection tributary already exists`

This means, that it is not possible to e.g. establish a unidirectional add OUC between a working and a protection tributary and a unidirectional drop OUC between the same working and a different protection tributary.

Validation rule: No conflicting OUC must already exist between working and protection tributary

OUC command processing shall deny requests to establish OUCs, if between the working and the protection tributary an OUC already exists that cannot coexist with the OUC requested.

Error code:

`SNVS – Status, Not in Valid State, Conflicting OUC already exists`

This covers the following cases:

- No additional OUC can be established, if a BIDIR OUC is already existing between both tribs.
- No BIDIR OUC can be established, if a UNIDIR-ADD or UNIDIR-DROP OUC is already existing between both tribs.
- No UNIDIR-ADD or UNIDIR-DROP OUC can be established, if an OUC of equal directionality is already existing between both tribs.

Due to internal system architecture there may be a state of an OUC, where it is still existing for some time after it has been deleted, before the deletion is really completed. In such a state the OUC will still be reported after RTRV-OUC. While such an OUC is existing, commands to create a new OUC on the affected working tributary or to again delete this OUC may be rejected inconsistently with error codes defined. No special validations and error codes are defined for this case.

Validation rule: Affected EDGE ports must not be in a line or equipment protection scheme

OUC command processing shall deny requests to establish OUCs, if one or both of the EDGE ports affected is involved in a line protection scheme like MSP or BLSR/MS-SPRing or an equipment protection scheme.

Error code:

`SNVS – Status, Not in Valid State, EDGE ports must not be in line or equipment protection schemes`

Validation rule: Affected EDGE port the EDGE-prt tributary is located on must not be in LOCKOUT state

OUC command processing shall deny requests to establish OUCs, if the EDGE port the EDGE-prt tributary is located on is in LOCKOUT state.

Error code:

`SNVS – Status, Not in Valid State, EDGE port carrying EDGE-prt must not be in LOCKOUT`

Validation rule: No path protection group parameters must be given for Setup of a unidirectional-add OUC

OUC command processing shall deny requests to establish unidirectional-add OUCs, if any path protection group parameter is given.

Error code:

`IDNV – Input, Data Not Valid, No path protection group parameters allowed for directionality UNIDIR-ADD`

Validation rule: No forced XC loopback must exist on EDGE-wrk tributary

OUC command processing shall deny requests to establish an OUC if, on the EDGE-wrk tributary, a forced cross-connection loopback exists.

Error code:

`SNVS – Status, Not in Valid State, XC loopback exists on EDGE-wrk or EDGE-prt tributary`

Validation rule: No forced XC loopback must exist on EDGE-prt tributary

OUC command processing shall deny requests to establish an OUC if, on the EDGE-prt tributary, a forced cross-connection loopback exists.

Error code:

`SNVS – Status, Not in Valid State, XC loopback exists on EDGE-wrk or EDGE-prt tributary`

ENT-OUC notification

The ENT-OUC notification will notify only the creation of the OUC itself. Cross-connections and path protection groups that are created implicitly via an OUC creation is notified via corresponding ENT-CRS-modifier and ENT-PROTN-GRP notifications.

Output format

Syntax:

ENT-OUC:*wrk_aid,prt_aid:ouc_dir,ouc_rate;*

Output parameters

Command parameters

1. **wrk_aid** – Working Tributary Access Identifier
   This parameter specifies the working tributary of the OUC.
   Type: STS1NumAID
   Range: n.a. (*all* values shall never occur as part of an output parameter)
2. **prt_aid** – Protection Tributary Access Identifier
   This parameter specifies the protection tributary of the OUC.
   Type: STSNumAID
   Range: n.a. (*all* values shall never occur as part of an output parameter)
3. **ouc_dir** – OUC Directionality
   Directionality of the OUC
   Type: Alphanumeric value set.
   Range:
   - BIDIR (default)
   - UNIDIR-ADD
   - UNIDIR-DROP
4. **ouc_rate** – OUC Rate
   The parameter *ouc_rate* indicates the rate of the OUC, which is determined by the cross-connection rate of the associated cross-connections. For a detailed description please refer to parameter rate in RTRV-CRS.
   Type: Alphanumeric value set.
   Range:
   - VC3
   - VC4
   - VC44C
   - VC416C
   - VC464C
   - STS1

- STS3
- STS12
- STS48
- STS192

;
```

ENT-PATH: Create ONNS path connection

Overview

Create an ONNS path connection with specified connection bandwidth between two client devices connected to the optical network using ONNS ports on ONNS controlled Host NE nodes with a specified protection class.

An ONNS connection may include multiple paths as in the case of a Network 1+1 connection that contains an active path and a standby path, each with its own pathID. An ONNS path is a path that connects two client EDGE ports on specified tribs through a series of NE nodes from a source node to a destination node to provide a communication service.

It is also possible to create multiple ONNS path connections of equal bandwidth, characteristics and constraints with one command, if all connections of such a group start at VCGTRIBs of one and the same VCG port and also end at VCGTRIBs of one single second VCG port.

It is also possible to create an M:N protected NN connection group with one command leading to the setup of numbers of working and protecting connections of equal bandwidth, characteristics and constraints according to a specified protection ratio M:N given in the command.

It is also possible to add a connection to an existing M:N protected NN connection group. The requested working connection has the same bandwidth, characteristics and constraints as the existing connection of the M:N protected connection group. A protection connection is setup according to the protection ratio M:N given by the selective existing M:N protected connection group.

The creation of ONNS connection via ENT-PATH is not allowed for source and/or destination ports of portclass UNI.

ENT-PATH-AUTO: Create auto-reroute ONNS connection. The **`ENT-PATH-AUTO`** command is used to establish an auto-reroute transmission connection between two Host NE EDGE ports. The **`ENT-PATH-AUTO`** command can be used to setup groups of auto-reroute protected connections.

ENT-PATH-N1PLUS1: Create 1+1 protected ONNS connection. The command **`ENT-PATH-N1PLUS1`** is used to establish a 1+1 protected transmission connection between two Host NE EDGE ports. The command **`ENT-PATH-N1PLUS1`** can be used to setup groups of 1+1 protected connections.

ENT-PATH-P1PLUS1NR: Create permanent 1+1 protected ONNS connection with non-revertive path restoration. The command **`ENT-PATH-P1PLUS1NR`** is used to establish a permanent 1+1 protected transmission connection with non-revertive path restoration (applied in case the worker or protection path fails) between two Host NE EDGE ports. The command **ENT-PATH-P1PLUS1NR** can be used to setup groups of permanent 1+1 protected connections with non-revertive path restoration.

ENT-PATH-UNPROT: Create unprotected ONNS connection. The **ENT-PATH-UNPROT** command is used to establish an unprotected transmission connection between two Host NE EDGE ports. The **ENT-PATH-UNPROT** command can be used to setup groups of unprotected connections.

ENT-PATH-YCONN: Create ONNS Y-connection. It is not possible to setup groups of Y-protected connections using the **ENT-PATH-YCONN** command. This is due to the fact, that Y-protection between VCGs does not make sense. The **ENT-PATH-YCONN** command is used to establish a Y-protected transmission connection between three Host NE EDGE ports.

ENT-PATH-MBYN: Create an M:N protected connection group of directional connections. The **ENT-PATH-MBYN** command is used to establish a number of working and protecting directional connections to form an M:N protected connection group.

ENT-PATH-MBYN: Add a connection to an existing M:N protected connection group. The **ENT-PATH-MBYN** command is used to add a working and a protecting connection (if the protection ratio demands this) to an existing M:N protected connection group. The existing M:N protected connection group is identified by its group identifier (nodeID&groupIndex).

The **ENT-PATH-protClass** command is used for the setup of adaptive ONNS connections. For the setup of adaptive ONNS connections, each parameter of the **ENT-PATH-protClass** command is applied for the adaptive ONNS connection as a whole and not for any separate constituent signal. Corresponding restrictions can be found in "Error responses" (p. 3-1739).

Properties

Login privilege: User Privilege Code: (UCFC/UCAL): P3

Abortable: No

Input format

Syntax of ENT-PATH-UNPROT

The **ENT-PATH-UNPROT** command is used to establish unprotected connections:

Command syntax: **ENT-PATH-UNPROT:***srcTid:[srcAid]:ctag::[srvID]:pdir:bandwidth:maxDelay:srcNID:srcPortID:destNID:destPortID:[nodeListUsage1,nodeList1]:[srlgExcludeList],[linkIncludeID][::specBlock]*;

Syntax of ENT-PATH-AUTO

The **ENT-PATH-AUTO** command is used to establish auto-rerouting connections:

Command syntax: **ENT-PATH-AUTO:***srcTid:[srcAid]:ctag::[srvID]:pdir: bandwidth:maxDelay:srcNID:srcPortID:destNID:destPortID: [nodeListUsage1,nodeList1]:[srlgExcludeList] ,[linkIncludeID] [::specBlock]*;

Syntax of ENT-PATH-N1PLUS1

The command **ENT-PATH-N1PLUS1** is used to establish 1+1 protected connections:

Command syntax: **ENT-PATH-N1PLUS1:***srcTid:[srcAid]:ctag::[srvID]:pdir: bandwidth:maxDelay:srcNID: srcPortID:destNID:destPortID: [nodeListUsage1,nodeList1]: [srlgExcludeList],[linkIncludeID]: [nodeListUsage2,nodeList2] [:specBlock]*;

Syntax of ENT-PATH-P1PLUS1NR

The command **ENT-PATH-P1PLUS1NR** is used to establish permanent 1+1 protected connections with non-revertive path restoration:

Command syntax:
ENT-PATH-P1PLUS1NR:*srcTid:[srcAid:ctag]::[srvID]:pdir:bandwidth:maxDelay:srcNID: srcPortID:destNID:destPortID:[nodeListUsage1,nodeList1]: [srlgExcludeList],[linkIncludeID]:[nodeListUsage2,nodeList2][:specBlock];*

Syntax of ENT-PATH-YCONN

The **ENT-PATH-YCONN** command is used to establish bridged Y-connections:

Command syntax: **ENT-PATH-YCONN:***srcTid:[srcAid]:ctag::[srvID]:pdir: bandwidth:maxDelay:srcNID: srcPortID:destNID,brDestNID: destPortID,brDestPortID:[nodeListUsage1,nodeList1]: [srlgExcludeList],[linkIncludeID]:[nodeListUsage2,nodeList2] [:specBlock]*;

Syntax of ENT-PATH-MBYN

The **ENT-PATH-MBYN** command is used to establish an M:N protected NN connection group or to add a worker connection to an existing M:N protection group:

Command syntax: **ENT-PATH-MBYN:**
srcTid:[srcAid]:ctag::[srvID]:[connID]:pdir:bandwidth:maxDelay: srcNID: srcPortID[,srcPortID1,...,srcPortID63]:destNID:destPortID[,destPortID1,..., destPortID63]:[nodeListUsage1,nodeList1]: [srlgExcludeList],[linkIncludeID]::specBlock;

REPT PTHCHG is generated

The **ENT-PATH** command shall generate a REPT-PTHCHG message.

REPT PTHCHG for groups of connections

The **ENT-PATH** command for groups of connections shall generate one separate REPT-PTHCHG message for each connection successfully setup.

Description

The ENT-PATH-*protClass* command is used to establish one or more optical transmission path(s) between two valid client routers or traditional nodes in the network that are attached to Host NE EDGE ports.

ENT-PATH creates an optical connection with specified connection bandwidth between two client devices connected to the optical network using ONNS ports / tribs on ONNS controlled Host NE nodes.

The *protClass* of the **ENT-PATH** command indicates what type of protection should be provided with the light path(s) to be established.

The path setup commands are:

- ENT-PATH-UNPROT
- ENT-PATH-N1PLUS1
- ENT-PATH-P1PLUS1
- ENT-PATH-YCONN
- ENT-PATH-AUTO
- ENT-PATH-MBYN

ENT-PATH-UNPROT sets up an unprotected path from source *srcNID*, *srcPortID* to destination *destNID*, *destPortID*. This is a basic ONNS connection with no ONNS protection response to failure except a REPT-PTHEVT. ENT-PATH-UNPROT shall set up a group of unprotected connections from srcNID, srcPortID to destination destNID, destPortID, if srcPortID specifies a list of VCG tributaries of one and the same EDGE VCG in *srcNID* and *destPortID* specifies an EDGE VCG in *destNID*.

For the setup of a group of unprotected connections with ENT-PATH-UNPROT the parameter grpSetupType can be used to specify, whether the total cost of all connections of the grouped setup or the number of routes taken by the connections of the grouped setup is minimized. This parameter is ignored, if the grouped setup actually only consists of the setup of one single unprotected connection, as in this case both alternatives will lead to equal results. This parameter shall also be ignored, if explicit routing is requested by setting parameter nodeListUsage1 to EXPLICIT, as also in this case both alternatives would make no difference.

ENT-PATH-AUTO sets up an auto-rerouting nonrevertive protected path.

ENT-PATH-AUTO, non-revertive: This is an ONNS nonrevertive auto-rerouting connection that ONNS will restore using ONNS mesh restoration techniques. The failed path will be bridged with a new path that satisfies all constraints applied to the connection. The new connection will be verified that it meets the service level agreements (SLA), and the failed path will be torn down. Link resources of the failed path will be returned to the available resource pool. ENT-PATH-AUTO, nonrevertive, shall set up a group of nonrevertive restoration protected connections from *srcNID*, *srcPortID* to destination *destNID*, *destPortID*, if *srcPortID* specifies a list of VCG tributaries of one and the same EDGE VCG in srcNID and *destPortID* specifies an EDGE VCG in *destNID*.

ENT-PATH-AUTO, revertive: This is an ONNS revertive auto-rerouting connection that ONNS will restore using ONNS mesh restoration techniques. The failed path will be bridged with a new path that satisfies all constraints applied to the connection. The new connection will be verified that it meets the service level agreements (SLA), and the resources of the original path will be kept. When the original path becomes good again, reversion takes place manually or automatically depending on the *switchback* parameter setting. The restoration path will be down after successful reversion. ENT-PATH-AUTO, revertive, shall set up a group of revertive restoration protected connections from *srcNID*, *srcPortID* to destination *destNID*, *destPortID*, if *srcPortID* specifies a list of VCG tributaries of one and the same EDGE VCG in *srcNID* and *destPortID* specifies an EDGE VCG in *destNID*.

ENT-PATH-N1PLUS1 sets up both paths of a network 1+1 protected connection. ONNS sets up two node disjoint and (if applicable) SRLG-diverse paths through the network that share a common ingress(/egress) port (/connPoint) on the source NE node and a common egress (/ingress) port (/connPoint) on the destination NE node. The N1PLUS1 setup shall support the setting of the path protection group parameters:

- revertive / non-revertive mode
- wait to restore timer
- hold off timer.

These parameters will be set consistently at both ends of the 1+1 connection in case of bidirectionality. The setup of the path protection group parameters via ENT-PATH-N1PLUS1 simplifies the provisioning of these parameters for ONNS 1+1 protection connections. These parameters are part of the path protection group and still provisionable via ED-PROTN-GRP. These parameters are not administrated by ONNS and for this reason are not specified as TL1 output parameters.

ENT-PATH-N1PLUS1 shall set up a group of 1+1 protected connections from *srcNID*, *srcPortID* to destination *destNID*, *destPortID*, if *srcPortID* specifies a list of VCG tributaries of one and the same EDGE VCG in *srcNID* and *destPortID* specifies an EDGE VCG in *destNID*.

ENT-PATH-P1PLUS1 shall set up both paths of a permanent 1+1 protected path. ONNS sets up two node disjoint and (if applicable) SRLG-diverse paths through the network that share a common ingress(/egress) port (/connPoint) on the source NE node and a common egress (/ingress) port (/connPoint) on the destination NE node. In case that the worker or protection path of this 1+1 protection connection fails a new non-revertive autoreroute path will be setup.

ENT-PATH-P1PLUS1 shall set up a group of permanent 1+1 protected connections from *srcNID*, *srcPortID* to destination *destNID*, *destPortID*, if *srcPortID* specifies a list of VCG tributaries of one and the same EDGE VCG in *srcNID* and *destPortID* specifies an EDGE VCG in *destNID*.

ENT-PATH-YCONN sets up both paths of a bridged Y-connection from one source NE node to two different destination NE nodes. ONNS sets up two node disjoint and (if applicable) SRLG-diverse paths through the network that share a common ingress(/egress) port (/connPoint) on the source NE node, but terminating at two different destination NE nodes with its own egress(/ingress) port (/connPoint).

ENT-PATH-MBYN shall set up a group of connections consisting of a number of working connections and a number of protecting connections from source *srcNID* with a list of tributaries to destination destNID with a list of tributaries.

The list of tributaries are given as:

- a list of *srcPortIDs* with a single, a list or a range of tributaries per *srcPortID* for the source
- one *srcPortID* with a list or a range of tributaries for the source
- a list of *destPortIDs* with a single, a list or a range of tributaries per *destPortID* for the destination
- one *destPortID* with a list or a range of tributaries for the destination.

ENT-PATH-MBYN shall add one working connection to an existing M:N protected connection group identified by its connection group identity (nodeIDgroupIndex) from source *srcNID*, *srcPortID* to destination *destNID*, *destPortID*. The requested working connection shall have the same bandwidth, characteristics and constraints as the existing connections of the M:N protected connection group. A protection connection is setup according to the protection ratio M:N given by the existing M:N protected connection group if necessary.

User Defined Connection Alias: A user defined connection alias (an alternate name) may be optionally specified with the **`ENT-PATH`** command. The alias is specified in the spec block via the parameter *connAlias*. If *connAlias* is not specified, the system will treat it as NULL. If the specified *connAlias* already exists in the source node, the command will be denied. *connAlias* is also returned as an output parameter. If none was defined a NULL is returned.

User Defined Connection Alias when setting up VCG connection groups: If a user defined connection alias (an alternate name) is specified with an ENT-PATH command setting up a group of connections, this alias is inherited to the connections of the group in the following way for VCG connection groups: Each connection shall get as connection alias the alias given in the command appended by "_" (underscore) and the tributary number of the corresponding tributary in the A-node (consisting of 3 digits), i.e. 4 characters are appended to the connection alias string. If the string resulting from appending the 4 characters to the alias string given in the command would exceed the total length allowed for a connection alias, the original string given in the command will first be truncated at its tail by such a number of characters, so that the length of the resulting connection alias (i.e. appended by 4 characters) will have the maximum length allowed. If such a connection alias will not be unique any more in the node, the setup of the corresponding connection is denied.

Example:

The following connection alias is supposed to have maximum length allowed: "Thisisalong connection alias…thisisalongconnectionalias". If given as alias in a group setup command, the aliases for the connections of this group would then look as follows:

"Thisisalong connection alias…thisisalongconnectional_001"

"Thisisalong connection alias…thisisalongconnectional_002"

…

"Thisisalong connection alias…thisisalongconnectional_190"

User Defined Connection Alias when setting up M:N connection groups: If a user defined connection alias (an alternate name) is specified with an ENT-PATH command setting up a group of connections, this alias is inherited to the connections of the group in the following way for M:N protected connection groups: Each working connection shall get as connection alias the alias given in the command appended by "_wrk_" and an index unique within the working connections in the group (consisting of 3 digits with leading zeroes), i.e.8 characters are appended to the connection alias string. Each protecting connection shall get as connection alias the alias given in the command appended by "_prt_" and an index unique within the protecting connections in the group (consisting of 3 digits with leading zeroes), i.e. 8 characters are appended to the connection alias string. If the string resulting from appending the 6 to 8 characters to the alias string given in the command would exceed the total length allowed for a connection alias, the original string given in the command will first be truncated at its tail by such a number of characters, so that the length of the resulting connection alias (i.e. appended by 8 characters) will have the maximum length allowed. If such a connection alias will not be unique any more in the node, the setup of the corresponding connection group is denied.

User Defined Connection Alias when adding M:N connections: If a user defined connection alias (an alternate name) is specified for a connection extension of a M:N protection group, this alias is inherited to the added connection of the group in the following way: The added working connection shall get as connection alias the user defined alias appended by ″_wrk_″ and a free index unique within the working connections with the same alias (consisting of 3 digits with leading zeroes), i.e. 8 characters are appended to the connection alias string.

A possible new protecting connection shall get as connection alias the user defined alias appended by ″_prt_″ and a free index unique within the protecting connections with the same alias (consisting of 3 digits with leading zeroes), i.e. 8 characters are appended to the connection alias string. If the string resulting from appending the 6 to 8 characters to the alias string given in the command would exceed the total length allowed for a connection alias, the original string given in the command will first be truncated at its tail by such a number of characters, so that the length of the resulting connection alias (i.e. appended by 8 characters) will have the maximum length allowed.

The creation of ONNS connection via ENT-PATH is not be allowed for source and/or destination ports of *portclass* UNI.

Input parameters

Command parameters

1. **`protClass`** – (modifier of ENT-PATH)
   Path protection class defines the type of restoration protection assigned to the path connection during path setup.
   UNPROT: path from source to destination is un-protected.
   AUTO: path from source to destination is auto-reroute path connection.
   N1PLUS1: paths from source to destination is set up as a network 1+1 connection.
   YCONN: paths from the same source to two different destinations are set up as a bridged connection.
   MBYN: group of M:N protected working and protecting paths from the same source node to the same destination node.
   P1PLUS1NR: paths from source to destination is set up as a permanent 1+1 protected connection with an additional non-revertive restoration path in case the worker or protection path fails.
2. **`srcTid`**
   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
3. **`srcAid`**
   Source node ONNS application access identifier of the ONNS controller OS command interface port.
   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn.

4. **ctag** – Correlation Tag
   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing “.”).
5. **srvID** – Service Identifier
   This parameter is a logical tag for the group of connections associated with a service defined by the Service Manager system (or other management entity).
   The *srvID* parameter is an integer value range = 1 – 20,000,000. Only one *srvID* is accepted. ALL is not supported.
6. **connID** – Connection ID
   See definition of the M:N protection group index of the input parameter *connID* in RTRV-PATH. Only relevant for MBYN.
   The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x.
7. **pdir** – Path Direction Topology
   Unidirectional A-Z (1WAY) or Bidirectional (2WAY).
   For connections of *protectionClass* MBYNWRK and MBYNPRT only the path direction topology Bidirectional (2WAY) is supported.
   Type: Value set.
   Range: 1WAY (default), 2WAY
8. **bandwidth** – Requested bandwidth / signalRate
   ONNS bandwidth is equal to or greater than the minimum cross connect rate (minXCrate) of the port type. Note: Only SONET switching levels in enumeration. For actual cross-connections ONNS adapts to SDH formats automatically if the ingress port is SDH.
   Type: Value set.
   Values: STS1, STS3, STS12, STS48, STS192.
9. **maxDelay** – Maximum transport delay
   Maximum transport delay through all nodes in the path. Total path delay must not exceed this value.
   Range: 0 (default), is used to select no delay limit; >0, maximum transport delay in milliseconds.
10. **srcNID** – Source nodeID
   ONNS source nodeID. Together with the following srcPortID field defines the associated Ingress connPoint that connects the source node to the edge/gateway switch or client router.
   Range: Four dot separated numeric strings. 0 – 255 for each numeric string.

11. **`srcPortID`** – Source PortID
ONNS source node ingress portID. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # of the *srcNID* ingress *connPoint*. ONNS assumes a bidirectional port pair.
Value: dash-separated list of 5 numeric strings
Example: 1-1-3-1-4
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 192).
Range, if port # specifies a VCG: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 9), Tributary # List (Any sequence of Tributary # or Tributary # Range sep. by & and in ascending order), Tributary # Range (Tributary#1&&Tributary#2), Tributary # (1 – 192).
Example: 1-1-15-6-1&3&5&&7&9&13&&18&21. The port AID 1-1-15-6 must denote a VCG.
Range, if protClass is equal ″MBYN″: Bay/Frame #(1), Shelf #(1), Slot/Pack #(1..39), Port #(1..16), Tributary # List (Any sequence of Tributary # or Tributary # Range sep. by &). Tributary # Range (Tributary#1&&Tributary#2). Tributary #(1..768).
Example: 1-1-3-1-1&2&8&13&&18&6&20&3&&5. The port AID 1-1-3-1 must not be a VCG In this example the bandwidth is supposed to be VC3/STS1
If *protClass* is equal ″MBYN″ the *srcPortID* can be a list up to 64 *portIDs*. If *protClass* is equal ″MBYN″ and a valid M:N *groupID* in the *connID* parameter was given only one *srcPortID* with one tributary is allowed.

12. **`destNID`** – Destination nodeID
ONNS destination nodeID. Together with the following *destPortID* field defines the associated Engress *connPoint* that connects the destination node to the edge/gateway switch or client router.
Type: Four dot separated numeric strings. 0 – 255 for each numeric string.

13. **`destPortID`** – Destination PortID
ONNS destination node egress portID. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # of the destNID egress *connPoint*.
Value: dash-separated list of 5 numeric strings
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 192).
Range, if Port # specifies a VCG: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 9), Tributary # (ALL).
The ALL qualifier for Tributary # in *destPortID* must be given, when a Tributary # List with more than 1 entry is given in *srcPortID*.
Range, if *protClass* is equal ″MBYN″: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1..39), Port # (1..16), Tributary # List (any sequence of Tributary # or Tributary # Range separated by &), Tributary # Range (Tributary#1&&Tributary#2), Tributary # (1..768).

Example: -1-3-1-1&2&8&13&&18&6&20&3&&5. The port AID 1-1-3-1 must not be a VCG. In this example the bandwidth is supposed to be VC3/STS1.
If *protClass* is equal ″MBYN″ the *destPortID* can be a list up to 64 portIDs. If *protClass* is equal ″MBYN″ and a valid M:N *groupID* in the *connID* parameter was given only one destPortID with one tributary is allowed.

14. **`brDestNID`** – Bridged Destination NodeID
ONNS bridged destination nodeID. Together with the following brDestPortID field defines the second associated Egress connPoint that connects the destination node to the edge/gateway switch or client router in case of protectionClass YCONN.
Type: Four dot separated numeric strings. 0 – 255 for each numeric string.

15. **`brDestPortID`** – Bridged Destination PortID
ONNS bridged destination node egress *portID* in case *protectionClass* = YCONN. The *portID* consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # of the brDestNID egress connPoint. 4.1; 5; 6
Value: dash-separated list of 5 numeric strings
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).

16. **`nodeListUsage1`** – Node List Usage 1
For connection setup NN used/uses the list of nodes included in the *nodeList1* array block in a manner specified by the *nodeListUsage1* variable. Both, *nodeListUsage1* and *nodeList1*, fields belong together and is reported when supplied as input to the **`ENT-PATH`** command.
An EXCLUDE list usage applies to all paths created (as in a N1PLUS1NR or N1PLUS1RV). A non-existent *nodeID* will be ignored in EXCLUDE *nodeList1* during path setup. A non-existent *nodeID* will cause setup failure in EXPLICIT *nodeList1* during path setup.
Range:
    - EXPLICIT, *nodeList1* contains the intermediate NE nodes of the path in the explicit order they are to be used. (An empty list will force a direct path from source to destination.)
    - EXCLUDE, nodes in the *nodeList1* must all be excluded from the path created. In the case when the *protectionClass* is either YCONN, N1PLUS1NR or N1PLUS1RV the nodes in the *nodeList1* below also apply to the second or restoration path.

17. **`nodeList1`** – Node List 1
When *nodeListUsage1* = EXPLICIT: List of intermediate nodes that specify the path in the exact node order specified in the input. Source and destination nodes are assumed to be included implicitly. The *nodeID* values are shown in the form: nid1([&nid2& …&nidx]).
When *nodeListUsage1* = EXCLUDE: List of nodes that must all be excluded from both paths. The *nodeID* values are shown in the from: nid1([&nid2& …&nidx]).
If the preceding required *nodeListUsage1* field is not supplied, this field must not be present. If user specifies empty EXCLUDE *nodeList1*, the connection should use indirect path from source node to destination node (i.e., at least one intermediate

node is needed). If user specifies empty EXPLICIT *nodeList1*, the connection should use a direct path from source to destination node (i.e., no intermediate node is allowed).
Type: &-separated list of nodeIDs. A *nodeID* is represented as four dot separated numeric string with each numeric string between 0 – 255.
Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123
Range: nid1([&nidx])* or empty list (where X <= 25 when *nodeListUsage1* = EXPLICIT) (where X <= 25 when *nodeListUsage1* = EXCLUSIVE)

18. **`srlgExcludeList`** – SRLG Exclude List
List of Shared Risk Link Group identifiers that are to be used to exclude links from the connection path(s) being created.
Type: &-separated list of numeric strings | empty | 0
Example: 33&49&64
Range: up to 10 numeric strings, each in the range 1 – 65535. The value 0 (default) or an empty field indicates no constraint are applied.

19. **`linkIncludeID`** – VPN Identifier
A connection constraint link property such as *linkIncludeID* that must be valid to include the link in the connection path(s) to be created. *linkIncludeID* is a link connection property that can be used to group and classify links. VPNID is a special case of this associative property.
Range: 1 – 65535. 0 (default) or an empty field indicates no VPN constraint is applied.
Note: Since the corresponding value is not supported as Host port parameter any input different from 0 will lead to DENY of the command.
This is an optional input parameter in the **`ENT-PATH`** command.

20. **`nodeList Usage2`** – Node List Usage 2
For connection setup NN used/uses the list of nodes included in the *nodeList2* array block in a manner specified by the *nodeListUsage2* variable. Both, *nodeListUsage2* and *nodeList2*, fields belong together and is reported when supplied as input to the **`ENT-PATH`** command. A non-existent *nodeID* will cause setup failure in EXPLICIT *nodeList1* during path setup.
This parameter is only be used when *protectionClass* is N1PLUS1 or YCONN.
This parameter shall also be allowed when protectionClass is P1PLUS1NR.
Range: EXPLICIT, *nodeList2* contains the intermediate NE nodes of the path in the explicit order they are to be used. (An empty list will force a direct path from source to destination.).

21. **`nodeList2`** – Node List 2
When nodeListUsage2=EXPLICIT: List of intermediate nodes that specify the path in the exact node order specified in the input. Source and destination nodes are assumed to be included implicitly. The nodeID values are shown in the form: nid1([[&nid2& …&nidx]]).
If the preceding required *nodeListUsage2* field is not supplied, this field must not be present. If user specifies empty EXPLICIT *nodeList2*, the connection should use a direct path from source to destination node (i.e., no intermediate node is

allowed).
This parameter is only be used when *protectionClass* is N1PLUS1 or YCONN.
This parameter shall also be allowed when protectionClass is P1PLUS1NR.
Type: &-separated list of *nodeIDs*. A *nodeID* is represented as four dot separated numeric string with each numeric string between 0 – 255.
Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123
Range: nid1([&nidX])* or empty list where X <= 8 when *nodeListUsage1* = EXPLICIT.

Spec block parameters

1. **`connMode`** – Connection Mode
   This parameter specifies, whether revertive or non-revertive mode is used as operation mode of the auto-reroute or 1+1 protected connection.
   This parameter can be used with the ENT-PATH-AUTO and ENT-PATH-N1PLUS1 command. This parameter can be used with the ENT-PATH-P1PLUS1NR command to specify, whether revertive or non-revertive mode is used as operation mode of the 1+1 protection of the permanent 1+1 protected connection.
   Type: Alphanumeric value set.

   Range:

   - NONREVERTIVE (default)
   - REVERTIVE.
2. **`rstrPriority`** – Restoration Priority
   This parameter describes the restoration priority of the connection.
   Range: 0 (default) – 7. Lower values represent higher priority.
3. **`connAlias`** – connection alias
   This parameter specifies a user defined string as an alternate name for the connection instead of *connID*.
   Type: Character string up to length 83.
   Range: The string consists of printable ASCII characters + NULL. The following characters cannot be used in the string: colon, semicolon, comma, double quotes.
4. **`disjointness`**
   The disjointness determines the path calculation logic.
   Type: Alphanumeric value set.

   Range:

   - COMPLETE: fully node and SRLG disjoint path
   - FULLYSRLG: maximal node and fully SRLG disjoint path
   - MAXIMAL: maximal node disjoint path.

   Maximal SRLG disjoint path calculation is not supported by the current path calculation algorithms.
   Impact on disjointness parameter values when protClass is set to N1PLUS1 or YCONN
   When *protClass* is set to N1PLUS1 or YCONN, only the *disjointness* parameter

values COMPLETE and FULLYSRLG is allowed.

Impact on disjointness parameter values when protClass is set to P1PLUS1NR

When *protClass* is set to P1PLUS1NR, only the *disjointness* parameter values COMPLETE and FULLYSRLG is allowed.

Default:

- COMPLETE: for protectionClass N1PLUS1 and YCONN.
- MAXIMAL: for protectionClass AUTONR and AUTORV.

The parameter is only applicable when *protectionClass* != UNPROT.
Default: COMPLETE: for *protectionClass* P1PLUS1NR

5. **`grpSetupType`** – grouped Setup Type
The grouped Setup Type specifies, whether for all NN connections of a grouped setup the total cost of all connections or the number of routes used by the connections are minimized.
Both alternatives will lead to equal results in the following cases:
   - Only one connection is setup with a grouped setup
   - There is enough bandwidth available via the cheapest route for all connections of a grouped setup.

   Type: Alphanumeric value set.
Range: MINCOST (default): the total cost for all connections of the grouped setup is minimized. MINROUTES: the number of routes used by the connections of the grouped setup is minimized.
6. **`protRatio`** – Protection ratio
For each working or protecting connection of an M:N protected connection group this parameter will report the concrete protection ratio as specified on creation of the group. For connections not being member of an M:N protected connection group, this parameter is not reported at all.
Type: Alphanumeric value set
Range. BY1 (ratio of 1 to 1 in number of protecting and working connections), 1BY2 (ratio of 1 to 2 in number of protecting and working connections), 1BY3 (ratio of 1 to 3 in number of protecting and working connections).
7. **`wtr`** – Wait to Restore Timer
This parameter specifies the value of the wait-to-restore time for revertive 1+1 protection switching. Parameter applies to 1+1 protected and permanent 1+1 protected connections.
The parameter specifies the wait to restore time used by the protection state machine operating in revertive mode.
Type: numeric string [minute]
Range: 0 – 60.
The path protection groups at the A and Z nodes of the connection are created with default values, if the parameter is not present in the spec_block.
Default: 0

8. **`htmr`** – Hold Off Timer
   This parameter specifies the value of the hold-off timer for 1+1 protection switching. Parameter applies to 1+1 protected and permanent 1+1 protected connections.
   The parameter specifies the hold-off time for automatic protection switching used by the protection state machine.
   Type: numeric string [ms]
   Range for high order path protection groups:
   - 0 -99 ms in 1 ms steps
   - 100 -10000 ms in 100 ms steps

   Range for low order path protection groups:
   - 0, 25, 50, 75 ms (thus in steps of 25 ms)
   - 100 -10000 ms in 100 ms steps.

   Default: None.
   The path protection groups at the A and Z nodes of the connection are created with default values, if the parameter is not present in the spec_block. Default value: 0.
9. **`switchBack`** – revertive restoration path switch back
   This parameter describes how a revertive restoration path is switched back to the original path.
   Type: Alphanumeric value set.
   Range:
   - AUTO: path is automatically switched back after wait to revert time.
   - MAN: path has to be manually switched back triggered by the TL1 command **`ED-PATH-ROLL`**.

   Default: AUTO.
   This parameter is only allowed for the **`ENT-PATH-AUTO`** command with *connMode* set to revertive.

Output format

System response format to ENT-PATH-protClass on grouped setup of VCG connections

For the ENT-PATH request for setting up a group of VCG connections the response is as follows:

- If the command as a whole is denied due to e.g. syntax or input failure, the command is denied simply giving completion code DENY together with the error reason
- If setting up of all connection of the group succeded, the command is completed giving completion code COMPLD and all connections of the group is listed. For each connection the parameters are given as would be given in a reply to a successful ENT-PATH-protClass command for a single connection.

- If not all connections could be set up successfully, but the setup of a number of connections failed, the command is completed giving completion code PRTL and giving a list of the following informations: For each connection whose setup succeeded the parameters are given as would be given in a reply to a successful ENT-PATH-protClass command for a single connection. For each connection whose setup failed the tributary ID is given together with the error reason for the failure as would be given in a reply to a failed ENT-PATH-protClass command for a single connection.
- If the setup of all connections failed individually, the command is denied giving completion code DENY and all connections of the group is listed. For each connection the tributary ID is given together with the error reason for the failure as would be given in a reply to a failed ENT-PATH-protClass command for a single connection.

System response format to ENT-PATH MBYN

The ENT-PATH-MBYN request for setting up an M:N protected group of connections normally will result in the setup of multiple working and protecting connections.

The following system response behavior is valid:

- If the command as a whole is denied due to e.g. syntax or input failure, the command is denied simply giving completion code DENY together with the error reason
- If it is not possible to setup all required connections but only a part of them, the whole group cannot be created and thus connections of the group that have already been setup must be torn down again (roll-back). In this case the command is denied giving completion code DENY together with one entry for each connection the setup of which failed together with the error reason. Additionally the reply shall contain one entry for each connection that had been setup successfully but had to be torn down for roll-back reason indicated by the specific error reason E061. Each working connection in such a reply is identified by the corresponding EDGE tributary AID as ″tribAID=<tributaryAID>″. Each protecting connection in such a reply is identified using the index of its connection ID by ″tribAID=#&<index>″
- If setting up of all connections of the group succeded, the command is completed giving completion code COMPLD and all connections of the group is listed. For each connection the parameters are given as would be given in a reply to a successful ENT-PATH-UNPROT command for a single connection.

System response format to ENT-PATH-MBYN for a added connection

The ENT-PATH-MBYN request for setting up a additional connection to a M:N protected group of connections will result in the setup of a working connection and possibly in the setup of a protecting connection. The following system response behavior is valid:

- If the command as a whole is denied due to e.g. syntax or input failure, the command is denied simply giving completion code DENY together with the error reason
- If it is not possible to setup possible protection connection or the working connection, the already setup connection must be torn down again (roll-back). In this case the command is denied giving completion code DENY together with an entry for the connection of which failed together with the error reason. Additionally the reply shall contain one entry for the connection that had been setup successfully but had to be torn down for roll-back reason indicated by the specific error reason E061.
  The working connection in such a reply is identified by the corresponding EDGE tributary AID as ″tribAID=<tributary AID>″. The protecting connection in such a reply is identified using the index of its connection ID by ″tribAID=#&<index>″
- If setting up of the added connections to the group together with a possible setup of a protection connection succeded, the command is completed giving completion code COMPLD and both additional connections of the group is listed. For both connection the parameters are given as would be given in a reply to a successful ENT-PATH-UNPROT command for a single connection.

System response format to ENT-PATH-N1PLUS1

The ENT-PATH-N1PLUS1 shall respond with the completion code PRTL if the path protection group parameters (revertive mode, wait to restore timer or hold off timer) setup with ENT-PATH-N1PLUS1 request are not successfully provisioned. The response shall contain the normal system response format to ENT-PATH-N1PLUS1 and additionally a failure information about the missing path protection group parameter provisioning.

Normal system response to ENT-PATH-AUTO/ENT-PATH-UNPROT

If the **ENT-PATH** request completes successfully, the following normal completion response is returned:

```
ENT-PATH-
    AUTO:srcTid:[srcAid]:ctag::srvID:pdir:bandwidth:maxDelay:srcNID:srcPortID:destNID:dest

   srcTid date time
M  ctag COMPLD
   ″ConnID=connID,ConnStatus=connStatus,pdir,protectionClass,bandwidth,
   [ConnAlias=connAlias],
   MaxDelay=maxDelay,[SrvID=srvID],Exclude=Node5ID&Node6ID,,
   SrlgExclude=srlgExcludeList,IncludeID=linkIncludeID,[SpecBlock],,
   SrcNID=srcNID,srcPortID,DestNID=destNID,destPortID:
```

```
   PathID=pathID1,State=pst1&sst1&tst1,
   NodeList=pNodeList1"
;
```

Note: *nodeListUsage1* = will be translated to either *Exclude* = or *Explicit*=, depending on which type of *nodeList1* was received as input. In the example the nodeList1 = Node5ID&Node61D.

Normal system response to ENT-PATH-N1PLUS1

If the **ED-PATH-N1PLUS1** request completes successfully, the following normal completion response is returned:

```
ENT-PATH-
      N1PLUS1:srcTid:[srcAid]:ctag::[srvID]:pdir:bandwidth:maxDelay:srcNID:srcPortID:destNID:de
[NodeListUsage2,nodeList2]:specBlock;

   srcTid date time

   NodeList=pNodeList1:
   PathID=pathID2,State=pst2&sst2&tst2,
   NodeList=pNodeList2"

   "E150::\"Status, Path Protection Group parameters Not Provisioned\","
;
```

Note: *nodeListUsage1* = will be translated to either *Exclude* = or *Explicit*=, depending on which type of *nodeList1* was received as input.

The system response for **ENT-PATH-P1PLUS1NR** corresponds with the system response of **ENT-PATH-N1PLUS1**.

Normal system response to ENT-PATH-YCONN

If the **ENT-PATH-YCONN** request completes successfully, the following normal completion response is returned:

```
RTRV-CKT:UNITE1:1-1-#-#-22-1-1:123;
IP 123
<

   UNITE1 04-12-28 00:22:15
M  123 COMPLD
   "ring0"
   "UNITE0,1,REMAID,REM-1-1-#-#-22-1-TS1,UNIDIR,STS1:rappl=ADD"
   "UNITE1,0,1-1-#-#-22-1-1,1-1-#-#-23-1-1,UNIDIR,STS1:rappl=THRU"
   "UNITE2,2,REM-1-1-#-#-24-1-TS1,PIF
;
```

Note: *nodeListUsage1* = will be translated to either *Exclude* = or *Explicit*=, depending on which type of *nodeList1* was received as input.

System response to ENT-PATH-AUTO/ENT-PATH-UNPROT for group of connections with successful setup of all connections affected

If the **ENT-PATH** request for setting up a group of N connections completes successfully for all connections, the following normal completion response is returned.

Note: There is no restriction wrt the order of the connection information sent within the reply. If one reply would exceed the maximum length allowed for a TL1 message, whole connection records are distributed into separate messages.

```
ENT-PATH-
     AUTO:srcTid:[srcAid]:ctag::srvID:pdir:bandwidth:maxDelay:srcNID:srcPortID:destNID:dest

   srcTid date time
```

```
M  ctag COMPLD
   ″ConnID=1connID,ConnStatus=1connStatus,pdir,protectionClass,bandwidth,

```

For adding a working connection the optional parameter *connID* is provisioned. The reply will contain the parameters of the setup working connection and possibly of a setup protection connection.

The **ENT-PATH** command for grouped connection setup shall send a maximum of 8 connection records per block. On all large output message blocks but the last, the continuation completion code COMPLD, PRTL or DENY is used depending on the outcome for the whole command and the semicolon (;) is replaced with a (>) terminator. Then on the last record block, the completion code COMPLD, PRTL or DENY is used depending on the outcome for the whole command with the final semicolon (;) data block terminator.

Note: This **ENT-PATH** command for grouped connection setup can produce large amounts of data. This will require proper sizing of the receive buffer of the OS system.

Output parameters

Command parameters

1. **`srcTid`**
   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **`date`**
   This parameter is set to the date when the output message is generate: YY-MM-DD where YY=2000-2099, MM=01-12, DD=01-31.
3. **`time`**
   This parameter is set to the time when the output message is generated: HH:MM:SS where HH=00-23,MM=00-59, SS=00-59.
4. **`ctag`**
   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ".").
5. **`completionCode`**
   Standard TL1 completion code result:
   - COMPLD: for success (default)
   - PRTL: for partial success / failure, see section ERROR RESPONSES for details
   - DENY: in case of errors, see section ERROR RESPONSES for details
6. **`connID`** – Connection ID
   This parameter reports only the connections originating at the specified source node. *connID* is formed from the *SrcNodeIP* and IngressPort# and an index # where 1675 LambdaUnite MSS uses bay = 1 = shelf.
   Type: Character string of length up to 39.
   Range: *nodeID&Tributary AID&Index* - to retrieve a specific entry, with
   - nodeID: four dot separated numeric strings: each string 0..255
   - Tributary AID: five dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # with:

Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary# 192.

- Index: Numeric string 0-4294967295.

The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.
Example: 29.13.196.203&1-13-15-1&271584.

Range: *nodeID&Tributary AID range* - if port # specifies a VCG to retrieve a connection group, with

- nodeID: four dot separated numeric strings: each string 0..255
- Tributary AID: five dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # with:

  Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 9), Tributary # ALL – special value to retrieve all connection records associated with the port ID.

As there is always at most one connection group associated with a VCG, the qualifier ALL specified for the Tributary # of input parameter *connID* will always deliver all connections of the affected group, i.e. all connections starting at the affected VCG. The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.
Example: 29.1196.203&1-5-13-7ALL. The port AID 1-5-13-7 must denote a VCG.

7. **`connAlias`** – Connection Alias
   This parameter specifies a user defined string as an alternate name for the connection instead of *connID*.
   Type: Character string up to length 83.
   Range: The string consists of printable ASCII characters + NULL. The following characters cannot be used in the string: colon, semicolon, comma, double quotes.
8. **`connStatus`** – Connection Status
   ConnStatus = pst&sst(&tst) Connection status is the overall status of the connection connID which may be different than the status of an individual *pathID* in that connection.

   connStatus is composed out of

   - pst (PrimaryState)
   - sst (SecondaryState)
   - tst (TertiaryState, optional).

   Up to two of the allowed values are simultaneously permitted as a sst/tst parameter. The two values must be separated by an ampersand (“&”). Individual status values are 7 characters or less
   Type: up to three &-separated value sets.

   Range *pst* values:

   - CON: Connected
   - DLT: Deleted
   - NOCON: Not Connected

- MAINT: Maintenence Mode
- UNKNOWN: Conn state unknown.

Range *sst* & *tst* values

- OK: Conn good
- FAILED: Conn failed
- SETUP: Conn SetUp occurring
- TRDOWN: Conn teardown occurring
- NO-IN: Conn failed, signal in bad
- RSTOR: path restore occurring
- RSTRD: Conn restored
- RSTRFL: Conn restore failed
- DLT-FL: Delete operation Failed
- UNKNOWN: Conn state unknown
- WTORSTR: Waiting to restore path
- PREMPT: Path pre-empted
- SETUPFL: Connection SetUp Failed
- FL-NVM: Not saved in NVM
- WTORV: Waiting to revert path
- EPRTFL: EDGE ort Failed
- BAD-IN Conn failed, Bad signal in
- BRDGD Path bridged

Note: Some states listed in this list will only occur within a DLT-PATH command response or within a REPT PTHCHG or REPT PTHEVT notification message.

Range *sst* values

- STBY: Standby (for protecting connections within an M:N protection group, when connection is not protecting a working connection)
- USED: Used (for protecting connections within an M:N protection group, when connection is currently protecting a working connection)

Range *tst* values

- DEGRADED: Non-revertive restoration was not possible if the worker or protection path of a permanent 1+1 protected connection fails

9. **`pdir`** – Path Direction Topology
   Uni-direction A-Z (1WAY) or Bi-direction – (2WAY).
   For connections of *protectionClass* MBYNWRK and MBYNPRT only the path direction topology Bidirectional (2WAY) is supported.
   Type: Value set.
   Range: 1WAY (default), 2WAY

10. **`protectionClass`** – Path Protection Class
    This parameter defines the type of restoration protection assigned to the path connection during path setup or after path modification.
    Range:
    - UNPROT (path from source to destination is un-protected)
    - AUTONR (path from source to destination is a non-revertive auto-reroute path connection)
    - N1PLUS1 (paths from source to destination is set up as a network 1+1 connection)
    - AUTORV (path from source to destination is a revertive auto-reroute path connection)
    - YCONN (paths from the same source to two different destinations are set up as a bridged connection)
    - MBYNWRK (working connection in an M:N connection group)
    - MBYNPRT (protecting connection in an M:N connection group)
    - P1PLUS1NR (paths from source to destination are set up as a 1+1 protected non-revertive connection with an additional non-revertive restoration path applied in case the worker or protection path fails.)
    - P1PLUS1NRRV (paths from source to destination are set up as a 1+1 protected revertive connection with an additional non-revertive restoration path applied in case the worker or protection path fails.)
11. **`bandwidth`** – Requested bandwidth/signalRate
    ONNS bandwidth is equal to or greater than the minimum cross connect rate (*minXCrate*) of the port type. Note: Only SONET switching levels in enumeration. For actual cross-connections ONNS adapts to SDH formats automatically if the ingress port is SDH.
    Type: Value set.
    Range: STS1, STS3, STS12 STS48, STS192, STS1-pipe, STS3-pipe, STS12-pipe STS48-pipe, STS192-pipe.
    These values are defined for setting up adaptive ONNS connections of the corresponding bandwidth. Specific restrictions wrt. the setup of adaptive ONNS connections can be found in “Error responses” (p. 3-1739).
12. **`maxDelay`** – Maximum transport delay
    Maximum transport delay through all nodes in the path. Total path delay must not exceed this value.
    Range: 0 (default), is used to select no delay limit; >0, maximum transport delay in milliseconds.
    This are an optional output parameter in the **`ENT-PATH`** command reply.

13. **`srvID`** – Service Identifier
    This parameter is a logical tag for the group of connections associated with a service defined by the Service Manager system (or other management entity).
    The *srvID* parameter is an integer value range = 1 – 20,000,000. Only one *srvID* is accepted. ALL is not supported.
14. **`nodeListUsage1`** – Node List Usage 1
    For connection setup NN used/uses the list of nodes included in the *nodeList1* array block in a manner specified by the *nodeListUsage1* variable. Both, *nodeListUsage1* and *nodeList1*, fields belong together and is reported when supplied as input to the **`ENT-PATH`** command.
    An EXCLUDE list usage applies to all paths created (as in a N1PLUS1NR or N1PLUS1RV). A non-existent *nodeID* will be ignored in EXCLUDE *nodeList1* during path setup. A non-existent *nodeID* will cause setup failure in EXPLICIT *nodeList1* during path setup.
    Range:
    - EXPLICIT, *nodeList1* contains the intermediate NE nodes of the path in the explicit order they are to be used. (An empty list will force a direct path from source to destination.)
    - EXCLUDE, nodes in the *nodeList1* must all be excluded from the path created. In the case when the *protectionClass* is either YCONN, N1PLUS1NR or N1PLUS1RV the nodes in the *nodeList1* below also apply to the second or restoration path.

    This are an optional output parameter in the **`ENT-PATH`** command reply.
15. **`nodeList1`** – Node List 1
    When *nodeListUsage1* = EXPLICIT: List of intermediate nodes that specify the path in the exact node order specified in the input. Source and destination nodes are assumed to be included implicitly. The *nodeID* values are shown in the form: nid1([&nid2& …&nidx]).
    When *nodeListUsage1* = EXCLUDE: List of nodes that must all be excluded from both paths. The *nodeID* values are shown in the from: nid1([&nid2& …&nidx]).
    If the preceding required *nodeListUsage1* field is not supplied, this field must not be present. If user specifies empty EXCLUDE *nodeList1*, the connection should use indirect path from source node to destination node (i.e., at least one intermediate node is needed). If user specifies empty EXPLICIT *nodeList1*, the connection should use a direct path from source to destination node (i.e., no intermediate node is allowed).
    Type: &-separated list of nodeIDs. A *nodeID* is represented as four dot separated numeric string with each numeric string between 0 – 255.
    Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123
    Range: nid1([&nidx])* or empty list (where X <= 8 when *nodeListUsage1* = EXPLICIT) (where X <= 15 when *nodeListUsage1* = EXCLUSIVE)
    This are an optional output parameter in the **`ENT-PATH`** command reply.

16. **`nodeListUsage2`**
For connection setup NN used/uses the list of nodes included in the *nodeList2* array block in a manner specified by the *nodeListUsage2* variable. Both, *nodeListUsage2* and *nodeList2*, fields belong together and is reported when supplied as input to the **`ENT-PATH`** command. A non-existent *nodeID* will cause setup failure in EXPLICIT *nodeList1* during path setup.
This parameter is only be used when *protectionClass* is N1PLUS1 or YCONN.
This parameter shall also be allowed when *protectionClass* is P1PLUS1NR.
Type: Value set.
Range: EXPLICIT, *nodeList2* contains the intermediate NE nodes of the path in the explicit order they are to be used. (An empty list will force a direct path from source to destination.).
This are an optional output parameter in the **`ENT-PATH`** command reply.This are an optional output parameter in the **`ENT-PATH`** command reply.This are an optional output parameter in the **`ENT-PATH`** command reply.
This are an optional output parameter in the **`ENT-PATH`** command reply.
17. **`nodeList2`**
When nodeListUsage2=EXPLICIT: List of intermediate nodes that specify the path in the exact node order specified in the input. Source and destination nodes are assumed to be included implicitly. The nodeID values are shown in the form: nid1([[&nid2& …&nidx]]).
If the preceding required *nodeListUsage2* field is not supplied, this field must not be present. If user specifies empty EXPLICIT *nodeList2*, the connection should use a direct path from source to destination node (i.e., no intermediate node is allowed).
This parameter is only be used when *protectionClass* is N1PLUS1 or YCONN.
This parameter shall also be allowed when *protectionClass* is P1PLUS1NR.
Type: &-separated list of *nodeIDs*. A *nodeID* is represented as four dot separated numeric string with each numeric string between 0 – 255.
Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123
Range: nid1([&nidX])* or empty list where X <= 8 when *nodeListUsage1* = EXPLICIT.
This are an optional output parameter in the **`ENT-PATH`** command reply.
18. **`srlgExcludeList`**
List of Shared Risk Link Group identifiers that are to be used to exclude links from the connection path(s) being created.
Type: &-separated list of numeric strings | empty | 0
Example: 33&49&64
Range: up to 10 numeric strings, each in the range 1 – 65535. The value 0 (default) or an empty field indicates no constraint are applied.
This are an optional output parameter in the **`ENT-PATH`** command reply.

19. **`linkIncludeID`** – VPN Identifier
    A connection constraint link property such as *linkIncludeID* that must be valid to include the link in the connection path(s) to be created. *linkIncludeID* is a link connection property that can be used to group and classify links. VPNID is a special case of this associative property.
    Range: 1 – 65535. 0 (default) or an empty field indicates no VPN constraint is applied.
    Note: Since the corresponding value is not supported as Host port parameter any input different from 0 will lead to DENY of the command.
    This are an optional output parameter in the **`ENT-PATH`** command reply.
20. **`srcNID`** – Source nodeID
    ONNS source nodeID. Together with the following srcPortID field defines the associated Ingress connPoint that connects the source node to the edge/gateway switch or client router.
    Range: Four dot separated numeric strings. 0 – 255 for each numeric string.
21. **`srcPortID`** – Source portID
    ONNS source node ingress portID. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # of the *srcNID* ingress *connPoint*. ONNS assumes a bidirectional port pair.
    Value: dash-separated list of 5 numeric strings
    Example: 1-1-3-1-4
    Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 192).
    Range for protecting connections in M:N connection groups: Bay/Frame # (1), Shelf # (1), Slot/Pack # (#), Port # (#), Tributary # (#)
22. **`destNID`** – Destination nodeID
    ONNS destination nodeID. Together with the following *destPortID* field defines the associated Engress *connPoint* that connects the destination node to the edge/gateway switch or client router.
    Type: Four dot separated numeric strings. 0 – 255 for each numeric string.
23. **`destPortID`** – Destination PortID
    ONNS destination node egress portID. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # of the destNID egress *connPoint*.
    Value: dash-separated list of 5 numeric strings
    Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 192).
    Range for protecting connections in M:N connection groups: Bay/Frame # (1), Shelf # (1), Slot/Pack # (#), Port # (#), Tributary # (#)

24. **`pathID1`** – Path ID 1
 The PathID of the 1st path that was created.
 Type: character string of length up to 20.
 Range: nodeID-Index: nodeID – four dot separated numeric strings, each string 0 – 255; Index – Numeric string 0-65535
 The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.
 Example: 29.13.196.203-65111
25. **`pathState1`** – Path State 1
 Path State1 = *pst*& *sst*[*&tst*]. pathState1 represents the status of the first path of the connection which may be different than the status of the overall connection in *connStatus*.
 PathState1 is composed out of *pst* (PrimaryState), *sst* (SecondaryState) and *tst* (TertiaryState, optional) Up to two of the allowed values are simultaneously permitted as a sst/tst parameter.The two values must be separated by an ampersand (″&″). Individual status values are 7 characters or less.
 Type: up to three &-separated value sets.
 Range *pst* values:
 - CON: Connected
 - NOCON: Not Connected
 - DLT: Deleted
 - MAINT: Maintenance mode.

 Range *sst* & *tst* values
 - OK: Conn good
 - FAILED-PATH: failed
 - SETUP: Conn SetUp occurring
 - TRDOWN: Conn teardown occurring
 - NO-IN: Conn failed, signal in bad
 - RSTOR: path restore occurring
 - RSTRD: Conn restored
 - RSTRFL: Conn restore failed
 - DLT-FL: Delete operation Failed
 - UNKNOWN: Conn state unknown
 - WTORSTR: Waiting to restore path
 - SETUPFL: Connection SetUp Failed
 - RVRTFL: Conn revert failed
 - PREMPTD: Preempted
 - WTORV: Waiting to revert path
 - BRDGD: Path bridged
 - EPRTFL: EDGE Port Failed

- BAD-IN: path failed, Bad signal in
- FLT: Fault.

Note: Some states listed in this list will only occur within a DLT-PATH command response or in a REPT-PTHCHG / PTHEVT notification.

26. **`pNodeList1`** – Path Node List 1
The path node list contains the list of nodes that the 1st path (*pathID1*) traverses in A-Z order from the source node.
Type: &-separated list of nodeIDs. A nodeID is represented as four dot separated numeric string with each numeric string between 0 – 255.
Range: nid1([&nidX])*
Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123
27. **`pathID2`** – Path ID 2
The PathID of the 2nd path (if existing) that was created.
Type: character string of length up to 20.
Range: nodeID-Index: nodeID – four dot separated numeric strings, each string 0 – 255; Index – Numeric string 0-65535.
The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.
Example: 29.13.196.203-65111
This are an optional output parameter in the **`ENT-PATH`** command reply.
28. **`pathState2`** – Path State 2
pathState2 = pst&sst[&tst]. *pathState2* represents the status of the second path (if existing) of the connection which may be different than the status of the overall connection in *connStatus*.

PathState2 is composed out of

- pst (PrimaryState)
- sst (SecondaryState)
- tst (TertiaryState, optional).

Up to two of the allowed values are simultaneously permitted as a sst/tst parameter.The two values must be separated by an ampersand (″&″). Individual status values are 7 characters or less.
Type: up to three &-separated value sets

Range *pst* values:

- CON: Connected
- NOCON: Not Connected
- DLT: Deleted
- MAINT: Maintenance mode.

Range *sst* & *tst* values

- OK: Conn good
- FAILED-PATH: failed
- SETUP: Conn SetUp occurring
- TRDOWN: Conn teardown occurring

- NO-IN: Conn failed, signal in bad
- RSTOR: path restore occurring
- RSTRD: Conn restored
- RSTRFL: Conn restore failed
- DLT-FL: Delete operation Failed
- UNKNOWN: Conn state unknown
- WTORSTR: Waiting to restore path
- SETUPFL: Connection SetUp Failed
- RVRTFL: Conn revert failed
- PREMPTD: Preempted
- WTORV: Waiting to revert path
- BRDGD: Path bridged
- EPRTFL: EDGE Port Failed
- BAD-IN: path failed, Bad signal in
- FLT: Fault.

Note: Some states listed in this list will only occur within a DLT-PATH command response or in a REPT-PTHCHG / PTHEVT notification.
This are an optional output parameter in the **`ENT-PATH`** command reply.

29. **`pNodeList2`** – Path Node List 2
The path node list contains the list of nodes that the 2nd path (pathID1, if existing) traverses in A-Z order from the source node.
Type: &-separated list of nodeIDs. A *nodeID* is represented as four dot separated numeric string with each numeric string between 0 – 255.
Range: nid1([&nidX])*
Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123
This are an optional output parameter in the **`ENT-PATH`** command reply.

30. **`brDestNID`** – Bridged Destination NodeID
ONNS bridged destination nodeID. Together with the following brDestPortID field defines the second associated Egress connPoint that connects the destination node to the edge/gateway switch or client router in case of protectionClass YCONN.
Type: Four dot separated numeric strings. 0 – 255 for each numeric string.

31. **`brDestPortiD`** – Bridged Destination PortID
ONNS bridged destination node egress *portID* in case *protectionClass* = YCONN. The *portID* consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # of the brDestNID egress connPoint. 4.1; 5; 6
Value: dash-separated list of 5 numeric strings
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).

32. **`tribAID`** – Tributary AID
The *connPoint* on the reporting port of the cross-connection *connPoint* pair. The *connPtA* consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # .
Type: dash-separated list of 5 numeric strings
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).
Special values for slot/pack, port, and tributary
Slot/Pack # #
Port # #
Tributary # #
Value "#" for slot/pack, port, and tributary indicates default tributary AID used for reporting the open end in not existing cross-connections in the A-node or Z-node for a protecting NN connection of an M:N protected connection group.
Slot/Pack # *
Port # *
Tributary # *
Value "*" for slot/pack, port, and tributary indicates unknown HO tributary AIDs used for reporting that the corresponding HO tributary of an EDGE port (specified in parameter *connPtA*) is allocated by one or more LO traditional cross-connections.
Slot/Pack # @
Port # @
Tributary # @
Value "@" for slot/pack, port, and tributary indicates that the corresponding HO input and/or output tributary specified by *connPtA* is involved as EDGE-prt tributary in an OUC.
Slot/Pack # $
Port # $
Tributary # $
Value "$" for slot/pack, port, and tributary indicates a temporary reservation of an output tributary of an ENNI port needed for a network connection setup.

Spec block parameters

Spec block parameters are repeated in the output when explicitly supplied in the input. Multiple parameters are separated by &.

1. **`connMode`** – Connection Mode
   This parameter specifies whether revertive or non-revertive mode is used as operation mode of the auto-reroute or 1+1 protected connection.
   This parameter can be used with the ENT-PATH-AUTO and ENT-PATH-N1PLUS1 command. This parameter can be used with the ENT-PATH-P1PLUS1NR command to specify, whether revertive or non-revertive mode is used as operation mode of the 1+1 protection of the permanent 1+1 protected connection.
   Type: Alphanumeric value set.

   Range:

   - NONREVERTIVE (default)
   - REVERTIVE
2. **`rstrPriority`** – Restoration Priority
   This parameter describes the restoration priority of the connection.
   Range: 0 (default) – 7. Lower values represent higher priority.
3. **`disjointness`**
   The actual level of disjointness of the calculated and established connection. The parameter is not filled when protectionClass is UNPROT.
   Type: Alphanumeric value set.

   Range:

   - COMPLETE: fully node and SRLG disjoint path
   - FULLYSRLG: maximal node and fully SRLG disjoint path
   - MAXIMAL: maximal node disjoint path.
4. **`grpSetupType` –** grouped Setup Type
   The grouped Setup Type specifies, whether for all NN connections of a grouped setup the total cost of all connections or the number of routes used by the connections are minimized.

   Both alternatives will lead to equal results in the following cases:

   - Only one connection is setup with a grouped setup
   - There is enough bandwidth available via the cheapest route for all connections of a grouped setup.

   Type: Alphanumeric value set.
   Range: MINCOST (default): the total cost for all connections of the grouped setup is minimized. MINROUTES: the number of routes used by the connections of the grouped setup is minimized.

5. **`protRatio`** – Protection ratio
   For each working or protecting connection of an M:N protected connection group this parameter will report the concrete protection ratio as specified on creation of the group. For connections not being member of an M:N protected connection group, this parameter is not reported at all.
   Type: Alphanumeric value set
   Range. BY1 (ratio of 1 to 1 in number of protecting and working connections), 1BY2 (ratio of 1 to 2 in number of protecting and working connections), 1BY3 (ratio of 1 to 3 in number of protecting and working connections).
6. **`htmr`** – Hold-Off Timer
   This parameter applies to 1+1 protected and permanent 1+1 protected connections. This parameter specifies the value of the hold-off timer for 1+1 protection switching.
   This parameter specifies the hold-off time for automatic protection switching used by the protection state machine.
   Type: numeric string [ms]
   Range:
   For high order path protection groups, the range is:
   - 0 .. 99 ms in 1 ms steps and
   - 100 .. 10000 ms in100 ms steps

   For low order path protection groups, the range is:
   - 0, 25, 50, 75 ms (thus in steps of 25 ms) and
   - 100 .. 10000 ms in 100 ms steps.

   The path protection groups at the A and Z nodes of the connection are created with default values, if the parameter is not present in the spec_block.
   Default: 0
7. **`wtr`** – Wait To Restore Time
   This parameter specifies the wait-to-restore time for revertive 1+1 protection switching.
   Parameter does not apply to a 1+1 protected connection revertive.
   Parameter applies to a permanent 1+1 protected connection with revertive SNCP/UPSR protection.
   Type: numeric string [minute].
   Range: 0 – 60.
   Default:
   None.
   The path protection groups at the A and Z nodes of the connection are created with default values, if the parameter is not present in the spec_block. Default Value: 0

8. **switchBack** – revertive restoration path switch back
   This parameter describes how a revertive restoration path is switched back to the original path.
   Type: Alphanumeric value set.
   Range:
   - AUTO: path is automatically switched back after wait to revert time.
   - MAN: path has to be manually switched back triggered by the TL1 command **ED-PATH-ROLL**.

   Default: AUTO.

Example input/output

Input/output example for ENT-PATH-UNPROT

The following is an example shows a successful execution of the **ENT-PATH-UNPROT** command:

```
ENT-PATH-UNPROT:LT-NN-789:snn:653456::1351591:1WAY:sts48:105:135.13.196.203:1-5-13-4

Error responses

Validation rule: Insufficient network resources

Error code:

`E001 – srvID – InSufficient Network Resources for connection setup`

Validation rule: Insufficient Network Resources for Alternate Route

If network resources for an alternate route of a restoration protected connection to be setup are insufficient, then the following error response is returned:

Error code:

`E004 – srvID – InSufficient Network Resources for Alternate Path`

The following list identifies conditions that will cause similar error responses:

Error code: `E012- SXCF – Status, XConn Failure caused path setup failure`

Error code:

`E013 – SSCF – Status, Signaling Communication link Failure (or abort) caused path operation failure`

Error code: `E014 – SXCT – Status, XConn Timeout`

Error code: `E016 – SHTO – Status, Host interface TimeOut`

Error code:

`E017 – SSTO – Status, Signaling Timeout caused path setup failure`

Error code: `E018 – SEPU – Status, EDGE Port Used up`

Error code:

`E022 – SPSF – Status, Path Setup Failure, caused by signal transmission failure at egress node`

E016 and E022 are only sent in notifications, not in command replies.

Error code: `E021 – SUNA – Status, port class UNI Not Allowed`

Validation rule: Maximum Delay Exceeded by calculated path

When the Maximum Transport Delay Exceeded, then the following error response is returned:

Error code: `E020 – srvID – Maximum Transport Delay Exceeded,errorData`

Validation rule: ENT-PATH syntax, parameter data invalid

When an invalid input parameter is used, then the following error response is returned:

Error code:
`E030 – srvID – Syntax, Parameter Data Invalid,invalid_parameter= fieldName`

The following list identifies conditions that will cause similar error responses:

Error code: `E032 – Input, Source node IDis invalid`

Error code: `E033 – Input, Node List has Invalid / unknown ID`

Error code: `E035 – This connection Alias Already Exists`

Validation rule: ENT-PATH syntax, invalid degree of disjointness value

When an invalid degree of disjointness value for protClass N1PLUS1 or YCONN is used, then the following error response is returned:

Error code: `E520 – IIDD – Input, Invalid Degree of Disjointness`

Validation rule: ENT-PATH syntax, data not consistent

When inconsistent input parameters are used, then the following error response is returned:

Error code: `E040 – srvID – Syntax, Data Not Consistent`

Validation rule: NN PortID parameter value is not valid

If the NE receives a connection request where the *portID* parameter value is not valid, then one of the following error response is returned:

Error code: `E081 – IIEP – Input, Invalid ingress / Egress Port,errorData`

The following list identifies conditions that will cause similar error responses:

Error code:
`E080 – IICP – Input, Invalid ConnPt, ID=<ASTN node ID>&<connPtID>`

Error code:
`E081 – IIEP – Input, Invalid ingress / Egress Port, ID=<ASTN node ID> &<connPtID>`

Error code:
`E082 – SCPU – Status, NNI connPoint / port Unavailable, ID=<ASTN node ID>&<connPtID>`

Error code:
`E083 – SCIU – Status, NNI connPoint in Use, XConn or reservation exists, ID=<ASTN node ID>&<connPtID>`

Error code:
`E084 – SHXC – Status, Host XConn on ConnPoint, ID=<ASTN node ID> &<connPtID>`

Error code E084 will also be generated in case of a normal (non-forced) loopback exists on the ConnPt, that is, a normal loopback is considered as a host cross-connection.

The following list identifies conditions that will cause error responses specific to ENT-PATH commands affecting VCG EDGE ports:

- Error code:
  `E052 – IIET – Input, Invalid EDGE port type combination with VCG connection setup`

The following list identifies conditions that will cause error responses specific to ENT-PATH commands to setup groups of connections:

- Error code:
  `E053 – IIGS – Input, Port type in srcPortID does not support group setup/SrcPortID`
- Error code:
  `E055 – IIPG – Input, Invalid protection type YCONN for connection groups`
- Error code:
  `E056 – IISD – Input, Grouped setup with inconsistent values of destPortID and srcPortID`

The following list identifies further conditions that will cause error responses specific to ENT-PATH commands wrt. the parameter grpSetupType in a grouped connection setup:

- Error code:
  `E057 – IIGT – Input, Parameter grpSetupType only allowed if protType is UNPROT`

The following list identifies conditions that will cause error responses specific to ENT-PATH commands to setup M:N protected groups of connections:

- Error code:
  `E058 – IISP – Input, Invalid Source Port type for M:N group setup`
- Error code:
  `E059 – IIDP – Input, Invalid Destination Port type for M:N group setup`
- Error code:
  `E060 – IPNE – Input, No EXPLICIT routing allowed for M:N group setup`
- Error code:
  `E061 – STSF – Status, Connection torn down due to M:N group setup failure`

The following list identifies further conditions that will cause error responses specific to ENT-PATH commands to setup M:N protected groups of connections:

- Error code: `E063 – INCG – Input, M:N groupID unknown`
  This error is responded if the specified M:N groupID for a connection extension unknown.

The following list identifies conditions that will cause error responses specific to ENT-PATH commands to add a working connection to a M:N protected group of connections:

- Error code:
  `E064 – INTL – Input, Number of source/destination Tributaries too Large`
  This error is responded if more than one source and/or destination tributary are provisioned to add a working connection to an existing M:N group.
- Error code:
  `E065 – IAWE – Input, number of Added Working connection Exceeded`
  This error is responded if the maximal number of working connections after adding working connections is exceeded.
- Error code:
  `E066 – IPNC – Input, Parameter Not allowed for M:N Connection extension`
  This error is responded if parameters like exclude SRLG, exclude nodes for a added working connection are provisioned.
- Error code: `E279 – SNRE – Status, NVM Record Exhausted`
  This failure condition is only valid until a variable NVM allocation scheme is implemented, that does not have any restrictions wrt the length of connection records to be stored.

Validation rule: Cross-connect connect failure

If the network element receives an **ENT-PATH** command, but when the request is failed due to cross-connect connect failure at a node during path setup, the following error response is returned:

```
   srcTid 2003-01-01 08:00:00
M  ctag DENY
   CFPE
   ″E160:srvID:\″XConn Connect Failure, Port does not exist or is TRADITIONAL\″,″
;
```

Error code:

`E160 – srvID – XConn Connect Failure, Port does not exist or is TRADITIONAL`

The following list identifies conditions that will cause similar error responses:

Error code:

`E161 – CFUT – XConn Connect Failure, Unexpected toplogy or related cross connect, ID=<ASTN node ID>&<connPtID1>&<connPtID2>`

Error code:

`E162 – CFXE – XConn Connect Failure, Cross connect already exists, ID= <ASTN node ID>&<connPtID1>&<connPtID2>`

Error code:

`E168 -CFPT – XConn Connect Failure, Invalid Access to Protection Tributary on 2-f BLSR/MS-SPRing EDGE port,ID=<ASTN node ID>&<connPtID>`

The following list identifies error conditions wrt. setting up of adaptive ONNS connections:

- Error code:
  `E170 – IIPA – Input, Invalid Protection type for Adaptive ONNS connection`
- Error code:
  `E171 – STMI – Status, Tributary Mode of ingress / egress Port Inconsistent with requested bandwidth, ID=<ASTN node ID>&<connPtID>`

Error response E171 will be raised in the following cases:

- It is tried to setup an adaptive mode ONNS connection (specified by a corresponding adaptive bandwidth value) on an EDGE port with fixed tributary mode
- It is tried to setup a fixed mode ONNS connection (specified by a corresponding fixed bandwidth value) on an EDGE port with adaptive tributary mode

ENT-PROTN-GRP: Enter protection group

Protection groups are used in protection switching. A protection group is made up of one or more working (service) entities and a protection entity. In addition to the entities that comprise the protection group, the protection group has parameters that affect the characteristics of the protection group, such as whether or not the protection switching is revertive.

The **`ENT-PROTN-GRP`** command allows one to create a user-provisioned association of optical interface ports which is used in protection. Protection groups also determine the set of tributaries from and to which the user can provision cross-connections. If a circuit pack contains more than one optical port, the user can provision the type of protection for each port independently of the other ports. Unprotected operation is supported for optical interface ports that are not in a protection group.

When creating a protection group, the following must be true (only a subset of the validation rules is described here – see corresponding error response section):

- the individual ports must not already be in another protection group.
- there are no existing cross-connections on the ports.
- each port in a protection group must be on a different circuit pack.

Some types of protection groups are created automatically by the system or with another stimuli. ENT-PROTN-GRP cannot be used to create the following types of protection groups:

- switching equipment protection (created as part of slot assignment or pack auto-creation)
- controller equipment protection (created as part of slot assignment or pack auto-creation)
- path protection group (created as part of ENT-CRS for path-protected cross-connection).

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M4

Priority: 1

Input format

Command syntax: **`ENT-PROTN-GRP`**:*tid*::*ctag*::*protype*:*spec_block*;

Input parameters

Command parameters (equipment protection group)

The command **`ENT-PROTN-GRP`** is applicable for EP155, EP51, LOXC, TransMUX, and ES64U equipment protection.

1. **`tid`** – Target Identifier
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **`ctag`** – Correlation Tag
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **`protype`** – Protection Type
   The parameter specifies the type of the protection group.
   Type: Alphanumeric value set.
   Range:
   - EQPTEP155 (if aid is EP155ProtGroupAID)
   - EQPTEP51 (if aid is EP51ProtGroupAID)
   - EQPTLOXC (if aid is LOXCProtGroupAID)
   - EQPTTMUX (if aid is TMUXProtGroupAID)
   - EQPTES64U, if *aid* is ES64UProtGroupAID.

   Default: None.

Command parameters (multiplex section/line protection group)

1. **`tid`** – Target Identifier
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **`ctag`** – Correlation Tag
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **`protype`** – Protection Type
   This parameter specifies the architecture (type) of the protection group. The value for the 1+1 line/MS protection group is 1+1. The value for the 1:1 line/MS protection group is 1xNOPT (only R3.0 and later)
   Type: Value set.
   Range: 1+1 or 1xNOPT

Command parameters (2-/4-fibre MS-SPRing/BLSR protection group)

1. **`tid`** – Target Identifier
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **`ctag`** – Correlation Tag
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **`protype`** – Protection Type
   This parameter specifies the protection group type for which the information is retrieved.
   Type: Alphanumeric value set.
   Range: 2F or 4F

Spec block parameters (equipment protection group)

1. **`pgid`** – protection group Id
   This parameter specifies the protection group Id as component of the protection group AID (AID field *TransProtGrpID*). For values less than 100, the leading zeros are optional. For example, either 007 or 7 is acceptable. If the user omits the leading zeros, the system will add them.
   Type: Numeric string.
   Range: 01 .. 99 (if *protype* is EQPTEP155, EQPTEP51, EQPTTMUX, or EQPTES64U); 01(if *protype* is EQPTLOXC).
2. **`protn`** – Protection Unit
   The parameter specifies the protection circuit pack AID being a member of the 1+1 equipment protection group.
   Type: AID
   Default: For switching protection group instance: CpAID related to slot 10. For controller protection group instance: CpAID related to slot 31. For EP155 protection group instance: – If no cross-connections are assigned to one of the two EP155 cards, the user can choose it by the **`ENT-PROT-GRP`** command Default protection unit is the right card. – If cross-connections are assigned to one of the cards, the other card must become the protection unit. This means that the creation (ENT-PROTN-GRP) is rejected, if the user selects the card with cross-connections as protection card.
3. **`wkg`** – Worker Unit
   This parameter specifies the worker circuit pack AID being a member of the 1+1 equipment protection group.
   Type: AID
   Range: CpAID
   Default: For switching protection group instance: CpAID related to slot 9. For controller protection group instance: CpAID related to slot 11. For EP155 protection group instance: – If no cross-connections are assigned to one of the two

EP155 cards, the user can choose it by the **`ENT-PROT-GRP`** command Default worker unit is the left card. – If cross-connections are assigned to one of the cards, this card must become the worker unit. This means that the creation (ENT-PROTN-GRP) is rejected, if the user selects the card with no cross-connections as worker card.

Spec block parameters (multiplex section/line protection group)

1. **`pgid`** – protection group Id
   This parameter specifies the protection group Id as component of the protection group AID (AID field *TransProtGrpID*). For values less than 100, the leading zeros are optional. For example, either 007 or 7 is acceptable. If the user omits the leading zeros, the system will add them.
   Type: Numeric string.
   Range: 1 … 999
2. **`protn`** – Protection Unit
   This parameter specifies the protection port AID being a member of the line protection/ MS protection group.
   Type: AID
   Range: SPortAID
3. **`protocol`** – APS Protocol
   This parameter specifies the protocol used by the protection state machine.
   The value 1+1_UNI is used for 1+1 unidirectional switching.
   The value 1x***N***_BIDIR is used for 1:1 bidirectional switching (***N*** = 1) (only R3.0 and later).
   The value 1+1_OPTM is used for 1+1 optimized, bidirectional switching (only R3.0 and later). The value 1+1_BIDIR is used for 1+1 bidirectional switching (only R4.0 and later).
   The value 1+1_BIDIR is used for 1+1 bidirectional switching (only R4.0 and later).
   The value 1+1_UNI shall be used for 1+1 unidirectional switching.
   The value 1x***N***_BIDIR shall be used for 1:N bidirectional switching (***N*** = 1..14).
   The value 1+1_OPTM shall be used for 1+1 optimized, bidirectional switching.
   The value 1+1_BIDIR shall be used for 1+1 bidirectional switching.
   Note that “OPTIMIZED” describes rather the protection type than a protocol. Only for compatibility reasons of TL1, the parameter *protocol* is used for its selection.
   Type: Alphanumeric value set.
   Range: 1+1_UNI, 1xN_BIDIR, 1+1_OPT.
   In mind the ***N*** in 1x***N***_BIDIR is considered to be always equal “1”. The value 1+1_OPTM implicitly specifies bidirectional operation mode.
   Default: 1+1_UNI, in case of protype = 1+1; 1xN_BIDIR, in case of protype = 1xNOPT (that means protection type 1:1).
4. **`rme`** – Protection Reversion
   The parameter specifies, whether revertive or non-revertive mode is used as operation mode of the protection group. The value ENABLE is used if the protection group operates in revertive mode. The value DISABLE is used if the protection group operates in non-revertive mode.

Type: Alphanumeric value set.
Range: DISABLE in case of protype = 1+1; ENABLE in case of protype = 1xNOPT.
Default: DISABLE, in case of protype = 1+1; ENABLE, in case of protype = 1xNOPT (i.e. protection type 1:1)

5. **`wkg`** – Worker Unit
   This parameter specifies the worker port AID being a member of the 1+1 line/MS protection group.
   Type: AID
   Range: SPortAID

Spec block parameters (2-fibre MS-SPRing/BLSR protection group)

1. **`ard`** – Automatic Ring Discovery
   If this parameter is enabled, the automatic ring discovery algorithm will assign nodeID values to each node in the ring and construct the necessary ring map information. All nodes in the ring must support the Ring Discovery interworking. If disabled, the user will assign the NodeID value manually with ED-MAP-RING and supply the ring map information to each node on the ring for the BLSR protocol to operate. It is necessary to activate this user-provisioned information with SET-MAP-RING. Until all nodes on the ring have the same ring map, nodes will have most likely an outstanding NodeID mismatch alarm active.
   Type: Alphanumeric string.
   Range: ENABLE, DISABLE.
   Default: ENABLE.
2. **`asmc`** – Automatic Squelch Map Calculation
   If this parameter is enabled, the automatic squelch map calculation is switched on. If disabled, the function is switched off.
   Type: Alphanumeric string
   Range: ENABLE, DISABLE (default)
3. **`east`** – East Port
   This parameter specifies the port being a member in the role of the east port for a 2-fibre MS-SPRing/BLSR protection group.
   Type: AID
   Range: SPortAID
4. **`pgid`** – protection group Id
   The parameter specifies the protection group Id as component of the protection group AID (AID field TransProtGrpID). For values less than 100, the leading zeros are optional. For example, either 007 or 7 is acceptable. If the user omits the leading zeros, the system will add them.
   Type: Numeric string.
   Range: 1 – 999

5. **`rcamode`** – Ring Circuit Alarm Mode
This parameter can be used to enable or disable ring circuit alarms for the local MS SPRING / BLSR protection group. Ring Circuit alarms are results of the ring circuit validation (Path Integrity Failure) and of the audit of the local squelch map (Local SQuelch Map Conflict). The parameter does not control the validation or audit itself, but only the associated alarming. If rcamode is DISABLED, any alarm associated with the local cross-connections will be suppressed and not issued.
Type: Alphanumeric value set.
Range: ENABLE (default), DISABLE
6. **`rid`** – Ring Identification
Option: The parameter is a mandatory parameter.
This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
Type: text string of chars allowed for TID strings.
Range: 1 to 15 characters.
Default: NONE.
7. **`west`** – West Port
This parameter specifies the port being a member in the role of the west port for a 2-fibre MS-SPRing/BLSR protection group.
Type: AID.
Range: SPortAID.
Default: None.

Spec block parameters (4-fibre MS-SPRing/BLSR protection group)

1. **`ard`** – Automatic Ring Discovery
If this parameter is enabled, the automatic ring discovery algorithm will assign nodeID values to each node in the ring and construct the necessary ring map information. All nodes in the ring must support the Ring Discovery interworking. If disabled, the user will assign the NodeID value and supply the ring map information to each node on the ring for the BLSR protocol to operate. Until all nodes on the ring have the same ring map, nodes will have most likely an outstanding NodeID mismatch alarm active.
Type: Alphanumeric string.
Range: ENABLE, DISABLE.
Default: ENABLE.
2. **`asmc`** – Automatic Squelch Map Calculation
If this parameter is enabled, the automatic squelch map calculation is switched on. If disabled, the function is switched off.
Type: Alphanumeric string
Range: ENABLE, DISABLE (default)
3. **`eapsprotn`** – Incoming East APS Protection Path
This parameter is derived from the incoming K2 overhead byte of the east port.

It indicates the protection path as follows:

- 0: short path code (S)
- 1: long path code (L)

The value UNAVAILABLE is used in case of an pending SF condition.
Type: Alphanumeric value set.
Range: 0, 1, UNAVAILABLE.
Default: 0.

4. **`eastwkg`** – East Worker Port
   This parameter specifies the port being a member in the role of the east worker port for a 4-fibre MS-SPRing/BLSR protection group.
   Type: In case of an asymmetric ring: alphanumeric string; in all other cases: AID.
   Range: In case of an asymmetric ring: NOTUSED. In all other cases: SPortAID.
5. **`pgid`** – protection group Id
   The parameter specifies the protection group Id as component of the protection group AID (AID field TransProtGrpID). For values less than 100, the leading zeros are optional. For example, either 007 or 7 is acceptable. If the user omits the leading zeros, the system will add them.
   Type: Numeric string.
   Range: 1 – 999
6. **`protnmode`** – Protection Switch Mode
   The parameter specifies the protection switch mode. The value LOOPBACK is used for the classical ring application. The value SHORTENED is used for transmission delay sensitive applications. The value TOPEX (only R3.0 – R3.2 and R8.0.1 and later) is used for the so called transoceanic application, which allows extra traffic, improves restorability and improves delay as well as in SHORTENED mode.
   In case of a ring switch … LOOPBACK performs the bridge and switch function in that nodes which are most close to the failed span. SHORTENED performs the bridge function at the add node repectively the switch function at the drop node of each ring circuit. It is an application only similar to the transoceanic protocol. TOPEX allows, compared to SHORTENED mode, additionally the traffic restoration of not affected spans. It is the transoceanic protocol application.
   Consistent Protection Switch Mode Setting: The Protection Switch Mode must be set consistently on all nodes in the ring. E.g. for all UNITE NEs in a TOP+EX ring the parameter protnmode must be set to TOPEX. In a ring with inconsistent Protection Switch Mode, there will be no protection switching. The UNITE NEs will raise an Inconsistent Ring Protection Mode alarm.
   Type: Alphanumeric value set.
   Range: LOOPBACK, SHORTENED, TOPEX.
   Default: LOOPBACK.

7. **rcamode** – Ring Circuit Alarm Mode
   This parameter can be used to enable or disable ring circuit alarms for the local MS SPRING / BLSR protection group. Ring Circuit alarms are results of the ring circuit validation (Path Integrity Failure) and of the audit of the local squelch map (Local SQuelch Map Conflict). The parameter does not control the validation or audit itself, but only the associated alarming. If rcamode is DISABLED, any alarm associated with the local cross-connections will be suppressed and not issued.
   Type: Alphanumeric value set.
   Range: ENABLE (default), DISABLE
8. **rid** – Ring Identification
   Option: The parameter is a mandatory parameter.
   This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
   Type: text string of chars allowed for TID strings.
   Range: 1 to 15 characters.
   Default: NONE
9. **westprotn** – West Protection Port
   This parameter specifies the port being a member in the role of the west protection port for a 4-fibre MS-SPRing/BLSR protection group.
   Type: AID
   Range: SPortAID
10. **westwkg** – West Worker Port
    This parameter specifies the port being a member in the role of the west worker port for a 4-fibre MS-SPRing/BLSR protection group
    Type: In case of an asymmetric ring: alphanumeric string; in all other cases: AID
    Range: In case of an asymmetric ring: NOTUSED; in all other cases: SPortAID.

Output format

After receiving the **ENT-PROTN-GRP** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

Output parameters

Refer to the "Output parameters" section of the "RTRV-HDR: Retrieve header" (p. 3-2417) command for a normal completion response.

Detailed behavior description

EP155 equipment protection group

The command establishes/creates a protection group of type as specified by means of parameter protype. If protype equals ’EQPTEP155’, then one instance of EP155 protection group will be created. The creation of the protection group is reported by means of an ENT-PROTN-GRP notification. The initial protection state information is reported via protection switch notification.

Port impact due to EP155 protection group - port deletion

All ports related to the protection card of the protection group is deleted. This deletion is reported by means of: A set of DLT-STM1E notifications if the protection port is an SDH port. The deletion of the objects leads to a clearance of pending alarms for these objects.

Port impact due to EP155 protection group - PM impact due to port deletion

PM monitoring for the deleted ports are stopped and current and history bins are deleted.

Tributary impact due to EP155 protection group - tributary deletion

All tributaries related to the protection port of the protection group is deleted. This deletion is reported by means of: A set of DLT-VC3 notifications if the protection port is an SDH port.

The number of tributaries to be deleted is derived from the port rate. The deletion of the objects leads to a clearance of pending alarms for these objects.

For efficiency reasons the notifications for tributaries are sent out as a single notification (so-called group notification) using a range over the aid which depends on the port rate of the associated port, i.e. the Simple_STS1NumAID field in the STS1NumAID is set to 1&&-<N> with N is maximal legal STS-1/AU-3 number

Tributary impact due to EP155 protection group - AID range for group notification

See STS-1/AU-3 Tributaries AID w.r.t. range for legal STS-1/AU-3 number. Example: The AID field in a group notification for a tributaries related to port 1 for a OP10 pack in slot 1 looks like: 1-1-#-#-1-1-1&&-192

PM impact due to tributary deletion

PM monitoring for the deleted tributaries are stopped and current and history bins are deleted.

EP51 equipment protection group

The command shall establish/create a protection group of type as specified by means of parameter protype. If protype equals ’EQPTEP51’, then one instance of EP51 protection group will be created.

The creation of the protection group is reported by means of an ENT-PROTN-GRP notification. The initial protection state information is reported via protection switch notification.

Port impact due to EP51 protection group - port deletion

All ports related to the protection pack of the protection group is deleted.

This deletion is reported by means of:

- A set of DLT-T3 notifications for the DS3 ports on the protection pack
- A set of DLT-EC1 notifications for the EC1 ports on the protection pack

The deletion of the objects leads to a clearance of pending alarms for these objects.

Port impact due to EP51 protection group - PM impact due to port deletion

PM monitoring for the deleted ports are stopped and current and history bins are deleted.

Tributary impact due to EP51 protection group - tributary deletion

All tributaries related to the protection port of the protection group is deleted.

This deletion is reported by means of:

- A DLT-PTF-STS notification for each deleted DS3 port of the protection pack
- A DLT-STS1 notification for each deleted EC1 port of the protection pack

The deletion of the objects leads to a clearance of pending alarms for these objects.

Tributary impact due to EP51 protection group - PM impact due to tributary deletion

PM monitoring for the deleted tributaries are stopped and current and history bins are deleted.

LOXC equipment protection group

The command establishes/creates a protection group for LOXC packs if *protype* is set to EQPTLOXC.

The creation of this protection group is reported by means of an **`ENT-PROTN-GRP`** notification. The initial protection state information has to be reported via protection switch notification.

The existence of transmission entities is not influenced by the creation of the LOXC EQP group since they will be only controlled by lower-order cross-connection commands.

LOXC – update affected entities

When an LOXC equipment protection group is created, then the lower-order switch capacity of the protection unit is set to the same size as for the related worker unit. In addition, the LO tributary standard of the protection unit is set to the value of the related worker unit. This is notified by means of an **ED-EQPT** notification.

TransMUX equipment protection group

The command establishes/creates a protection group for TransMUX packs if *protype* is set to EQPTTMUX. The creation of this protection group is reported by means of an **ENT-PROTN-GRP** notification. The initial protection state information is reported via protection switch notification.

TransMUX – update affected entities

When a TransMUX equipment protection group is created, then the TransMUX capacity of the protection unit is set to the same size as for the related worker unit. This is notified by means of an **ED-EQPT** notification.

ES64U equipment protection group

The command establishes/creates a protection group for ES64U packs if *protype* is set to EQPTES64U. The creation of this protection group is reported by means of an **ENT-PROTN-GRP** notification. The initial protection state information is reported via protection switch notification.

ES64U – update affected entities

When an ES64U equipment protection group is created, then the ES64U capacity of the protection unit is set to the same size as for the related worker unit and the ES64U IP Address *dcn_ipad* is overtaken from worker to protection pack. This is notified by means of an **ED-EQPT** notification.

1+1 and 2F protection group

The command establishes/creates a protection group of type as specified by means of parameter *protype*. If *protype* equals ’1+1’, then one instance of 1+1 MS/line protection group will be created. If *protype* equals ’2F’, then one instance of type 2-fibre MS-SPRing/BLSR protection group will be created.

The creation of the protection group is reported by means of an **ENT-PROTN-GRP** notification. The initial protection state information is reported via protection switch notification.

1+1 protection group

All tributaries related to the protection port of the protection group is deleted if an MSP 1+1 is entered.

- A set of DLT-VC3 notifications if the protection port is an SDH port
- A set of DLT-STS1 notifications if the protection port is an SONET port

The number of tributaries to be deleted is derived from the port rate. The deletion of the objects leads to a clearance of pending alarms for these objects. For efficiency reasons the notifications for tributaries are sent out as a single notification (so-called group notification) using a range over the aid which depends on the port rate of the associated port, i.e. the Simple_STS1NumAID field in the STS1NumAID is set to 1&&-<N> with N is maximal legal STS-1/AU-3 number.

Example: The AID field in a group notification for a tributaries related to port 1 for a OP10 pack in slot 1 looks like: 1-1-#-#-1-1-1&&-192.

4 F protection group

The command establishes/creates a protection group of type as specified by means of parameter *protype*. If protype equals 4F', then one instance of type 4 fibre MS-SPRing/BLSR protection group will be created.

If east side parameters (worker and protection) and west side (worker and protection) is specified in the command request, then a 2-sided MS-SPRing/BLSR protection group is created.

The creation of the protection group is reported by means of an **`ENT-PROTN-GRP`** notification. The initial protection state information is reported via protection switch notification.

1+1 Protection Group: Tributary impact due to MSP group - tributary deletion of MSP 1+1 protected connections

All tributaries related to the protection port of the protection group are deleted if an MSP 1+1 is entered:

- a set of DLT-VC3 notifications if the protection port is an SDH port
- a set of DLT-STS1 notifications if the protection port is an SONET port

The number of tributaries to be deleted are derived from the port rate.

The deletion of the objects leads to a clearance of pending alarms for these objects.

1+1 Protection Group: Tributary impact due to MSP group - group notification

The notifications for the affected tributaries are a group notification. See definition in detailed behavior description section of ENT-EQPT.

1+1 Protection Group: Tributary impact due to MSP group - PM impact due to tributary deletion

PM monitoring for the deleted tributaries is stopped and current and history bins are deleted.

Example input/output

Equipment protection group

The following example creates equipment protection group information:

```
ENT-PROTN-GRP:LT-UNITE::123456::EQPTEP155:wkg=1-1-#-#-21-CP protn=1-1-#-#-22-
      CP,pgid=01;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
;
```

Multiplex section/line protection group 1+1

The following example creates 1+1 multiplex section/line protection group information:

```
ENT-PROTN-GRP:LT-UNITE::123456::1+1:wkg=1-1-#-#-13-1,protn=1-1-#-#-14-1,
pgid=001;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
;
```

2 fibre MS-SPRing/BLSR protection group

The following example shows the use of **ENT-PROTN-GRP** command to create a 2F protection group:

```
ENT-PROTN-GRP:LT-UNITE::123456::2F:east=1-1-#-#-10-1,west=1-1-#-#-08-
      1,pgid=003,rid=”denver21”;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
;
```

4 fibre MS-SPRing/BLSR protection group

The following example shows the use of **ENT-PROTN-GRP** command to create a 4F protection group:

```
ENT-PROTN-GRP:LT-UNITE::123456::4F:eastwkg=1-1-#-#-10-1, eastprotn=1-1-#-#-11-
      1,westwkg=1-1-#-#-08-1,westprotn=1-1-#-#-09-1,pgid=003,rid=”denver21”;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses (EP*n* equipment protection group)

Validation rule: EP*n* pack already used in other equipment protection group

The creation of an EP***n*** equipment protection group will be denied if the specified worker or protection pack is already a member of another EP***n*** equipment protection group.

Error code:

`SNVS – Status, Not in Valid State, circuit pack is member of an equipment protection group`

Validation rule: No HO/LO cross-connections, conversion cross-connections or substructure allowed

The creation of the EP***n*** Equipment Protection group is rejected, if HO or LO cross-connections, conversion cross-connections or lower order substructure exist on the EP***n*** pack, which was specified as protection pack by the command.

Error code:

`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: Transparent DCC connections

Check of transparent DCC connections involving the circuit pack to be proposed as protection pack.

Error code:

`SNVS – Status, Not in Valid State, Transparent DCC connections are existing at protection pack`

Validation rule: Not used as timing reference

Check of that none of the ports of the proposed protection circuit pack is used as timing reference

Error code:

`SNVS – Status, Not in Valid State, at least one port of the protection pack is used as timing reference`

Validation rule: Not used for OW

Check of that no connection to a OW port of the proposed protection circuit pack exists.

Error code:

`SNVS – Status, Not in Valid State, connection to OW port of the protection pack exists`

Validation rule: No XC loopbacks allowed

Check of XC loopbacks involving the circuit pack to be proposed as protection pack.

Error code:

`SNVS – Status, Not in Valid State, XC loopbacks still exist at the protection pack`

Validation rule: No facility loopbacks allowed

Check of facility loopbacks involving the circuit pack to be proposed as protection pack.

Error code:

`SNVS – Status, Not in Valid State, facility loopbacks still exist at the protection pack`

Validation rule: No test access session

Tributaries related to the circuit pack to be proposed as protection pack must not be used in a test access session either as tributary under test or as test access tributary.

Error code:
`SNVS – Status, Not in Valid State, Tributary used in test access session`

Validation rule: No port in *portClass* INNI

The creation of the EP155 Equipment Protection group is rejected, if at least one of the affected ports in in *portClass* INNI.

Error code: `SNVS – Status, Not in Valid State, portClass must not be INNI`

Validation rule: No port on protection pack in *portClass* EDGE

The creation of the EP155 Equipment Protection group is rejected, if at least one of the affected ports on the protection pack is in *portClass* EDGE.

Error code:
`SNVS – Status, Not in Valid State, Port is still in use by ONNS`

Validation rule: No port on protection pack in portClass UNI

The creation of the EP155 Equipment Protection group is rejected, if at least one of the affected ports on the protection pack is in *portClass* UNI.

Error code:
`SNVS – Status, Not in Valid State, Port is still in use by ONNS`

Error responses (LOXC Equipment Protection Group)

Validation rule: LOXC switch capacity and unit roles

The creation of the LOXC Equipment Protection group is rejected, if the worker unit has a low order switch capacity of 0 GBit/s or if the protection unit has a low order switch capacity greater than 0 GBit/s.

Error code:
`SNVS – Status, Not in Valid State, LOXC switch capacity invalid`

This is not an exclusive “or”. If one condition is true, the error will be sent.

Other checks are not necessary. Cross-connections, loopbacks, test access and other configurations may have been applied to the worker unit while establishment of the LOXC equipment protection group.

Validation rule: Worker and protection LOXC must be of same type

The creation of the LOXC Equipment Protection group is rejected, if the worker LOXC type is different from the protection LOXC type.

Error code:

`SNVS – Status, Not in Valid State, worker and protection LOXC must be of same type`

Error responses (TransMUX protection groups)

Validation rule: TransMUX pack already used in other equipment protection group

The creation of an TransMUX equipment protection group will be denied if the specified worker or protection pack is already a member of another TransMUX equipment protection group.

Error code:

`SNVS – Status, Not in Valid State, circuit pack is member of an equipment protection group`

Validation rule: TransMUX switch capacity and unit roles

The creation of the TransMUX Equipment Protection group is rejected, if the worker unit has a TransMUX switch capacity of 0 GBit/s or if the protection unit has a TransMUX switch capacity greater than 0 GBit/s.

Error code:

`SNVS – Status, Not in Valid State, TMUX switch capacity invalid`

The creation of a TransMUX equipment protection group is only allowed, if the worker TransMUX pack has *tmuxcap* > 0 and the protection pack has *tmuxcap* = 0.

Validation rule: Slot restrictions for TransMUX equipment protection group

The creation of a TransMUX equipment protection group will only be accepted if the worker pack is plugged in a valid worker TransMUX slot and the protection unit is plugged in the adjacent slot to the right of the worker unit. In all other cases the creation of a TransMUX equipment protection group will be rejected.

Error code:

`IDNV – Input, Data Not Valid, invalid slots for worker and protection unit`

Error responses (ES64U protection groups)

Validation rule: ES64U pack already used in other equipment protection group

The creation of an ES64U equipment protection group will be denied if the specified worker or protection pack is already a member of another ES64U equipment protection group.

Error code:

`SNVS – Status, Not in Valid State, circuit pack is member of an equipment protection group`

Validation rule: ES64U switch capacity and unit roles

The creation of the ES64U equipment protection group is rejected, if the worker unit has an ES64U switch capacity of 0 GBit/s or if the protection unit has an ES64U switch capacity greater than 0 GBit/s.

Error code:

`SNVS – Status, Not in Valid State, ES64U switch capacity invalid`

The creation of an ES64U equipment protection group is only allowed, if the worker ES64U pack has *es64ucap* > 0 and the protection pack has *es64ucap* = 0.

Error responses (general)

Validation rule: port on different packs

Each port, being a member within the protection group, is located on different circuit packs.

Error code:

`SNVS – Status, Not in Valid State, ports must be on different circuit packs`

Validation rule: common interface type

Each port being a member within the protection group, shall have the same interface standard i.e. all ports shall either operate in SONET mode or in SDH mode.

Error code:

`SNVS – Status, Not in Valid State, ports have different interface types`

Validation rule: supported port rate

The port rate is supported for the specified protection type

Error code:

`SNVS – Status, Not in Valid State, port rate not supported for this protection type`

Value Range: See value range definition for the attribute *pgrate* in the "RTRV-PROTN-GRP: Retrieve protection group" (p. 3-2759) output section w.r.t. supported port rates for the different protection types.

Validation rules for value range

See value range definition for the attribute *pgrate* in the "RTRV-PROTN-GRP: Retrieve protection group" (p. 3-2759) output section w.r.t. supported port rates for the different protection types.

Validation rule: common port rate

Each port being a member within the protection group, shall have the same port rate.

Error code:

`SNVS – Status, Not in Valid State, ports have different port rates`

Validation rule: No test access session

Tributaries related to the specified ports must not be used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, Tributary used in test access session`

Validation rule: XC pack is (pre-)provisioned

There is at least one XC pack pre-provisioned or provisioned.

Error code: `SNVS – Status, Not in Valid State, XC Pack not provisioned`

Validation rule: unique pgid

The specified *pgid* is not already used by an already existing protection group AID of the same protection type.

Error code:

`SDNC – Status, Data Not Consistent, pgid is already used by another protection group of the same type`

Validation rule: maximum number of 2-fibre and 4-fibre MS SPRING / BLSR protection groups

The number of 2-fibre and/or 4-fibre MS SPRING / BLSR protection groups in the system shall not exceed 32.

Error code:

`SSRE – Status, System Resources Exceeded, allowed number of MS SPRING and BLSR protection groups is exceeded`

This restriction results from the number of K-byte express channels which can be supported by the system. The number of groups actually supported by the system is also limited by factors such as the system capacity, the number of ports per slot, the number of ports per group (2-fibre / 4-fibre / 4-fibre asymmetric groups), and the number of DCC channels supported by the CTL (if automatic ring discovery is used).

Error responses (multiplex section/line protection group)

Validation rule: no timing reference on protection port

Protection port is not assigned to a timing reference.

Error code:

`SNVS – Status, Not in Valid State, protection port is assigned to a line timing reference`

Validation rule: no out-of-service state on protection port

Protection port shall not have the value ’OUTOFSERVICE’ for the attribute *servcond*.

Error code:

`SNVS – Status, Not in Valid State, protection port is out-of-service`

Validation rule: no timing reference on other port of protection unit

No other port of unit related to the protection port is assigned to a timing reference if a .timing reference is already assigned to the intended worker port.

Error code:

`SNVS – Status, Not in Valid State, other port of protection unit is assigned to a line timing reference`

Validation rule: No MSP 1:1 protection for bitrate STM-256

The system shall reject an ENT command for the architecture 1:1 (protype = 1xNOPT), if the port bitrate is STM-256.

Error code:

`IDNC – Input, Data, Not Consistent, This MSP protection type not supported for a port with the indicated rate`

Validation rule: No MSP 1+1 optimized protection for SONET

The system shall reject an ENT command for the architecture 1+1 (protype = 1+1) if it is combined with the operation parameter value ’optimized’ (protocol =1+1_OPTM) and if the port mode is SONET.

Error code:

`IDNC – Input, Data Not Consistent, MSP 1+1_optimized not supported for SONET mode`

Validation rule: No MSP 1:1 protection for SONET

The system shall reject an ENT command for the architecture 1:1 (protype = 1xNOPT), if the port mode is SONET.

Error code:

`IDNC – Input, Data, Not Consistent, No MSP protection supported for SONET mode`

Validation rule: MSP type 1:1 is never non-revertive

The system shall reject an ENT command for the architecture 1:1 (protype = 1xNOPT), if it is combined with the operation mode ’non-revertive’ (rme=disabled).

Error code:

`IDNC – Input, Data, Not Consistent, MSP Protection Type 1x1 is always revertive`

Validation rule: No MSP/APS 1+1 revertive protection for bitrate STM-256/OC-768

The system shall reject an ENT command for the architecture 1+1 (protype = 1+1) and the operation mode 'revertive' (rme=enabled) , if the port bitrate is STM-256 or OC-768.

Error code:

`IDNC – Input, Data Not Consistent, revertive mode not supported for MSP Protection Type 1+1 and a port with the indicated rate`

Validation rule: No MSP/APS 1+1 for bitrate STM-256/OC-768

The system shall reject an ENT command for the architecture 1+1 (protype = 1+1), if the port bitrate is STM-256 or OC-768.

Error code:

`IDNC – Input, Data Not Consistent, This MSP protection type not supported for a port with the indicated rate`

Validation rule: only MSP 1+1 can be optimized

The system shall reject an ENT command for any architecture beside 1+1 (protype = 1+1) if it is combined with the operation parameter value 'optimized'.

Error code:

`IDNC – Input, Data, Not Consistent, Optimized exists only with 1+1 Protection Type`

Validation rule: No MSP 1+1 optimized for bitrate STM-256

The system shall reject an ENT command for the architecture 1+1 (protype = 1+1), if combined with the parameter protocol=OPTM and the port bitrate STM-256.

Error code:

`IDNC – Input, Data, Not Consistent, This MSP protection type not supported for a port with the indicated rate`

Validation rule: No HO/LO cross-connection or LO substructure at protection tribs

The creation of the Protection group is rejected, if HO or LO cross-connections or LO substructure exist on protection tributaries related to the specified ports.

Error code:

`SNVS – Status, Not in Valid State, cross-connections or substructure still exist`

Validation rule: No XC loopbacks on protection tribs

There shall exist no cross-connection loopbacks on protection tributaries related to the specified ports.

Error code:
`SNVS – Status, Not in Valid State, Tributary is used in cross-connection loopback`

Validation rule: No input tributary of LO pathprotected cross-connection on the worker port

No tributary on the dedicated worker port of the 1+1 or 1:1 multiplex section/line protection group is used as input tributary of a lower order path-protected cross-connection.

Error code:
`SNVS – Status, Not in Valid State, trib of MSP 1+1/1x1 port as input-trib in pathprotected LO crossconnection`

Validation rule ID 69476 disallows any cross-connection at the dedicated protection port. The tributaries at the worker port cannot be used as input tribs in pathprotected LO cross-connections. This is checked in the validation rule ID 69570 above.

Any other cross-connection is allowed at the worker port, i.e.

- HO point-to-point cross-connections
- HO path protected cross-connections
- LO point-to-point cross-connections
- Output of LO path protected cross-connections

Validation rule: MSP type 1+1_optimized is never revertive

The system shall reject an ENT command for the architecture 1+1 (protype = 1+1) if it is combined with the operation parameter value 'optimized' and with the operation mode "'revertive'" (*rme* = enab.).

Error code:
`IDNC – Input, Data, Not Consistent, MSP 1+1_Optimized is always non-revertive`

Validation rule: supported *portClass*

Ports must not be of *portClass* INNI

Error code: `SNVS – Status, Not in Valid State, portClass must not be INNI`

Validation rule: no EDGE protection port for 1+1 MSP

In case of a 1+1 MSP group the specified protection port is not of portClass EDGE

Error code: `SNVS – Status, Not in Valid State, portClass may not be EDGE`

Validation rule: no EDGE protection port for 1:1 MSP

In case of a 1:1 MSP group the specified protection port is not of portClass EDGE.

Error code: `SNVS – Status, Not in Valid State, portClass may not be EDGE`

Validation rule: no UNI protection port for 1+1 MSP

In case of a 1+1 MSP group the specified protection port is not of portClass UNI

Error code: `SNVS – Status, Not in Valid State, portClass may not be UNI`

Validation rule: no UNI protection port for 1:1 MSP

In case of a 1:1 MSP group the specified protection port is not of portClass UNI.

Error code: `SNVS – Status, Not in Valid State, portClass may not be UNI`

Error responses (2-fibre MS-SPRing/BLSR protection group)

Validation rule: unique *rid*

The specified *rid* is not already used by an already existing protection group of type 2F, 4F.

Error code:
`IDNV – Input, Data Not Valid, rid is already used by another protection group`

Validation rule: dcc enabled

If the parameter ard (automatic ring discovery) is not DISABLED, for each side at least one dcc channel (section/dcc-r or line/dcc-m) is enabled.

Error code: `SNVS – Status, Not in Valid State, no dcc channel enabled`

Validation rule: Automatic squelch map calculation only with automatic ring discovery

If the parameter ard is specified with the value DISABLE (automatic ring discovery disabled), then the parameter *asmc* must not be set to ENABLE (default value).

Error code:
`IDNV – Input, Data Not Valid, Automatic Squelch Map Calculation only allowed with Automatic Ring Discovery`

Validation rule: supported *portClass*

Ports must not be of *portClass* INNI

Error code: `SNVS – Status, Not in Valid State, portClass must not be INNI`

Validation rule: supported *portClass*

Ports must not be of *portClass* UNI

Error code: `SNVS – Status, Not in Valid State, portClass must not be UNI`

Validation rule: No HO/LO cross-connection or LO substructure at tributaries

The creation of the protection group is rejected, if HO or LO cross-connections or LO substructure exist on tributaries related to the specified ports.

Error code:
`SNVS – Status, Not in Valid State, cross-connections or substructure still exist`

Validation rule: no XC loopbacks on tribs

There shall exist no cross-connection loopbacks on tributaries related to the specified ports.

Error code:
`SNVS – Status, Not in Valid State, Tributary is used in cross-connection loopback`

Error responses (4-fibre MS-SPRing/BLSR protection group)

Validation rule: unique *rid*

The specified *rid* is not already used by an already existing protection group of type 2F, 4F.

Error code:
`IDNV – Input, Data Not Valid, rid is already used by another protection group`

Validation rule: dcc enabled

If the parameter *ard* (automatic ring discovery) is ENABLED, for each worker port at least one dcc channel (section/dcc-r or line/dcc-m) is enabled.

Error code: `SNVS – Status, Not in Valid State, no dcc channel enabled`

Validation rule: dcc enabled on protection port

If the parameter ard (automatic ring discovery) is ENABLED, for each protection port of an asymmetric span at least one dcc channel (section/dcc-r or line/dcc-m) is enabled.

Error code: `SNVS – Status, Not in Valid State, no dcc channel enabled`

The characteristic of an asymmetric ring is that one or more spans have only protection lines, no working lines (asymmetric spans). In these asymmetric spans it must be possible to use the DCC channels of the protection ports.

Automatic Squelch Map Calculation only with Automatic Ring Discovery

If the parameter *ard* is specified with the value DISABLE (automatic ring discovery disabled), then the parameter *asmc* must not be set to ENABLE (default value).

Error code:
`IDNV – Input, Data Not Valid, Automatic Squelch Map Calculation only allowed with Automatic Ring Discovery`

Validation rule: Timing reference on protection port only allowed in asymmetric spans of a ring

The system shall not allow to assign the protection port of a symmetric span of a ring to a timing reference. The assignment of the protection port to a timing reference is only allowed for asymmetric spans.

Error code:

`SNVS – Status, Not in Valid State, protection port is assigned to a line timing reference`

The characteristic of an asymmetric ring is that one or more spans have only protection lines, no working lines (asymmetric spans). In these asymmetric spans it must be possible to use the protection ports for timing.

Validation rule: no out-of-service state on protection port

Protection port shall not have the value ’OUTOFSERVICE’ for the attribute *servcond*.

Error code:

`SNVS – Status, Not in Valid State, protection port is out-of-service`

Validation rule: no timing reference on other port of protection unit

No other port of unit related to the protection port is assigned to a timing reference if a timing reference is already assigned to the intended worker port.

Error code:

`SNVS – Status, Not in Valid State, other port of protection unit is assigned to a line timing reference`

Validation rule: SDH ports for TOP

If *protnmode* equals ’SHORTENED’ or ’TOPEX’ (both are TOP), then all specified member ports shall have the interface standard SDH.

Error code:

`SNVS – Status, Not in Valid State, SONET port not allowed for TOP`

Validation rule: complete side information

The parameters *eastwkg*, *eastprotn*, *westwkg*, *westprotn* must be present in the request.

Error code: `IDNV – Input, Data Not Valid, side information is not complete`

Validation rule: supported *portClass*

Ports must not be of *portClass* INNI

Error code: `SNVS – Status, Not in Valid State, portClass must not be INNI`

Validation rule: supported *portClass*

Ports must not be of *portClass* UNI

Error code: `SNVS – Status, Not in Valid State, portClass must not be UNI`

Validation rule: supported *portClass*

Protection ports must not be of *portClass* EDGE

Error code:

`SNVS – Status, Not in Valid State, portClass of protection port must not be EDGE`

Validation rule: supported *portClass* for TOP

If *protnmode* equals SHORTENED or TOPEX (both are TOP), then none of the specified member ports shall have the *portClass* EDGE.

Error code:

`SNVS – Status, Not in Valid State, portClass must not be EDGE for TOP`

Validation rule: No HO/LO cross-connection or LO substructure at tributaries

The creation of the Protection group is rejected, if HO or LO cross-connections or LO substructure exist on tributaries related to the specified ports.

Error code:

`SNVS – Status, Not in Valid State, cross-connections or substructure still exist`

Validation rule: no XC loopbacks on tribs

There shall exist no cross-connection loopbacks on tributaries related to the specified ports.

Error code:

`SNVS – Status, Not in Valid State, Tributary is used in cross-connection loopback`

ENT-PROTN-GRP notification

Output format

The following syntax is used for 1+1 equipment, 1+1 multiplex section/line, 2-/4-fibre MS-SPRing/BLSR protection group.

General Syntax: **`ENT-PROTN-GRP`**:*aid*:*protype:spec_block*;

Path Protection Group Syntax: **`ENT-PROTN-GRP`**:*aid*:*protype:spec_block {outtribaid, CML: cml_block}+*;

CML Block Distribution on 2 Notifications: If the number of CML blocks to be sent in an ENT-PROTN-GRP Notification exceeds the capabilities of the system, then the CML blocks is sent in 2 separate ENT-PROTN-GRP Notifications. The sets of CML blocks contained in the 2 ENT-PROTN-GRP Notifications is disjoint.

Output parameters

Command parameters (1+1 equipment protection group)

1. **`aid`** – Access Identifier
   This parameter specifies the AID of the 1+1 protection equipment group.
   Type: AID
   Range: SwitchAndTmgProtGrpAID for switching protection group instance; CtlProtGroupAID for controller protection group instance; EP155ProtGroupAID for EP155 protection group instance, TMUXProtGroupAID for TransMUX groups, ES64UProtGroupAID for ES64U groups.
2. **`protype`** – Protection Type
   The parameter specifies the type of the protection group for retrieving the information.
   Type: Alphanumeric value set.

   Range:

   - EQPTSWFBR (if *aid* is SwitchAndTmgProtGrpAID)
   - EQPTCTL (if *aid* is CtlProtGroupAID)
   - EQPTEP155 (if *aid* is EP155ProtGroupAID)
   - EQPTEP51 (if *aid* is EP51ProtGroupAID)
   - EQPTLOXC (if *aid* is LOXCProtGroupAID)
   - EQPTTMUX (if *aid* is TMUXProtGroupAID)
   - EQPTES64U, if *aid* is ES64UProtGroupAID.

Command parameters (multiplex section/line protection group)

1. **`aid`** – Access Identifier
   This parameter specifies the aid of a 1+1 multiplex section/line protection group or the aid of a 1:1 multiplex section/line protection group (only R3.0 and later).
   Type: AID
   Range: OnePlusOne_ProtGrpAID or NByOne_ProtGrpAID
2. **`protype`** – Protection Type
   The parameter specifies the architecture (type) of the protection group. The value for the 1+1 line/MS protection group is 1+1. The value for the 1:1 line/MS protection group is 1x***N***OPT (only R3.0 and later).
   In mind the ***N*** in "1x***N***OPT" is considered to be always equal "1".
   Type: Alphanumeric value set.
   Range: 1+1 (default) or 1xNOPT.

Command parameters (2-fibre MS-SPRing/BLSR protection group)

1. **`aid`** – Access Identifier
   This parameter specifies the AID of the 2 fibre MS-SPRing/BLSR protection group.
   Type: AID
   Range: TwoFibre_ProtGrpAID
   Default: No default
2. **`protype`** – Protection Type
   The parameter specifies the type of the protection group. The value for the 2-fibre MS-SPRing/BLSR protection group is 2F.
   Type: Alphanumeric value set.
   Range: 2F.

Command parameters (4-fibre MS-SPRing/BLSR protection group)

1. **`aid`** – Access Identifier
   This parameter specifies the AID of the 4 fibre MS-SPRing/BLSR protection group.
   Type: AID
   Range: FourFibre_ProtGrpAID
2. **`protype`** – Protection Type
   The parameter specifies the type of the protection group. The value for the 4-fibre MS-SPRing/BLSR protection group is 4F.
   Type: Alphanumeric value set.
   Range: 4F.

Command parameters (Path protection group)

1. **`aid`** – Access Identifier
   This parameter specifies the AID of the path protection group.
   Type: AID
   Range: STS1NumAID or VCGNumAID or GenLOTribAID or TMuxAPTNumAID. The usage of wild cards is not restricted. This range specifies all AIDs which can be used to identify a path protection group. Any defined wild cards (e.g. **`all`** or **`vall`** or **`usall`** in various positions) are allowed.
2. **`protype`** – Protection Type
   The parameter specifies the type of the protection group. The value for the path protection group is PATHDRI.
   Type: Alphanumeric value set.
   Range: PATHDRI
3. **`outtribaid`** – Output Tributary Access Identifier
   This parameter specifies the output tributary AID for a constituent signal within the protection group. One value is returned for each constituent signal together with the corresponding CML (Constituent Member List) block.
   Type: AID
   Range: STS1NumAID or VCGNumAID or GenLOTribAID or TMuxAPTNumAID. The usage of wild cards is not restricted. This range specifies all AIDs which can be used to identify a path protection group. Any defined wild cards (e.g. **`all`** or **`vall`** or **`usall`** in various positions) are allowed.

Spec block parameters (1+1 equipment protection group)

1. **`protn`** – Protection Unit
   The parameter specifies the protection circuit pack AID being a member of the 1+1 equipment protection group.
   Type: AID
   Default: For switching protection group instance: CpAID related to slot 10. For controller protection group instance: CpAID related to slot 31. For EP155 protection group instance: – If no cross-connections are assigned to one of the two EP155 cards, the user can choose it by the **`ENT-PROT-GRP`** command Default protection unit is the right card. – If cross-connections are assigned to one of the cards, the other card must become the protection unit. This means that the creation (ENT-PROTN-GRP) is rejected, if the user selects the card with cross-connections as protection card.
2. **`wkg`** – Worker Unit
   This parameter specifies the worker circuit pack AID being a member of the 1+1 equipment protection group.
   Type: AID
   Range: CpAID
   Default: For switching protection group instance: CpAID related to slot 9. For controller protection group instance: CpAID related to slot 11. For EP155 protection group instance: – If no cross-connections are assigned to one of the two

EP155 cards, the user can choose it by the **ENT-PROT-GRP** command Default worker unit is the left card. – If cross-connections are assigned to one of the cards, this card must become the worker unit. This means that the creation (ENT-PROTN-GRP) is rejected, if the user selects the card with no cross-connections as worker card.

Spec block parameters (multiplex section/line protection group)

1. **apspn** – MSP-APS ASAP Pointer
   This parameter specifies the value for the ASAP (alarm severity assignment profile) name of type MSP-APS (Multiplex Section Protection – Automatic protection switching).
   Type: Alphanumeric string
   Range: 1-24 characters including character '-'.
   Default: DEFAULT
2. **dcclmsprotmd** – DCC Line/MS Protection Mode
   The parameter specifies, whether the line/MS dcc channel is switched as part of the line/MS protection group. The value ENABLE is used, if DCC channel is switched as part of line/MS protection group; otherwise the value DISABLED is used.
   Type: Alphanumeric value set 3;
   Range: ENABLE, DISABLE
   Default: DISABLE
3. **dccsrsprotmd** – DCC Sect/RS Protection Mode
   The parameter specifies, whether the section/RS dcc channel is switched as part of the line/MS protection group. The value ENABLE is used, if dcc channel is switched as part of line/MS protection group; otherwise the value DISABLED is used.
   Type: Alphanumeric value set
   Range: ENABLE, DISABLE
   Default: DISABLE
4. **protn** – Protection Unit
   This parameter specifies the protection port AID being a member of the line protection/ MS protection group.
   Type: AID
   Range: SPortAID

5. **wkg** – Worker Unit
   This parameter specifies the worker port AID being a member of the 1+1 line/MS protection group.
   Type: AID
   Range: SPortAID
6. **wtr** – Wait To Restore Time
   The parameter specifies the “wait to restore” time used by the protection state machine operating in revertive mode. In case of MSP 1+1 optimized, the same parameter is used for the “wait to rename” time.
   Type: numeric string [minute]
   Range: 0 – 60
   Default: 5.

Spec block parameters (2-fibre MS-SPRing/BLSR protection group)

1. **ard** – Automatic Ring Discovery
   If this parameter is enabled, the automatic ring discovery algorithm will assign nodeID values to each node in the ring and construct the necessary ring map information. All nodes in the ring must support the Ring Discovery interworking. If disabled, the user will assign the NodeID value manually with ED-MAP-RING and supply the ring map information to each node on the ring for the BLSR protocol to operate. It is necessary to activate this user-provisioned information with SET-MAP-RING. Until all nodes on the ring have the same ring map, nodes will have most likely an outstanding NodeID mismatch alarm active.
   Type: Alphanumeric string.
   Range: ENABLE, DISABLE.
   Default: ENABLE.
2. **asmc** – Automatic Squelch Map Calculation
   If this parameter is enabled, the automatic squelch map calculation is switched on. If disabled, the function is switched off.
   Type: Alphanumeric string
   Range: ENABLE, DISABLE (default)
3. **blsrpn** – MS-SPRing-BLSR ASAP Pointer
   This parameter specifies the value for the ASAP (alarm severity assignment profile) name of type MS-SPRing-BLSR.
   Type: Alphanumeric string
   Range: 1-24 characters including the character “-”.
   Default: DEFAULT
4. **east** – East Port
   This parameter specifies the port being a member in the role of the east port for a 2-fibre MS-SPRing/BLSR protection group.
   Type: AID
   Range: SPortAID

5. **rcamode** – Ring Circuit Alarm Mode
   This parameter can be used to enable or disable ring circuit alarms for the local MS SPRING / BLSR protection group. Ring Circuit alarms are results of the ring circuit validation (Path Integrity Failure) and of the audit of the local squelch map (Local SQuelch Map Conflict). The parameter does not control the validation or audit itself, but only the associated alarming. If rcamode is DISABLED, any alarm associated with the local cross-connections will be suppressed and not issued.
   Type: Alphanumeric value set.
   Range: ENABLE (default), DISABLE
6. **rid** – Ring Identification
   This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
   Type: text string of chars allowed for TID strings.
   Range: 1 to 15 characters.
   Default: NONE.
7. **west** – West Port
   This parameter specifies the port being a member in the role of the west port for a 2-fibre MS-SPRing/BLSR protection group.
   Type: AID.
   Range: SPortAID.
   Default: None.
8. **wtr** – Wait To Restore Time
   This parameter specifies the wait to restore time for ring switches used by the protection state machine operating in revertive mode. The protection operates in revertive mode if the wait-to-restore time is in the range 0-12. The protection operates in non-revertive mode if the wait-to-restore time has the value 99 representing the infinite value.
   Note: If *wtr* time is set to infinite, the switch request state is WTR until a higher request occurs.
   Type: numeric string [minute].
   Range: 0 – 12 in 1 minute increments and 99.
   Default: 5.

Spec block parameters (4-fibre MS-SPRing/BLSR protection group)

1. **ard** – Automatic Ring Discovery
   If this parameter is enabled, the automatic ring discovery algorithm will assign nodeID values to each node in the ring and construct the necessary ring map information. All nodes in the ring must support the Ring Discovery interworking. If disabled, the user will assign the NodeID value and supply the ring map information to each node on the ring for the BLSR protocol to operate. Until all

nodes on the ring have the same ring map, nodes will have most likely an outstanding NodeID mismatch alarm active.
Type: Alphanumeric string.
Range: ENABLE, DISABLE.
Default: ENABLE.

2. **`asmc`** – Automatic Squelch Map Calculation
If this parameter is enabled, the automatic squelch map calculation is switched on. If disabled, the function is switched off.
Type: Alphanumeric string
Range: ENABLE, DISABLE (default)
3. **`blsrpn`** – MS-SPRing-BLSR ASAP Pointer
This parameter specifies the value for the ASAP (alarm severity assignment profile) name of type MS-SPRing-BLSR.
Type: Alphanumeric string.
Range: 1-24 characters including the character "-".
Default: DEFAULT.
4. **`eastprotn`** – East Protection Port
This parameter shall specifies the port being a member in the role of the east protection port for a 4-fibre MS-SPRing/BLSR protection group.
Type: AID
Range: SPortAID
5. **`eastwkg`** – East Worker Port
This parameter specifies the port being a member in the role of the east worker port for a 4-fibre MS-SPRing/BLSR protection group.
Type: In case of an asymmetric ring: alphanumeric string; in all other cases: AID.
Range: In case of an asymmetric ring: NOTUSED. In all other cases: SPortAID.
6. **`protnmode`** – Protection Switch Mode
The parameter specifies the protection switch mode. The value LOOPBACK is used for the classical ring application. The value SHORTENED is used for transmission delay sensitive applications. The value TOPEX (only R3.0 - R3.2 and R8.0.1 and later) is used for the so called transoceanic application, which allows extra traffic, improves restorability and improves delay as well as in SHORTENED mode.
In case of a ring switch … LOOPBACK performs the bridge and switch function in that nodes which are most close to the failed span. SHORTENED performs the bridge function at the add node repectively the switch function at the drop node of each ring circuit. It is an application only similar to the transoceanic protocol.
TOPEX allows, compared to SHORTENED mode, additionally the traffic restoration of not affected spans. It is the transoceanic protocol application.
Consistent Protection Switch Mode Setting: The Protection Switch Mode must be set consistently on all nodes in the ring. E.g. for all UNITE NEs in a TOP+EX ring the parameter protnmode must be set to TOPEX. In a ring with inconsistent

Protection Switch Mode, there will be no protection switching. The UNITE NEs will raise an Inconsistent Ring Protection Mode alarm.
Type: Alphanumeric value set.
Range: LOOPBACK, SHORTENED, TOPEX.
Default: LOOPBACK.

7. **`rcamode`** – Ring Circuit Alarm Mode
This parameter can be used to enable or disable ring circuit alarms for the local MS SPRING / BLSR protection group. Ring Circuit alarms are results of the ring circuit validation (Path Integrity Failure) and of the audit of the local squelch map (Local SQuelch Map Conflict). The parameter does not control the validation or audit itself, but only the associated alarming. If rcamode is DISABLED, any alarm associated with the local cross-connections will be suppressed and not issued.
Type: Alphanumeric value set.
Range: ENABLE (default), DISABLE

8. **`rid`** – Ring Identification
This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
Type: text string of chars allowed for TID strings.
Range: 1 to 15 characters.
Default: NONE

9. **`swtr`** – Span Wait To Restore Time
The parameter specifies the wait to restore time for span switches used by the protection state machine operating in revertive mode. The protection shall operate in revertive mode if the wait-to-restore time is in the range 0-12. The protection shall operate in non-revertive mode if the wait-to-restore time has the value 99 representing the infinite value.
Note: If *wtr* time is set to infinite, the switch request state is WTR until a higher request occurs.
Type: numeric string [minute].
Range: 0 – 12 in 1 minute increments and 99.
Default: 5.

10. **`westprotn`** – West Protection Port
This parameter specifies the port being a member in the role of the west protection port for a 4-fibre MS-SPRing/BLSR protection group.
Type: AID
Range: SPortAID

11. **`westwkg`** – West Worker Port
    This parameter specifies the port being a member in the role of the west worker port for a 4-fibre MS-SPRing/BLSR protection group
    Type: In case of an asymmetric ring: alphanumeric string; in all other cases: AID
    Range: In case of an asymmetric ring: NOTUSED; in all other cases: SPortAID.
12. **`wtr`** – Wait To Restore Time
    This parameter specifies the wait to restore time for ring switches used by the protection state machine operating in revertive mode. The protection operates in revertive mode if the wait-to-restore time is in the range 0-12. The protection operates in non-revertive mode if the wait-to-restore time has the value 99 representing the infinite value.
    Note: If wtr time is set to infinite, the switch request state is WTR until a higher request occurs.
    Type: numeric string [minute].
    Range: 0 – 12 in 1 minute increments and 99.
    Default: 5.

Spec block parameters (path protection group)

1. **`cst`** – Constituent Signal Type
   In cases of mixed usage of SONET and SDH terms in provisioning of cross-connection and provisioning of protection group no conversion will happen. The equivalent term may be shown instead. For example: Assume the protection group port rate – identified by the modifier – is entered as a SDH term. If before the underlying cross-connection rate has been entered as a SONET term the parameter cst will nevertheless show the SONET term according ID 24284 (e.g. STS48C).
   This parameter specifies the rate of the path protection group.
   Type: Alphanumeric value set.
   Range: LOVT1, STS1, STS3C, STS12C, STS48C, STS192C, LOVC12, LOVC3, VC3, VC4, VC44C, VC416C, VC464C.
2. **`dripathpn`** – SNCP-UPSR ASAP Pointer
   This parameter specifies the value for the ASAP (alarm severity assignment profile) name of type SNCP-UPSR.
   Type: Alphanumeric string.
   Range: 1-24 characters including the character “-”.
   Default: DEFAULT.
3. **`htmr`** – Hold-Off Time
   This parameter specifies the hold-off time for automatic protection switching used by the protection state machine.
   Type: numeric string [ms].
   Range: 0 .. 99 ms in 1 ms steps and 100 .. 10000 ms in 100 ms steps.

4. **`ppgname`** – Path protection group Name
   This parameter specifies the path protection group name. Storage and retrieval of the *ppgname* is case sensitive, but actual use of the *ppgname* to determine the corresponding protection group is case insensitive.
   Type: text string.
   Range: 0 to 24 characters.
   Default: empty string
5. **`protn`** – Protection Tributary
   This parameter specifies the protection input tributary AID being a member of the path protection group.
   Type: AID.
   Range: STS1NumAID or VCGNumAID or GenLOTribAID or TMuxAPTNumAID.
6. **`rme`** – Protection Reversion
   This parameter specifies, whether revertive or non-revertive mode is used as operation mode of the protection group.
   The value ENABLE is used if the protection operates in revertive mode.
   The value DISABLE is used if the protection operates in non-revertive mode.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE.
7. **`snctype`** – SNC Protection Type
   This parameter specifies the type of the path protection w.r.t. switch criteria used by the protection state machine.
   The value SNCI (Inherent) is used if server signal fail is used as switch criteria.
   The value SNCN (Non-Instrusive) is used if server signal fail and defects supervised by a non-intrusive path monitor are used as switch criteria
   The value NA is used if one of the tributary inputs is related to a port operating in SONET mode.
   Type: Alphanumeric value set.
   Range: SNCI, SNCN, NA.
8. **`wkg`** – Worker Tributary
   This parameter specifies the worker input tributary AID being a member of the path protection group.
   Type: AID.
   Range: STS1NumAID or VCGNumAID or GenLOTribAID or TMuxAPTNumAID.
   The usage of wild cards is not allowed for any part of the AID.
9. **`wtr`** – Wait To Restore Time
   This parameter specifies the wait to restore time used by the protection state machine operating in revertive mode.
   Type: numeric string [minute].
   Range: 0 – 60.

CML block parameters (path protection group)

1. **`cst`** – Constituent Signal Type
   In cases of mixed usage of SONET and SDH terms in provisioning of cross-connection and provisioning of protection group no conversion will happen. The equivalent term may be shown instead. For example: Assume the protection group port rate – identified by the modifier – is entered as a SDH term. If before the underlying cross-connection rate has been entered as a SONET term the parameter cst will nevertheless show the SONET term according ID 24284 (e.g. STS48C).
   This parameter specifies the rate of the constituent signal within the path protection group.
   Type: Alphanumeric value set.
   Range: LOVT1, STS1, STS3C, STS12C, STS48C, STS192C, LOVC12, LOVC3, VC3, VC4, VC44C, VC416C, VC464C
   Default: The default value is derived from the tributary input signal rate list in case of fixed mode.

Example output

1+1 Equipment Protection Group

The following example reports the creation of an 1+1 equipment protection group:

```
LT-UNITE 00-11-03 15:00:00
A  000 REPT DBCHG
   ″TIME=15-00-00,DATE=00-11-03:ENT-PROTN-GRP:1-1-estgrp:EQPTSWFBR:wkg=1-1-#-#-xcw-
      cp,protn=1-1-#-#-xcp-cp″
;
```

Multiplex section/line protection group 1+1

The following example reports the creation of an 1+1 multiplex section/line protection group:

```
LT-UNITE 00-11-03 15:00:00
A  000 REPT DBCHG
   ″TIME=15-00-00,DATE=00-11-03:ENT-PROTN-GRP:1-1-o01:1+1:wkg=1-1-#-#-13-1,protn=1-1
      -#-#-14-1,wtr=5,apspn=DEFAULT,
      dcclmsprotmd=DISABLE,dccsrsprotmd=DISABLE,protocol=1+1_UNI,rme=DISABLE″
;
```

2 fibre MS-SPRing/BLSR protection group

The following example reports the creation of a 2 fibre MS-SPRing/BLSR protection group:

```
LT-UNITE 00-11-03 15:00:00
A  000 REPT DBCHG
   ″TIME=15-00-00,DATE=00-11-03:ENT-PROTN-GRP:1-1-t001:2F:east=1-1-#-#-13-1,west=1-1
      -#-#-14-1,rid=\″denver\″,wtr=5,blsrpn=DEFAULT″
;
```

4 fibre MS-SPRing/BLSR protection group

The following example reports the creation of a 4 fibre MS-SPRing/BLSR protection group:

```
LT-UNITE 00-11-03 15:00:00
A  000 REPT DBCHG
   ″TIME=15-00-00,DATE=00-11-03:ENT-PROTN-GRP:1-1-f001:4F:eastwkg=1-1-#-#-13-
      1,eastprotn=1-1-#-#-15-1,westwkg=1-1-#-#-14-1,westwkg=1-1-#-#-16-
      1,rid=\″denver\″,protnmode=LOOPBACK,swtr=5,wtr=5,blsrpn=DEFAULT″
;
```

Path protection group

The following example reports the creation of a path protection group:

```
LT-UNITE 05-05-31 15:00:00
A  000 REPT DBCHG
   ″TIME=15-00-00,DATE=00-11-03:ENT-PROTN-GRP:1-1-#-#-10-1-25:PATHDRI:cst=STS1,wkg=1
      -1-#-#-08-1-25,protn=1-1-#-#-06-1-
      1,ppgname=\″group018\″,htmr=100,wtr=5,dripathp=path2,rme=DISABLE,snctype=NA″
   ″1-1-#-#-10-1-25,CML:cst=STS1″
;
```

ENT-PTF notification

Output format

Syntax

`ENT-PTF`-*modifier:aid::spec_block;*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   The access identifier specifies the PTF tributary whose attributes are reported.
   Type: AID
   Range:
   - PTNumAID for modifier: STS, HOSTS1, HOVC4, ALL
   - TMuxAPTNumAID for modifier: TMASTS1
   - TMuxSPTNumAID for modifier: HOSTS1, TMSSTS1

   as defined in AID structure with exception of value **`all`**.
2. **`modifier`**
   The modifier specifies the type of the tributary.
   Type: Alphanumeric value set.
   Range:
   - STS for DS3 card
   - HOSTS1 for LOXC card
   - HOVC4 for LOXC card
   - TMASTS1 for TransMUX asynchronous port
   - TMSSTS1 for TransMUX synchronous port

Spec block parameters

1. **`brstintvl`**– Bursty Interval
   The parameter *brstintvl* specifies the measurement period for degraded defect if *sdsfmode* is set to BURST. If *sdsfmode* is not set to BURST, then *brstintvl* has no affect to NE behavior.
   Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS (path terminations related to physical T3 ports). But the parameters for near end performance monitoring on T3 related path terminations are kept for compatibility reasons.

   The parameter *brstintvl* is not supported for the following modifiers:
   - HOSTS1
   - HOVC4

- TMASTS1
- TMSSTS1

Option: If the parameter *brstintvl* is not supported, then the parameter is omitted.
Type: Integer.
Range: 2, 3, … 10 [seconds]
Default: 7 [seconds].

2. **`brstthr`** – Bursty Error Threshold
The parameter *brstthr* specifies the degradation threshold for degraded defect if *sdsfmode* is set to BURST. If *sdsfmode* is not set to BURST then *brstthr* has no affect to NE behavior.
Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS (path terminations related to physical T3 ports). But the parameters for near end performance monitoring on T3 related path terminations are kept for compatibility reasons.
The parameter *brstthr* is not supported for the following modifiers:
   - HOSTS1
   - HOVC4
   - TMASTS1
   - TMSSTS1

   Option: If the parameter *brstthr* is not supported, then the parameter is omitted.
Type: Integer.
Range: 5, 10, 15, … 50 [%].
Default: 30.

3. **`crslpbkstat`** – Cross-connect Loopback Status
The parameter *crslpbkstat* reports the configuration of the cross-connection loopback of this tributary. For changing the loopback operation refer to "OPR-LPBK: Operate cross-connection loopback" (p. 3-2035).
The parameter *crslpbkstat* is not supported for the following modifiers:
   - HOSTS1
   - HOVC4
   - TMSSTS1

   Option: If the parameter *crslpbkstat* is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range: YES, for enabled loopback; NO, for disabled loopback

4. **`degthr`** – Signal Degrade Threshold
This parameter specifies the exponent to base 10 for building the degraded threshold level. The degraded threshold level is used for building the degraded defect if *sdsfmode* is set to POISSON. If *sdsfmode* is not set to POISSON then *degthr* has no affect to NE behavior. For the definition of *sdsfmode* refer to

RTRV-PTF Output parameters.
Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS (path terminations related to physical T3 ports). But the parameters for near end performance monitoring on T3 related path terminations are kept for compatibility reasons.

The parameter *degthr* is not supported for the following modifiers:

- HOSTS1
- HOVC4
- TMSSTS1

Type: Integer.
Range (as exponents of 10): –5; –6; –7; –8; –9.
Default: –6.

5. **dexcthr** – Excessive Degrade Threshold
This parameter specifies the exponent to base 10 for building the excessive threshold level. The excessive threshold level is used for building the excessive bit error defect if *sdsfmode* is set to POISSON. If *sdsfmode* is not set to POISSON then *dexcthr* has no affect to NE behavior. For the definition of sdsfmode refer to RTRV-PTF Output parameters.
Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS (path terminations related to physical T3 ports). But the parameters for near-end performance monitoring on T3 related path terminations are kept for compatibility reasons.

   The parameter *dexcthr* is not supported for the following modifiers:

   - HOSTS1
   - HOVC4
   - TMSSTS1

   Type: Integer.
   Range (as exponents of 10): –3; –4; –5.
   Default: –3.

6. **exphptrc** – Expected HP trace identifier
This parameter specifies the Expected Higher Order Path Trace Identifier (J1). The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is only useful if ptrcrfmt is set to 16.

   Limitation: The parameter is not supported for modifiers:

   - TMSSTS1

   Type: Hexadecimal number without a preceding "H".
   Range: length: 32 hexadecimal digits; value: specific string acc. ITU/ETSI mode 1.
   Default: 89000000000000000000000000000000

7. **`feppm`** – Far End Path PM Enable
   The parameter *feppm* specifies whether the performance monitoring for the far end is enabled or disabled for this tributary.
   This parameter is omitted for PTF entities which have been created due to a substructured SONET/SDH signal.
   Limitation for PTF related modifiers: Far-end performance monitoring is not available for modifier STS. But the parameters for far-end performance monitoring on T3 related path terminations are kept for compatibility reasons.

   The parameter is not supported for the following modifiers:

   - TMSSTS1

   Type: Alphanumeric value set.

   Range:

   - ENABLE
   - DISABLE (default).

8. **`hptimais`** – HP Trace Identifier Mismatch AIS Insertion
   The parameter *hptimais* shall specifies if a detected TIM will cause AIS insertion. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).

   The parameter is not supported for the following modifiers:

   - TMSSTS1

   Type: Alphanumeric value set.

   Range:

   - ENABLE
   - DISABLE.

   Default: The default value depends on interface standard specified by *ptfstd* for the PTF tributary. DISABLE, if *ptfstd* = SONET

9. **`hptimmon`** – HP Trace Identifier Mismatch Monitor
   This parameter specifies if the mode of the TIM detection. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).

   The parameter is not supported for the following modifiers:

   - TMSSTS1

   Type: Alphanumeric value set.

   Range:

   - ENABLE
   - DISABLE (default).

10. **`inputsig`** – Tributary Input Signal Rate List
    This parameter specifies the input LO signal structure.

The parameter *inputsig* is only supported for the following modifiers:

- HOVC4
- HOSTS1
- TMSSTS1

Option: If the parameter *inputsig* is not supported, then the parameter is omitted.
Type: numeric value set
Range: NX-NX-… (N is the number of Xs. X can be 3, 12, or 11 representing VC3, VC12 or VT1.5).
The possible values (SDH) are: 6312, 13-4212, 2112-13-2112, 4212-13, 23-2112, 13-2112-13, 2112-23, 33
The possible values (SONET) are: 2811
Restricted Range with AU3/AU4 Conversion cross-connections:
If *modifier* = HOVC4 and the HO PTF is used for conversion cross-connections, then the range of *inputsig* is restricted to: 33.
Restricted Range with TransMUX:
If *modifier* = TMSTS1, then the range of *inputsig* is restricted to: 2811.

Default:

- 6312 for SDH
- 2811 for SONET

11. **neppm** – Near End Path PM Enable
This parameter specifies whether the performance monitoring for the near end is enabled or disabled for this tributary.
This parameter is omitted for PTF entities which have been created due to a substructured SONET/SDH signal.
Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS. But the possibility to enable near-end performance monitoring on T3 related path terminations is kept for compatibility reasons.

The parameter is not supported for the following modifiers:

- TMSSTS1

Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE.

Default: DISABLE.

12. **pmhpfeses** – PM HP Far End SES Threshold
This parameter specifies the Higher Order Path Far End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the far end. The behavior depends on interface standard specified by *ptfstd* for the PTF tributary. If *ptfstd* is not set to SDH then *pmhpfeses* has no affect to NE behavior.

This parameter is omitted for PTF entities which have been created due to a substructured SONET/SDH signal.
Limitation for PTF related modifiers: Far-end performance monitoring is not available for modifier STS. But the possibility to enable far-end performance monitoring on T3 related path terminations is kept for compatibility reasons.

The parameter is not supported for the following modifiers:

- TMSSTS1
- TMASTS1

Type: Integer.
Range: 1, 2, 3, …, 63998, 63999, 64000. Includes SDH/SONET range.
Default: 2400

13. **`pmhpneses`** – PM HP Near End SES Threshold
This parameter specifies the Higher Order Path Near End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the near end. The behavior depends on interface standard specified by *ptfstd* for the tributary. If *ptfstd* is not set to SDH then *pmhpneses* has no affect to NE behavior.
This parameter is omitted for PTF entities which have been created due to a substructured SONET/SDH signal.
Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS. But the parameters for near-end performance monitoring on T3 related path terminations are kept for compatibility reasons.

The parameter is not supported for the following modifiers:

- TMSSTS1
- TMASTS1

Type: Integer.
Range: 1, 2, 3, …, 63998, 63999, 64000. Includes SDH/SONET range.
Default: 2400

14. **`ptca`** – Path TCA Profile Pointer
This parameter specifies the name of the threshold crossing alert (TCA) profile used for this tributary.

TCA profile: The TCA profile type depends on the type and standard of the PTF, which is specified with the parameter *modifier* or *aidtype*:

- PATH if *modifier* = TMASTS1

The parameter is not supported for the following modifiers:

- TMSSTS1
- TMASTS1
- HOVC4

Type: Alphanumeric value set.
Range: 1 … 24 characters.
Default: DEFAULT0

15. **`ptfstd`** – Path Termination Standard
    Standard of the tributary with Path Termination Function.
    This is currently a read-only parameter.
    Type: Alphanumeric value set.
    Range:
    - SDH (only if *modifier* = HOVC4)
    - SONET (only if *modifier* = STS, HOSTS1, TMASTS1, or TMSSTS1)

    Default:
    - SDH (if if *modifier* = HOVC4)
    - SONET (if *modifier* = STS, HOSTS1, TMASTS1, or TMSSTS1).
16. **`ptpn`** – Path Terminating ASA Profile Name
    This parameter points to a tributary ASAP profile name *pfname* for the designated AID.
    The parameter is not supported for the following modifiers:
    - TMSSTS1

    Type: Alphanumeric value set. A hyphen (“-”) is allowed in the name additionally.
    Range: 1 … 24 characters
    Default: DEFAULT
17. **`ptrcrfmt`** – Path Trace Read Format
    The parameter *ptrcrfmt* specifies the format of the path trace (J1 byte) to be received (sink).
    The parameter is not supported for the following modifiers:
    - TMSSTS1

    Type: Numeric string.
    Range:
    - 2: for non-specific repeating byte
    - 16: for 16 byte specific string
    - 64: for 64 byte string.
18. **`ptrcwfmt`** – Path Trace Write Format
    The parameter ptrcwfmt specifies the format of the path trace (J1 byte) to be sent (source).
    The parameter is not supported for the following modifiers:
    - TMSSTS1

    Type: Numeric string.
    Range:
    - 2: for non-specific repeating byte
    - 16: for 16 byte specific string
    - 64: for 64 byte string.

    Default: 2.

19. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
    This parameter specifies the determination mode of degraded defect for transmission.
    Limitation for PTF related to modifiers: Near-end performance monitoring is not available for modifier STS. The parameters for near-end performance monitoring on T3 related path terminations are kept for compatibility reasons.

    The parameter is not supported for the following modifiers:

    - TMSSTS1
    - TMASTS1
    - HOVC4
    - HOSTS1

    Option: If the parameter *sdsfmode* is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range: BURST, POISSON
    Default: The default value depends on interface standard specified by *ptfstd* for the tributary. POISSON, if *ptfstd* = SONET.

20. **`substr`** – Substructured
    The parameter *substr* indicates if the PTF is substructured.
    Additional description for LOXC
    This parameter indicates if the PTF is configured for AU3/AU4 conversion cross-connections.
    The parameter *substr* is set autonomously when an AU3/AU4 conversion cross-connection is created. A PTF, which is configured for AU3/AU4 conversion cannot be used to set up HO cross-connections.
    The parameter *substr* is only supported, if *modifier* = STS.
    If the parameter *substr* is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.

    Range:

    - CNV: In use for HO side of a conversion cross-connection
    - NO: Not used for conversion cross-connections

    Default: NO.

21. **`tmonmd`** – Tributary Monitoring Mode
    This parameter specifies the monitoring mode for the tributary.

    The parameter is not supported for the following modifiers:

    - TMSSTS1

    Type: Alphanumeric value set.
    Range: MON, NMON (default).

22. **`trc`** – Outgoing Path Trace
    This parameter specifies the path trace (J1) to be sent (source). For the 16 byte path trace format the following syntactical rule is applied: The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is irrelevant if the format is non-specific repeating byte (*ptrcwfmt* = 2).
    The parameter is not supported for the following modifiers:
    - TMSSTS1

    Type: Hexadecimal number without a preceding “H”.
    Range: the range depends on the parameter ptrcwfmt specified in RTRV-PTF Output parameters
    - length: 32 hexadecimal digits, if *ptrcwfmt*=16; 128 hexadecimal digits, if *ptrcwfmt* = 64
    - value: specific string acc. ITU/ETSI mode 1, if *ptrcwfmt*=16; 64 byte string if *ptrcwfmt* = 64

    Default: 00. This implies also that *ptrcwfmt* is set to 2.
23. **`tslmmon`** – Trail Signal Label Mismatch Monitor
    The parameter *tslmmon* specifies the mode of the TSL mismatch detection.
    The parameter is not supported for the following modifiers:
    - TMSSTS1

    Type: Alphanumeric value set.
    Range: DISABLE, ENABLE.
    Default: ENABLE.
24. **`unequiposig`** – Unequipped Output Signal List
    The parameter *unequiposig* specifies the output LO signal structure, independent whether the signal is connected or not. The parameter *unequiposig* is only supported for modifiers HOVC4. HOSTS1. and TMSSTS1.
    Option: If the parameter *unequiposig* is not supported, then the parameter is omitted.
    Type: numeric value set
    Range: NX-NX-…(N is the number of Xs. X can be 3, 12, or 11 representing VC3, VC12 or VT1.5).
    The possible values (SDH) are: 6312, 13-4212, 2112-13-2112, 4212-13, 23-2112, 13-2112-13, 2112-23, 33
    The possible values (SONET) are: 2811
    Restricted Range with AU3/AU4 Conversion cross-connections:
    If *modifier* = HOVC4 and the HO PTF is used for conversion cross-connections, then the range of *unequiposig* is restricted to: 33.
    Restricted Range with TransMUX:
    If *modifier* = TMSTS1, then the range of *inputsig* is restricted to: 2811.
    Default:
    - 6312 for SDH
    - 2811 for SONET

Example output

```
   LT-UNITE 00-11-11 11:11:00
A  001 REPT DBCHG
   ”TIME=11-10-30,DATE=00-11-11:ENT-PTF-STS:1-1-#-#-21-4-1::

      3,hptimais=DISABLE,exphptrc=890000000000000000000000000000000,hptimmon=DISABLE,ptpn=DEF
;
```

ENT-RC-NEIGHBOR: Add a routing controller to the list of neighboring routing controllers

A routing controller (RC) in this list is considered to be a (logical) adjacent RC and routing information is exchanged with this RC.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S3

Priority: 1

Abortable: No.

Input format

Command syntax: **`ENT-RC-NEIGHBOR`**:*tid*::*ctag*:::*spec_block*;

Input parameters

Command parameters

1. **`tid`** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **`ctag`** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters.
   Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

Spec block parameters

1. **`remrcid`** – Remote Routing Controller Identifier
   This parameter is used to indicate the Id of the remote routing controller.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
2. **`remrcscn`** – Remote Routing Controller SCN IP Address
   This parameter is used to indicate the IP address of the remote routing controller.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.

3. **remrcraid** – Remote Routing Controller Routing Aread ID
   This parameter is used to indicate the routing area ID of the level 0 area of a neighboring route controller.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   0.0.0.0 is not allowed.
4. **remrcOspfFlooding** – Remote Routing Controller OSPF Flooding
   This parameter indicates whether OSPF flooding is enabled to the remote RC or not.
   Type: Alphanumeric value set.
   Range: DISABLE or ENABLE.

Output format

If the **ENT-RC-NEIGHBOR** command is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   ″[rate]:thru[,lpaid]:spec_block″
   ...
   ″[rate]:thru[,lpaid]:spec_block″
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output Parameter section for the “RTRV-HDR: Retrieve header” (p. 3-2417) command.

Detailed behavior description

The **ENT-RC-NEIGHBOR** command adds a routing controller to the list of neighboring routing controllers. The RC neighboring list is used to create level 1 adjacencies for DDRP / OSPF-TE routing.

Example input/output

The following example shows the result of a ENT-RC-NEIGHBOR command:

```
RTRV-MAP-NEIGHBOR:LT-UNITE::123456;
   LT-UNITE 00-11-01 15:00:00
M  123456 COMPLD
   ″STM256:DCC,1-1-#-#-1-1:
nsap=39840F80000000000000000000000000a400,npaid=1-1-#-#-1-1,tid=LT-
      UNITE2,dcctype=SECTION″
   ″STM256:DCC,1-1-#-#-1-1:
nsap=39840F80000000000000000000000000a400,npaid=1-1-#-#-1-1,tid=LT-
      UNITE2,dcctype=LINE″
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **ENT-RC-NEIGHBOR** command.

Validation rule: RC must be created

If the RC is not created (via ACT-L1ROUTING), then the command is denied.

Error code: `IDNV – Input, Data Not Valid, RC node not created`

Validation rule: Neighboring RC must differ from own RC

The command is denied if the neighboring RC ID identified by *remrcid* and/or the neighboring IP address identified by *remrcscn* is identical with the own RC id respectively own RC IP SCN address.

Error code:

`IDNV – Input, Data Not Valid, neighboring RC ID/IP address used by own RC`

Validation rule: RC must not be in Neighboring List

The command is denied if the routing controller is already in the neighboring RC list, i.e. the command is denied if either *remrcid*, *remrcscn*, or *remrcraid* are already in the neighboring RC list.

Error code: `IDNV – Input, Data Not Valid, RC neighbor already provisioned`

Validation rule: Maximum Number of Neighboring RCs

The command is denied if the neighboring RC list already contains 64 entries.

Error code:

`SSRE – Status, System Resources Exceeded, allowed limit of neighboring RCs exceeded`

Related TL1 messages

- "RTRV-RC-NEIGHBOR: Retrieve all neighboring routing controllers" (p. 3-2816)
- "DLT-RC-NEIGHBOR: Delete a routing controller from the list of neighboring routing controllers" (p. 3-247)

ENT-RC-NEIGHBOR notification

Output format

The **ENT-RC-NEIGHBOR** notification has the following specific syntax:

ENT-RC-NEIGHBOR:::*spec_block*

Output parameters

Spec block parameters

1. **remrcid** – Remote Routing Controller Identifier
This parameter is used to indicate the Id of the remote routing controller.
Type: Four dot separated numeric strings.
Range: Each numeric string: 0 .. 255.
2. **remrcscn** – Remote Routing Controller SCN IP Address
This parameter is used to indicate the IP address of the remote routing controller.
Type: Four dot separated numeric strings.
Range: Each numeric string: 0 .. 255.
3. **remrcraid** – Remote Routing Controller Routing Aread ID
This parameter is used to indicate the routing area ID of the level 0 area of a neighboring route controller.
Type: Four dot separated numeric strings.
Range: Each numeric string: 0 .. 255.
0.0.0.0 is not allowed.
4. **remrcOspfFlooding** – Remote Routing Controller OSPF Flooding
This parameter indicates whether OSPF flooding is enabled to the remote RC or not.
Type: Alphanumeric value set.
Range: DISABLE or ENABLE.

Example output

```
RTRV-MAP-NEIGHBOR:LT-UNITE::123456;

```

ENT-ROLL: Enter roll

The **ENT-ROLL**-*modifier* command can be initiated by a user to roll the input of a cross-connection from a given tributary to another tributary while leaving the output unchanged. The **ENT-ROLL** command can be modelled by a DLT-CRS (deleting the existing cross-connection) followed by a ENT-CRS (establishing the new cross-connection according to the specified new input-tributary). This also holds for path-protected cross-connections for which the input of one of the legs can be rolled via the **ENT-ROLL** command, while leading the output of the path selector unchanged.

The tributary to which the roll cross-connection is to be established does not need to be free of alarms/failure conditions – no check in advance will be made. The cross-connection will thus be established also in case of AIS-P, LOP-P, UNEQ etc. as is the case with a normal ENT-CRS command as well.

The *modifier* in the **ENT-ROLL** command indicates the cross-connection rate of the tributary for which the command is applied to. There is no difference if the rate is specified as a SONET rate (STS1, STS3,..) or as SDH-rate (VC3, VC4,..) for the deleting of the old and establishing of the new cross-connection i.e. the ENT-ROLL-<*sonet-rate*> yields to the same physical and logical behavior as ENT-ROLL-<*sdh-rate*>.

No check is made if the *modifier* matches the interface-standard of the port i.e. if the port is provisioned as SONET (resp. SDH) and the rate is a SONET (resp. SDH) rate.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 3

Abortable: No

Input format

Command syntax: **ENT-ROLL**-*modifier*:*tid*:*in_aid*,*out_aid*:*ctag*:::*spec_block*;

Input parameters

Command parameters

1. **modifier**
   This parameter indicates the cross-connection on which the **ENT-ROLL** command acts on.
   For detailed description please refer to the “RTRV-CRS: Retrieve cross-connection” (p. 3-2306) command.
   Type: Alphanumeric value set.

Range (SDH):

- LOVC12
- LOVC3
- VC3
- VC4
- VC44C
- VC416C
- VC464C

Range (SONET):

- LOVT1
- STS1
- STS3
- STS12
- STS48
- STS192
- AU3TU3
- TU3AU3.

No use of the **all** value is allowed.

2. **tid** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
3. **in_aid** – Input Access Identifier
   This parameter specifies the source of the cross-connection.
   For a detailed description please refer to the in_aid output parameter in “RTRV-CRS: Retrieve cross-connection” (p. 3-2306).
   Type: GenTribAID or GenLOTribAID.
   Range: No use of the **all** or **usall** or **vall** values within the in_*aid* are allowed.
4. **out_aid** – Output Access Identifier
   This parameter specifies the tributary which is the sink of the cross-connection.
   For a detailed description please refer to the out_aid output parameter in “RTRV-CRS: Retrieve cross-connection” (p. 3-2306).
   Type: GenTribAID or .GenLOTribAID
   Range: No use of the **all** or **usall** or **vall** values within the *out_aid* is allowed.
5. **ctag** – Correlation Tag
   See definition of *ctag* in “RTRV-HDR: Retrieve header” (p. 3-2417).

Spec block parameters

1. **`newinaid`** – New Input Access Identifier
   This parameter specifies the source of the new cross-connection to be established after the existing one is deleted.
   Type: GenTribAID or GenLOTribAID.
   STS1NumAID are used for high order tributaries on e.g. OP***n*** or EP***n*** packs, VCGNumAID are used for high order tributaries on e.g. GE***n*** or OPT2G5 packs, GenLOTribAID are used for low order tributaries on I/O packs e.g. OP***n*** or EP155.
   Range: n. a.
   No use of the **`all`**, **`vall`** or **`usall`** values within the *newinaid* is allowed.

2. **`newloca`** – New Location-a
   This parameter specifies the new source TID if the *newinaid* is in a BLSR protection group.
   Additional information are given for this parameter in the RTRV-CRS section with respect to: figure illustrating BLSR connections, inter-ring cross-connections with collapsed nodes and extra traffic handling.
   loca (location-a) specifies the TID of the node at which service is added to the BLSR. This parameter is required for BLSR THROUGH, INTER-BLSR and DROP connections, if the Automatic Squelch Map Calculation function is disabled.. The parameter loca can be specified for BLSR THROUGH, INTER-BLSR and DROP connections while the Automatic Squelch Map Calculation function is enabled to do a User Override.
   The *loca* parameter value has to be omitted for ADD, non-BLSR connections. A 2way cross-connection is considered to be a DROP if the out_aid is a non BLSR high-order tributary.
   For lower-order cross-connections the parameter *loca* is the TID of that ring node in the direction towards the specified input tributary (upstream), where the HO path termination source function resides. If there is no such function in an upstream ring node then *loca* is the TID of the node where the related HO circuit is first added to the ring. Refer to the Fig. in the loca description of this section for further explanation.
   At the lower-order side of a conversion cross-connection, the same rules for *loca* is applicable as for lower-order cross-connections.
   Additional information are given for this parameter in the RTRV-CRS section with respect to:
   - figure illustrating BLSR connections,
   - inter-ring cross-connections with collapsed nodes,
   - extra traffic handling.

   Type: TID
   Range: 1 to 20 characters. Needs to be the same as defined in RTRV-HDR.

3. **`newppgname`** – New Path protection group Name
   This parameter specifies the name of the new path protection group. This parameter is applicable if a leg of a path-protected cross-connection is rolled – the parameter in this case is optional and if not entered the default is used. For non path-protected cross-connection this parameter does not apply and is omitted.
   Note: Storage and retrieval of the ppgname is case sensitive, but the actual use of the ppgname to determine the corresponding protection group is case insenitive.
   This parameter is applicable to path-protected high order cross-connections only and is omitted for non path-protected cross-connections and any low order cross-connection (independent whether unprotected or protected).
   Default: NULL

4. **`xcappl`** – cross-connection Application
   This parameteris a numeric value which indicates the application for which the cross-connection is used in the context of compound cross-connection topologies.
   The parameter is not further processed in the NE, but only stored (when establishing or modifying the cross-connection) and returned when retrieving the cross-connection.
   The numeric values are assigned to approriate textstrings (see Range below) and the Manager should display these value in case of a RTRV-CRS.

   As a possible assignment proposal the following may serve:

   - 0) Unknown
   - 1) 1-Way Point-to-Point
   - 2) 1-Way Path-Protected
   - 3) 1-Way Adjunct Path-Protected
   - 4) 1-Way Conversion Cross-Connection
   - 10) 2-Way Point-to-Point
   - 11) 2-Way Conversion Cross-Connection
   - 20) UPSR (or SNCP Ring) Add, Drop
   - 21) UPSR (or SNCP) Ring-to-Ring, Single Node Interconnection, Same NE
   - 22) UPSR (or SNCP) Drop, 1-Way Broadcast
   - 23) UPSR (or SNCP Ring) Add, Drop connection (Broadcast)
   - 30) Logical Ring (or SNCP) Add, Drop
   - 40) Ring Interworking, Drop-and-Continue, BLSR (or MS-SPRing) Primary Node
   - 41) Ring Interworking, Drop-and-Continue, BLSR (or MS-SPRing) Primary Nodes in same NE
   - 42) Ring Interworking, Dual Transmit, BLSR (or MS-SPRing) Terminating Node
   - 50) Ring Interworking, Drop-and-Continue, UPSR (or SNCP Ring)

- 51) Ring Interworking, Drop-and-Continue, UPSR (or SNCP Ring) Nodes in same NE
- 60) 1-Way Broadcast -- note: this is with N greater than or equal to 2.

Type: numerical value set
Range: 0 (default), 1, 2.., 255

5. **xcnum** – cross-connection Number
This parameter identifies each cross-connection leg in a specific compound cross-connection topology. This parameter is optional – if not entered the default is used.
Like the *xcappl* parameter the *xcnum* parameter is not further processed in the NE, but only stored (when establishing or modifying the cross-connection) and returned when retrieving the cross-connection. It may be used by a manager to characterize and group cross-connections belonging to complex cross-connection topology (e.g. compound cross-connections as used in Ring Interworking scenarios)
Type: numeric value set (12 digit)
Two digits for the bay, one digit for the shelf, two digits for the slot, two digit for the port, three digits for the high-order tributary, and two digits for the low-order tributary.
If a high-order tributary is addressed then the last two digits are set to 00.
Range: 000000000000 (default).. 999999999999

Output format

If the ENT-Roll command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

Behavior

Because the ENT-ROLL can be understood as a sequence consisting of a DLT-CRS operation followed by an ENT-CRS operation there does not exists a (separate) ENT-ROLL notification. Instead a DLT-CRS notification is sent, followed by an ENT-CRS notification. Furthermore additionally an ED-CRS notification is triggered by the **ENT-ROLL** command, when the *repleg* status is altered. Refer also to the section “DLT-CRS: Delete cross-connection” (p. 3-145) and “ENT-CRS: Enter cross-connection” (p. 3-1464) behavior.

Transaction behavior

For the **ENT-ROLL** command a validation is performed before the COMPLD is returned. This means it has to be checked if the DLT-CRS (using the validation rules as stated in the DLT-CRS section) as well as the following ENT-CRS (by using the validation rules as stated in the ENT-CRS section) can be performed successfully, BEFORE the command is executed. With this approach it is guaranteed that the command either is rejected or succeeds as a whole by executing the deletion- AND the entering-operation.

In case of low-order cross-connections a ENT-ROLL command may lead to rolling multiple cross-connections sharing the specified input tributary. In this case all all validations for the deletion of the old cross-connections and the creation of the new cross-connections have to be successfully passed before sending the COMPLD indication.

Updated affected entities: 1-way, 2-way cross-connection

Refer to the section *Detailed behavior description* of the “ENT-CRS: Enter cross-connection” (p. 3-1464) and “DLT-CRS: Delete cross-connection” (p. 3-145) commands for the affected entities.

Updated affected entities: path-protected cross-connection

If one leg of path-protected cross-connection is rolled, the following updates takes place:

1. The path-protected cross-connection instance is deleted and this is notified via one DLT-CRS notification.
2. Two legs composing the path-protected XCs are created and this is notified via ENT-CRS notification. The initial values for the cross-connection legs are derived from:
   - the data of the deleted leg not specified in the roll request
   - the data as specified in the roll request; i.e. for the rolled leg the attributes: *loca*, *xcappl*, *xcnum*.
3. The attribute *wkg* (if worker leg is rolled) or *protn* (if protection leg is rolled) are updated (gets the value of the new input trib) for the associated path protection group. If in addition a new value for *ppgname* is specified, then the corresponding protection group is updated accordingly. These updates are reported by means of a ED-PROTN-GRP notification.

For details on protection group and the related notifications please refer to the protection group section.

Deletion of the leg non-affected by the roll command is needed, since also the *in_aid2* attribute for this leg is changed. Attribute *in_aid2* is considered as part of the key/identifier for the leg itself, and therefore the deletion and creation sequence is the only approach in order to notify the performed DB changes.

Updated affected entities: low-order path-protected cross-connection in Emulated Selector Bridges

The rolling of a path protected cross-connection being part of a low-order emulated selector bridge construct is notified by the system towards the management system interface by two removal notification for the both old path-protected cross-connections sharing the same input tributary followed by two times two establishment notifications for each of the new cross-connection legs established (two per path-protected cross-connection).

If one leg of pathprotected crossconnection being part of a low-order emulated selector bridge construct is rolled, the following updates shall take place:

1. The two pathprotected cross-connection instances sharing the input trib to be rolled are deleted and this is notified via two DLT-CRS notification.
2. Creation of path-protected cross-connections:
   - Two legs composing the first path-protected XC are created and this is notified via ENT-CRS notification.
   - Two legs composing the path-protected XC are created and this is notified via ENT-CRS notification.
   - The initial values for the cross-connection legs are drived from: the data of the deleted leg not specified in the roll request; the data as specified in the roll request; i.e. for the rolled leg the attributes: *loca*, *xcappl*, *xcnum*.
3. The attribute *wkg* (if worker leg is rolled) or *protn* (if protection leg is rolled) are updated (gets the value of the new input trib) for the associated path protection group. If in addition a new value for *ppgname* is specified, then the corresponding protection group is updated accordingly. These updates are reported by means of a ED-PROTN-GRP notification.

For details on protection group and the related notifications please refer to the protection group section.

Deletion of the legs non-affected by the roll command is needed, since also the *in_aid2* attribute for this leg is changed. Attribute *in_aid2* is considered as part of the key/identifier for the leg itself, and therefore the deletion and creation sequence is the only approach in order to notify the performed DB changes.

Updated affected entities: bridged lower order cross-connections

If a lower cross-connection, which shares its input tributary with other lower order cross-connections (i.e. bridged cross-connection), is rolled to a new input tributary, then all cross-connections using the same input tributary is rolled to the new input tributary.

This results in the following updates and notifications:

1. The cross-connection instances sharing the input trib to be rolled are deleted and this is notified via DLT-CRS notifications.
2. New cross-connections using the new input trib are created and this is notified via ENT-CRS notifications.

Updated affected entities: bridged AU3/AU4 conversion cross-connections

If an AU3/AU4 conversion cross-connection, which shares its input tributary with other AU3/AU4 conversion cross-connections (i.e. bridged cross-connection), is rolled to a new input tributary, then all cross-connections using the same input tributary is rolled to the new input tributary.

This results in the following updates and notifications:

1. The cross-connection instances sharing the input trib to be rolled are deleted and this is notified via DLT-CRS notifications.
2. New cross-connections using the new input trib are created and this is notified via ENT-CRS notifications.

Identification of VCG tributaries

The system shall allow to roll cross-connections at VCG tributaries using the AID format of an AU-3/STS-1 Tributary. I.e. the VCG number specified in the port field of the AID is allowed with or without the leading ″v″.

Further Side-effects when rolling low-order cross-connections

If a leg of a low-order cross-connection is being rolled further side-effects as described with ENT-CRS and DLT-CRS may occur.

Example input/output

Example 1:

Suppose the following existing non-BLSR 1-way vc3-cross-connection

1-1-#-#-1-1-3 → 1-1-#-#-5-1-17

is rolled to

1-1-#-#-2-1-3 → 1-1-#-#-5-1-17

also being a non-BLSR cross-connection. This would be accomplished via:

```
ENT-ROLL-VC3:UNITE-NE:1-1-#-#-1-1-3,1-1-#-#-5-1-17:123456:::newinaid=1-1-#-#-2-1-3;

   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

Example 2:

Suppose the following existing non-BLSR 1-way vc3-cross-connection:

1-1-#-#-1-1-3 → 1-1-#-#-5-1-17

is rolled to:

1-1-#-#-2-1-3 → 1-1-#-#-5-1-17

with the new tributary being involved in a BLRS protection group. This would be accomplished via:

```
ENT-ROLL-VC3:UNITE-NE:1-1-#-#-1-1-3,1-1-#-#-5-1-17:123456:::newinaid=1-1-#-#-2-1-
      3,newloca=BLSR-pprot-name;

   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

Example 3:

Suppose the following vc4 path-protected cross-connection exists:

worker-leg: 1-1-#-#-1-1-1→ 1-1-#-#-5-1-1

protection leg: 1-1-#-#-2-1-1 → 1-1-#-#-5-1-1

The worker leg now is rolled towards the new in_aid: 1-1-#-#-3-1-1:

This would be accomplished via:

```
ENT-ROLL-VC4:UNITE-NE:1-1-#-#-1-1-1,1-1-#-#-5-1-1:123456:::newinaid=1-1-#-#-3-1-1;

   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

Example 4:

Suppose the following low-order VC3 bidirectional cross-connection exists:

Input: 1-1-#-#-1-1-1-22

Output: 1-1-#-#-5-1-1-43

The worker leg now is rolled towards the new input: 1-1-#-#-3-1-1-1 which causes the bidirectional cross-connection to be split into two unidirectional ones:

Unchanged leg: from 1-1-#-#-5-1-1-43 to 1-1-#-#-1-1-1-22

Rolled leg: from 1-1-#-#-3-1-1-1 to 1-1-#-#-5-1-1-43

This would be accomplished via:

```
ENT-ROLL-LOVC3:UNITE-NE:1-1-#-#-1-1-1-22,1-1-#-#-5-1-1-43:\
123456:::newinaid=1-1-#-#-3-1-1-1;
```

```
   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

Error responses

The rolling of a cross-connection can be conceptually understood as the removal of one cross-connection leg followed by the establishment of a new cross-connection leg, with the restriction that the logical output tributary of both legs is the same. Therefore the vaildation rules for the **ENT-ROLL** command are as specified in the DLT-CRS section and the ENT-CRS.

This means that if the **ENT-ROLL** command would fail to meet a criteria as specified in the DLT-CRS section the same command denial would be the consequence. In an anolg way if the **ENT-ROLL** command would fail to meet a criteria as specified in the ENT-CRS section the same command denial would be the consequence.

Validation rule: No Rolling of low-order cross-connections with LOXC/1

For low-order cross-connections, cross-connection command processing shall verify that the low-order switching pack currently used by the system is not of type LOXC/1.

Error code:

`SNVS – Status, Not in Valid State, Roll of low-order cross-connections not allowed with LOXC/1`

GR-199-CORE

ENT-STM1E notification

Output format

The **ENT-STM1E** notification uses the general format of a REPT DBCHG (Report Database Change) notification.

Syntax: **ENT-STM1**:*aid*::*spec_block*

Output parameter

Command parameters

1. **aid** – Access Identifier
   Access Identifier of STM1 port.
   Type: AID.
   Range: SPortAID of STM1E port.

Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This parameter is supported by ports of *portClass* INNI.
   This parameter is supported by ports of *portClass* ENNI.
   Type: Numeric string.
   Range: 1(default)…65535
2. **brstintvl**– Bursty Interval
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **brstthr** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.
4. **clientNodeID** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is

not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
This parameter is supported by ports of *portClass* UNI.
Type: IPv4 format: Four dot separated numeric string.
Range: Each numeric string: 0…255
Default: 0.0.0.0

5. **`crstat`** – Constituent Rates Status list
This parameter shows the rates of the port signals. For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 3, or 4 representing VC3 or VC4.

6. **`degthr`** – Signal Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –5; –6; –7; –8; –9.
Default: –6.

7. **`dexcthr`** – Excessive Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –5; –6; –7; –8; –9.
Default: –6.

8. **`exprstrc`** – Value of Expected J0
Expected regenerator section trace identifier.
The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
Type: Hexadecimal digits
Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 89hex followed by 15 bytes 00hex

9. **`femspm`** – Far-end Multiplex Section PM Enable
Enable or disable of the performance monitoring of the multiplex section.
Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

10. **`frcdus`** – Force to DUS
    Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
    Type: Alphanumeric value set.

    Range:

    - ENABLE , set a forced DUS/DNU
    - DISABLE (default), clear a forced DUS/DNU

11. **`fsflpbkstat`** – Far Side Facililiy Loopback Status
    This parameter specifies the current far-side facility loopback status of the considered output *aid*.
    A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
    Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
    Type: Alphanumeric value set.

    Range:

    - YES
    - NO (default).

12. **`inputsig`** – Tributary Input Signal Rate List
    This parameter is a list of VCn rates across the port's bandwidth.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.
    Default: 14.

13. **`istd`** – Interface Standard
    Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter istddflt.
    Type: Alphanumeric value set.
    Range: SDH.
    Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).

14. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.

For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkLPID", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: numeric value set.
Range: 0 (default) to 4294967295
The default value shall have the meaning of "no localLPID provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

15. **`lpbk`** – Loopback
This parameter specifies the current near-side loopback status of the considered output *aid*.
A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
Type: Alphanumeric value set.
Range:
    - YES
    - NO (default).
16. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
This identifies the maximum rate at which cross-connections are allowed for ports of *portClass* INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
maxNNXCRate is introduced specifically for use by ONNS application.
Type: Alphanumeric value set.
Range: VC3 or VC4 (default).
17. **`minNNXCRate`** – Minimum NN Cross Connect Rate
This identifies the minimum rate at which cross-connections are allowed for ports of *portClass* INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
minNNXCRate is introduced specifically for use by ONNS application.
Type: Alphanumeric value set.
Range: VC3 (default) or VC4.
18. **`ndetmd`** – Neighbor Detection Mode
The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range:
AUTO, MAN
Default:
For *portClass* = INNI: AUTO
For *portClass* = ENNI: MAN

19. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
This identifies the unique node identifier of the neighbor node of ports of portClass = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until portClass is INNI. This parameter can only be modified, if ndetmd=MAN.
If ndetmd=MAN, this parameter shall indicate the value set by the operator. If ndetmd=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborASTNNodeID is introduced specifically for use by ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0 If portClass = INNI, the default value shall have the meaning of ″no neighbor discovered″.

20. **`neighborNodeID`** – Neighbor Node Id
This identifies the IP address of the neighbor node of ports of portClass = INNI. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until portClass is INNI. This parameter can only be modified, if ndetmd=MAN. If ndetmd=MAN, this parameter shall indicate the value set by the operator. If ndetmd=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is introduced specifically for use by ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

21. **`neighborPortID`** – Neighbor Port Id
This identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic

neighbor detection.
neighborPortID is introduced specifically for use by NN application.
Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

22. **`nemspm`** – MS Near-End PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE

23. **`networkTNAType`** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkTNAType", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.
Range:
    - IPV4 (default)
    - IPV6
    - NSAP

24. **`networkTNAAddress`** – Network TNA Address
The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkTNAAddress", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number: 0000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of "no TNA Address provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

25. **`pmmsfeses`** – Performance Monitoring MS Far-End SES Threshold
This parameter describes the Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) per second to declare a second as severly errored.
Type: numeric value set.
Range: STM1: 1 – 192000.
Default: for STM1: 28800.

26. **`pmmsneses`** – Performance Monitoring MS Near-End SES Threshold
This parameter describes the Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) per second to declare a second as severly errored.
Type: numeric value set.
Range: STM1: 1 – 192000.
Default: for STM1: 28800.

27. **`pmode`** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.

Range:

- AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
- MON indicates that alarm monitoring is taking place on the port.
- NMON means that alarm monitoring is not occurring on the port.

28. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) per second to declare a second as severly errored.
Type: numeric value set.
Range: 1 – 64000.
Default: for STM1: 2400.

29. **`portClass`** – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: Alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

30. **`portControl`** – Port Control (PortAdministrative Mode)
The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
Type: Alphanumeric value set.
Range: NORMAL (default), LOCKOUT

31. **`propagationDelay`** – Propagation Delay
This identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
propagationDelay is introduced specifically for use by ONNS application.
Type: Numeric string.
Range: 0(default) …25. The unit of this value is ″milliseconds″.

32. **`rsmstca`** – RS/MS TCA Profile Pointer
Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
Type: Alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.

33. **`rspm`** – RS PM Enable
    Enable or disable regenerator section (section) performance monitoring.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
34. **`rstimca`** – RS TIM Consequent Action Enable
    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimca* is autonomously set by the neighbor detection mechanism.
    Type: Alphanumeric value set.
    Range:
    - ENABLE (default): enable consequent action for TIM
    - DISABLE: disable consequent action for TIM.
35. **`rstimmon`** – RS TIM Monitor Enable
    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
    Type: Alphanumeric value set.
    Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
36. **`sdhpn`** – SDH ASAP
    This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET ASAP for the SONET ports of corresponding line rate (see definition of output parameter SONET in RTRV-OC12) to be compatible with current generation applications.
    Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
    Range: String with a maximum of 24 characters.
    Default: DEFAULT.
37. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
    The degraded state is detected in Burst or Poisson mode.
    Type: Alphanumeric value set.
    Range:
    - BURST (default)
    - POISSON.

38. **`servcond`** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
   - INSERVICE (default): Provisioning values for service are accepted
   - OUTOFSERVICE: Provisioning values for service are not accepted.
39. **`srlgList`** – Shared Risk Link Group Identities List
The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.
40. **`strcfmt`** – Format of incoming J0
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
Type: Numeric string.
Range:
   - 1: for specific repeating byte (SONET)
   - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
   - 16: for 16 byte specific string (ITU/ETSI mode 1).
   - 64: for 64 byte string (SONET).
41. **`strcout`** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string.

Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 01Hex

42. **`strcwfmt`** – Format of outgoing J0
The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
Type: Numeric string.

Range:

- 1: for specific repeating byte (SONET)
- 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

43. **`tcamd`** – TCA mode
This parameter shows the modus of the PM thresholding.

Two thresholding methods are applicable:

- TR-only (lso known as the implicit reset method)
- TR-RTR (lso known as the explicit reset method).

Type: Alphanumeric value set.
Range: TR or TRRTR (default).

44. **`trbmd`** – Tributary mode
    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* has no effect.
    Type: Alphanumeric value set.
    Range: ADAPTIVE, FIXED.
    Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400) command.

45. **`unequiposig`** – Unequipped Output Signal List
    This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the "unequipped" signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for tx and rx side of the port are allowed.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.
    Default: 14.

Example input/output

```
   UNITE-NE 00-11-28 08:00:30
A  001 REPT DBCHG
   "TIME=08-00-12,DATE=00-11-28:ENT-STM1E:1-1-#-#-1-
      1::servcond=DISABLE,inputsig=14,...,unequiposig=14"
;
```

ENT-STM1 notification

Output format

The **ENT-STM1** notification uses the general format of a **REPT DBCHG** (Report Database Change) notification.

Syntax: **ENT-STM1**:*aid*::*spec_block*

Output parameters

Command parameters

1. **aid** – Access Identifier
Type: AID.
Range: SPortAID of STM1 port.

Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)
The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Numeric string.
Range: 1(default)…65535
2. **brstintvl**– Bursty Interval
Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
Type: numeric value set.
Range: 2 to 10.
Default: 7.
3. **brstthr** – Bursty Error Threshold
Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
Type: numeric value set.
Range (as percentage): 5, 10, … 50.
Default: 30.
4. **clientNodeID** – Client Node IDentifier
The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
This parameter is supported by ports of *portClass* UNI.
Type: IPv4 format: Four dot separated numeric string.
Range: Each numeric string: 0…255
Default: 0.0.0.0

5. **`crstat`** – Constituent Rates Status list
   This parameter shows the rates of the port signals. For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List .
   Type: numeric value set
   Range: NX-NX-NX-…
   N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.
6. **`degthr`** – Signal Degrade Threshold
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –5; –6; –7; –8; –9.
   Default: –6.
7. **`dexcthr`** – Excessive Degrade Threshold
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –3; –4; –5.
   Default: –3.
8. **`exprstrc`** – Value of Expected J0
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
9. **`femspm`** – Far-end Multiplex Section PM Enable
   Enable or disable of the performance monitoring of the multiplex section.
   Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

10. **`frcdus`** – Force to DUS
Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
Type: Alphanumeric value set.

    Range:

    - ENABLE , set a forced DUS/DNU
    - DISABLE (default), clear a forced DUS/DNU

11. **`fsflpbkstat`** – Far Side Facililiy Loopback Status
This parameter specifies the current far-side facility loopback status of the considered output *aid*.
A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
Type: Alphanumeric value set.

    Range:

    - YES
    - NO (default).

12. **`inputsig`** – Tributary Input Signal Rate List
This parameter is a list of VCn rates across the port's bandwidth.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.
Default: 14.

13. **`istd`** – Interface Standard
Each synchronous optical interface can be set to SDH or SONET.
Type: Alphanumeric value set.
Range: SONET, SDH.
Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).

14. **`linkResCls`** – Link Resource Class
The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute

represents a 32-bit mask.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set (4 bytes), every bit defining one link class
Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
Default: 00 for each alphanumeric character

15. **`localLinkID`** – Local Link IDentity
    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
16. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: numeric value set.
    Range: 0 (default) to 4294967295
    The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.
17. **`lpbk`** – Loopback
    This parameter specifies the current near-side loopback status of the considered output *aid*.
    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
    Type: Alphanumeric value set.

Range:

- YES
- NO (default).

18. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3 or VC4 (default)

19. **`minNNXCRate`** – Minimum NN Cross Connect Rate
The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3 (default) or VC4.

20. **`ndetmd`** – Neighbor Detection Mode
The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range:
AUTO, MAN
Default:
For *portClass* = INNI: AUTO
For *portClass* = ENNI: MAN

21. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This

parameter can only be modified, if *ndetmd* = MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.

22. **`neighborNodeID`** – Neighbor Node Id
This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

23. **`neighborPortID`** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.
Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

24. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

25. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

26. **`nemspm`** – MS Near-End PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

27. **`networkTNAType`** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.
Range:
    - IPV4 (default)
    - IPV6
    - NSAP

28. **`networkTNAAddress`** – Network TNA Address

The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter is supported by ports of *portClass* UNI.

This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number: 0000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

29. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-1/OC-3: 1 – 192000

    Default: The default values differ for SDH and SONET:

    - STM1: 28800
    - OC3: 154.

30. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-1/OC-3: 1 – 192000

    Default: The default values differ for SDH and SONET and the different rates:

    - STM1: 28800
    - OC3: 154.

31. **`pmode`** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

32. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of allowed ranges for SDH and SONET):1 – 64000
Default: The default values differ for SDH and SONET and the different rates:
    - STM 1: 2400
    - OC3: 155
33. **`portClass`** – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: Alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.
34. **`portControl`** – Port Control (PortAdministrative Mode)
The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
Type: Alphanumeric value set.
Range: NORMAL (default), LOCKOUT
35. **`propagationDelay`** – Propagation Delay
This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
propagationDelay is used by the ONNS application.
Type: Numeric string.
Range: 0(default) …255. The unit of this value is ″milliseconds″.
36. **`remAdvNodeID`** – Remote Advertised Node IDentity
The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until both these conditions are fulfilled.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

37. **remLinkID** – Remote Link IDentity
The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: numeric value set
Range: 0 (default) to 4294967295

38. **remRAID** – Remote Routing Area IDentity
The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

39. **remTID** – Remote TID
The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: TID or empty-string
Range: Please refer to the TID definition in the “RTRV-HDR: Retrieve header” (p. 3-2417) description.
Default: empty string: ″″

40. **rsmstca** – RS/MS TCA Profile Pointer
Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
Type: Alphanumeric string.
Range: String with maximum of 24 characters.
Default: DEFAULT0.

41. **rspm** – RS PM Enable
Enable or disable regenerator section (section) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

42. **rstimca** – RS TIM Consequent Action Enable
Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimca* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.
Range:
    - ENABLE (default): enable consequent action for TIM
    - DISABLE: disable consequent action for TIM.

43. **rstimmon** – RS TIM Monitor Enable
Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.
Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor

44. **sdhpn** – SDH ASAP
This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET ASAP for the SONET ports of corresponding line rate (see definition of output parameter SONET in RTRV-OC12) to be compatible with current generation applications.
Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.

45. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
The degraded state is detected in Burst or Poisson mode.
Type: Alphanumeric value set.
Range:
   - BURST (default)
   - POISSON.
46. **`servcond`** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
   - INSERVICE (default): Provisioning values for service are accepted
   - OUTOFSERVICE: Provisioning values for service are not accepted.
47. **`srlgList`** – Shared Risk Link Group Identities List
The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.
48. **`strcfmt`** – Format of incoming J0
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
Type: Numeric string.
Range:
   - 1: for specific repeating byte (SONET)
   - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
   - 16: for 16 byte specific string (ITU/ETSI mode 1).
   - 64: for 64 byte string (SONET).

49. **`strcout`** – Value of outgoing J0
 This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
 If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
 Type: Hexadecimal digits.
 Range:
 - 1 byte string
 - 16 bytes string
 - 64 bytes string dependent on the strcwfmt parameter.

 Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
 Default: 01Hex
50. **`strcwfmt`** – Format of outgoing J0
 The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
 Type: Numeric string.
 Range:
 - 1: for specific repeating byte (SONET)
 - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
 - 16: for 16 byte specific string (ITU/ETSI mode 1).
 - 64: for 64 byte string (SONET).
51. **`tcamd`** – TCA mode
 This parameter shows the modus of the PM thresholding.
 Two thresholding methods are applicable:
 - TR-only (lso known as the implicit reset method)
 - TR-RTR (lso known as the explicit reset method).

 Type: Alphanumeric value set.
 Range: TR or TRRTR (default).

52. **`trbmd`** – Tributary mode
    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port.
    Type: Alphanumeric value set.
    Range: FIXED.
53. **`unequiposig`** – Unequipped Output Signal List
    This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the "unequipped" signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for tx and rx side of the port are allowed.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.
    Default: 14.

Example output

```
   UNITE-NE 00-11-28 08:00:30
A  001 REPT DBCHG
   ″TIME=08-00-12,DATE=00-11-28:ENT-STM1:1-1-#-#-1-
      1::servcond=DISABLE,inputsig=14,...,unequiposig=14″
;
```

ENT-STM4 notification

Output format

The **ENT-STM4** notification uses the general format of a **REPT DBCHG** (Report Database Change) notification.

Syntax: **ENT-STM4**:*aid*::*spec_block*

Output parameters

Command parameters

1. **aid** – Access Identifier
   Type: AID.
   Range: SPortAID of STM-4 port.

Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This parameter is supported by ports of *portClass* INNI.
   This parameter is supported by ports of *portClass* ENNI.
   Type: Numeric string.
   Range: 1(default)…65535
2. **brstintvl**– Bursty Interval
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **brstthr** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps.
   This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.
4. **clientNodeID** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
This parameter is supported by ports of *portClass* UNI.
Type: IPv4 format: Four dot separated numeric string.
Range: Each numeric string: 0…255
Default: 0.0.0.0

5. **`crstat`** – Constituent Rates Status list
This parameter shows the rates of the port signals. For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 3, 4 or 4C representing VC3, VC4 or VC4-4C

6. **`degthr`** – Signal Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –5; –6; –7; –8; –9.
Default: –6.

7. **`dexcthr`** – Excessive Degrade Threshold
Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
Type: numeric value set.
Range (as exponents of 10): –3; –4; –5.
Default: –3.

8. **`exprstrc`** – Value of Expected J0
Expected regenerator section trace identifier.
The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
Type: Hexadecimal digits
Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 89hex followed by 15 bytes 00hex

9. **`femspm`** – Far-end Multiplex Section PM Enable
Enable or disable of the performance monitoring of the multiplex section.
Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

10. **`frcdus`** – Force to DUS
Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
Type: Alphanumeric value set.
Range:
    - ENABLE , set a forced DUS/DNU
    - DISABLE (default), clear a forced DUS/DNU

11. **`fsflpbkstat`** – Far Side Facililiy Loopback Status
This parameter specifies the current far-side facility loopback status of the considered output *aid*.
A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
Type: Alphanumeric value set.
Range:
    - YES
    - NO (default).

12. **`inputsig`** – Tributary Input Signal Rate List
This parameter is a list of VCn rates across the port's bandwidth.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 3, 4 or 4C representing VC3, VC4 or VC4-4C.
Default: 44.

13. **`istd`** – Interface Standard
Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter istddflt.
Type: Alphanumeric value set.
Range: SONET, SDH.
Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).

14. **`linkResCls`** – Link Resource Class
The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute

represents a 32-bit mask.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set (4 bytes), every bit defining one link class
Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
Default: 00 for each alphanumeric character

15. **`localLinkID`** – Local Link IDentity
    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
16. **`localLPID`** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.
    Type: numeric value set.
    Range: 0 (default) to 4294967295
    The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.
17. **`lpbk`** – Loopback
    This parameter specifies the current near-side loopback status of the considered output *aid*.
    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
    Type: Alphanumeric value set.

Range:

- YES
- NO (default).

18. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3, VC4 or VC44C (default)

19. **`minNNXCRate`** – Minimum NN Cross Connect Rate
The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3 (default), VC4 or VC44C.

20. **`ndetmd`** – Neighbor Detection Mode
The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range:
AUTO, MAN
Default:
For *portClass* = INNI: AUTO
For *portClass* = ENNI: MAN

21. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This

parameter can only be modified, if *ndetmd* = MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.

22. **neighborNodeID** – Neighbor Node Id
This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

23. **neighborPortID** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.
Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

24. **neighborSigPCID** – Neighbor Signaling PC IDentity
The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

25. **neighborSigPCIPAddr** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

26. **nemspm** – MS Near-End PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

27. **networkTNAType** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkTNAType", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.
Range:
    - IPV4 (default)
    - IPV6
    - NSAP

28. **`networkTNAAddress`** – Network TNA Address

The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter is supported by ports of *portClass* UNI.

This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number:
  0000000000000000000000000000000000000000…
  FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

29. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-4/OC-12: 1 – 768000.

    Default: The default values differ for SDH and SONET:

    - STM4: 115200
    - OC12: 615.

30. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-4/OC-12: 1 – 768000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM4: 115200
    - OC3: 615.

31. **`pmode`** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

32. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of allowed ranges for SDH and SONET):1 – 64000.
Default: The default values differ for SDH and SONET and the different rates:
    - STM4: 2400
    - OC12: 616.
33. **`portClass`** – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: Alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.
34. **`portControl`** – Port Control (PortAdministrative Mode)
The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
Type: Alphanumeric value set.
Range: NORMAL (default), LOCKOUT
35. **`propagationDelay`** – Propagation Delay
This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
propagationDelay is used by the ONNS application.
Type: Numeric string.
Range: 0(default) …255. The unit of this value is ″milliseconds″.
36. **`remAdvNodeID`** – Remote Advertised Node IDentity
The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until both these conditions are fulfilled.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

37. **`remLinkID`** – Remote Link IDentity
The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: numeric value set
Range: 0 (default) to 4294967295

38. **`remRAID`** – Remote Routing Area IDentity
The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

39. **`remTID`** – Remote TID
The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: TID or empty-string
Range: Please refer to the TID definition in the “RTRV-HDR: Retrieve header” (p. 3-2417) description.
Default: empty string: *""*

40. **`rsmstca`** – RS/MS TCA Profile Pointer
    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
    Type: Alphanumeric string.
    Range: String with maximum of 24 characters.
    Default: DEFAULT0.
41. **`rspm`** – RS PM Enable
    Enable or disable regenerator section (section) performance monitoring.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
42. **`rstimca`** – RS TIM Consequent Action Enable
    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimca* is autonomously set by the neighbor detection mechanism.
    Type: Alphanumeric value set.
    Range:
    - ENABLE (default): enable consequent action for TIM
    - DISABLE: disable consequent action for TIM.
43. **`rstimmon`** – RS TIM Monitor Enable
    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
    Type: Alphanumeric value set.
    Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
44. **`sdhpn`** – SDH ASAP
    This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET ASAP for the SONET ports of corresponding line rate (see definition of output parameter SONET in RTRV-OC12) to be compatible with current generation applications.
    Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
    Range: String with a maximum of 24 characters.
    Default: DEFAULT.

45. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
The degraded state is detected in Burst or Poisson mode.
Type: Alphanumeric value set.
Range:
    - BURST (default)
    - POISSON.
46. **`servcond`** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
47. **`srlgList`** – Shared Risk Link Group Identities List
The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.
48. **`strcfmt`** – Format of incoming J0
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
Type: Numeric string.
Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

49. **`strcout`** – Value of outgoing J0
    This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
    If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
    Type: Hexadecimal digits.

    Range:

    - 1 byte string
    - 16 bytes string
    - 64 bytes string.

    Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
    Default: 01Hex
50. **`strcwfmt`** – Format of outgoing J0
    The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
    Type: Numeric string.

    Range:

    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
51. **`tcamd`** – TCA mode
    This parameter shows the modus of the PM thresholding.

    Two thresholding methods are applicable:

    - TR-only (lso known as the implicit reset method)
    - TR-RTR (lso known as the explicit reset method).

    Type: Alphanumeric value set.
    Range: TR or TRRTR (default).

52. **`trbmd`** – Tributary mode
    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* has no effect.
    Type: Alphanumeric value set.
    Range: ADAPTIVE, FIXED.
    Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400) command.
53. **`unequiposig`** – Unequipped Output Signal List
    This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the "unequipped" signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for tx and rx side of the port are allowed.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 3, 4 or 4C representing VC3, VC4 or VC4-4C.
    Default: 44.

Example output

```
   UNITE-NE 00-11-28 08:00:30
A  001 REPT DBCHG
   "TIME=08-00-12,DATE=00-11-28:ENT-STM4:1-1-#-#-1-
      1::servcond=DISABLE,inputsig=44,...,unequiposig=44"
;
```

ENT-STM16 notification

Output format

The **ENT-STM16** notification uses the general format of a **REPT DBCHG** (Report Database Change) notification.

Syntax: **ENT-STM16**:*aid*::*spec_block*

Output parameters

Command parameters

1. **aid** – Access Identifier
   Access Identifier of STM16 port.
   Type: AID.
   Range: SPortAID of STM16 port.
   The keyword **all** is not allowed.

Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This parameter is supported by ports of *portClass* INNI.
   This parameter is supported by ports of *portClass* ENNI.
   Type: Numeric string.
   Range: 1(default)…65535
2. **brstintvl**– Bursty Interval
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **brstthr** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.

4. **`clientNodeID`** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute "uniClientNodeID", as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.
   This parameter is supported by ports of *portClass* UNI.
   Type: IPv4 format: Four dot separated numeric string.
   Range: Each numeric string: 0…255
   Default: 0.0.0.0
5. **`crstat`** – Constituent Rates Status list
   This parameter shows the rates of the port signals. For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.
   Type: numeric value set.
   Range: NX-NX-NX-…
   N is the number of Xs. X can be 3, 4, 4C or 16C representing VC3, VC4, VC4-4C or VC4-16C.
6. **`degthr`** – Signal Degrade Threshold
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –5; –6; –7; –8; –9.
   Default: –6.
7. **`dexcthr`** – Excessive Degrade Threshold
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –3; –4; –5.
   Default: –3.
8. **`exprstrc`** – Value of Expected J0
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.

Type: Hexadecimal digits
Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
Default: 89hex followed by 15 bytes 00hex

9. **`femspm`** – Far-end Multiplex Section PM Enable
Enable or disable of the performance monitoring of the multiplex section.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).
10. **`frcdus`** – Force to DUS
Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
Type: Alphanumeric value set.
Range:
    - ENABLE , set a forced DUS/DNU
    - DISABLE (default), clear a forced DUS/DNU
11. **`fsflpbkstat`** – Far Side Facililiy Loopback Status
This parameter specifies the current far-side facility loopback status of the considered output *aid*.
A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
Type: Alphanumeric value set.
Range:
    - YES
    - NO (default).
12. **`inputsig`** – Tributary Input Signal Rate List
This parameter is a list of VCn rates across the port’s bandwidth.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 3, 4, 4C or 16C representing VC3, VC4, VC4-4C or VC4-16C.
Default: The initial value of X is 4.
Example:
An STM-16 signal might be represented by 93-14-14C-243 which implies 9 VC3s, 1 VC4, 1 VC4-4C, 24 VC3s. The representation is not unique, for example it could also be 33-63-14-14C-243. Worst case of string length for STM16: 47 characters.

13. **istd** – Interface Standard
    Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter istddflt.
    Type: Alphanumeric value set.
    Range: SDH.
    Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).
14. **linkResCls** – Link Resource Class
    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Alphanumeric value set (4 bytes), every bit defining one link class
    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
    Default: 00 for each alphanumeric character
15. **localLinkID** – Local Link IDentity
    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
16. **localLPID** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This attribute replaces attribute "uniNetworkLPID", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
    This parameter is supported by ports of *portClass* UNI.
    This parameter is supported by ports of *portClass* EDGE.

Type: numeric value set.
Range: 0 (default) to 4294967295
The default value shall have the meaning of "no localLPID provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

17. **`lpbk`** – Loopback
This parameter specifies the current near-side loopback status of the considered output *aid*.
A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
Type: Alphanumeric value set.
Range:
    - YES
    - NO (default).
18. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3, VC4, VC44C or VC416C (default)
19. **`minNNXCRate`** – Minimum NN Cross Connect Rate
The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3 (default), VC4, VC44C or VC416C.
20. **`ndetmd`** – Neighbor Detection Mode
The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.

This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range:
AUTO, MAN
Default:
For *portClass* = INNI: AUTO
For *portClass* = ENNI: MAN

21. **neighborASTNNodeID** – Neighbor ASTN Node Id
This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.

22. **neighborNodeID** – Neighbor Node Id
This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

23. **neighborPortID** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.

Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

24. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

25. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

26. **`nemspm`** – MS Near-End PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

27. **`networkTNAType`** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this

attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.

Range:

- IPV4 (default)
- IPV6
- NSAP

28. **`networkTNAAddress`** – Network TNA Address
The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkTNAAddress", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number:
0000000000000000000000000000000000000000…
FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

29. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):
    - STM-16/OC-48: 1 – 3072000
    - STM-64/OC-192: 1 – 12288000
    - STM-256/OC-768: 1 – 49152000.

    Default: The default values differ for SDH and SONET and the different rates:
    - STM16: 460800
    - STM64: 1843200
    - STM256: 7372800
    - SONET OC48: 2459
    - SONET OC192: 9835
    - SONET OC768: 39340.
30. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):
    - STM-16/OC-48: 1 – 3072000
    - STM-64/OC-192: 1 – 12288000
    - STM-256/OC-768: 1 – 49152000.

Default: The default values differ for SDH and SONET and the different rates:

- STM16: 460800
- STM64: 1843200
- STM256: 7372800
- SONET OC48: 2459
- SONET OC192: 9835
- SONET OC768: 39340.

31. **`pmode`** – Port Mode
    This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
    Type: Alphanumeric value set.
    Range:
    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.
32. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
    This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
    Type: numeric value set.
    Range (superset of allowed ranges for SDH and SONET):1 – 64000
    Default: The default values differ for SDH and SONET and the different rates:
    - SDH (all rates): 2400
    - SONET OC48: 2392
    - SONET OC192: 8554
    - SONET OC768: 22776.
33. **`portClass`** – Port Class
    This parameter identifies the port class of the AID.
    In which role the port is used by the ONNS application is specified by this parameter *portClass*.
    Type: Alphanumeric value set.
    Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
    Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

34. **`portControl`** – Port Control (PortAdministrative Mode)
The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
Type: Alphanumeric value set.
Range: NORMAL (default), LOCKOUT

35. **`propagationDelay`** – Propagation Delay
This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
propagationDelay is used by the ONNS application.
Type: Numeric string.
Range: 0(default) …255. The unit of this value is ″milliseconds″.

36. **`remAdvNodeID`** – Remote Advertised Node IDentity
The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition: The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

37. **`remLinkID`** – Remote Link IDentity
The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: numeric value set
Range: 0 (default) to 4294967295

38. **`remRAID`** – Remote Routing Area IDentity
    The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
    The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
39. **`remTID`** – Remote TID
    The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: TID or empty-string
    Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
    Default: empty string: ""
40. **`rsmstca`** – RS/MS TCA Profile Pointer
    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
    Type: Alphanumeric string.
    Range: String with maximum of 24 characters.
    Default: DEFAULT0.
41. **`rspm`** – RS PM Enable
    Enable or disable regenerator section (section) performance monitoring.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
42. **`rstimca`** – RS TIM Consequent Action Enable
    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimca* is autonomously set by the neighbor detection mechanism.
    Type: Alphanumeric value set.

Range:

- ENABLE (default): enable consequent action for TIM
- DISABLE: disable consequent action for TIM.

43. **rstimmon** – RS TIM Monitor Enable
Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.
Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
44. **sdhpn** – SDH ASAP
This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET Alarm Severity Assignment Profile for the SONET ports (see definition of output parameter SONET in "RTRV-OC48: Retrieve OC48 port" (p. 3-2638)) to be compatible with current generation applications.
Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.
45. **sdsfmode** – Signal Degrade/Signal Fail Mode
The degraded state is detected in Burst or Poisson mode.
Type: Alphanumeric value set.
Range:
    - BURST (default)
    - POISSON.
46. **servcond** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
47. **srlgList** – Shared Risk Link Group Identities List
The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.

48. **`strcfmt`** – Format of incoming J0
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
Type: Numeric string.
Range:
   - 1: for specific repeating byte (SONET)
   - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
   - 16: for 16 byte specific string (ITU/ETSI mode 1).
   - 64: for 64 byte string (SONET).

49. **`strcout`** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
Type: Hexadecimal digits.
Range:
   - 1 byte string
   - 16 bytes string
   - 64 bytes string dependent on the strcwfmt parameter.

   Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 01Hex

50. **`strcwfmt`** – Format of outgoing J0
    The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
    Type: Numeric string.
    Range:
    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).
51. **`tcamd`** – TCA mode
    This parameter shows the modus of the PM thresholding.
    Two thresholding methods are applicable:
    - TR-only (lso known as the implicit reset method)
    - TR-RTR (lso known as the explicit reset method).
    Type: Alphanumeric value set.
    Range: TR or TRRTR (default).
52. **`trbmd`** – Tributary mode
    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port.
    Type: Alphanumeric value set.
    Range: FIXED.
53. **`unequiposig`** – Unequipped Output Signal List
    This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the "unequipped" signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for tx and rx side of the port are allowed.
    Type: numeric value set.
    Range: NX-NX-NX-…
    N is the number of Xs. X can be 3, 4, 4C or 16C representing VC3, VC4, VC4-4C or VC4-16C.
    Default: 164 = all VC4.

Example output

```
   UNITE-NE 00-11-28 08:00:30
A  001 REPT DBCHG
   ″TIME=08-00-12,DATE=00-11-28:ENT-STM16:1-1-#-#-1-
      1::servcond=DISABLE,inputsig=164,...,unequiposig=164″
;
```

ENT-STM16T notification

Output format

The **ENT-STM16T** notification uses the general format of a REPT DBCHG Report Database Change notification.

Syntax

ENT-STM16T*:aid::spec_block*

Output parameters

Command parameters

1. **aid** – Access Identifier
   Access Identifier of STM16 port.
   Type: AID.
   Range: SPortAID of STM16 port.
   The keyword **all** is not allowed.

Spec block parameters

1. **exprstrc** – Value of Expected J0
   For ENT-STM16T Notification this parameter refers to the incoming (inress) direction.
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
2. **exprstrcout** – Value of Expected J0 in outgoing direction
   Expected regenerator section trace identifier in outgoing (egress) direction.
   The parameter expstrcout specifying the expected path trace is only relevant for the section trace supervision in outgoing direction when the related trace read format strcfmtout is set to 16 (16-byte-specific-string mode).
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex

3. **`fsflpbkstat`** – Far Side Facility Loopback Status
   This parameter specifies the current far-side facility loopback status of the considered output *aid*.
   A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
   Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
   Type: Alphanumeric value set.

   Range:

   - YES
   - NO (default).

4. **`istd`** – Interface Standard
   Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter istddflt.
   Type: Alphanumeric value set.
   Range: SDH.
   Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).

5. **`lpbk`** – Loopback
   This parameter specifies the current near-side loopback status of the considered output *aid*.
   A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
   Type: Alphanumeric value set.

   Range:

   - YES
   - NO (default).

6. **`pmode`** – Port Mode
   This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
   Type: Alphanumeric value set.

   Range:

   - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
   - MON indicates that alarm monitoring is taking place on the port.
   - NMON means that alarm monitoring is not occurring on the port.

7. **pmrsneses** – Performance Monitoring Section/RS Near-End SES Threshold
   This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET.
   Type: numeric value set.
   Range (superset of allowed ranges for SDH and SONET):1 – 64000
   Default: The default values differ for SDH and SONET and the different rates:
   - SDH (all rates): 2400
   - SONET OC48: 2392
   - SONET OC192: 8554
   - SONET OC768: 22776.
8. **pmrsneses**out – Performance Monitoring Section/RS Near-End SES Threshold in Outgoing Direction
   This parameter describes the Section/RS Near-End SES threshold value for the outgoing (egress) direction. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severly errored. The default value depends on the interface standard and may differ between SDH and SONET.
   Type: numeric value set
   Range (superset of allowed ranges for SDH and SONET): 1 – 64000
   Default:
   The default values differ for SDH and SONET and the different rates:
   - SDH (all rates): 2400
   - SONET OC48: 2392
9. **rsmstca** – RS/MS TCA Profile Pointer
   Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
   Type: Alphanumeric string.
   Range: String with maximum of 24 characters.
   Default: DEFAULT0.
10. **rspm** – RS PM Enable
   For ENT-STM16T Notification this parameter refers to the incoming (ingress) direction.
   Enable or disable regenerator section (section) performance monitoring.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).

11. **rspm**out – RS PM Enable in Outgoing Direction
Enable or disable regenerator section (section) performance monitoring for the outgoing (egress) direction.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE (default).
12. **rstimmon** – RS TIM Monitor Enable
For ENT-STM16T this parameter refers to the incoming (Ingress) direction.
Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
Type: Alphanumeric value set.
Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor
13. **rstimmonout** – RS TIM Monitor Enable in Outgoing direction
Regenerator Section Trace Identifier Mismatch Monitor enable (J0) in outgoing (egress) direction. This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).
Type: Alphanumeric value set.
Range: ENABLE – enable TIM Monitor, DISABLE (default) – disable TIM Monitor
14. **sdhpn** – SDH ASAP
This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET Alarm Severity Assignment Profile for the SONET ports to be compatible with current generation applications.
Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.
15. **servcond** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
16. **strcfmt** – Format of incoming J0
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
Type: Numeric string.

Range:

- 1: for specific repeating byte (SONET)
- 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

For ENT-STM16T this parameter refers to the incoming (Ingress) direction.

17. **`strcfmtout`** – Format of outgoing J0
For ENT-STM16T Notification this parameter refers to the incoming (Ingress) direction.
The read format of J0 in outgoing (egress) direction, the outgoing section trace (strcout) and the expected section trace (exprstrcout).
Type: Numeric string.
Range:
    - 1, for specific repeating byte (SONET)
    - 2 (default), for non-specific repeating byte (ITU/ETSI mode 2)
    - 16, for 16 byte specific string (ITU/ETSI mode 1)
    - 64, for 64 byte string (SONET).
18. **`tcamd`** – TCA mode
This parameter shows the modus of the PM thresholding.
Two thresholding methods are applicable:
    - TR-only (lso known as the implicit reset method)
    - TR-RTR (lso known as the explicit reset method).

    Type: Alphanumeric value set.
    Range: TR or TRRTR (default).

Example output

```
   UNITE-NE 00-11-20 8:01:03
A  611 REPT DBCHG
   ″Time=8-00-30,DATE=00-11-20:DLT-STM16T:1-1-#-#-4-1″
;
```

ENT-STM64 notification

Output format

Syntax: **ENT-STM64**:*aid*::*spec_block*

Output parameters

Command parameters

1. **aid** – Access Identifier
   Type: AID
   Range: STM-64 port AID

Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)
   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This parameter is supported by ports of *portClass* INNI.
   This parameter is supported by ports of *portClass* ENNI.
   Type: Numeric string.
   Range: 1(default)…65535
2. **brstintvl**– Bursty Interval
   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
3. **brstthr** – Bursty Error Threshold
   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, … 50.
   Default: 30.
4. **clientNodeID** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems

reasonable for a possible extension of this attribute to other port classes in future.
This parameter is supported by ports of *portClass* UNI.
Type: IPv4 format: Four dot separated numeric string.
Range: Each numeric string: 0…255
Default: 0.0.0.0

5. **crstat** – Constituent Rates Status list
   This parameter shows the rates of the port signals. For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.
   Type: numeric value set.
   Range: NX-NX-NX-…
   N is the number of Xs. X can be 3, 4, 4C, 16C or C64 representing VC3, VC4, VC4-4C, VC4-16C or VC-64C.
6. **degthr** – Signal Degrade Threshold
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –5; –6; –7; –8; –9.
   Default: –6.
7. **dexcthr** – Excessive Degrade Threshold
   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.
   Type: numeric value set.
   Range (as exponents of 10): –3; –4; –5.
   Default: –3.
8. **exprstrc** – Value of Expected J0
   Expected regenerator section trace identifier.
   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex
9. **fec** – FEC Enable
   Forward Error Correction Enable. Enable to include the FEC information in the outgoing signal.
   Type: Alphanumeric value set.
   Range:

DISABLE (only) for:

- OC192 / STM64 Intermediate Reach / Short Haul 1550 nm optics
- OC192 / STM64 intermediate reach / SH 32 colour passive WDM compatible optics
- OC192 / STM64 Long Reach / Long Haul 1550 nm optics
- OC192 / STM64 low cost intra office 1310 nm optics
- OC192 / STM64 client ports (related to OTN ports)
- OC768/STM256 basis low cost intra office 1310 nm optics.

ENABLE / DISABLE for:

- OC192 / STM64 OLS800G compatible 80 colour optics
- OC768 / STM256 Long Reach / Long Haul 1550 nm optics (80km)
- OC768 / STM256 OLS Xtreme compatible 64 colour optics (extended L band)

ENABLE (only)for:

- OC192 / STM64 OLS Xtreme compatible 128 colour optics 40G

Default:

DISABLE for:

- OC192 / STM64 Intermediate Reach / Short Haul 1550 nm optics
- OC192 / STM64 intermediate reach / SH 32 colour passive WDM compatible optics
- OC192 / STM64 Long Reach / Long Haul 1550 nm optics
- OC192 / STM64 low cost intra office 1310 nm optics
- OC192 / STM64 client ports (related to OTN ports)
- OC768/STM256 basis low cost intra office 1310 nm optics.

ENABLE for:

- OC192 / STM64 OLS800G compatible 80 colour optics
- OC192 / STM64 OLS Xtreme compatible 128 colour optics 40G
- OC768 / STM256 Long Reach / Long Haul 1550 nm optics with strong FEC (80km)
- OC768 / STM256 OLS Xtreme compatible 64 colour optics (extended L band)

10. **`femspm`** – Far-end Multiplex Section PM Enable
    Enable or disable of the performance monitoring of the multiplex section.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).

11. **`frcdus`** – Force to DUS
Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message ″do not use″ will be transmitted from that optical interface.
Type: Alphanumeric value set.
Range:
    - ENABLE: (set a forced DUS/DNU)
    - DISABLE (default): (clear a forced DUS/DNU).
12. **`fsflpbkstat`** – Far Side Facililiy Loopback Status
This parameter specifies the current far-side facility loopback status of the considered output *aid*.
A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
Type: Alphanumeric value set.
Range:
    - YES
    - NO (default).
13. **`inputsig`** – Tributary Input Signal Rate List
This parameter is a list of VCn rates across the port's bandwidth.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 3, 4, 4C, 16C or C64 representing VC3, VC4, VC4-4C, VC4-16C or VC4-64C.
Default: 644.
14. **`istd`** – Interface Standard
Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter istddflt.
Type: Alphanumeric value set.
Range: SDH.
Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2400).
15. **`linkResCls`** – Link Resource Class
The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute

represents a 32-bit mask.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set (4 bytes), every bit defining one link class
Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
Default: 00 for each alphanumeric character

16. **`localLinkID`** – Local Link IDentity
The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: numeric value set
Range: 0 (default) to 4294967295

17. **`localLPID`** – Local Logical Port IDentity
The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: numeric value set.
Range: 0 (default) to 4294967295
The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

18. **`maxNNXCRate`** – Maximum NN Cross Connect Rate
The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3, VC4, VC44C, VC416C or VC464C (default)

19. **`minNNXCRate`** – Minimum NN Cross Connect Rate
The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range: VC3 (default), VC4, VC44C, VC416C or VC464C.

20. **`msrei`** – MS-REI mode
Definition: An special extended MS REI mode is standardized for STM64/OC192 interfaces. To support the interworking with older STM64/OC192 interfaces the single byte mode (non-extended) should also be supported.
Type: Alphanumeric value set.
Range:
   - SINGLE
   - EXTENDED (default).

21. **`ndetmd`** – Neighbor Detection Mode
The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Alphanumeric value set.
Range:
AUTO, MAN
Default:
For *portClass* = INNI: AUTO
For *portClass* = ENNI: MAN

22. **`neighborASTNNodeID`** – Neighbor ASTN Node Id
This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.

If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborASTNNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0. If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″.

23. **`neighborNodeID`** – Neighbor Node Id
This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborNodeID is used by the ONNS application.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.
Default: 0.0.0.0
If *portClass* = INNI, the default value shall have the meaning of ″no neighbor discovered″

24. **`neighborPortID`** – Neighbor Port Id
This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.
If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.
neighborPortID is used by the ONNS application.
Type: Four dash separated numeric string.
Range: Each numeric string: 0…255.
Default: 0-0-0-0.
Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

25. **`neighborSigPCID`** – Neighbor Signaling PC IDentity
The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

26. **`neighborSigPCIPAddr`** – Neighbor Signaling PC IP Address
The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This parameter is supported by ports of *portClass* ENNI.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

27. **`nemspm`** – MS Near-End PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range:
   - ENABLE
   - DISABLE (default).

28. **`networkTNAType`** – Network TNA Type
The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type: Alphanumeric value set.
Range:
   - IPV4 (default)
   - IPV6
   - NSAP

29. **`networkTNAAddress`** – Network TNA Address
The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
This attribute replaces attribute "uniNetworkTNAAddress", as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.
This parameter is supported by ports of *portClass* UNI.
This parameter is supported by ports of *portClass* EDGE.
Type:
- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:
- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number: 0000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:
- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:
- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 0000000000000000000000000000000000000000

The default value shall have the meaning of "no TNA Address provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

30. **och** – optical channel enable
Enable or disable of the optical channel. If the optical channel is disabled the further optical channel parameters don't have any impact on transmission.
Type: Alphanumeric value set.

Range:

- for ports on OP10 packs, which support to enable or disable OCH: ENABLE: enable optical channel; DISABLE: disable optical channel
- for ports on OP10 and OP40 packs, which cannot support OCH: DISABLE: disable optical channel
- for ports on OP10 and OP40 packs,, which only support OCH: ENABLE: enable optical channel
- for client ports on packs which support OTN: DISABL: disable, optical channel not applicable.

Default:

- for OP10 and OP40 packs, which cannot support OCH: DISABLE
- for OP10 packs, which cannot support OCH: ENABLE
- for OP10 and OP40 packs, which only support OCH: ENABLE
- for client ports on packs which support OTN: DISABLE.

31. **`otnclient`** – OTN Client Port
This parameter indicates whether the port is an OTN Client Port or an optical SDH/SONET port.
Type: Alphanumeric value set.
Range:
    - YES for OTN client port
    - NO for optical SDH/SONET port.

`pmmsfeses` – Performance Monitoring Line/MS Far-End SES Threshold
This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-16/OC-48: 1 – 3072000
- STM-64/OC-192: 1 – 12288000
- STM-256/OC-768: 1 – 49152000.

Default: The default values differ for SDH and SONET and the different rates:

- STM16: 460800
- STM64: 1843200
- STM256: 7372800
- SONET OC48: 2459

- SONET OC192: 9835
- SONET OC768: 39340.

32. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold
This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):
   - STM-16/OC-48: 1 – 3072000
   - STM-64/OC-192: 1 – 12288000
   - STM-256/OC-768: 1 – 49152000.

   Default: The default values differ for SDH and SONET and the different rates:
   - STM16: 460800
   - STM64: 1843200
   - STM256: 7372800
   - SONET OC48: 2459
   - SONET OC192: 9835
   - SONET OC768: 39340.

33. **`pmode`** – Port Mode
This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
Type: Alphanumeric value set.
Range:
   - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start. The value AUTO is only supported for optical SDH/SONET ports, i.e. not supported for client ports.
   - MON indicates that alarm monitoring is taking place on the port.
   - NMON means that alarm monitoring is not occurring on the port.

   Default:
   - AUTO for optical SDH/SONET ports
   - NMON for client ports.

34. **`pmrsneses`** – Performance Monitoring Section/RS Near-End SES Threshold
This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of allowed ranges for SDH and SONET):1 – 64000
Default: The default values differ for SDH and SONET and the different rates:
    - SDH (all rates): 2400
    - SONET OC48: 2392
    - SONET OC192: 8554
    - SONET OC768: 22776.
35. **`polynomial`** – Optical Channel Scrambling Polynomial
This parameter is used by the Wavewrapper scrambler on the optical channel. This parameter is relevant only if the optical channel is enabled (och = ENABLE).
Type: numeric value set.
Range: 1x7 + x + 1; 2x16 + x12 + x3 + x + 1.
Default: 2.
36. **`portClass`** – Port Class
This parameter identifies the port class of the AID.
In which role the port is used by the ONNS application is specified by this parameter *portClass*.
Type: Alphanumeric value set.
Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.
Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.
37. **`portControl`** – Port Control (PortAdministrative Mode)
The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.
Type: Alphanumeric value set.
Range: NORMAL (default), LOCKOUT
38. **`propagationDelay`** – Propagation Delay
This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.
propagationDelay is used by the ONNS application.
Type: Numeric string.
Range: 0(default) …255. The unit of this value is ″milliseconds″.

39. **`remAdvNodeID`** – Remote Advertised Node IDentity
    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition:
    The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.
    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
40. **`remLinkID`** – Remote Link IDentity
    The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: numeric value set
    Range: 0 (default) to 4294967295
41. **`remRAID`** – Remote Routing Area IDentity
    The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:
    The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: Four dot separated numeric string
    Range: Each numeric string: 0…255
    Default: 0.0.0.0
42. **`remTID`** – Remote TID
    The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* ENNI.
Type: TID or empty-string
Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
Default: empty string: ""

43. **`rsmstca`** – RS/MS TCA Profile Pointer
    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
    Type: Alphanumeric string.
    Range: String with maximum of 24 characters.
    Default: DEFAULT0.
44. **`rspm`** – RS PM Enable
    Enable or disable regenerator section (section) performance monitoring.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
45. **`rstimca`** – RS TIM Consequent Action Enable
    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimca* is autonomously set by the neighbor detection mechanism.
    Type: Alphanumeric value set.
    Range:
    - ENABLE (default): enable consequent action for TIM
    - DISABLE: disable consequent action for TIM.
46. **`rstimmon`** – RS TIM Monitor Enable
    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).
    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.
    Type: Alphanumeric value set.
    Range:
    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor

47. **sdhpn** – SDH ASAP
This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET Alarm Severity Assignment Profile for the SONET ports (see definition of output parameter SONET in “RTRV-OC192: Retrieve OC192 port” (p. 3-2664)) to be compatible with current generation applications.
Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.
48. **sdsfmode** – Signal Degrade/Signal Fail Mode
The degraded state is detected in Burst or Poisson mode.
Type: Alphanumeric value set.
Range:
    - BURST (default)
    - POISSON.
49. **servcond** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
50. **srlgList** – Shared Risk Link Group Identities List
The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.
If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.
This parameter is supported by ports of *portClass* INNI.
This parameter is supported by ports of *portClass* ENNI.
Type: Ten numeric strings separated by dashes.
Range: Each numeric string: 0…65535.
Default: 0-0-0-0-0-0-0-0-0-0.

51. **strcfmt** – Format of incoming J0
The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.
Type: Numeric string.
Range:
 - 1: for specific repeating byte (SONET)
 - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
 - 16: for 16 byte specific string (ITU/ETSI mode 1).
 - 64: for 64 byte string (SONET).
52. **strcout** – Value of outgoing J0
This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.
If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.
Type: Hexadecimal digits.
Range:
 - 1 byte string
 - 16 bytes string
 - 64 bytes string dependent on the strcwfmt parameter.

 Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
 Default: 01Hex
53. **strcwfmt** – Format of outgoing J0
The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.
Type: Numeric string.
Range:
 - 1: for specific repeating byte (SONET)
 - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
 - 16: for 16 byte specific string (ITU/ETSI mode 1).
 - 64: for 64 byte string (SONET).
54. **tcamd** – TCA mode
This parameter shows the modus of the PM thresholding.

Two thresholding methods are applicable:

- TR-only (lso known as the implicit reset method)
- TR-RTR (lso known as the explicit reset method).

Type: Alphanumeric value set.
Range: TR or TRRTR (default).

55. **`trbmd`** – Tributary mode
If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port.
Type: Alphanumeric value set.
Range: FIXED.

56. **`unequiposig`** – Unequipped Output Signal List
This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the *unequipped* signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for *tx* and *rx* side of the port are allowed.
Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 3, 4, 4C, 16C or C64 representing VC3, VC4, VC4-4C, VC4-16C or VC4-64C.
Default: 644 = all VC4.

Example output

```
   UNITE-NE 00-11-28 08:00:30
A  001 REPT DBCHG
   ″TIME=08-00-12,DATE=00-11-28:ENT-STM64:1-1-#-#-1-1::servcond=DISABLE,och=DISABLE,
inputsig=644,...,unequiposig=644,fec=DISABLE,feccor=DISABLE,fectype=INBAND″
;
```

ENT-STS1 notification

Output format

Syntax: **ENT-STS1**:*aid*::*spec_block*

Output parameters

Command parameters

1. **aid** – Access Identifier
AID of the SONET tributary. The keyword **all** is not allowed on any level.
Type: AID
Range: STS1NumAID

Spec block parameters

1. **brstintvl**– Bursty Interval
Measurement period for determining bursty errors The setting of this parameter is used when *sdsfmode* = BURST.
Type: numeric value set.
Range: 2 to 10.
Default: 7.
2. **brstthr** – Bursty Error Threshold
The values are set in percent for the degradation threshold. The setting of this parameter is used when *sdsfmode* = BURST.
Type: numeric value set.
Range (as percentage): 5, 10, 15, 20, 25, 30, … 50.
Default: 30.
3. **crslpbkstat** – Cross-connect loopback status
State of cross- connect loopback.
Type: Alphanumeric value set.
Range:
   - YES = Cross-connect loopback is provisioned
   - NO (default) = No cross-connect loopback is provisioned.
4. **degthr** – Signal Degrade Threshold
The setting of this parameter are used when *sdsfmode* = POISSON
Type: numeric value set.
Range (as exponents of 10): –5; –6 (default); –7; –8; –9
5. **dexcthr** – Excessive Degrade Threshold
The setting of this parameter are used when *sdsfmode* = POISSON. The values are set as exponent of 10.
Type: numeric value set.
Range (as exponent of 10) –3 (default); –4; –5.

6. **`exphptrc`** – Expected Path Trace (J1)
   The parameter *exphptrc* specifying the expected path trace is only relevant for the path trace supervision when the path trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex.
7. **`feppm`** – Far-End Path PM Enable
   It indicates whether this performance monitoring feature is enabled or disabled.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
8. **`hptimmon`** – Path Trace Monitoring Enable (J1)
   Description: High order path trace (J1) identifier mismatch (TIM) monitor enable. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
9. **`loca`** – Ring A-node TID
   This parameter specifies the TID of the node at which the service is added to the BLSR ring. This parameter is required for the input of tributaries to be used by ONNS on ports of *portClass* = EDGE being members in BLSR/MS-SPRing protection groups. The *loca* parameter value is an empty string for all other tributaries.
   loca is introduced specifically for use related to ONNS application.
   Type: TID or empty-string.
   Range: Please refer to the TID definition in “RTRV-HDR: Retrieve header” (p. 3-2417) description.
   Default: empty string: ″″. This is displayed as \″\″ in output direction.
10. **`locz`** – Ring Z-node TID
   This parameter specifies the TID of the node at which the service is dropped from the BLSR ring. This parameter is required for the output of tributaries to be used by ONNS on ports of *portClass* = EDG E being members in BLSR/MS-SPRing protection groups. The *locz* parameter value is an empty string for all other tributaries.

locz is introduced specifically for use related to ONNS application.
Type: TID or empty-string.
Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
Default: empty string: "". This is displayed as \"\" in output direction.

11. **neppm** – Near-End Path PM Enable
It indicates whether this performance monitoring feature is enabled or disabled.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).
12. **pjepm** – Pointer Justification Event PM Enable
It indicates whether this performance monitoring feature is enabled or disabled.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).
13. **pmhpfeses** – Performance Monitoring Path Far-End SES Threshold
This parameter describes the Path Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. When the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of ranges for SDH and SONET): 1-64000.
Default: 2400.
14. **pmhpneses** – Performance Monitoring Path Near-End SES Threshold
This parameter describes the Path Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. When the interface standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (superset of ranges for SDH and SONET): 1-64000.
Default: 2400.
15. **pse** – PDI-P Switching Enable
The PDI-P Switching Enable parameter indicates if the PDI-P contributes to the automatic path protection switch criteria.
Type: Alphanumeric value set.
Range:
    - ENABLE
    - DISABLE (default).

16. **`ptca`** – Path TCA Profile Pointer
 Type: Alphanumeric string.
 Range: string with up to 24 characters.
 Default: DEFAULT0.
17. **`ptrcrfmt`** – Path Trace Read Format (J1)
 The read format of J1, the incoming path trace (*ptrc*).
 Type: numeric string.
 Range:
 - 2: for non-specific repeating byte
 - 16: for 16 byte specific string.
 - 64: for 64 byte string.
 Default: 2.
18. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
 The degraded state is detected in BURST or POISSON mode.
 Type: Alphanumeric value set.
 Range:
 - BURST
 - POISSON (default).
19. **`substr`** – Substructured
 This parameter indicates if the tributary is substructured.
 Substructure for LO cross-connections:
 A HO tributary, which is sub structured for LO cross-connections, has a HO path termination associated which provides LO tributaries to be used for LO cross-connections.
 The parameter *substr* is set autonomously when LO cross-connections are created or deleted with ENT-CRS or DLT-CRS commands (see also the lower order cross-connection creation/deletion behavior description for the commands ENT-CRS and DLT-CRS).
 A sub structured HO tributary cannot be used to set up HO cross-connections. The parameter *substr* is set autonomously when the LO substructure is created or deleted using the **`ED-SUBS`** command.
 Substructure for conversion cross-connections:
 A HO tributary, which is sub structured for the LO side of a conversion cross-connection, has a HO path termination associated which provides LO tributaries to be used for conversion cross-connections.
 The parameter *substr* is set autonomously when an AU3/AU4 conversion cross-connection is created.
 A HO tributary, which is sub structured for conversion cross-connections, cannot be used to set up HO cross-connections.
 Type: Alphanumeric value set.

Range:

- YES: Automatically sub structured for LO cross-connections
- MANSUB: Manually sub structured for LO cross-connections
- CNVSUB: Automatically sub structured for the LO side of conversion cross-connections
- NO (default): Not sub structured, not used for conversion cross-connections

If the STS-1 tributary is related to a EC1 port, then no LO cross-connections are allowed. As a consequence, the parameter *substr* can only have the values CNV and NO in this case.

20. **`tmonmd`** – Tributary Monitoring Mode
This parameter indicates the mode of the tributary.
Type: Alphanumeric value set.
Range:
    - MON = alarm monitoring is taking place on the port.
    - NMON (default) = alarm monitoring is not occurring on the port.
21. **`tribsonetpn`** – Tributary Alarm Severity Assignment Profile
This parameter points to a tributary ASAP profile name of type PATH for the designated AID.
Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.

Example output

```
   UNITE-NE 00-10-14 14:59:09
A  592 REPT DBCHG
   ″TIME=14-59-09,DATE=00-10-14:ENT-STS1:1-1-#-#-3-1-1::
      tmonmd=MON,tribsonetpn=Default,...,pmhpneses=30,pmhpfeses=30″
;
```

ENT-T3 notification

Output format

Syntax

`ENT-T3`:*aid::spec_block*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
Type: AID
Range: APortAID of DS3 port.

Spec block parameters

1. **`ds3pn`** – DS3 ASAP
DS3 Alarm Severity Assignment Profile. This parameter retrieves the ASAP profile name of type DS3 to which the designated AID points.
Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.
2. **`eif`** – Electrical Interface Type
The parameter eif indicates the type of input the port has been provisioned to receive.
Type: Alphanumeric value set.
Range: DS3
3. **`fmt`** – Signal Format
This parameter shows the format for the DS3 signal
Type: Alphanumeric value set. A hyphen (“-”) is allowed in the alphanumeric values additionally.
Range:
   - C-BIT (default): C-bit parity channelized DS3 format
   - M23: M23 channelized DS3 format
   - UNFRAMED-CC: UNFRAMED and CLEAR-CHANNEL format
4. **`fsflpbkstat`** – Far Side Facililiy Loopback Status
This parameter specifies the current far-side facility loopback status of the considered output *aid*.
A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.
Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.
Type: Alphanumeric value set.

Range:

- YES
- NO (default).

5. **infepm** – Incoming DS3 Far End Path PM Enable
This parameter enables/disables the incoming DS3 far end path performance monitoring.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE (default).
6. **inlnpm** – Incoming DS3 Line PM Enable
This parameter enables/disables the incoming DS3 line performance monitoring.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE (default).
7. **inpm** – Incoming DS3 Near End Path PM Enable
This parameter enables/disables the incoming DS3 near end path performance monitoring.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE (default).
8. **lbo** – Line Build Out
This parameter defines the cable length applicable for the DS3 port.
Type: Alphanumeric value set.
Range:
    - SHORT (default): 0 … 68.5 m (0 … 225 ft)
    - LONG: 68.5 … 137 m (225 … 450 ft).
9. **lpbk** – Loopback
This parameter specifies the current near-side loopback status of the considered output *aid*.
A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
Type: Alphanumeric value set.
Range:
    - YES
    - NO (default).
10. **outmntc** – Outgoing Maintenance Signal
This parameter determines whether an AIS, a DS3AIS or IDLE signal is transmitted in response to an unconnected input.
Type: Alphanumeric value set.
Range: AIS (default), DS3AIS, IDLE

11. **`outfepm`** – Outgoing DS3 Far End Path PM Enable
    This parameter enables/disables the outgoing DS3 far end path performance monitoring.
    Type: Alphanumeric value set.
    Range: ENABLE, DISABLE (default).
12. **`outpm`** – Outgoing DS3 Near End Path PM Enable
    This parameter enables/disables the outgoing DS3 near end path performance monitoring.
    Type: Alphanumeric value set.
    Range: ENABLE, DISABLE (default).
13. **`pmode`** – Port Mode
    This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.
    Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.
14. **`pmsesl`** – PM Threshold for SES – Line
    PM Threshold (errors in a second) for declaring SES – Line
    Type: numeric value set.
    Range: 1 … 8000
    Default: 44
15. **`pmsesp`** – PM Threshold for SES – Path Incoming
    PM Threshold (errors in a second) for declaring SES – Path in incoming direction.
    Type: numeric value set.
    Range: 1 … 8000
    Default: 44
16. **`pmsespfe`** – PM Threshold for Far-End SES – Path Incoming
    PM Threshold (errors in a second) for declaring Far-End SES – Path in incoming direction.
    Type: numeric value set.
    Range: 1 … 8000
    Default: 44
17. **`pmsespfeout`** – PM Threshold (errors in a second) for declaring Far-End SES – Path in outgoing direction.
    Type: numeric value set.
    Range: 1 … 8000
    Default: 44

18. **pmsespout** – PM Threshold for SES – Path Outgoing
PM Threshold (errors in a second) for declaring SES – Path in outgoing direction.
Type: numeric value set.
Range: 1 … 8000
Default: 44
19. **sdthr** – Signal Degrade Threshold
Signal degrade threshold in a range from 10exp-3 to 10exp-9.
Type: numeric value set.
Range: (as exponents of 10): -3, -4, -5, -6, -7, -8, -9
Default: -6
20. **servcond** – Service Condition
This parameter indicates its status concerning service involvement.
Type: Alphanumeric value set.
Range:
    - INSERVIC: Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.

    Default: INSERVICE.
21. **tca** – DS3 PM TCA
The parameter *tca* assigns a DS3 PM TCA profile name to the designated AID.
Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
Range: String with a maximum of 24 characters: DEFAULT, DEFAULT0
Default: DEFAULT0
22. **vmr** – Violation Monitoring Mode
This parameter indicates the status of the DS3 P-bit parity violation monitoring and removal.
Type: Alphanumeric value set. A hyphen ("-") is allowed in the alphanumeric values additionally.
Range: VMR, VM, NO-VM
Default: NO-VM.

Example output

```
   UNITE-NE 00-11-28 08:00:30
A  001 REPT DBCHG
   ″TIME=08-00-12,DATE=00-11-28:ENT-T3:1-1-#-#-21-1::
      cbitmis=NORMAL,eif=DS3,ptype=T3,fmt=C-BIT,.... sigmis=NORMAL,vmr=NO-VM ″
;
```

ENT-TCA-PROF: Enter TCA Profile

The **ENT-TCA-PROF** command allows the user to create a new Performance Monitoring (PM) Threshold Crossing Alert (TCA) profile with a specific name. The system supports two default sets of profiles called ″Default″ and ″Default0″. When a new profile is created, all the threshold values are copied from the ″Default″ profile.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): PM3

Priority: 1

Abortable: Yes

Input format

Command syntax:

ENT-TCA-PROF:*tid::ctag::pftype,pfname;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **ctag** – Correlation Tag
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
3. **pftype** – Profile Type
   This indicates the type of PM TCA profile for the selected facility.
   Type: value set.
   Range: SECTION-LINE, RS-MS, HOVC, PATH, ENET, ODU, LOVC, LOPATH, DS3, DS1.
4. **pfname** – Profile Name
   This indicates the name of the PM TCA profile which was already established by the command **ENT-TCA-PROF**. If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested. If a valid profile name is inserted in this field, the output will display the parameters within the profile with their values. A *pfname* value will always uniquely identify an existing profile for a specified *pftype* value. NULL means, that the Profile Name is omitted.
   Type: Alphanumeric string.
   Range: This is an alphanumeric character string with a maximum of 24 characters.
   Default: If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested.

Output format

If the NE fully complies with the ENT-TCA-PROF request, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

Output parameters

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The command shall establish/create a new TCA profile of type as specified by means of parameter pftype. The name of the new TCA profile corresponds to the parameter pfname. The creation of the new TCA profile is reported by means of an ENT-TCA-PROF notification.

Example input/output

The following example shows the successful completion of a ENT-TCA-PROF command by the NE:

```
ENT-TCA-PROF:UNITE-NE::123456::section-line,DTAG;
UNITE-NE 00-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command Error responses section.

Validation rule: Maximum number of TCA profiles reached

If the maximum number of TCA profiles reached, the error message is generated.

Error code:

`SSRE – Status, System Resources Exceeded, limit of profiles exceeded`

Validation rule: profile name already exists

If the system receives a new profile name that already exists for that profile type, the following error response is returned.

Error code: `IEAE – Input, Entity Already Exists, duplicate profile name`

Related TL1 messages

- "RTRV-TCA-PROF: Retrieve TCA profile" (p. 3-2982)
- "DLT-TCA-PROF: Delete TCA profile" (p. 3-259)
- "ED-TCA-PROF: Edit TCA profile" (p. 3-1214)

ENT-TCA-PROF notification

Output format

Command syntax: **ENT-TCA-PROF**::*pftype*,*pfname*:*spec_block;*

Output parameters

Command parameters

1. **pftype** – Profile Type
This indicates the type of PM TCA profile for the selected facility.
Type: value set.
Range: SECTION-LINE, RS-MS, HOVC, PATH, ENET, ODU, LOVC, LOPATH, DS3, DS1.
2. **pfname** – Profile Name
This indicates the name of the PM TCA profile which was already established by the command **ENT-TCA-PROF**. If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested. If a valid profile name is inserted in this field, the output will display the parameters within the profile with their values. A *pfname* value will always uniquely identify an existing profile for a specified *pftype* value. NULL means, that the Profile Name is omitted.
Type: Alphanumeric string.
Range: This is an alphanumeric character string with a maximum of 24 characters.
Default: If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested.

Spec block parameters - profile parameters of type SECTION-LINE

1. **qhcvsoc3**
15-minute threshold for CV-S bin for OC-3.
Type: Integer.
Range: 0-57599100
Default: 140.
2. **daycvsoc3**
Day threshold for CV-S bin of OC-3.
Type: Integer.
Range: 0-4294967295
Default: 1344.
3. **qhcvsoc12**
15-minute threshold for CV-S bin for OC-12.
Type: Integer.
Range: 0-57599100
Default: 560.

4. **daycvsoc12**
   Day threshold for CV-S bin for OC-12.
   Type: Integer.
   Range: 0-4294967295
   Default: 5376.
5. **qhcvsoc48**
   15-minute threshold for CV-S bin for OC-48.
   Type: Integer.
   Range: 0-57599100
   Default: 2240.
6. **daycvsoc48**
   Day threshold for CV-S bin for OC-48.
   Type: Integer.
   Range: 0-4294967295
   Default: 21504.
7. **qhcvsoc192**
   15-minute threshold for CV-S bin for OC-192.
   Type: Integer.
   Range: 0-57599100
   Default: 8960.
8. **daycvsoc192**
   Day threshold for CV-S bin for OC-192.
   Type: Integer.
   Range: 0-4294967295
   Default: 86016.
9. **qhcvsoc768**
   15-minute threshold for CV-S bin for OC-768.
   Type: Integer.
   Range: 0-57599100
   Default: 35840.
10. **daycvsoc768**
    Day threshold for CV-S bin for OC-768.
    Type: Integer.
    Range: 0-4294967295
    Default: 344064.
11. **qhcvsec1**
    15-minute threshold for CV-S bin for EC-1.
    Type: Integer.
    Range: 0-57599100
    Default: 47

12. **daycvsec1**
    Day threshold for CV-S bin of EC-1.
    Type: Integer.
    Range: 0-4294967295
    Default: 448
13. **qhess**
    15-minute threshold for ES-S bin.
    Type: Integer.
    Range: 0-900
    Default: 25.
14. **dayess**
    Day threshold for ES-S bin.
    Type: Integer.
    Range: 0-86400
    Default: 250.
15. **qhsess**
    15-minute threshold for SES-S bin.
    Type: Integer.
    Range: 0-810
    Default: 10.
16. **daysess**
    Day threshold for ES-S bin.
    Type: Integer.
    Range: 0-77760
    Default: 40.
17. **qhsefss**
    15-minute threshold for SEFS-S bin.
    Type: Integer.
    Range: 0-900
    Default: 5.
18. **daysefss**
    Day threshold for SEFS-S bin.
    Type: Integer.
    Range: 0-86400
    Default: 10.
19. **qhcvloc3**
    15-minute threshold for CV-L and CV-LFE bin for OC-3.
    Type: Integer.
    Range: 0-172799100
    Default: 140.

20. **`daycvloc3`**
    Day threshold for CV-L bin and CV-LFE for OC-3.
    Type: Integer.
    Range: 0-4294967295
    Default: 1344.
21. **`qhcvloc12`**
    15-minute threshold for CV-L and CV-LFE bin for OC-12.
    Type: Integer.
    Range: 0-691199100
    Default: 560.
22. **`daycvloc12`**
    Day threshold for CV-L bin and CV-LFE for OC-12.
    Type: Integer.
    Range: 0-4294967295
    Default: 5376.
23. **`qhcvloc48`**
    15-minute threshold for CV-L and CV-LFE bin for OC-48.
    Type: Integer.
    Range: 0-2764799100
    Default: 2240.
24. **`daycvloc48`**
    Day threshold for CV-L and CV-LFE bin for OC-48.
    Type: Integer.
    Range: 0-4294967295
    Default: 21504.
25. **`qhcvloc192`**
    15-minute threshold for CV-L and CV-LFE bin for OC-192.
    Type: Integer.
    Range: 0-4294967295
    Default: 8960.
26. **`daycvloc192`**
    Day threshold for CV-L and CV-LFE bin for OC-192.
    Type: Integer.
    Range: 0-4294967295
    Default: 86016.
27. **`qhcvloc768`**
    15-minute threshold for CV-L and CV-LFE bin for OC-768.
    Type: Integer.
    Range: 0-4294967295
    Default: 35840.

28. **`daycvloc768`**
Day threshold for CV-L and CV-LFE bin for OC-768.
Type: Integer.
Range: 0-4294967295
Default: 344064.

29. **`qhcvlec1`**
15-minute threshold for CV-L and CV-LFE bin for EC-1.
Type: Integer.
Range: 0-57599100
Default: 47

30. **`daycvlec1`**
Day threshold for CV-L bin and CV-LFE for EC-1.
Type: Integer.
Range: 0-4294967295
Default: 448

31. **`qhesl`**
15-minute threshold for ES-L and ES-LFE bin.
Type: Integer.
Range: 0-900
Default: 25.

32. **`dayesl`**
Day threshold for ES-L and ES-LFE bin.
Type: Integer.
Range: 0-86400
Default: 250.

33. **`qhfeccloc192`**
15-minute threshold for FECC-L bin for OC-192.
Type: Integer.
Range: 0 – 4294967295
Default: 5184.

34. **`dayfeccloc192`**
Day threshold for FECC-L bin for OC-192.
Type: Integer.
Range: 0 – 4294967295
Default: 497644.

35. **`qhfeccloc768`**
15-minute threshold for FECC-L bin for OC-768.
Type: Integer.
Range: 0 – 4294967295
Default: 20736.

36. **`dayfeccloc768`**
    Day threshold for FECC-L bin for OC-768.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 1990656.
37. **`qhsesl`**
    15-minute threshold for SES-L and SES-LFE bin.
    Type: Integer.
    Range: 0-810
    Default: 10.
38. **`daysesl`**
    Day threshold for SES-L and SES-LFE bin.
    Type: Integer.
    Range: 0-77760
    Default: 40.
39. **`qhuasl`**
    15-minute threshold for UAS-L and UAS-LFE bin.
    Type: Integer.
    Range: 0-900
    Default: 10.
40. **`dayuasl`**
    Day threshold for UAS-L and UAS-LFE bin.
    Type: Integer.
    Range: 0-86400
    Default: 10.

Spec block parameters - profile parameters of type RS-MS

1. **`qhrsnbbe`**
   15-minute threshold for RS_N_BBE bin.
   Type: Integer.
   Range: 0-7199100
   Default: 9000.
2. **`dayrsnbbe`**
   Day threshold for RS_N_BBE bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.
3. **`qhrsnes`**
   15-minute threshold for RS_N_ES bin.
   Type: Integer.
   Range: 0-900
   Default: 180.

4. **dayrsnes**
   Day threshold for RS_N_ES bin.
   Type: Integer.
   Range: 0-86400
   Default: 1500.
5. **qhrsnses**
   15-minute threshold for RS_N_SES bin.
   Type: Integer.
   Range: 0-810
   Default: 15.
6. **dayrsnses**
   Day threshold for RS_N_SES bin.
   Type: Integer.
   Range: 0-77760
   Default: 20.
7. **qhrsnuas**
   15-minute threshold for RS_N_UAS bin.
   Type: Integer.
   Range: 0-900
   Default: 15.
8. **dayrsnuas**
   Day threshold for RS_N_UAS bin.
   Type: Integer.
   Range: 0-86400
   Default: 20.
9. **qhmsbbestm1**
   15-min threshold for MS_N_BBE and MS_F_BBE for stm1 bin.
   Type: Integer.
   Range: 0-172799100
   Default: 228000.
10. **daymsbbestm1**
    Day threshold for MS_N_BBE and MS_F_BBE for stm1 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 432000.
11. **qhmsbbestm4**
    15-min threshold for MS_N_BBE and MS_F_BBE for stm4 bin.
    Type: Integer.
    Range: 0-691199100
    Default: 912000.

12. **daymsbbestm4**
Day threshold for MS_N_BBE and MS_F_BBE for stm4 bin.
Type: Integer.
Range: 00-4294967295
Default: 1728000.

13. **qhmsbbestm16**
15-min threshold for MS_N_BBE and MS_F_BBE for stm16 bin.
Type: Integer.
Range: 0-2764799100
Default: 3648000.

14. **daymsbbestm16**
Day threshold for MS_N_BBE and MS_F_BBE for stm16 bin.
Type: Integer.
Range: 0-4294967295
Default: 6912000.

15. **qhmsbbestm64**
15-min threshold for MS_N_BBE and MS_F_BBE for stm64 bin.
Type: Integer.
Range: 0-4294967295
Default: 14592000.

16. **daymsbbestm64**
Day threshold for MS_N_BBE and MS_F_BBE for stm64 bin.
Type: Integer.
Range: 0-4294967295
Default: 27648000.

17. **qhmsbbestm256**
15-min threshold for MS_N_BBE and MS_F_BBE for stm256 bin.
Type: Integer.
Range: 0-4294967295
Default: 58368000.

18. **daymsbbestm256**
Day threshold for MS_N_BBE and MS_F_BBE for stm256 bin.
Type: Integer.
Range: 0-4294967295
Default: 110592000.

19. **qhmses**
15-minute threshold for MS_N_ES and MS_F_ES bin.
Type: Integer.
Range: 0-900
Default: 50.

20. **`daymses`**
    Day threshold for MS_N_ES and MS_F_ES bin.
    Type: Integer.
    Range: 0-86400
    Default: 150.
21. **`qhmsnfeccstm64`**
    15-minute threshold for MS-N-FECC bin forSTM-64.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 5184.
22. **`daymsnfeccstm64`**
    Day threshold for MS-N-FECC bin forSTM-64.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 49764.
23. **`qhmsnfeccstm256`**
    15-minute threshold for MS-N-FECC bin forSTM-256.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 20736.
24. **`daymsnfeccstm256`**
    Day threshold for MS-N-FECC bin forSTM-256.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 1990656.
25. **`qhmsses`**
    15-minute threshold for MS_N_SES and MS_F_SES bin.
    Type: Integer.
    Range: 0-810
    Default: 10.
26. **`daymsses`**
    Day threshold for MS_N_SES and MS_F_SES bin.
    Type: Integer.
    Range: 0-77760
    Default: 15.

27. **qhmsuas**
    15-min threshold for MS_N_UAS and MS_F_UAS for stm64 bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
28. **daymsuas**
    Day threshold for MS_N_UAS and MS_F_UAS for stm64 bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.

Spec block parameters - reset profile parameters of type RS-MS

1. **qhrtrrsnbbe**
   15-minute reset threshold for RS_N_BBE bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
2. **dayrtrrsnbbe**
   Day reset threshold for RS_N_BBE bin.
   Type: Integer.
   Range: 0-691113600
   Default: 4800.
3. **qhrtrrsnes**
   15-minute reset threshold for RS_N_ES bin.
   Type: Integer.
   Range: 0-900
   Default: 20.
4. **dayrtrrsnes**
   Day reset threshold for RS_N_ES bin.
   Type: Integer.
   Range: 0-86400
   Default: 150.
5. **qhrtrrsnses**
   15-minute reset threshold for RS_N_SES bin.
   Type: Integer.
   Range: 0-810
   Default: 0.
6. **dayrtrrsnses**
   Day reset threshold for RS_N_SES bin.
   Type: Integer.
   Range: 0-77760
   Default: 0.

7. **`qhrtrrsnuas`**
   15-minute reset threshold for RS_N_UAS bin.
   Type: Integer.
   Range: 0-900
   Default: 0.
8. **`dayrtrrsnuas`**
   Day reset threshold for RS_N_UAS bin.
   Type: Integer.
   Range: 0-86400
   Default: 0.
9. **`qhrtrmsbbestm1`**
   15-min reset threshold for MS_N_BBE and MS_F_BBE for stm1 bin.
   Type: Integer.
   Range: 0-172799100
   Default: 2400.
10. **`dayrtrmsbbestm1`**
   Day reset threshold for MS_N_BBE and MS_F_BBE for stm1 bin.
   Type: Integer.
   Range: 0-4294967295
   Default: 43200.
11. **`qhrtrmsbbestm4`**
   15-min reset threshold for MS_N_BBE and MS_F_BBE for stm4 bin.
   Type: Integer.
   Range: 0-691199100
   Default: 9600.
12. **`dayrtrmsbbestm4`**
   Day reset threshold for MS_N_BBE and MS_F_BBE for stm4 bin.
   Type: Integer.
   Range: 0-4294967295
   Default: 172800.
13. **`qhrtrmsbbestm16`**
   15-min reset threshold for MS_N_BBE and MS_F_BBE for stm16 bin.
   Type: Integer.
   Range: 0-2764799100
   Default: 38400.
14. **`dayrtrmsbbestm16`**
   Day reset threshold for MS_N_BBE and MS_F_BBE for stm16 bin.
   Type: Integer.
   Range: 0-4294967295
   Default: 691200.

15. **qhrtrmsbbestm64**
    15-min reset threshold for MS_N_BBE and MS_F_BBE for stm64 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 153600.
16. **dayrtrmsbbestm64**
    Day reset threshold for MS_N_BBE and MS_F_BBE for stm64 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 2764800.
17. **qhrtrmsbbestm256**
    15-min reset threshold for MS_N_BBE and MS_F_BBE for stm256 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 614400.
18. **dayrtrmsbbestm256**
    Day reset threshold for MS_N_BBE and MS_F_BBE for stm256 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 11059200.
19. **qhrtrmses**
    15-minute reset threshold for MS_N_ES and MS_F_ES bin.
    Type: Integer.
    Range: 0-900
    Default: 5.
20. **dayrtrmses**
    Day reset threshold for MS_N_ES and MS_F_ES bin.
    Type: Integer.
    Range: 0-86400
    Default: 15.
21. **qhrtrmsnfeccstm64**
    15-minute reset threshold for MS-N-FECC bin forSTM-64.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 0.
22. **dayrtrmsnfeccstm64**
    Day reset threshold for MS-N-FECC bin forSTM-64.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 0.

23. **qhrtrmsnfeccstm256**
15-minute reset threshold for MS-N-FECC bin forSTM-256.
Type: Integer.
Range: 0 – 4294967295
Default: 0.

24. **dayrtrmsnfeccstm256**
Day reset threshold for MS-N-FECC bin forSTM-256.
Type: Integer.
Range: 0 – 4294967295
Default: 0.

25. **qhrtrmsses**
15-minute reset threshold for MS_N_SES and MS_F_SES bin.
Type: Integer.
Range: 0-810
Default: 0.

26. **dayrtrmsses**
Day reset threshold for MS_N_SES and MS_F_SES bin.
Type: Integer.
Range: 0-77760
Default: 0.

27. **qhrtrmsuas**
15-min reset threshold for MS_N_UAS and MS_F_UAS.
Type: Integer.
Range: 0-900
Default: 0.

28. **dayrtrmsuas**
Day reset threshold for MS_N_UAS and MS_F_UAS.
Type: Integer.
Range: 0-86400
Default: 0.

Spec block parameters - profile parameters of type ODU

1. **qhodupbbeodu1**
15-minute threshold for ODU_N_BBE bin and ODU_F_BBE for ODU1P.
Type: Integer.
Range: 0-18377100
Default: 32000.

2. **dayodupbbeodu1**
Day threshold for ODU_N_BBE bin and ODU_F_BBE for ODU1P.
Type: Integer.
Range: 0-1764201600
Default: 61000.

3. **qhodupes**
   15-minute threshold for ODU_N_ES and ODU_F_ES bin for ODU1P.
   Type: Integer.
   Range: 0-900
   Default: 50.
4. **dayodupes**
   Day threshold for ODU_N_ES and ODU_F_ES bin for ODU1P..
   Type: Integer.
   Range: 0-86400
   Default: 150.
5. **qhodupses**
   15-minute threshold for ODU_N_SES and ODU_F_SES bin for ODU1P.
   Type: Integer.
   Range: 0-810
   Default: 10.
6. **dayodupses**
   Day threshold for ODU_N_SES and ODU_F_SES bin for ODU1P.
   Type: Integer.
   Range: 0-77760
   Default: 15.
7. **qhodupuas**
   15-minute threshold for ODU_N_UAS and ODU_F_UAS bin for ODU1P.
   Type: Integer.
   Range: 0-900
   Default: 15.
8. **dayodupuas**
   Day threshold for ODU_N_UAS and ODU_F_UAS bin for ODU1P.
   Type: Integer.
   Range: 0-86400
   Default: 20.

Spec block parameters - reset profile parameters of type ODU

1. **qhrtrodupbbeodu1**
   15-minute reset threshold for ODU_N_BBE bin and ODU_F_BBE for ODU1P.
   Type: Integer.
   Range: 0-18377100
   Default: 200.
2. **dayrtrodupbbeodu1**
   Day reset threshold for ODU_N_BBE bin and ODU_F_BBE for ODU1P.
   Type: Integer.
   Range: 0-1764201600
   Default: 4800.

3. **qhrtrodupes**
   15-minute reset threshold for ODU_N_ES and ODU_F_ES bin for ODU1P.
   Type: Integer.
   Range: 0-900
   Default: 5.
4. **dayrtrodupes**
   Day reset threshold for ODU_N_ES and ODU_F_ES bin for ODU1P.
   Type: Integer.
   Range: 0-86400
   Default: 15.
5. **qhrtrodupses**
   15-minute reset threshold for ODU_N_SES and ODU_F_SES bin for ODU1P.
   Type: Integer.
   Range: 0-810
   Default: 0.
6. **dayrtrodupses**
   Day reset threshold for ODU_N_SES and ODU_F_SES bin for ODU1P.
   Type: Integer.
   Range: 0-77760
   Default: 0.
7. **qhrtrodupuas**
   15-minute threset reshold for ODU_N_UAS and ODU_F_UAS bin for ODU1P.
   Type: Integer.
   Range: 0-900
   Default: 0.
8. **dayrtrodupuas**
   Day reset threshold for ODU_N_UAS and ODU_F_UAS bin for ODU1P.
   Type: Integer.
   Range: 0-86400
   Default: 0.

Spec block parameters - profile parameters of type HO-VC

1. **qhvcbbevc3**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC3 bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
2. **dayvcbbevc3**
   Day threshold for VC_N_BBE and VC_F_BBE for VC3 bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.

3. **qhvcbbevc4**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC4 bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
4. **dayvcbbevc4**
   Day threshold for VC_N_BBE and VC_F_BBE for VC4 bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.
5. **qhvcbbevc44c**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC44C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
6. **dayvcbbevc44c**
   Day threshold for VC_N_BBE and VC_F_BBE for VC44C bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.
7. **qhvcbbevc416c**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC416C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
8. **dayvcbbevc416c**
   Day threshold for VC_N_BBE and VC_F_BBE for VC416C bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.
9. **qhvcbbevc464c**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC464C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
10. **dayvcbbevc464c**
    Day threshold for VC_N_BBE and VC_F_BBE for VC464C bin.
    Type: Integer.
    Range: 0-691113600
    Default: 48000.

11. **qhvcesvc3**
    15-minute threshold for VC_N_ES and VC_F_ES VC3 bin.
    Type: Integer.
    Range: 0-900
    Default: 150.
12. **dayvcesvc3**
    Day threshold for VC_N_ES and VC_F_ES VC3 bin.
    Type: Integer.
    Range: 0-86400
    Default: 600.
13. **qhvcesvc4**
    15-minute threshold for VC_N_ES and VC_F_ES for VC4 bin.
    Type: Integer.
    Range: 0-900
    Default: 180.
14. **dayvcesvc4**
    Day threshold for VC_N_ES and VC_F_ES for VC4 bin.
    Type: Integer.
    Range: 0-86400
    Default: 1500.
15. **qhvcesvc44c**
    15-minute threshold for VC_N_ES and VC_F_ES for VC4-4C bin.
    Type: Integer.
    Range: 0-900
    Default: 180.
16. **dayvcesvc44c**
    Day threshold for VC_N_ES and VC_F_ES for VC4-4C bin.
    Type: Integer.
    Range: 0-86400
    Default: 1500.
17. **qhvcesvc416c**
    15-minute threshold for VC_N_ES and VC_F_ES for VC4-16C bin.
    Type: Integer.
    Range: 0-900
    Default: 180.
18. **dayvcesvc416c**
    Day threshold for VC_N_ES and VC_F_ES for VC4-16C bin.
    Type: Integer.
    Range: 0-86400
    Default: 1500.

19. **qhvcesvc464c**
    15-minute threshold for VC_N_ES and VC_F_ES for VC4-64C bin.
    Type: Integer.
    Range: 0-900
    Default: 180.
20. **dayvcesvc464c**
    Day threshold for VC_N_ES and VC_F_ES for VC4-64C bin.
    Type: Integer.
    Range: 0-86400
    Default: 1500.
21. **qhvcsesvc3**
    15-minute threshold for VC_N_SES and VC_F_SES for VC3 bin.
    Type: Integer.
    Range: 0-810
    Default: 15.
22. **dayvcsesvc3**
    Day threshold for VC_N_SES and VC_F_SES for VC3 bin.
    Type: Integer.
    Range: 0-77760
    Default: 20.
23. **qhvcsesvc4**
    15-minute threshold for VC_N_SES and VC_F_SES for VC4 bin.
    Type: Integer.
    Range: 0-810
    Default: 15.
24. **dayvcsesvc4**
    Day threshold for VC_N_SES and VC_F_SES for VC4 bin.
    Type: Integer.
    Range: 0-77760
    Default: 20.
25. **qhvcsesvc44c**
    15-minute threshold for VC_N_SES and VC_F_SES for VC44C bin.
    Type: Integer.
    Range: 0-810
    Default: 15.
26. **dayvcsesvc44c**
    Day threshold for VC_N_SES and VC_F_SES for VC44C bin.
    Range: 0-77760
    Default: 20.

27. **qhvcsesvc416c**
15-minute threshold for VC_N_SES and VC_F_SES for VC416C bin.
Type: Integer.
Range: 0-810
Default: 15.
28. **dayvcsesvc416c**
Day threshold for VC_N_SES and VC_F_SES for VC416C bin.
Type: Integer.
Range: 0-77760
Default: 20.
29. **qhvcsesvc464c**
15-minute threshold for VC_N_SES and VC_F_SES for VC464C bin.
Type: Integer.
Range: 0-810
Default: 15.
30. **dayvcsesvc464c**
Day threshold for VC_N_SES and VC_F_SES for VC464C bin.
Type: Integer.
Range: 0-77760
Default: 20.
31. **qhvcuasvc3**
15-minute threshold for VC_N_UAS and VC_F_UAS for VC3 bin.
Type: Integer.
Range: 0-900
Default: 15.
32. **dayvcuasvc3**
Day threshold for VC_N_UAS and VC_F_UAS for VC3 bin.
Type: Integer.
Range: 0-86400
Default: 20.
33. **qhvcuasvc4**
15-minute threshold for VC_N_UAS and VC_F_UAS for VC4 bin.
Type: Integer.
Range: 0-900
Default: 15.
34. **dayvcuasvc4**
Day threshold for VC_N_UAS and VC_F_UAS for VC4 bin.
Type: Integer.
Range: 0-86400
Default: 20.

35. **qhvcuasvc44c**
 15-minute threshold for VC_N_UAS and VC_F_UAS for VC44C bin.
 Type: Integer.
 Range: 0-900
 Default: 15.
36. **dayvcuasvc44c**
 Day threshold for VC_N_UAS and VC_F_UAS for VC44C bin.
 Type: Integer.
 Range: 0-86400
 Default: 20.
37. **qhvcuasvc416c**
 15-minute threshold for VC_N_UAS and VC_F_UAS for VC416C bin.
 Type: Integer.
 Range: 0-900
 Default: 15.
38. **dayvcuasvc416c**
 Day threshold for VC_N_UAS and VC_F_UAS for VC416C bin.
 Type: Integer.
 Range: 0-86400
 Default: 20.
39. **qhvcuasvc464c**
 15-minute threshold for VC_N_UAS and VC_F_UAS for VC464C bin.
 Type: Integer.
 Range: 0-900
 Default: 15.
40. **dayvcuasvc464c**
 Day threshold for VC_N_UAS and VC_F_UAS for VC464C bin.
 Type: Integer.
 Range: 0-86400
 Default: 20.
41. **qhpjcpos**
 15-minute threshold for positive PJC bin.
 Type: Integer.
 Range: 0-1800000
 Default: 30.
42. **daypjcpos**
 Day threshold for positive PJC bin.
 Type: Integer.
 Range: 0-172800000
 Default: 2880.

43. **qhpjcneg**
 15-minute threshold for negative PJC bin.
 Type: Integer.
 Range: 0-1800000
 Default: 30.
44. **daypjcneg**
 Day threshold for negative PJC bin.
 Type: Integer.
 Range: 0-172800000
 Default: 2880.

Spec block parameters - reset profile parameters of type HO-VC

1. **qhrtrvcbbevc3**
 15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC3 bin.
 Type: Integer.
 Range: 0-7199100
 Default: 200.
2. **dayrtrvcbbevc3**
 Day reset threshold for VC_N_BBE and VC_F_BBE for VC3 bin.
 Type: Integer.
 Range: 0-691113600
 Default: 4800.
3. **qhrtrvcbbevc4**
 15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC4 bin.
 Type: Integer.
 Range: 0-7199100
 Default: 200.
4. **dayrtrvcbbevc4**
 Day reset threshold for VC_N_BBE and VC_F_BBE for VC4 bin.
 Type: Integer.
 Range: 0-691113600
 Default: 4800.
5. **qhrtrvcbbevc44c**
 15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC44C bin.
 Type: Integer.
 Range: 0-7199100
 Default: 200.
6. **dayrtrvcbbevc44c**
 Day reset threshold for VC_N_BBE and VC_F_BBE for VC44C bin.
 Type: Integer.
 Range: 0-691113600
 Default: 4800.

7. **`qhrtrvcbbevc416c`**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC416C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
8. **`dayrtrvcbbevc416c`**
   Day reset threshold for VC_N_BBE and VC_F_BBE for VC416C bin.
   Type: Integer.
   Range: 0-691113600
   Default: 4800.
9. **`qhrtrvcbbevc464c`**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC464C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
10. **`dayrtrvcbbevc464c`**
    dayrtrvcbbevc464c
    Type: Integer.
    Range: 0-691113600
    Default: 4800.
11. **`qhrtrvcesvc3`**
    15-minute reset threshold for VC_N_ES and VC_F_ES VC3 bin.
    Type: Integer.
    Range: 0-900
    Default: 10.
12. **`dayrtrvcesvc3`**
    Day reset threshold for VC_N_ES and VC_F_ES VC3 bin.
    Type: Integer.
    Range: 0-86400
    Default: 60.
13. **`qhrtrvcesvc4`**
    15-minute reset threshold for VC_N_ES and VC_F_ES for VC4 bin.
    Type: Integer.
    Range: 0-900
    Default: 20.
14. **`dayrtrvcesvc4`**
    Day reset threshold for VC_N_ES and VC_F_ES for VC4 bin.
    Type: Integer.
    Range: 0-86400
    Default: 150.

15. **qhrtrvcesvc44c**
15-minute reset threshold for VC_N_ES and VC_F_ES for VC4-4C bin.
Type: Integer.
Range: 0-900
Default: 20.
16. **dayrtrvcesvc44c**
Day reset threshold for VC_N_ES and VC_F_ES for VC4-4C bin.
Type: Integer.
Range: 0-86400
Default: 150.
17. **qhrtrvcesvc416c**
15-minute reset threshold for VC_N_ES and VC_F_ES for VC4-16C bin.
Type: Integer.
Range: 0-900
Default: 20.
18. **dayrtrvcesvc416c**
Day reset threshold for VC_N_ES and VC_F_ES for VC4-16C bin.
Type: Integer.
Range: 0-86400
Default: 150.
19. **qhrtrvcesvc464c**
15-minute reset threshold for VC_N_ES and VC_F_ES for VC4-64C bin.
Type: Integer.
Range: 0-900
Default: 20.
20. **dayrtrvcesvc464c**
Day reset threshold for VC_N_ES and VC_F_ES for VC4-64C bin.
Type: Integer.
Range: 0-86400
Default: 150.
21. **qhrtrvcsesvc3**
15-minute reset threshold for VC_N_SES and VC_F_SES for VC3 bin.
Type: Integer.
Range: 0-810
Default: 0.
22. **dayrtrvcsesvc3**
Day reset threshold for VC_N_SES and VC_F_SES for VC3 bin.
Type: Integer.
Range: 0-77760
Default: 0.

23. **qhrtrvcsesvc4**
15-minute reset threshold for VC_N_SES and VC_F_SES for VC4 bin.
Type: Integer.
Range: 0-810
Default: 0.

24. **dayrtrvcsesvc4**
Day reset threshold for VC_N_SES and VC_F_SES for VC4 bin.
Type: Integer.
Range: 0-77760
Default: 0.

25. **qhrtrvcsesvc44c**
15-minute reset threshold for VC_N_SES and VC_F_SES for VC44C bin.
Type: Integer.
Range: 0-810
Default: 0.

26. **dayrtrvcsesvc44c**
Day reset threshold for VC_N_SES and VC_F_SES for VC44C bin.
Type: Integer.
Range: 0-77760
Default: 0.

27. **qhrtrvcsesvc416c**
15-minute reset threshold for VC_N_SES and VC_F_SES for VC416C bin.
Type: Integer.
Range: 0-810
Default: 0.

28. **dayrtrvcsesvc416c**
Day reset threshold for VC_N_SES and VC_F_SES for VC416C bin.
Type: Integer.
Range: 0-77760
Default: 0.

29. **qhrtrvcsesvc464c**
15-minute reset threshold for VC_N_SES and VC_F_SES for VC464C bin.
Type: Integer.
Range: 0-810
Default: 0.

30. **dayrtrvcsesvc464c**
Day reset threshold for VC_N_SES and VC_F_SES for VC464C bin.
Type: Integer.
Range: 0-77760
Default: 0.

31. **qhrtrvcuasvc3**
15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC3 bin.
Type: Integer.
Range: 0-900
Default: 0.

32. **dayrtrvcuasvc3**
Day reset threshold for VC_N_UAS and VC_F_UAS for VC3 bin.
Type: Integer.
Range: 0-86400
Default: 0.

33. **qhrtrvcuasvc4**
15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC4 bin.
Type: Integer.
Range: 0-900
Default: 0.

34. **dayrtrvcuasvc4**
Day reset threshold for VC_N_UAS and VC_F_UAS for VC4 bin.
Type: Integer.
Range: 0-86400
Default: 0.

35. **qhrtrvcuasvc44c**
15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC44C bin.
Type: Integer.
Range: 0-900
Default: 0.

36. **dayrtrvcuasvc44c**
Day reset threshold for VC_N_UAS and VC_F_UAS for VC44C bin.
Type: Integer.
Range: 0-86400
Default: 0.

37. **qhrtrvcuasvc416c**
15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC416C bin.
Type: Integer.
Range: 0-900
Default: 0.

38. **dayrtrvcuasvc416c**
Day reset threshold for VC_N_UAS and VC_F_UAS for VC416C bin.
Type: Integer.
Range: 0-86400
Default: 0.

39. **`qhrtrvcuasvc464c`**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC464C bin.
    Type: Integer.
    Range: 0-900
    Default: 0.
40. **`dayrtrvcuasvc464c`**
    Day reset threshold for VC_N_UAS and VC_F_UAS for VC464C bin.
    Type: Integer.
    Range: 0-86400
    Default: 0.
41. **`qhrtrpjcpos`**
    15-minute reset threshold for positive PJC bin.
    Type: Integer.
    Range: 0-1800000
    Default: 0.
42. **`dayrtrpjcpos`**
    Day reset threshold for positive PJC bin.
    Type: Integer.
    Range: 0-172800000
    Default: 0.
43. **`qhrtrpjcneg`**
    15-minute reset threshold for negative PJC bin.
    Type: Integer.
    Range: 0-1800000
    Default: 0.
44. **`dayrtrpjcneg`**
    Day reset threshold for negative PJC bin.
    Type: Integer.
    Range: 0-172800000
    Default: 0.

Spec block parameters - profile parameters of type PATH

1. **`qhcvpsts1`**
   15-minute threshold for CV-P and CV-PFE bin for STS1.
   Type: Integer.
   Range: 0-57599100
   Default: 15.
2. **`daycvpsts1`**
   Day threshold for CV-P and CV-PFE bin for STS1.
   Type: Integer.
   Range: 0-4294967295
   Default: 125.

3. **`qhcvpsts3c`**
   15-minute threshold for CV-P and CV-PFE bin for STS3C.
   Type: Integer.
   Range: 0-57599100
   Default: 25.
4. **`daycvpsts3c`**
   Day threshold for CV-P and CV-PFE bin for STS3C.
   Type: Integer.
   Range: 4294967295
   Default: 250.
5. **`qhcvpsts12c`**
   15-minute threshold for CV-P and CV-PFE bin for STS12C.
   Type: Integer.
   Range: 0-57599100
   Default: 75.
6. **`daycvpsts12c`**
   Day threshold for threshold for CV-P and CV-PFE bin for STS12C.
   Type: Integer.
   Range: 4294967295
   Default: 750.
7. **`qhcvpsts48c`**
   15-minute threshold for CV-P and CV-PFE bin for STS48C.
   Type: Integer.
   Range: 0-57599100
   Default: 300.
8. **`daycvpsts48c`**
   Day threshold for CV-P and CV-PFE bin for STS48C.
   Type: Integer.
   Range: 4294967295
   Default: 3000.
9. **`qhcvpsts192c`**
   Day threshold for CV-P and CV-PFE bin for STS192C.
   Type: Integer.
   Range: 0-57599100
   Default: 1200.
10. **`daycvpsts192c`**
   Day threshold for CV-P and CV-PFE bin for STS192C.
   Type: Integer.
   Range: 0-4294967295
   Default: 12000.

11. **qhespsts1**
    15-minute threshold for ES-P and ES-PFE bin for STS1.
    Type: Integer.
    Range: 0-900
    Default: 12.
12. **dayespsts1**
    Day threshold for ES-P and ES-PFE bin for STS1.
    Type: Integer.
    Range: 0-86400
    Default: 100.
13. **qhespsts3c**
    15-minute threshold for ES-P and ES-PFE bin for STS3C.
    Type: Integer.
    Range: 0-900
    Default: 20.
14. **dayespsts3c**
    Day threshold for ES-P and ES-PFE bin for STS3C.
    Type: Integer.
    Range: 0-86400
    Default: 200.
15. **qhespsts12c**
    15-minute threshold for ES-P and ES-PFE bin for STS12C.
    Type: Integer.
    Range: 0-900
    Default: 60.
16. **dayespsts12c**
    Day threshold for ES-P and ES-PFE bin for STS12C.
    Type: Integer.
    Range: 0-86400
    Default: 600.
17. **qhespsts48c**
    15-minute threshold for ES-P and ES-PFE bin for STS48C.
    Type: Integer.
    Range: 0-900
    Default: 240.
18. **dayespsts48c**
    Day threshold for ES-P and ES-PFE bin for STS48C.
    Type: Integer.
    Range: 0-86400
    Default: 2400.

19. **`qhespsts192c`**
Day threshold for ES-P and ES-PFE bin for STS192C.
Type: Integer.
Range: 0-900
Default: 240.

20. **`dayespsts192c`**
Day threshold for ES-P and ES-PFE bin for STS192C.
Type: Integer.
Range: 0-86400
Default: 9600.

21. **`qhsesp`**
15-minute threshold for SES-P and SES-PFE bin.
Type: Integer.
Range: 0-810
Default: 3.

22. **`daysesp`**
Day threshold for SES-P and SES-PFE bin.
Type: Integer.
Range: 0-77760
Default: 7.

23. **`qhuasp`**
15-minute threshold for UAS-P and UAS-PFE bin.
Type: Integer.
Range: 0-900
Default: 10.

24. **`dayuasp`**
Day threshold for UAS-P and UAS-PFE bin.
Type: Integer.
Range: 0-86400
Default: 10.

25. **`qhppjcgen`**
15-minute threshold for PPJC-PGen bin.
Type: Integer.
Range: 0-1800000
Default: 30.

26. **`dayppjcgen`**
Day threshold for PPJC-PGen bin.
Type: Integer.
Range: 0-172800000
Default: 2880.

27. **qhnpjcgen**
    15-minute threshold for NPJC-PGen bin.
    Type: Integer.
    Range: 0-1800000
    Default: 30.
28. **daynpjcgen**
    Day threshold for NPJC-PGen bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.
29. **qhppjcdet**
    15-minute threshold for PPJC-PDet bin.
    Type: Integer.
    Range: 0-1800000
    Default: 30.
30. **dayppjcdet**
    Day threshold for PPJC-PDet bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.
31. **qhnpjcdet**
    15-minute threshold for NPJC-PDet bin.
    Type: Integer.
    Range: 0-18000000
    Default: 30.
32. **daynpjcdet**
    Day threshold for NPJC-PDet bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.

Spec block parameters - profile parameters of type ENET

1. **qhpdege**
   15-minute threshold for PDE bin for GE.
   Type: Integer.
   Range: 0-183000000
   Default: 187500.
2. **daypdege**
   Day threshold for PDE bin for GE.
   Type: Integer.
   Range: 0-4294967295
   Default: 9000000.

3. **`qhpdevcg`**
   15-minute threshold for PDE bin for VCG.
   Type: Integer.
   Range: 0-183000000
   Default: 10.
4. **`daypdevcg`**
   Day threshold for PDE bin for VCG.
   Type: Integer.
   Range: 0-4294967295
   Default: 50.
5. **`qhedfe1ge`**
   15min EDFE for 1GbE Ethernet port.
   Type: Integer.
   Range: 0-1371951220
   Default: 1875000.
6. **`dayedfe1ge`**
   24 h EDFE for 1GbE Ethernet port.
   Type: Integer.
   Range: 0-4294967295
   Default: 9000000.
7. **`qhedfc1ge`**
   15min EDFC for 1GbE Ethernet port.
   Type: Integer.
   Range: 0-1371951220
   Default: 10.
8. **`dayedfc1ge`**
   24 h EDFC for 1GbE Ethernet port.
   Type: Integer.
   Range: 0-4294967295
   Default: 50.
9. **`qhedfe10ge`**
   15min EDFE for 10GbE Ethernet port.
   Type: Integer.
   Range: 0-2147483647
   Default: 18750000.
10. **`dayedfe10ge`**
    24 h EDFE for 10GbE Ethernet port
    Type: Integer.
    Range: 0-4294967295
    Default: 90000000.

11. **qhedfc10ge**
    15min EDFC for 10GbE Ethernet port.
    Type: Integer.
    Range: 0-2147483647
    Default: 100.
12. **dayedfc10ge**
    24 h EDFC for 10GbE Ethernet port.
    Type: Integer.
    Range: 0-4294967295
    Default: 500.
13. **qhedfe1gevcg**
    15min EDFE for 1GbE VCG port.
    Type: Integer.
    Range: 0-1371951220
    Default: 10.
14. **dayedfe1gevcg**
    24 h EDFE for 1GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 50.
15. **qhedfc1gevcg**
    15min EDFC for 1GbE VCG port.
    Type: Integer.
    Range: 0-1371951220
    Default: 10.
16. **dayedfc1gevcg**
    24 h EDFC for 1GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 50.
17. **qhedfe10gevcg**
    15min EDFE for 10GbE VCG port.
    Type: Integer.
    Range: 0-2147483647
    Default: 100.
18. **dayedfe10gevcg**
    24 h EDFE for 10GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 500.

19. **`qhedfc10gevcg`**
    15min EDFC for 10GbE VCG port.
    Type: Integer.
    Range: 0-2147483647
    Default: 100.
20. **`dayedfc10gevcg`**
    24 h EDFC for 10GbE VCG port.
    Type: Integer.
    Range: 0-4294967295-4294967295
    Default: 500.

Spec block parameters - reset profile parameters of type ENET

1. **`qhrtrpdege`**
   15-minute reset threshold for PDE bin for GE.
   Type: Integer.
   Range: 0-183000000
   Default: 937500.
2. **`dayrtrpdege`**
   Day reset threshold for PDE bin for GE.
   Type: Integer.
   Range: 0-4294967295
   Default: 4500000.
3. **`qhrtrpdevcg`**
   15-minute reset threshold for PDE bin for VCG.
   Type: Integer.
   Range: 0-183000000
   Default: 2.
4. **`dayrtrpdevcg`**
   Day reset threshold for PDE bin for VCG.
   Type: Integer.
   Range: 0-4294967295
   Default: 5.
5. **`qhrtredfe1ge`**
   15min reset threshold for EDFE of 1GbE Ethernet port.
   Type: Integer.
   Range: 0-1371951220
   Default: 937500.
6. **`dayrtredfe1ge`**
   24h reset threshold for EDFE of 1GbE Ethernet port.
   Type: Integer.
   Range: 0-4294967295
   Default: 4500000.

7. **`qhrtredfc1ge`**
   15min reset threshold for EDFC of 1GbE Ethernet port.
   Type: Integer.
   Range: 0-1371951220
   Default: 2.
8. **`dayrtredfc1ge`**
   24h reset threshold for EDFC of 1GbE Ethernet port.
   Type: Integer.
   Range: 0-4294967295
   Default: 5.
9. **`qhrtredfe10ge`**
   15min reset threshold for EDFE of 10GbE Ethernet port.
   Type: Integer.
   0-2147483647
   Default: 9375000.
10. **`dayrtredfe10ge`**
    24h reset threshold for EDFE of 10GbE Ethernet port.
    Type: Integer.
    Range: 0-4294967295
    Default: 45000000.
11. **`qhrtredfc10ge`**
    15min reset threshold for EDFC of 10GbE Ethernet port.
    Type: Integer.
    0-2147483647
    Default: 20.
12. **`dayrtredfc10ge`**
    24h reset threshold for EDFC of 10GbE Ethernet port.
    Type: Integer.
    Range: 0-4294967295
    Default: 50.
13. **`qhrtredfe1gevcg`**
    15min reset threshold for EDFE of 1GbE VCG port.
    Type: Integer.
    Range: 0-1371951220
    Default: 2.
14. **`dayrtredfe1gevcg`**
    24h reset threshold for EDFE of 1GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 5.

15. **qhrtredfc1gevcg**
    15min reset threshold for EDFC of 1GbE VCG port.
    Type: Integer.
    Range: 0-1371951220
    Default: 2.
16. **dayrtredfc1gevcg**
    24h reset threshold for EDFC of 1GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 5.
17. **qhrtredfe10gevcg**
    15min reset threshold for EDFE of 10GbE VCG port.
    Type: Integer.
    0-2147483647
    Default: 20.
18. **dayrtredfe10gevcg**
    24h reset threshold for EDFE of 10GbE VCG port.
    Type: Integer.
    Range: 0-294967295
    Default: 50.
19. **qhrtredfc10gevcg**
    15min reset threshold for EDFC of 10GbE VCG port.
    Type: Integer.
    Range: 0-2147483647
    Default: 20.
20. **dayrtredfc10gevcg**
    24h reset threshold for EDFC of 10GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 50.

Spec block parameters- profile parameters of type LOVC

1. **qhvcbbevc12**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC12 bin.
   Type: Integer.
   Range: 0-1799100
   Default: 9000.
2. **dayvcbbevc12**
   Day threshold for VC_N_BBE and VC_F_BBE for VC12 bin.
   Type: Integer.
   Range: 0-172713600
   Default: 12000.

3. **qhvcbbelovc3**
   15-minute threshold for VC_N_BBE and VC_F_BBE for lower order VC3 bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
4. **dayvcbbelovc3**
   Day threshold for VC_N_BBE and VC_F_BBE for lower order VC3 bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.
5. **qhvcesvc12**
   15-minute threshold for VC_N_ES and VC_F_ES for VC12 bin.
   Type: Integer.
   Range: 0-900
   Default: 120.
6. **dayvcesvc12**
   Day threshold for VC_N_ES and VC_F_ES for VC12 bin.
   Type: Integer.
   Range: 0-86400
   Default: 350.
7. **qhvceslovc3**
   15-minute threshold for VC_N_ES and VC_F_ES for lower order VC3 bin.
   Type: Integer.
   Range: 0-900
   Default: 150.
8. **dayvceslovc3**
   Day threshold for VC_N_ES and VC_F_ES for lower order VC3 bin.
   Type: Integer.
   Range: 0-86400
   Default: 600.
9. **qhvcsesvc12**
   15-minute threshold for VC_N_SES and VC_F_SES for VC12 bin.
   Type: Integer.
   Range: 0-810
   Default: 15.
10. **dayvcsesvc12**
    Day threshold for VC_N_SES and VC_F_SES for VC12 bin.
    Type: Integer.
    Range: 0-77760
    Default: 20.

11. **`qhvcseslovc3`**
    15-minute threshold for VC_N_SES and VC_F_SES for lower order VC3 bin.
    Type: Integer.
    Range: 0-810
    Default: 15.
12. **`dayvcseslovc3`**
    Day threshold for VC_N_SES and VC_F_SES for lower order VC3 bin.
    Type: Integer.
    Range: 0-77760
    Default: 20.
13. **`qhvcuasvc12`**
    15-minute threshold for VC_N_UAS and VC_F_UAS for VC12 bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
14. **`dayvcuasvc12`**
    Day threshold for VC_N_UAS and VC_F_UAS for VC12 bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.
15. **`qhvcuaslovc3`**
    15-minute threshold for VC_N_UAS and VC_F_UAS for lower order VC3 bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
16. **`dayvcuaslovc3`**
    Day threshold for VC_N_UAS and VC_F_UAS for lower order VC3 bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.

Spec block parameters- reset profile parameters of type LOVC

1. **`qhrtrvcbbevc12`**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC12 bin.
   Type: Integer.
   Range: 0-1799100
   Default: 50.
2. **`dayrtrvcbbevc12`**
   Day reset threshold for VC_N_BBE and VC_F_BBE for VC12 bin.
   Type: Integer.
   Range: 0-172713600
   Default: 1200.

3. **`qhrtrvcbbelovc3`**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for lower order VC3 bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
4. **`dayrtrvcbbelovc3`**
   Day reset threshold for VC_N_BBE and VC_F_BBE for lower order VC3 bin.
   Type: Integer.
   Range: 0-691113600
   Default: 4800.
5. **`qhrtrvcesvc12`**
   15-minute reset threshold for VC_N_ES and VC_F_ES for VC12 bin.
   Type: Integer.
   Range: 0-900
   Default: 5.
6. **`dayrtrvcesvc12`**
   Day reset threshold for VC_N_ES and VC_F_ES for VC12 bin.
   Type: Integer.
   Range: 0-86400
   Default: 35.
7. **`qhrtrvceslovc3`**
   15-minute reset threshold for VC_N_ES and VC_F_ES for lower order VC3 bin.
   Type: Integer.
   Range: 0-900
   Default: 10.
8. **`dayrtrvceslovc3`**
   Day reset threshold for VC_N_ES and VC_F_ES for lower order VC3 bin.
   Type: Integer.
   Range: 0-86400
   Default: 60.
9. **`qhrtrvcsesvc12`**
   15-minute reset threshold for VC_N_SES and VC_F_SES for VC12 bin.
   Type: Integer.
   Range: 0-810
   Default: 0.
10. **`dayrtrvcsesvc12`**
    Day reset threshold for VC_N_SES and VC_F_SES for VC12 bin.
    Type: Integer.
    Range: 0-77760
    Default: 0.

11. **qhrtrvcseslovc3**
    15-minute reset threshold for VC_N_SES and VC_F_SES for lower order VC3 bin.
    Type: Integer.
    Range: 0-810
    Default: 0.
12. **dayrtrvcseslovc3**
    Day reset threshold for VC_N_SES and VC_F_SES for lower order VC3 bin.
    Type: Integer.
    Range: 0-77760
    Default: 0.
13. **qhrtrvcuasvc12**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC12 bin.
    Type: Integer.
    Range: 0-900
    Default: 0.
14. **dayrtrvcuasvc12**
    Day reset threshold for VC_N_UAS and VC_F_UAS for VC12 bin.
    Type: Integer.
    Range: 0-86400
    Default: 0.
15. **qhrtrvcuaslovc3**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for lower order VC3 bin.
    Type: Integer.
    Range: 0-900
    Default: 0.
16. **dayrtrvcuaslovc3**
    Day reset threshold for VC_N_UAS and VC_F_UAS for lower order VC3 bin.
    Type: Integer.
    Range: 0-86400
    Default: 0.

Spec block parameters.- Profile Parameters of Type LOPATH

1. **qhcvvt1**
   15-minute threshold for CV-P and CV-PFE bin for VT1.
   Type: Integer.
   Range: 0-14399100
   Default: 75.
2. **daycvvt1**
   Day threshold for CV-P and CV-PFE bin for VT1.
   Type: Integer.
   Range: 0-1382313600
   Default: 750.

3. **qhesvt1**
   15-minute threshold for ES-P and ES-PFE bin for VT1.
   Type: Integer.
   Range: 0-900
   Default: 40.
4. **dayesvt1**
   Day threshold for ES-P and ES-PFE bin for VT1.
   Type: Integer.
   Range: 0-86400
   Default: 900.
5. **qhsesvt1**
   15-minute threshold for SES-P and SES-PFE bin for VT1.
   Type: Integer.
   Range: 0-810
   Default: 40.
6. **daysesvt1**
   Day threshold for SES-P and SES-PFE bin for VT1.
   Type: Integer.
   Range: 0-77760
   Default: 900.
7. **qhuasvt1**
   15-minute threshold for UAS-P and UAS-PFE bin for VT1.
   Type: Integer.
   Range: 0-900
   Default: 40.
8. **dayuasvt1**
   Day threshold for UAS-P and UAS-PFE bin for VT1.
   Type: Integer.
   Range: 0-86400
   Default: 900.

Spec block parameters - profile parameters of type DS3

1. **qhcvl**
   15-minute threshold for CV-L bin of DS3 Line.
   Type: Integer.
   Range: 0-7200000
   Default: 387.
2. **daycvl**
   Day threshold for CV-L bin of DS3 Line.
   Type: Integer.
   Range: 0- 691200000
   Default: 3865.

3. **`qhesl`**
   15-minute threshold for Es-L bin of DS3 Line.
   Type: Integer.
   Range: 0-900
   Default: 25.
4. **`dayesl`**
   Day threshold for ES-L bin of DS3 Line.
   Type: Integer.
   Range: 0-86400
   Default: 250.
5. **`qhesal`**
   15-minute threshold for ESA-L bin of DS3 Line.
   Type: Integer.
   Range: 0-900
   Default: 25.
6. **`dayesal`**
   Day threshold for ESB-L bin of DS3 Line.
   Type: Integer.
   Range: 0-86400
   Default: 250.
7. **`qhesbl`**
   15-minute threshold for ESB-L bin of DS3 Line.
   Type: Integer.
   Range: 0-900
   Default: 25.
8. **`dayesbl`**
   Day threshold for ESB-L bin of DS3 Line.
   Type: Integer.
   Range: 0-86400
   Default: 250.
9. **`qhsesl`**
   15-minute threshold for SES-L bin of DS3 Line.
   Type: Integer.
   Range: 0-810
   Default: 4.
10. **`daysesl`**
    Day threshold for SES-L bin of DS3 Line.
    Type: Integer.
    Range: 0-77760
    Default: 40.

11. **qhcvp**
    15-minute threshold for CV-P and CV-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-7200000
    Default: 382.
12. **daycvp**
    Day threshold for CV-P and CV-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-691200000
    Default: 3820.
13. **qhesp**
    15-minute threshold for ES-P and ES-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-900
    Default: 25.
14. **dayesp**
    Day threshold for ES-P and ES-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 250.
15. **qhesap**
    15-minute threshold for ESA-P and ESA-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-900
    Default: 25.
16. **dayesap**
    Day threshold for ESA-P and ESA-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 250.
17. **qhesbp**
    15-minute threshold for ESB-P and ESB-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-900
    Default: 25.

18. **dayesbp**
    Day threshold for ESB-P and ESB-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 250.
19. **qhsesp**
    15-minute threshold for SES-P and SES-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-810
    Default: 4.
20. **daysesp**
    Day threshold for SES-P and SES-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-77760
    Default: 40.
21. **qhuasp**
    15-minute threshold for UAS-P and UAS-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-900
    Default: 10.
22. **dayuasp**
    Day threshold for UAS-P and UAS-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 10.
23. **qhsasp**
    15-minute threshold for SAS-P and SAS-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-900
    Default: 2.
24. **daysasp**
    Day threshold for SAS-P and SAS-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 8.

Example output

The following example reports the creation of the TCA profile DTAG:

```
LT-UNITE 00-11-03 15:00:00
A  000 REPT DBCHG
   ”TIME=15-00-00,DATE=00-11-03:ENT-TCA-PROF::RS-MS,DTAG:
qhrsnes=10,qhrsnbbe=6”
;
```

ENT-TMAT3 notification

Output format

Command syntax: **ENT-TMAT3**:*aid*::*spec_block*;

Output parameters

Command parameters

1. **aid** – Access Identifier of a TransMUX asynchronous adjunct port.
Type: AID
Range: TMuxAPortAID
The keyword **all** is allowed up to shelf level.
Default: None.

Spec block parameters

1. **ds3pn** – DS3 ASAP
DS3 Alarm Severity Assignment Profile. This parameter retrieves the ASAP profile name of type DS3 to which the designated AID points.
Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
Range: String with a maximum of 24 characters.
Default: DEFAULT.
2. **fmt** – Signal Format
This parameter shows the format for the DS3 signal
Type: Alphanumeric value set. A hyphen (“-”) is allowed in the name additionally.
Range:
   - C-BIT: C-bit parity channelized DS3 format
   - M23: M23 channelized DS3 format. M23 format contains seven DS2 signals, which contain DS1 signals.

   Default: C-BIT.
3. **outfepm** – Outgoing DS3 Far End Path PM Enable
This parameter enables/disables the outgoing DS3 far end path performance monitoring.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE.
Default: DISABLE.
4. **outpm** – Outgoing DS3 Near End Path PM Enable
This parameter enables/disables the outgoing DS3 near end path performance monitoring.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE.
Default: DISABLE.

5. **`pmode`** – Port Mode
   This parameter sets the mode of the port.
   Type: Alphanumeric value set.
   Range:
   - MON indicates that alarm monitoring is taking place on the port.
   - NMON means that alarm monitoring is not occurring on the port.
   Default: NMON.
6. **`servcond`** – Service Condition
   This parameter indicates its status concerning service involvement.
   Type: Alphanumeric value set.
   Range:
   - INSERVICE: Provisioning values for service are accepted
   - OUTOFSERVICE: Provisioning values for service are not accepted.
   Default: INSERVICE.
7. **`tca`** – DS3 PM TCA
   This parameter assigns a DS3 PM TCA profile name to the designated AID.
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: String with a maximum of 24 characters.
   - DEFAULT
   - DEFAULT0
   Default: DEFAULT0.

Example input/output

```
   UNITE-NE 00-11-28 08:00:30
A  001 REPT DBCHG
   ″TIME=08-00-12,DATE=00-11-28:ENT-TMAT3:1-1-#-#-21-tma1:: eif=DS3,fmt=C-
      BIT,....,vmr=NO-VM ″
;
```

ENT-TMST3 notification

Output format

Command syntax: **`ENT-TMST3`**:*aid*::*spec_block*;

Output parameters

Command parameters

1. **`aid`** – Access Identifier of a TransMUX virtual synchronous adjunct port.
   Type: AID
   Range: TMuxSPortAID
   The keyword **`all`** is allowed up to shelf level.
   Default: None.

Example input/output

```
   UNITE-NE 00-11-28 08:00:30
A  001 REPT DBCHG
   "TIME=08-00-12,DATE=00-11-28:ENT-TMST3:1-1-#-#-21-tms1"
;
```

ENT-ULS: Enter upper layer stack

The **ENT-ULS** command is used to provision parameters of the TCP/IP stack.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S4

Priority: 1

Abortable: No.

Input format

Command syntax: **ENT-ULS**:*tid::ctag:::spec_block;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition of tid in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **ctag** – Correlation Tag
   See definition of ctag in "RTRV-HDR: Retrieve header" (p. 3-2417).

Spec block parameters

1. **ip_ad_astn** – IP Address of ASTN
   This parameter is used to set the router ID for the SCN and the SNN node.
   Note: The provisioning of this IP address is ONLY ALLOWED ONCE.
   Type: Four dot separated numeric strings.
   Range:
   - For first numeric string: 0 .. 223
   - For second to fourth numeric string: 0 .. 255.

   The values 0.0.0.0 and 1.1.1.1 are not allowed.
2. **ip_ad_uni** – IP address for UNI
   This parameter is used to set the UNI node IP address.
   Type: Four dot separated numeric strings.
   Range:
   - For first numeric string: 0 .. 223
   - For second to fourth numeric string: 0 .. 255.
3. **sigPCIP_Address** – IP address for Signaling Controller (E-NNI node)
   This parameter is used to set the signaling controller IP address (E-NNI node address).
   Type: Four dot separated numeric strings.

Range:

- For first numeric string: 0 .. 223
- For second to fourth numeric string: 0 .. 255.

The values 0.0.0.0, 1.1.1.1 and 127.0.0.1 are not allowed.

4. **sigPCID** – Identifier of the Signaling Controller (E-NNI node)
   This parameter is used to set the signaling controller identifier.
   Type: Four dot separated numeric strings.
   Range: Four times numeric string: 0 .. 255
5. **ip_drad** – IP Default Router Address
   This parameter is used to set or retrieve the IP default router address (IPv4) to which the host points to, needed for the T-TD functionality.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
6. **ip_drlan** – IP Default Router LAN port AID
   This parameter specifies with which LAN port the default router is associated.
   Type: AID.
   Range: LanPortAID. The value lanall is not allowed.
   Default: 1-1-lan1.
7. **lv_port** – T-TD Length Value Port
   This parameter is used to set or retrieve the port number over which the T-TD function is accessible using the Length Value encoding method.
   Type: Numeric string.
   Range: Each numeric string: 0 .. 65535, except the value 3083.
   Default: 3081.
8. **raw_port** – T-TD Raw Mode Port
   This parameter is used to set or retrieve the port AID of number over which the T-TD function is accessible using raw-mode encoding.
   Type: Numeric string.
   Range: Each numeric string: 0 .. 65535, except the value 3083.
   Default: 3082.

Output format

If the ENT-ULS request is successful, the following normal completion message is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The command setsthe parameters as specified for the input spec_block parameters.

Reset: Modification of any of the parameters *ip_ad_astn*, *lv_port*, *raw_port* leads to a reset of the DCF controller and disconnection of management communications.

Implicit UNI node creation

Setting the parameter *ip_ad_uni* away from the default value creates the UNI node.

Implicit E-NNI node creation

Setting the parameter *sigPCIP_Address* away from the default value creates the E-NNI node. There is no implicit or explicit command to delete an E-NNI node.

Example input/output

The following example shows the result of an ENT-ULS command, which modifies the port number used for T-TD length value encoding:

```
ENT-ULS:LT-UNITE::123456:::lv_port=7777;
   LT-UNITE 00-11-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **ENT-ULS** command.

Validation rule: no TCP port number change with enabled T-TD function

T-TD related port numbers cannot be changed as long as T-TD function is enabled.

Error code:

`SNVS – Status, Not in Valid State, port numbers cannot be changed when T-TD is enabled`

Validation rule: check for correct IP configuration

The **ENT-ULS** command is only allowed if there is already a valid IP configuration (ip_ad – IP address of LAN, ip_snm – subnet mask of LAN) provisioned for the LAN port specified by ip_drlan.

Error code: `SNVS – Status, Not in Valid State, incomplete IP configuration`

Validation rule: check for correct configured Default Router LAN Port

The system do not allow to change the default router address (ip_drad) as long as there is no default router LAN port (ip_drlan) specified which has a valid IP Address (ip_ad) and IP Subnet Mask (ip_snm) configured.

Furtheron the LAN must be enabled, i.e. ip_lanstat=ENABLE and lanstat=ENABLE.

Error code:
`SNVS – Status, Not in Valid State, default router LAN port not configured`

Validation rule: check for correct OSI node configuration

The system shall not allow to set *ip_drlan* (IP Default Router LAN) as long as this LAN port is not assigned to OSI node 1(see ENT-FECOM-LAN).

Error code: `SNVS – Status, Not in Valid State, wrong IP configuration`

Validation rule: check that *raw_port* and *lv_port* are unequal

The **`ENT-ULS`** command is refused, if the two port parameters *raw_port* and *lv_port* are set to equal values.

Error code:
`IDNC – Input, Data Not Consistent, raw_port and lv_port must be unequal`

Validation rule: check of the maintenance condition

System must be in MCOND for change of *ip_ad_astn*.

Error code:
`SNVS – Status, Not in Valid State, Not in maintenance condition`

Validation rule: check of *xcsetup* for *ip_ad_astn* change

On a change of *ip_ad_astn* the system shall check that *xcsetup* = TRADITIONAL.

Error code: `SNVS – Status, Not in Valid State, xcsetup must be TRADITIONAL`

Validation rule: check of the maintenance condition for UNI IP address change

System must be in MCOND for change of *ip_ad_uni*.

Error code:
`SNVS – Status, Not in Valid State, Not in maintenance condition`

Validation rule: check of the maintenance condition for SC IP address and/or SC ID change.

System must be in MCOND for change of *sigPCIP_Address* and/or *sigPCID*.

Error code:
`SNVS – Status, Not in Valid State, Not in maintenance condition`

Validation rule: *sigPCIP_Address* and *sigPCID* must be supplied together.

The command is rejected if *sigPCIP_Address* is supplied, but *sigPCID* is not. It shall also be rejected if *sigPCID* is supplied, but *sigPCIP_Address* is not.

Error code:
`IDNC – Input, Data Not Consistent, sigPCIP_Address and sigPCID must be supplied together`

Validation rule: UNI IP address, SC IP Address and SCN IP address must be different.

The command is rejected if any two of *ip_ad_uni*, *sigPCIP_Address*, and *ip_ad_astn* have identical values.

Error code:

`IDNC – Input, Data Not Consistent, UNI IP address, sigPCIP address, and ASTN IP address must not be equal`

Validation rule: SC IP Address and RC IP address must be different

The command is rejected if *sigPCIP_Address* and *RoutingControlIPAddr* in **`ACT-L1ROUTING`** have identical values.

Error code:

`IDNC – Input, Data Not Consistent, sigPCIP address and RC IP address must not be equal`

ENT-ULS notification

Output format

The **ENT-ULS** notification has the following specific syntax:

ENT-ULS:::*spec_block*

The output parameters *sid*, *date*, *time*, and *ctag* are described in the REPT DBCHG notification.

Output parameters

1. **ip_ad_astn** – IP Address of ASTN
   This parameter is used to set the router ID for the SCN and the SNN node.
   Note: The provisioning of this IP address is ONLY ALLOWED ONCE.
   Type: Four dot separated numeric strings.
   Range:
   - For first numeric string: 0 .. 223
   - For second to fourth numeric string: 0 .. 255.

   The values 0.0.0.0 and 1.1.1.1 are not allowed.
2. **ip_ad_uni** – IP address for UNI
   This parameter is used to set the UNI node IP address.
   Type: Four dot separated numeric strings.
   Range:
   - For first numeric string: 0 .. 223
   - For second to fourth numeric string: 0 .. 255.
3. **sigPCIP_Address** – IP address for Signaling Controller (E-NNI node)
   This parameter is used to set the signaling controller IP address (E-NNI node address).
   Type: Four dot separated numeric strings.
   Range:
   - For first numeric string: 0 .. 223
   - For second to fourth numeric string: 0 .. 255.

   The values 0.0.0.0, 1.1.1.1 and 127.0.0.1 are not allowed.
4. **sigPCID** – Identifier of the Signaling Controller (E-NNI node)
   This parameter is used to set the signaling controller identifier.
   Type: Four dot separated numeric strings.
   Range: Four times numeric string: 0 .. 255
5. **ip_drad** – IP Default Router Address
   This parameter is used to set or retrieve the IP default router address (IPv4) to which the host points to, needed for the T-TD functionality.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.

6. **`ip_drlan`** – IP Default Router LAN port AID
   This parameter specifies with which LAN port the default router is associated.
   Type: AID.
   Range: LanPortAID. The value lanall is not allowed.
   Default: 1-1-lan1.
7. **`lv_port`** – T-TD Length Value Port
   This parameter is used to set or retrieve the port number over which the T-TD function is accessible using the Length Value encoding method.
   Type: Numeric string.
   Range: Each numeric string: 0 .. 65535, except the value 3083.
   Default: 3081.
8. **`raw_port`** – T-TD Raw Mode Port
   This parameter is used to set or retrieve the port AID of number over which the T-TD function is accessible using raw-mode encoding.
   Type: Numeric string.
   Range: Each numeric string: 0 .. 65535, except the value 3083.
   Default: 3082.

Example output

The following is an example ENT-ULS notification in case the lv_port parameter was changed:

```
   LT-UNITE 00-11-01 15:00:00
A  000 REPT DBCHG
   ″TIME=15-00-00,DATE=00-11-03:ENT-ULS:::lv_port=7777″
;
```

ENT-ULSDCC-L3: Create a further OSI node

The command **ENT-ULSDCC-L3** is used to create a new OSI node. Up to 8 independent OSI instances can exist in a NE: Node-1 has a NSAP and the nodes 2-8 have each a Network Entity Title (NET). NSAP = NET + SEL Node-1 with AID osinode1 is created by start up of the UNITE NE as default. Node 2-8 can be created and configured with this command by entering an osinode AID which is not used until now, a NET area address and an IS-IS Level. Parameter in the SYSTEM field of the NET are predefined. Further parameter for configuration can be set like IS domain, RA prefix and RA destination node.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S4

Priority: 1

Abortable: No.

Input format

Command syntax: **ENT-ULSDCC-L3**:*tid*::*ctag*::*osinode*:*spec_block*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for input parameter syntax and description of this parameter.
3. **osinode**
   A 1675 LambdaUnite MSS NE can have up to 8 instances of the OSI stack. Node-1 (osinode1) is default. Node 2-8 (osinode{2-8}) can be created and configured.
   Type: AID.
   Range: osinode{2-8}.

Spec block parameters

1. **l3afi** – NSAP/NET Authority and Format Identifier
   This parameter sets or retrieves the format for the rest of the address.
   Type: Hexadecimal number.
   Range: 10 – 99
   Default: 39. This value identifies the iso_dcc format.
2. **l3idi** – NSAP/NET initial Domain Identifier

This parameter consists of two values:

- a 3 semi-octet (3-digit hexadecimal) IDI part to specify the country code indicating the registration authority responsible for the allocation and assignment of the NSAP address.
- a 1 semi-octet (1-digit hexadecimal) IDI pad part. The parameter is used for set and retrieve values.

Type: Hexadecimal number.
Range: 0000 – FFFF
Default:
SONET: IDI = 840; IDI pad = F
SDH: IDI = 000; IDI pad = 0.

3. **`l3dfi`** – NSAP/NET DSP Format Identifier
This parameter (2-digit hex) NSAP is used to set or retrieve the format for the rest of the address.
Type: Hexadecimal number.
Range: 00 – FF.
Default: 80. This value represents the SONET DSP format.
4. **`l3org`** – NSAP/NET Organization Identifier
This parameter of NSAP is used to set or retrieve the NSP (allocated Company Code).
Type: Hexadecimal number.
Range: 000000 – FFFFFF.
Default: 000000.
5. **`l3res`** – NSAP/NET Reserved
This NSAP part currently has not been assigned a specific purpose.
Type: Hexadecimal number.
Range: 0000 – FFFF.
Default: 0000.
6. **`l3rd`** – NSAP/NET Routing Domain
This parameter of NSAP is used to set or retrieve a unique routing domain within an administrative domain. A standard for use has not been defined until now.
Type: Hexadecimal number.
Range: 0000 – FFFF.
Default: 0000.
7. **`l3area`** – NSAP/NET Area Identifier
This parameter of NSAP is used to set or retrieve the area. So NEs can be identified in the same area.
Type: Hexadecimal number.
Range: 0000 – FFFF.
Default: 0000.

8. **l3isisnl** – Layer 3 IS Level
   This parameter indicates the network router type: ES-IS (level1, value L1), IS-IS (level2, value L2) and partition repair capability (value3).
   Note: This parameter is not reported when output parameter *osinode* = scnnode.
   Type: Alphanumeric string.
   Range:
   - L1: this means level1, IS-IS, only allowed when parameter l3radesnode=0
   - L12: this means level2, IS-IS which contains also level1, ES-IS
   - L12PRC : this means partition repair capable (PRC) and contains also level1 and level2.

   Default: L1.
9. **l3domain** – Layer3 IS Domain
   Per node in a NE, a domain group must be specified. This will be done with this parameter which can be set and retrieved. All nodes in the NE with the same domain-number are interconnected and can communicate without the need for inter-domain routing via RA-PREFIX.
   Note: This parameter is not reported when output parameter *osinode* = scnnode.
   Type: Alphanumeric string.
   Range:
   - 1 for osinode1
   - 1 – 2 for osinode2 to osinode8.

   Default: 1.
10. **l3raprefix** – Layer3 Reachable Address Prefix
   This value specifies an area address or a part of an area address representing an area address group. This parameter is needed when nodes in different routing domains (see *l3domain*) must communicate. The node must forward then CLNP PDUs to the RA-Destination-Node if the destination NSAPs of CLNP PDUs match with the PA-Prefix.
   Note: This parameter is not reported when output parameter *osinode* = scnnode.
   Type: Hexadecimal number.
   Range:
   - NONE,
   - a string of 1 to 13 bytes: first byte (most significant): 10 – 99; rest: 0000 – FFFF.

   The value represents an area address or a part of an area address beginning with AFI.
   Default: empty string.

11. **l3radesnode** – Layer3 Reachable Address Destination Node
    This parameter is in combination with parameter l3raprefix necessary. The value represents the destination node in the same NE. An internal connection over a domain-boundary is established between this node and the RA-Destination-Node, with IS-IS disabled over that connection.
    Note: This parameter is not reported when output parameter *osinode* = scnnode.
    Type: AID and digit value.
    Range:
    - 0, osinode{2-8} for osinode1
    - 0, osinode1 for osinode2 to osinode 8.
    Value 0 indicates that functionality of RA-Prefix is disabled.
    Default: 0.
12. **nsapthlev** – Number of OSI Nodes Threshold Level
    This parameter indicates the NSAP count threshold level for monitoring the number of OSI nodes (NSAPs) for the level 1 area in which the OSI node specified by the *osinode* parameter is located. A threshold value of zero (0) indicates that NSAP threshold alarming is disabled. The parameter is omitted for the SCN node.
    Type: Numeric string.
    Range: 0 no alarming; 1 – 250threshold alarming
    Default: 0

Output format

If the **ENT-ULSDCC-L3** is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The command creates a new OSI node as specified in the command line. The command leads to a reset of the DCF controller and disconnection of management communication. The update is reported by means of **ENT-ULSDCC-L3** notification.

Example input/output

The following example shows the result of **ENT-ULSDCC-L3**:

```
ENT-ULSDCC-L3:NE-
      UNITE::4744843::osinode8:l3afi=39,l3idi=840F,l3dfi=80,l3org=100100,l3res=0000,l3rd=0020,l
```

```
   NE-UNITE 01-01-15 11:59:02
M  4744843 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **ENT-ULSDCC-L3** command.

Validation rule: OSI Node is already created

If the command is used with a value for parameter osinode which is already used for a creation of a OSI node, the command is rejected. This means the operation is rejected when the node ID is already in the created state.

Error code: `IEAE – Input, Entity Already Exists, osinode`

Validation rule: Address area value – RA-Prefix value

If a new RA-Prefix matches with the concerning part of the new area address the provisioning of the new NSAP area address must be rejected.

Error code:
`IDNV – Input, Data Not Valid, NSAP Area Address matches with RA-Prefix`

Validation rule: RA-prefix value – Address area value

If a RA-Prefix will be initiated and the value matches with the concerning part of the NSAP Area Address of this node the command must be rejected. The prefix should be specific enough, so that it matches not with NSAPs in both domains.

Error code:
`IDNV – Input, Data Not Valid, RA-Prefix matches with the NSAP Area Address`

Validation rule: *l3radesnode* value must be different from osinode

The command will be rejected when parameter *l3radesnode* is equal to the *osinode* parameter of the node.

Error code: `IDNV – Input, Data Not Valid, equal node IDs`

Validation rule: *l3radesnode* must be in the created state

If the destination node (*l3radesnode* parameter) is not in the created state, the command must be rejected.

Error code:
`SNVS – Status, Not in Valid State, l3radesnode not in created state`

Validation rule: consistency of *l3radesnode* with *l3raprefix*

If the value for the RA Destination Node (l3radesnode parameter) is equal to 0 while the value of the RA Prefix (l3raprefix parameter) is not NONE the command must be rejected.

Error code:

`IDNV – Input, Data Not Valid, l3prefix and l3radesnode inconsistent`

Validation rule: *l3radesnode* value and *l3isisnl* value

The l3isisnl parameter value L1 (Level1) is only allowed when the entered l3radesnode=0

Error code: `IDNV – Input, Data Not Valid, constraint l3radesnode`

Validation rule: only one single node in a separate domain supported

The command is rejected when l3domain has an other value than 1 and there is already an other osinode which has a value other than 1 for l3domain.

Error code:

`IDNV – Input, Data Not Valid, only a single node in separate domain supported`

Validation rule: consistency *l3domain* with *l3radesnode* for nodes 2 to 8

The command is rejected when l3domain for osinode2 to osinode8 has a value of 1 and l3radesnode is not equal to 0.

Error code:

`IDNV – Input, Data Not Valid, inconsistency l3domain with l3radesnode`

ENT-ULSDCC-L3 notification

The command **ENT-ULSDCC-L3** effects a communication SW-reset (protocol stack) and the management connection is lost. Therefore it cannot be guaranteed that a notification could be returned as described below.

Output format

The ENT-ULSDCC-L3 notification has the following specific syntax:

ENT-ULSDCC-L3*::osinode:spec_block*

Output parameters

Command parameters

1. **osinode**
   A 1675 LambdaUnite MSS NE can have up to 8 instances of the OSI stack. Node-1 (osinode1) is default. Node 2-8 (osinode{2-8}) can be created and configured.
   Type: AID.
   Range: osinode{1-8}.

Spec block parameters

1. **l3afi** – NSAP/NET Authority and Format Identifier
   This parameter sets or retrieves the format for the rest of the address.
   Type: Hexadecimal number.
   Range: 10 – 99
   Default: 39. This value identifies the iso_dcc format.
2. **l3idi** – NSAP/NET initial Domain Identifier
   This parameter consists of two values:
   - a 3 semi-octet (3-digit hexadecimal) IDI part to specify the country code indicating the registration authority responsible for the allocation and assignment of the NSAP address.
   - a 1 semi-octet (1-digit hexadecimal) IDI pad part. The parameter is used for set and retrieve values.

   Type: Hexadecimal number.
   Range: 0000 – FFFF
   Default:
   SONET: IDI = 840; IDI pad = F
   SDH: IDI = 000; IDI pad = 0.
3. **l3dfi** – NSAP/NET DSP Format Identifier
   This parameter (2-digit hex) NSAP is used to set or retrieve the format for the rest of the address.
   Type: Hexadecimal number.
   Range: 00 – FF.
   Default: 80. This value represents the SONET DSP format.

4. **`l3org`** – NSAP/NET Organization Identifier
   This parameter of NSAP is used to set or retrieve the NSP (allocated Company Code).
   Type: Hexadecimal number.
   Range: 000000 – FFFFFF.
   Default: 000000.
5. **`l3res`** – NSAP/NET Reserved
   This NSAP part currently has not been assigned a specific purpose.
   Type: Hexadecimal number.
   Range: 0000 – FFFF.
   Default: 0000.
6. **`l3rd`** – NSAP/NET Routing Domain
   This parameter of NSAP is used to set or retrieve a unique routing domain within an administrative domain. A standard for use has not been defined until now.
   Type: Hexadecimal number.
   Range: 0000 – FFFF.
   Default: 0000.
7. **`l3area`** – NSAP/NET Area Identifier
   This parameter of NSAP is used to set or retrieve the area. So NEs can be identified in the same area.
   Type: Hexadecimal number.
   Range: 0000 – FFFF.
   Default: 0000.
8. **`l3isisnl`** – Layer 3 IS Level
   This parameter indicates the network router type: ES-IS (level1, value L1), IS-IS (level2, value L2) and partition repair capability (value3).
   Note: This parameter is not reported when output parameter *osinode* = scnnode.
   Type: Alphanumeric string.
   Range:
   - L1: this means level1, IS-IS, only allowed when parameter l3radesnode=0
   - L12: this means level2, IS-IS which contains also level1, ES-IS
   - L12PRC : this means partition repair capable (PRC) and contains also level1 and level2.

   Default: L1.
9. **`l3domain`** – Layer3 IS Domain
   Per node in a NE, a domain group must be specified. This will be done with this parameter which can be set and retrieved. All nodes in the NE with the same domain-number are interconnected and can communicate without the need for inter-domain routing via RA-PREFIX.
   Note: This parameter is not reported when output parameter *osinode* = scnnode.
   Type: Alphanumeric string.

Range:

- 1 for osinode1
- 1 – 2 for osinode2 to osinode8.

Default: 1.

10. **l3raprefix** – Layer3 Reachable Address Prefix
    This value specifies an area address or a part of an area address representing an area address group. This parameter is needed when nodes in different routing domains (see *l3domain*) must communicate. The node must forward then CLNP PDUs to the RA-Destination-Node if the destination NSAPs of CLNP PDUs match with the PA-Prefix.
    Note: This parameter is not reported when output parameter *osinode* = scnnode.
    Type: Hexadecimal number.
    Range:
    - NONE,
    - a string of 1 to 13 bytes: first byte (most significant): 10 – 99; rest: 0000 – FFFF.

    The value represents an area address or a part of an area address beginning with AFI.
    Default: empty string.
11. **l3radesnode** – Layer3 Reachable Address Destination Node
    This parameter is in combination with parameter l3raprefix necessary. The value represents the destination node in the same NE. An internal connection over a domain-boundary is established between this node and the RA-Destination-Node, with IS-IS disabled over that connection.
    Note: This parameter is not reported when output parameter *osinode* = scnnode.
    Type: AID and digit value.
    Range:
    - 0, osinode{2-8} for osinode1
    - 0, osinode1 for osinode2 to osinode 8.

    Value 0 indicates that functionality of RA-Prefix is disabled.
    Default: 0.
12. **nsapthlev** – Number of OSI Nodes Threshold Level
    This parameter indicates the NSAP count threshold level for monitoring the number of OSI nodes (NSAPs) for the level 1 area in which the OSI node specified by the *osinode* parameter is located. A threshold value of zero (0) indicates that NSAP threshold alarming is disabled. The parameter is omitted for the SCN node.
    Type: Numeric string.
    Range: 0 no alarming; 1 -250 threshold alarming
    Default: 0

Example output

```
   NE-UNITE 01-01-13 01:57:42
A  000 REPT DBCHG
”TIME=01-47-43,DATE=01-01-13:ENT-ULSDCC-L3::
osinode7:l3afi=39,l3idi=850F,l3dfi=80,l3org=100100,
l3res=0000,l3rd=0020,l3area=4711,l3isisnl=Ll2,
l3domain=2,l3raprefix=3984,l3radesnode=osinode1,
nsapthlev=0”
;
```

ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks

Among other Layer 4 covers the TARP functionality. The parameter of this command for 1675 LambdaUnite MSS NEs are only related to the TARP.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S4

Priority: 1

Abortable: No.

Input format

Command syntax: **ENT-ULSDCC-L4**:*tid*::*ctag*::*osinode*:[*spec_block*];

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for input parameter syntax and description of this parameter.
3. **osinode**
   A 1675 LambdaUnite MSS NE can have up to 8 instances of the OSI stack. Node-1 is created by start up of the 1675 LambdaUnite MSS NE as default. Node 2-8 can be created and configured.
   Type: AID.
   Range: osinode{1-8}.

Spec block parameters

1. **l4etdc** – TARP Data Cache
   This parameter is only valid for node-1. It is used to enable or disable TARP data cache.
   Type: Alphanumeric value set.
   Range: ENABLE (default), DISABLE.
2. **l4etof** – TARP origination
   This parameter only valid for node-1. It is used to enable or disable TARP Origination function and is valid for all interfaces of a node.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE.
   Default: ENABLE (for osinode1), DISABLE (for osinode2-8, fixed).

3. **l4etpf** – TARP propagation
   This parameter is used to enable or disable TARP Propagation function for a node.
   Type: Alphanumeric value set.
   Range:
   - ENABLE (default)
   - DISABLE.
4. **l4etrf** – TARP responder
   This parameter is only valid for node-1. It is used to enable or disable TARP responder function
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE.

   Default: For node-1: ENABLE DISABLE (fixed for nodes 2-8).
5. **l4ajafi** – TARP Man. Adjacency: NET Authority and Format Identifier
   This parameter of NSAP is used to set or retrieves the format for the rest of the address.
   Type: Hexadecimal number.
   Range: 10 – 99.
   Default: Value of authority and format identifier part of NET of node defined by parameter *osinode*.
6. **l4ajidi** – TARP Man. Adjacency: NET initial Domain Identifier
   This NSAP part consists two values:
   - a 3 semi-octet (3-digit hexadecimal) IDI part to specify the country code indicating the registration authority responsible for the allocation and assignment of the NSAP address.
   - a 1 semi-octet (1-digit hexadecimal) IDI pad part.

   The parameter is used for set and retrieve values.
   Type: Hexadecimal number.
   Range: 0000 – FFFF.
   Default: Value of initial domain identifier part of NET of node defined by parameter *osinode*.
7. **l4ajdfi** – TARP Man. Adjacency: NET DSP Format Identifier
   The purpose of this 1 octet (2-digit hex) NSAP part is to set or retrieve the format for the rest of the address.
   Type: Hexadecimal number.
   Range: 00 – FF.
   Default: Value of DSP format identifier part of NET of node defined by parameter *osinode*.

8. **l4ajorg** – TARP Man. Adjacency: NET Organization Identifier
   This parameter of NSAP is used to set or retrieve the NSP (allocated company code).
   Type: Hexadecimal number.
   Range: 000000 – FFFFFF.
   Default: Value of organization part of NET of node defined by parameter *osinode*.
9. **l4ajres** -TARP Man. Adjacency: NET Reserved
   This NSAP part currently has not been assigned a specific purpose.
   Type: Hexadecimal number.
   Range: 0000 – FFFF.
   Default: Value of reserved part of NET of node defined by parameter *osinode*.
10. **l4ajrd** – TARP Man. Adjacency: NET Routing Domain
    This parameter of NSAP is used to set or retrieve a unique routing domain within an administrative domain. A standard for use has not been defined until now.
    Type: Hexadecimal number.
    Range: 0000 – FFFF.
    Default: Value of routing domain part of NET of node defined by parameter *osinode*.
11. **l4ajarea** – TARP Man. Adjacency: NET Area Identifier
    This parameter of NSAP is used to set or retrieve the area. So NEs can be identified in the same area.
    Type: Hexadecimal number.
    Range: 0000 – FFFF.
    Default: Value of area part of NET of node defined by parameter *osinode*.
12. **l4ajsys** – TARP Man. Adjacency: NET System Identifier
    This system parameter of the NSAP is set by the Equipment Manufacturer. The value is fix and globally unique among all NEs. For values of NSAP/NET system parameter.
    Type: Hexadecimal number.
    Range: 000000000000 – FFFFFFFFFFFF.

Output format

If the **ENT-ULSDCC-L4** is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The command sets respectively modifies layer 4 parameter for a node as specified in the spec_block of the command line. Result should be an update of the OSI stack.

Modification of any of the parameters *l4etof*, *l4etpf*, *l4etrf* leads to a reset of the DCF controller and disconnection of management communication.

The update is reported by means of **`ENT-ULSDCC-L4`** notification.

Up to two TARP manual adjacencies are possible for each node in an 1675 LambdaUnite MSS NE. One manual adjacency is added with each command request.

In order to update/modify an already provisioned manual adjacency, the following command sequence must be applied:

1. delete the manual adjacency to be modified by means of **`DLT-ULSDCC-L4`**
2. add the manual adjacency with the new values by means of **`ENT-ULSDCC-L4`**.

The sequence of disabling and enabling the TARP Data Cache (l4etdc=DISABLE – l4etdc=ENABLE) shall flush the TDC. If remote NEs are accessed via a gateway NE using the T-TD function, remote NEs may not be reachable after NSAP changes at the remote NEs. In this case flushing of the TARP Data Cache at the gateway NE by disabling and enabling it can be used to reestablish the accessibility of remote NEs.

Example input/output

The following example shows the result of **`ENT-ULSDCC-L4`**:

```
ENT-ULSDCC-L4:NE-
      UNITE::4744843::osinode1:l4ajafi=39,l4ajidi=840F,l4ajdfi=80,l4ajorg=100100,l4ajres=0000,l

   NE-UNITE 01-01-18 10:09:52
M  4744843 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **`ENT-ULSDCC-L4`** command.

Validation rule: TARP origination only valid for node-1

The parameter *l4etof* can only be set to ENABLE for osinode1. When trying to ENABLE *l4etof* for osinode2-8 the command should be rejected.

Error code: `IDRG – Input, Data Range Error, osinode`

Validation rule: TARP responder only valid for node-1

The parameter *l4etrf* can only be set to ENABLE for osinode1. When trying to ENABLE *l4etrf* for osinode2-8 the command should be rejected.

Error code: `IDRG – Input, Data Range Error, osinode`

Validation rule: TARP data cache enabling only valid for node-1

The parameter *l4etdc* can only be set to ENABLE or DISABLE for osinode1. When trying to set *l4etdc* for osinode2-8 the command should be rejected.

Error code: `IDRG – Input, Data Range Error, osinode`

Validation rule: TARP data cache change only if TARP origination enabled

The parameter *l4etdc* can only be changed while the TARP origination function is enabled (l4etof=ENABLE).

Error code:
`SNVS – Status, Not in Valid State, TARP origination function disabled`

Validation rule: Not allowed to disable TARP when T-TD is enabled

The parameters *l4etof*, *l4etpf*, *l4etrf* for osinode1 can not be disabled when T-TD is enabled (see "ED-NE: Edit NE" (p. 3-442) *tl1tcpipgw*). The command should be rejected in this case.

Error code: `SNVS – Status, Not in Valid State, T-TD enabled`

Validation rule: Can't disable TARP propagation while LAN TARP storm suppression is enabled

If it is tried to set l4etpf=DISABLE while lantlss=ENABLE (see RTRV-FECOM-LAN) the command is denied.

Error code:
`INVS – Status, Not in Valid State, TARP propagation can not be disabled`

Validation rule: *l4ajsys* must be supplied

The parameter *l4ajsys* must be supplied when manual adjacencies are configured, i.e. when any of the other NET parameters *l4ajafi, l4ajidi, l4ajdfi, l4ajorg, l4ajrd, l4ajarea* is present, otherwise the command should be rejected.

Error code: `IDNC – Input, Data Not Consistent`

Validation rule: *l4ajsys* per osinode must be different

Each manual adjacency for one osinode must have a different value for the parameter *l4ajsys*, i.e. all pairs of *osinode*/*l4ajsys* must be unique in the system.

Error code: `IDNV – Input, Data Not Valid, l4ajsys/osinode not unique`

Validation rule: no more than two TARP manual adjacencies per node

In case two TARP manual adjacencies are already created for a node, the creation of a third TARP manual adjacency for that node is denied:

Error code: `SROF – Status, Requested Operation Failed`

Validation rule: Provisioning of TARP manual adjacencies only if TARP enabled

The system shall deny an attempt to provision a TARP manual djacency if the TARP Origination and the TARP Propagation functions are disabled.

Error code: `SROF – Status, Requested Operation Failed`

ENT-ULSDCC-L4 notification

Output format

Syntax: The **ENT-ULSDCC-L4** notification has the following specific syntax:

ENT-ULSDCC-L4::*osinode*:*spec_block*

Output parameters

Command parameters

1. **osinode**
   A 1675 LambdaUnite MSS NE can have up to 8 instances of the OSI stack.
   Node-1 is created by start up of the 1675 LambdaUnite MSS NE as default. Node 2-8 can be created and configured.
   Type: AID.
   Range: osinode{1-8}.

Spec block parameters

1. **l4etdc** – TARP Data Cache
   This parameter is only valid for node-1. It is used to enable or disable TARP data cache.
   Type: Alphanumeric value set.
   Range: ENABLE (default), DISABLE
2. **l4etof** – TARP origination
   This parameter only valid for node-1. It is used to enable or disable TARP Origination function and is valid for all interfaces of a node.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE.
   Default: ENABLE (for osinode1), DISABLE (for osinode2-8, fixed).
3. **l4etpf** – TARP propagation
   This parameter is used to enable or disable TARP Propagation function for a node.
   Type: Alphanumeric value set.
   Range:
   - ENABLE (default)
   - DISABLE.
4. **l4etrf** – TARP responder
   This parameter is only valid for node-1. It is used to enable or disable TARP responder function
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE.

   Default: For node-1: ENABLE DISABLE (fixed for nodes 2-8).

5. **l4ajafi** – TARP Man. Adjacency: NET Authority and Format Identifier
   This parameter of NSAP is used to set or retrieves the format for the rest of the address.
   Type: Hexadecimal number.
   Range: 10 – 99.
   Default: Value of authority and format identifier part of NET of node defined by parameter *osinode*.
6. **l4ajidi** – TARP Man. Adjacency: NET initial Domain Identifier
   This NSAP part consists two values:
   - a 3 semi-octet (3-digit hexadecimal) IDI part to specify the country code indicating the registration authority responsible for the allocation and assignment of the NSAP address.
   - a 1 semi-octet (1-digit hexadecimal) IDI pad part.

   The parameter is used for set and retrieve values.
   Type: Hexadecimal number.
   Range: 0000 – FFFF.
   Default: Value of initial domain identifier part of NET of node defined by parameter *osinode*.
7. **l4ajdfi** – TARP Man. Adjacency: NET DSP Format Identifier
   The purpose of this 1 octet (2-digit hex) NSAP part is to set or retrieve the format for the rest of the address.
   Type: Hexadecimal number.
   Range: 00 – FF.
   Default: Value of DSP format identifier part of NET of node defined by parameter *osinode*.
8. **l4ajorg** – TARP Man. Adjacency: NET Organization Identifier
   This parameter of NSAP is used to set or retrieve the NSP (allocated company code).
   Type: Hexadecimal number.
   Range: 000000 – FFFFFF.
   Default: Value of organization part of NET of node defined by parameter *osinode*.
9. **l4ajres** -TARP Man. Adjacency: NET Reserved
   This NSAP part currently has not been assigned a specific purpose.
   Type: Hexadecimal number.
   Range: 0000 – FFFF.
   Default: Value of reserved part of NET of node defined by parameter *osinode*.
10. **l4ajrd** – TARP Man. Adjacency: NET Routing Domain
   This parameter of NSAP is used to set or retrieve a unique routing domain within an administrative domain. A standard for use has not been defined until now.
   Type: Hexadecimal number.
   Range: 0000 – FFFF.
   Default: Value of routing domain part of NET of node defined by parameter *osinode*.

11. **`l4ajarea`** – TARP Man. Adjacency: NET Area Identifier
    This parameter of NSAP is used to set or retrieve the area. So NEs can be identified in the same area.
    Type: Hexadecimal number.
    Range: 0000 – FFFF.
    Default: Value of area part of NET of node defined by parameter *osinode*.
12. **`l4ajsys`** – TARP Man. Adjacency: NET System Identifier
    This system parameter of the NSAP is set by the Equipment Manufacturer. The value is fix and globally unique among all NEs. For values of NSAP/NET system parameter.
    Type: Hexadecimal number.
    Range: 000000000000 – FFFFFFFFFFFF.

Example output

```
   NE-UNITE 01-01-19 04:29:01
A  000 REPT DBCHG
   ”TIME=04-29-00,DATE=01-01-19:ENT-ULSDCC-
      L4::osinode1:l4etof=DISABLE,l4etpf=ENABLE,l4etrf=DISABLE,l4ajafi=39,l4ajidi=0,l4ajdfi=
;
```

ENT-USER-SECU: Enter user security

The **ENT-USER-SECU** command is used by an administrator to enter a new user and security parameters associated with that user.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S5

Priority: 1

Abortable: No.

Input format

Command syntax: **ENT-USER-SECU**:*tid*:*uid*:*ctag*::*pid*,,[*upc*]:[*spec_block*];

Input parameters

Note: The new setting becomes operational only after a new login.

Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **uid** – User ID
   This parameter specifies the new user ID (*uid*) name.
   Type: Alphanumeric string (case-sensitive)
   Range: 1 – 10 characters
   The *uid* ALL is not allowed in any combination of upper or lower cases.
3. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
4. **pid** – Password ID
   This parameter specifies the password ID for the *uid*.
   This required parameter is the confidential password authenticator for the given *uid*.
   Password strings are transmitted in non-encrypted form in the **ACT-USER** command; are encrypted when stored in the NE; and are never transmitted from the NE.
   Type: character string (case-sensitive)
   Range: 6 to 10 legal characters. Valid passwords consist of at least two

non-alphabetic characters with at least one special character. The special character can be one of the required non-alpha characters. For example, TEST1+ is a valid password. The first character of a password must be a letter.
Default: For the two superusers the default password is: UNITE+01 for User ID LUC01 and UNITE+02 for User ID LUC02. For other users: not applicable.

5. **upc** – User Privilege Code List
   This parameter specifies the user privilege code UCFC/UCAL pair assigned to a user. Multiple UCFC/UCALs can be specified using single ampersands ('&'). If a user tries to operate a command with a privilege code higher than assigned to the user for the category of the command the command will be denied.
   Type: Alphanumeric string; for concatenation "&" is also allowed.
   Range: P***i***, M***i***, T***i***, S***i***, PM***i***, D***i***, C***i***, where ***i*** is an integer ranging from 0 to 5, with ***i*** = 0 implying that there is no authorization for the functional category. S0 is not allowed.
   Default: P1&M1&T1&S1&PM1&C0 except for super users: P5&M5&T5&S5&PM5&C5.
   Note: The system does not support commands for the D (DEBUG) category. Setting this privilege code does not have any effect on the system behavior and it will not be visible in output direction. It is only for compatibility.
   See also "List of user privilege codes" (p. 15-1).

Spec block parameters

1. **page** – Password Aging Interval
   This parameter specifies the period in days after which the user has to change the password of their account. If the value is set to 0 then the password aging function is disabled.
   Type: Integer.
   Range: 0, 7-999 [days]
   Default: 90
2. **screen** – Message Screening
   This parameter specifies what output messages are associated with the *uid*. This parameter is omitted if the user has none of these values. Any combination of these values may be specified using ampersand (&)
   Type: Alphanumeric string. An '&' is also allowed for concatenation of values.
   Range:
   - DBCHG
     Data Base Change notifications: changes in creation of entities, in user provisionable parameters, in deletion of entities will be reported (data base changes).
     File Transfer In-progress notifications: The user will receive **REPT DBCHG** and REPT EVT FXFR messages.
     The value DBCHG shall always be used together with the value STCHG.
   - STCHG

State Change notifications – report changes in user non-provisionable parameters (state changes). The user will receive **REPT DBCHG** messages.

The value STCHG shall always be used together with the value DBCHG.

- PSCHG

  Protection switch notifications – report protection switch changes. User will receive REPT EVT and REPT SW messages.

- ALARMS

  Alarm notifications. The user will receive REPT ALM ENV, REPT ALM, and REPT EVT messages.

- ONNS

  ONNS Notifications. Database and state changes associated with entities managed by ONNS application and only issued when *xcsetup* = NN. The related ONNS TL1 notifications are REPT PTHCHG, REPT PTHEVT, REPT NNCHG, REPT NNEVT.

- SECURITY: Security event notifications

- ALL

  All notifications.

  All Notifications: This value can be used in input direction as a short-hand notation for DBCHG&STCHG&PSCHG&ALARMS&ONNS&SECURITY

- OWN

  Responses to own commands. The user will receive no other notifications.

- NA

  Not applicable. For users with uidclass=MEMADMIN only this value is allowed. The notification behavior is controlled in this case by the user class. If the value NA is applied for users of other user classes, then the value has the same effect as DBCHG.

- Default: OWN

  If more than one value is set the values will be concatenated by '&'. Example: DBCHG&STCHG&ALARMS

Restriction: When *uidclass* is set to MEMADMIN, *screen* must be set to NA.

3. **tmout** – Inactivity Timeout Period
   If there are no messages between the user and the NE over the Timeout Period, the session is logged off. A value of 0 disables the timeout function.
   Type: Integer.
   Range: 0 – 999 [minutes]
   Default: 30

4. **uidclass** – UID Class
   This is the user class of a *uid*.
   Type: Alphanumeric value set.

Range:

- OTHER – This is the default class. For users in this class, command privileges and notifications are controlled only by their UPCs and their notification Registration List.
- MEMADMIN – User class for memory administration users. All users of this class share the same atag counter for autonomous messages and are allowed to execute the command **RTRV-AO**.

Default: OTHER.

Restriction: When *uidclass* is set to MEMADMIN, *screen* must be set to NA.

Output format

After receiving the **ENT-USER-SECU** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

This command creates the NE’s user data. A new user *uid* (User ID) will be established. The values of *pid* (Password ID), *upc* (User Privilege Code List), *alw_login* (Allow Login), *screen* (Message Screening), *page* (Password Aging Interval), *tmout* (Inactivity Timeout Period) will be assigned to the new user. If optional values are not specified the default values will be used.

This update is reported via the corresponding ENT-USER-SECU notification – see “ENT-USER-SECU notification” (p. 3-1975)section.

The execution of ENT-USER-SECU command is entered in the Security Information Log.

The NE will always have two preinstalled users with full privileges in all functional categories. These two users will be referred to as super-users. The two super-users are also Security Administrators because they have the S5 privilege code. The NE will not allow adding additional super-user type users. It will not be possible to remove either of the original super-user login IDs. An existing login ID (*uid*) except the super-user login IDs cannot be renamed. It must be deleted and re-entered with new *uid* value.

Example input/output

The following example shows the successful completion of the **ENT-USER-SECU** command by the NE:

ENT-USER-SECU:LT-UNITE-123:nbguser1:123456::pass12+,,P3&M3:screen;=DBCHG&STCHG;&PSCHG;,page=345,tmout=360;

```
   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Validation rule: Entering user's own or existing uid.

If the NE receives an ENT-USER-SECU command from a user trying to enter his or her own *uid* or an existing *uid*.

Error code: `IDNV – Input, Data Not Valid, duplicate UID`

Validation rule: Maximum number of *uids* reached

If the NE receives an ENT-USER-SECU command when it already has reached its maximum number of defined User IDs.

Error code: `SLEM – Status, List Exceeds Maximum UIDs`

Validation rule: Invalid *upc*

If the NE receives an ENT-USER-SECU command with a upc=P5&M5&T5&S5&PM5 or a upc=S0.

Error code: `IDNV – Input, Data Not Valid, invalid UPC`

Validation rule: Compatibility screen, uidclass parameter

If the NE receives an ENT-USER-SECU command with *uidclass* = MEMADMIN and *screen* !=NA it rejects the command with

Error code:
`IDNV – Input, Data Not Valid, incompatible` *`screen, uidclass`* `parameters`

ENT-USER-SECU notification

Output format

The **ENT-USER-SECU** notification has the following specific syntax:

ENT-USER-SECU:*uid*:,,[*upc*]:*spec_block*

Output parameters

Command parameters

1. **uid** – User Identifier
   This is the unique user login identifier for which the ACT-USER login command is intended. Grouping and/or ranging of *uid* values for the **ACT-USER** command are not allowed. Valid *uid* values for the **ACT-USER** command are case-sensitive alphanumeric strings which have been previously provisioned as valid login IDs in the NE.
   Type: Alphanumeric string (case-sensitive)
   Range: 5 – 10 characters
   The *uid* ALL is not allowed in any combination of upper or lower cases.
   Default: not applicable
2. **upc** – User Privilege Code List
   This parameter specifies the user privilege code UCFC/UCAL pair assigned to a user. Multiple UCFC/UCALs can be specified using single ampersands ('&'). If a user tries to operate a command with a privilege code higher than assigned to the user for the category of the command the command will be denied.
   Type: Alphanumeric string; for concatenation "&" is also allowed.
   Range: P***i***, M***i***, T***i***, S***i***, PM***i***, D***i***, C***i***, where ***i*** is an integer ranging from 0 to 5, with ***i*** = 0 implying that there is no authorization for the functional category. S0 is not allowed.
   Default: P1&M1&T1&S1&PM1&C0 except for super users: P5&M5&T5&S5&PM5&C5.
   Note: The system does not support commands for the D (DEBUG) category. Setting this privilege code does not have any effect on the system behavior and it will not be visible in output direction. It is only for compatibility.
   See also "List of user privilege codes" (p. 15-1).

Spec block parameters

1. **alw_login** – Allow Login
   This parameter displays the enable/disable state of a User ID.
   A User ID can be automatically disabled by the system when the time specified by parameter *usrage* (see "RTRV-NE-SECU: Retrieve NE security" (p. 3-2552)) expires or via the **ED-USER-SECU** command. A User ID can be enabled via the **ED-USER-SECU** command.
   If a User ID is disabled, logins with that User ID are denied.
   Type: Alphanumeric value set.

Range:

- YES: User ID is enabled
- NO: User ID is disabled

Default: YES

2. **page** – Password Aging Interval
   This parameter specifies the period in days after which the user has to change the password of their account. If the value is set to 0 then the password aging function is disabled.
   Type: Integer.
   Range: 0, 7-999 [days]
   Default: 90
3. **screen** – Message Screening
   This parameter specifies what output messages are associated with the *uid*. This parameter is omitted if the user has none of these values. Any combination of these values may be specified using ampersand (&)
   Type: Alphanumeric string. An '&' is also allowed for concatenation of values.
   Range:
   - DBCHG

     Data Base Change notifications: changes in creation of entities, in user provisionable parameters, in deletion of entities will be reported (data base changes).

     File Transfer In-progress notifications: The user will receive **REPT DBCHG** and REPT EVT FXFR messages.
   - STCHG

     State Change notifications – report changes in user non-provisionable parameters (state changes). The user will receive **REPT DBCHG** messages.
   - PSCHG

     Protection switch notifications – report protection switch changes. User will receive REPT EVT and REPT SW messages.
   - ALARMS

     Alarm notifications. The user will receive REPT ALM ENV, REPT ALM, and REPT EVT messages.
   - ONNS

     ONNS Notifications. Database and state changes associated with entities managed by ONNS application and only issued when *xcsetup* = NN.

     The related ONNS TL1 notifications are REPT PTHCHG, REPT PTHEVT, REPT NNCHG, REPT NNEVT.
   - SECURITY: Security event notifications
   - OWN

     Responses to own commands. The user will receive no other notifications.

     Note: OWN will never be shown in conjunction with DBCHG, STCHG, PSCHG or ALARMS.

- NA

  Not applicable. For users with uidclass=MEMADMIN only this value is allowed. The notification behavior is controlled in this case by the user class. If the value NA is applied for users of other user classes, then the value has the same effect as DBCHG.
- Default: OWN

  If more than one value is set the values will be concatenated by ’&’. Example: DBCHG&STCHG&ALARMS

4. **`tmout`** – Inactivity Timeout Period
   If there are no messages between the user and the NE over the Timeout Period, the session is logged off. A value of 0 disables the timeout function.
   Type: Integer.
   Range: 0 – 999 [minutes]
   Default: 30
5. **`uidclass`** – UID Class
   This is the user class of a *uid*.
   Type: Alphanumeric value set.
   Range:
   - OTHER – This is the default class. For users in this class, command privileges and notifications are controlled only by their UPCs and their notification Registration List.
   - MEMADMIN – User class for memory administration users. All users of this class share the same atag counter for autonomous messages and are allowed to execute the command **`RTRV-AO`**.

   Default: OTHER.
   Restriction: When *uidclass* is set to MEMADMIN, *screen* must be set to NA.

Example output

The example shows a normal notification after an ENT-USER-SECU Command:

```
   LT-UNITE-123 00-01-01 08:00:50
A 815 REPT DBCHG
   ″TIME=08-00-12,DATE=00-01-01:ENT-USER-
      SECU:nbguser1:,,P3&M3:screen=DBCHG&STCHG&PSCHG,page=345,tmout=360,uidclass=OTHER,alw_l
;
```

ENT-VC3 notification

Output format

Syntax: **`ENT-VC3`**:*aid*::*spec_block*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Description: AID of the SDH tributary. The keyword **`all`** is not allowed on any level.
   Type: AID
   Range: STS1NumAID

Spec block parameters

1. **`brstintvl`**– Bursty Interval
   Measurement period for determining bursty errors The setting of this parameter is used when *sdsfmode* = BURST.
   Type: numeric value set.
   Range: 2 to 10.
   Default: 7.
2. **`brstthr`** – Bursty Error Threshold
   The values are set in percent for the degradation threshold. The setting of this parameter is used when *sdsfmode* = BURST.
   Type: numeric value set.
   Range (as percentage): 5, 10, 15, 20, 25, 30, … 50.
   Default: 30.
3. **`crslpbkstat`** – Cross-connect loopback status
   State of cross- connect loopback.
   Type: Alphanumeric value set.
   Range:
   - YES = Cross-connect loopback is provisioned
   - NO (default) = No cross-connect loopback is provisioned.
4. **`degthr`** – Signal Degrade Threshold
   The setting of this parameter are used when *sdsfmode* = POISSON
   Type: numeric value set.
   Range (as exponents of 10): –5; –6 (default); –7; –8; –9
5. **`dexcthr`** – Excessive Degrade Threshold
   The setting of this parameter are used when *sdsfmode* = POISSON. The values are set as exponent of 10.
   Type: numeric value set.
   Range (as exponent of 10) –3 (default); –4; –5.

6. **`exphptrc`** – Expected Path Trace (J1)
   The parameter *exphptrc* specifying the expected path trace is only relevant for the path trace supervision when the path trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
   Type: Hexadecimal digits
   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.
   Default: 89hex followed by 15 bytes 00hex.
7. **`feppm`** – Far-End Path PM Enable
   It indicates whether this performance monitoring feature is enabled or disabled.
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
8. **`hptimmon`** – Path Trace Monitoring Enable (J1)
   Description: High order path trace (J1) identifier mismatch (TIM) monitor enable. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE (default).
9. **`loca`** – Ring A-node TID
   This parameter specifies the TID of the node at which the service is added to the BLSR ring. This parameter is required for the input of tributaries to be used by ONNS on ports of *portClass* = EDGE being members in BLSR/MS-SPRing protection groups. The *loca* parameter value is an empty string for all other tributaries.
   loca is introduced specifically for use related to ONNS application.
   Type: TID or empty-string.
   Range: Please refer to the TID definition in “RTRV-HDR: Retrieve header” (p. 3-2417) description.
   Default: empty string: ″″. This is displayed as \″\″ in output direction.
10. **`locz`** – Ring Z-node TID
    This parameter specifies the TID of the node at which the service is dropped from the BLSR ring. This parameter is required for the output of tributaries to be used by ONNS on ports of *portClass* = EDG E being members in BLSR/MS-SPRing protection groups. The *locz* parameter value is an empty string for all other tributaries.

locz is introduced specifically for use related to ONNS application.
Type: TID or empty-string.
Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
Default: empty string: "". This is displayed as \"\" in output direction.

11. **neppm** – Near-End Path PM Enable
    It indicates whether this performance monitoring feature is enabled or disabled.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
12. **pjepm** – Pointer Justification Event PM Enable
    It indicates whether this performance monitoring feature is enabled or disabled.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
13. **pmhpfeses** – Performance Monitoring Path Far-End SES Threshold
    This parameter describes the Path Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. When the interface standard is changed the current default value is not adapted automatically.
    Type: numeric value set.
    Range (superset of ranges for SDH and SONET): 1-64000.
    Default: 2400.
14. **pmhpneses** – Performance Monitoring Path Near-End SES Threshold
    This parameter describes the Path Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. When the interface standard is changed the current default value is not adapted automatically.
    Type: numeric value set.
    Range (superset of ranges for SDH and SONET): 1-64000.
    Default: 2400.
15. **ptca** – Path TCA Profile Pointer
    Type: Alphanumeric string.
    Range: string with up to 24 characters.
    Default: DEFAULT0.
16. **ptrcrfmt** – Path Trace Read Format (J1)
    The read format of J1, the incoming path trace (ptrc).
    Type: numeric string.

Range:

- 2: for non-specific repeating byte
- 16: for 16 byte specific string.
- 64: for 64 byte string.
  Default: 2.

17. **`sdsfmode`** – Signal Degrade/Signal Fail Mode
    The degraded state is detected in BURST or POISSON mode.
    Type: Alphanumeric value set.
    Range:
    - BURST (default)
    - POISSON
18. **`substr`** – Substructured
    This parameter indicates if the tributary is substructured.
    Substructure for LO cross-connections:
    A HO tributary, which is sub structured for LO cross-connections, has a HO path termination associated which provides LO tributaries to be used for LO cross-connections.
    The parameter *substr* is set autonomously when LO cross-connections are created or deleted with ENT-CRS or DLT-CRS commands (see also the lower order cross-connection creation/deletion behavior description for the commands ENT-CRS and DLT-CRS).
    A sub structured HO tributary cannot be used to set up HO cross-connections. The parameter *substr* is set autonomously when the LO substructure is created or deleted using the **`ED-SUBS`** command.
    Substructure for conversion cross-connections:
    A HO tributary, which is sub structured for the LO side of a conversion cross-connection, has a HO path termination associated which provides LO tributaries to be used for conversion cross-connections.
    The parameter *substr* is set autonomously when an AU3/AU4 conversion cross-connection is created.
    A HO tributary, which is sub structured for conversion cross-connections, cannot be used to set up HO cross-connections.
    Type: Alphanumeric value set.
    Range:
    - YES: Automatically sub structured for LO cross-connections
    - MANSUB: Manually sub structured for LO cross-connections
    - CNVSUB: Automatically sub structured for the LO side of conversion cross-connections
    - NO (default): Not sub structured, not used for conversion cross-connections
19. **`tcamd`** – TCA mode
    This parameter shows the modus of the PM thresholding.

Two thresholding methods are applicable:

- TR-only (also known as the implicit reset method)
- TR-RTR (also known as the explicit reset method).
  Type: Alphanumeric value set.
  Range: TR, TRRTR (default).

20. **`tmonmd`** – Tributary Monitoring Mode
    This parameter indicates the mode of the tributary.
    Type: Alphanumeric value set.
    Range:
    - MON = alarm monitoring is taking place on the port.
    - NMON (default) = alarm monitoring is not occurring on the port.
21. **`tribsdhpn`** – Tributary Alarm Severity Assignment Profile
    This parameter points to a tributary ASAP profile name of type PATH for the designated AID.
    Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
    Range: string with a maximum of 24 characters.
    Default: DEFAULT.

Example output

```
   UNITE-NE 00-10-14 14:59:09
A  592 REPT DBCHG
   ″TIME=14-59-09,DATE=00-10-14:ENT-VC3:1-1-#-#-3-1-1::
      tmonmd=MON,tribsdhpn=Default,...,pmhpneses=30,pmhpfeses=30″
;
```

ENT-VCG – Enter virtual concatenation group

The **ENT-VCG** command provisions a virtual concatenation group of an ES64U together with all VCGTRIBs belonging to it.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Priority: 1

Abortable: No.

Input format

ENT-VCG-*modifier:tid:aid:ctag:::spec_block;*

Input parameters

Command parameters

1. **modifier**
   The modifier specifies the type of the virtual concatenation group of the unit. Implicit, it indicates the transmission rate for which VCG related data will be retrieved.
   The parameter *modifier* must be given if a virtual concatenation group on a GE10PL1 or ES64U pack shall be addressed. Otherwise this parameter has to be omitted.
   Type: Alphanumeric value set.
   Range:
   - 1GEPL representing a 1 GE port on the GE10PL1 pack
   - 10GEPL representing a 10 GE port on the GE10PL1 pack
   - ES64U representing a VCG port at an ES64U subsystem

   Default: None.
   The command is only allowed for *modifier* = ES64U.
2. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
3. **aid** – Access Identifier
   The access identifier specifies the virtual concatenation group (VCG) port number to be created.
   Type: AID.
   Range: VCGAID as defined in AID structure. The values
   - **vall** for Simple_VCGAID
   - **usall** for Simple_UnivSlotAID
   - **all** for Simple_UnivSlotAID

- **all** for Simple_ShelfAID and
- **all** for BayAID

are excluded.
Default: None.

4. **ctag** – Correlation Tag
Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **inputsig** – Tributary Input Signal Rate List
This parameter reports the tributary structure of the VCG port in input direction. This will implicitly give the maximum capacity of the VCG port, too. The tributary structure depends on interface standard specified for this VCG by istd . For definition of *istd* refer to "RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3078) Output parameters.
If the input parameter *modifier* = 1GEPL or *modifier* = 10GEPL, then the possible tributary structures depends on interface standard specified for this VCG by istd and on the virtual concatenation mode *vcat*. For definitions of *istd* and *vcat* refer to RTRV-VCG Output Parameters.
Type: numeric string of the form NX
    - N specifies the count of container type X
    - X specifies the container type (or envelope).

    Range:
    - Values: N = 7, X = 4; Modifier=omitted; Interface Standard=SDH; Virtual Concatenation=not applicable; Represented Signal Structure: 7 times VC4
    - Values: N = 7, X = 4; Modifier=1GEPL; Interface Standard=SDH; Virtual Concatenation=ENABLE; Represented Signal Structure: 7 times VC4
    - Values: N = 64, X = 4; Modifier=10GEPL; Interface Standard=SDH; Virtual Concatenation=ENABLE; Represented Signal Structure: 64 times VC4
    - Values: N = 1, X = c64; Modifier=10GEPL; Interface Standard=SDH; Virtual Concatenation=DISABLE; Represented Signal Structure: 1 times VC4-64C
    - Values: N = 21, X = 1; Modifier=omitted; Interface Standard=SONET; Virtual Concatenation=not applicable; Represented Signal Structure: 21 times STS-1
    - Values: N = 21, X = 1; Modifier=1GEPL; Interface Standard=SONET; Virtual Concatenation=ENABLE; Represented Signal Structure: 21 times STS-1
    - Values: N = 7, X = 3; Modifier=1GEPL; Interface Standard=SONET; Virtual Concatenation=ENABLE; Represented Signal Structure: 7 times STS-3C
    - Values: N = 192, X = 1; Modifier=10GEPL; Interface Standard=SONET; Virtual Concatenation=ENABLE; Represented Signal Structure: 921 times STS-1

- Values: N = 64, X = 3; Modifier=10GEPL; Interface Standard=SONET; Virtual Concatenation=ENABLE; Represented Signal Structure: 64 times STS-3C
- Values: N = 1, X = 192; Modifier=10GEPL; Interface Standard=SONET; Virtual Concatenation=DISABLE; Represented Signal Structure: 1 times STS-192C

For *modifier* = ES64U, the value combination of “N” and “X” is done according to the following rules:

- *istd* = SONET
- X = 1 for STS-1
- N $\in$ {1, 2, …, 192}

For *modifier* = ES64U, the parameter *inputsig* is visible for retrieval, but it cannot be modified once the VCG is established.

Default:

- modifier = omitted, Interface Standard=SDH, Default Value = 74
- modifier = 1GEPL, Interface Standard=SDH, Default Value = 74
- modifier = 10GEPL, Interface Standard=SDH, Default Value = 644
- modifier = omitted, Interface Standard=SONET, Default Value = 211
- modifier = 1GEPL, Interface Standard=SONET, Default Value = 211
- modifier = 10GEPL, Interface Standard=SONET, Default Value = 1921
- modifier = ES64U, Interface Standard=SONET, Default Value not applicable

Default in case of System Default *portClass* EDGE: In case of the *portclassdefault* EDGE, i.e. VCGs are created with *eportClass* EDGE, the default values for *unequiposig* is as in table above with the following exception: For *modifier* = GE10PL and *Interface Standard* = SONET, the default value is 643.

For *modifier* = ES64U, this parameter will always be defined by the **`ENT-VCG`** command.

2. **`vcat`** – Virtual Concatenation

The parameter *vcat* specifies whether the Ethernet signal is mapped to a number of virtually concatenated tributaries (value = ENABLE) or into a contiguously concatenated tributaries (value = DISABLE). In the latter case, LCAS related parameters become insignificant (values set to default, values cannot be changed). This parameter is not supported if the input parameter *modifier* is omitted. If the parameter *vcat* is not supported, then the parameter is omitted.

Type: Alphanumeric value set.

Range:

- For *modifier* = ES64U: ENABLE.
- Otherwise: ENABLE, DISABLE.

For *modifier* = ES64U, the parameter *vcat* is visible for retrieval, but cannot be modified once the VCG is established.

Default: Enable.

Output format

If the network element fully complies with the **ENT-VCG** request, the following normal completion response shall be returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The **ENT-VCG** command generates a **REPT DBCHG** message for the creation of the VCG together with a **REPT DBCHG** message for the creation of the VCG tributaries (**ENT-VCGTRIB** notification).

The command establishes a virtual concatenation group together with the virtual concatenation group tributaries belonging to it according to the parameters given with this command. The virtual concatenation group tributary number range is from 1 up to the number of tributaries given by the parameter *inputsig*.

The modification is reported by means of an **ENT-VCG** notification and grouped notifications for VCG tributaries.

Group notification for VCG tributaries

For efficiency reasons the notifications for VCG tributaries shall be sent out as a single notification (so-called group notification) using a range over the AID which depends on the used mapping of the associated VCG port, i.e. the *Simple_VCGNumAID* field in the *VCGNumAID* is set to

- 1&&-***<N>*** for sequential range
- 1&-4…&-***<N>*** for non-sequential range

where ***<N>*** is the maximal legal VCG tributary number.

Example:

The AID field in a group notification for a VCG tributaries related to VCG port 1 for a GE1 pack in slot 1 looks like:

1-1-#-#-1-v1-1&&-21 (for STS-1/VC-3 mapping)

1-1-#-#-1-v1-1&-4&-7&-10&-13&-16&-19 (for STS-3c/VC-4 mapping)

Example input/output

```
ENT-VCG-ES64U:UNITE-NE:1-1-#-#-22-v9:123456:::
inputsig=121,vcat=ENABLE;

```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **INH-MSG** command.

Validation rule: Command only allowed for VCG on ES64U circuit pack

If the command is not applied to a VCG on a ES64U pack, then the command is denied.

Error code:

`IENE – Input, Entity Not Exists, Command only allowed for a ES64U pack`

Validation rule: Command not allowed for ES64U with switch capacity 0

If the switch capacity *es64ucap* for a ES64U pack is 0, then the command is denied.

Error code:

`IENE – Input, Entity Not Exists, Command not allowed for an inactive ES64U pack`

Validation rule: Command not allowed for ES64U protecting pack

If the command is applied to an ES64U protecting pack in an equipment protection, then the command is denied.

Error code:
`IENE – Input, Entity Not Exists, Command not allowed for a protecting ES64U pack`

Validation rule: Sufficient backplane bandwidth available

Check that sufficient backplane bandwidth is available before a new VCG is established. In general the number of allocated backplane bandwidth must be less than the maximum number of supported STS-1 equivalents, 192 for the first and 192 for the second segment. For contiguous concatenated tributaries it must be checked if the necessary coherent backplane bandwidth in available due to backplane capacity fragmentation issues.

Error code:
`SSRE – Status, System Resources Exceeded, no sufficient backplane bandwidth available`

Validation rule: VCG already exists

Check if the VCG number is already used.

Error code: `IDNV – Input, Data Not Valid, VCG already exists`

Validation rule: Parameter inputsig is mandatory

Check if the parameter *inputsig* is given as input.

Error code: `IDNV – Input, Data Not Valid, Parameter inputsig is mandatory`

Validation rule: Parameter vcat is mandatory

Check if the parameter *vcat* is given as input.

Error code: `IDNV – Input, Data Not Valid, Parameter vcat is mandatory`

ENT-VCG notification

Output format

Syntax: The **ENT-VCG** notification has the following specific syntax:

ENT-VCG*[-modifier]:aid::spec_block;*

Output parameters

Command parameters

1. **modifier**
   The modifier specifies the type of the virtual concatenation group of the unit. Implicit, for the 1GEPL, 10GEPL application, it indicates the transmission rate for which VCG related data will be notified.
   For the ES64U application, the transmission rate is defined by the user with the **ENT-VCG** command and input parameter *inputsig*.
   The parameter *modifier* must be given if a virtual concatenation group on a GE10PL1 or a ES64Upack is notified. Otherwise this parameter has to be omitted.
   Type: Alphanumeric value set.

   Range:

   - 1GEPL representing a 1 GE port on the GE10PL1 pack
   - 10GEPL representing a 10 GE port on the GE10PL1 pack
   - ES64U representing a VCG port at an ES64U subsystem

   Default: None.
2. **aid** – Access Identifier
   The access identifier specifies the virtual concatenation group (VCG) to be operated on.
   Type: AID.

   Range: VCGAID as defined in AID structure. The values

   - **vall** for Simple_VCGAID
   - **usall** for Simple_UnivSlotAID
   - **all** for Simple_UnivSlotAID
   - **all** for Simple_ShelfAID and
   - **all** for BayAID

   is excluded.

Spec block parameters

1. **clientNodeID** – Client Node IDentifier
   The *clientNodeID* identifies the IP address of a client node attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.
   For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be

evaluated until *eportClass* is set to a value supporting it.
This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other eport classes in future.
This parameter is supported by ports of *eportClass* UNI.
For *modifier* = ES64U, the parameter is visible with default values for retrieval, but it cannot be modified.
Type: IPv4 format: Four dot separated numeric string
Range: Each numeric string: 0…255
Default: 0.0.0.0

2. **`cnprole`** – Customer/Network Port Role
   This parameter specifies whether the addressed port is used as a customer WAN port or a network WAN port.
   This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U.
   If the parameter *cnprole* is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range: CUSTOMER, for a customer WAN port. NETWORK, for a network WAN port.
   Default: NETWORK.
3. **`dftpri`** – Default User Priority
   This parameter specifies the default user priority acc. the IEEE 802.1Q tagging scheme.
   This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U.
   If the parameter *dftpri* is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range:
   - HIGH
   - LOW (default).
4. **`dftvlan`** – Default VLAN Identifier
   This parameter specifies the value of the VLAN identifier which is applied to frames (tagging) at LAN ingress (i.e. from LAN into the Ethernet-port). This only applies to frames carrying no VLAN identifier, yet. This parameter is also used to provision the customer tag (CID) to be used in transparent tagging mode.
   This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U.
   If the parameter *dftvlan* is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range:
   - 1, 2, 3, … 4092, 4093
   - UNAVAILABLE (default).
   To express the state UNAVAILABLE system internally the invalid VLAN ID 4094 is used.

5. **`enetpn`** – Ethernet Alarm Severity Assignment Profile Name
   This parameter points to an ASAP profile name of type ENET for the designated AID.
   Ethernet port and VCG port have the same ASAP profile named ENET.
   Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
   Range: 1 … 24 characters length.
   Default: DEFAULT.
6. **`enettca`** – Ethernet TCA Profile Name
   This parameter specifies the name of the threshold crossing alert (TCA) profile used for the VCG.
   This parameter is not supported if the input parameter *modifier* = ES64U.
   If the parameter *enettca* is not supported, then the parameter is omitted.
   Type: Alphanumeric string.
   Range: 1 … 24 characters length.
   Default: DEFAULT0.
7. **`eportClass`** – Ethernet Port Class
   This identifies the Ethernet port class of the AID. *eportClass* is used to specify Ethernet ports for use by NN application.
   This parameter is visible with default values for retrieval, but cannot be modified if the input parameter *modifier* = ES64U.
   Type: Alphanumeric value set.

   Range: Depends on the *modifier*:

   - if *modifier* is missing or is 1GEPL, then the value range is: TRADITIONAL, EDGE, UNI
   - if *modifier* is 10GEPL, then the value range is: TRADITIONAL, EDGE
   - if *modifier* is ES64U, then the value range is: TRADITIONAL

   Default: Depends on system parameters Cross Connect Setup (*xcsetup*) and Port Class Default (*portclassdefault*):

   - if *xcsetup* is TRADITIONAL, then the default value is TRADITIONAL
   - if *xcsetup* is SWISS, then the value of *portclassdefault* is used as default value.
   - if *modifier* is ES64U, then the value range is: TRADITIONAL
8. **`eportControl`** – Ethernet Port Control
   This identifies the administrative mode of Ethernet ports of *eportlass* = EDGE or UNI. For Ethernet ports of other Ethernet port class this parameter is not relevant. *eportControl* is introduced specifically for use by NN application.
   This parameter is visible with default values for retrieval, but cannot be modified if the input parameter *modifier* = ES64U.
   Type: Alphanumeric value set.
   Range: NORMAL (default), MAINT, LOCKOUT .

9. **`htmr`** – Hold-Off Time
   The parameter *htmr* specifies the hold off time for the LCAS protection. If a tributary is configured to take part on transmission for the VCG and it goes to state faulty then this tributary is taken out of transmission by LCAS after the hold off time. This time is configured on group level, i.e. all tributaries have the same value for hold-off time. This parameter only affects NE behavior if lcasmd=ENABLE.
   This parameter is visible with default values for retrieval, but cannot be modified if the input parameter *modifier* = ES64U.
   Type: numeric value set.
   Range: 0 (default), 100, 200, …, 9900, 10000 [milliseconds].
10. **`inputsig`** – Tributary Input Signal Rate List
   This parameter reports the tributary structure of the VCG port in input direction. This will implicitly give the maximum capacity of the VCG port, too. The tributary structure depends on interface standard specified for this VCG by *istd* . For definition of *istd* refer to the “Output parameters” section in “RTRV-VCG: Retrieve virtual concatenation group” (p. 3-3078).
   If the input parameter *modifier* = 1GEPL or *modifier* = 10GEPL, then the possible tributary structures depends on interface standard specified for this VCG by istd and on the virtual concatenation mode *vcat*. For definitions of *istd* and *vcat* refer to the “Output parameters” section in “RTRV-VCG: Retrieve virtual concatenation group” (p. 3-3078)..
   Type: numeric string of the form ***NX***
   - ***N*** specifies the count of container type ***X***
   - ***X*** specifies the container type (or envelope).

   Range:

Values	Modifier	Interface standard	Virtual concatenation	Represented signal structure
N = 7, ***X*** = 4	omitted	SDH	not applicable	7 × VC4
N = 7, ***X*** = 4	1GEPL	SDH	ENABLE	7 × VC4
N = 64, ***X*** = 4	10GEPL	SDH	ENABLE	64 × VC4
N = 1, ***X*** = c64	10GEPL	SDH	DISABLE	1 × VC4-64C
N = 21, ***X*** = 1	omitted	SONET	not applicable	21 × STS-1
N = 21, ***X*** = 1	1GEPL	SONET	ENABLE	21 × STS-1
N = 7, ***X*** = 3	1GEPL	SONET	ENABLE	7 × STS-3C
N = 192, ***X*** = 1	10GEPL	SONET	ENABLE	192 × STS-1
N = 64, ***X*** = 3	10GEPL	SONET	ENABLE	64 × STS-3C
N = 1, ***X*** = 192	10GEPL	SONET	DISABLE	1 × STS-192C

Range: Depends on the *modifier*:

- if *modifier* is ES64U, then the value combination of ″N″ and ″X″ is according the following rules:
  istd=SONET
  X = 1 (for STS-1)
  N $\in$ {1, 2, … 192}
- if *modifier* is ES64U, then the parameter *inputsig* is visible for retrieval, but cannot be modified once the VCG is established.

Default:

- modifier = omitted, Interface Standard=SDH, Default Value = 74
- modifier = 1GEPL, Interface Standard=SDH, Default Value = 74
- modifier = 10GEPL, Interface Standard=SDH, Default Value = 644
- modifier = omitted, Interface Standard=SONET, Default Value = 211
- modifier = 1GEPL, Interface Standard=SONET, Default Value = 211
- modifier = 10GEPL, Interface Standard=SONET, Default Value = 1921

Default in case of System Default *portClass* EDGE: In case of the *portclassdefault* EDGE, i.e. VCGs are created with *eportClass* EDGE, the default values for *unequiposig* is as in table above with the following exception:
For *modifier* = GE10PL and *Interface Standard* = SONET, the default value is 643.
For *modifier* = ES64U this parameter is always defined by the **`ENT-VCG`** command.

11. **`istd`** – Interface Standard
This parameter specifies the interface standard of this VCG. This value is applied for both input and output direction.
For *modifier* = 1GEPL, 10GEPL or ES64U the parameter is visible for retrieval, but cannot be modified.
Type: Alphanumeric value set.
Range:
   - SDH
   - SONET.

   Default: *modifier* 1GEPL, 10GEPL or ES64U: The value is derived from the circuit pack parameter *istd*. no *modifier*. As derived from parameter *istddflt* specified at configuration management, section System RTRV-EQPT.

12. **`lcasmd`** – LCAS Mode
This parameter specifies the operation mode of the Link Capacity Adjustment Scheme for this VCG. This value is bidirectional.
This parameter is visible with default values for retrieval, but cannot be modified if the input parameter *modifier* = ES64U.
Type: Alphanumeric value set.
Range:
   - DISABLE
   - ENABLE (default).

Default:

- if *modifier* = ES64U: then DISABLE
- if other or no *modifier*: then ENABLE

13. **localLPID** – Local Logical Port IDentity
    The *localLPID* provides a unique logical identification of a single port with an *eportClass* value used by the ONNS application and supporting this specific parameter.
    This identification is from the local NEs point-of-view.
    Depending on the *eportClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like, for example,*networkTNAAddress*.
    For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, that means, it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.
    This attribute replaces attribute “uniNetworkLPID”, as this attribute will not be exclusively valid any more for *eportClass* UNI only and thus a more generic name seems reasonable.
    The parameter *localLPID* is used by ONNS for switching network connections on SONET/SDH layer.
    This parameter is supported by ports of *eportClass* UNI.
    This parameter is supported by ports of *eportClass* EDGE.
    This parameter is visible with default values for retrieval, but cannot be modified if the input parameter *modifier* = ES64U.
    Type: numeric value set.
    Range: 0 to 4294967295
    Default: 0

14. **localLPIDVCAT** – Local Logical Port Identity on VCAT layer
    The *localLPIDVCAT* provides a unique logical identification of a single VCG port with an *eportClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.
    Depending on the *eportClass* value of the port, the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like, for example, *networkTNAAddrVCAT*.
    For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, that means it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.
    The parameter *localLPIDVCAT* is used by ONNS for switching network connections on VCAT layer.
    This parameter is supported by ports of *eportClass* UNI.
    This parameter is supported by ports of *eportClass* EDGE.
    Type: numeric value set.
    Range: 0 to 4294967295.
    Default: 0.

15. **`networkTNAType`** – Network TNA Type
    The *networkTNAType* identifies the type of the Network TNA Address attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, that means, it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.
    This attribute replaces attribute "uniNetworkTNAType", as this attribute will not be exclusively valid any more for *eportClass* UNI only and thus a more generic name seems reasonable.
    The parameter *networkTNAType* is used by ONNS for switching network connections on SONET/SDH layer.
    This parameter is supported by ports of *eportClass* UNI.
    This parameter is supported by ports of *eportClass* EDGE.
    This parameter is visible with default values for retrieval, but cannot be modified if the input parameter *modifier* = ES64U.
    Type: Alphanumeric value set.
    Range: IPV4, IPV6, or NSAP.
    Default: IPV4.
16. **`networkTNATypeVCAT`** – Network TNA Type on VCAT level
    The *networkTNATypeVCAT* identifies the type of the Network TNA Address on VCAT level attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.
    For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, that means, it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.
    The parameter *networkTNATypeVCAT* is used by ONNS for switching network connections on VCAT layer.
    This parameter is supported by ports of eportClass UNI.
    This parameter is supported by ports of eportClass EDGE.
    This parameter is visible with default values for retrieval, but cannot be modified if the input parameter *modifier* = ES64U.
    Type: Alphanumeric value set.
    Range: IPV4, IPV6, or NSAP.
    Default: IPV4.
17. **`networkTNAAddress`** – Network TNA Address
    The *networkTNAAddress* identifies the Network TNA Address attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.
    The content depends on the given NetworkTNAType. For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, that means, it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.
    This attribute replaces attribute "uniNetworkTNAAddress", as this attribute will not be exclusively valid any more for *eportClass* UNI only and thus a more generic

name seems reasonable.
The parameter *networkTNAAddress* is used by ONNS for switching network connections on SONET/SDH layer.
This parameter is supported by ports of *eportClass* UNI.
This parameter is supported by ports of *eportClass* EDGE.
This parameter is visible with default values for retrieval, but cannot be modified if the input parameter *modifier* = ES64U.
Type:
networkTNAType = IPV4: Four dot separated numeric string (represents 4 bytes)
networkTNAType = IPV6: Eight dash separated hexadecimal number (represents 16 bytes)
networkTNAType = NSAP: Hexadecimal number (represents 20 Bytes)
Range:
IPV4: Each numeric string: 0…255
IPV6: Each hexadecimal number: 0000…FFFF
NSAP: Hexadecimal number:
0000000000000000000000000000000000000000 …
FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF
Examples:
IPV4: 129.12.3.178
IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF
Default:
IPV4: 0.0.0.0
IPV6: 0-0-0-0-0-0-0-0
NSAP: 0000000000000000000000000000000000000000

18. **`networkTNAAddrVCAT`** – Network TNA Address on VCAT level
The *networkTNAAddrVCAT* identifies the Network TNA Address on VCAT level attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.
The content depends on the given *NetworkTNATypeVCAT*. For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, that means, it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.
The parameter *networkTNAAddrVCAT* is used by ONNS for switching network connections on VCAT layer.
This parameter is supported by ports of *eportClass* UNI.
This parameter is supported by ports of *eportClass* EDGE.
This parameter is visible with default values for retrieval, but cannot be modified if the input parameter *modifier* = ES64U.
Type:
networkTNAType = IPV4: Four dot separated numeric string (represents 4 bytes)
networkTNAType = IPV6: Eight dash separated hexadecimal number (represents 16 bytes)
networkTNAType = NSAP: Hexadecimal number (represents 20 Bytes)

Range:
IPV4: Each numeric string: 0…255
IPV6: Each hexadecimal number: 0000…FFFF
NSAP: Hexadecimal number:
0000000000000000000000000000000000000000 …
FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF
Default:
IPV4: 0.0.0.0
IPV6: 0-0-0-0-0-0-0-0
NSAP: 0000000000000000000000000000000000000000

19. **plcrthr** – Threshold for Partial Loss of Capacity (Receive)
The parameter *plcrthr* specifies the acceptable limit of valid VCG members in receive direction (refer to the *outmbs* parameter of all related VCGTRIB entities) for which the PLCR alarm will not yet be raised. The PLCR alarm will be raised if the actual number of those VCG members is between [1 … (value of the *plcrthr* parameter – 1)] (if *plcrthr* ≥ 2). The PLCR alarm shall never be raised if *plcrthr* is set to 1.
The PLCR alarm will be cleared if the actual number of those VCG members is equal to or more than the value of the *plcrthr* parameter (or if the number of those VCG members is 0 – in this case the TLCR alarm will be raised instead). This parameter is not supported if the input parameter *modifier* is omitted. If the parameter *plcrthr* is not supported, then the parameter is omitted.
This parameter is visible with default values for retrieval, but cannot be modified if the input parameter *modifier* = ES64U.
Type: numeric value set.
Range: 1, 2, 3, …, 192.
Default:

Modifier	Input signal structure	Default value
1GEPL	74	7
1GEPL	211	21
10GEPL	644, 1c64	64
10GEPL	1921, 1192	192

20. **plctthr** – Threshold for Partial Loss of Capacity (Transmit)
The parameter *plctthr* specifies the acceptable limit of valid VCG members in transmit direction (refer to the *inmbs* parameter of all related VCGTRIB entities) for which the PLCT alarm will not yet be raised. The PLCT alarm will be raised if the actual number of those VCG members is between [1 … (value of the *plctthr* parameter – 1)] (if *plctthr* ≥ 2). The PLCR alarm shall never be raised if *plctthr* is set to 1.
The PLCT alarm will be cleared if the actual number of those VCG members is equal to or more than the value of the *plctthr* parameter (or if the number of those VCG members is 0 – in this case the TLCT alarm will be raised instead).

This parameter is not supported if the input parameter *modifier* is omitted. If the parameter *plctthr* is not supported, then the parameter is omitted.
This parameter is visible with default values for retrieval, but cannot be modified if the input parameter *modifier* = ES64U.
Type: numeric value set.
Range: 1, 2, 3, ..., 192.
Default:

Modifier	Input signal structure	Default value
1GEPL	74	7
1GEPL	211	21
10GEPL	644, 1c64	64
10GEPL	1921, 1192	192

21. **`stdis`** – Spanning Tree Protocol Disable
    This parameter allows to enable or disable the Spanning Tree Protocol for the given port. This parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
    This parameter is not supported if the input parameter *modifier* = 1GEPL, *modifier* = 10GEPL or *modifier* = ES64U.
    If the parameter *stdis* is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range: DISABLE, STP is disabled, i.e. the port is not used to build the spanning tree. ENABLE (default), STP is enabled, i.e. the port is used to build the spanning tree.
    As VCGs are by default network ports the default value is to enable STP.
22. **`stpcost`** – Spanning Tree Path Cost
    The parameter *stpcost* specifies the STP-related cost of the path egressing the given port.
    This parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
    This parameter is not supported if the input parameter *modifier* = 1GEPL,*modifier* = 10GEPL or *modifier* = ES64U
    If the parameter *stpcost* is not supported, then the parameter is omitted.
    Type: Integer.
    Range: 1 to 200000000.
    Default: 20000.
    The default value depends on the provisioned VCG size. As currently only a fix size of 7 VC4s or 21 STS1s corresponding to approximately 1 Gbit is supported, the default value is as shown above.

23. **`stpp`** – Spanning Tree Port Priority
    The parameter *stpp* specifies the priority of the given port for the Spanning Tree Protocol. If the input parameter *modifier* = 1GE, then this parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.
    If the input parameter *modifier* = 1GE, then this parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database. This parameter is not supported if the input parameter: *modifier* = ES64U.
    This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter *stpp* is not supported, then the parameter is omitted.
    Type: Integer.
    Range: 0 to 255.
    Default: 128.
24. **`tcamd`** – TCA mode
    This parameter shows the modus of the PM thresholding.
    Two thresholding methods are applicable:
    - TR-only (also known as the implicit reset method)
    - TR-RTR (also known as the explicit reset method)

    This parameter is not supported if the input parameter: *modifier* = ES64U. If the parameter *tcamd* is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range: TR, TRRTR.
    Default: TRRTR in SDH mode; TR in SONET mode.
25. **`unequiposig`** – Unequipped Tributary Output Signal Rate List
    The parameter *unequiposig* specifies the tributary structure and the capacity of the VCG port in output direction. As long as there is no cross-connection applied the specified tributaries are occupied by an unequipped signal. The parameter will implicitly give the maximum capacity of the VCG port, too.
    If the input parameter *modifier* is omitted, then the tributary structure depends on interface standard specified for this VCG by *istd* . For the definition of *istd* refer to the “Output parameters” section of “RTRV-VCG: Retrieve virtual concatenation group” (p. 3-3078).
    If the input parameter *modifier* = 1GEPL or *modifier* = 10GEPL, then the range of possible tributary structures depends on interface standard specified for this VCG by *istd* and on the virtual concatenation mode *vcat*. For definitions of *istd* and *vcat* refer to the “Output parameters” section of “RTRV-VCG: Retrieve virtual concatenation group” (p. 3-3078). The signal will be immediately terminated on the unit. So no unequipped signal is

visible to the outside world.

The parameter *unequiposig* is set automatically according to the input value of the *inputsig* parameter if *modifier* = ES64U. For *modifier* = ES64U the parameter *unequiposig* is only retrievable and cannot be changed, because it follows always the value of the *inputsig* parameter.

Type: numeric string of the form ***NX***

- ***N*** specifies the count of container type ***X***
- ***X*** specifies the container type (or envelope).

Range:

Values	Modifier	Interface standard	Virtual concatenation mode	Represented signal structure
N = 7, ***X*** = 4	omitted	SDH	not applicable	7 × VC4
N = 7, ***X*** = 4	1GEPL	SDH	ENABLE	7 × VC4
N = 64, ***X*** = 4	10GEPL	SDH	ENABLE	64 × VC4
N = 1, ***X*** = c64	10GEPL	SDH	DISABLE	1 × VC4-64C
N = 21, ***X*** = 1	omitted	SONET	not applicable	21 × STS-1
N = 21, ***X*** = 1	1GEPL	SONET	ENABLE	21 × STS-1
N = 7, ***X*** = 3	1GEPL	SONET	ENABLE	7 × STS-3C
N = 192, ***X*** = 1	10GEPL	SONET	ENABLE	192 × STS-1
N = 64, ***X*** = 3	10GEPL	SONET	ENABLE	64 × STS-3C
N = 1, ***X*** = 192	10GEPL	SONET	DISABLE	1 × STS-192C

Range: For *modifier* = ES64U the same value set is applicable as for parameter *inputsig*.

Default:

Modifier	Interface Standard	Default Value
omitted	SDH	74
1GEPL	SDH	74
10GEPL	SDH	644
omitted	SONET	211
1GEPL	SONET	211
10GEPL	SONET	1921

Default in case of System Default *portClass* EDGE: In case of the *portclassdefault* EDGE, that means, VCGs are created with *eportClass* EDGE, the default values for *unequiposig* is as in table above with the following exception:

For *modifier* = GE10PL and *Interface Standard* = SONET, the default value is 643.

26. **`vcat`** – Virtual Concatenation
    This parameter vcat specifies whether the Ethernet signal is mapped to a number of virtually concatenated tributaries (value = ENABLE) or into a contiguously concatenated tributaries (value = DISABLE). In the latter case, LCAS related parameters become insignificant (values set to default, values cannot be changed). This parameter is not supported if the input parameter *modifier* is omitted. If the parameter *vcat* is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range:
    - For *modifier* ES64U: ENABLE (default)
    - otherwise: DISABLE.
    - For *modifier* = ES64U the parameter *vcat* is visible for retrieval, but cannot be modified once the VCG is established.
27. **`vmode`** – VCG Monitoring Mode
    the parameter *vmode* specifies the monitoring mode for VCG. Alarms for this port will be reported if in mode MON otherwise not. There is no automatic mode.
    Type: Alphanumeric value set.
    Range:
    - MON, for monitored
    - NMON (default), for not monitored.
28. **`vpm`** – VCG Performance Monitoring
    The parameter *vpm* specifies whether the performance monitoring is enabled or disabled for this port.
    This parameter is not supported if the input parameter: *modifier* = ES64U. If the parameter *vpm* is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range:
    - DISABLE (default)
    - ENABLE.
29. **`vrtswid`** – Virtual Switch Identifier
    This parameter identifies the instance of the virtual switch.
    This parameter is not supported if the input parameter *modifier* = ES64U. If the parameter *vrtswid* is not supported, then the parameter is omitted.
    Type: Integer.
    Range: 1 – Currently this is the only allowed value

30. **vvidlsd** – Valid VLAN Identifier List (dynamic)

    This parameter gives the list of all dynamic VLAN identifiers allowed for this port as gathered autonomously via GVRP. The list is ampersand grouped (& and &&). The vlan identifier of an incoming frame must be a member of this dynamic VLAN Id list or the static VLAN Id list vvidls. Frames tagged by a vlan identifier not member of these lists will be discarded. This parameter is also used in transparent tagging mode to report the list of valid customer tags (CIDs) for network ports (*cnprole* = NETWORK) collected by GVRP.

    This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL.

    If the parameter *vvidlsd* is generally not supported, then the parameter is always omitted. Otherwise, this parameter is reported only if

    - the virtual switch entity exists (i.e. the VLAN tagging mode vlantagmd of the slot the addressed EPort belongs to is set to 802.1TAG) AND
    - GVRP is enabled on the virtual switch (*gvrpmode* = ENABLED)
    - the port is a NETWORK port (*cnprole* = NETWORK).

    Type: Alphanumeric string and the character ’&’.

    Range:

    - Value of each single member (valid VLAN identifier) in the list 1, 2, …, 4092, 4093
    - In case the list has no members (empty list) -1.

    If the value can not be retrieved: UNAVAILABLE

    Default: There is no default value.

    Example 1:

    vvidlsd=-1 The list has no members (empty list).

    Example 2:

    vvidlsd=3&5&40&&45 This list has the members 3, 5, 40, 41, 42, 43, 44 and 45.

31. **wtr** – Wait To Restore Time

    The parameter *wtr* specifies the wait to restore time for the LCAS protection. If a tributary is configured to take part on transmission for the VCG and it recovers from a faulty state then this tributary is taken in again to transmission by LCAS after the wait-to-restore time. This time is configured on group level, i.e. all tributaries have the same value for the wait-to-restore time. This parameter only affects NE behavior if *lcasmd* = ENABLED.

    For *modifier* = ES64U the parameter is visible with default values for retrieval, but cannot be modified.

    Type: Alphanumeric value set.

    Range: 0, 1, 2, …, 59, 60 [minutes].

    Default: 0.

Example output

Example of VCG creation related to a 1GE interface of a GE1 pack:

```
   UNITE-NE 08-03-28 11:11:00
A  001 REPT DBCHG
   ″TIME=11-10-30,DATE=08-03-28:ENT-VCG:1-1-#-#-2-
      V3::cnprole=NETWORK,dftpri=LOW,dftvlan=UNAVAILABLE,enetpn=DEFAULT,enettca=DEFAULT,epor
;
```

Example of VCG creation related to a 1 GE interface of the GE10PL1 pack (interface standard mode SONET):

```
   UNITE-NE 08-03-28 11:11:00
A  001 REPT DBCHG
   ″TIME=11-10-30,DATE=08-03-28:ENT-VCG-1GEPL:1-1-#-#-39-v1::\

    localLPIDVCAT=0″
```

;

ENT-VCG-TRANS notification

Output format

The **ENT-VCG-TRANS** notification uses the general format of a REPT DBCHG notification.

Syntax

ENT-VCG*:aid::spec_block;*

Output parameters

Command parameters

1. **aid** – Access Identifier
   This parameter specifies the VCG to be operated on.
   Type: AID.
   Range: VCGAID as defined in AID structure. The values **vall** for Simple_VCGAID and **usall** for Simple_UnivSlotAID is accepted.

Spec block parameters

1. **camd** – Consequent Action Mode
   This parameter specifies the mode of the consequent action to be executed in egress direction (to the synchronous port) on detected signal fail conditions (dPLM, AI_TSF or detected generic AIS) on the ODU layer
   Type: Alphanumeric value set.
   Range: GENERICAIS (default), MSAIS, LASEROFF
2. **enetpn** – Ethernet Alarm Severity Assignment Profile Name
   This parameter points to a tributary ASAP profile name of type ENET for the designated AID.
   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
   Range: 1 … 24 characters length.
   Default: DEFAULT.
3. **fevpm** – Far End VCG Performance Monitoring
   The parameter fevpm specifies whether the far end performance monitoring is enabled or disabled for this port. For the fully transparent application performance monitoring is actually done on the ODUkP layer. This parameter enables/disable therefore far end PM on the ODUkP layer.
   Type: Alphanumeric value set.
   Range: DISABLE (default), ENABLE
4. **inputsig** – Tributary Input Signal Rate List
   This parameter reports the tributary structure of the VCG port in input direction. This will implicitly give the maximum capacity of the VCG port, too. The tributary structure is independent from the interface standard istd specified for this VCG.

Type: numeric string of the form NX

- N specifies the count of container type X
- X specifies the container type (or envelope).

Range:

- N=17,
- X = 4 for VC-4 / STS3-3c.

Default: 174.

5. **nevpm** – Near End VCG Performance Monitoring
The parameter nevpm specifies whether the near end performance monitoring is enabled or disabled for this port. For the fully transparent application performance monitoring is actually done on the ODUkP layer. This parameter enables/disable therefore near end PM on the ODUkP layer.
Type: Alphanumeric value set
Range: DISABLE (default), ENABLE
6. **istd** – Interface Standard
This parameter specifies the interface standard of this VCG. This value is applied for both input and output direction.
Type: Alphanumeric value set.
Range:
   - SDH
   - SONET.

   Default: As derived from parameter *istddflt* specified at configuration management, section System RTRV-EQPT.
7. **nevpm** – Near End VCG Performance Monitoring
This parameter specifies whether the near end performance monitoring is enabled or disabled for this port.
Type: Alphanumeric value set.
Range: DISABLE (default), ENABLE
8. **pmvcgfeses** – Performance Monitoring VCG Far-End SES Threshold
This parameter describes the ODUkP Far-End SES threshold value. It indicates the number of errored blocks per second to declare a second as severely errored. The default value is defined in G.8201 for OTN. If the interface standard is changed the current default value is not changed.
Type: numeric value set.
Range (the range depends on the ODUkP rate): ODU1P: 1 – 20420
Default: ODU1P: 3064
G.8201 defines block based PM on the ODUkP layer.
9. **pmvcgneses** – Performance Monitoring VCG Near-End SES Threshold
This parameter describes the VCG (actually ODUkP) Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severly errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface

standard is changed the current default value is not adapted automatically.
Type: numeric value set.
Range (the range depends on the ODUkP rate): ODU1P: 1 – 20420
Default: ODU1P: 3064
G.8201 defines block based PM on the ODUkP layer.

10. **`tcamd`** – TCA mode
This parameter shows the modus of the PM thresholding.
Two thresholding methods are applicable: TR-only, (also known as the implicit reset method). TR-RTR, (also known as the explicit reset method).
Type: Alphanumeric value set.
Range: TR, TRRTR.
Default: TRRTR in SDH mode; TR in SONET mode.

11. **`transpn`** – Transparent Alarm Severity Assignment Profile Name
This parameter points to a ASAP profile name of type TRANSPARENCY for the designated AID.
Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
Range: 1 … 24 characters length
Default: DEFAULT.

12. **`transtca`** – Transparent TCA Profile Name
The parameter transtca specifies the name of the threshold crossing alert (TCA) profile used for the VCG..
Type: Alphanumeric string.
Range: 1 … 24 characters length
Default: DEFAULT0

13. **`unequiposig`** – Unequipped Tributary Output Signal Rate List
This parameter specifies the tributary structure and the capacity of the VCG port in output direction. As long as there is no cross-connection applied the specified tributaries are occupied by an unequipped signal. The parameter will implicitly give the maximum capacity of the VCG port, too. The tributary structure is independentof the interface standard specified for this VCG.
Type: numeric string of the form NX.
    - N specifies the count of container type X
    - X specifies the container type (or envelope)

    Range:
    - N = 17
    - X = 4 for VC-4 / STS-3C

    Default: 174

14. **`vmode`** – VCG Monitoring Mode
This parameter wtr specifies the monitoring mode for VCG.
Type: Alphanumeric value set.
Range: MON: for monitored; NMON (default): for not monitored.

Example output

```
   LT-UNITE 00-11-11 11:11:00
A  001 REPT DBCHG
   ”TIME=11-10-30,DATE=00-11-11:ENT-VCG-TRANS:1-1-#-#-2-V3::
      camd=GENERICAIS,enetpn=DEFAULT,fevpm=DISABLE,inputsig=174,nevpm=DISABLE,pmvcgfeses=3064,p
;
```

ENT-VCGTRIB notification

Output format

The **ENT-VCGTRIB** notification uses the general format of a **REPT DBCHG** Report Database Change notification.

Syntax: The **ENT-VCGTRIB** notification has the following specific syntax:

ENT-VCGTRIB-modifier:*aid*::*spec_block*;

Output parameters

Command parameters

1. **modifier**
   This parameter specifies the type of the tributary.
   Type: Alphanumeric value set.
   Range: STS, VC, STST, VCT.
2. **aid** – Access Identifier
   This parameter specifies the VCG tributary whose attributes are reported.
   Type: AID.
   Range: VCGNumAID as defined in AID structure with exception of value all.

Spec block parameters

1. **brstintvl**- Bursty Interval
   This parameter specifies the measurement period for degraded defect if *sdsfmode* is set to BURST. If *sdsfmode* is not set to BURST then *brstintvl* has no affect to NE behavior.
   Type: Integer..
   Range: 2, 3, …, 10 [seconds].
   Default: 7 [seconds].
2. **brstthr** – Bursty Error Threshold
   This parameter specifies the degradation threshold for degraded defect if *sdsfmode* is set to BURST. If *sdsfmode* is not set to BURST then *brstthr* has no affect to NE behavior.
   Type: Integer.
   Range: 5, 10, 15, … 50 [%].
   Default: 30 [%].
3. **crslpbkstat** – Cross-connect Loopback Status
   This parameter reports the configuration of the cross-connection loopback of this tributary. For changing the loopback operation refer to "OPR-LPBK: Operate cross-connection loopback" (p. 3-2035).
   Type: Alphanumeric value set.
   Range: YES, for enabled loopback; NO, for disabled loopback.

4. **`degthr`** – Signal Degrade Threshold
   This parameter specifies the exponent to base 10 for building the degraded threshold level. The degraded threshold level is used for building the degraded defect if sdsfmode is set to POISSON. If *sdsfmode* is not set to POISSON then *degthr* has no affect to NE behavior. For the definition of *sdsfmode* refer to the Output parameters section.
   Type: Integer.
   Range: -5, -6, -7, -8, -9 i.e. range is 10exp-9 to 10exp-5.
   Default: -6
5. **`dexcthr`** – Excessive Degrade Threshold
   This parameter specifies the exponent to base 10 for building the excessive threshold level. The excessive threshold level is used for building the excessive bit error defect if *sdsfmode* is set to POISSON. If *sdsfmode* is not set to POISSON then *dexcthr* has no affect to NE behavior. For the definition of *sdsfmode* refer to the Output parameters section.
   Type: Integer.
   Range: -3, -4, -5 i.e. range is 10exp-5 to 10exp-3.
   Default: -3.
6. **`exphptrc`** – Expected HP trace identifier
   This parameter specifies the Expected Higher Order Path Trace Identifier (J1). The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is only useful if *ptrcrfmt* is set to 16.
   For VCG tributaries located on ES64U packs, this parameter shall be visible with default values for retrieval but cannot be modified.
   Type: Hexadecimal number without a preceding "H".
   Range: length, 32 hexadecimal digits; value, specific string acc. ITU/ETSI mode 1.
   Default: 89000000000000000000000000000000.
7. **`feppm`** – Far End Path PM Enable
   This parameter specifies whether the performance monitoring for the far end is enabled or disabled for this tributary.
   For VCG tributaries located on ES64U packs, this parameter shall be visible with default values for retrieval but cannot be modified.
   Type: Alphanumeric value set.
   Range: DISABLE, ENABLE.
   Default: DISABLE.
8. **`hptimais`** – HP Trace Identifier Mismatch AIS Insertion
   This parameter specifies if a detected TIM will cause AIS insertion. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
   Type: Alphanumeric value set.

Range: DISABLE , ENABLE.
Default: The default value depends on interface standard specified by istd for the VCG owning this tributary. For definition of *istd* refer to "RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3078) Output parameters. DISABLE, if *istd* = SONET; ENABLE, if *istd* = SDH.

9. **`hptimmon`** – HP Trace Identifier Mismatch Monitor
   This parameter specifies if the mode of the TIM detection. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
   Type: Alphanumeric value set.
   Range: DISABLE (default), ENABLE.
10. **`inmbs`** – Input Membership
    This parameter specifies if the tributary shall take part to the transmission of its owning VCG in input direction. Input direction in this case means from the LCAS source on the GE1 pack to the cross-connect pack XC***n***. The addressing scheme of the tributaries by using VCGNumAIDs is ensuring that only legal AIDs are used. So no consideration about the "illegal" tributaries (for example, 1-1-#-#-1-1-3 for VC-4) is necessary. The parameter *inmbs* is only valid for modifiers different from STST and VCT, that means, is omitted in the command response for STST and VCT.
    The system shall not evaluate the parameter *inmbs* if the parameter *vcat* of the related VCG is set to DISABLE. The parameter is retrievable.
    Type: Alphanumeric value set.
    Range: DISABLE , ENABLE.
    Default:
    - for modifiers STST or VCT: ENABLE
    - for all other modifiers: DISABLE.

    The VCG for GE***n*** and ES64U has as default the size 0, that means, it has no member. So the default for the parameter above for VCGTRIB needs to be DISABLE so that the user may decide explicitly if one tributary shall take part to the transmission.
11. **`inmbst`** – Input Member Status
    This parameter reports the status of the tributary related to its VCG membership in input direction.
    Type: Alphanumeric value set.
    Range:
    - for modifiers STST or VCT always ACTIVE is reported
    - for all other modifiers:
    - NA, for not applicable, i.e. if the trib. is no member of the VCG or if virtual concatenation is disabled
    - ADD, the tributary is in the LCAS state ″Wait-for-Add″, ″Add″ or ″Wait-for-ACK″

- ACTIVE, the tributary is member of the VCG and working
- FAILED, the tributary is member of the VCG but taken off by LCAS (incoming failed condition for the sink tributary)
- UNAVAILABLE, for not available, i.e. the trib. is member of the VCG but the current data is not retrievable for any reason.

  The state FAILED can only be reported if *lcasmd* is set to ENABLE for the VCG owning this tributary. For parameter *lcasmd* refer to the Output parameters section of "RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3078).

  For VCG tributaries located on ES64U packs, only "NA" will be reported.

12. **neppm** – Near End Path PM Enable

    This parameter specifies whether the performance monitoring for the near end is enabled or disabled for this tributary.

    For VCG tributaries located on ES64U packs, this parameter cannot be modified but will be reported with default values since performance monitoring on VCGTRIB level is not supported.

    Type: Alphanumeric value set.

    Range:

    - DISABLE (default)
    - ENABLE.

13. **outmbs** – Output Membership

    This parameter specifies if the tributary shall take part to the transmission of its owning VCG in output direction. Output direction in this case means from the cross-connect pack XCn to the LCAS sink on the GE1 GE***n*** pack. The parameter outmbs is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT. The system shall not evaluate the parameter *outmbs* if the parameter *vcat* of the related VCG is set to DISABLE. The parameter is retrievable.

    Type: Alphanumeric value set.

    Range:

    - DISABLE
    - ENABLE.

    Default: for modifiers STST or VCT ENABLE. for all other modifiers: DISABLE. The GE***n*** and ES64U has as default the size 0, i.e. it has no member. So the default for the parameter above for VCGTRIB needs to be DISABLE so that the user may decide explicitly if one tributary shall take part to the transmission.

14. **outmbst** – Output Member Status

    This parameter reports the status of the tributary related to its VCG membership in output direction.

    Type: Alphanumeric value set.

Range:

- NA, for not applicable, if i.e. the trib. is no member of the VCG or if virtual concatenation is disabled
- ADD, the tributary is in the LCAS state ″Wait-for-Add″, ″Add″ or ″Wait-for-ACK″
- ACTIVE, the tributary is member of the VCG and working
- FAILED, the tributary is member of the VCG but not working due to a failure condition. Includes period during ″Hold-Off″.
- WTR, failure condition has cleared, tributary is in wait to restore condition.
- UNAVAILABLE, for not available, i.e. the trib. is member of the VCG but the current data is not retrievable for any reason.

  The state WTR can only be reported if lcasmd is set to ENABLE for the VCG owning this tributary. For parameter lcasmd refer to RTRV-VCG Output Parameters. For a detailed explanation of the ADD state in the LCAS protection scheme, please refer to SRD_DATA_Virtual_Concatenation.

For VCG tributaries located on ES64U packs, only “NA” will be reported.

15. **`pmhpfeses`** – PM HP Far End SES Threshold

    This parameter specifies the Higher Order Path Far End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the far end. The behavior depends on interface standard specified by *istd* for the VCG owning this tributary. For definition of *istd* refer to the output parameters section of “RTRV-VCG: Retrieve virtual concatenation group” (p. 3-3078). If *istd* is not set to SDH then *pmhpfeses* has no affect to NE behavior.

    For VCG tributaries located on ES64U packs, this parameter can be modified although it has currently no effect as performance monitoring on VCGTRIB level is not supported.

    Type: Integer.

    Range: 1, 2, 3, …, 63998, 63999, 64000, includes SDH/SONET range.

    Default: 2400.

16. **`pmhpneses`** – PM HP Near End SES Threshold

    This parameter specifies the Higher Order Path Near End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the near end. The behavior depends on interface standard specified by *istd* for the VCG owning this tributary. For definition of *istd* refer to the output parameters section of “RTRV-VCG: Retrieve virtual concatenation group” (p. 3-3078). If *istd* is not set to SDH then *pmhpneses* has no affect to NE behavior.

    For VCG tributaries located on ES64U packs, this parameter can be modified

although it has currently no effect as performance monitoring on VCGTRIB level is not supported.
Type: Integer.
Range: 1, 2, 3, …, 63998, 63999, 64000, includes SDH/SONET range.
Default: 2400.

17. **`ptca`** – Path TCA Profile Pointer
This parameter specifies the name of the threshold crossing alert (TCA) profile used for this tributary.
The parameter *ptca* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.
For VCG tributaries located on ES64U packs, this parameter can be modified although it has currently no effect as performance monitoring on VCGTRIB level is not supported.
Type: Alphanumeric string.
Range: 1 … 24 characters.
Default: DEFAULT0.

18. **`ptpn`** – Path Terminating ASA Profile Name
This parameter points to a tributary ASAP profile name pfname for the designated AID.
Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.
Range: 1 … 24 characters.
Default: DEFAULT.

19. **`ptrcrfmt`** – Path Trace Read Format
This parameter specifies the format of the path trace (J1 byte) to be received (sink).
For VCG tributaries located on ES64U packs, this parameter shall be visible with default values for retrieval, but cannot be modified.
Type: numeric string.
Range:
- 2, for non-specific repeating byte
- 16, for 16 byte specific string
- 64, for 64 byte string.

Default:
For VCG tributaries located on GE1 packs: 2
For VCG tributaries located on GE10PL1 or ES64U packs: 16 if *istd* = SDH, 64 if *istd* = SONET.

20. **`ptrcwfmt`** – Path Trace Write Format
This parameter specifies the format of the path trace (J1 byte) to be sent (source).
For VCG tributaries located on ES64U packs, this parameter shall be visible with default values for retrieval, but cannot be modified.
Type: numeric string.

Range:

- 2, for non-specific repeating byte
- 16, for 16 byte specific string
- 64, for 64 byte string.

Default:
For VCG tributaries located on GE1 packs: 2
For VCG tributaries located on GE10PL1 or ES64U packs: 16 if *istd* = SDH, 64 if *istd* = SONET.

21. **sdsfmode** – Signal Degrade/Signal Fail Mode
This parameter specifies the determination mode of degraded defect for transmission.
Type: Alphanumeric value set.
Range: BURST or POISSON.
Default: For VCG tributaries located on a GE10PL1 pack, the default is: BURST.
For VCG tributaries located on other packs, the default value depends on interface standard specified by *istd* for the VCG owning this tributary. For definition of *istd* refer to the “Output parameters” section of “RTRV-VCG: Retrieve virtual concatenation group” (p. 3-3078).
    - POISSON, if *istd* = SONET
    - BURST, if *istd* = SDH
22. **tcamd** – TCA mode
This parameter is only available for SDH mode. This means the modifier must be VC. The parameter shows the modus of the PM thresholding. Two thresholding methods are applicable for SDH: TR-only (also known as the implicit reset method), TR-RTR (also known as the explicit reset method). For SONET the parameter *tcamd* does not exist. SONET ports only support ″TR-only″ mode. Thus the mode must be internally set to ″TR-only″.
Type: Alphanumeric value set.
Range: TR, TRRTR.
Default: SDH mode: TRRTR. SONET mode: TR (internal).
For SONET the parameter *tcamd* does not exist. SONET ports only support ″TR-only″ mode. Thus the mode must be internally set to ″TR-only″.
The parameter *tcamd* is only valid for modifiers different from STST and VCT, i.e. shall be omitted in the command response for STST and VCT.
For VCG tributaries located on ES64U packs, this parameter can be modified although it has currently no effect as performance monitoring on VCGTRIB level is not supported.
23. **tmonmd** – Tributary Monitoring Mode
This parameter specifies the monitoring mode for the tributary.
For VCG tributaries located on ES64U packs, this parameter can be modified although it has currently no effect.
Type: Alphanumeric value set.
Range: MON or NMON (default).

24. **`trc`** – Outgoing Path Trace
This parameter specifies the path trace (J1) to be sent (source). For the 16 byte path trace format the following syntactical rule is applied: The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is irrelevant if the format is non-specific repeating byte (*ptrcwfmt* = 2).
For VCG tributaries located on ES64U packs, this parameter shall be visible with default values for retrieval, but cannot be modified.
Type: Hexadecimal number without a preceding "H".
Range: the range depends on the parameter ptrcwfmt specified in **`RTRV-VCGTRIB`** Output parameters length
    - 32, hexadecimal digits, if *ptrcwfmt* = 16
    - 128, hexadecimal digits, if *ptrcwfmt* = 64
    - value: specific string acc. ITU/ETSI mode 1, if *ptrcwfmt* = 16; 64 byte string, if *ptrcwfmt* = 16.

    Default: Depending on the default value of *ptrcwfmt*:
    - 00hex, if *ptrcwfmt* = 2.
    - 89hex followed by 15 bytes 00hex, if *ptrcwfmt* = 16.
    - 64 bytes 00hex, if *ptrcwfmt* = 64.
25. **`tslmmon`** – Trail Signal Label Mismatch Monitor
This parameter specifies the mode of the TSL mismatch detection.
For VCG tributaries located on ES64U packs, this parameter is visible with default values for retrieval, but cannot be modified.
Type: Alphanumeric value set.
Range:
    - DISABLE
    - ENABLE (default).

Example output

```
   LT-UNITE 00-11-11 11:11:00
A  001 REPT DBCHG
   ″TIME=11-10-30,DATE=00-11-11:ENT-VCGTRIB-STS:1-1-#-#-2-V1-4::

;
```

ENT-VRTSW notification

Output format

The **ENT-VRTSW** notification uses the general format of a REPT DBCHG (Report Database Change) notification.

Command syntax: **ENT-VRTSW***:aid:vrtswid:spec_block;*

Output parameters

Command parameters

1. **aid** – Access Identifier
   This parameter specifies the slot containing a GE1 pack to be operated on.
   Type: AID.
   Range: UnivSlotAID as defined in AID structure with the exception of the value all and usall.
2. **vrtswid** – Virtual Switch Identifier
   This parameter identifiers the instance of the virtual switch.
   - A Virtual Switch ID is unique within a single circuit pack. When creating a new Virtual Switch, the system automatically assigns a unique ID to it.
   - There will be one virtual switch per physical switch, implicitly all LAN ports and all WAN ports on the physical switch are part of the single virtual switch. The ID of this virtual switch is fixed to 1. A future release may support multiple virtual switches per physical switch.

   Type: Integer.
   Range: 1 – Currently this is the only allowed value.
   Default: 1.

Spec block parameters

1. **eplst** – EPORT AID list
   This parameter specifies a list of EPORT instances connected to the virtual switch instance as specified by *vrtswid*.
   In R3 there is only one virtual switch instance to which all ports are mapped. Therefore this list is fix.
   Type: AID list.

Range: A list of EPortAIDs as specified in the AID definition section with the exception of the values all and usall in the respective components of the AID, separated by an ampersand ('&')
Example: If all four EPORTs of a GE1 are mapped to one virtual switch: 1-#-#-1-1-1&1-#-#-1-1-2&1-#-#-1-1-3&1-#-#-1-1-4

2. **`ethertype`** – VLAN tag protocol ID
This parameter specifies the VLAN tag protocol ID necessary for interworking purposes. This parameter is used to control whether the virtual switch operates in IEEE802.1Q tagging mode (i.e. set to 0x8100) or in transparent tagging mode (i.e. set to value different to 0x8100).
Type: Hexadecimal value.
Range: 0x0600 .. 0xFFFF.
The following values have a specific meaning:
   - 0x8100: virtual switch operates in IEEE802.1Q tagging mode
   - any other value: virtual switch operates in transparent tagging mode.

   Default: 0x8100.
3. **`gvrpmode`** – GVRP mode
The parameter *gvrpmode* allows to control the dynamic VLAN registration mode.
Type: Alphanumeric value set.
Range: ENABLED, GVRP is enabled. DISABLED (default), GVRP is disabled.
4. **`stbrpriority`** – Spanning tree bridge priority
This parameter specifies the priority of the bridge to be used by the Spanning Tree Protocol.
Type: Integer.
Range: 0 to 65535.
The stepping as recommended by the standard (steps of 4096 starting at 0) should be implemented by the management system. The NE will accept any value in the range described above. This has the consequence, that also the range restriction ″0 to 61440″ is not done by the NE.
Default: 32768.
5. **`stfdtm`** – Spanning Tree forward delay timer
The parameter *stfdtm* specifies the rSTP-related bridge forward delay timer. This parameter is relevant for both rSTP and STP.
Type: Integer.
Range: 1 .. 255.
Default: 15.
6. **`sthellotm`** – Spanning Tree hello timer
The parameter *sthellotm* specifies the rSTP-related bridge hello timer. This parameter is relevant for both rSTP and STP.
Type: Integer.
Range: 1 .. 225.
Default: 2.

7. **`stmaxage`** – Spanning Tree maximum age timer
   The parameter *stmaxage* specifies the rSTP-related maximum PDU transmission delay timer. This parameter is relevant for both rSTP and STP.
   Type: Integer.
   Range: 1 .. 255.
   Default: 20.
8. **`vcglst`** – VCG AID list
   The parameter *vcglst* specifies a list of VCG instances connected to the virtual switch instance as specified by *vrtswid*.
   In R3 there is only one virtual switch instance to which all eports are mapped. Therefore this list is fix.
   Type: AID list.
   Range: A list of VCGAIDs as specified in the AID definition section with the exception of the values all, usall and vall in the respective components of the AID, separated by an ampersand ('&').
   Example: If all four VCGs of a GE1 are mapped to one virtual switch:
   1-#-#-1-1-v1&1-#-#-1-1-v2&1-#-#-1-1-v3&1-#-#-1-1-v4.

Example output

```
  LT-UNITE 02-05-15 13:31:30
A  001 REPT DBCHG
   "TIME=13-30-00,DATE=02-05-15:ENT-VRTSW:1-1-#-#-1:1:eplst=1-1-#-#-1-1&1-1-#-#-1-
      2&1-1-#-#-1-3&1-1-#-#-1-
      4,gvrpmode=ENABLED,stbrpriority=32768,stfdtm=15,sthellotm=2,stmaxage=20,ethertype=0x8100,
;
```

INH-MSG: Inhibit message

The **INH-MSG** command instructs the NE to inhibit the forwarding of autonomous messages on the user session or per system (depending on parameter *sessions*). Autonomous messages are messages which are provided by the system itself without a trigger via the management interface (e.g. alarms, switch reports).

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 1

Abortable: no

Input format

Command syntax: **INH-MSG-ALL**:*tid*::*ctag*[::,,,,*sessions*];

The purpose of the commas in case the optional parameter *sessions* is present is that the format is compliant with non-supported position defined parameters in GR-833.

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
3. **sessions** – Affected sessions
   This parameter specifies for which sessions the *msgstate* is applied.
   Type: Alphanumeric value set.
   Range: CURRENT: affected session is the current session of the user who executed the command.
   Default: CURRENT

Output format

If the INH-MSG request completes successfully, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The command disables autonomous message reporting as specified by *sessions*.

If the user is logged in more than once, and *sessions* = CURRENT, only the current login session is affected by this command.

If the **INH-MSG** command inhibits autonomous messages that have already been suspended, it will complete successfully.

For *sessions* = CURRENT, the *atag* sequence will be reset to 000 when autonomous message are resumed.

The *atag* for a memory administration user is not affected by this command, see also "RTRV-AO: Retrieve autonomous output" (p. 3-2241).

Example input/output

The following is an example of the **INH-MSG** command:

```
INH-MSG-ALL:LT-UNITE::123456;

   LT-UNITE 00-11-15 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **INH-MSG** command.

Related TL1 messages

- "ALW-MSG: Allow message" (p. 3-33)
- "RTRV-ATTR-MSG: Retrieve attribute message" (p. 3-2260)

References

GR-833-CORE

INIT-EQPT (slot): Initialize equipment (slot)

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M4

Priority: 1

Abortable: No.

Input format

Command syntax: **`INIT-EQPT`**:*tid*:*aid*:*ctag*[:::*spec_block*];

Input parameters

Command parameters

1. **`tid`** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **`aid`** – Access Identifier
   The AID of a slot.
   Type: AID.
   Range:
   - SlotAID
   - UnivSlotAID
   - XCSlotAID
   - CTLSlotAID.

   The keyword **`usall`** is not allowed for Simple_UnivSlotAID
   The keyword **`xcall`** is not allowed for Simple_XCSlotAID
   The keyword **`ctlall`** is not allowed for Simple_CTLSlotAID
   The keyword **`all`** is not allowed for Simple_SlotAID
   The keyword **`all`** is not allowed on bay/shelf level.
3. **`ctag`** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **`resettype`** – Reset Type
   With this parameter the type of the reset is selected. Full reset can be traffic affecting and controller reset is not traffic affecting.
   Type: Alphanumeric value set.

Range:

- FULL: Full reset
- CONTR: Controller reset.

Default: FULL.

Output format

If the NE fully complies with the INIT-EQPT request, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

- *resettype* = FULL: The command resets the controller and all transmission devices of the circuit pack in the addressed slot.
- *resettype* = CONTR: The command resets only the controller of the circuit pack in the addressed slot and not the transmission devices.

The **INIT-EQPT** command does not generate a **REPT DBCHG** message. There are no unique state change notifications associated with the **INIT-EQPT** command. There are, however, all the state change notifications (operational state) associated with the subsequent restart of the circuit pack.

Update affected entities

These resets affect the operational state of the circuit pack. This change is reported by means of an ED-STATE-EQPT notification for the affected circuit pack. An exception is the reset for CTL pack. For this board no notification is created.

Example input/output

The following shows an example of the **INIT-EQPT** command where the AID identifies the universal slot 7 in bay 1, shelf 1:

```
INIT-EQPT:LT-UNITE:1-1-#-#-7:123456:::resettype=CONTR;

   LT-UNITE 00-11-16 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **INIT-EQPT** command.

Related TL1 messages

"INIT-SYS: Initialize system" (p. 3-2026)

References

GR-833-CORE

INIT-SYS: Initialize system

The **INIT-SYS** command results in a full reset of all circuit packs that are present in the system. The initialization is equivalent to power cycle reset of the whole system.

The **INIT-SYS** command is traffic affecting.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S4

Priority: 1

Abortable: no

Input format

Command syntax: **INIT-SYS**:*tid*::*ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

If the NE fully complies with the INIT-SYS request, the following normal completion response is returned to indicate the initialization has been started:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

The **INIT-SYS** command does not generate a **REPT DBCHG** message. There are no unique state change notifications associated with the **INIT-SYS** command. There are, however, all the state change notifications associated with the subsequent restart of all CTIPs. This includes multiple state change messages. Refer to autonomous notifications because of state changes.

Example input/output

The following is an example for the **INIT-SYS** command:

```
INIT-SYS:LT-UNITE::123456;

   LT-UNITE 00-11-16 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to INIT-SYS command.

OPR-DEFRAG: Perform defragmentation

Overview

This command is used to initiate the defragmentation of a link or other entity.

This command is issued by an operator to actually perform a defrag or empty port operation on a port. The command causes the receiving node to start the defrag or empty port operation as specified by the scope field. The sequence of operations that will be followed is first computed and then each action is carried out as an atomic operation.

Database change reports generated

As a result of the time-slot movements, this command shall cause db change notifications.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P3

Abortable: No.

Input format

Command syntax: **`OPR-DEFRAG:`***src-Tid:[src-Aid]:ctag::scope:targetID*;

Input parameters

1. **`srcTid`** – Target Identifier
   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **`ctag`** – Correlation Tag
   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ".").

3. **`srcAid`**
   Source node ONNS application access identifier of the ONNS controller OS command interface port.
   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn.
4. **`scope`**
   This parameter specifies the scope of the defrag or empty port operation: intra-port,inter-port [intra link] or empty port.
   Type: Alphanumeric value set.

   Range:

   - PORT: specifies that the defrag is intra fiber, i.e. on a specific port. In this case the targetID is the same as the portAID. The corresponding neighbor node and neighbor portAID can be deduced form the targetID.
   - LINK: specifies the link defrag is inter fiber but within a link bundle. Also, the link defrag operation is performed on all the bundles between the two neighboring nodes. TargetID specifies the neighbor nodes ASTN node ID.
   - EMPTYPORT: specifies to empty a port by moving all connections via this port to other ports within the same link bundle. The targetID defines the port which should be emptied. The corresponding neighbor node and neighbor portAID can be deduced form the targetID.
5. **`targetID`**
   The specification of the targetID depends on the setting of the parameter scope: PORT specifies the AID of the port on the local node that is to be defragmented LINK specifies the ASTN node ID of the neighbor node of the connected link that is to be defragmented EMPTYPORT specifies the AID of the port on the local node that is to be emptied
   Type: Four dash separated numeric string for the portAID. Four dot separated numeric string for the neighbor ASTN node ID.
   Range: Each numeric string: 0…255.

Output format

If the **`OPR-DEFRAG`** request checked on the input parameters against NNDM, the following normal completion response is returned:

```
   srcTid date time
M  ctag COMPLD
;
```

The final successful defragmentation operation and also the interruption or abortion of the operation is sent out via **`REPT NNCHG`** notification

Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completion code* and their syntax are included in the section “Output parameters” of the “RTRV-PATH: Retrieve ONNS connection data” (p. 3-2698) command.

Example input/output

Input/output examples for intra-port defragmentation

The following example shows a successful completion of a intra-port defragmentation command:

```
OPR-DEFRAG:NN001:snn:ed01::PORT,1-1-2-1;

   NN001 2002-01-12 01:03:16
M  ed01 COMPLD
;
```

Input/output examples for inter-port defragmentation

The following example shows a successful completion of an inter-port defragmentation:

```
OPR-DEFRAG:NN001:snn:ed01::LINK, 29.13.80.192;

   NN001 2002-01-12 01:03:16
M  ed01 COMPLD
;
```

The following example shows a successful completion of an empty port defragmentation:

```
OPR-DEFRAG:NN001:snn:ed01::EMPTYPORT,1-1-2-1;

   NN001 2002-01-12 01:03:16
M  ed01 COMPLD
;
```

Error responses

The following list identifies conditions that will cause a similar error response:

`E410 (IIPI) Input, Invalid PortId`

`E512 (IINI) Error – Input, Invalid Neighbor node ID`

Conflicting Defragmentation Request

There is already a defragmentation action in progress with the NE. The following list identifies conditions that will cause a similar error response:

Error code: `E620 (DAIP) Defragmentation already in progress`

Port Failure

If a failure occurs like remote node crash or fiber cut while a defrag or empty port operation is requested, the request will return with a DENY message and an error code specifying the type of failure. The following list identifies conditions that will cause a similar error response:

Error code: `E617 (PLFS) Port or Line in Failed State`

Port Lockout State

Depending on the operation request the system will behave differently if a port is in LOCKOUT state:

- Defrag Operation: The request will return with a DENY message and an error code specifying the type of failure if one of the ports is in LOCKOUT state.
- Empty Port Operation: The request will return with a DENY message and an error code specifying the type of failure if the specified port is not in LOCKOUT state. Other ports of the link bundle are allowed to be in LOCKOUT state.

The following list identifies conditions that will cause a similar error response:

Error code: `E618 (PLOS) Port in Lock-Out State`

Error code: `E619 (PNLS) Port is not in Lock-Out State`

Port can not be emptied

The request will return for an empty port operation with a DENY message and an error code if:

- it is the only port in the link bundle
- all other ports of the link bundle are in LOCKOUT state
- no connections can be moved, because there is no place in the other (not locked-out) ports of the same link bundle.

The following list identifies conditions that will cause a similar error response:

- `E621 (NTPA) No Target Port Available`
- E622 (NFSA) No Free Space on remaining link bundle Available

OPR-EXT-CONT: Operate external control

The **OPR-EXT-CONT** command operates a MDO port (Miscellaneous Discrete Output / external discrete control), that means, it switches on the MDO port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 1

Abortable: No

Input format

Command syntax: **OPR-EXT-CONT**:*tid:aid:ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   This is the address of the MDO port entities on which the command operates. If misc_outall is specified the configuration of all MDO's will be retrieved.
   Type: AID
   Range: Miscellaneous_out_discreteAID
   Default: misc_outall (if the *aid* is omitted).
3. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output format

The following example shows the successful completion of the **OPR-EXT-CONT** command by the NE:

```
   sid date time
M  ctag COMPLD
;
```

If the **OPR-EXT-CONT** command does not alter the existing attributes, i.e., the control referenced by the aid is already operated, the NE will not deny the command. The system will respond with the completion message shown above.

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

If no probable cause is assigned to the MDO port the command changes the state of the MDO specified via aid to ″switched on″, i.e. the MDO port will be activated.

The update will be reported via a OPR-EXT-CONT – REPT DBCHG message. Refer to the definition of the OPR-EXT-CONT notification.

Example input/output

The following example shows the successful completion of the **OPR-EXT-CONT** command by the NE:

```
OPR-EXT-CONT:LT-UNITE-123:MISC_OUT3:123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **OPR-EXT-CONT** command.

Validation rule: probable cause assigned to MDO port

A probable cause is assigned to the MDO port. This command will be not performed.

Error code: `SDNC – Status, Data Not Consistent, asgncond not empty`

Related TL1 messages

OPR-EXT-CONT notification

Output format

The **`OPR-EXT-CONT`** notification has the following specific syntax:

`OPR-EXT-CONT`:*aid*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Refer to the *aid* parameter in the output parameters section of the "RTRV-ATTR-CONT: Retrieve attribute control" (p. 3-2254).

Example output

The example shows a normal OPR-EXT-CONT notification:

```
   LT-UNITE-123 00-01-01 08:00:50
A 815 REPT DBCHG
   "TIME=08-00-12,DATE=00-01-01:OPR-EXT-CONT:MISC_OUT3"
;
```

OPR-LPBK: Operate cross-connection loopback

The **OPR-LPBK**-*modifier* command can be initiated by a user to establish a loopback on a high-order or low-order tributary.

In this section only the loopback on tributaries is considered.

A cross-connection loopback consists of a cross-connection from an input (high-order or low-order) tributary to an output (high-order or low-order) tributary of the same tributary via the referring cross-connection fabric. Note that this loopback is possible on any logical tributary whether there is a cross-connection for that tributary or there is no cross-connection for that tributary (in this case the tributary is said to be ″idle″ – thus the naming cross-connection loopback might be slightly misleading – the naming cross-connection loopback should be understood in the sense that the cross-connection fabric is involved in this command and not in the sense that an existing cross-connection is looped back) After releasing the loopback the former, pre-existing cross-connections (if any) must be automatically re-established.

For setting a loopback on an existing cross-connection the command parameter *cmdmde* has to set to FRCD, else if the tributary is *idle* the *cmdmde* is NORM.

The *modifier* in the **OPR-LPBK** command indicates the rate on which the loopback command is applied to. For high-order tributaries, there is no difference if the rate is specified as a SONET rate (STS1, STS3,..) or as SDH-rate (VC3, VC4,..) i.e. the **OPR-LPBK**-<*sonet-rate*> yields to the same physical and logical behavior as **OPR-LPBK**-<*sdh-rate*>. No check is made if the *modifier* matches the interface-standard of the port i.e. if the port is provisioned as SONET (resp. SDH) and the rate is a SONET (resp. SDH) rate.

For low-order tributaries this is not applicable as there are no tributaries of the same rate in SONET and SDH. Note that for high-order tributaries loopbacks can be still established (like ″idle″ tributaries) if they are substructured or even cross-connected on low-order level.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): T4

Priority: 1

Abortable: No.

Input format

Command syntax: **OPR-LPBK**-*modifier*:*tid*:*aid*:*ctag*::,,,*lpbktyp*[:*spec_block*];

Input parameters

Command parameters

1. **`modifier`**
   This parameter indicates the tributary- respectively cross-connection-rate on which the **`OPR-LPBK`** command acts on.
   For detailed description please refer to the "RTRV-CRS: Retrieve cross-connection" (p. 3-2306) command
   Type: Alphanumeric value set.
   Range:
   - VC3
   - VC4
   - VC44C
   - VC416C
   - VC464C
   - STS1
   - STS3
   - STS12
   - STS48
   - STS192
   - LOVC3
   - LOVC12
   - LOVT1.

   No use of the **`all`** value is allowed.
2. **`tid`** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and the description of this parameter.
3. **`aid`** – Access Identifier
   This parameter specifies the tributary for which the loopback is requested.
   Type: GenTribAID or GenLOTribAID.
   No **`all`** or **`usall`** or **`vall`**-value is possible for any part of the aid.
4. **`ctag`** – Correlation Tag
   See definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2417).
5. **`lpbktyp`** – Loopback Type
   This parameter specifies the type of loopback to be operated. In case of a tributary loopback (either with or without cross-connection) this parameter will be set to CRS.
   Type: alphanumeric value string.
   Range: CRS.

Spec block parameters

1. **`cmdmde`** – Command Mode
   This parameter specifies the command execution mode. If the tributary is involved in a cross-connection the parameter is set to FRCD, else if the tributary is idle (i.e. non cross-connected) *cmdmde* is set to NORM.
   The difference is mainly that in case of an existing cross-connection (in_aid → out_aid) the counterpart (i.e. the out_aid) which formerly delivered traffic will be set to AIS by the loopback operation.
   Type: Alphanumeric value string.
   Range:
   - NORM (default)
   - FRCD.

Output format

If the **`OPR-LPBK`** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

Loopback on tributaries can be switched via the **`OPR-LPBK`** command. The parameters *crslpbkstat* and *crslpbkrate* of the entity tributary are updated: – *crslpbkstat* is updated to YES, – *crslpbkrate* is updated to the entered value as given by the *modifier* parameter.

The update of crslpbkrate is not applicable to LONIM entities as the rate is unique per *aidtype*.

This update is reported by an ED-*rr* (*rr* being either VC3 or STS1) notification for normal tributaries, an ED-VCGTRIB notification for virtual concatenation tributaries, an ED-LONIM notification for low order tributaries..

Behavior for ONNS

No cross-connection loopbacks are supported on ONNS ports (of port class, I-NNI, UNI, or E-NNI) as it is described in the validation rules below.

Cross-connection loopbacks on ONNS ports of port class EDGE are supported.

Updated affected entities when switching a HO-Loopback

Apart from the tributary entity no further entities are affected by the **OPR-LPBK** command.

When using the loopback possibility for VCG-tribs it is in the operators responsibility to ensure that the complete bundle of VCG-tribs (building the VCG) are looped. Otherwise parts of the traffic will be missing.

Update of affected entities when switching a LO-Loopback

In case of switching a LO-loopback while no related LO-Cross-connection is existing the related HO-tributary may be substructured automatically for the first time or the substructure may be adapted. For these side effects the same rules as for creating a LO-cross-connection is applied, see Detailed Behavior of ENT-CRS, ID 72712 and following.

Example input/output

Example 1:

Suppose the following aid 1-1-#-#-1-1-4 is *in_aid* of a cross-connection.

The following command will set a loopback for that tributary.

```
OPR-LPBK-VC4:UNITE-NE:1-1-#-#-1-14:123456::,,,CRS:
cmdmde=FRCD;

   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

Example 2:

Suppose the following aid 1-1-#-#-1-1-4 is not cross-connected.

The following command will set a loopback for that tributary.

```
OPR-LPBK-VC4:UNITE-NE:1-1-#-#-1-1-4:123456::,,,CRS;

   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

Error responses

Validation rule: Valid rate

Loopback command processing verifies that the specified rate is equivalent to the rate of the existing cross-connection. Hereby the SONET-rates are treated identical to the SDH-rates (i.e. sts1/vc3, STS3/vc4 etc.).

The validation is only applied, if the specified tributary is consistent with the tributary boundaries for the specified rate.

Error code:

`IDNC – Input Data Not Consistent, Rate is inconsistent with existing cross-connection`

For the check of the tributary boundary consistency, separate validation rules are defined, see ID 29449 and ID 72755.

Validation rule: Valid loopback type

Loopback command processing verifies that the parameter and *lpbktyp* match i.e. for a tributary loopback the modifier must be present, the aid must specify a tributary and the *lpbktyp* must be CRS.

Error code:

`IDNC – Input Data Not Consistent, Inconsistent loopback type w.r.t. aid`

Validation rule: Loopback must not already exist

Loopback command processing verifies that the loopback command can not be applied to an already existing loopback.

Error code: `SAOP – Status Already Operated, loopback already exists`

Validation rule: No test access session

Loopback command processing shall deny commands requesting a loopback at a tributary which is used in a test access session either as tributary under test or as test access tributary.

Error code:

`SNVS – Status, Not in Valid State, Tributary used in test access session`

Validation rule: No HO loopback while LO cross-connection, substructure or conversion cross-connection exists

If the high-order tributaries specified in the high-order loopback command are substructured or LO cross-connections or conversion cross-connections exist at the tributaries, then the command is denied.

Error code:

`SNVS – Status, Not in Valid State, LO cross-connections or substructure still exist`

Validation rule: No HO loopback while conversion cross-connection exists

If the high-order tributaries specified in the high-order loopback command are involved in conversion cross-connections, then the command is denied.

Error code:

`SNVS – Status, Not in Valid State, LO cross-connections, substructure or conversion cross-connections still exist`

Validation rule: No LO loopback while conversion cross-connections exist

If an attempt is made to create a LO loopback, while a conversion cross-connection exists at the HO tributary or at a LO tributary related to the same HO tributary, then the command is denied.

Error code:

`SNVS – Status, Not in Valid State, conversion cross-connections are still existing`

Validation rule: AID boundary and rate consistency

Loopback command processing verifies that the logical AID specified in the command is consistent with the modifier rate. Consistency implies the following condition:

- The boundary of the specified tributary is consistent with the specified rate.
- STS-1/VC-3 payloads can start at any position.
- The first (STS-1 equivalent) tributary of an STS-3/VC-4 rate cross-connection must be on a mod3 + 1 boundary (1, 4 , 7, …).
- The first STS-1 of an STS-12/VC-4-4c rate cross-connection must be on a mod12 + 1 boundary (1, 13, 25, …).
- The first STS-1 of an STS-48/VC-4-16c rate cross-connection must be on a mod48 + 1 boundary (1, 49, 97, …).
- The first STS-1 of an STS-192/VC-4-64c rate cross-connection must be on a mod192 + 1 boundary (1, 193, 385, …).

Error code:

`IDNC – Input Data Not Consistent, Tributary boundary is inconsistent with the indicated rate`

Validation rule: LO-AID boundary and rate consistency

Loopback command processing verifies that the logical AID specified in the command is consistent with the modifier rate. Consistency implies the following condition:

- The boundary of the specified tributary is consistent with the specified rate.
- STS-1/VC-3 payloads can start at any position.
- If modifier=LOVT1 then LONUMAID (1,2, … 28)
- If modifier==LOVC3 then LONUMAID (1, 22, 43).
- If modifier==LOVC12 then LONUMAID (1, 2, …).

Error code:

`IDNC – Input, Data Not Consistent, Tributary boundary is inconsistent with the indicated rate`

Validation rule: Entities must be adaptable for LO loopbacks

Loopback command processing shall verify that the low-order tributaries specified in the low-order loopback command can be properly created by adaptation of the existing substructure.

Error code:

`IENE – Input, Entity Not Exists, Substructure cannot be adapted`

Validation rule: Tributary provisioning and rate consistency

For fixed rate tributaries, loopback command processing verifies that

- If the port identified by logical input AID is provisioned to operate in the fixed signal rate mode, as determined by the tributary mode parameter, then the specified modifier rate is equivalent to the provisioned signal rate of the input tributary, as determined by the tributary input signal rate parameter.
- This also holds for the output tributary, which must match the input tributary in the sense of equivalence of modifier rate with the output signal rate Note that in both cases that SDH- and SONET tributary signal rates are treated identical (from the loopback perspective) i.e. there is no difference if the SDH values or the SONET values (for the inputsig- and unequiposig-parameters) are used for the tributary signal rate as long as those rates are compatible (i.e. vc3/sts1, vc4/sts3 etc.).

Error code:

`IDNC – Input Data Not Consistent, Specified Tributary does not support the indicated rate`

Note: In case of adaptive rate no consistency check is required

Validation rule: *cmdmde* matches cross-connection non-/existence

Loopback command processing will verify that

- in case no cross-connection exists the *cmdmde* must be NORM
- in case a cross-connection exists the *cmdmde* must be FRCD.

In the other cases

- no cross-connection and *cmdmde* = FRCD and
- cross-connection and *cmdmde* = NORM a rejection takes place.

Error code:

`IDNC – Input Data Not Consistent, cross-connection-existence not consistent with cmdmde-value`

Validation rule: No low-order crossconnection loopbacks with LOXC/1

Loopback command processing shall verify that the low-order switching pack currently used by the system is *not* of type LOXC/1.

Error code:

`SNVS – Status, Not in Valid State, low-order crossconnection loopbacks not allowed with LOXC/1`

Validation rule: No loopbacks on tributaries below ports of *portClass* INNI

Loopback command processing shall verify that the tributary does not belong to a port of *portClass* INNI.

Error code:

`SNVS – Status, Not in Valid State, Port must not be of portClass INNI`

Validation rule: No loopbacks on tributaries below ports of *portClass* UNI

Loopback command processing shall verify that the tributary does not belong to a port of *portClass* UNI.

Error code:

`SNVS – Status, Not in Valid State, Port must not be of portClass UNI`

Validation rule: No loopbacks on tributaries below ports of *portClass* ENNI

Loopback command processing shall verify that the tributary does not belong to a port of *portClass* ENNI.

Error code:

`SNVS – Status, Not in Valid State, Port must not be of portClass ENNI`

Validation rule: No low-order loopbacks with LOXC cap. equal 0

When creating lower-order loopbacks, the command processing shall verify that the capacity of the low-order switching pack is set to a value greater than 0.

Error code:

`SNVS – Status, Not in Valid State, LOXC switch capacity invalid`

GR-199-CORE

OPR-LPBK notification (cross-connection loopback)

There will be no **OPR-LPBK** notification because the changes (for the parameter *crslpbkstat* and *crslpbkrate*) caused by an OPR-LPBK command will be notified via an ED-*rr* (*rr* either VC3 or STS1) notification for normal tributaries, an ED-VCGTRIB notification for virtual concatenation tributaries, an ED-LONIM notification for low order tributaries.

OPR-LPBK: Operate facility loopback

For the GE***n***-pack only a far-side facility loopback for the EPort is allowed – an OPR-LPBK for the EPort to switch a near-side facility loopback is denied.

The **`OPR-LPBK`** command can be initiated by a user to establish a loopback on an OP***n*** or GE***n*** port (but not on an acgPort on LOXC packs) in the NE.

Two types of facility loopback can be distinguished:

- a near-side facility loopback which means that signal on the in-port is looped to the out-port and
- a far-side facility loopback, which means that the signal on the out-port is looped back to the in-port.

Switching a facility loopback has no restrictions to existing cross-connections loopbacks or cross-connections, i.e. facility loopbacks are assumed to precede over already existing cross-connection loopbacks. When a facility loopback is released the previously existing cross-connection loopback(s) will show up again.

Note that as safeguard for unintentional corruption of traffic the switching of a facility loopback will only be possible if the affected port's service condition is set to out of service (*servicecond* = OUTOFSERVICE) – this can be achived via the ED-*rr* command.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): T4

Priority: 1

Abortable: No

Input format

Command syntax: **`OPR-LPBK`**-*modifier*:*tid*:*aid*:*ctag*::,,,*lpbktyp*;

Input parameters

Command parameters

1. **`modifier`**
   This parameter indicates the port rate on which the **`OPR-LPBK`** command acts on.
   Type: Alphanumeric value set.

   Range:

   - STM1E
   - STM1
   - STM4
   - STM16

- STM16T
- STM64
- STM256
- EC1
- OC3
- OC12
- OC48
- OC48T
- OC192
- OC768
- 1GE
- 1GEPL
- 10GEPL
- T3

No use of the **all** value is allowed.

2. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **aid** – Access Identifier
   Access Identifier of the port for which the loopback state is returned.
   Type: AID
   Range: SPortAID (when using OP***n***, EP155, OPT***n*** packs or EC1 interfaces on the EP51 pack) as defined in AID structure. The values:
   - all for Simple_SPortAID, usall for Simple_UnivSlotAID, all for Simple_UnivSlotAID, all for Simple_ShelfAID and all for BayAID is excluded.

   APortAID (when using DS3 interfcaes on the EP51 pack) as defined in AID structure. The values:
   - all for Simple_APortAID, usall for Simple_UnivSlotAID, all for Simple_UnivSlotAID, all for Simple_ShelfAID and all for BayAID is excluded.

   EPortAID (when using GE***n*** packs) as defined in AID structure. The values:
   - all for Simple_EPortAID, usall for Simple_UnivSlotAID, all for Simple_UnivSlotAID, all for Simple_ShelfAID and all for BayAID is excluded.
4. **ctag** – Correlation Tag
   his is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

5. **`lpbktyp`** – Loopback Type
   This parameter specifies the type of loopback to be operated.
   In case of a facility loopback this parameter is set to
   - FACILITY for a near-side facility loopback
   - FSF for a far-side facility loopback.

   Type: Alphanumeric value string.
   Range:
   - FACILITY
   - FSF.

Output format

If the **`OPR-LPBK`** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

Behavior – OP*n* Port

Loopback on OP***n*** ports can be switched via the **`OPR-LPBK`** command.

The attribute *lpbk* and *fsflpbkstat* of the entity port are updated by this command:

- *lpbk* should be set to YES in case the *lpbktyp* = FACILITY
- *fsflpbkstat* should be set to YES in case the *lpbktyp* = FSF.

This update is reported by an ED-*rr* notification for an OP***n*** port (*rr* specifying the affected port, i.e. OC<M>/ STM<N>).

Behavior – OPT*n* Port

Loopback on OPT***n*** ports can be switched via the **`OPR-LPBK`** command.

The attribute *lpbk* and *fsflpbkstat* of the entity port is updated by this command:

- *lpbk* should be set to YES in case the *lpbktyp* = FACILITY
- *fsflpbkstat* should be set to YES in case the *lpbktyp* = FSF.

This update is reported by an ED-*rr* notification for an OPT***n*** port (*rr* specifying the affected port, i.e. OC<M>/ STM<N>)..

Behavior - EP155 Port

Loopback on EP***n*** ports can be switched via the **OPR-LPBK** command.

The attribute *lpbk* and *fsflpbkstat* of the entity port is updated by this command:

- *lpbk* should be set to YES in case the lpbktyp=FACILITY
- *fsflpbkstat* should be set to YES in case the lpbktyp=FSF.

This update is reported by an ED-rr notification for an EP155 port (*rr* specifying the affected port STM1E).

In case of a EP155 protection group the command is only applicable for the ports of the worker unit. Reason: Ports of the protection card are removed by creation of the protection group.

Behavior – Asynchronous port

Loopback on asynchronous ports can be switched via the **OPR-LPBK** command.

The attribute *lpbk* and *fsflpbkstat* of the entity port is updated by this command:

- *lpbk* should be set to YES in case the *lpbktyp* = FACILITY
- *fsflpbkstat* should be set to YES in case the *lpbktyp* = FSF.

This update is reported by an **ED-rr** notification for an asynchronous port (*rr* specifying the affected port). Not all types of asynchronous ports support loopbacks. See the modifier range for supported asynchronous ports.

Behavior - EC1 Port

Loopback on ports can be switched via the **OPR-LPBK** command.

The attribute *lpbk* and *fsflpbkstat* of the entity port are updated by this command:

- *lpbk* should be set to YES in case the *lpbktyp* = FACILITY
- *fsflpbkstat* should be set to YES in case the *lpbktyp* = FSF.

This update is reported by an ED-EC1 notification for the port.

Behavior – GE1 Port

Loopback on GE1 ports can be switched via the **OPR-LPBK** command.

The attribute *lpbk* and *fsflpbkstat* of the entity port are updated by this command:

- *lpbk* should be set to YES in case the *lpbktyp* = FACILITY
- *fsflpbkstat* should be set to YES in case the *lpbktyp* = FSF.

This update is reported by an ED-EPORT notification for a GE***n*** port (only *fsflpbkstat*).

Behavior – Any Port on GE10PL1

Loopback on all successfully provisioned ports of a GE10PL1 pack can be switched via the **OPR-LPBK** command.

The parameter *fsflpbkstat* of the entity EPORT is updated by this command:

- *fsflpbkstat* should be set to YES in case the lpbktyp=FSF.

This update is reported by an ED-EPORT notification for the related EPORT (only for the parameter fsflpbkstat). Any attempts to change the parameter lpbktyp to the value FACILITY is rejected. The term ″any port″ refers to ports of both transmission rates, 1 GE and 10 GE.

Behavior for ONNS

Facility loopbacks are not allowed when portClass = EDGE or INNI.

Behavior FS - NS, NS - FS

Switching directly from an existing near-side loopback (far-side loopback) to a far-side loopback (near-side loopback) is not possible (i.e. is denied). Instead the existing loopback has to be released prior to establish another one.

Example 1

Provisioning a near-side facility loopback:

OPR-LPBK-STM16:UNITE-NE:1-1-#-#-1-1:123456:,,,FACILITY;

REPT DBCHG

ED-STM16:1-1-#-#-1-1::lpbk=YES;

Example 2

Provioning a far-side facility loopback:

OPR-LPBK-OC192:UNITE-NE:1-1-#-#-4-1:123456:,,,FSF;

REPT DBCHG

ED-OC192:1-1-#-#-4-1::fsflpbkstat=YES;

Updated affected entities

Apart from the port entity no further entities are affected by the **OPR-LPBK** command. Updates of the port entities are reported via ED-*rr* (OP***n*** port) or ED-EPORT (GE***n*** port) notifications.

Example input/output

Example:

Suppose for the port 1 of the pack in slot 01 a far-side facility loopback is set:

```
OPR-LPBK-STM16:UNITE-NE:1-1-#-#-1-1:123456::,,,FSF;

   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

Error responses

Validation rule: Port is out-of-service

Loopback command processing verifies that the affected port is in out-of-service state, i.e. *servicecond* = OUTOFSERVICE.

Error code: `SNVS – Status, Not in Valid State, Port is not out-of-service`

Validation rule: *modifier* consistent with given port-rate

Loopback command processing verifies that the *modifier* parameter is consistent with the rate of the port (given by the *aid* parameter). E.g. for an OP2G5 only the *modifier* values STM16 or OC48 (depending on the port's interface standard) are allowed, for an OP10 only *modifier* values STM64 or OC192 (depending on the port's interface standard) are allowed etc.

Error code:

```
IDNC – Input Data Not Consistent, modifier is inconsistent with
existing port rate
```

Validation rule: *modifier* consistent with given port's interface standard

Loopback command processing verifies that the *modifier* parameter is consistent with the interface standard of the port (this port given by the aid parameter). E.g. for an SDH port only the *modifier* values for STM16 or STM64 or STM256 are valid, for a SONET port only the *modifier* values OC48 or OC192 or OC768 are valid.

Error code:

```
ICNV – Input Command Not Valid, Interface Standard does not match
```

Validation rule: *modifier* consistent with the related circuit pack type

Loopback command processing shall verify in case that the modifier parameter does not distinguish various entities by transmission rate or by interface standard that the addressed entity belongs to the correct pack type. E.g. if the modifier value 1GE has been sent for an 1 GE port on the GE10PL1 pack or if the modifier value 1GEPL has been sent for a port on the GE1 pack, then the command is rejected.

Error code:

```
IDNC – Input, Data Not Consistent, modifier is inconsistent with the
related circuit pack type
```

Validation rule: Inconsistent facility loopback types on port pairs

The command is denied, if a near side or far side facility loopback is switched on an STM1E, STM1, STM4, OC3 or OC12 port, while on the other port of the same port pair a loopback of the other type already exists. A port pair is defined as 2 ports with consecutive port numbers n and n+1, where n can be any of the odd port numbers residing on the pack.

Error code:
`SNVS – Status, Not in Valid State, Facility loopback with different type exists at neighbor port`

Validation rule: Loopback must not already exist

Loopback command processing verifies that the loopback command can not be applied to an already existing loopback. The request to establish a near-side (far-side) loopback will be rejected if a near-side (far-side) loopback for the effected port already exists.

Error code: `SAOP – Status Already Operated, loopback already exists`

Validation rule: For ports on GE*n* packs only far-side loopback allowed

Loopback command processing shall verify that for an EPort only a far-side facility loopback (lpbktyp=FSF) can be switched.

Error code: `IDNV – Input Data Not Valid, Invalid loopback for EPort`

Validation rule: No change of loopback allowed

Switching directly from an existing near-side loopback (far-side loopback) to a far-side loopback (near-side loopback) is not possible (i.e. is denied).

Error code:
`SNVS – Status, Not in Valid State, Trial to change loopback type`

Validation rule: No loopbacks on ports of *portClass* INNI

Loopback command processing shall verify that the port has not *portClass* INNI.

Error code:
`SNVS – Status, Not in Valid State, Port must not be of portClass INNI`

Validation rule: No loopbacks on ports of *portClass* UNI

Loopback command processing shall verify that the port has not *portClass* UNI.

Error code:
`SNVS – Status, Not in Valid State, Port must not be of portClass UNI`

Validation rule: No loopbacks for PTF on LOXC allowed

Loopback command processing shall deny loopback requests for high-order path-termination functions residing on the LOXC pack.

Error code: `IDNV – Input, Data Not Valid, Invalid loopback for PTF on LOXC`

OPR-LPBK notification (facility)

There will be no **`OPR-LPBK`** notification because the changes (for the parameter *lpbk* and *fsflpbkstat*) caused by an OPR-LPBK command will be notified via an ED-*rr* notification for an OP***n*** / EP***n*** / OPT***n*** port (*rr* specifying the affected port i.e. OC<M>/STM<N>, OC<M>T/STM<N>T or via an ED-EPORT notification for a GE***n*** port (*fsflpbkstat* only).

OPR-MAINT-ONNS: Maintenance actions for the ONNS application

The **OPR-MAINT-ONNS** command can be used to execute specific maintenance actions for the ONNS application. Such maintenance actions are, for example, removal of orphaned entities like cross-connections or cross-connection legs.

The type of maintenance action to be executed is specified by the parameter *reqType*. Depending on the value of parameter *reqType*, additional parameters in the spec block need to be specified.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P5

Priority: 1

Abortable: No

Input format

Command syntax: **OPR-MAINT-ONNS**:*srcTid*:*srcAid*:*ctag*:*reqType*:*spec_block*;

Input parameters

Command parameters

1. **srcTid**
   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **srcAid**
   Source node ONNS application access identifier of the ONNS controller OS command interface port.
   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn.
3. **ctag** – Correlation Tag
   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ".").

4. **`reqType`**

   This parameter indicates the maintenance operation that is to be performed.
   Type: Alphanumeric value set.

   Range:

   - REMLEG: removes a cross-connection leg from a “bridged” cross-connection of class NN. The cross-connection affected and the leg to be removed are specified via spec block parameter *pathID* or *connPtID*.
   - REMLEG_RESV: removes a cross-connection leg from a “bridged” cross-connection of class NN and installs an M:N reservation on the iNNI tributary the leg has been removed from. The cross-connection affected and the leg to be removed are specified via spec block parameter *pathID* or *connPtID*.

     Note that option *REMLEG_RESV* normally only makes sense if the leg to be removed is specified by the *pathID*.

Spec block parameters

1. **`pathID`**

   The PathID of the 1st path that was created.
   Type: character string of length up to 20.
   Range: nodeID-Index (nodeID: four dot separated numeric strings: each string 0 – 255) (Index: Numeric string 0-65535).
   The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x
   Example: 29.13.196.203-65111
   Default: None.

   In case a value for *pathID* is given, the requested operation will only be applied to the leg having this path ID assigned only under the following conditions:

   - No value for parameter *connPtID* is additionally given
   - This path ID is assigned to a leg of a “bridged” cross-connection of class NN
   - This path ID is different from the path ID assigned to the second leg of the affected “bridged” cross-connection
   - This path ID is different from an all-zero path ID

     In this case it is recommended to execute an XC recovery or protection switch of the active XC in the affected node in order to restart the ONNS connection state machine, as there is a certain possibility for the affected ONNS connection for being in a state the state machine is not able to handle any more.

2. **`connPtID`**

   ONNS connection point identifier for the ingress tributary ID of the leg to be removed from a “bridged” cross-connection.
   It consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary #.
   Type: Dash-separated list of 5 numeric strings.

   Range:

   - Bay/Frame #1
   - Shelf #1
   - Slot/Pack #1…39

- Port #1…16
- Tributary #1…128

Default: None.

In case a value for *connPtID* is given, the requested operation is applied to the leg identified by the specified *connPtID* only under the following conditions:

- No value for parameter *pathID* is additionally given
- The specified connPt identifies a leg of a "bridged" cross-connection of class NN
- The *pathID* associated to the specified leg is the all-zero *pathID* or is equal to the *pathID* associated to the second leg of the "bridged" cross-connection of class NN.

Output format

If the **OPR-MAINT-ONNS** request is accepted by the system, the following normal completion response format below is returned:

```
   srcTid date time
M  ctag COMPLD
;
```

Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *conpletion code* and their syntax are included in the section "Output parameters" of the "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2698) command.

Example input/output

The following example shows a successful completion of an **OPR-MAINT-ONNS** command for removal of an orphaned cross-connection leg specified by the associated *connPt* ID:

```
OPR-MAINT-ONNS:LT-ONNS-789:snn:123456:REMLEG:
connPtID=1-1-3-2-12;

   LT-ONNS-789 2008-05-01 08:00:00
M  123456 COMPLD
;
```

The following example shows a successful completion of an **OPR-MAINT-ONNS** command for removal of an orphaned cross-connection leg with installation of M:N reservation, where the leg is specified by the path ID:

```
OPR-MAINT-ONNS:LT-ONNS-789:snn:123456:REMLEG_RESV:
```

```
pathID=135.14.196.203-32165;

   LT-ONNS-789 2008-05-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer also to the section "Error responses" of "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2698). The error responses listed there also apply to the **OPR-MAINT-ONNS** command.

Validation rule: OPR-MAINT-ONNS with *reqType* = REMLEG or REMLEG_RESV not allowed because of specified connection is not valid

The **OPR-MAINT-ONNS** command with *reqType* = REMLEG or REMLEG_RESV is rejected with the following error response, in case the connection addressed does not have class NN or is not a "brdiged" cross-connection:

Error code: `E700 - ICID - Invalid Connection IDentification`

Validation rule: OPR-MAINT-ONNS with *reqType* = REMLEG or REMLEG_RESV not allowed because of both pathID and connPtID specified

The **OPR-MAINT-ONNS** command with *reqType* = REMLEG or REMLEG_RESV is rejected with the following error response, in case of both *pathID* and *connPtID* for leg identification are specified in the command:

Error code: `E701 - DLID - Duplicate Leg IDentification`

Validation rule: OPR-MAINT-ONNS with *reqType* = REMLEG or REMLEG_RESV not allowed because of invalid leg identification via pathID or connPtID

The **OPR-MAINT-ONNS** command with *reqType* = REMLEG or REMLEG_RESV is rejected with the following error response, in case of the leg identification via *pathID* or *connPtID* is not supported:

Error code: `E702 - ULID - Unsupported Leg IDentification`

Related TL1 messages

- "AUD: Perform audit data" (p. 3-46)

OPR-PROTNSW: Operate protection switch

The **OPR-PROTNSW** command allows to switch one or more existing protection group instances of any protection group type. Different identification methods are supported for the different protection types.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M4

Priority: 1

Abortable: No

Input format

1+1 equipment group

Command syntax: **OPR-PROTNSW**:*tid*:*aid*:*ctag*::*protype*:*spec_block*;

Multiplex section/line protection group

Command syntax: **OPR-PROTNSW**:*tid*:*aid*:*ctag*::*protype*:*spec_block;*

2-/4-fibre MS-SPRing/BLSR protection group

Command syntax: **OPR-PROTNSW**:*tid*:*[aid]*:*ctag*::*protype*,*[rid]*:*spec_block*;

Path protection group

Command syntax: **OPR-PROTNSW**:*tid*:*[aid]*:*ctag*::*protype, ,[ppgname][,aid1]*:*spec_block*;

The parameter *ppgname* is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of *ppgname* is not recommended.

> **Important!** The use of *ppgname* as input parameter with alias function is not yet supported. Address path-protected cross-connections individually via *Navis*® Optical EMS/CIT GUI using their AIDs.

> **Important!** If a OPR-PROTNSW command is executed on an MSP 1+1 optimized while the actual protection state does not allow the specified protection switch, then the command is denied with the wrong error code:
> `SROF – Status, Requested Operation Failed..`

The expected error response is:

```
SNVS – Status, Not in Valid State, switch command not allowed for
actual protection state
```

Input parameters

Command parameters (1+1 equipment protection group)

1. **tid** – Target Identifier
   See definition in input parameters section “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **aid** – Access Identifier
   Description: The parameter specifies the aid of 1+1 equipment protection group.
   Type: AID
   Range: SwitchAndTmgProtGrpAID (for higher-order switch fabirc and timing group) or CtlProtGroupAID (for system controller protection group) or EP155ProtGroupAID (for EP155 protection group) or EP51ProtGroupAID (for electrical 51 MBit/s groups) or LOXCProtGroupID (for lower-order switch fabric groups) or TMUXProtGroupAID (for TransMUX groups) or ES64UProtGroupAID (for ES64U groups).
   Default: No default
3. **ctag** – Correlation Tag
   See definition in input parameters section “RTRV-HDR: Retrieve header” (p. 3-2417).
4. **protype** – Protection Type
   The parameter specifies the type of the 1+1 equipment protection group for retrieving the information.
   Type: Alphanumeric value set.
   Range:
   - EQPTSWFBR, if *aid* is SwitchAndTmgProtGrpAID;
   - EQPTCTL, if *aid* is CtlProtGroupAID;
   - EQPTEP155, if *aid* is EP155ProtGroupAID;
   - EQPTEP51, if *aid* is EP51ProtGroupAID;
   - EQPTLOXC, if *aid* is LOXCProtGroupAID.
   - EQPTTMUX, if *aid* is TMUXProtGroupAID.
   - EQPTES64U, if *aid* is ES64UProtGroupAID.

Command parameters (multiplex section/line protection group)

1. **tid** – Target Identifier
   See definition in input parameters section “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **aid** – Access Identifier
   This parameter specifies the aid of a 1+1 multiplex section/line protection group or the aid of a 1:1 multiplex section/line protection group (only R3.0 and later) or an port aid being a member of the group.
   Type: AID
   Range: OnePlusOne_ProtGrpAID (not ranged) or NByOne_ProtGrpAID (not ranged) or SPortAID (not ranged).

3. **`ctag`** – Correlation Tag
   See definition in input parameters section “RTRV-HDR: Retrieve header” (p. 3-2417).
4. **`protype`** – Protection Type
   This parameter specifies the architecture (type) of the protection group. The value for the 1+1 line/MS protection group is 1+1. The value for the 1:1 line/MS protection group is 1xNOPT (only R3.0 and later)
   Type: Value set.
   Range: 1+1 or 1xNOPT

Command parameters (2-/4-fibre MS-SPRing/BLSR protection group)

1. **`tid`** – Target Identifier
   See definition in input parameters section “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **`aid`** – Access Identifier
   This parameter specifies the aid of an MS-SPRing/BLSR protection group or an port aid being a member of the group.
   Option: If *rid* is specified, then *aid* can be omitted.
   Type: AID
   Range: TwoFibre_ProtGrpAID (not ranged) or FourFibre_ProtGrpAID (not ranged) or SPortAID (not ranged)
3. **`ctag`** – Correlation Tag
   See definition in input parameters section “RTRV-HDR: Retrieve header” (p. 3-2417).
4. **`protype`** – Protection Type
   This parameter specifies the protection group type for which the information is retrieved.
   Type: Alphanumeric value set.
   Range: 2F or 4F
5. **`rid`** – Ring Identification
   This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
   If *aid* is specified, then *rid* can be omitted.
   Type: text string of chars allowed for TID strings.
   Range: 1 to 15 characters.
   Default: NONE.

Command parameters (Path protection group)

1. **`tid`** – Target Identifier
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **`aid`** – Access Identifier
   This parameter specifies a path protection group aid or an input tributary aid being a member of the group in combination with *ppgname*.
   The parameter specifies an input tributary *aid* when used in combination with parameter *aid1*.
   Option: If *ppgname* is specified, then *aid* can be omitted or used as an input tributary aid. The parameter *ppgname* is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of ppgname is not recommended. For low order path protections, the aid is mandatory since the *ppgname* is not supported for those protection groups. For such protection groups, always a path protection group AID has to be specified.
   Option: If parameters aid specifies a HO tributary on a port of port class EDGE and this tributary is combined with another HO tributary within an OUC, then the command shall operate on all protection groups of type PATHDRI identified by these two HO tributaries, if existing. If aid specifies a HO tributary on a port of port class INNI, the command is rejected.
   Option: When parameter aid is used in combination with parameter *aid1*, then the command shall operate on all protection groups of type PATHDRI having the AIDs given in parameters *aid* and *aid1* as input tributaries. If *aid* or *aid1* specifies a tributary on a port of port class INNI, the command is rejected.
   Type: AID
   Range: STS1NumAID or VCGNumAID or GenLOTribAID or TMuxAPTNumAID. The usage of wild cards is not restricted. This range specifies all AIDs which can be used to identify a path protection group. Any defined wild cards (e.g. **`all`** or **`vall`** or **`usall`** in various positions) are allowed.
3. **`protype`** – Protection Type
   This parameter specifies the protection group type for which the information is retrieved.
   Type: Alphanumeric value set.
   Range: PATHDRI
4. **`ppgname`** – Path protection group Name
   In particular follow the reference to check options and mandatory omissions associated with this parameter.
   The parameter specifies the path protection group name. Storage and retrieval of the ppgname is case sensitive, but actual use of the ppgname to determine the corresponding protection group is case insensitive.
   Option for high order path protection groups: For high order path protections, if aid is specified, then *ppgname* can be omitted. For low order path protections, the *ppgname* is omitted as not being supported at all. If an input value is specified for ppgname and none is specified for aid, then RTRV-PROTN-GRP operates on all

protection groups of type PATHDRI that have the specified path protection group name. If input values are specified for *aid* and *ppgname* then RTRV-PROTN-GRP operates on all protection groups of type PATHDRI that have the specified *aid*, *ppgname* pair. The command will complete successfully if there is no protection group described by *aid*, *ppgname*, but no data will be returned.
The parameter *ppgname* is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of *ppgname* is not recommended.
Type: text string
Range: 1 to 24 characters

5. **`aid1`** – Access identifier 1
   Together with parameter *aid* this parameter specifies a pair of tributaries in order to execute switches to emulated selector bridges in one command.
   Option: If input values are specified for *aid* and *aid1* then OPR-PROTNSW operates on all protection groups of type PATHDRI that have these specified tributaries as inputs. If input values are ecified for *aid* and *aid1*and additionally a value is specified for *ppgname*, OPR-PROTNSW shall operate only on those protection groups that additionally match the ppgname value. *aid1* specifies a HO tributary in a port of port class INNI, the command is rejected.
   Type: AID
   Range: STS1NumAID. The use of wildcards is not allowed.

Command parameters (Constituent Path Protection Group)

1. **`tid`** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **`aid`** – Access Identifier
   This parameter specifies a path protection group aid or an input tributary aid being a member of the group in combination with *ppgname*.
   Option: If *ppgname* is specified, then aid can be used as an input tributary aid. The parameter *ppgname* is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of *ppgname* is not recommended.
   Type: AID
   Range: STS1NumAID, VCGNumAID
   The use of wild cards is not restricted for STS1NumAID and VCGNumAID. No wildcards are allowed in a GenLOTribAID.
   This range specifies all AIDs, which can be used to identify a constituent path protection group.
3. **`ctag`** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

4. **`protype`** – Protection Type
   The parameter specifies the protection group type to be identified.
   Type: Alphanumeric value set.
   Range: CONSTITUENTPATH

5. **`ppgname`** – Path protection group Name
   The parameter specifies the path protection group name. Storage and retrieval of the ppgname is case sensitive, but actual use of the ppgname to determine the corresponding protection group is case insensitive.
   Option for high order path protection groups: For high order path protections, if aid is specified, then *ppgname* can be omitted. For low order path protections, the *ppgname* is omitted as not being supported at all. If an input value is specified for ppgname and none is specified for aid, then RTRV-PROTN-GRP operates on all protection groups of type PATHDRI that have the specified path protection group name. If input values are specified for *aid* and *ppgname* then RTRV-PROTN-GRP operates on all protection groups of type PATHDRI that have the specified *aid*, *ppgname* pair. The command will complete successfully if there is no protection group described by *aid*, *ppgname*, but no data will be returned.
   The parameter *ppgname* is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of *ppgname* is not recommended.
   Type: text string
   Range: 1 to 24 characters

Spec block parameters (1+1 equipment protection group)

See detailed behavior description w.r.t. allowed switch commands; i.e allowed value combinations for parameters *dest, sc*.

1. **`dest`** – Destination
   This parameter specifies the destination of the switch command; i.e. which side is active in terms of the member role within the protection group after the switch has been executed.

   The following values are supported:

   - WKG: Worker
   - PROTN: Protection

   Type: Alphanumeric value set.
   Range: WKG, PROTN

2. **`sc`** – Switch Command
   This parameter specifies the switch command to be executed by the protection state machine.

The following values are supported:

- FRCD: Forced Switch
- MAN: Manual Switch.

Type: Alphanumeric value set.
Range: MAN, if protype is EQPTCTL; FRCD, MAN (for all other equipment protection group types).

Spec block parameters (multiplex section/line protection group)

See detailed behavior description w.r.t. allowed switch commands; i.e allowed value combinations for parameters *dest, sc*.

1. **`dest`** – Destination
   This parameter specifies the destination of the switch command; i.e. to which side the switch command shall applied to.
   The following values are supported:
   - WKG: Worker
   - PROTN: Protection

   The parameter will not be taken into consideration, if a LOCKOUT switch command is performed. Details see behavior description.
   Type: Alphanumeric value set.
   Range: WKG, PROTN.
2. **`sc`** – Switch Command
   This parameter specifies the switch command to be executed by the protection state machine.
   The following values are supported:
   - LOCKOUT: Lockout
   - FRCD: Forced Switch
   - MAN: Manual Switch

   Type: Alphanumeric value set.
   Range: LOCKOUT, FRCD, MAN

Spec block parameters (2-fibre MS-SPRing/BLSR protection group)

See detailed behavior description w.r.t. allowed switch commands; i.e allowed value combinations for parameters *dest, destside, sc*, swtype.

1. **`dest`** – Destination
   This parameter specifies the destination of the switch command. The following values are supported: PROTN, Protection.
   Type: Alphanumeric value set.
   Range: PROTN.
2. **`destside`** – Destination Side

This parameter specifies the destination side to which the switch command is applied; i.e.

- it is EAST for the east ring side
- it is WEST for the west ring side.

Type: Alphanumeric value set.
Range: EAST, WEST.

3. **`sc`** – Switch Command
   This parameter specifies the switch command to be executed by the protection state machine.

   The following values are supported:

   - LOCKOUT: Lockout
   - FRCD: Forced Switch
   - MAN: Manual Switch.

   Type: Alphanumeric value set.
   Range: LOCKOUT, FRCD, MAN.
4. **`swtype`** – Switch Type
   This parameter specifies what type of protection switching is used for the MS-SPRing/BLSR protection group. The value RING is used for loopback switching. The value SPAN can be used in case of span switching.
   Type: Alphanumeric value set.
   Range: RING, SPAN.

Spec block parameters (4-fibre MS-SPRing/BLSR protection group)

See detailed behavior description w.r.t. allowed switch commands; i.e allowed value combinations for parameters *dest, destside, sc,* swtype.

1. **`dest`** – Destination
   This parameter specifies the destination of the switch command. The following values are supported: PROTN, Protection.
   Type: Alphanumeric value set.
   Range: PROTN
2. **`destside`** – Destination Side
   This parameter specifies the destination side to which the switch command is applied; i.e.

   - it is EAST for the east ring side
   - it is WEST for the west ring side.

   Type: Alphanumeric value set.
   Range: EAST, WEST.
3. **`sc`** – Switch Command
   This parameter specifies the switch command to be executed by the protection state machine.

The following values are supported:

- LOCKOUT: Lockout
- FRCD: Forced Switch
- MAN: Manual Switch

Type: Alphanumeric value set.
Range: LOCKOUT, FRCD, MAN.

4. **`swtype`** – Switch Type
   This parameter specifies what type of protection switching is used for the MS-SPRing/BLSR protection group. The value RING is used for loopback switching (i.e. service route is looped back onto the protection route in the direction opposite the failure). The value SPAN is used in case of span switching (i.e. all traffic being carried on the worker span between an adjacent pair of nodes is switched to the protection span, between the same pair of nodes and on the same side of the ring).
   Type: Alphanumeric value set.
   Range: RING, SPAN.

Spec block parameters (path protection group)

See detailed behavior description w.r.t. allowed switch commands; i.e allowed value combinations for parameters *dest, sc*.

1. **`dest`** – Destination
   This parameter specifies the destination of the switch command; i.e. to which side the switch command is applied to.
   The following values are supported:
   - WKG: Worker
   - PROTN: Protection.

   Type: Alphanumeric value set.
   Range: WKG, PROTN
2. **`sc`** – Switch Command
   This parameter specifies the switch command to be executed by the protection state machine.
   The following values are supported:
   - LOCKOUT:Lockout
   - FRCD: Forced Switch
   - MAN: Manual Switch.

   Type: Alphanumeric value set.
   Range: LOCKOUT, FRCD, MAN.

Spec block parameters (constituent path protection group)

See detailed behavior description w.r.t. allowed switch commands; i.e allowed value combinations for parameters *dest, sc*.

1. **`dest`** – Destination
   This parameter specifies the destination of the switch command; i.e. to which side the switch command is applied to.
   The following values are supported:
   - WKG: Worker
   - PROTN: Protection.

   Type: Alphanumeric value set.
   Range: WKG, PROTN
2. **`sc`** – Switch Command
   This parameter specifies the switch command to be executed by the protection state machine.
   The following values are supported:
   - LOCKOUT:Lockout
   - FRCD: Forced Switch
   - MAN: Manual Switch.

   Type: Alphanumeric value set.
   Range: LOCKOUT, FRCD, MAN.

Output format

After receiving the **`OPR-PROTNSW`** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

Detailed behavior description

The command switches the identified protection group. The switch command is processed according to the state machine behavior for the different protection group types. As consequence, the values of the following attributes of the state machine may be updated:

EQPTSWFBR: *actunit, swreq*

EQPTCTL: *actunit, swreq*

EQPTEP155: *actunit, swreq*

EQPTEP51: *actunit, swreq*

EQPTLOXC: *actunit, swreq*

EQPTTMUX: *actunit*, *swreq*

EQPTES64U: *actunit*, *swreq*

1+1/1:1: *actunit*, *swreq*

2F: *eswreq*, *wswreq*

4F: *eactunit*, *eswreq*, *wactunit*, *wswreq*,

PATHDRI: *actunit*, *actunitaid*, *swreq*

The update of the attributes is reported by means of a protection switch notification for the corresponding protection group type.

Behavior of path-protected cross-connections in Fixed and Adaptive Mode

If the protection type specified in the command is PATHDRI, then the command ispplied to all constituent members of the path protected cross-connection.

- If there are two or more constituent members, and the protection switch state of one or more constituent members does not allow the command execution, then the command is successfully completed. The system sends protection switch notifications only for those constituent members, where the command has been successfully executed.
- If there is only one constituent member, and the protection switch state does not allow the command execution, then the command is denied with the appropriate error response. This behavior is applicable for path protected cross-connections in fixed and adaptive mode. In fixed mode, there can be only one constituent member, and the command will be denied if it cannot be executed. Path protected pipe mode cross-connections with only one constituent member show the same behavior as path protections in fixed mode.

Identification of path protection groups

For PATHDRI, the protection switch applies to all constituents of the identified tributary. For this case, the following table summarizes the use of path protection group names as related to OPR-PROTNSW.

aid	ppgname	dest (note 2)	comment
not used	ppgname	WKG or PROTN	operation applies to all tributaries that are group members of the ppgname (note 1)
grp member (input) logical tributary AID	ppgname	WKG or PROTN	operation applies to all tributaries that are group members of the aid, ppgname subset (note 1)
path prot grp id (output logical tributary AID)	not used	WKG or PROTN	normal, non-aliasing target identification (note 1, note 2)

Note 1: group members are defined to be the working and protection input logical tributaries of the path protection group.

Note 2: the output logical tributary aid of an adjunct path-protected cross-connection is not a path prot grp id, only the output of a path-protected cross-connection is.

Allowed/supported switch commands for 1+1 Equipment Protection

The following table shows the allowed/supported value combinations for the parameters *sc*, *dest* w.r.t. OPR-PROTNSW for 1+1 equipment protection group.

sc	dest
FRCD	WKG
FRCD	PROTN
MAN	WKG
MAN	PROTN

Note 1: For the controller protection group instance only *sc* = MAN is applicable.

Behavior description for multiplex section/line protection

The destination parameter dest is noten taken in consideration, if a LOCKOUT command is performed.

This means for the different MSP types:

- 1:1/1+1 : allways the protection side is locked out and the working side carries the traffic. (By this (PROTN) was specified in the tables)
- 1+1 optimized: The actual protection state is frozen. The actual inactive side is locked out. (To make it also consistent to the other MSPs also (PROTN) was specified in the table).

Allowed/supported switch commands for 1:1 MSP Protection SDH

The following table shall show the allowed/supported value combinations for the parameters sc, dest, destside, swtype dest w.r.t. OPR-PROTNSW for 1:1 Multiplex Section/Line protection group for SDH mode:

sc	dest
FRCD	WKG
FRCD	PROTN
MAN	PROTN
LOCKOUT	(PROTN)

Allowed/supported switch commands for 1+1 MSP Protection

The following table shall show the allowed/supported value combinations for the parameters sc, dest w.r.t. OPR-PROTNSW for 1+1 Multiplex Section/Line protection group:

sc	dest
FRCD	WKG
FRCD	PROTN
MAN	WKG
MAN	PROTN
LOCKOUT	(PROTN)

Allowed/supported switch commands for 1+1 Optimized MSP

The following table shall show the allowed/supported value combinations for the parameters sc, dest w.r.t. OPR-PROTNSW for 1+1 optimized Multiplex Section protection group:

sc	dest
FRCD	WKG
FRCD	PROTN
LOCKOUT	(PROTN)

Allowed/supported switch commands for 2-fibre MS-SPRing/BLSR

The following table shows the allowed/supported value combinations for the parameters *sc, dest, destside, swtype* w.r.t. OPR-PROTNSW for 2-fibre MS-SPRing/BLSR protection groups.

Case	sc	dest	destside	swtype
LP-S	LOCKOUT	PROTN	EAST or WEST	SPAN
FS-R	FRCD	not used/ omitted	EAST or WEST	RING
MS-R	MAN	not used/ omitted	EAST or WEST	RING

Allowed/supported switch commands for 4-fibre MS-SPRing/BLSR

The following table shall show the allowed/supported value combinations for the parameters sc, dest, destside, swtype w.r.t. OPR-PROTNSW for 4-fibre MS-SPRing/BLSR protection groups.

Case	sc	dest	destside	swtype
LP-S	LOCKOUT	PROTN	EAST or WEST	SPAN
FS-R	FRCD	not used/ omitted	EAST or WEST	RING
FS-S	FRCD	not used/ omitted	EAST or WEST	SPAN
MS-R	MAN	not used/ omitted	EAST or WEST	RING
MS-S	MAN	not used/ omitted	EAST or WEST	SPAN

Allowed/supported switch commands for path protection group

The following table shows the allowed/supported value combinations for the parameters *sc*, *dest* w.r.t. OPR-PROTNSW for path protection groups.

Dependency of allowed/supported switch request were simplified in order to:

- comply with new GR-1400 (01/99)
- harmonize with 1+1 Multiplex section/Line protection group.

sc	dest
LOCKOUT	PROTN
FRCD	WKG
FRCD	PROTN
MAN	WKG
MAN	PROTN

Example input/output

1+1 Equipment protection group

The following example shows an successful ’manual switch to protection’ command for a 1+1 equipment protection group:

```
OPR-PROTNSW:LT-UNITE:1-1-estgrp:123456::EQPTSWFBR:sc=MAN,dest=PROTN;

   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
;
```

Multiplex section/line protection group 1+1

The following example shows an successful ’forced switch to worker’ command for a 1+1 multiplex section/line protection group:

```
OPR-PROTNSW:LT-UNITE:1-1-o001:123456::1+1:sc=FRCD,dest=WKG;

   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
;
```

Multiplex section/line protection group 1:1 (SDH)

The following example shows an successful ’manual switch to protection’ command for a 1:1 multiplex section/line protection group:

```
OPR-PROTNSW:LT-UNITE:1-1-o001:123456::1xNOPT:sc=MAN,dest=PROTN;

   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
;
```

Multiplex section/line protection group 1:1 optimized

The following example shows an successful lockout command for a 1+1 optimized multiplex section/line protection group: Please keep in mind, that the *dest* parameter is not taken in consideration:

```
OPR-PROTNSW:LT-UNITE:1-1-o001:123456::1+1:sc=LOCKOUT,dest=PROTN;

   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
;
```

2 fibre MS-SPRing/BLSR protection group

The following example shows an successful ’manual ring switch’ command for the east side of a 2F MS-SPRing/BLSR protection group:

```
OPR-PROTNSW:LT-UNITE:1-1-t001:123456::2F:sc=MAN,swtype=RING,destside=EAST;

   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
;
```

4 fibre MS-SPRing/BLSR protection group

The following example shows an successful ’manual span switch’ command for the west side of a 4F MS-SPRing/BLSR protection group:

```
OPR-PROTNSW:LT-UNITE:1-1-f001:123456::4F:sc=MAN,swtype=SPAN,destside=WEST;

   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
```

```
;
```

Path protection group

The following example shows an successful ’lockout of protection’ command for a path protection group:

```
OPR-PROTNSW:LT-UNITE:1-1-#-#-10-1-25:123456::PATHDRI:sc=LOCKOUT,dest=PROTN;

   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
;
```

The following example shows a successful ’lockout of protection’ command to both path protection groups forming an emulated selector bridge on input tributaries 1-1-#-#-8-1-25 and 1-1-#-#-6-1-25:

```
OPR-PROTNSW:LT-UNITE:1-1-#-#-8-1-25:123456::PATHDRI,,,
1-1-#-#-6-1-25:sc=LOCKOUT,dest=PROTN;

   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses (general)

Validation rule: complete switch command

The switch command (combination of *sc*, *dest*, *destside*, *sctype*) is complete; i.e. all needed parameters are present.

Error code: `IDNV – Input, Data Not Valid, incomplete switch command`

Validation rule: supported switch command

The switch command (combination of *sc*, *dest*, *destside*, *sctype*) is supported by the specified protection group type.

Error code: `IDNV – Input, Data Not Valid, invalid switch command`

Validation rule: allowed switch command in that state

The specified switch command is allowed in the actual protection state.

Error code:
`SNVS – Status, Not in Valid State, switch command not allowed for actual protection state`

Validation rule: consistent aid and protype

The specified *aid* is consistent with the specified *protype*.

Error code: `IIAC – Input, Invalid ACcess identifier, incorrect syntax`

Error responses (1+1 Equipment protection group)

Validation rule: Clock not in warming-up status (Switching Protection Group)

The clock of the destination as requested in the manual switch command is not in the 'warming-up' state.

Error code:
`SNVS – Status, Not in Valid State, clock of destination XC is in warming-up state, please wait some minutes`

Validation rule: No forced switch to empty XC slot (Switching Protection Group)

The system shall not allow to execute a forced switch on a Switching Protection Group to an empty XC slot.

Error code: `ENEQ – Equipage, Not EQuipped, XC destination slot empty`

Validation rule: No forced switch to unusable XC slot (Switching Protection Group)

The system shall not allow to execute a forced switch on a Switching Protection Group to a XC slot which has an open latch or a power failure.

Error code: `SNVS – Status, Not in Valid State, XC destination not usable`

Validation rule: No manual protection switch if the switchover leads to traffic impairments

The system shall not allow to execute a manual switch on a Switching or LOXC Protection Group with a combination of XC circuit pack types which leads to traffic impairments in the case of protection switches.

Error code:
`SNVS – Status, Not in Valid State, Protection switch with current combination of circuit pack types is traffic affecting`

Validation rule: No forced switch to empty LOXC slot (LOXC Protection Group)

The system shall not allow to execute a forced switch on an LOXC Protection Group to an empty LOXC slot.

Error code: `ENEQ – Equipage, Not EQuipped, LOXC destination slot empty`

Validation rule: No forced switch to unusable LOXC slot (LOXC Protection Group)

The system shall not allow to execute a forced switch on an LOXC Protection Group to an LOXC slot which has an open latch or a power failure.

Error code: `SNVS – Status, Not in Valid State, LOXC destination not usable`

Validation rule: No forced switch to empty slot (TransMUX Protection Group)

The system does not allow to execute a forced switch on a TransMUX protection group to an empty slot.

Error code: `ENEQ – Equipage, Not EQuipped, TMUX destination slot empty`

Validation rule: No forced switch to unusable TransMUX pack (TransMUX Protection Group)

The system does not allow to execute a forced switch on a TransMUX protection group to a TransMUX pack which has an open latch or a power failure.

Error code: `SNVS – Status, Not in Valid State, TMUX destination not usable`

Validation rule: No forced switch to empty slot (ES64U Protection Group)

The system does not allow to execute a forced switch on an ES64U protection group to an empty slot.

Error code: `ENEQ – Equipage, Not EQuipped, ES64U destination slot empty`

Validation rule: No forced switch to unusable ES64U pack (ES64U Protection Group)

The system does not allow to execute a forced switch on a ES64U protection group to a ES64U pack which has an open latch or a power failure.

Error code:

`SNVS – Status, Not in Valid State, ES64U destination not usable`

Error responses (MS/Line protection group)

Validation rule: succeeding switch command

The switch command is executed by the protection state machine running on the XC pack.

Error code: `SPFA – Status, Protection unit FAiled`

Validation rule: MSP type 1:1 does not allow manual switch requests to worker

The system shall reject an OPR command to select the worker port as active port (actunit=WKR) if the current protection architecture is 1:1 (protype = 1x1). This applies only to manual switch requests.

Error code:

```
SNVS – Status, Not in Valid State, Manual Switch to Worker for
Protection Type 1x1 not allowed
```

Validation rule: MSP type 1+1_optimized does not allow manual switch commands

The system shall reject an OPR command for manual switch requests if the operation is ’optimized’.

Error code:

```
SNVS – Status, Not in Valid State, Manual Switch for Protection Type
1+1_Optimized not allowed
```

Error responses (2-/4-fibre MS-SPRing/BLSR protection group)

Validation rule: consistent *aid* and *rid*

If both an aid and an rid are specified as input parameters and they are inconsistent, then the following error response is returned

Error code: `IDNV – Input, Data Not Valid, inconsistent aid and rid`

Validation rule: succeeding switch command

The switch command is executed by the protection state machine running on the XC pack.

Error code: `SPFA – Status, Protection unit FAiled`

Validation rule: APS switch time constraint

The switch command is executed by the protection state machine using the APS within time constraints

Error code: `SPFA – Status, Protection unit FAiled, APS did not succeed`

Error responses (Path protection group)

Validation rule: Protection Group must exist

If the parameter *aid*, or the combination of the parameters *aid* and *ppgname* does not specify a path protection group, then the following error response is returned:

Error code: `IENE – Input, Entity Not Exists`

Validation rule: Boundary consistency for constituent members

When the protection type specified in the command is CONSTITUENTPATH and the constituent member of the path-protected pipe cross-connection is a concatenated signal, then the command is only executed if the specified tributary AID is the first tributary of the concatenated signal.

Error code:
`IENE – Input, Entity Not Exists, constituent member does not exist`

Validation rule: Protection Group must exist

If the combination of the parameters *aid* and *aid1* does not specify a path protection group, then the following error response is returned:

Error code: `IENE – Input, Entity Not Exists`

Validation rule: succeeding switch command

The switch command is executed by the protection state machine running on the XC pack.

Error code: `SPFA – Status, Protection unit FAiled`

Validation rule: *ppgname* and low order path protections

If a *ppgname* is given as input parameter while the *aid* references a low order tributary, then the following error response is returned:

Error code:

`IDNV – Input, Data Not Valid, ppgname not supported for this transmission rate`

Validation rule: Access via tributary on INNI port

If in input parameter *aid* or *aid1* for access via input or output a tributary is given located on a port of port class INNI, then the following error response is returned:

Error code:

`IDNV – Input, Data Not Valid, No Access via AID located on INNI port`

OPR-SYNCNSW: Operate synchronization switch

The **OPR-SYNCNSW** command can be initiated by user to request the NE to operate manual or forced synchronization reference protection switch or external timing output protection switch (for SDH only), to lockout synchronization reference or external output timing (for SDH only) switching or to request a change from the provisioned synchronization mode to forced holdover state.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M4

Priority: 1

Abortable: No

Input format

Command syntax: **OPR-SYNCNSW**-*modifier*:*tid*::*ctag*::*sc[,dest]*;

Input parameters

Command parameters

1. **modifier** – modifier
   This parameter indicates the management system on which the switch request acts. The *modifier* REF specifies the assigned timing reference switch. The *modifier* MOD specifies the clock mode switch of the system clock. The *modifier* OUTREF specifies the external timing output switch (for SDH only).
   Type: Alphanumeric value set.
   Range:
   - REF
   - MOD
   - OUTREF
2. **tid** – target identifier
   See definition of this parameter in "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **ctag** – correlation tag
   See definition of this parameter in "RTRV-HDR: Retrieve header" (p. 3-2417).
4. **sc** – switch command
   Note: When entering an OPR-SYNCSW-OUTREF command this parameter must be specified in uppercase letters, otherwise the command is rejected with error code: `SNVS /* Status, Not in Valid State, parameter required */`
   This parameter defines the type of switch action that is initiated on the timing reference or mode.

The following values are valid depending on parameter *modifier*.

- *modifier* REF: LOCKOUT – The reference which is addressed by the *dest* parameter, will be locked out by the user and cannot be used as a timing reference signal until the lockout is cleared. FRCD – A forced switch is initiated. It forces selection of the specified reference determined by the *dest* parameter. MAN – A manual switch is initiated to the specified reference determined by the *dest* parameter. CLRWTR – The wait to restore period of the reference which is addressed by the *dest* parameter will be terminated. The signal status will return to normal.
- *modifier* MOD: FRCD – A forced switch is initiated. It forces system timing from the locked mode to the holdover mode (Clock Backup Request).
- *modifier* OUTREF (for SDH only): LOCKOUT – The reference which is addressed by the *dest* parameter, will be locked out by the user and cannot be used for external timing output until the lockout is cleared. FRCD – A forced switch for external timing output is initiated. It forces selection of the specified reference determined by the *dest* parameter. MAN – A manual switch for the external timing output is initiated to the specified reference determined by the the *dest* parameter.

LOCKOUT has the highest priority, followed by FRCD, then MAN.
Type: Alphanumeric value set.

Range:

- LOCKOUT
- FRCD
- MAN
- CLRWTR.

Default: Not applicable.

5. **`dest`** – destination
   This parameter specifies the assigned timing reference identifier destination. This is the list of timing references available to the system clock or to the timing link switch of the external output timing. This parameter is valid and required for the REF and OUTREF modifiers.
   Type: AID

   Range:

   - *modifier* REF: External_timing_ref_AID, Line_timing_ref_AID
   - *modifier* OUTREF (for SDH only): Line_timing_ref_AID

   Default: Not applicable.

Output format

After receiving the **`OPR-SYNCNSW`** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
```

;

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The **OPR-SYNCNSW** command generates no **REPT DBCHG** Report Database Change notification. The **OPR-SYNCNSW** command returns a REPT EVT Report Event notification in consequence of a protection switch notification.

Clock backup request

Forced Holdover: The forced switch of system clock to holdover external request causes the system clock to be switched to holdover regardless of the state of the timing references. The following parameter is affected by the clock mode switch request Forced Holdover: – clkmod_stat = FORCED-HOLDOVER.

System timing reference or output timing switch request

Forced Switch: The forced switch to timing reference external switch request causes the system to be switched to the selected timing reference regardless of the state of that timing reference. While in the Forced Switch state the system may not switch the active timing reference, neither automatically nor by means of the Forced Switch or Manual Switch command.

Manual Switch: The manual switch to timing reference external request causes the system to be switched to the selected timing reference. The system leaves the Manual Switch state by means of the Clear, Lockout or Forced Switch commands. While in the Manual Switch state the system may switch the active timing reference automatically if required for protection switching, the system leaves the Manual Switch state due to automatic switching.

Lockout: The Lockout of reference external request is provided to allow manual disabling of individual references. While in the Lockout state the system may not switch the active timing reference to the reference, which is locked out.

The following parameters are affected by the system timing reference switch request:

- active_ref = [External_timing_ref_AID, Line_timing_ref_AID]
- refsw_stat = [FORCED, MANUAL]
- ref_lock = LOCKOUT
- ref_stat = NORMAL.

The following parameters are affected by the external output timing switch request:

- active_oref_stat = Line_timing_ref_AID
- orefswr_stat = [FORCED, MANUAL]
- sclkref_lockstat = LOCKOUT.

Example input/output

The following is an example of the **OPR-SYNCNSW** command for System Timing with *modifier* MOD:

```
OPR-SYNCNSW-MOD:LT-UNITE::123456::FRCD;

   LT-UNITE 00-11-09 12:00:00
M  123456 COMPLD
;
```

The following is an example of the **OPR-SYNCNSW** command for System Timing with *modifier* REF:

```
OPR-SYNCNSW-REF:LT-UNITE::123456::MAN,EXTREF1;

   LT-UNITE 00-11-09 12:00:00
M  123456 COMPLD
;
```

The following is an example of the **OPR-SYNCNSW** command for Output Timing with *modifier* OUTREF:

```
OPR-SYNCNSW-OUTREF:LT-UNITE::123456::LOCKOUT,LINE3;

   LT-UNITE 00-11-09 12:00:00
M  123456 COMPLD
;
```

Error responses

Validation rule: Parameter sc or dest is missing

If the system receives a OPR-SYNCNSW command with modifiers REF or OUTREF and one of the parameters *sc* or *dest* are missing, the system responds with:

Error code: `SNVS – Status, Not in Valid State, parameter required`

Validation rule: Invalid switch command

If the system receives a command with a *sc* value that is not supported, the system responds with:

Error code: `IDNV – Input, Data Not Valid, invalid sc`

Validation rule: Reference switching during lockout or disabled state

If the system receives a switch command to reference which is locked out or disabled, the system responds with:

Error code: `SNVS – Status, Not in Valid State, reference unavailable`

Validation rule: Clear wait to restore timer not applicable

If the system receives a clear request for a wait to restore timer while the reference is not in wait to restore state, the system responds with:

Error code: `SNVS – Status, Not in Valid State, clear request impossible`

Validation rule: Parameter not supported for modifier

If the system receives a OPR-SYNCNSW command with *modifier* MOD together with not supported parameter *dest*, the system responds with:

Error code: `IDNV – Input, Data Not Valid, parameter not required`

Validation rule: Clock backup switch request when clock mode is free running

If the system receives a OPR-SYNCNSW command with *modifier* MOD while the provisioned synchronization mode is free running, the system responds with:

Error code: `SSRD – Status, Switch Request Denied, clock mode inconsistent`

Validation rule: No change of the request state, request not practicable

If the system receives a switch command that results in no change to the switch request state or the active unit state, the system responds with:

Error code: `SNVS – Status, Not in Valid State, request not practicable`

Validation rule: Forced or manual switch request while reference is in forced state

If the system receives a manual or forced switch request to a reference which is already in forced state, the system responds with:

Error code: `SNVS – Status, Not in Valid State, request not practicable`

GR-833-CORE

OPR-VCGTRIB: Operate virtual concatenation group tributary

The **OPR-VCGTRIB** command allows to preempt a running wait-to-restore at a VCG tributary being memeber of a LCAS protection scheme. The wait-to-restore status is part of the LCAS protection scheme.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 1

Abortable: No

Input format

Command syntax: **OPR-VCGTRIB-modifier**:*tid:aid:ctag::sc;*

Input parameters

Command parameters

1. **modifier**
   This parameter soecifies the type of the tributary.
   Type: Alphanumeric value set.
   Range: STS, VC
2. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
3. **aid** – Access Identifier
   The access identifier specifies the VCG tributary whose attributes are to be modified.
   Type: AID

   Range: VCGNumAID as defined in AID structure. The values

   - *all* for Simple_VCGNumAID
   - *vall* for Simple_VCGAID
   - *usall* for Simple_UnivSlotAID
   - *all* for Simple_UnivSlotAID
   - *all* for Simple_ShelfAID and
   - *all* for BayAID

   is excluded.

4. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
5. **sc** – switch command
   The parameter *sc* specifies the switch action applied to the VCG tributary.
   Type: Alphanumeric value set.
   Range: CLRWRT.

Output format

If the NE fully complies with the **OPR-VCGTRIB** request, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The command shall preempt the wait-to-restore timer of the VCG tributary, addressed. State changes caused by this preemption are reported according an autonomous ED-VCGTRIB notification for this VCGTRIB for the parameter *inmbst*.

Example input/output

```
OPR-VCGTRIB-VC:LT-UNITE:1-1-#-#-1-v1-2:123456::CLRWTR;

   LT-UNITE 00-11-11 11:11:00
M  123456 COMPLD
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **OPR-VCGTRIB** command.

Validation rule: Check modifier against circuit pack type

If the command is applied with modifier = VC or STS to a VCG Tributary on a Transparent pack, then the command is denied.

Error code: `IENE – Input, Entity Not Exists`

Validation rule: wait-to-restore is not pending

Check that addressed tributary is in state wait-to-restore if parameter *sc* = CLRWTR is applied.

Error code:

`SNVS – Status, Not in Valid State, Tributary is not in state wait-to-restore`

- "ED-VCGTRIB: Edit virtual concatenation group tributary" (p. 3-1416)

Protection switch notification

Output format

General

The following syntax is used for: 1+1 equipment, 1+1 multiplex section/line, 1:N multiplex section/line, 2-/4-fibre MS-SPRing/BLSR, path protection group.

1+1 equipment protection includes LOXC, TransMUX, and ES64U equipment protection groups.

Command syntax: **`REPT EVT`** *modifier aid*:*condtype*,*condeff*,*ocrdat*,*ocrtm*:*conddescr;*

1+1 equipment protection group

The REPT EVT Notification is generated if the swreq (switch request state) attribute is changed due to an automatic switch or a switch command. In addition, a REPT SW Notification is generated if the actunit (active unite state) attribute is changed due to an automatic switch or a switch command.

If both, actunit and swreq are changed due to an automatic switch or a switch command, then one REPT SW Notification and one REPT EVT Notification is generated.

Output parameters

Command parameters (1+1 equipment protection group, REPT EVT)

1. **`modifier`** – Modifier
   This parameter specifies the value ’COM’ as an event that applies to the whole NE.
   Type: Alphanumeric value set.
   Range: COM.
2. **`aid`** – Access Identifier
   Description: The parameter specifies the aid of 1+1 equipment protection group.
   Type: AID
   Range: SwitchAndTmgProtGrpAID or CtlProtGroupAID or EP155ProtGroupAID or EP51ProtGroupAID or LOXCProtGroupAID or TMUXProtGroupAID or ES64UProtGroupAID
   All actual existing equipment protection groups will be returned with a specific AID:
   - SwitchAndTmgProtGrpAID for high order switch fabric and timing group,
   - CtlProtGroupAID for system controller group,
   - EP155ProtGroupAID for electrical 155 MBit/s groups,
   - EP51ProtGroupAID for electrical 51 MBit/s groups,
   - LOXCProtGroupAID for low order switch fabric groups.

- TMUXProtGroupAID for TransMUX groups
- ES64UProtGroupAID for es64u groups

Default: No default

3. **condtype** – Condition Type
   This parameter specifies/identifies the type of event indication being reported. The value GP (General Purpose) is used for all 1+1 equipment protection switch events.
   Type: Alphanumeric value set.
   Range: GP.
4. **condeff** – Condition Effect
   This parameter indicates the effect of the reported event on the NE. The value TC – (Transient Condition) is used for all protection switch events.
   Type: Alphanumeric value set.
   Range: TC.
5. **ocrdat** – Occurrence Date
   This parameter indicates the date of the switch event being reported.
   Type: value set of format MM-DD.
   Range: M, D are digits. Leading zeros are not suppressed. MM represents month, DD the day.
6. **ocrtm** – Occurrence Time
   This parameter indicates the time of the switch event being reported.
   Type: value set of format HH-MM-SS.
   Range: H, M, S are digits. Leading zeros are not suppressed. HH represents hours, MM minutes, SS seconds.
7. **conddescr** – Condition Description
   This parameter provides additional information w.r.t. the protection event.

   The string value depends on the actual switch request state as follows

   - *swreq*: *condescr*
   - EQPTFAILED: \“Protection switch, EQPT, Equipment failed”\
   - FS: \“Protection switch, EQPT, Forced switch”\
   - MS: \“Protection switch, EQPT, Manual switch”\
   - NR: \“Protection switch, EQPT, No request”\

   Type: inner string.
   Range: See above. Note: For protection type EQPTCTL swreq=FS or condescr =\“Protection switch, EQPT, Forced switch\” is not applicable.
   Initial PROTNSW:
   The system evaluates the current fault information at the protection group creation time. Based on that, the system calculates and reports the switch request state. The value will be either ’NR’ or ’EQPTFAILED’ .

Command parameters (multiplex section/line protection group, REPT EVT)

1. **`modifier`** – Modifier
   The parameter is derived from the interface rate of the ports within the protection group. It shall indicate the same value as for the two ports.
   Type: Alphanumeric value set.
   Range: OC3, OC12, OC48, OC192, OC768, STM1, STM4, STM16, STM64, STM256
   Default: The default value is the interface rate of the worker port.
2. **`aid`** – Access Identifier
   This parameter specifies the port AID being a member of the protection group.
   It is derived from the active unit state as follows:
   a. current value of *actunit*, *aid* value
   b. WKG, worker port aid
   c. PROTN, protection port aid
   Type: AID
   Range: SPortAID
   Initial PROTNSW:
   The worker port AID is used in the initial protection switch notification.
3. **`condtype`** – Condition Type
   This parameter identifies the type of event indication being reported. The value GP (General Purpose) is used independent for the operation mode if the active unit state has not changed.
   If active unit state has changed and operation mode is revertive, the following values is used: The value WKSWPR-2 is used if service is switched to the protection section/line. The value WKSWBK is used if service is switched to the worker section/line.
   If active unit has changed and operation mode is non-revertive, the value PS is used.
   Type: Alphanumeric value set.
   Range: GP, WKSWPR-2, WKSWBK, PS
   Initial PROTNSW:
   The value ’GP’ is used in the initial protection switch notification.
4. **`condeff`** – Condition Effect
   This parameter indicates the effect of the reported security event on the NE. The value TC – (Transient Condition) is used for all protection switch events.
   Type: Alphanumeric value set.
   Range: TC
5. **`ocrdat`** – Occurrence Date
   This parameter indicates the date of the security event being reported.
   Type: value set of format MM-DD
   Range: M, D are digits. Leading zeros are not suppressed. MM represents month, DD the day.

6. **`ocrtm`** – Occurrence Time
   Description The parameter shall indicate the time of the security event being reported.
   Type: value set of format HH-MM-SS
   Range: H, M, S are digits. Leading zeros are not suppressed. HH represents hours, MM minutes, SS seconds.
7. **`conddescr`** – Condition Description
   This parameter provides additional information w.r.t. the protection event. The string value depends on the actual switch request state as follows:
   - *swreq*: *conddescr*
   - LO: \“Protection switch, {rr} port, Lockout switch,, 1+1/1:1\”
   - FS: \“Protection switch, {rr} port, Forced switch,, 1+1/1:1\”
   - FOP: \“Protection switch, {rr} port, FOP,, 1+1/1:1\”
   - SF: \“Protection switch, {rr} port, SF,, 1+1/1:1\”
   - SD: \“Protection switch, {rr} port, SD,, 1+1/1:1\”
   - MS: \“Protection switch, {rr} port, Manual switch,, 1+1/1:1\”
   - WTR: \“Protection switch, {rr} port, WTR,, 1+1/1:1\”
   - DNR: \“Protection switch, {rr} port, DNR,, 1+1/1:1\”
   - NR: \“Protection switch, {rr} port, No request,, 1+1/1:1\”

   The value for variable *rr* is derived from the port rate within the protection group.
   Type: inner string.
   Range: See description above.
   Initial PROTNSW:
   The value ’NR’ is used for *swreq* in the initial protection switch notification.

Command parameters (2-fibre MS-SPRing/BLSR protection group, REPT EVT)

Protection switch events are reported separately for each side within the protection group. The *aid* parameter can be used in order to identify the side for which the switch event is reported.

1. **`modifier`** – Modifier
   The parameter is derived from the interface rate of the ports within the protection group. It shall indicate the same value as for the two ports.
   Type: Alphanumeric value set.
   Range: OC48, OC192, OC768, STM16, STM64, STM256
   Default: The default value is the interface rate of the worker port.
2. **`aid`** – Access Identifier
   This parameter specifies for which ring side the corresponding switch request is active; it shall either specify the east port AID or the west port AID within the protection group.
   Type: AID.
   Range: SPortAID.

3. **`condtype`** – Condition Type
   This parameter identifies the type of event indication being reported. The value WKSWPR-2 is used if service is switched to the protection route. The value WKSWBK is used if service is switched to the worker route. The value GP (General Purpose) is used if the active route has not changed.
   Type: Alphanumeric value set.
   Range: GP, WKSWPR-2, WKSWBK
   Initial PROTNSW: The value *WKSWBK* is used in the initial protection switch notification.
4. **`condeff`** – Condition Effect
   This parameter indicates the effect of the reported event on the network element. The value TC – (Transient Condition) is used for all protection switch events.
   Type: Alphanumeric value set.
   Range: TC
5. **`ocrdat`** – Occurrence Date
   The parameter shall indicate the date of the switch event being reported.
   Type: value set of format MM-DD
   Range: M, D are digits. Leading zeros are not suppressed. MM represents month, DD the day.
6. **`ocrtm`** – Occurrence Time
   The parameter shall indicate the time of the switch event being reported.
   Type: value set of format HH-MM-SS
   Range: H, M, S are digits. Leading zeros are not suppressed. HH represents hours, MM minutes, SS seconds.
7. **`conddescr`** – Condition Description
   This parameter provides additional information w.r.t. the protection event. The string value depends on the actual swreq as follows:
   - *swreq*: *condescr*
   - LPS: \“Protection switch, {rr} port, Lockout switch, LPS, 2F”\
   - FSR: \“Protection switch, {rr} port, Forced switch, FSR, 2F”\
   - SFR: \“Protection switch, {rr} port, Signal fail, SFR, 2F”\
   - SDR: \“Protection switch, {rr} port, Signal degrade, SDR, 2F”\
   - MSR: \“Protection switch, {rr} port, Manual switch, MSR, 2F”\
   - WTR: \“Protection switch, {rr} port, Wait to restore, WTR, 2F”\
   - RRS: \“Protection switch, {rr} port, Reverse request, RRS, 2F”\

- RRR: \“Protection switch, {rr} port, Reverse request, RRR, 2F”\
- NR: \“Protection switch, {rr} port, No request, NR, 2F”\

The value for variable *rr* is derived from the port rate within the protection group. See value range definition for the attribute *pgrate* in the “RTRV-PROTN-GRP: Retrieve protection group” (p. 3-2759) output section w.r.t. supported port rates for the different protection types.
Type: inner string
Range: See description above.
Initial PROTNSW: The value ’NR’ is used for *swreq* in the initial protection switch notification.

Command parameters (4-fibre MS-SPRing/BLSR protection group, REPT EVT)

Protection switch events are reported separately for each side within the protection group. The aid parameter can be used in order to identify the side for which the switch event is reported.

1. **`modifier`** – Modifier
   The parameter is derived from the interface rate of the ports within the protection group. It shall indicate the same value as for the two ports.
   Type: Alphanumeric value set.
   Range: OC48, STM16, OC192, STM64. If *protnmode* = TOPEX, then the range is restricted to: STM64 only
   Default: The default value is the interface rate of the worker port.
2. **`aid`** – Access Identifier
   This parameter specifies the port AID being a member of the protection group.
   It is derived from the active unit state for each side (east or west) as follows:
   a. current value of *actunit*, *aid* value
   b. WKG, worker port aid
   c. PROTN, protection port aid
      The attributes switch request state and active unite state may be updated in the context of a switch event. Actual means the value of the parameter after the switch has occurred.

   Type: AID.
   Range: SPortAID.
   Initial PROTNSW: The worker port AID is used in the initial protection switch notification.
   Asymmetric Ring Support: In all protection switch notifications for an asymmetric span, where a worker port AID is required, but the worker port is not available, the AID of the protection port of the same side of the protection group is used.
3. **`condtype`** – Condition Type
   This parameter identifies the type of event indication being reported. The value WKSWPR-ep is used if service is switched to east protection span.
   The value WKSWBK-wp is used if service is switched to west protection span.
   The value WKSWBK is used if service is switched to working. The value GP

(General Purpose) is used if the active route/span has not changed.
Type: Alphanumeric value set.
Range: GP, WKSWPR-ep, WKSWPR-wp, WKSWBK
Initial PROTNSW: The value *WKSWBK* is used in the initial protection switch notification.

4. **condeff** – Condition Effect
he parameter shall indicate the effect of the reported event on the network element. The value TC – (Transient Condition) is used for all protection switch events.
Type: Alphanumeric value set.
Range: TC
5. **ocrdat** – Occurrence Date
The parameter shall indicate the date of the switch event being reported.
Type: value set of format MM-DD
Range: M, D are digits. Leading zeros are not suppressed. MM represents month, DD the day.
6. **ocrtm** – Occurrence Time
The parameter shall indicate the time of the switch event being reported.
Type: value set of format HH-MM-SS
Range: H, M, S are digits. Leading zeros are not suppressed. HH represents hours, MM minutes, SS seconds.
7. **conddescr** – Condition Description
This parameter provides additional information w.r.t. the protection event. The string value depends on the actual swreq as follows:
   - *swreq*: *condescr*
   - LPS: \“Protection switch, {rr} port, Lockout switch, LPS, 4F”\
   - FSS: \“Protection switch, {rr} port, Forced switch, FSS, 4F”\
   - FSR: \“Protection switch, {rr} port, Forced switch, FSR, 4F”\
   - SFS: \“Protection switch, {rr} port, Signal fail, SFS, 4F”\
   - SFR: \“Protection switch, {rr} port, Signal fail, SFR, 4F”\
   - SDS: \“Protection switch, {rr} port, Signal degrade SDS, 4F”\
   - SDR: \“Protection switch, {rr} port, Signal degrade, SDR, 4F”\
   - MSS: \“Protection switch, {rr} port, Manual switch, MSS, 4F”\
   - MSR: \“Protection switch, {rr} port, Manual switch, MSR, 4F”\
   - WTR: \“Protection switch, {rr} port, Wait to restore, WTR, 4F”\
   - RRS: \“Protection switch, {rr} port, Reverse request, RRS, 4F”\

- RRR: \“Protection switch, {rr} port, Reverse request, RRR, 4F”\
- NR: \“Protection switch, {rr} port, No request, NR, 4F”\

The value for variable *rr* is derived from the port rate within the protection group. See value range definition for the attribute *pgrate* in the “RTRV-PROTN-GRP: Retrieve protection group” (p. 3-2759) output section w.r.t. supported port rates for the different protection types.
Type: inner string.
Range: See Description.
Initial PROTNSW: The value ’NR’ is used for *swreq* in the initial protection switch notification.

Command parameters (Path protection group, REPT EVT)

1. **modifier** – Modifier
The parameter is derived from the interface rate of the ports within the protection group. It shall indicate the same value as for the two ports.
Type: Alphanumeric value set.
Range: STS1, STS3C, STS12C, STS48C, STS192C, VC3, VC4, VC44C, VC416C, VC464C
Default: The default value is derived from the tributary input signal rate list in case of fixed mode.
2. **aid** – Access Identifier
This parameter specifies for the output tributary AID of the constituent path selector AID being a member of the path protection group.
Note: If path protection group consists only of one constituent path selector, the output tributary AID is equal to the path protection group AID.
Type: AID.
Range: STS1NumAID or VCGNumAID or GenLOTribAID.
The use of wild cards is not allowed for any part of the AID.
3. **condtype** – Condition Type
This parameter specifies the type of event indication being reported. The value GP (General Purpose) is used if the active unit state has not changed.
If active unit state has changed, the following values are used: The value WKSWPR-2 is used if service is switched to the protection tributary. The value WKSWBK is used if service is switched to the worker tributary.
Type: Alphanumeric value set.
Range: GP, WKSWPR-2, WKSWBK.
Initial PROTNSW: The value ’GP’ is used in the initial protection switch notification.
4. **condeff** – Condition Effect
The parameter shall indicate the effect of the reported event on the network element. The value TC – (Transient Condition) is used for all protection switch events.
Type: Alphanumeric value set.
Range: TC

5. **ocrdat** – Occurrence Date
   The parameter shall indicate the date of the switch event being reported.
   Type: value set of format MM-DD
   Range: M, D are digits. Leading zeros are not suppressed. MM represents month, DD the day.
6. **ocrtm** – Occurrence Time
   The parameter shall indicate the time of the switch event being reported.
   Type: value set of format HH-MM-SS
   Range: H, M, S are digits. Leading zeros are not suppressed. HH represents hours, MM minutes, SS seconds.
7. **conddescr** – Condition Description
   This parameter provides additional information w.r.t. the protection event. The string value depends on the actual switch request state as follows:
   - *swreq*: *conddescr*
   - LO: \“Protection switch, {rr} CS, Lockout switch”\
   - FS: \“Protection switch, {rr} CS, Forced switch”\
   - SF: \“Protection switch, {rr} CS, SF”\
   - SD: \“Protection switch, {rr} CS, SD”\
   - MS: \“Protection switch, {rr} CS, Manual switch”\
   - WTR: \“Protection switch, {rr} CS, WTR”\
   - NR: \“Protection switch, {rr} CS, No request”\

   The value for variable *rr* is derived from the constituent signal type; i.e. it has the following values: LOVT1, STS1, STS3C, STS12C, STS48C, STS192C, LOVC12, LOVC3, VC3, VC4, VC44C, VC416C, VC464C.
   Type: inner string.
   Range: See description above.
   Initial PROTNSW: The value ’NR’ is used for *swreq* in the initial protection switch notification.

Example output

1+1 Equipment protection group

he following example reports a manual switch to protection circuit pack for 1+1 equipment protection group. Because the manual switch chnges the active unite state and the switch request state, a REPT SW Notification is generated in addition to the REPT EVT Notification:

```
   LT-UNITE 99-01-10 08:12:00
A  001 REPT SW
   ″1-1-#-#-xcp-cp,1-1-#-#-xcw-cp″
;

   LT-UNITE 98-01-10 08:12:00
A  002 REPT EVT COM
```

```
   "1-1-estgrp:GP,TC,01-10,08-12-00:\"Protection Switch, EQPT, Manual switch\""
;
```

Multiplex section/line protection group (1+1 and 1:1)

The following example reports a lockout switch for a 1+1 multiplex section/line protection group:

```
   LT-UNITE 98-01-10 08:12:00
A  015 REPT EVT OC3
   "1-1-#-#-10-2:WKSWBK,TC,01-10,08-12-00:\"Protection Switch, OC3 port, Lockout
      switch,, 1+1/1x1\""
;
```

2 fibre MS-SPRing/BLSR protection group

The following example reports a manual ring switch of the east side for a 2F MS-SPRing/BLSR protection group:

```
   LT-UNITE 98-01-10 08:12:00
A  015 REPT EVT OC48
   "1-1-#-#-10-2:WKSWPR-2,TC,01-10,08-12-00:\"Protection Switch, OC48 port, Manual
      switch, MSR, 2F\""
;
```

4 fibre MS-SPRing/BLSR protection group

The following example reports a manual span switch of the east side for a 4F MS-SPRing/BLSR protection group:

```
   LT-UNITE 98-01-10 08:12:00
A  015 REPT EVT OC192
   "1-1-#-#-10-1:WKSWPR-2,TC,01-10,08-12-00:\"Protection Switch, OC192 port, Manual
      switch, MSS, 4F\""
;
```

Path protection group

The following example reports a autonomous switch to protection for a 1+1 path protection group:

```
   LT-UNITE 98-01-10 08:12:00
A  015 REPT EVT STS1
   "1-1-#-#-10-1-25:WKSWPR-2,TC,01-10,08-12-00:\"Protection Switch, STS1 CS, SF\""
;
```

REPT ALM: Report alarm

REPT ALM messages are generated autonomously by the NE to report an alarm that requires immediate attention by the craft at the OS. Each alarm message has an alarm severity associated with it.

Output format

The general output format of the **REPT ALM** message is defined as follows:

```
sid date time
almcde atag REPT ALM modifier
  ″aid:ntfcncde,condtype,srveff,ocrdat,ocrtm:conddescr″
   (1 or more lines of the above)
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the output parameter section for the **RTRV-HDR** command.

Output parameters

Command parameters

1. **almcde** – Alarm Code
   The alarm code indicates the severity of the reported alarm or if the alarm is cleared.
   Type: Value set.
   Range:
   - *C: Critical alarm
   - **: Major alarm
   - *: Minor alarm
   - A: Automatic message (nonalarm). This is used only to report a cleared alarm.
2. **atag** – Automatic Tag
   This parameter is used for message sequencing. The number is incremented by one for each autonomous message sent by the NE.
   Type: Integer (3 digits).
   Range: 000 – 999 Leading zeros are not suppressed.
3. **modifier** – Message Modifier
   This parameter defines the AID type to which the alarm belongs.
   Type: Alphanumeric value set.
   Range:
   - COM: Common. An alarm/event that applies to the whole NE system; for example, a processing error.
   - EQPT: An equipment-related alarm/event.
   - SYST: An alarm/event related to system timing.

- OUTT: An alarm/event related to output timing.
- STM1E: A facility-related alarm/event for synchronous transport mode 1 (electrical).
- STM1: A facility-related alarm/event for synchronous transport mode 1.
- STM4: A facility-related alarm/event for synchronous transport mode 4.
- STM16: A facility-related alarm/event for synchronous transport mode 16.
- STM16T: A facility-related alarm/event for fully transparent synchronous transport mode 16.
- STM64: A facility-related alarm/event for synchronous transport mode 64.
- STM256: A facility-related alarm/event for synchronous transport mode 256.
- ODU1: A facility-related alarm/event for optical data units of level 1
- OC3: A facility-related alarm/event at the optical carrier signal level 3.
- OC12: A facility-related alarm/event at the optical carrier signal level 12.
- OC48: A facility-related alarm/event at the optical carrier signal level 48.
- OC48T: A facility-related alarm/event at the fully transparent optical carrier signal level 48.
- OC192: A facility-related alarm/event at the optical carrier signal level 192
- OC768: A facility-related alarm/event at the optical carrier signal level 768
- T3: A facility-related alarm/event at the DS3 level
- TMAT3: A facility-related alarm/event at the DS3 level related to TransMUX function
- EC1: A facility-related alarm/event at the EC1 level
- 1GE: A facility-related alarm/event for 1 Gigabit Ethernet.
- 1GEPL: A facility-related alarm/event for 1 Gigabit Ethernet Private Line.
- 10GEPL: A facility-related alarm/event for 10 Gigabit Ethernet Private Line.
- VC3: A facility-related alarm/event for virtual container 3.
- VCG: A facility-related alarm/event for virtual concatenation group.
- VC4: A facility-related alarm/event for virtual container 4
- VC44C: A facility-related alarm/event for a signal concatenated at 4 times the VC4 rate.
- VC416C: A facility-related alarm/event for a signal concatenated at 16 times the VC4 rate.
- VC464C: A facility-related alarm/event for a signal concatenated at 64 times the VC4 rate.
- STS1: A facility-related alarm/event at synchronous transport signal level 1.
- TMASTS1: A facility-related alarm/event at synchronous transport signal level 1 related to TransMUX function.

- STS3C: A facility-related alarm/event at synchronous transport signal level 3.
- STS12C: A facility-related alarm/event at synchronous transport signal level 12.
- STS48C: A facility-related alarm/event at synchronous transport signal level 48.
- STS192C: A facility-related alarm/event at synchronous transport signal level 192.
- HOVC4 : A facility-related alarm/event for virtual container 4 higher-order path termination.
- HOSTS1: A facility-related alarm/event at synchronous transport signal level 1 higher-order path termination.
- LOVC3: A facility-related alarm/event for virtual container 3 (lower-order path).
- LOVC12: A facility-related alarm/event for virtual container 12
- LOVT1: A facility-related alarm/event at transport level VT1.5.
- TMSVT: A facility-related alarm/event at transport level VT1.5 related to TransMUX function.
- DS1: A facility-related alarm/event at transport level DS1.
- LINK: A signaling communication link related alarm/event for ONNS

Default: None.

4. **`aid`** – Access Identifier
   This is the address of the entity for which an alarm condition is being reported.
   Type: AID.
   Range: All defined AIDs are allowed. It should be a valid AID for the specified *modifier*. Refer to the definition of AIDs.
5. **`ntfcncde`** – Notification Code
   This is the alarm severity of the reported Alarm or the clear information of a cleared Alarm.
   Type: Alphanumeric value set.
   Range:
   - CR – Critical (ITU / Telcordia)
   - MJ – Major (ITU / Telcordia)
   - MN – Minor (ITU / Telcordia)
   - CL – Cleared.
6. **`condtype`** – Condition Type
   This parameter identifies the probable cause (type of alarm indication) being reported.
   Type: Alphanumeric value set.
   Range: All defined probable causes.
   `srveff` – Service Effect
   This parameter identifies the service affect of alarms being reported. It presents the “best guess” from a local system point of view.
   Type: Alphanumeric value set.

Range:

- SA: Service-Affecting alarm condition
- NSA: Non-Service-Affecting alarm condition.

7. **`ocrdat`** – Occurrence Date
   This parameter indicates the raising / clearing date of the alarm.
   Type: value set of the format MM-DD.
   Range: MM represents the month, DD represents the day, leading zeros are not suppressed.
8. **`ocrtm`** – Occurrence Time
   This parameter indicates the raising / clearing time of the alarm. The accuracy should be +/- 1 second.
   Type: value set of the format HH-MM-SS.
   Range: HH represents the hours, MM represents the minutes, SS represents the seconds, leading zeros are not suppressed.
9. **`conddescr`** – Description of the Condition
   This is a textual Description of the Condition.
   Type: inner string of the format:
   \″<category>, <entity>, <description>, <additional text>\″ or
   \″<category>, <entity>, <description>, <additional text>-cleared\″ (this form is used in REPT ALM/EVT for cleared alarms)
   Range:
   - category: is the category
   - entity: is the entity for which the alarm is reported
   - description: is the Alarm description, the string is up to 32 characters
   - additional text: additional text.

   If there is no additional text, then the trailing comma may be omitted.

Detailed behavior description

If an alarm has an severity of critical, major, or minor, then its occurrence will be reported in a REPT ALM message. An exception to this rule is an environmental alarm which is reported by a REPT ALM ENV autonomous message.

An alarm reported to the OS via the REPT ALM message has a corresponding REPT ALM clearance message that is generated when the alarm clears.

Example input/output

The following example shows an autonomous message REPT ALM for an LOS Alarm:

```
   LT-UNITE-123 00-01-01 08:00:00
*C 126 REPT ALM OC48
  ″1-1-#-#-3-1:CR,LOS,SA,01-01,07-29-13:\″Communication-Transport, OC48 port, Loss
      Of Signal\″″
```

```
;
```

The following example shows an autonomous message REPT ALM for an LOS Alarm clear:

```
   LT-UNITE-123 00-01-01 08:00:00
A  127 REPT ALM OC48
  ″1-1-#-#-3-1:CL,LOS,SA,01-01,07-29-13:\″Communication-Transport, OC48 port, Loss
      Of Signal-cleared\″″
;
```

REPT-ALM-ENV: Report alarm environment

The **REPT ALM ENV** autonomous messages report when environmental alarm of severity CR (critical), MJ (major), or MN (minor) either sets or clears.

Output format

The general output format of the **REPT ALM ENV** message is defined as follows:

```
   sid date time
almcde atag REPT ALM ENV
  "aid:ntfcncde,almtype,ocrdat,ocrtm[,almmsg]"
   (1 or more lines of the above)
;
```

Output parameters

Command parameters

1. **almcde** – Alarm Code
   The alarm code indicates the severity of the reported alarm or if the alarm is cleared.
   Type: Value set.
   Range:
   - *C: Critical alarm
   - **: Major alarm
   - *: Minor alarm
   - A: Automatic message (nonalarm). This is used only to report a cleared alarm.
2. **atag** – Automatic Tag
   This parameter is used for message sequencing. The number is incremented by one for each autonomous message sent by the NE.
   Type: Integer (3 digits).
   Range: 000 – 999 Leading zeros are not suppressed.
3. **aid** – Access Identifier
   This is the address of the entity for which an alarm condition is being reported.
   Type: AID.
   Range: Miscellaneous_in_discreteAID. The AID misc_inall must not appear.
4. **almtype** – Alarm Type
   This parameter identifies the type of alarm indication being reported.
   Type: Alphanumeric value set.
   Range: MISC (default), an event that applies to the miscellaneous discrete outputs inputs.

5. **`ocrdat`** – Occurrence Date
   This parameter indicates the raising / clearing date of the alarm.
   Type: value set of the format MM-DD.
   Range: MM represents the month, DD represents the day, leading zeros are not suppressed.
6. **`ocrtm`** – Occurrence Time
   This parameter indicates the raising / clearing time of the alarm. The accuracy should be +/- 1 second.
   Type: value set of the format HH-MM-SS.
   Range: HH represents the hours, MM represents the minutes, SS represents the seconds, leading zeros are not suppressed.
7. **`almmsg`** – Alarm Message
   A string describing the alarm of the environmental point.
   Note: This string is configurable by the **`SET-ATTR-ENV`** command.
   Type: text string.
   Range: upper and lower case, up to 32 characters.
   Default: Miscellaneous Discrete.

Detailed behavior description

REPT ALM ENV messages will be reported if on environmental points (MDI's) an alarm of severity CR (critical), MJ (major), or MN (minor) will be raised.

An alarm reported to the OS via the REPT ALM ENV message has a corresponding REPT ALM ENV clearance message that is generated when the alarm condition clears.

An environmental alarm of severity NA (warning (ITU) / not alarmed (telcordia) will be reported by REPT EVT.

Example input/output

The following example shows a REPT ALM ENV message if an environmental alarm appears:

```
   LT-UNITE-123 00-01-01 08:00:00
*C 126 REPT ALM ENV
  ″MISC_IN7:CR,MISC,01-01,07-29-13,\″open door\″″
;
```

The following example shows a REPT ALM ENV message if an environmental alarm disappears:

```
   LT-UNITE-123 00-01-01 08:00:00
A  127 REPT ALM ENV
  ″MISC_IN7:CL,MISC,01-01,07-29-13,\″open door\″″
;
```

REPT CONNCHG notification

Overview

The **REPT CONNCHG** notification is used to notify the setup or tear down of Network Connections via multiple domains triggered via UNI. UNI triggered setup/tear down of single domain connections is not notified.

The REPT CONNCHG notification is also used to notify about TL1 triggered changes (ENT/ED/DLT-CONN) or autonomously triggered changes of Network Connection parameters.

The REPT CONNCHG notification message reports specific changes in the system data repositories of the ingress node of every involved domain. Changes can be caused by a user's TL1 command, UNI request or by autonomous internally generated connection changes.

Notification messages resulting from a TL1 command or UNI request

If the data repository change occurs as a result of a TL1 ENT-CONN, DLT-CONN, ED-CONN command or a UNI request, then a REPT CONNCHG message is transmitted to all users provisioned to receive REPT CONNCHG messages. Therefore, a management OS must expect to receive data repository change messages for changes it caused, caused by a CIT user as well as those caused by a UNI request. The REPT CONNCHG CCB field will indicate the TL1 command that caused the connection change.

Autonomous Network Connection configuration change REPT CONNCHG format

Autonomous network connection configuration changes that affect the data repository will cause a REPT CONNCHG messages that are output with the CCB = CONN.

Output format

Output format for a REPT CONNCHG notification message

The general format of a REPT CONNCHG notification is as follows:

```
   srcTid date time
A  atag REPT CONNCHG
   ″TIME=ocrTime, DATE=ocrDate:CCB=ccb:srcASTNNodeID:msgCode,eventText″
   ″[CallID=callID],[ConnID=connID]:specBlock″;
```

Output parameters

Command parameters

1. **`srcTid`**
   Target identifier of the source node is the logical name of the Host NE. ONNS uses the same unique *tid* used by Host NE. See also the definition of *tid* in RTRV-HDR.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.

2. **`date`**
   Date. The date parameter is set to the date when the output message is generated.
   Type: Value set.
   Range:
   YY-MM-DD, where
   - YY=00-99,
   - MM=01-12,
   - DD=01-31

   Default: current date

3. **`time`**
   Time. The time parameter is set to the time when the output message is generated. See also time in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: Value set.
   Range:
   HH:MM:SS, where
   - HH=00-23,
   - MM=00-59,
   - SS=00-59

   Default: current time

4. **`atag`** – Automatic Tag
   The *atag* is used for message sequencing. The *atag* is available per user session. The number is incremented by one for each autonomous message, and the messages are transmitted to the user in that same order.
   Type: decimal number
   Range: 000-999
   Default: 0

5. **`ocrDate`** – Occurence Date
   Date. The date parameter is set to the date when the event occurred in the system.
   Type: Value set.
   Range:

YY-MM-DD, where

- YY=00-99,
- MM=01-12,
- DD=01-31

Default: occurence date

6. **`ocrTime`** – Occurence Time

   Time. The time parameter is set to the time when the event occurred in the system.
   Type: Value set.
   Range:
   HH:MM:SS, where

   - HH=00-23,
   - MM=00-59,
   - SS=00-59

   Default: occurrence time

7. **`comBlock(CB)`**- CCB common block

   This block contains the parts of the command (TL1 or UNI request) causing this REPT CONNCHG notification plus further event info. The following parameters, separated by : will be present:

   - CCB – command code block for the command which caused the event
   - srcASTNNodeID – srcASTNNodeID input parameter to the command
   - msgCode – msgCode of the event
   - eventText – further event info.

   a. **`CCB`** – Command Code Block

      Represents the network connection command (TL1 or UNI request) causing the change. This confirmation notification indicates a network connection change was stored in the ONNS Host NVM.

      Type: Value set.

      Range:

      CONN is specified when the change is not directly caused by a network connection command (TL1 or UNI request), e.g. forced deletion other values are used when the change is directly caused by a user TL1 or UNI request command:
      – ENT-CONN
      – ED-CONN
      – DLT-CONN

   b. **`srcASTNNodeID`**

      ONNS source nodeID. Together with the following *srcPortID* field defines the associated Ingress *connPoint* that connects the source node to the edge/gateway switch or client router.

      Type: Four dot separated numeric strings

      Range: for each numeric string: 0..255

c. **`msgCode`** – Message Code

Message Code or Status code indicates known or suspected cause or reason for the event, change, or condition.

Type: Alphanumeric string of length 4

Range: See for possible message codes in chapter “CONNCHG events”.

d. **`eventText`**

This field records an event description message.

Type: text string

Range: See for possible message codes in chapter “CONNCHG events”.

e. **`CONNCHG events`**

EVENTS SPECIFIC TO ENT-CONN:

Successful Network Connection setup

Event: C001 – Network Connection successfully setup

Calling Party Busy

Event: E001 – Ingress address already in use

Called Party Busy

Event: E002 – Egress address already in use

Unavailable SNP

Event: E004 – Selected timeslot on eNNI link already in use

Error code “Unavailable SNP” shall include error code “Invalid SNP”, as long as internally both are not distinguishable, because “Unavailable SNP” is considered as the more generic one.

Unavailable SNPP

Event: E006 – Selected port on eNNI link already in use

Error code “Unavailable SNPP” shall include error code “Invalid SNPP”, as long as internally both are not distinguishable, because “Unavailable SNPP” is considered as the more generic one.

Invalid SPC SNP

Event: E007 – Invalid Egress address

The event “Invalid SPC SNP” shall especially be applied in case input parameters *destTNAAddress* does not address a network TNA address information (that is, does not address a TNA information for the SDH/SONET layer).

Invalid route

Event: E008 – Invalid Level1 Routing decision

Service affecting defect

Event: E009 – Service affecting defect

Non service affecting defect

Event: E010 – Non service affecting defect

Unavailable service level

Event: E011 – Service level is unavailable

Unavailable directionality

Event: E012 – Directionality is unavailable

Unauthorized sender (policy error)

Event: E013 – Unauthorized sender (policy error)

Unauthorized receiver (policy error)

Event: E014 – Unauthorized receiver (policy error)

RSVP protocol failure

The output format is shown below, where **`<error code>`** is a 2-character code and **`<value>`** is a 3-character code describing the RSVP defined error codes and values.

Event: E015 – Protocol failure, <error code> / <value>

Input Parameter Source Label not valid

The following event is raised if the value for the input parameter *srcLabel* is not valid.

Event: E016 – invalid Source Label

Input Parameter Destination TNA Address not valid

The following event is raised if the value for the input parameter *destTNAAddress* is not valid.

Event: E017 – invalid Destination TNA Address

EVENTS SPECIFIC TO DLT-CONN:

Graceful deletion of a Network Connection

Event: C060 – Network Connection graceful deleted

EVENTS INDEPENDENT TO NETWORK CONNECTION COMMANDS

Forced Deletion of a Network Connection

Event: C100 – Network Connection forced deleted

8. **`callID`**
   The *callID* indicates a call of a logical call / connection separation (call capability). This *callID* can be a operator specific identity of Type = 0x01 (source transport network element address is 4 bytes).
   Type: Alphanumeric value set (12 bytes). The first 4 bytes describe the source transport network element address and the following 8 bytes the local identifier.
   Range: string with 24 hexadecimal numbers (0 .. F).

9. **`connID`**
   Connection ID for an existing ONNS connection segment of a UNI or Network connection. *ConnID* is formed from the *SrcNodeID*, the Ingress Tributary # and an index # where 1675 LambdaUnite MSS uses bay =1= shelf.

Spec Block Parameters

The following spec block parameters are only visible in notifications created as result of an ENT-CONN or eNNI setup request.

1. **`bandwidth`**
   Link *signalRate* is equal to or greater than the minimum cross-connect rate *minXCrate* of the *port_type*.
   Type: Value set.
   Range: STS1, STS3, STS12 STS48, STS192, STS1-pipe, STS3-pipe, STS12-pipe STS48-pipe, STS192-pipe.
   Default: None.

   This is an output parameter in **`REPT CONNCHG`** in the following cases:

   - CCB = **`ENT-CONN`**

2. **`destLabel`**
   The destination label defines together with the destination logical port ID the associated egress *connPoint* that connects the destination node of the Network Connection. The *destLabel* is defined in KLM notation. *destLabel* is the requested setup parameter (via ENT-CONN or UNI) and is only visible at the source node of the Network Connection.
   Type: Character string.
   Range:

   Generalized Label: five dash separated numeric strings representing S#,U#,K#,L#,M# with:

   - S #0..65535
   - U #0..15
   - K #0..15
   - L #0..15
   - M #0..15

   Example for an STS-12c connection service on a OC48 link which starts at timeslot 25: 9-0-0-0-0.
   Destination Label 65535-15-15-15-15 is reserved for GbE connections.
   destLabel is the requested setup parameter (via ENT-CONN or UNI) and is only visible on the source node of the Network Connection.

   This are an output parameter in REPT CONNCHG in the following cases:

   - CCB=ENT-CONN

3. **`destLogicalPortID`**
   destLogicalPortID is the requested setup parameter (via ENT-CONN or UNI) and is only visible on the source node of the Network Connection.

   This are an output parameter in REPT CONNCHG in the following cases:

   - CCB=ENT-CONN

4. **`destIPv4TNAAddr`**
   Identifier of a TNA address in IPv4 format.
   Type: Four dot separated numeric strings
   Range: for each numeric string: 0 .. 255
   destIPv4TNAAddr is an optional parameter and is only visible on the source node of the Network Connection if the requested *destTNAType* parameter value (via ENT-CONN or UNI) is IPv4TNAADDR.

   This are an output parameter in REPT CONNCHG in the following cases:

   - CCB=ENT-CONN

5. **`destIPv6TNAAddr`**
   Identifier of a TNA address in IPv6 format.
   Type: Eight hyphen separated hexadecimal numbers
   Range: for each hexadecimal number: 0 .. FFFF
   destIPv6TNAAddr is an optional parameter and is only visible on the source node of the Network Connection if the requested *destTNAType* parameter value (via ENT-CONN or UNI) is IPv6TNAADDR.

   This are an output parameter in REPT CONNCHG in the following cases:

   - CCB=ENT-CONN

6. **`destNSAPTNAAddr`**
   Identifier of a TNA address in NSAP format.
   Type: Alphanumeric value set (20 byte)
   Range: up to 20 alphanumeric strings with hexadecimal values 00..FF
   destNSAPTNAAddr is an optional parameter and is only visible on the source node of the Network Connection if the requested *destTNAType* parameter value (via ENT-CONN or UNI) is NSAPTNAADDR.

   This are an output parameter in REPT CONNCHG in the following cases:

   - CCB=ENT-CONN

7. **`dir`**
   Path Direction Topology:

   - Unidirectional A-Z (1WAY) or
   - Bidirectional (2WAY)

   For connections of *protectionClass* MBYNWRK and MBYNPRT only the path direction topology Bidirectional (2WAY) is supported.
   Type: Value set.
   Range: 1WAY (default) or 2WAY

   This are an output parameter in REPT CONNCHG in the following cases:

   - CCB=ENT-CONN

8. **`routingList`**

   This parameter describes the level 1 routing described as a list of level 1 nodeIDs and linkIDs. The *routingList* retrieved from an intermediate or destination domain will not show the *localAdvNodeID – localLinkID* combination of preceding domains.
   Type: Character string.
   Range:

   hyphen separated list of numeric string pairs, where the first numeric string represents a *localAdvNodeID* and the second a *localLinkID* with:

   - *localAdvNodeID*: four dot separated numeric string, each numeric string with the values 0..255
   - *localLinkID*: numeric string, with the values 0..42946967295

   at maximum 10 *localAdvNodeIDs* and 10 *localLinkIDs*.
   The hyphen is used as separator between the two numeric strings as also between the string pairs.
   Example for a *routingList* describing level 1 Routing via 3 domains at the source domain: 126.43.231.4-643-1.232.3.1-4209-1.4.23.8-5.
   routingList is an optional parameter and is only visible for Network Connections via multiple domains.

   This are an output parameter in REPT CONNCHG in the following cases:

   - CCB=ENT-CONN

9. **`exclLinkResCls`**

   The exclude list of *linkResCls* is used to exclude interdomain links from the interdomain routing calculation. *exclLinkResCls* is the requested setup parameter (via ENT-CONN) and is only visible at the source node of the Network Connection.
   Type: Alphanumeric value set (4 bytes), every bit defining one link class
   Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
   exclLinkResCls is the requested setup parameter (via ENT-CONN) and is only visible at the source node of the Network Connection.

   This are an output parameter in REPT CONNCHG in the following cases:

   - CCB=ENT-CONN

10. **`genLabelRequest`**

    This are an output parameter in REPT CONNCHG in the following cases:

    - CCB=ENT-CONN

11. **`inclLinkResCls`**
    The include list of *linkResCls* is used to define interdomain links which has to be included for interdomain routing calculation. *inclLinkResCls* is the requested setup parameter (via ENT-CONN) and is only visible at the source node of the Network Connection.
    Type: Alphanumeric value set (4 bytes), every bit defining one link class
    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF
    inclLinkResCls is the requested setup parameter (via ENT-CONN) and is only visible at the source node of the Network Connection.

    This are an output parameter in REPT CONNCHG in the following cases:

    - CCB=ENT-CONN

12. **`ingressLSP`**
    Local Connection ID for the connection segment of a Network Connection between source UNI-C to UNI-N or eNNI-U to eNNI-D.
    srcLSP is formed from the Tunnel_ID of the UNI_IPv4_SESSION/eNNI_IPv4_SESSION object and the LSP_ID of the LSP_TUNNEL_IPv4_SENDER_TEMPLATE of this connection segment.
    Type: character string of length up to 1
    Range:

    TunnelID-LSPID, with

    - TunnelID: numeric string: 0..65535
    - LSPID: numeric string: 0..65535

    Example: 2319-321

    This are an output parameter in REPT CONNCHG in the following cases:

    - CCB=ENT-CONN

13. **`policyData`**
    Policy data may in general include credentials identifying users or user classes, account numbers, limits, quotas, etc. to support access policies.
    Type: Alphanumeric value set (60 bytes)
    Range: up to 60 alphanumeric characters with hexadecimal values 00..FF

    This are an output parameter in REPT CONNCHG in the following cases:

    - CCB=ENT-CONN

14. **`protType`**
    This parameter defines the requested protection of advertised abstract links (interdomain as well as intradomain).
    It is the requested setup parameter (via **`ENT-CONN`**) and is only visible at the source node if requested.
    Type: Alphanumeric value set.

    Range:

    - 0x1: only unprotected links shall be considered for routing
    - 1+1: only 1+1 MSP protected links shall be considered for routing)
    - N/A: all links shall be considered for routing, irr. of their protection type

This are an output parameter in REPT CONNCHG in the following cases:

- CCB=ENT-CONN

15. **`remoteTID`**
    This parameter provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.
    This parameter is supported by ports of *portClass* ENNI.
    Type: TID or empty-string
    Range: Please refer to the TID definition in the RTRV-HDR description.
    remoteTID is an optional parameter and is not visible for Network Connections running in a single domain. It shall also not be visible in the destination domain for Network Connections running via multiple domains.

    This are an output parameter in REPT CONNCHG in the following cases:

    - CCB=ENT-CONN

16. **`servLevel`**
    The service level is mapping the connection type of an ONNS connection segment of the Network Connection. The values of the connection type are representing a mapping of the ONNS parameters *connectionClass*, *disjointness* and *grpSetupType* (for Ethernet connections).
    Type: Numeric string.
    Range: 0..255

    This are an output parameter in REPT CONNCHG in the following cases:

    - CCB=ENT-CONN

17. **`srcLabel`**
    The source label defines together with the source logical port ID the associated ingress *connPoint* that connects the source node of the Network Connection. The *srcLabel* is defined in KLM notation.
    srcLabel is the requested setup parameter (via ENT-CONN or UNI) and is only visible on the source node of the Network Connection.
    Type: Character string.
    Range:

    Generalized Label: five dash separated numeric strings representing S#,U#,K#,L#,M# with:

    - S #0..65535
    - U #0..15
    - K #0..15

- L #0..15
- M #0..15

Example for an STS-12c connection service on a OC48 link which starts at timeslot 25: 9-0-0-0-0.
Source Label 65535-15-15-15-15 is reserved for GbE connections.
srcLabel is the requested setup parameter (via ENT-CONN or UNI) and is only visible on the source node of the Network Connection.

This are an output parameter in REPT CONNCHG in the following cases:

- CCB=ENT-CONN

18. **`srcLogicalPortID`**
Logical Port Identifier related to the TNA address. *srcLogicalPortID* is the requested setup parameter (via ENT-CONN or UNI) and is only visible on the source node of the Network Connection.
Type: numeric value set
Range: 0 to 4294967295

This are an output parameter in REPT CONNCHG in the following cases:

- CCB=ENT-CONN

19. **`scrIPv4TNAAddr`**
Identifier of a TNA address in IPv4 format.
Type: Four dot separated numeric strings
Range: for each numeric string: 0 .. 255
srcIPv4TNAAddr is an optional parameter and is only visible on the source node of the Network Connection if the requested *destTNAType* parameter value (via ENT-CONN or UNI) is IPv4TNAADDR.

This are an output parameter in REPT CONNCHG in the following cases:

- CCB=ENT-CONN

20. **`srcIPv6TNAAddr`**
Identifier of a TNA address in IPv6 format.
Type: Eight hyphen separated hexadecimal numbers
Range: for each hexadecimal number: 0 .. FFFF
srcIPv6TNAAddr is an optional parameter and is only visible on the source node of the Network Connection if the requested *destTNAType* parameter value (via ENT-CONN or UNI) is IPv6TNAADDR.

This are an output parameter in REPT CONNCHG in the following cases:

- CCB=ENT-CONN

21. **`srcNSAPTNAAddr`**
Identifier of a TNA address in NSAP format.
Type: Alphanumeric value set (20 byte)
Range: up to 20 alphanumeric strings with hexadecimal values 00..FF
srcNSAPTNAAddr is an optional parameter and is only visible on the source node of the Network Connection if the requested *destTNAType* parameter value (via ENT-CONN or UNI) is NSAPTNAADDR.

This are an output parameter in REPT CONNCHG in the following cases:

- CCB=ENT-CONN

22. **`tspec`** – Traffic Parameters

The range of the traffic parameters depends on the used LSP Encoding Type. The *tspec* defines information about the traffic of the connection segments between source UNI-C to UNI-N and destination UNI-N to UNI-C or between domains (eNNI-U and eNNI-D).
Type: Character string.
Range for LSP Encoding Type "SONET/SDH":

SONET/SDH tspec: five dash separated numeric strings representing SignalType#, RCC#, NCC#, NVC#, MT# with:

- SignalType #1..12
- RCC #0,1
- NCC #0..255
- NVC #0..63
- MT #1..64

Example for an STS-12c: 6-1-4-0-1-0.
SONET/SDH Tspec parameters "T" and "Profile" is not stored in NVM.
Range for LSP Encoding Type "ETHERNET":

ETHERNET tspec: five dash separated numeric strings representing Token Bucket Rate#, Token Bucket Size#, Peak Data Rate#, Minimum Policed Unit#, Maximum Packet Size# with:

- Token Bucket Rate #32-bit IEEE floating point number
- Token Bucket Size #32-bit IEEE floating point number
- Peak Data Rate #32-bit IEEE floating point number
  (e.g. 0x4CEE6B28 for 1GE)
- Minimum Policed Unit #1..FFFFFFFF
- Maximum Packet Size #1..FFFFFFFF

This are an output parameter in REPT CONNCHG in the following cases:

- CCB=ENT-CONN

23. **`tunnelIfID`**

All SDH/SONET connections belonging to the same VCAT group are identified by the LSP Tunnel Interface ID.
Type: character string of length up to 24
Range:

LSRRouterID&InterfaceID - with:

- *LSRRouterID*: four dot separated numeric strings: each string 0..255
- *InterfaceID*: Numeric string 0..4294967295

Example: 117.32.234.13&32439

This are an output parameter in REPT CONNCHG in the following cases:

- CCB=ENT-CONN

Example output

Output format for a REPT CONNCHG notification message after ENT-CONN

The format of a REPT CONNCHG notification in the source node of the Network Connection is as follows:

```
    LT-ONNS101 2002-08-01 08:00:00
A  01135 REPT CONNCHG
   ″TIME=07-59-59,DATE=2002-08-01:CCB=ENT-CONN:125.114.48.12:C001:\″Network
      Connection successfully setup\:″
   ″CallID=A123B3EF1345A123B3EF1345,ConnID=135.13.196.203&1-6-5-1&1:ServiceLevel=0&

```

Output format for a REPT CONNCHG notification message after ED-CONN

The format of a REPT CONNCHG notification in the source node of the Network Connection is as follows:

```
  LT-ONNS101 2002-08-01 08:00:00
A  01135 REPT CONNCHG
   ″TIME=07-59-59,DATE=2002-08-01:CCB=ED-CONN:125.114.48.12:C050:\″Network
      Connection Alias changed\:″
   ″CallID=A123B3EF1345A123B3EF1345,ConnID=135.13.196.203&1-6-5-1&1,NetwConn01:″
```

Output format for a REPT CONNCHG notification message after DLT-CONN

The general format of a REPT CONNCHG notification in the source node of the Network Connection is as follows:

```
  LT-ONNS101 2002-08-01 08:00:00
A  01135 REPT CONNCHG
   ″TIME=07-59-59,DATE=2002-08-01:CCB=DLT-CONN:125.114.48.12:C060:\″Network

- "DLT-CONN: Delete network connection" (p. 3-139)

REPT DBCHG: Report data base change

The **REPT DBCHG** message reports any change in the system database.

Output format

The **REPT DBCHG** message uses the following format:

```
   sid date time
A  atag REPT DBCHG
   "TIME=chgtm,DATE=chgdat:ccb:[aid]:[com_block]:[spec_block]"
     ...
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

1. **atag** – Automatic Tag
   The *atag* is used for message sequencing. The *atag* is available per user session. The number is incremented by one for each autonomous message, and the messages are transmitted to the user in that same order.
   Type: decimal number.
   Range: 0 to 999.
   Default: 0
2. **chgtm** – Change Time
   Time when the change is occurred.
   Type: value set.
   Range: HH-MM-SS.
3. **chgdat** – Change Date
   Date when the change occurred
   Type: Value set.
   Range: YY-MM-DD
4. **ccb** – Command Code Block
   This field will be set to the TL1 command that causes that database change. The *com_block* and *spec_block* fields will be set according to the parameters that changed.
   Type: Alphanumeric value set verb-modifier[-modifier].
5. **aid** – Access Identifier
   AID of the entity for which the change is reported
   Type: AID.
   Range: As defined by the *aid* input parameter of the corresponding command, defined by *ccb*.

6. **`com_block`** – Common Block
   This is a position-defined field. If the database change is the result of a TL1 command which contains parameters in this block, the parameter values are included in this block in the same order as the corresponding TL1 command.
   As exception to this rule are some commands in the protection fragment, where the aliases *rid* and *ppgname* are not reported in the **`REPT DBCHG`** notification.
   If the database change is the result of a TL1 command, then the parameter *ctag* from the TL1 command is not included in the *com_block*.
   Type: As defined in the input *com_block* of the corresponding command, defined by *ccb*.
   Range: As defined in the input *com_block* of the corresponding command, defined by *ccb*.
   Default: As defined in the input *com_block* of the corresponding command, defined by *ccb*.
7. **`spec_block`** – Specific Block
   This is a name-defined field. If the database change is the result of a TL1 command which contains parameters in this block, the parameter names and values are included in this block. parameters within the specific block are positionally independent and are specified using a name-defined construct of *parameter* = value in a comma-separated list. The parameter names are the same as those for the corresponding TL1 command.
   Type: As defined in the input *spec_block* of the corresponding command, defined by *ccb*.
   Range: As defined in the input *spec_block* of the corresponding command, defined by *ccb*.
   Default: As defined in the input *spec_block* of the corresponding command, defined by *ccb*.

Detailed behavior description

The **`REPT DBCHG`** message reports any change in the system database. Changes can be caused by a TL1 user or by an internally-generated state change.

Changes in user provisionable attributes are reported as the equivalent TL1 command that would cause that change.

Changes in non-user provisionable attributes are reported using only the AID and the block parameters, i.e. leaving the *ccb* parameter empty.

System initialization

Any time a command is entered that causes a system reset, a **`REPT DBCHG`** message is transmitted before the system resets.

AID ranges

If a database change occurs as a result of a TL1 command in which an AID range is entered, the system responds separate **`REPT DBCHG`** messages for each affected AID.

Messages caused by own changes

If the database change occurs as a result of a TL1 command, a **REPT DBCHG** message is transmitted to users provisioned to receive **REPT DBCHG** messages, including the user which issued the command.

Example input/output

The following is an example of the **REPT DBCHG** command:

```
   UNITE-NE 00-11-08 08:00:00
A  001 REPT DBCHG
   ”TIME=07-59-59,DATE=00-11-08: ENT-EQPT:1-1-#-#-05::nvmname=OP2G5,nvmqual=13SR4”
;
```

GR-199-CORE

REPT EVT: Report event

REPT EVT messages are generated autonomously to report alarms of severity NA – Warning (ITU) / Not Alarmed (Telcordia). Also events like protection switches will be reported.

Output format

The general format of a **REPT EVT** autonomous message is as follows:

```
   sid date time
A  atag REPT EVT modifier

      ″aid:condtype,condeff,ocrdat,ocrtm,,,,[thlev][,tmper][:conddescr]″
   (1 or more lines of the above)
;
```

Note: The trailing comma has to be present if *thlev*, *tmper*, or both are used.

Since trailing commas to the left of a colon can be deleted, for non-TCA events, the output format is as follows:

```
   sid date time
A  atag REPT EVT modifier
   ″aid:condtype,condeff,ocrdat,ocrtm[:conddescr]″
   (1 or more lines of the above)
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Command parameters

1. **atag** – Automatic Tag
   This parameter is used for message sequencing. The number is incremented by one for each autonomous message sent by the NE.
   Type: Integer (3 digits).
   Range: 000 – 999 Leading zeros are not suppressed.
2. **modifier** – Message Modifier
   This parameter defines the AID type to which the alarm belongs.
   Type: Alphanumeric value set.
   Range:
   - COM: Common. An alarm/event that applies to the whole NE system; for example, a processing error.
   - EQPT: An equipment-related alarm/event.

- SYST: An alarm/event related to system timing.
- OUTT: An alarm/event related to output timing.
- STM1E: A facility-related alarm/event for synchronous transport mode 1 (electrical).
- STM1: A facility-related alarm/event for synchronous transport mode 1.
- STM4: A facility-related alarm/event for synchronous transport mode 4.
- STM16: A facility-related alarm/event for synchronous transport mode 16.
- STM16T: A facility-related alarm/event for fully transparent synchronous transport mode 16.
- STM64: A facility-related alarm/event for synchronous transport mode 64.
- STM256: A facility-related alarm/event for synchronous transport mode 256.
- ODU1: A facility-related alarm/event for optical data units of level 1
- OC3: A facility-related alarm/event at the optical carrier signal level 3.
- OC12: A facility-related alarm/event at the optical carrier signal level 12.
- OC48: A facility-related alarm/event at the optical carrier signal level 48.
- OC48T: A facility-related alarm/event at the fully transparent optical carrier signal level 48.
- OC192: A facility-related alarm/event at the optical carrier signal level 192
- OC768: A facility-related alarm/event at the optical carrier signal level 768
- T3: A facility-related alarm/event at the DS3 level
- TMAT3: A facility-related alarm/event at the DS3 level related to TransMUX function
- EC1: A facility-related alarm/event at the EC1 level
- 1GE: A facility-related alarm/event for 1 Gigabit Ethernet.
- 1GEPL: A facility-related alarm/event for 1 Gigabit Ethernet Private Line.
- 10GEPL: A facility-related alarm/event for 10 Gigabit Ethernet Private Line.
- VC3: A facility-related alarm/event for virtual container 3.
- VCG: A facility-related alarm/event for virtual concatenation group.
- VC4: A facility-related alarm/event for virtual container 4
- VC44C: A facility-related alarm/event for a signal concatenated at 4 times the VC4 rate.
- VC416C: A facility-related alarm/event for a signal concatenated at 16 times the VC4 rate.
- VC464C: A facility-related alarm/event for a signal concatenated at 64 times the VC4 rate.
- STS1: A facility-related alarm/event at synchronous transport signal level 1.

- TMASTS1: A facility-related alarm/event at synchronous transport signal level 1 related to TransMUX function.
- STS3C: A facility-related alarm/event at synchronous transport signal level 3.
- STS12C: A facility-related alarm/event at synchronous transport signal level 12.
- STS48C: A facility-related alarm/event at synchronous transport signal level 48.
- STS192C: A facility-related alarm/event at synchronous transport signal level 192.
- HOVC4 : A facility-related alarm/event for virtual container 4 higher-order path termination.
- HOSTS1: A facility-related alarm/event at synchronous transport signal level 1 higher-order path termination.
- LOVC3: A facility-related alarm/event for virtual container 3 (lower-order path).
- LOVC12: A facility-related alarm/event for virtual container 12
- LOVT1: A facility-related alarm/event at transport level VT1.5.
- TMSVT: A facility-related alarm/event at transport level VT1.5 related to TransMUX function.
- DS1: A facility-related alarm/event at transport level DS1.
- LINK: A signaling communication link related alarm/event for ONNS

3. **`aid`** – Access Identifier
   This is the address of the entity for which an alarm condition is being reported.
   Type: AID.
   Range: All defined AIDs are allowed. It should be a valid AID for the specified *modifier*. Refer to the definition of AIDs.
4. **`condeff`** – Condition Effect
   This parameter indicates the effect of the reported event on the NE. It is used to distinguish between persistent and transient alarms/events.
   Two state transitions can be distinguished for a persistent alarm/event:
   - raise transition: state change from not present to present
   - clear transition: state change from present to not present.

   A transient alarm/event has no 'presence' state; i.e. just the occurrence of that event/alarm is reported. ABN condition are always persistent and not transient.
   Type: Alphanumeric value set.
   Range:
   - CL: Standing condition cleared for a persistent alarm/event.
   - SC: Standing condition raised for a persistent alarm/event
   - TC: Transient condition occurred for a transient alarms/events.

   Default: There is no default value.

5. **`conddescr`** – Description of the Condition
   ASAP related conditions:
   This is a textual Description of the Condition.
   Type: inner string of the format:
   \″<category>, <entity>, <description>, <additional text>\″ or
   \″<category>, <entity>, <description>, <additional text>-cleared\″ (this form is used in REPT ALM/EVT for cleared alarms)
   Range:
   - category: is the category
   - entity: is the entity for which the alarm is reported
   - description: is the Alarm description, the string is up to 32 characters
   - additional text: additional text.

   If there is no additional text, then the trailing comma may be omitted.
   TCA related conditions:
   The general format is: category, entity, description, additional text. If there is no additional text, then the trailing comma may be omitted.
   Type: inner string
   Range:
   - For STM<N>, STM<N>, OC<N>T, OC<N>: Quality of service, {rr} port, TCA where rr is equal to the port rate
   - For ODU<N>: Quality of service, {rr} path, TCA where rr is equal to the ODU rate (e.g., ODU1)
   - For VC3, VC4, VC44C, VC416C, VC464C, STS1, STS3C, STS12C, STS48C and STS192C: Quality of service, {rr} CS, TCA where rr is equal to the signal rate
   - For terminated VC4 and STS1signals: Quality of service, {rr} CS, TCA where rr is equal to the Constituent Signal (CS) rate
   - For GE port: Quality of service, {ge_rate}GE, TCA where ge_rate is the signal rate of the GE port
   - For VCG port: Quality of service, VCG, TCA
   - For DS3 port: Quality of service, T3 port, TCA.
   - For TMAT3 port: Quality of service, T3 port, TCA
   - For TMASTS1 path termination: Quality of service, {***rr***} path, TCA, where ***rr*** is equal to STS1 rate
   - For not terminated DS1 tributary: Quality of service, DS1 path, TCA

   Abnormal conditions:
   The general format is: category, description.
   Type: inner string.

Range:

- Description for a protection group AID: – Abnormal condition, forced switch active – Abnormal condition, lockout active
- Description for a timing reference AID: – Abnormal condition, operate in hold-over – Abnormal condition, operate in free run mode
- Description for a port AID: – Abnormal condition, facility loopback active
- Description for a logical tributary AID: – Abnormal condition, cross-connect loopback active – Abnormal condition, test access session active
- Description for a system AID: – Abnormal condition, System operates in maintenance mode – Abnormal condition, Autonomous event forwarding is inhibited.

Security related Conditions:
The parameter shall provide additional information w.r.t. the security event.
Type: Inner string
Range:
The following strings are applicable for the one remaining *condtype* SEC-USERLOGIN.
Also see the relation between *condeff* and *conddescr*:
condeff – conddescr
SC – \″login – <uid>\″
CL – \″logout – <uid>\″
CL – \″forced logout – <uid> \″
CL – \″inactivity timeout – \″
CL – \″logout, disconnected – <uid> \″
The security event notification is related to the user session which is indicated by the user ID (*uid*).

6. **`condtype`** – Condition Type
ASAP related conditions:
This parameter identifies the probable cause (type of alarm indication) being reported.
Type: Alphanumeric value set.
Range: All defined probable causes..
TCA related condition types:
This parameter identifies the type of event indication being reported.
Type: inner string with the Format: T-<montype>
Range:

- Range for SDH signals

  The following values are for all *STM<N> signals*: T-RS-N-ES, T-RS-N-SES, T-RS-N-BBE, T-RS-N-UAS, T-MS-N-ES, T-MS-N-SES, T-MS-N-BBE, T-MS-N-UAS, T-MS-F-ES, T-MS-F-SES, T-MS-F-BBE, T-MS-F-UAS

  The following values are for all *STM<N>T signals*: T-RS-N-ES, T-RS-N-SES, T-RS-N-BBE, T-RS-N-UAS, T-RS-N-ES-EGR, T-RS-N-SES-EGR, T-RS-N-BBE-EGR, T-RS-N-UAS-EGR

The following values also are for *STM64 and STM256 signals*: T-MS-N-FECC

The following values are for *VC3, VC4, VC44C, VC416C and VC464C tributaries*: T-VC-N-ES, T-VC-N-SES, T-VC-N-BBE, T-VC-N-UAS, T-VC-F-ES, T-VC-F-SES, cVC-F-BBE, T-VC-F-UAS, T-PJCPOS, T-PJCNEG

The following values are for *VC12 tributaries*: T-VC-N-ES, T-VC-N-SES, T-VC-N-BBE, T-VC-N-UAS, T-VC-F-ES, T-VC-F-SES, T-VC-F-BBE, T-VC-F-UAS

- Range for SONET signals

  The following values are for all *OC<N> and EC1 signals*: T-CVS, T-ESS, T-SESS, T-SEFS-S, T-CVL, T-ESL, T-SESL, T-UASL, T-CV-LFE, T-ES-LFE, T-SES-LFE, T-UAS-LFE

  The following values are for all *OC<N>T signals*: T-CVS, T-ESS, T-SESS, T-SEFS-S, T-CVS-EGR, T-ESS-EGR, T-SESS-EGR, T-SEFS-S-EGR

  The following values are also for *OC192 and OC768 signals*: T-FECC-L

  The following values are for STS1, STS3C, STS12C, STS48C and STS192C tributaries: T-CVP, T-ESP, T-SESP, T-UASP,T-CV-PFE, T-ES-PFE, T-SES-PFE, T-UAS-PFE, PPJC-PDet, NPJC-PDet, NPJC-PDet, NPJC-PGen

  The following values are for *TMASTS1 tributaries*: T-CVP, T-ESP, T-SESP, T-UASP, T-CV-PFE, T-ES-PFE, T-SES-PFE, T-UAS-PFE

  The following values are for *VT1 tributaries*: T-CVP, T-ESP, T-SESP, T-UASP,T-CV-PFE, T-ES-PFE, T-SES-PFE, T-UAS-PFE

- Range for DS3/DS1 signals

  The following values are for *DS3 signals with T3 modifier*:

  T-CVL, T-ESL, T-ESA-L, T-ESB-L, T-SESL, T-CVP, T-ESP, T-ESA-P, T-ESB-P, T-SESP, T-UASP, T-SAS-P, T-CV-PFE, T-ES-PFE, T-ESA-PFE, T-ESB-PFE, T-SES-PFE, T-UAS-PFE, T-SAS-PFE, T-CVP-EGR, T-ESP-EGR, T-ESA-P-EGR, T-ESB-P-EGR, T-SESP-EGR, T-UASP-EGR, T-SAS-P-EGR, T-CV-PFE-EGR, T-ES-PFE-EGR, T-ESA-PFE-EGR, T-ESB-PFE-EGR, T-SES-PFE-EGR, T-UAS-PFE-EGR, T-SAS-PFE-EGR

  The following values are for *DS3 signals with TMAT3 modifier*:

  T-CVP-EGR, T-ESP-EGR, T-ESA-P-EGR, T-ESB-P-EGR, T-SESP-EGR, T-UASP-EGR, T-SAS-P-EGR, T-CV-PFE-EGR, T-ES-PFE-EGR, T-ESA-PFE-EGR, T-ESB-PFE-EGR, T-SES-PFE-EGR, T-UAS-PFE-EGR, T-SAS-PFE-EGR

  The following values are for *DS1 signals*:

  T-CVP-EGR, T-ESP-EGR, T-SESP-EGR, T-UASP-EGR, T-SAS-P-EGR

- Range for other signals

  The following values are for all *ODU<N> signals*:

  T-ODU-N-ES, T-ODU-N-SES, T-ODU-N-BBE, T-ODU-N-UAS, T-ODU-F-ES, T-ODU-F-SES, T-ODU-F-BBE, T-ODU-F-UAS

  For *ENET signals*:

  T-PDE, T-EDFE, T-EDFC

Abnormal condition types:
This parameter identifies the type of event indication being reported.
Type: inner string with the Format: ABN-<abntype>

Range:

- ABN-FORCESW: Forced switch active
- ABN-LOCKOUT: Lockout active
- ABN-HLDOVRSYNC: Holdover synchronization mode
- ABN-FREERUNSYNC: Free-run synchronization mode
- ABN-LPBKPORT : Facility Loopback
- ABN-LPBKXCON: Cross Connect Loopback
- ABN-MAINTENANCE: System operates in maintenance mode
- ABN-TESTACC: Test access session has been setup.

Security related Condition Types:
The parameter specifies/identify the type of security event being reported.
Type: Alphanumeric value set.
Range: SEC-USERLOGIN
Default: None.

7. **`ocrdat`** – Occurrence Date
This parameter indicates the raising / clearing date of the alarm.
Type: value set of the format MM-DD.
Range: MM represents the month, DD represents the day, leading zeros are not suppressed.
8. **`ocrtm`** – Occurrence Time
This parameter indicates the raising / clearing time of the alarm. The accuracy should be +/- 1 second.
Type: value set of the format HH-MM-SS.
Range: HH represents the hours, MM represents the minutes, SS represents the seconds, leading zeros are not suppressed.
9. **`thlev`** – Threshold Level
This parameter is only used for Threshold Crossing Alerts (TCAs). It reports the threshold level value which is set by ED-TCA-PROF.
The two applicable thresholding methods (tcamd) must be distinguished. For TR-only mode:
   - the raise TCA threshold value is reported.

   For TR-RTR mode:
   - the raise TCA threshold value is reported for the raise event
   - the reset TCA threshold value is reported for the clear event.

   Type: Integer.
Range: >1 (1 … 4294967295). Leading zeros will be suppressed.
10. **`tmper`** – Time Period
This parameter reports the monitored time interval. This parameter is only used for Threshold Crossing Alerts (TCAs).
Type: value set.
Range: 15-MIN, 1-DAY.

Detailed behavior description

If an alarm is provisioned as NA – Warning (ITU) / Not Alarmed (Telcordia), then the occurrence of that alarm is reported in a REPT EVT message. REPT EVT messages also occur when any such standing alarm clears and is used to report transient conditions.

A standing condition is an alarm event that has a beginning and an end. When the event begins, the standing condition is declared via an autonomous message. When the event ends, an autonomous message is sent to indicate that the event cleared.

A transient condition only results in one autonomous message – a declaration that a specific transient condition occurred.

Autonomous performance monitoring (PM) threshold crossing alert (TCA) messages are provided to the OS using the REPT EVT TL1 message.

1675 LambdaUnite MSS supports two thresholding methods:

1. TR-only (also known as the implicit reset method). Then the TCA is a transient one – it is reported when the threshold is crossed. Because it is transient, there is no report when it clears (TC only).
2. TR-RTR (also known as the explicit reset method). Then the TCA has a standing condition, this means it has a beginning and an end (SC and CL).

The severity of a TCA is not provisionable. It is always NA – warning (ITU) / not alarmed (Telcordia) which implies TCA messages are always reported via REPT EVT.

Protection switching messages are provided to the OS using the REPT EVT TL1 message.

The REPT EVT message reports updates of the protection states.

Abnormal Condition messages are provided to the OS using the REPT EVT TL1 message.

The REPT EVT message reports updates of the abnormal condition states. The abnormal condition is always a standing condition, this means it has a beginning and an end (SC and CL).

The severity of a ABN condition is not provisionable. It is always NA – warning (ITU) / not alarmed (Telcordia) which implies ABN messages are always reported via REPT EVT.

Notification of Abnormal Condition Test Access session active

The system shall notify the Abnormal Condition “Test Access session active” for the tributaries under test, i.e. the E and F tributaries. For each tributary under test, one notification is sent.

The tributary AID and the number of notifications depends on the Test Access mode.

For single test tributary modes one notification is sent:

- MONE/SPLTE – one notification for the E tributary
- MONF/SPLTF – one notification for the F tributary

For dual test tributary modes two notifications are sent:

- MONEF/SPLTEF – one notification for the E tributary and one for the F tributary

Example input/output

The following example shows an autonomous message REPT EVT for an LOS Alarm which has a severity NA assigned:

```
   LT-UNITE-123 00-01-01 08:00:00
A  003 REPT EVT OC48
   ″1-1-#-#-3-1:AIS-L,SC,01-01,07-59-59:\″Communication-Transport, OC48 port, Alarm
      Indication Signal\″″
;
```

The following example shows an autonomous message REPT ALM for an LOS Alarm clear which has a severity NA assigned:

```
   LT-UNITE-123 00-01-01 08:00:00
A  003 REPT EVT OC48
   ″1-1-#-#-3-1:AIS-L,CL,01-01,07-59-59:\″Communication-Transport, OC48 port, Alarm
      Indication Signal-cleared\″″
;
```

Note: Examples for the other types of REPT EVT e.g. TCAs and protection switches are described in other sections which describes the specifics of the area to which the events belongs to (e.g. performance monitoring, protection switching).

REPT EVT FXFR: Report event FXFR

REPT EVT FXFR is an autonomous message that is used to report remote file transfer activities.

Output format

The general format of a **REPT EVT FXFR** autonomous message is as follows:

```
   sid date time
A  atag REPT EVT FXFR
                              ″filename,fxfr_status[,fxfr_rslt][,bytes_xfrd]″;
```

Output parameters

Command parameters

1. **atag** – Automatic Tag
   This parameter is used for message sequencing. The number is incremented by one for each autonomous message sent by the NE.
   Type: Integer (3 digits).
   Range: 000 – 999 Leading zeros are not suppressed.
2. **filename**
   This parameter identifies the name of the file transferred.
   Type: text string.
   Range: 1 to 128 characters.
3. **fxfr_status**
   This parameter indicates the file transfer status.
   Type: Alphanumeric value set.
   Range:
   - START, indicates file transfer has started
   - IP, indicates file transfer is In-Progress; optional
   - COMPLD, indicates file transfer has completed.
4. **fxfr_rslt**
   This parameter indicates success or failure of the file transfer. This parameter is only displayed when the file transfer has completed (that is., *fxfr_status* is COMPLD).
   Type: Alphanumeric value set.
   Range:
   - SUCCESS, indicates successful file transfer
   - FAILURE, indicates failed file transfer
5. **bytes_xfrd**
   Number of bytes transferred for IP and total number of bytes for COMPLD.
   Type: Alphanumeric value set.

Detailed behavior description

After the initial response to the **COPY-RFILE** command by the NE, the autonomous message must be used to communicate any kind of event. So, if the connection or file transfer fails, the autonomous message must be sent with a failure indication. Once the file has been completely downloaded, the autonomous message must then be sent with a successful indication.

Reasons of transmit failure - external communication failure

If the command failed due to an external communications failure.

The following list identifies conditions that will cause an SROF error response as given above:

- External communication failure
- Unsuccessful file transfer.

Reasons of transmit failure - transferred file is invalid

If the transferred file is deemed invalid for miscellaneous reasons such as incorrect checksum, invalid control information, etc., the system responds with *fxfr_rslt* = FAILURE.

Backup failed after unsuccessful retransmission of files

If during a database backup a transaction log overflow occurs, and the retransmission of database files fails, then the system responds with *fxfr_rslt* = FAILURE.

During database backup, all database changes caused by provisioning activities are stored temporarily in a transaction log. This prevents changes of the database while the backup is running. Excessive provisioning during database backup may cause an overflow of the transaction log. In this case, the changes are written to the database and the affected database files are retransmitted. In the case that the retransmission fails, the backup is terminated with error.

Reasons of transmit failure - Generic not available

If the command failed because the generic is not available, the system shall respond with fxfr_rslt=FAILURE. The following condition will cause this ENSG error response: Not a software generic file.

Reasons of transmit failure - Directory not accessible

If a directory is specified that cannot be found or cannot be accessed due to improper privileges, the system responds with *fxfr_rslt* = FAILURE.

Reasons of transmit failure - Product mismatch

If the command failed due to a product mismatch in a retrieved file (file does not belong to NE type), the system responds with *fxfr_rslt* = FAILURE.

ES64U pack mismatch

If the command failed due to one of the following ES64U pack mismatches:

- A database of a available ES64U cannot retrieved and is therefore not contained in the uploaded database generic (Backup).
- A downloaded database generic contains ES64U databases which have a mismatch with the expected databases.

In all cases, the system responds with *fxfr_rslt* = FAILURE.

Example input/output

The following example shows an autonomous message **REPT EVT FXFR** for starting a file transfer:

```
   LT-UNITE-123 00-01-01 08:00:00
A  003 REPT EVT FXFR
   ″/UNITE/release4,START,8051″
;
```

The following example shows an autonomous message **REPT EVT FXFR** for an inprogress statement:

```
   LT-UNITE-123 00-01-01 08:00:00
A  003 REPT EVT FXFR
   ″/UNITE/release4,IP,2000″
;
```

The following example shows an autonomous message **REPT EVT FXFR** for a successful file transfer:

```
   LT-UNITE-123 00-01-01 08:00:00
A  003 REPT EVT FXFR
   ″/UNITE/release4,COMPLD,SUCCESS,8051″
;
```

REPT L1ROUTING notification

Overview

The **REPT L1ROUTING** notification is used to notify about TL1 triggered (ACT/CANC-L1ROUTING) enabling or disabling of a level 1 Routing Controller.

The **REPT L1ROUTING** notification message reports if an ONNS node is enabled or disabled as level 1 Routing Controller. Enabling or disabling are caused by a user's TL1 command.

Notification messages resulting from a TL1 command that were caused by the user's own requested changes

If an ONNS node is enabled or disabled as level 1 Routing Controller as a result of a TL1 ACT-L1ROUTING or CANC-L1ROUTING command, then a REPT L1ROUTING message is transmitted to all users provisioned to receive REPT L1ROUTING messages, including the user that issued the command.

Therefore, a management OS must expect to receive messages for changes it caused as well as those made by a CIT user.

Output format

Output format for a REPT L1ROUTING notification message after ACT-L1ROUTING

The general format of a **REPT L1ROUTING** notification is as follows:

```
   srcTid date time
A  atag REPT L1ROUTING
   ″TIME=ocrTime,DATE=ocrDate:RCStatus=rcStatus:srcASTNNodeID″
   ″L1Routing=routeFunc,L1RoutingAreaID=routeAreaID,L1ParentRoutingAreaID=
prouteAreaID,L1RoutingControllerID=routeControlID,L1RoutingControllerIPAddr=
routeControlIPAddr,AbstractModel=abstractModel,AbstractNodeID=abstractNodeID″;
```

Output parameters

Command parameters

1. **`srcTid`**
   Target identifier of the source node is the logical name of the Host NE. ONNS uses the same unique *tid* used by Host NE. See also the definition of *tid* in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **`date`**
   Date. The date parameter is set to the date when the output message is generated.
   Type: Value set.
   Range:
   YY-MM-DD, where
   - YY=00-99,
   - MM=01-12,
   - DD=01-31

   Default: current date
3. **`time`**
   Time. The time parameter is set to the time when the output message is generated.
   See also time in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: Value set.
   Range:
   HH:MM:SS, where
   - HH=00-23,
   - MM=00-59,
   - SS=00-59

   Default: current time
4. **`atag`** – Automatic Tag
   The *atag* is used for message sequencing. The *atag* is available per user session. The number is incremented by one for each autonomous message, and the messages are transmitted to the user in that same order.
   Type: decimal number
   Range: 000-999
   Default: 0
5. **`ocrDate`** – Occurence Date
   Date. The date parameter is set to the date when the event occurred in the system.
   Type: Value set.
   Range:

YY-MM-DD, where

- YY=00-99,
- MM=01-12,
- DD=01-31

Default: occurence date

6. **`ocrTime`** – Occurence Time
   Time. The time parameter is set to the time when the event occurred in the system.
   Type: Value set.
   Range:
   HH:MM:SS, where
   - HH=00-23,
   - MM=00-59,
   - SS=00-59

   Default: occurrence time
7. **`rcStatus`** – Routing Controller Status
   Represents the change of The ONNS node as level 1 Routing Controller caused by a TL1 command.
   Type: Value set.
   Range:
   - *enabled*: ONNS node is enabled as level 1 Routing Controller
   - *disabled*: ONNS node is disabled as level 1 Routing Controller
8. **`ASTNNodeID`**
   ONNS source nodeID. Together with the following *srcPortID* field defines the associated Ingress *connPoint* that connects the source node to the edge/gateway switch or client router.
   Type: Four dot separated numeric strings
   Range: for each numeric string: 0..255
9. **`routeFunc`**
   routeFunc defines if the *LSAAdvertisedRouter* has level 1 routing controller functionality.
   Type: Alphanumeric value set.
   Range: PRIMARY (ONNS node is the primary level 1 routing controller)
10. **`routeAreaID`**
    routeAreaID defines the identity of the routing area.
    Type: four dot separated numeric string
    Range: 0 – 255 for each numeric string.
11. **`prouteAreaID`**
    prouteAreaID defines the identity of the parent routing area.
    Type: four dot separated numeric string
    Range: 0 – 255 for each numeric string.

12. **`routeControlID`**
    routeControlID defines the identity of the level 1 routing controller.
    Type: four dot separated numeric string
    Range: 0 – 255 for each numeric string.
13. **`routeControlIPAddr`**
    routeControlIPAddr defines the IP address for this routing controller node as level 1 routing controller address.
    Type: four dot separated numeric string
    Range:
    For first numeric string: 0 … 223
    For second to fourth numeric string: 0 … 255
    The values 0.0.0.0 and 1.1.1.1 are excluded.
14. **`abstractModel`**
    abstractModel defines the abstraction model used by the level 1 routing controller.
    Type: Alphanumeric value set.
    Range: ABSTRACTNODE
15. **`abstractNodeID`**
    abstractNodeID is defined in case the *abstractModel* is ABSTRACTNODE. This parameter specifies the abstract node ID, which is advertised in the level 1 area.
    Type: four dot separated numeric string
    Range: 0 – 255 for each numeric string
    Parameter *abstractNodeID* is optional for *abstractModel* values other then ABSTRACTNODE.

Example output

Output example for an enabled level 1 routing controller

The following example shows the output of a **`REPT L1ROUTING`** notification caused by an **`ACT-L1ROUTING TL1`** command:

```
   LT-ONNS9 2002-07-18 08:00:00
A  113456 REPT DBCHG
   ”TIME=07-59-59,DATE=2002-08-01:ACT-L1ROUTING:::RoutingFunc=PRIMARY,
RoutingAreaID=111.234.215.6,ParentRoutingAreaID=111.214.115.7,
L1RoutingControllerID=218.3.45.56,L1RoutingControllerIPAddr=129.32.19.2,
AbstractModel=ABSTRACTNODE,AbstractNodeID=129.239.4.23”;
```

REPT-NNCHG notification

Overview

The **REPT NNCHG** notification is used to notify about NNDR bandwidth availability changes. In addition, the **REPT NNCHG** notification is used to notify about ONNS restarts. In addition the **REPT NNCHG** notification is used to notify about ONNS System Parameter changes by **ED-NNCNFG** command. In addition, the **REPT NNCHG** notification is used to notify about ONNS Defragmentation Operation Completion by **OPR-DEFRAG** command.

The **REPT NNCHG** notification message reports NNDR bandwidth availability changes which trigger distribution of a new Link State Advertisement (LSA). In addition, the **REPT NNCHG** notification message reports restarts of the ONNS which in case of the XC would not become transparent for the connected management system, otherwise. This notification then would allow a management system to execute **RTRV-PATH** commands to the affected node to align on connection data and states. This is necessary, as a management system is neither notified about connection data and state changes during downtime of the XC nor about actual connection data and states after recovery of the XC. In addition the **REPT NNCHG** notification message reports the change of the ONNS System Parameters like “wait to restore timer”, “default restoration priority”, or “administrative cost escalation”.

Output format

Output format for REPT NNCHGfor ONNS data repositories

The generic format of a **REPT NNCHG** message is as follows with the update management block (*umb*) and the common data block (*comBlock*).

```
   srcTid rpt-date rpt-time
A  atag REPT NNCHG
   ″umb:comBlock″
;
```

Expanded output format for REPT NNCHG for ONNS data repositories

The general format of a **REPT NNCHG** autonomous notification message with expanded *umb* and *comBlock* is as follows:

```
   srcTid rpt-date rpt-time
A  atag REPT NNCHG
   ″TIME=ocrTime,DATE=ocrDate:srcNodeID:srcAid:dataSrcID:msgCode,,
\″ eventText \″,[eventData]″
;
```

Output parameters

Command parameters

1. **`srcTid`** – Source Node Identifier
   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **`rpt-date`** – Report date
   This parameter is set to the date when the output message is generated.
   Note: Format uses a 4 digit year instead of a 2 digit year as for host TL1 commands. Compare to RTRV-HDR.
   Range: YY-MM-DD; where YY=2000-2099, MM=01-12, DD=01-31.
3. **`rpt-time`** – Report time
   This parameter is set to the time when the output message is generated.
   Range: HH:MM:SS; where HH=00-23, MM=00-59, SS=00-59.
4. **`atag`** – Automatic Tag
   This parameter is used for message sequencing. The atag is available per user session. The number is incremented by one for each autonomous message, and the messages are transmitted to the user in that same order.
   Values: 000 (default) – 999
5. Update Management Block (umb): **`ocrDate`** – Occurrence Date
   The date parameter is set to the date when the event occurred in the system.
   Values: .YY-MM-DD where YY=2000-2099, MM=01-12, DD=01-31
6. umb: **`ocrTime`** – Occurrence Time
   Time when the change occurred.
   The time parameter is set to the time when the event occurred in the system.
   Values: HH-MM-SS where HH=0-23, MM=00-59, SS=00-59.
7. Common Block (cb): **`srcNodeID`**
   ONNS source nodeID. Together with the following srcPortID field defines the associated Ingress connPoint that connects the source node to the edge/gateway switch or client router.
   Range: Four dot separated numeric strings. 0 – 255 for each numeric string.
8. cb: **`srcAid`**
   Source node ONNS application access identifier of the ONNS controller OS command interface port.
   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn.
9. cb: **`msgCode`**
   This parameter identifies the reported change.
   Type: Alphanumeric string of length.

10. cb: **`dataSrcID`**
    The data repository or software package reporting the change: NNDR for the Network Neighbor Data Repository.
    Range:
    - NNDR: for the Network Neighbor Data Repository
    - NNSYS: for ONNS System
    - NNDEFRAG: for the Defragmentation Operation
11. cb: **`eventText`**
    Free format text, up to 80 characters.
12. cb: **`eventData`**
    Further event data as named-parameter=value pair(s). Comma separated when multiple pairs.

Example output

`REPT NNCHG` output example for threshold-triggered LSA notification

The following is an example of the **`REPT NNCHG`** message for an ONNS Neighbor Nodal Data Repository LBA update due to a capacity threshold crossing, which causes an LSA distribution:

```
   LT-ONNS-101 2002-08-01 08:02:37
A  593 REPT NNCHG
   ″TIME=08-02-00,DATE=02-08-01:178.223.45.172:SNN:NNDR:C050,,\″ LSA update sent due
       to significant bandwidth change
\″,TC=50,,NeighborNodeID=178.23.145.12″
;
```

`REPT NNCHG` output example for timer-triggered LSA notification

The following is an example of the **`REPT NNCHG`** message for an Neighbor Nodal Data Repository LBA update due to timer expiration, which causes an LSA distribution:

```
   LT-ONNS-007 2002-08-01 08:02:05
A  152 REPT NNCHG
   ″TIME=08-02-00,DATE=02-08-01:178.223.45.172:SNN:NNDR:C060,,\″ LSA update sent due
       to periodic timer expiry \″,TMR=15″
;
```

Note: This message only occurs when the capacity changes have not been reported by a capacity threshold-triggered LSA notification.

`REPT NNCHG` output example for ONNS restart

The following is an example of the **`REPT NNCHG`** message sent after a restart of the ONNS:

```
   LT-ONNS-007 2003-07-01 08:02:05
```

```
A  152 REPT NNCHG
   ″TIME=08-02-00,DATE=03-07-01:178.223.45.172:SNN:NNSYS:C085,,\″ NN Ready  \″″
;
```

The management system needs this information to perform a resynchronization for example in case of an XC reboot with link bundle IDs being new assigned.

REPT NNCHG output example for ONNS restart initiation

The following is an example of the **REPT NNCHG** message sent when a restart of the ONNS applications has been initiated manually:

```
   LT-ONNS-007 2003-07-01 08:02:05
A  152 REPT NNCHG
   ″TIME=08-02-00,DATE=03-07-01:178.223.45.172:SNN:NNSYS:C080,,\″ NN Restart  \″″
;
```

An ONNS restart can be initiated manually by executing a specific **TST-PKG** TL1 command. This TL1 command is not applicable in general, but its use is restricted to authorized persons only. This notification is especially important to document manually initiated ONNS restarts within notification logs and to distinguish such restarts from autonomous ones.

REPT NNCHG output example for ONNS System Parameter changes

The following is an example of the **REPT NNCHG** message sent after a change of ONNS System Parameters :

```
ED-NNCNFG:LT-ONNS-A::123456::waitToRevertTimer=120,defaultRstrPriority=4;

   LT-ONNS-A 2003-07-01 08:02:05
A  152 REPT NNCHG
   ″TIME=08-02-00,DATE=03-07-01:178.223.45.172:SNN:NNSYS:C090,,\″ NN System
      Parameter Changed and Stored in NVM
      \″,WaitToRevertTimer=120,DefaultRstrPriority=4″
;
```

The event data shall contain all changed ONNS system parameters (see output specblock parameters of ED-NNCNFG)

REPT NNCHG output example for a successful defragmentation operation

The following is an example of the **REPT NNCHG** message sent after successful defragmentation operation:

```
OPR-DEFRAG:LT-ONNS-A::123456::LINK,29.13.80.192;

   LT-ONNS-A 2003-07-01 08:02:05
A  152 REPT NNCHG
```

```
   "TIME=08-02-00,DATE=03-07-01:178.223.45.172:SNN:NNDEFRAG:C150,,\" Defragmentation
       successfully completed \",LINK,TargetID=29.13.80.192"
   "MovedPaths:135.13.19.203-43216,135.13.198.103-41216,135.13.194.233-43226,
135.13.106.212-42916,135.13.139.203-43216,135.13.129.203-43216"
   "MovedPaths:135.13.196.217-43216,135.13.196.203-43319,135.13.139.198-43216,
135.13.146.203-43216,135.13.199.203-43216,135.13.196.213-43216"
...
  "MovedPaths:135.13.196.203-40216,135.13.196.203-43916,135.13.196.263-43216,
135.13.135.203-43216,135.13.196.218-43216,135.13.196.203-44156"
;
```

This event is sent out after successfully intra port, inter port or empty port operation

REPT NNCHG output example for an interruption of the defragmentation operation

The following is an example of the **REPT NNCHG** message sent after interruption of the defragmentation operation:

```
OPR-DEFRAG:LT-ONNS-A::123456::LINK,29.13.80.192;

   LT-ONNS-A 2003-07-01 08:02:05
A  010152 REPT NNCHG
   "TIME=08-02-00,DATE=03-07-01:178.223.45.172:SNN:NNDEFRAG:C151,,\" Defragmentation
       partially completed: Local Bridge and Merge Failure
\",LINK,TargetID=29.13.80.192,PathID=135.13.196.203-432165"
    "MovedPaths:135.13.196.203-40216,135.13.196.203-43916,135.13.196.263-43216,
135.13.135.203-43216,135.13.196.218-43216,135.13.196.203-44156"

;
```

There could be situations in which the defrag operation gets interrupted or terminated such that it was not able to cleanly complete the particular connection move (bridge and merge on the local or remote end of the connection) that it was involved in.

In these cases it is possible that a dangling bridge and merge cross-connection is left on either the local or the remote end. When this happens, an additional value is returned as part of the qualifier, that is the *pathID* of the connection move that was left incomplete.

The following list identifies conditions that will cause a similar notification:

- C151 (LBMF) Local Bridge and Merge Failure, [Scope,TargetID,PathID]
- C152 (LXCF) Local Cross Connect Release Failure, [Scope,TargetID,PathID]
- C153 (RBMF) Remote Bridge and Merge Failure, [Scope,TargetID,PathID]
- C154 (RXCF) Remote Cross Connect Release Failure, [Scope,TargetID,PathID]
- C155 (LDPD) Path Being Deleted, [Scope,TargetID]
- C156 (NNRP) No Neighbor Response, [Scope,TargetID,PathID]

Notification C153 is also send if a port of the remote side which should be defragmented is in LOCKOUT state.

REPT NNCHG output example for an incomplete empty port operation

The following is an example of the **REPT NNCHG** message sent after incomplete empty port operation

```
OPR-DEFRAG:LT-ONNS-A::123456::EMPTYPORT,1-1-1-2;

   LT-ONNS-A 2003-07-01 08:02:05
A  010152 REPT NNCHG
   ″TIME=08-02-00,DATE=03-07-01:178.223.45.172:SNN:NNDEFRAG:C157,,\″ Empty Port
      partially completed \″,EMPTYPORT,TargetID=1-1-1-2,RemainPaths=2″
   ″MovedPaths:135.13.196.203-40216,135.13.196.203-43916,135.13.196.263-43216,
135.13.135.203-43216,135.13.196.218-43216,135.13.196.203-44156″

;
```

The port has inmovable paths or there is not enough space in other ports of the link bundle to completely empty the port.

REPT NNCHG output example for a collision failure of the defragmentation operation

The following is an example of the **REPT NNCHG** message sent after collision or communication failure of the defragmentation operation: The node on the far end of the fiber is also performing a defrag action on the same fiber. Or, the local node is performing a defrag action on a separate fiber with both actions affecting the same path. Or the node on the far end is performing a defrag action on a separate fiber with both actions affecting the same path. In this case the operate defrag returns without any action performed.

```
OPR-DEFRAG:LT-ONNS-A::123456::LINK,29.13.80.192;

   LT-ONNS-A 2003-07-01 08:02:05
A  010152 REPT NNCHG
   ″TIME=08-02-00,DATE=03-07-01:178.223.45.172:SNN:NNDEFRAG:C158,,\″ Defragmentation
       unsuccessful: Conflicting Action at Local or Neighbor Node
\″,LINK,TargetID=29.13.80.192″
;
```

REPT NNCHG output example if a HW failure occurs during defragmentation operation

The following is an example of the **REPT NNCHG** message sent after a HW failure occurs during the defragmentation operation:

```
OPR-DEFRAG:LT-ONNS-A::123456::LINK,29.13.80.192;

   LT-ONNS-A 2003-07-01 08:02:05
A  010152 REPT NNCHG
```

```
   ″TIME=08-02-00,DATE=03-07-01:178.223.45.172:SNN:NNDEFRAG:C159,,\″ Defragmentation
       unsuccessful: Port or Line in Failed State
\″,LINK,TargetID=29.13.80.192″
;
```

In the rare case that a catastrophic failure occurs (local node crashes, remote node crashes, the fiber gets cut) while a defrag operation is in progress, the operation will return with a defragmentation unsuccessful notification.

REPT NNCHG output example if a SW failure occurs during defragmentation operation

The following is an example of the **REPT NNCHG** message sent after a SW failure occurs during the defragmentation operation:

```
OPR-DEFRAG:LT-ONNS-A::123456::LINK,29.13.80.192;

   LT-ONNS-A 2003-07-01 08:02:05
A  010152 REPT NNCHG
   ″TIME=08-02-00,DATE=03-07-01:178.223.45.172:SNN:NNDEFRAG:C160,,\″ Defragmentation
       denied: SW failure \″,LINK,TargetID=29.13.80.192″
;
```

In the rare case that a software failure occurs while a defrag operation is in progress, the operation will return with a DENY notification.

REPT-NNEVT notification

Overview

REPT NNEVT notification messages are generated autonomously to report internal ONNS events and status changes such as signaling session failures, internal communication problems, and NVM errors, and Threshold Control Alert status changes..

Output format

The generic format of a **REPT NNEVT** autonomous notification message is as follows with the update management block (*umb*) and the common data block (*comBlock*):

```
   srcTid rpt-date rpt-time
A  atag REPT NNEVT
   ″umb:comBlock″
;
```

Expanded output format

The general format of a REPT NNEVT autonomous notification message with expanded *umb* and *comBlock* is as follows:

```
   srcTid rpt-date rpt-time
A  atag REPT NNEVT

      ″TIME=ocrTime,DATE=ocrDate:srcNodeID:srcAid:msgCode:dataSrcID:condType:condDescr,\″ event
;
```

Output parameters

Command parameters

1. **srcTid** – Source Node Identifier
   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.
   Type: identifier, in addition the special character underscore “_” and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **rpt-date** – Report date
   This parameter is set to the date when the output message is generated.
   Note: Format uses a 4 digit year instead of a 2 digit year as for host TL1 commands. Compare to RTRV-HDR.
   Range: YY-MM-DD; where YY=2000-2099, MM=01-12, DD=01-31.

3. **`rpt-time`** – Report time
   This parameter is set to the time when the output message is generated.
   Range: HH:MM:SS; where HH=00-23, MM=00-59, SS=00-59.
4. **`atag`** – Automatic Tag
   This parameter is used for message sequencing. The atag is available per user session. The number is incremented by one for each autonomous message, and the messages are transmitted to the user in that same order.
   Values: 000 (default) – 999
5. umb – Update Management Block
   - **`ocrDate`** – Occurrence DATE
     The date parameter is set to the date when the event occurred in the system.
     Values: .YY-MM-DD where YY=2000-2099, MM=01-12, DD=01-31
   - **`ocrTime`** – Occurrence TIME
     The time parameter is set to the time when the event occurred in the system.
     Values: HH-MM-SS where HH=0-23, MM=00-59, SS=00-59.
6. comBlock – Common Block
   This parameter contains the following fields:
   - **`srcNodeID`**
     ONNS source nodeID. Together with the following srcPortID field defines the associated Ingress connPoint that connects the source node to the edge/gateway switch or client router.
     Range: Four dot separated numeric strings. 0 – 255 for each numeric string.
   - **`srcAid`**
     Source node ONNS application access identifier of the ONNS controller OS command interface port.
     Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn.
   - **`msgCode`**
     This code identifies the reason for the event:
     Type: Alphanumeric string of length 4.
   - **`dataSrcID`**
     The software package originating the event:
     CONN (for Connection Data Mgmt), H-INTF (for Host Interface Pkg), NNDM (Network Neighbor Data Mgmt), NN-SIG (for Signaling Pkg), NNSYS (for ONNS System Pkg).
   - **`condType`** – Condition Type
     Values: GEV (General Event), HBO (Host Buffer overflow), NVF (NVM Failure), SCE (Signaling Comm Established), SCF (Sig Comm Failure), TMO (TimeOut expired), TCA (Threshold Control Alert status change).
   - **`condDescr`** – Description of the condition
     This parameter consists of the following comma separated fields: category, entity, description code.

Category values: SIGSES = SIG session; COMM = Communications; STATUS = Event Status

Entity values: NVM, SYSTEM, DCNPORT, LINKBUNDLE

Description code: FAILED = status failure; OK = status okay; ERROR = error condition, INACTIVE = status value, LOW = status value, HIGH = status value.

- **`eventText`**

  Free format text, up to 80 characters.

- **`eventData`**

  Event data, as name-value pairs.

  For *condType* = TCA, the following name-value pairs are used: *LinkId* = aSTNNodeId&neighborASTNNodeID, *LinkBundleID* = linkBundleID.

Example output

The following **`REPT NNEVT`** autonomous message illustrates how an ONNS failure event is reported for signaling communication loss.

```
   LT-WS-ONNS-007 2002-08-01 08:00:00
A  00359 REPT NNEVT
   ″DATE=2002-08-01,TIME=07-59-59:135.13.196.45:SNN:F401:NN-
      SIG:SCF:SIGSES,DCNPORT,ERROR,\″ SIG Communications Loss
      \″,NBRID=neighborNodeID″
;
```

Other failure notification messages are listed below:

- F403 – CONN:NVF:COMM, NVM, ERROR – CONN NVM write error
- F404 – H-INTF:HBO:COMM, HostPort, ERROR – Host comm buffer overflow error
- F405 – NNSYS:GEV:STATUS,SYSTEM, FAILED – NN Failed
- F406 – NNDM:NVF:COMM, NVM, ERROR – NNDM NVM write error
- F407:NNDM:XCF:XCON,NNIPORT,FAILED,An XConn Failure occurred during Bridge to original Revertive path connection
- F408:NNDM:XCF:XCON,NNIPORT,FAILED, An XConn Failure occurred on Merge to Revertive path connection
- F409:NNDM:XCF:XCON,TSTPORT,FAILED, Test port bridge XCON failed
- F411:NNDM:EQF:PRTST,TSTPORT,FAILED,Test port equipment failed.

`REPT NNEVT` for clearing of a failure

An ONNS clearing event notification is sent when a failure condition has been repaired or cleared. The following event indicates successful establishment of a signaling communication session. Some ONNS failures do not have clearing notifications:

```
   LT-WS-ONNS-007 2002-08-01 08:00:00
```

```
A   00359 REPT NNEVT
   "DATE=2002-08-01,TIME=07-59-59:135.13.196.45:SNN:S451:NN-SIG:SCE:SIGSES,
      DCNPORT,OK,\" SIG Communication Session Established \",NBRID=198.168.224.37"
;
```

ONNS TCA events shall have a status message code that begins with S (i.e. Sxxx).

REPT NNEVT for raising TCA

The following **REPT NNEVT** autonomous message illustrates how an ONNS TCA event is reported for the TCA status becoming LOW:

```
   LT-WS-ONNS-007 2002-08-01 08:00:00
A   00359 REPT NNEVT
   "DATE=2002-08-01,TIME=07-59-59:135.13.196.45:SNN:S502:NNDM:TCA:
      STATUS,LINKBUNDLE,LOW,\" LOW status entered
      \",LinkID=135.13.196.45&135.13.25.68,LinkBundleID=5"
;
```

Other TCA related notification messages (including S502) are listed below:

- S501 – NNDM:TCA:STATUS,LINKBUNDLE,INACTIVE, INACTIVE status entered
- S502 – NNDM:TCA:STATUS,LINKBUNDLE,LOW, LOW status entered
- S503 – NNDM:TCA:STATUS,LINKBUNDLE,HIGH, HIGH status entered

REPT NNEVT for clearing TCA

The following **REPT NNEVT** autonomous message illustrates how an ONNS TCA event is reported for the clearing of a TCA:

```
   LT-WS-ONNS-007 2002-08-01 08:00:00
A   00359 REPT NNEVT
   "DATE=2002-08-01,TIME=07-59-59:135.13.196.45:SNN:S501:NNDM:TCA:
      STATUS,LINKBUNDLE,INACTIVE,\" INACTIVE status entered
      \",LinkID=135.13.196.45&135.13.25.68,LinkBundleID=5"
;
```

REPT-PTHCHG notification

Overview

The **REPT PTHCHG** notification is used to notify about TL1 triggered changes (**ENT/ED/DLT-PATH**) or autonomously triggered changes, such as restoration, of ONNS connection parameters.

The **REPT PTHCHG** notification is used to notify about UNI triggered changes (create/delete connections) of ONNS connection parameters.

The **REPT PTHCHG** notification is used to notify about Network Connection TL1 triggered changes (**ENT/ED/DLT-CONN**) of ONNS connection parameters.

The **REPT PTHCHG** notification message reports specific changes in the ONNS system data repositories. Changes can be caused by a user's TL1 path command, by UNI connection requests or by autonomous internally-generated connection changes such as path restoration.

Notification messages resulting from a TL1 command that were caused by the user's own requested changes

If the data repository change occurs as a result of a TL1 ent-path or dlt-path or ed-path-prot/roll command, then a REPT PTHCHG message is transmitted to all users provisioned to receive REPT PTHCHG messages, including the user that issued the command. Therefore, a management OS must expect to receive data repository change messages for changes it caused as well as those made by a CIT user. The REPT PTHCHG CCB field will indicate the TL1 command that caused the connection change.

Notification messages resulting from UNI connection requests

If the data repository change occurs as a result of a UNI connection setup or delete request, then a REPT PTHCHG message is transmitted to all users provisioned to receive REPT PTHCHG message. There will be separate PTHCHG messages from every domain with ONNS functionality affected by the connection request. Therefore, a management OS must expect to receive data repository change messages for changes caused by UNI connection requests. The REPT PTHCHG CCB field will indicate the UNI connection requests by the corresponding TL1 commands ENT-PATH and DLT-PATH.

Notification messages resulting from a TL1 network connection request

If the data repository change occurs as a result of a TL1 ENT-CONN or DLT-CONN, then a REPT PTHCHG message is transmitted to all users provisioned to receive REPT PTHCHG messages. There will be separate PTHCHG messages from every domain with ONNS functionality affected by the connection request. Therefore, a management OS must expect to receive data repository change messages for changes caused by TL1 network connection requests. The REPT PTHCHG CCB field will indicate the TL1 network connection requests by the corresponding TL1 commands ENT-PATH and DLT-PATH.

REPT PTHCHG for path/connection object creation

Only the connection objects (identified by *connID* and *pathID's*) generated by the TL1 ENT-PATH setup commands or a UNI connection request are returned in a REPT PTHCHG message. All of the supporting objects (such as cross-connections that are reported by the host NE) which are autonomously created due to the original connection object's creation are not reported in a ONNS REPT PTHCHG notification message. The Host NEs are responsible for sending REPT-DBCHG's for each cross-connection along the path of the connection.

REPT PTHCHG for path/connection object creation

Only the connection objects (identified by *connID* and *pathID's*) indirectly generated by the TL1 ENT-CONN setup commands or a eNNI connection request are returned in a REPT PTHCHG message. All of the supporting objects (such as cross-connections that are reported by the host NE) which are autonomously created due to the original connection object's creation are not reported in a ONNS REPT PTHCHG notification message. The Host NEs are responsible for sending REPT-DBCHG's for each cross-connection along the path of the connection.

TL1 commands associated with multiple *connID*'s

If a data repository change occurs as a result of a TL1 command in which multiple connections are involved, then the ONNS system will output separate REPT PTHCHG notification messages for each affected *connID*. The REPT PTHCHG CCB field will indicate the TL1 command that caused the connection change.

UNI connection requests associated with multiple *connID*'s

If a data repository change occurs as a result of a UNI connection request in which multiple connections are involved (e.g. Ethernet UNI connection), then the ONNS system will output separate REPT PTHCHG notification messages for each affected *connID*. The REPT PTHCHG CCB field will indicate the corresponding TL1 command of the connection request that caused the connection change.

The REPT PTHCHG message contains *pst*, *sst* and *tst* state information

The primary pathState (*pst*), secondary state (*sst*) and optional tertiary state (*tst*) parameters of a connection and path appear in the REPT PTHCHG message just as reported in the connection record that is returned in a TL1 command response. If a path or connection's state is changed by a TL1 command, the *pst*, *sst* and *tst* parameters that are returned in the REPT PTHCHG message are the actual *pst*, *sst* and *tst* parameters of the connection object after the state change has occurred. When reporting a path restoration change, the state included in the REPT PTHCHG message is the *ConnStatus* at the time that the message is sent.

The REPT PTHCHG message associated with a connection always contains the entire connection record and includes path Direction (*pdir*). If a connection object's configuration changes autonomously, the *pst*, *sst* and *tst* parameters of the REPT PTHCHG are the actual *pst*, *sst*, and *tst* parameters of the connection object after the configuration change has occurred.

If a connection status or path state changes autonomously, the new state of the ingress (and local egress) paths are returned in a single REPT PTHEVT message.

The REPT PTHCHG message contains *pst*, *sst* and *tst* state information

The primary pathState (pst), secondary state (sst) and optional tertiary state (tst) parameters that are returned in the REPT PTHCHG message triggered by a UNI connection request are the actual pst, sst and tst parameters of the connection object after the state change has occurred.

The REPT PTHCHG message contains *pst*, *sst* and *tst* state information

The primary pathState (*pst*), secondary state (*sst*) and optional tertiary state (*tst*) parameters that are returned in the REPT PTHCHG message triggered by a TL1 network connection request (ENT-CONN, DLT-CONN) are the actual *pst*, *sst* and *tst* parameters of the connection object after the state change has occurred.

User defined connection alias returned with REPT-PTHCHG event

The user defined connection alias, if defined, is returned with the event report along with other parameters. If no *connAlias* is defined, then a NULL is returned.

Autonomous path connection configuration change REPT PTHCHG format

Autonomous connection configuration changes that affect the ONNS connection data repository will cause a REPT PTHCHG messages that are output with the CCB= PATH.

Autonomous Path Notification behavior on a protection switch within an M:N protected connection group

In case of a successful protection switch within an M:N protected connection group, the following autonomous notifications are sent with CCB=PATH:

- First of all a REPT PTHEVT notification with code F105 indicating the failure of the working connection, i.e. the working connection and the working path in pathID1 will be in state CON&FAILED
- Then a REPT PTHCHG notification with code C173 for the working connection indicating the completed setup of the protecting path and indicating that the system is waiting for the signal confirmation of the egress port. The connection will be in state CON&SETUP, the protecting path will be associated as pathID2 being in path state CON&SETUP as well. The ID of the associated protecting connection will be given in parameter assocConnID.

- After successful signal confirmation a REPT PTHCHG notifications for the working connection with code C015 indicating that the completed protection switch has been saved in NVM. The connection and the protecting path in pathID2 will both be in state CON&OK&TSTRD
- Additionally a REPT PTHCHG notification for the protecting connection with code C175, also indicating that the completed protection switch has been saved in NVM. The protecting connection will be in state CON&USED and no path will be associated. The ID of the associated working connection will be given in parameter assocConnID.

Autonomous Path Notification behavior on a protection release within an M:N protected connection group

In case of a successful protection release within an M:N protected connection group, the following autonomous notifications are sent with CCB=PATH:

- First of all a REPT PTHEVT notification with code S105 indicating that the original path of working connection is good again and the wait-to-restore time is started. The working connection and the working path in pathID1 will be in state CON&OK&WTORV
- After expiry of the wait-to-restore time a REPT PTHEVT notification with code S102 for the working connection indicating the switch back to the original path. The connection and the working path in pathID1 will be in state CON&OK
- Then a REPT PTHCHG notification for the working connection with code C174 indicating that the protection switch has been released and saved in NVM. The protecting path will not be associated any more in pathID2 and the parameter assocConnID will have the value OPEN.
- Finally a REPT PTHCHG notification for the protecting connection with code C176, also indicating that the protection switch has been released and saved in NVM. The protecting path will be associated again in pathID1 in state RSVD&OK. The connection will be in state CON&STBY and the parameter assocConnID will have the value OPEN.

Output format

Output format for a `REPT PTHCHG` notification message after a connection setup request

The general format of a **`REPT PTHCHG`** notification message from a **`ENT-PATH`** command or a UNI connection setup request is as follows:

```

   [SrcNID=srcNID,srcPortID,DestNID=destNID,destPortID]
   [,brDestNID=brDestNID,brDestPortID]
   [:PathID=pathID1,State=pst&sst&tst,NodeList=srcNode&nodeIP1&nodeIP2&...&destNode]
   [:PathID=pathID2,State=pst2&sst2&tst2,NodeList=srcNodeIP& ... &destNodeIP]″
;
```

Output format for an autonomous **REPT PTHCHG** notification message

The general format of an autonomous **REPT PTHCHG** notification message is as follows:

```
   srcTid rpt-date rpt-time
A  atag REPT PTHCHG
   ″TIME=ocrTime,DATE=ocrDate:CCB=PATH:srcNodeIP:srcAid:msgCode,eventText″,
   ″ConnID=connID,ConnStatus=pst&sst&tst,connControl,[pdir],[protectionClass],
   bandwidth,[ConnAlias=connAlias],
   [MaxDelay=maxDelay],[SrvID=srvID],[nodeListUsage1=nodeList1],
   [nodeListUsage2=nodeList2],[SrlgExclude=srlgExcludeList],
   [IncludeID=linkIncludeID],[specBlock],[reserved],
   [SrcNID=srcNID,srcPortID,DestNID=destNID,destPortID]
   [,brDestNID=brDestNID,brDestPortID]:
   PathID=pathID1,State=pst&sst&tst,[NodeList=srcNode&nodeIP1&nodeIP2&...&destNode]
```

```
   [:PathID=pathID2,State=pst2&sst2&tst2,NodeList=srcNodeIP& ... &destNodeIP]″
;
```

Output parameters

Command parameters

1. **`srcTid`**
   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **`rpt-date`** – Reporting date
   This parameter is set to the date when the output message is generated.
   Note: Format uses a 4 digit year instead of a 2 digit year as for host TL1 commands. Compare to **`RTRV-HDR`**.
   Range: YY-MM-DD; where YY=00-99, MM=01-12, DD=01-31.
3. **`rpt-time`** – Reporting time
   This parameter is set to the time when the output message is generated.
   Range: HH:MM:SS; where HH=00-23, MM=00-59, SS=00-59.
4. **`atag`** – Automatic Tag
   This parameter is used for message sequencing. The atag is available per user session. The number is incremented by one for each autonomous message, and the messages are transmitted to the user in that same order.
   Values: 000 (default) – 999
5. **`ocrDate`** – Occurrence Date
   The date parameter is set to the date when the event occurred in the system.
   Values: .YY-MM-DD where YY=00-99, MM=01-12, DD=01-31
6. **`ocrTime`** – Occurrence Time
   The time parameter is set to the time when the event occurred in the system.
   Values: HH-MM-SS where HH=0-23, MM=00-59, SS=00-59.
7. **`comBlock(CB)`**- CCB common block
   This block contains the parts of the command (TL1 or UNI request) causing this REPT PTHCHG notification plus further event info. The following parameters, separated by : will be present:
   - CCB – command code block for the command which caused the event
   - srcNID – srcNID input parameter to the command
   - srcAID – srcAID input parameter to the command

- msgCode – msgCode of the event
- eventText – further event info.

a. **CCB** – Command Code Block

Represents the path command (TL1 or UNI request) causing the change.This confirmation notification indicates an ONNS managed path change was stored in the ONNS Host NVM.

Range: PATH (is specified when the change is not directly caused by path command (TL1 or UNI request), e.g. used for a connection/path change due to restoration. Other values are used when the change is directly caused by a user TL1 or UNI request command: ENT-PATH-UNPROT, ENT-PATH-AUTO, ENT-PATH-N1PLUS1, ED-PATH-PROT, ED-PATH-ROLL, DLT-PATH, ENT-PATH-YCONN, ED-PATH, ENT-PATH-MBYN, ENT-PATH-P1PLUS1NR.

b. **srcNID**

Note: Not present when CCB=DLT-PATH.

ONNS source nodeID. Together with the following srcPortID field defines the associated Ingress connPoint that connects the source node to the edge/gateway switch or client router.

Range: Four dot separated numeric strings. 0 – 255 for each numeric string.

c. **srcAid**

Source node ONNS application access identifier of the ONNS controller OS command interface port.

Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn.

d. **msgCode**

Message Code or Status code indicates known or suspected cause or reason for the event, change, or condition.

e. **eventText**

This field records an event description message.

8. **connID**, **connAlias**, **connStatus**, **pdir**, **protectionClass**, **bandwidth**, **maxDelay**, **srvID**, **nodeListUsage1**, **nodeList1**, **nodeListUsage2**, **nodeList2**, **srlgExcludeList**

See the parameter description in the "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2698) section.

9. **connControl** – Connection Control

Indicates whether the ONNS connection is controlled by ONNS or by external control (UNI, eNNI connections).

Type: Value set.

Range:

- ONNS (ONNS connections, created via ENT-PATH)
- EXT (ONNS connections, created via ENT-CONN, UNI or eNNI)

10. **`pdir`** – Path Direction Topology
    Unidirectional A-Z (1WAY) or Bidirectional (2WAY).
    For connections of *protectionClass* MBYNWRK and MBYNPRT only the path direction topology Bidirectional (2WAY) is supported.
    Type: Value set.
    Range: 1WAY, 2WAY
    Default: 1WAY.
    This is a mandatory output parameter in **`REPT PTHCHG`** in the following cases:
    - CCB = **`ENT-PATH-*`**

    Otherwise it is an optional parameter in **`REPT PTHCHG`**.
11. **`protectionClass`**
    This parameter defines the type of restoration protection assigned to the path connection during path setup or after path modification.
    Range:
    - UNPROT (path from source to destination is un-protected)
    - AUTONR (path from source to destination is a non-revertive auto-reroute path connection)
    - N1PLUS1 (paths from source to destination is set up as a 1+1 protected connection)
    - AUTORV (path from source to destination is a revertive auto-reroute path connection)
    - YCONN (paths from the same source to two different destinations are set up as a bridged connection).
    - MBYNWRK (working connection in an M:N connection group)
    - MBYNPRT (protecting connection in an M:N connection group)
    - P1PLUS1NR (paths from source to destination are set up as a 1+1 protected non-revertive connection with an additional non-revertive restoration path applied in case the worker or protection path fails.)
    - P1PLUS1NRRV (paths from source to destination are set up as a 1+1 protected revertive connection with an additional non-revertive restoration path applied in case the worker or protection path fails.)

    This is a mandatory output parameter in **`REPT PTHCHG`** in the following cases:
    - CCB = **`ENT-PATH-*`**
    - CCB = **`ED-PATH-PROT`**

    Otherwise it is an optional parameter in **`REPT PTHCHG`**.

12. **`bandwidth`** – Requested bandwidth / signalRate
    Link *signalRate* is equal to or greater than the minimum cross-connect rate *minXCrate* of the *port_type*.
    Type: Value set.
    Range: STS1, STS3, STS12 STS48, STS192, STS1-pipe, STS3-pipe, STS12-pipe STS48-pipe, STS192-pipe.
    Default: None.

    This is a mandatory output parameter in **`REPT PTHCHG`** in the following cases:

    - CCB = **`ENT-PATH-*`**

    In all other cases, it is an optional parameter in **`REPT PTHCHG`**, that is, it is not mentioned explicitly as mandatory.

13. **`maxDelay`** – Maximum transport delay
    Maximum transport delay through all nodes in the path. Total path delay must not exceed this value.
    Range: 0, is used to select no delay limit; 1 – 32767, maximum transport delay in milliseconds.
    Default: 0.

    This is a mandatory output parameter in **`REPT PTHCHG`** in the following cases:

    - CCB = **`ENT-PATH-*`**
    - CCB = **`ED-PATH-PROT`**
    - CCB = **`ED-PATH-ROLL`**

    Otherwise it is an optional parameter in **`REPT PTHCHG`**.

14. **`srvID`** – Service Identifier
    This parameter is a logical tag for the group of connections associated with a service defined by the Service Manager system (or other management entity).
    Type: Integer.
    Range: 1 – 20000000
    Only one *srvID* is accepted. The value "ALL" is not supported.

15. **`nodeListUsage1`**
    For connection setup NN used/uses the list of nodes included in the *nodeList1* array block in a manner specified by the *nodeListUsage1* variable. Both, *nodeListUsage1* and *nodeList1*, fields belong together and is reported when supplied as input to the **`ENT-PATH`** command. An EXCLUDE list usage applies to all paths created (as in a N1PLUS1NR or N1PLUS1RV). A non-existent *nodeID* will be ignored in EXCLUDE *nodeList1* during path setup. A non-existent *nodeID* will cause setup failure in EXPLICIT *nodeList1* during path setup.
    Type: Value set.

Range:

- EXPLICIT, *nodeList1* contains the intermediate NE nodes of the path in the explicit order they are to be used. (An empty list will force a direct path from source to destination.)
- EXCLUDE, nodes in the *nodeList1* must all be excluded from the path created. In the case when the *protectionClass* is either YCONN, N1PLUS1NR or N1PLUS1RV the nodes in the *nodeList1* below also apply to the second or restoration path.

This is a mandatory output parameter in **REPT PTHCHG** in the following cases:

- CCB = **ENT-PATH-*** and parameter exists
- CCB = **ED-PATH-*** and parameter exists

Otherwise it is an optional parameter in **REPT PTHCHG**.

16. **nodeList1**

When *nodeListUsage1* = EXPLICIT: List of intermediate nodes that specify the path in the exact node order specified in the input. Source and destination nodes are assumed to be included implicitly. The *nodeID* values are shown in the form: nid1([&nid2& …&nidx]).

When *nodeListUsage1* = EXCLUDE: List of nodes that must all be excluded from both paths. The *nodeID* values are shown in the from: nid1([&nid2& …&nidx]).

If the preceding required *nodeListUsage1* field is not supplied, this field must not be present. If user specifies empty EXCLUDE *nodeList1*, the connection should use indirect path from source node to destination node (that is, at least one intermediate node is needed). If user specifies empty EXPLICIT *nodeList1*, the connection should use a direct path from source to destination node (that is, no intermediate node is allowed).

Type: &-separated list of nodeIDs. A *nodeID* is represented as four dot separated numeric string with each numeric string between 0 – 255.

Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123

Range: nid1([&nidx])* or empty list (where X <= 25 when *nodeListUsage1* = EXPLICIT) (where X <= 25 when *nodeListUsage1* = EXCLUSIVE)

This is a mandatory output parameter in **REPT PTHCHG** in the following cases:

- CCB = **ENT-PATH-*** and parameter exists
- CCB = **ED-PATH-*** and parameter exists

17. **nodeListUsage2**

For connection setup NN used/uses the list of nodes included in the *nodeList2* array block in a manner specified by the *nodeListUsage2* variable. Both, *nodeListUsage2* and *nodeList2*, fields belong together and is reported when supplied as input to the **ENT-PATH** command. A non-existent *nodeID* will cause setup failure in EXPLICIT *nodeList1* during path setup.

This parameter is only be used when *protectionClass* is N1PLUS1 or YCONN.

This parameter shall also be allowed when *protectionClass* is P1PLUS1NR.
Type: Value set.
Range: EXPLICIT, *nodeList2* contains the intermediate NE nodes of the path in the explicit order they are to be used. (An empty list will force a direct path from source to destination.).

This is a mandatory output parameter in **`REPT PTHCHG`** in the following cases:

- CCB = **`ENT-PATH-*`** and parameter exists
- CCB = **`ED-PATH-*`** and parameter exists

18. **`nodeList2`**
When *nodeListUsage2* = EXPLICIT: List of intermediate nodes that specify the path in the exact node order specified in the input. Source and destination nodes are assumed to be included implicitly. The *nodeID* values are shown in the form: nid1([[&nid2& …&nidx]]).
If the preceding required *nodeListUsage2* field is not supplied, this field must not be present. If user specifies empty EXPLICIT *nodeList2*, the connection should use a direct path from source to destination node (i.e., no intermediate node is allowed).
This parameter is only be used when *protectionClass* is N1PLUS1 or YCONN.
This parameter shall also be allowed when *protectionClass* is P1PLUS1NR
Type: &-separated list of *nodeIDs*. A *nodeID* is represented as four dot separated numeric string with each numeric string between 0 – 255.
Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123
Range: nid1([&nidX])* or empty list where X <= 8 when *nodeListUsage1* = EXPLICIT.

This is a mandatory output parameter in **`REPT PTHCHG`** in the following cases:

- CCB = **`ENT-PATH-*`** and parameter exists
- CCB = **`ED-PATH-*`** and parameter exists

19. **`srlgExcludeList`** – SRLG Exclude List
List of Shared Risk Link Group identifiers that are to be used to exclude links from the connection path(s) being created.
Type: &-separated list of numeric strings | empty | 0
Example: 33&49&64
Range: up to 25 numeric strings, each in the range 1 – 65535. The value 0 (default) or an empty field indicates no constraint are applied.

This is a mandatory output parameter in **`REPT PTHCHG`** in the following cases:

- CCB = **`ENT-PATH-*`**
- CCB = **`ED-PATH-*`**
- CCB = **`ED-ROLL`**

20. **`linkInclude`** – VPN Identifier
    A connection constraint link property such as *linkIncludeID* that must be valid to include the link in the connection path(s) to be created. *linkIncludeID* is a link connection property that can be used to group and classify links. VPNID is a special case of this associative property.
    Range: 1 – 65535. 0 (default) or an empty field indicates no VPN constraint is applied.
    Note: Since the corresponding value is not supported as Host port parameter any input different from 0 will lead to DENY of the command.
21. **`srcNID`** – NN source node Network IP Access identifier (nid).
    ONNS source nodeID. Together with the following srcPortID field defines the associated Ingress connPoint that connects the source node to the edge/gateway switch or client router.
    Range: Four dot separated numeric strings. 0 – 255 for each numeric string.
22. **`srcPortID`**
    ONNS source node ingress portID. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # of the *srcNID* ingress *connPoint*. ONNS assumes a bidirectional port pair.
    Value: dash-separated list of 5 numeric strings
    Example: 1-1-3-1-4
    Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).
23. **`destNID`** – Destination nodeID
    ONNS destination nodeID. Together with the following *destPortID* field defines the associated Engress *connPoint* that connects the destination node to the edge/gateway switch or client router.
    Type: Four dot separated numeric strings. 0 – 255 for each numeric string.
24. **`destPortID`**
    ONNS destination node egress portID. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # of the destNID egress *connPoint*.
    Value: dash-separated list of 5 numeric strings
    Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).
25. **`brDestNID`** – Bridged Destination NodeID
    ONNS bridged destination nodeID. Together with the following brDestPortID field defines the second associated Egress connPoint that connects the destination node to the edge/gateway switch or client router in case of protectionClass YCONN.
    Type: Four dot separated numeric strings. 0 – 255 for each numeric string.

26. **`brDestPortID`** – Bridged Destination PortID
ONNS bridged destination node egress *portID* in case *protectionClass* = YCONN. The *portID* consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # of the brDestNID egress connPoint. 4.1; 5; 6
Value: dash-separated list of 5 numeric strings
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).

27. **`pathID1`** – Path ID 1
The PathID of the 1st path that was created.
Type: character string of length up to 20.
Range: nodeID-Index (nodeID: four dot separated numeric strings: each string 0 – 255); (Index: Numeric string 0-65535).
The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.
Example: 29.13.196.203-65111

28. **`pathState1`** – Path State 1
Path State1 = *pst*& *sst*[*&tst*]. pathState1 represents the status of the first path of the connection which may be different than the status of the overall connection in *connStatus*.

PathState1 is composed out of

- *pst* (PrimaryState)
- *sst* (SecondaryState)
- *tst* (TertiaryState, optional).

Up to two of the allowed values are simultaneously permitted as a sst/tst parameter.The two values must be separated by an ampersand (″&″). Individual status values are 7 characters or less.
Type: up to three &-separated value sets.

Range *pst* values:

- CON: Connected
- NOCON: Not Connected
- DLT: Deleted
- MAINT: Maintenance mode.

Range *sst* & *tst* values:

- OK: Conn good
- FAILED: PATH failed
- SETUP: Conn SetUp occurring
- TRDOWN: Conn teardown occurring
- NO-IN: Conn failed, signal in bad
- RSTOR: path restore occurring
- RSTRD: Conn restored
- RSTRFL: Conn restore failed

- DLT-FL: Delete operation Failed
- UNKNOWN: Conn state unknown
- WTORSTR: Waiting to restore path
- SETUPFL: Connection SetUp Failed
- RVRTFL: Conn revert failed
- PREMPTD: Preempted
- WTORV: Waiting to revert path
- BRDGD: Path bridged
- EPRTFL: EDGE Port Failed
- BAD-IN: path failed, Bad signal in
- FLT: Fault.

Note: Some states listed in this list will only occur within a DLT-PATH command response or in a REPT-PTHCHG / PTHEVT notification.

Range *pst* values:

- RSVD: Reserved, for paths associated to protecting connections within an M:N protection group, while not protecting a working traffic.

29. **`pNodeList1`** – Path Node List 1
The path node list contains the list of nodes that the 1st path (*pathID1*) traverses in A-Z order from the source node.
Type: &-separated list of nodeIDs. A nodeID is represented as four dot separated numeric string with each numeric string between 0 – 255.
Range: nid1([&nidX])*
Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123

30. **`pathID2`** – Path ID 2
The PathID of the 2nd path (if existing) that was created.
Type: character string of length up to 20.
Range: nodeID-Index (nodeID: four dot separated numeric strings: each string 0 – 255), (Index: Numeric string 0-65535).
The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.
Example: 29.13.196.203-65111

31. **`pathState2`** – Path State 2
pathState2 = pst&sst[&tst]. *pathState2* represents the status of the second path (if existing) of the connection which may be different than the status of the overall connection in *connStatus*.

PathState2 is composed out of:

- *pst* (PrimaryState)
- *sst* (SecondaryState)
- *tst* (TertiaryState, optional).

Up to two of the allowed values are simultaneously permitted as a sst/tst parameter.The two values must be separated by an ampersand ("&"). Individual status values are 7 characters or less.
Type: up to three &-separated value sets.
Range *pst* values:

- CON: Connected
- NOCON: Not Connected
- DLT: Deleted
- MAINT: Maintenance mode.

Range *sst* & *tst* values:

- OK: Conn good
- FAILED: PATH failed
- SETUP: Conn SetUp occurring
- TRDOWN: Conn teardown occurring
- NO-IN: Conn failed, signal in bad
- RSTOR: path restore occurring
- RSTRD: Conn restored
- RSTRFL: Conn restore failed
- DLT-FL: Delete operation Failed
- UNKNOWN: Conn state unknown
- WTORSTR: Waiting to restore path
- SETUPFL: Connection SetUp Failed
- RVRTFL: Conn revert failed
- PREMPTD: Preempted
- WTORV: Waiting to revert path
- BRDGD: Path bridged
- EPRTFL: EDGE Port Failed
- BAD-IN: path failed, Bad signal in
- FLT: Fault.

Note: Some states listed in this list will only occur within a DLT-PATH command response or in a REPT-PTHCHG / PTHEVT notification.

32. **`pNodeList2`** – Path Node List 2
The path node list contains the list of nodes that the 2nd path (pathID1, if existing) traverses in A-Z order from the source node.
Type: &-separated list of nodeIDs. A *nodeID* is represented as four dot separated numeric string with each numeric string between 0 – 255.
Range: nid1([&nidX])*
Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123

33. **`reqType`**
Note: Only present if CCB=ED-PATH[-mod].
This parameter indicates the operation that is to be performed on the connection specified.
Type: Alphanumeric value set
Range:
    - SETPARAM: modifies the value of *rstrPriority*, *wtr*, *htmr*, or *switchBack* of the connection to the value specified in the spec block
    - SETPROT: converts the connection specified by its *connID* to a new protection type specified by the *connMode* parameter in the spec block.

    Default: None.This are a mandatory output parameter in REPT PTHCHG in the following cases: CCB=ED-PATH-* It is not sent in REPT PTHCHG otherwise.
This is a mandatory output parameter in **`REPT PTHCHG`** in the following cases:
    - CCB = **`ED-PATH-*`**

    Otherwise it is not sent in **`REPT PTHCHG`**.

34. **`msgCode`**
Message Code or Status code indicates a known result.
Type: Alphanumeric string of length 4

Spec block parameters

1. **`connMode`** – Connection Mode
The connection mode determines ONNS treatment of the failed path after an auto-reroute restoration.
Type: Alphanumeric value set.
Range:
    - UNPROT: converts a auto connection to a unprotected
    - N1PLUS1: Network 1+1 protected connection
    - NONREVERTIVE: Auto-reroute non-revertive
    - EVERTIVE: Auto-reroute revertive
    - YCONN: Y-connection
    - BRIDGEY: Y connection Protection

- MBYNWRK: Working connection within an M:N protection group
- MBYNPRT: Protecting connection within an M:N protection group.

2. **`rstrPriority`** – Restoration Priority
   This parameter describes the restoration priority of the connection.
   Range: 0 (default) – 7. Lower values represent higher priority.
3. **`connectionPriority`** – Connection Priority
   Connection priority allows connection setup of a higher priority connection to utilize the existing path through the network when the existing connection is pre-emptible.
   Range: 0 (default) – 7. 0 = locked, 1 – 7 = Priority, Connection may be pre-empted.
4. **`disjointness`**
   The actual level of disjointness of the calculated and established connection. The parameter is not filled when protectionClass is UNPROT.
   Type: Alphanumeric value set.
   Range:
   - COMPLETE: fully node and SRLG disjoint path
   - FULLYSRLG: maximal node and fully SRLG disjoint path
   - MAXIMAL: maximal node disjoint path.

   Default:
   This are a mandatory output parameter in REPT PTHCHG in the following cases:
   - CCB=ENT-PATH-* and parameter exits
   - CCB=ED-PATH-* and parameter exits
   - MAXIMAL: maximal node disjoint path.

   It is an optional parameter in REPT PTHCHG otherwise.
5. **`connGrpID`**
   Connection Group ID for an existing ONNS connection to report the connection group the connection is member of or ″UNDEFINED″, if connection is not member of a group.
   For connection groups identified by A VCG EDGE port, *connGrpID* is formed from the *SrcNodeID* and the Ingress Port #, where 1675 LambdaUnite MSS uses bay =1= shelf. The connection group ID is automatically assigned to a connection, when it is setup. The connection group ID will consist of the nodeID and the EDGE port AID in case the EDGE port is a VCG. The connection group ID will be ″UNDEFINED″ otherwise. For M:N protected connection groups, *connGrpID* is formed from the *SrcNodeID* and a group index chosen by the source node to be unique within this node. The connection group ID is automatically assigned to a connection, when it is setup. The connection group ID will consist of the node ID and a group index in case the connection is member of an M:N connection group. The connection group ID will be ″UNDEFINED″ otherwise.
   Type: Character string of length up to 25.

Range:

- UNDEFINED – special value for connections not being member of a group
- nodeID&Port AID – value for connections being member of a ″GbE Connection Group″
- nodeID&groupIndex – value for connections being member of a ″M:N Connection Group″
- nodeID: four dot separated numeric strings: each string 0..255
- Port AID – four dot separated numeric strings: representing Bay/Frame #, Shelf #, Slot/Pack #, Port # with: Bay/Frame #1, Shelf #1, Slot/Pack #1..39, Port #1..8)
- groupIndex – integer value specifying an M:N connection group 0-65535.

The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.

6. **`protRatio`** – Protection ratio
   For each working or protecting connection of an M:N protected connection group this parameter will report the concrete protection ratio as specified on creation of the group. For connections not being member of an M:N protected connection group, this parameter is not reported at all.
   Type: Alphanumeric value set
   Range. 1BY1 (ratio of 1 to 1 in number of protecting and working connections), 1BY2 (ratio of 1 to 2 in number of protecting and working connections), 1BY3 (ratio of 1 to 3 in number of protecting and working connections).
7. **`assocConnID`** – Associated Connection ID
   Associated Connection ID for an existing ONNS connection of an M:N connection group to report the connection ID of the associated connection within the group, when a protection switch is active, i.e. for a working connection the ID of the associated protecting connection and for a protecting connection the ID of the associated working connection is reported. The associated connection ID will be ″OPEN″ for connections of an M:N connection group not involved in a protection switch. The associated connection ID will not be reported for connections not being member of an M:N connection group.
   Connection ID for an existing ONNS path connection service. Reports only the connections originating at the specified source node. ConnID is formed from the SrcNodeID, the Ingress Tributary # and an index # where 1675 LambdaUnite MSS uses bay =1= shelf.
   Type: Character string of length up to 39.
   Range:

ALL - special value to retrieve all connection records | nodeID&Tributary AID&Index - to retrieve a specific entry, with:

- nodeID: four dot separated numeric strings: each string 0..255
- Tributary AID: five dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # with: Bay/Frame #1, Shelf #1, Slot/Pack # 1..39 , Port #1..16, Tributary #1..192.
- Index: Numeric string 0-4294967295

The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x. Example: 29.13.196.203&1-1-13-15-1&271584

nodeID&Tributary AID range - if port # specifies a VCG to retrieve a connection group, with:

- nodeID: four dot separated numeric strings: each string 0..255
- Tributary AID: five dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # with: Bay/Frame #1, Shelf #1, Slot/Pack # 1..39 , Port #1..9, Tributary #ALL – special value to retrieve all connection records associated with the port ID.

As there is always at most one connection group associated with a VCG, the qualifier ALL specified for the Tributary # of input parameter *connID* will always deliver all connections of the affected group, i.e. all connections starting at the affected VCG. The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x. Example: 29.13.196.203&1-5-13-7-ALL. The port AID 1-5-13-7 must denote a VCG.

nodeID&defaultTributary AID&Index - to retrieve a protecting connection of an M:N connection group, with:

- nodeID: four dot separated numeric strings: each string 0..255
- defaultTributary AID: five dash separated numeric strings with Bay/Frame #1, Shelf #1, Slot/Pack ##, Port ##, Tributary ##
- Index: Numeric string 0-4294967295

  The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.

nodeID&groupIndex -to retrieve all connections belonging to an M:N protected connection group, with:

- nodeID: four dot separated numeric strings: each string 0..255
- groupIndex: integer value specifying a connection group within nodeID 0-65535.

The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.
Default: n/a.

This are a mandatory output parameter in REPT PTHCHG in the following cases:

- CCB=ENT-PATH-* and parameter exists
- CCB=PATH and parameter exists

It is an optional parameter in REPT PTHCHG otherwise.

8. **`htmr`** – Hold-Off Timer
   This parameter applies to 1+1 protected and permanent 1+1 protected connections.
   This parameter specifies the value of the hold-off timer for 1+1 protection switching.
   This parameter specifies the hold-off time for automatic protection switching used by the protection state machine.
   Type: numeric string [ms]
   Range:

   For high order path protection groups, the range is:

   - 0 .. 99 ms in 1 ms steps and
   - 100 .. 10000 ms in100 ms steps

   For low order path protection groups, the range is:

   - 0, 25, 50, 75 ms (thus in steps of 25 ms) and
   - 100 .. 10000 ms in 100 ms steps.

   The path protection groups at the A and Z nodes of the connection are created with default values, if the parameter is not present in the spec_block.
   Default: 0
   This parameter shall relate to the *htmr* parameter provisioned via the TL1 commands **`ENT-PATH`** or **`ED-PATH-PROT`**. Configuration of path protection group parameter via **`ED-PROTN-GRP`** is not forbidden, but should be discouraged, since this configuration is not reflected in the ONNS view. During normal operation of an ONNS connection, the **`ED-PROTN-GRP`** parameters are considered but during ONNS protection conversion the ONNS stored path protection group parameters are considered.

   This are a mandatory output parameter in REPT PTHCHG in the following cases:

   - CCB=ENT-PATH-* and parameter exists
   - CCB=PATH and parameter exists

9. **`wtr`** – Wait To Restore Time
   This parameter specifies the wait-to-restore time for revertive 1+1 protection switching.
   Parameter does not apply to a 1+1 protected connection revertive.
   Parameter applies to a permanent 1+1 protected connection with revertive SNCP/UPSR protection.
   Type: numeric string [minute].
   Range: 0 – 60.
   Default:
   None.
   The path protection groups at the A and Z nodes of the connection are created with default values, if the parameter is not present in the spec_block. Default Value: 0
   This parameter shall relate to the *wtr* parameter provisioned via the TL1 commands **`ENT-PATH`** or **`ED-PATH-PROT`**. Configuration of path protection group parameter via

ED-PROTN-GRP is not forbidden, but should be discouraged, since this configuration is not reflected in the ONNS view. During normal operation of an ONNS connection, the **ED-PROTN-GRP** parameters are considered but during ONNS protection conversion the ONNS stored path protection group parameters are considered.

This are a mandatory output parameter in REPT PTHCHG in the following cases:

- CCB=ENT-PATH-* and parameter exists
- CCB=PATH and parameter exists

Example output

The following notification examples detail specific situations and the corresponding message codes used in the REPT PTHCHG notification to alert the OS system of the occurrence.

;
```

Connection Restorations

- C015 – Connection restored and Saved in NVM applies to AUTONR and AUTORV connections
- C020 – Failed Path Deleted and Removed from NVM
- C025 – AUTORV Connection restored and Saved in NVM applies if the AUTORV is switched back to original path
- C200 – \″ Connection Setup completed and Waiting for signal confirmation of egress port \″, with connStatus = CON&SETUP
- C201 – \″ Restoration Setup completed and Waiting for signal confirmation of egress port \″, with connStatus = CON&SETUP
- C210 – \″ Connection Setup completed and No signal at ingress port \″, with connStatus = CON&NO-IN
- C211 – \″ Restoration Setup completed and No signal at ingress port \″, with connStatus = CON&NO-IN

REPT PTHCHG output example for PATH restoration for AUTONR

The following is an example of the REPT PTHCHG message for a path restoration change that has been saved in the ONNS NVM connection data repository. An TL1 initiated auto-rerouting connection has failed and has been restored. This REPT PTHCHG is sent after the restoration result is in NVM, and while the failed path is being torn down:

```
   LT-ONNS101 2002-07-01 08:00:00
A  00134 REPT PTHCHG
   ″TIME=ocrTime,DATE=ocrDate:CCB=PATH:125.114.48.12:SNN:C015:\″Connection restored
      and Saved in NVM\″,″
   ″ConnID=125.114.48.12&1-1-3-4-1&1,ConnStatus=CON&OK,ONNS,2WAY,AUTONR,STS192,
   connAlias=AEXP-NY-BOS-ckt,
   MaxDelay=199,,,SrlgExclude=630&820&720,IncludeID=0,RstrPriority=3,,
   SrcNID=125.114.48.12,1-1-3-4-1,DestNID=125.6.19.43,1-1-14-2-1:
   PathID=125.114.48.12-12123,State=CON&OK,
   NodeList=125.114.48.12&nodeID1&nodeID2&...&125.6.19.43:
   PathID=125.114.48.12-11013,State=CON&TRDOWN,
   NodeList=125.114.48.12&nodeID4&nodeID5&...&125.6.19.43″
;
```

Certain Failures at connection creation

- C250 – \″ Connection Setup failed
  Note: All *errorCodes* and ″*errorMessages*″ from ENT-PATH path setup error responses can occur in this situation.
- C251 – \″ Restoration Setup failed
  Note: All *errorCodes* and ″*errorMessages*″ from ENT-PATH path setup error responses can occur in this situation.

Edit of Connections

REPT-PTHEVT notification

Overview

The **REPT PTHEVT** notification is used to notify about autonomously triggered changes of the status of ONNS connections. REPT PTHEVT notifications are sent also for ONNS connections requested by network connections (by UNI, eNNI, or ENT-CONN).

REPT PTHEVT notification messages are generated autonomously by ONNS to report network connection status changes, and path state change events.

General description of ONNS events

ONNS reports events to NMS when certain network connection state changes occur or path state events that relate to connections originating from this node.

In general, destination nodes report client port alarms as a path fault event via the signaling network to the controlling source node. The source node will verify the fault state by checking the ingress signal states. Then ONNS shall send up a REPT PTHEVT: failed_path notification message indicating that the optical path has failed, and then ONNS begins the rerouting process to create a new optical path if one is required by the provisioned restoration service.

ONNS reports events to the Network Management users that are provisioned to receive the ONNS PTHCHG's. Message provisioning occurs via the Host NE's ED-USER-SECU command.

When the source node has verified a path failure, it shall send out a REPT PTHEVT notification indicating that the path has failed. When the restoration path switch has occurred successfully, the source node shall report the REPT PTHCHG: restoration message indicating that the restoration path is operational and reports its pathID. When the connection status changes to CON&OK, ONNS shall report the event by a REPT PTHEVT: connection_OK notification. When the ingress signal state of source or destination port is determined to have failed and restoration would not be successful, ONNS shall not proceed with restoration and ONNS report a REPT PTHEVT: Input_failed notification.

1+1 protection switching events are not reported via a REPT PTHEVT notification

Protection switching messages is not provided to the MS using the REPT PTHEVT TL1 message. By definition, a protection switching event occurs when the service switches from working to protection or active to standby and vice versa.

Unique autonomous REPT PTHEVT notification messages

REPT PTHEVT shall not report any autonomous notification messages that are reported by other ONNS REPT notifications. REPT PTHEVT shall report connection status changes and path state changes. As an example, REPT PTHCHG autonomous notification messages report when connection configuration or provisioning changes are made. REPT PTHEVT does not report the connection provisioning changes.

User defined connection alias returned with REPT-PTHEVT

The user defined connection alias, if defined, is returned with the event report along with other parameters. If no connAlias is defined, then a NULL is returned.

Output format

The general format of a **REPT PTHEVT** autonomous notification message is as follows:

```
   srcTid rpt-date rpt-time
A  atag REPT PTHEVT
   ″TIME=ocrTime,DATE=ocrDate:srcNID:srcAid:msgCode::condType:condDescr:\″
      eventText\″:[eventData]″
   ″ConnID=connID,ConnStatus=pst&sst[&tst],connControl,
   ConnAlias=connAlias,
   PathID=pathID,State=pst&sst[&tst]″
   [″errorMsgCode:\″ ErrorText String \″:[errorData]″]
;
```

Output parameters

Command parameters

1. **srcTid** – Source Node Identifier
   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.
   Type: identifier, in addition the special character underscore “_” and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **rpt-date** – Reporting date
   This parameter is set to the date when the output message is generated.
   Note: Format uses a 4 digit year instead of a 2 digit year as for host TL1 commands. Compare to RTRV-HDR.
   Range: YY-MM-DD; where YY=00-99, MM=01-12, DD=01-31.
3. **rpt-time** – Reporting time
   This parameter is set to the time when the output message is generated.
   Range: HH:MM:SS; where HH=00-23, MM=00-59, SS=00-59.

4. **`atag`** – Automatic Tag
   This parameter is used for message sequencing. The atag is available per user session. The number is incremented by one for each autonomous message, and the messages are transmitted to the user in that same order.
   Values: 000 (default) – 999
5. **`ocrDate`** – Occurrence Date
   The date parameter is set to the date when the event occurred in the system.
   Values: .YY-MM-DD where YY=2000-2099, MM=01-12, DD=01-31
6. **`ocrTime`** – Occurrence Time
   The time parameter is set to the time when the event occurred in the system.
   Values: HH-MM-SS where HH=0-23, MM=00-59, SS=00-59.
7. **`comBlock (CB)`**- CCB common block
   This common block contains the message-dependent parameters.
   a. **`srcNID`**
      ONNS source nodeID. Together with the following srcPortID field defines the associated Ingress connPoint that connects the source node to the edge/gateway switch or client router.
      Range: Four dot separated numeric strings. 0 – 255 for each numeric string.
   b. **`srcAid`**
      Source node ONNS application access identifier of the ONNS controller OS command interface port.
      Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn.
   c. **`msgCode`**
      Message Code or Status code indicates known or suspected cause or reason for the event, change, or condition.
   d. **`condType`** – Condition Type
      This is a short hand notation for the *condDescr*.
      Range: CLR (Path condition cleared), PFL (Path Failure), LOS (Loss of Signal), PEF (Port Equipment Failure), PEV (Generic Path event).
   e. **`condDescr`** – Condition Description
      This is a more detailed description of the condition and consists of the following comma separated fields: *category*, *entity*, *protType* (may be empty), *description*, *additional text* (optional, if omitted, the comma before might be omitted, too).
      Range for *category*: TRAN (Transmission), RESTR (Restoration), PRTST (Port_state).
      Range for *entity*: PATH (path connection), CONN (End to end connection), XCON (NE cross-connection), IPORT (Ingress port), GRP (connection group).

Range for *protType*: UNPROT (Unprotected path), N1PLUS1 (Netwrk1+1 protected path), AUTONR (Auto-rerouted protection path, non-revertive), AUTORV (Auto-rerouted protection path, revertive), YCONN (Y-Connection), MBYNWRK (Working connection of M:N protection group), P1PLUS1 (Permanent 1+1 connection).

Range for *description*: FAILED (path failure), FAULT (path fault), CLEAR (path problem cleared), RSTRFL (connection restore failed), WARNING (path warning), PRTFL (Protection Switch Failed).

f. **eventText**

This field records an event description message.

g. **eventData**

Further event data as named-parameter=value pair(s). Comma separated when multiple pairs.

8. **connID**, **connAlias**, **connStatus**, **pathID1**, **pathState1**, **pathID2**, **pathState2**
See the parameter description in the "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2698) section.

9. **connControl** – Connection Control
Indicates whether the ONNS connection is controlled by ONNS or by external control (UNI, eNNI connections).
Type: Value set.
Range:
   - ONNS (ONNS connections, created via ENT-PATH)
   - EXT (ONNS connections, created via ENT-CONN, UNI or eNNI)

10. **errorMsgCode** – Error Message Code
Message Code or Status code indicates known or suspected cause or reason for the event, change, or condition.

11. **errorText**
Additional free format error message text

12. **errorData**
Further error data which reports named-parameter=value pair(s) for the paths.

Example output

Declaration of a PATH failure event

The following REPT PTHEVT autonomous notification message illustrates how an unprotected path connection fault is reported. The REPT PTHEVT autonomous message declares the occurrence of a path failure on *pathID* of connection *connID*, and describes the state of the path:

```
   WS-LT-ONNS-M 2002-08-01 08:00:00
A  00313 REPT PTHEVT
   ″TIME=07-59-59,DATE=2002-08-01:135.13.16.45:SNN:F102::PFL:RESTR,CONN,
AUTONR,FAILED:\″Connection Failed, Restoration In Progress\″:″
   ″ConnID=135.13.196.45&1-1-4-2-1&1,ConnStatus=CON&FAILED,ONNS,
```

```
ConnAlias=AEXP-NY-BOS-ckt,PathID=135.13.196.45-987654,State=CON&FAILED"
;
```

- F101 – PFL:TRAN,CONN,UNPROT,FAILED – Unprotected Connection Failed
- F108 – LOS:TRAN,CONN,UNPROT,FAULT – Incoming signal fault, LOS fault at Ingress Node
- F116 – PEF:PRTST,IPORT,UNPROT,FAILED – EDGE Port failure, UNPROT Connection Path failure
- F210 – PEF:PRTST, IPORT UNPROT, FAILED – UNI Port failure, UNPROT Connection failure
- F220 – PEF:PRTST, IPORT UNPROT, FAILED – eNNI Port failure, UNPROT Connection failure
- F102 – PFL:RESTR,CONN,AUTONR,FAILED – Connection Failed, Restoration In Progress
- F106 – PFL:RESTR,CONN,AUTONR,RSTRFL – Restoration Failed, Connection Failed
- F117 – PEF:PRTST,IPORT,AUTONR,FAILED – EDGE Port failure, no restoration attempted
- F211 – PEF:PRTST, IPORT, AUTONR, FAILED – UNI Port failure, no restoration attempted
- F221 – PEF:PRTST, IPORT, AUTONR, FAILED – eNNI Port failure, no restoration attempted
  No restoration attempt (non-revertive) is initiated by the source node because fault is detected outside of the ONNS domain.
- F109 – LOS:TRAN, CONN, AUTONR, FAULT – Incoming signal fault (LOS), no restoration attempted.
  Restoration attempt is initiated by the source node; destination node detects that the fault is outside of the ONNS domain and rejects the restoration attempt
- F113 – LOS:TRAN, CONN, AUTONR, FAULT – Incoming signal fault, DestNode, restoration attempt aborted
- F105 – PFL:RESTR, CONN, AUTORV, FAILED – Connection Failed, Restoration In Progress
- F107 – PFL:RESTR, CONN, AUTORV, RSTRFL – Restoration Failed, Connection Failed
- F118 – PEF:PRTST, IPORT AUTORV, FAILED – EDGE Port failure, no restoration attempted
- F213 – PEF:PRTST, IPORT AUTORV, FAILED – UNI Port failure, no restoration attempted

- F223 – PEF:PRTST, IPORT AUTORV, FAILED – eNNI Port failure, no restoration attempted
  No restoration attempt (revertive) is initiated by the source node because fault is detected outside of the ONNS domain.
- F110 – LOS:TRAN, CONN, AUTORV, FAULT – Incoming signal fault (LOS), no restoration attempted
  Restoration attempt is initiated by the source node; destination node detects that the fault is outside of the ONNS domain and rejects the restoration attempt.
- F114 – LOS:TRAN, CONN, AUTORV, FAULT – Incoming signal fault, DestNode, restoration attempt aborted
- F103 – PFL:TRAN,CONN,N1PLUS1,FAILED – N1PLUS1 Connection Failed
- F104 – PFL:TRAN,PATH,N1PLUS1,FAULT – N1PLUS1 Path Failed
- F111 – LOS:TRAN,CONN,N1PLUS1,FAULT – Incoming signal fault, LOS fault at Ingress Node
- F119 – PEF:PRTST,IPORT,N1PLUS1,FAILED – EDGE Port failure, N1PLUS1 Connection Failure
- F212 – PEF:PRTST, IPORT, N1PLUS1, FAILED – UNI Port failure, N1PLUS1 Connection Failure
- F224 – PEF:PRTST, IPORT, N1PLUS1, FAILED – eNNI Port failure, N1PLUS1 Connection Failure
- F214 – PFL:TRAN,CONN,P1PLUS1,FAILED – P1PLUS1 Connection Failed
- F215 – PFL:TRAN,CONN,P1PLUS1,FAILED – P1PLUS1 Connection Failed, Restoration In Progress
- F216 – PFL:TRAN,CONN,P1PLUS1,RSTRFL – P1PLUS1 Connection Failed, Restoration Failed
- F217 – PFL:TRAN,PATH,P1PLUS1,FAULT – P1PLUS1 Path Failed
- F218 – PFL:TRAN,PATH,P1PLUS1,FAULT – P1PLUS1 Path Failed, Restoration In Progress
- F219 – PFL:TRAN,PATH,P1PLUS1,RSTRFL – P1PLUS1 Path Failed, Restoration Failed
- F135 – PFL:TRAN, CONN, YCONN, FAILED – YCONN Connection Failed
- F136 – PFL:TRAN, PATH, YCONN, FAULT – YCONN Path Failed
- F137 – LOS:TRAN, CONN, YCONN, FAULT – Incoming signal fault, LOS fault at Ingress Node
- F138 – LOS:TRAN, CONN, YCONN, FAULT – Incoming signal fault, LOS fault at DestNode
- F139 – PEF:PRTST, IPORT, YCONN, FAILED – EDGE Port failure, YCONN Connection Failure
- F120 – PFL:PROTN, CONN, MBYNWRK, FAILED – Connection Failed , Protection Switch In Progress

- F121 – PFL:PROTN, CONN, MBYNWRK, PRTNP – Protection Switch Not Possible, No MBYNPRT Connection Available, Connection Failed
- F122 – LOS:TRAN, CONN, MBYNWRK, FAULT – Incoming signal fault (LOS), no protection switch attempted
- F123 – LOS:TRAN, CONN, MBYNWRK, FAULT – Incoming signal fault, DestNode, protection switch attempt aborted
- F124 – PEF:PRTST, IPORT, MBYNWRK, FAILED – EDGE Port failure, no protection switch attempted
- F126 – PFL:TRAN, PATH, MBYNWRK, FAULT – Standby Path Failed
- F127 – PFL:PROTN, CONN, MBYNWRK, PRTFL – Protection Switch Failed, Connection Failed
- F125 – PFL:TRAN, CONN, MBYNPRT, FAILED – MbyN Protecting Connection Failed

Clearing of a REPT PTHEVT event or restoration failure event

The following REPT PTHEVT autonomous message reports that the LOS cleared. If the connection has two paths, the *pathID* and *pathState* for both paths is included:

```
   WS-LT-ONNS-A 2002-07-01 08:11:05
A  01104 REPT PTHEVT
   ″TIME=07-59-59,DATE=2002-08-
      01:135.13.19.45:SNN:S101::CLR:TRAN,CONN,UNPROT,CLEAR:\″ Unprotected path is
      OK\″:″
   ″ConnID=135.13.196.45&1-1-4-2-1&1,ConnStatus=CON&OK,EXT,
   ConnAlias=AEXP-NY-BOS-ckt,
   PathID=135.13.196.45-987654,State=CON&OK″
;
```

- S101 – CLR:TRAN, CONN, UNPROT, CLEAR – Unprotected Path is OK
- S106 – CLR:TRAN, IPORT, UNPROT, CLEAR – EDGE Port, IN Signal Fault has cleared
- S114 – CLR:PRTST, IPORT, UNPROT, CLEAR – EDGE Port, Port Failure has cleared
- S210 – CLR:TRAN, IPORT, UNPROT, CLEAR – UNI Port, IN Signal Fault has cleared
- S213 – CLR:PRTST, IPORT, UNPROT, CLEAR – UNI Port, Port Failure has cleared
- S220 – CLR:TRAN, IPORT, UNPROT, CLEAR – eNNI Port, IN Signal Fault has cleared
- S221 – CLR:PRTST, IPORT, UNPROT, CLEAR – eNNI Port, Port Failure has cleared
- S102 – CLR:TRAN, CONN, AUTONR, CLEAR – Original Path is Clear, Connection OK

- S107 – CLR:TRAN, IPORT, AUTONR, CLEAR – EDGE Port, IN Signal Fault has cleared
- S115 – CLR:PRTST, IPORT, AUTONR, CLEAR – EDGE Port, Port Failure has cleared
- S211 – CLR:TRAN, IPORT, AUTONR, CLEAR – UNI Port, IN Signal Fault has cleared
- S214 – CLR:PRTST, IPORT, AUTONR, CLEAR – UNI Port, Port Failure has cleared
- S226 – CLR:TRAN, IPORT, AUTONR, CLEAR – eNNI Port, IN Signal Fault has cleared
- S227 – CLR:PRTST, IPORT, AUTONR, CLEAR – eNNI Port, Port Failure has cleared
- S105 – CLR:TRAN, PATH, AUTORV, WTORV – Original Path is Clear, Waiting to Revert

The following notification message is valid for autoreroute revertive connections:

- S125 – CLR:RESTR, PATH, AUTORV, CLEAR – Reroute path of AUTORV is now OK
- S108 – CLR:TRAN, IPORT, AUTORV, CLEAR – EDGE Port, IN Signal Fault has cleared
- S116 – CLR:PRTST, IPORT, AUTORV, CLEAR – EDGE Port, Port Failure has cleared
- S216 – CLR:TRAN, IPORT, AUTORV, CLEAR – UNI Port, IN Signal Fault has cleared
- S217 – CLR:PRTST, IPORT, AUTORV, CLEAR – UNI Port, Port Failure has cleared
- S222 – CLR:TRAN, IPORT, AUTORV, CLEAR – eNNI Port, IN Signal Fault has cleared
- S223 – CLR:PRTST, IPORT, AUTORV, CLEAR – eNNI Port, Port Failure has cleared
- S103 – CLR:TRAN, CONN, N1PLUS1, CLEAR – N1PLUS1 Connection is OK
- S104 – CLR:TRAN, PATH, N1PLUS1, CLEAR – N1PLUS1 Path is now OK
- S109 – CLR:TRAN, IPORT, N1PLUS1, CLEAR – EDGE Port, IN Signal Fault has cleared
- S117 – CLR:PRTST, IPORT, N1PLUS1, CLEAR – EDGE Port, Port Failure has cleared
- S212 – CLR:TRAN, IPORT, N1PLUS1, CLEAR – UNI Port, IN Signal Fault has cleared
- S215 – CLR:PRTST, IPORT, N1PLUS1, CLEAR – UNI Port, Port Failure has cleared

- S224 – CLR:TRAN, IPORT, N1PLUS1, CLEAR – eNNI Port, IN Signal Fault has cleared
- S225 – CLR:PRTST, IPORT, N1PLUS1, CLEAR – eNNI Port, Port Failure has cleared
- S137 – CLR:TRAN, CONN, P1PLUS1, CLEAR – P1PLUS1 Connection is OK
- S138 – CLR:TRAN, PATH, P1PLUS1, CLEAR – P1PLUS1 Path is now OK
- S139 – CLR:TRAN, IPORT, P1PLUS1, CLEAR – EDGE Port, IN Signal Fault has cleared
- S140 – CLR:PRTST, IPORT, P1PLUS1, CLEAR – EDGE Port, Port Failure has cleared
- S135 – CLR:TRAN, CONN, YCONN, CLEAR – YCONN Conection is OK
- S136 – CLR:TRAN, PATH, YCONN, CLEAR – YCONN Path is now OK
- S118 – CLR:PRTST, IPORT, YCONN, CLEAR – EDGE Port, Port Failure has cleared
- S119 – CLR:TRAN, IPORT, YCONN, CLEAR – EDGE Port, IN Signal Fault has cleared
- S120 – CLR:TRAN, CONN, MBYNWRK, CLEAR – Original Path is Clear, Connection OK
- S121 – CLR:TRAN, IPORT, MBYNWRK, CLEAR – EDGE port, IN Signal Fault has cleared
- S122 – CLR:PRTST, IPORT, MBYNWRK, CLEAR – EDGE port, Port Failure has cleared
- S123 – CLR:TRAN, PATH, MBYNWRK, WTORV – Original Path is Clear, Waiting to Revert
- S126 – CLR:PROT, PATH, MBYNWRK, CLEAR – Protection path of MBYNWRK is now OK
- S124 – CLR:TRAN, CONN, MBYNPRT, CLEAR – MbyN Protecting Connection is OK

Path Setup Failure Notification in case of Retries

A special case of the REPT PTHEVT message covers the situation when a path setup attempt failed and a path setup retry will occur. The error message included is the code that would have been returned in a failed ENT-PATH response. The following is the output response:

```
   WS-LT-ONNS-A 2002-07-01 08:11:05
A  01104  REPT PTHEVT
   ″TIME=07-59-59,DATE=2002-08-
      01:135.13.196.45:SNN:S311::PEV:TRAN,PATH,AUTONR,FAILED:\″Path operation
      attempt failed, An error occurred\″:PathID=135.13.196.45-9874″
   ″ConnID=135.13.196.45&1-1-4-2-1&1,ConnStatus=CON&FAILED,ONNS,
   ConnAlias=AEXP-NY-BOS-ckt,
   PathID=135.13.196.45-654,State=CON&FAILED[:
```

```
   PathID=135.13.196.45-9874,State=CON&FAILED]″
   ″Error=E022:\″Status, Path Setup Failure caused by signal transmission failure at
       egress node\″:NodeID=nodeIPaddr″
;
```

Group Setup Failure Notification

A special case of the REPT PTHEVT message covers the situation when a group setup attempt is incomplete as a result of a failed transmission check (wait for light) of a worker connection of a M:N group. The error message included is the code that would have been returned in a failed ENT-PATH response. The following is the output response:

```
   WS-LT-ONNS-A 2002-07-01 08:11:05
A  01104  REPT PTHEVT
   ″TIME=07-59-59,DATE=2002-08-
      01:135.13.196.45:SNN:S311::PEV:TRAN,GRP,MBYNWRK,FAILED:\″Group operation
      attempt incomplete, An error occurred\″:GrpID=135.13.196.45-97″
   ″ConnID=135.13.196.45&1-1-4-2-1&1,ConnStatus=CON&FAILED,ONNS,
   ConnAlias=AEXP-NY-BOS-ckt,
   PathID=135.13.196.45-654,State=CON&FAILED″
   ″Error=E022:\″Status, Path Setup Failure caused by signal transmission failure at
       egress node\″:NodeID=nodeIPaddr″
;
```

- S301 – PEV:TRAN, PATH, UNPROT, DLT-FL – Path delete failed during setup retry or restoration
- S310 – PEV:TRAN, PATH,UNPROT, FAILED – ″Path operation attempt failed. An error occurred″, PathID=pathID ″Error=*Exxx*:″*errorCode,errorText*″,*errorData*″

The following table gives an overview of all clear event codes defined:

	UNPROT	AUTONR	AUTORV	N1PLUS1	P1PLUS1	YCONN	MBYNWRK	MBYNPRT
CLR: TRAN; CONN; <protType>, CLEAR	S101	S102	S102	S103	S137	S135	S120	S124
CLR: TRAN; PATH; <protType>, CLEAR	n/a	n/a	n/a	S104	S138	S136	n/a	n/a
CLR: TRAN; IPORT; <protType>, CLEAR	S106	S107	S108	S109	S139	S119	S121	n/a
CLR: PRTST, IPORT, <protType>, CLEAR	S114	S115	S116	S117	S140	S118	S122	n/a
CLR: TRAN, PATH, <protType>, WTORV	n/a	n/a	S105	n/a	n/a	n/a	S123	n/a

	UNPROT	AUTONR	AUTORV	N1PLUS1	P1PLUS1	YCONN	MBYNWRK	MBYNPRT
PFL: TRAN, PATH, <protType>, DLT-FL	S301	S302	S303	S304	S145	S305	S306	S307
PEV: TRAN, PATH, <protType>, FAILED	S310	S311	S312	S313	S146	S314	S315	S316
PEV: TRAN, GRP, <protType>, FAILED	n/a	n/a	n/a	n/a	n/a	n/a	S317	n/a
CLR: RESTR, PATH, <protType>, CLEAR	n/a	n/a	S125	n/a	n/a	n/a	S126	n/a

Issues wrt. event codes, that should be solved in a later release (R7):

- Currently S102 is defined for AUTONR, but should be defined for AUTORV Implementation: Simply “AUTO” is used
- The following codes are defined in SW, but not used, and also not defined in Req.
  - msgTable[NNTypes::S110] = ″S110:CLR:TRAN,EPORT,UNPROT,CLEAR,\\\\\″ EDGE port, Dest IN Signal Fault has cleared \\\\\″″″;
  - msgTable[NNTypes::S111] = ″S111:CLR:TRAN,EPORT,AUTONR,CLEAR,\\\\\″ EDGE port, Dest IN Signal Fault has cleared \\\\\″″″;
  - msgTable[NNTypes::S112] = ″S112:CLR:TRAN,EPORT,AUTORV,CLEAR,\\\\\″ EDGE port, Dest IN Signal Fault has cleared \\\\\″″″;
  - msgTable[NNTypes::S113] = ″S113:CLR:TRAN,EPORT,N1PLUS1,CLEAR, \\\\\″ EDGE port, Dest IN Sig-nal Fault has cleared \\\\\″″″;
- Not used in SW
  S110, S111, S112, S113, S114, S115, S116, S117, S118, S119

REPT SW: Report switch

`REPT SW` messages are generated autonomously to report equipment protection switches of a duplex equipment unit pair. These equipment pairs are referred to as 1+1 equipment protection groups. The message indicates the equipment/circuit pack that was placed in the active state.

The notification has been extended for LOXC equipment protection groups.

Output format

The general format of a REPT SW message is as follows:

```
   tid date time
A  atag REPT SW
   ″actid,stbyid″
;
```

Output parameters

Command parameters

1. **`atag`** – AutomaticTag
   This parameter specifies the message sequence number. The number is incremented by one for each autonomous message generated by the NE. Leading zeros are not suppressed.
   Type: Numeric string.
   Range: 000 .. 999
2. **`actid`** – Active Identifier
   This parameter specifies the circuit pack AID which is active within the 1+1 equipment protection group.
   Type: AID
   Range: CpAID (if reported by a EQP group with protype unequal to EQPTLOXC) or LoxcAID (if reported by a EQP group with protype equal to EQPTLOXC).
3. **`stbyid`** – Standby Identifier
   This parameter specifies the circuit pack AID which is standby (non-active) within the 1+1 equipment protection group.
   Type: AID
   Range: CpAID (if reported by a EQP group with protype unequal to EQPTLOXC) or LoxcAID (if reported by a EQP group with protype equal to EQPTLOXC).

Detailed behavior description

The system shall evaluate the current fault information and the current active unit at the protection group creation time. Based on that, the sytem shall calculate and report the selected active unit and the standby unit.

Example input/output

The following example shows a switch report (with *stbyid* parameter):

```
   LT-UNITE 99-01-10 08:12:00
A  001 REPT SW
   ″1-1-#-#-xcp-cp,1-1-#-#-xcw-cp″
;
```

GR-833-CORE

RLS-EXT-CONT: Release external control

The **RLS-EXT-CONT** command releases an MDO port (Miscellaneous Discrete Output / external discrete control), i.e. switches off the MDO port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 1

Abortable: No

Input format

Command syntax: **RLS-EXT-CONT**:*tid:aid:ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   This is the address of the MDO port entities on which the command operates. If misc_outall is specified the configuration of all MDO's will be retrieved.
   Type: AID
   Range: Miscellaneous_out_discreteAID
   Default: misc_outall (if the *aid* is omitted).
3. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output format

The following example shows the successful completion of the **RLS-EXT-CONT** command by the NE:

```
   sid date time
M  ctag COMPLD
;
```

If the **RLS-EXT-CONT** command does not alter the existing attributes, i.e., the control referenced by the aid is already released, the NE will not deny the command. The system will respond with the completion message shown above.

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

If no probable cause is assigned to the MDO port the command changes the state of the MDO specified via aid to ″switched off″, i.e. the MDO port will be deactivated.

The update will be reported via a RLS-EXT-CONT – REPT DBCHG message. Refer to the definition of the RLS-EXT-CONT notification.

Example input/output

The following example shows the successful completion of the **RLS-EXT-CONT** command by the NE:

```
RLS-EXT-CONT:LT-UNITE-123:MISC_OUT3:123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **RLS-EXT-CONT** command.

Validation rule: probable cause assigned to MDO port

A probable cause is assigned to the MDO port. This command will be not performed.

Error code: `SDNC – Status, Data Not Consistent, asgncond not empty`

References

GR-833-CORE, Issue 4, June 2000, OTGR Section 12.3, Network Maintenance: Network Element and Transport Surveillance Messages.

RLS-EXT-CONT notification

Output format

The **`RLS-EXT-CONT`** notification has the following specific syntax:

`RLS-EXT-CONT`:*aid*

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   This is the address of the MDO port entity for which the configuration is retrieved or on which an operation is performed.
   Type: AID.
   Range: Miscellaneous_out_discreteAID. misc_outall must not be reported or used.

Example output

The example shows a normal RLS-EXT-CONT notification:

```
   LT-UNITE-123 00-01-01 08:00:50
A 815 REPT DBCHG
   ”TIME=08-00-12,DATE=00-01-01:RLS-EXT-CONT:MISC_OUT3”
;
```

RLS-LPBK (cross-connection loopback) notification

There will be no **RLS-LPBK** notification because the changes (for the parameter *crslpbkstat* and *crslpbkrate*) caused by an RLS-LPBK command will be notified via an ED-*rr* (*rr* being either VC3 or STS1) notification for normal tributaries and by an ED-VCGTRIB notification for virtual concatenation tributaries.

RLS-LPBK (facility loopback) notification

There will be no **`RLS-LPBK`** notification because the changes (for the parameter *lpbk* and *fsflpbkstat*) caused by an RLS-LPBK command will be notified via an ED-rr notification for an OP***n*** / EP***n*** / OPT***n*** port (rr specifying the affected port i.e. OC<M>/STM<N>OC<M>T/STM<N>T) or via an ED-EPORT notification for a GE***n*** port (*fsflpbkstat* only).

RLS-LPBK: Release loopback (cross-connection)

The **RLS-LPBK**-*modifier* command can be initiated by a user to release a loopback on a tributary.

In this section only the loopback on tributaries are considered.

The *modifier* in the **RLS-LPBK** command indicates the rate on which the loopback command is applied to. There is no difference if the rate is specified as a SONET rate (STS1, STS3,..) or as SDH-rate (VC3, VC4,..) for the i.e. the RLS-LPBK-<*sonet-rate*> yields to the same physical and logical behavior as RLS-LPBK-<*sdh-rate*>. No check is made if the *modifier* matches the interface-standard of the port i.e. if the port is provisioned as SONET (resp. SDH) and the rate is a SONET (resp. SDH) rate.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): T4

Priority: 1

Abortable: No

Input format

Command syntax: **RLS-LPBK**-*modifier*:*tid*:*aid*:*ctag*;

Input parameters

Command parameters

1. **modifier**
   This parameter indicates the tributary- respectively cross-connection-rate on which the **OPR-LPBK** command acts on.
   For detailed description please refer to the "RTRV-CRS: Retrieve cross-connection" (p. 3-2306) command
   Type: Alphanumeric value set.
   Range:
   - VC3
   - VC4
   - VC44C
   - VC416C
   - VC464C
   - STS1
   - STS3
   - STS12
   - STS48

- STS192
- LOVC3
- LOVC12
- LOVT1.

No use of the **all** value is allowed.

2. **tid** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
3. **aid** – Access Identifier
   This parameter specifies the tributary for which the loopback is released.
   Type: GenTribAID or GenLOTribAID
   Range: No **all** or **usall** or **vall**-value is possible for any part of the aid.
4. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: current implementation also allows “0” as valid *ctag*, which is an extension to GR-831.

Output format

If the **RLS-LPBK** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Detailed behavior description

Existing loopback on tributaries can be released via the **RLS-LPBK** command. The attribute *crslpbkstat* of the entity tributary is updated to NO.

This update is reported by

- an ED-*rr* (*rr* either VC3 or STS1) notification for normal tributaries
- an ED-VCGTRIB notification for virtual concatenation tributaries
- an ED-PTF notification for HO path terminations
- an ED-LONIM notification for low order tributaries.

Updated affected entities when releasing a HO-Loopback

Apart from the tributary entity no further entities are affected by the **RLS-LPBK** command.

Updated affected entities when releasing a LO-Loopback

In case of releasing a LO-loopback which leads to a removal of the last LO-Cross-connection within the related HO-tributary the substructuring of this HO-tributary may be removed automatically.

Example input/output

```
RLS-LPBK-vc3:UNITE-NE:1-1-#-#-1-1-4:123456;

   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

Error responses

Validation rule: Valid rate

Loopback command processing verifies that the specified rate is equivalent to the rate of the existing loopback. Hereby the SONET-rates are treated identical to the SDH-rates (i.e. sts1/vc3, STS3/vc4 etc.).

Error code:

`IDNC – Input Data Not Consistent, Rate is inconsistent with existing cross-connection`

Validation rule: Entities (tributaries) must exist

Loopback command processing verifies that the logical tributaries specified in the command do exist.

Error code:

`IENE – Input, Entity Not Exists, Specified tributary/tributaries do not exist`

Validation rule: Loopback must exist

Loopback command processing verifies that the **`RLS-LPBK`** command can not be applied to non-existing loopback.

Error code: `SNVS – Status, Not in Valid State, loopback does not exist`

GR-199-CORE

RLS-LPBK: Release loopback (facility)

The **RLS-LPBK**-*modifier* command can be initiated by a user to release an existing loopback on an OP***n***, GE***n***, EP***n*** or OPT***n*** port in the NE.

Note that the loopback type is not specified explicitly as a command parameter – instead the currently existing loopback (either a near-side or a far-side) will be released.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): T4

Priority: 1

Abortable: No

Input format

Command syntax: **RLS-LPBK**-*modifier*:*tid*:*aid*:*ctag*;

Input parameters

Command parameters

1. **modifier**
   The modifier parameter indicates the port rate on which the **OPR-LPBK** command acts on.
   Type: Alphanumeric value set.
   Range:
   - STM1E
   - STM1
   - STM4
   - STM16
   - STM16T
   - STM64
   - STM256
   - OC3
   - OC12
   - OC48
   - OC48T
   - OC192
   - OC768
   - 1GE

- 1GEPL
- 10GEPL
- T3.

No use of the **`all`** value is allowed.

2. **`tid`** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **`aid`** – Access Identifier
   Access Identifier of the port for which the loopback state is returned.
   Type: AID
   Range: SPortAID (when using OP***n***, EP155, OPT***n*** packs or EC1 interfaces on the EP51 pack) as defined in AID structure. The values:
   - all for Simple_SPortAID, usall for Simple_UnivSlotAID, all for Simple_UnivSlotAID, all for Simple_ShelfAID and all for BayAID is excluded.

   APortAID (when using DS3 interfcaes on the EP51 pack) as defined in AID structure. The values:
   - all for Simple_APortAID, usall for Simple_UnivSlotAID, all for Simple_UnivSlotAID, all for Simple_ShelfAID and all for BayAID is excluded.

   EPortAID (when using GE***n*** packs) as defined in AID structure. The values:
   - all for Simple_EPortAID, usall for Simple_UnivSlotAID, all for Simple_UnivSlotAID, all for Simple_ShelfAID and all for BayAID is excluded.
4. **`ctag`** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

Output format

If the **`RLS-LPBK`** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

Behavior – OP*n* Port

Existing loopback on ports can be released via the **RLS-LPBK** command. The attribute *lpbk* and *fsflpbkstat* of the entity port is updated by this command:

- *lpbk* should be set to NO in case the *lpbktyp* = FACILITY is released
- *fsflpbkstat* should be set to NO in case the *lpbktyp* = FSF is released.

This update is reported by a ED-*rr* notification for an OP***n*** port (*rr* specifying the affected port i.e. OC<M>/STM<N>).

Example:

RLS-LPBK-OC48:UNITE-NE:1-1-#-#-1-1:123456;

REPT DBCHG

ED-OC48:1-1-#-#-1-1::fsflpbkstat=NO;

Behavior – OPT*n* Port

Existing loopback on ports can be relaesed via the **RLS-LPBK** command. The attribute *lpbk* and *fsflpbkstat* of the entity port is updated by this command:

- *lpbk* should be set to NO in case the *lpbktyp* = FACILITY is released
- *fsflpbkstat* should be set to NO in case the *lpbktyp* = FSF is released.

This update is reported by a ED-*rr* notification for an OPT***n*** port (*rr* specifying the affected port i.e. OC<M>T/STM<N>T).

Behavior - EP155 Port

Existing loopback on ports can be released via the “RLS-LPBK: Release loopback (facility)” (p. 3-2198) command.

The attribute *lpbk* and *fsflpbkstat* of the entity port is updated by this command:

- *lpbk* should be set to NO in case the *lpbktyp* = FACILITY is released
- *fsflpbkstat* should be set to NO in case the *lpbktyp* = FSF is released.

This update is reported by an ED-rr notification for an EP155 port (*rr* specifying the affected port STM1E).

Behavior – Asynchronous port

Existing loopback on asynchronous ports can be released via the **RLS-LPBK** command. The attribute *lpbk* and *fsflpbkstat* of the entity port is updated by this command:

- *lpbk* should be set to NO in case the *lpbktyp* = FACILITY is released
- *fsflpbkstat* should be set to NO in case the *lpbktyp* = FSF is released.

This update is reported by an **ED-*rr*** notification for an asynchronous port (*rr* specifying the affected port). Not all types of asynchronous ports support loopbacks. See the modifier range for supported asynchronous ports.

Behavior - EC1 Port

Existing loopback on EC1 ports can be released via the **`RLS-LPBK`** command. The attribute *lpbk* and *fsflpbkstat* of the entity port is updated by this command:

- *lpbk* should be set to NO in case the *lpbktyp* = FACILITY is released
- *fsflpbkstat* should be set to NO in case the *lpbktyp* = FSF is released.

This update is reported by an ED-EC1 notification for the port.

Behavior – GE1 Port

Existing loopback on ports can be released via the **`RLS-LPBK`** command. The attribute *lpbk* and *fsflpbkstat* of the entity port is updated by this command:

- *lpbk* should be set to NO in case the *lpbktyp* = FACILITY is released
- *fsflpbkstat* should be set to NO in case the *lpbktyp* = FSF is released.

This update is reported by an ED-EPORT notification for a GE***n*** port (only *fsflpbkstat*).

Behavior – Any Port on GE10PL1

Loopback on all successfully provisioned ports of a GE10PL1 pack can be switched via the **`OPR-LPBK`** command.

The parameter fsflpbkstat of the entity EPORT is updated by this command:

- *fsflpbkstat* should be set to YES in case the *lpbktyp* = FSF.

This update is reported by an ED-EPORT notification for the related EPORT (only for the parameter *fsflpbkstat*). Any attempts to change the parameter *lpbktyp* to the value FACILITY is rejected.

Updated affected entities

Apart from the port entity no further entities are affected by the **`RLS-LPBK`** command. Updates of the port entities are reported via ED-rr (OP***n*** port/ EP***n*** port / OPT***n*** port) or ED-EPORT (GE***n*** port) notifications.

Example input/output

Please refer to the *Detailed behavior description* section for this command.

Error responses

Validation rule: Loopback must exist

Loopback command processing verifies that the **`RLS-LPBK`** command can not be applied to non-existing loopback. This means e.g. that a request to release a near-side (far-side) loopback while no near-side (far-side) loopback exists is rejected.

Error code: `SNVS – Status, Not in Valid State, loopback does not exist`

Validation rule: *modifier* consistent with given port-rate

Loopback command processing verifies that the *modifier* parameter is consistent with the rate of the port (given by the *aid* parameter). E.g. for an OP2G5 only the *modifier* values STM16 or OC48 (depending on the port's interface standard) are allowed, for an OP10 only *modifier* values STM64 or OC192 (depending on the port's interface standard) are allowed etc.

Error code:

`IDNC – Input Data Not Consistent, modifier is inconsistent with existing port rate`

Validation rule: *modifier* consistent with given port's interface standard

Loopback command processing verifies that the *modifier* parameter is consistent with the interface standard of the port (given by the *aid* parameter). E.g. for an SDH port only the *modifier* values for STM16 or STM64 or STM256 are valid, for a SONET port only the *modifier* values OC48 or OC192 or OC768 are valid.

Error code:

`ICNV – Input Command Not Valid, Interface Standard does not match`

Validation rule: *modifier* consistent with the related circuit pack type

Loopback command processing shall verify in case that the modifier parameter does not distinguish various entities by transmission rate or by interface standard that the addressed entity belongs to the correct pack type. E.g. if the modifier value 1GE has been sent for an 1 GE port on the GE10PL1 pack or if the modifier value 1GEPL has been sent for a port on the GE1 pack, then the command is rejected.

Error code:

`IDNC – Input, Data Not Consistent, modifier is inconsistent with the related circuit pack type`

GR-199-CORE

RLS-PROTNSW: Release protection switch

The **`RLS-PROTNSW`** command allows to clear protection switch requests for one or more existing protection group instances of any protection group type. Different identification methods are supported for the different protection types.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M4

Priority: 1

Abortable: No

Input format

1+1 equipment group

Command syntax: **`RLS-PROTNSW`**:*tid*:*aid*:*ctag*::*protype*:*spec_block*;

Multiplex section/line protection group

Command syntax: **`RLS-PROTNSW`**:*tid*:*aid*:*ctag*::*protype*:*spec_block;*

2-/4-fibre MS-SPRing/BLSR protection group

Command syntax: **`RLS-PROTNSW`**:*tid*:*[aid]*:*ctag*::*protype*,*[rid]*:*spec_block*;

Path protection group

Command syntax: **`RLS-PROTNSW`**:*tid*:*[aid]*:*ctag*::*protype, ,[ppgname][,aid1]*:*spec_block*;

The parameter *ppgname* is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of *ppgname* is not recommended.

> **Important!** The use of *ppgname* as input parameter with alias function is not yet supported. Address path-protected cross-connections individually via *Navis*® Optical EMS/CIT GUI using their AIDs.

> **Important!** If a RLS-PROTNSW command is executed on an MSP 1+1 optimized protection group while the command would have no effect (e.g. already cleared by previous command), then the command is denied with the error code: `SROF, Status, Requested Operation Failed`. The correct behavior should be that the command completes without error.

Input parameters

Command parameters (1+1 equipment protection group)

1. **tid** – Target Identifier
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   Description: The parameter specifies the aid of 1+1 equipment protection group.
   Type: AID
   Range: SwitchAndTmgProtGrpAID or CtlProtGroupAID or EP155ProtGroupAID or EP51ProtGroupAID or LOXCProtGroupAID or TMUXProtGroupAID or ES64UProtGroupAID
   All actual existing equipment protection groups will be returned with a specific AID:
   - SwitchAndTmgProtGrpAID for high order switch fabric and timing group,
   - CtlProtGroupAID for system controller group,
   - EP155ProtGroupAID for electrical 155 MBit/s groups,
   - EP51ProtGroupAID for electrical 51 MBit/s groups,
   - LOXCProtGroupAID for low order switch fabric groups.
   - TMUXProtGroupAID for TransMUX groups
   - ES64UProtGroupAID for es64u groups

   Default: No default
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.
4. **protype** – Protection Type
   The parameter specifies the type of the protection group.
   Type: Alphanumeric value set.
   Range:
   - EQPTSWFBR (if *aid* is SwitchAndTmgProtGrpAID)
   - EQPTCTL (if *aid* is CtlProtGroupAID)
   - EQPTEP155 (if *aid* is EP155ProtGroupAID)
   - EQPTEP51 (if *aid* is EP51ProtGroupAID)
   - EQPTLOXC (if *aid* is LOXCProtGroupAID)
   - EQPTTMUX (if *aid* is TMUXProtGroupAID)
   - EQPTES64U (if *aid* is ES64UProtGroupAID)

Command parameters (multiplex section/line protection group)

1. **`tid`** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **`aid`** – Access Identifier
   This parameter specifies the aid of a 1+1 multiplex section/line protection group or the aid of a 1:1 multiplex section/line protection group (only R3.0 and later) or an port aid being a member of the group.
   Type: AID.
   Range: OnePlusOne_ProtGrpAID (not ranged) or SPortAID NByOne_ProtGrpAID (not ranged) or SPortAID (not ranged).
3. **`ctag`** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows “0” as valid *ctag*, which is an extension to GR-831.
4. **`protype`** – Protection Type
   This parameter specifies the architecture (type) of the protection group. The value for the 1+1 line/MS protection group is 1+1. The value for the 1:1 line/MS protection group is 1xNOPT (only R3.0 and later).
   Type: Value set.
   Range: 1+1 or 1xNOPT

Command parameters (2-/4-fibre MS-SPRing/BLSR protection group)

1. **`tid`** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **`aid`** – Access Identifier
   This parameter specifies the aid of an MS-SPRing/BLSR protection group or an port aid being a member of the group.
   Option: If *rid* is specified, then *aid* can be omitted.
   Type: AID.
   Range: TwoFibre_ProtGrpAID (not ranged) or FourFibre_ProtGrpAID (not ranged) or SPortAID (not ranged)
3. **`ctag`** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows “0” as valid *ctag*, which is an extension to GR-831.

4. **`protype`** – Protection Type
   This parameter specifies the protection group type for which the information is retrieved.
   Type: Alphanumeric value set.
   Range: 2F or 4F
5. **`rid`** – Ring Identification
   This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
   Type: text string of chars allowed for TID strings.
   Range: 1 to 15 characters.
   Default: NONE.
   Option: If *aid* is specified, then *rid* can be omitted.

Command parameters (Path protection group)

1. **`tid`** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **`aid`** – Access Identifier
   This parameter specifies a path protection group *aid* or an input tributary *aid* being a member of the group in combination with *ppgname*.
   The parameter specifies an input tributary when used in combination with parameter *aid1*.
   Option: If *ppgname* is specified, then *aid* can be omitted or used as an input tributary *aid*. The parameter *ppgname* is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of *ppgname* is not recommended. For low order path protections, the *aid* is mandatory since the *ppgname* is not supported for those protection groups. For such protection groups, always a path protection group AID has to be specified.
   Option: If parameter *aid* specifies a HO tributary on a port of port class EDGE and this tributary is combined with another HO tributary within an OUC, then the command shall operate on all protection groups of type PATHDRI identified by these two HO tributaries, if existing. If *aid* specifies a HO tributary on a port of port class INNI, the command is rejected.
   Option: When parameter aid is used in combination with parameter *aid1*, then the command shall operate on all protection groups of type PATHDRI having the AIDs given in parameters *aid* and *aid1* as input tributaries. If *aid* or *aid1* specifies a tributary on a port of port class INNI, the command is rejected.
   Type: AID
   Range: STS1NumAID or VCGNumAID or GenLOTribAID or TMuxAPTNumAID. The usage of wild cards is not restricted. This range specifies all AIDs which can be used to identify a path protection group. Any defined wild cards (e.g. **`all`** or **`vall`** or **`usall`** in various positions) are allowed.

3. **`protype`** – Protection Type
   This parameter specifies the protection group type for which the information is retrieved.
   Type: Alphanumeric value set.
   Range: PATHDRI
4. **`ppgname`** – Path protection group Name
   In particular follow the reference to check options and mandatory omissions associated with this parameter.
   The parameter specifies the path protection group name. Storage and retrieval of the *ppgname* is case sensitive, but actual use of the *ppgname* to determine the corresponding protection group is case insensitive.
   Option for high order path protection groups: For high order path protections, if *aid* is specified, then *ppgname* can be omitted. For low order path protections, the *ppgname* is omitted as not being supported at all.
   If an input value is specified for *ppgname* and none is specified for aid, then RTRV-PROTN-GRP operates on all protection groups of type PATHDRI that have the specified path protection group name. If input values are specified for aid and *ppgname* then RTRV-PROTN-GRP operates on all protection groups of type PATHDRI that have the specified *aid*, *ppgname* pair.
   The command will complete successfully if there is no protection group described by *aid*, *ppgname*, but no data will be returned.
   The parameter *ppgname* is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of *ppgname* is not recommended.
   Type: text string
   Range: 1 to 24 characters
   Option: or high order path protections, if *aid* is specified, then *ppgname* can be omitted. For low order path protections, the *aid* is not omitted since the *ppgname* is not supported for those protection groups. For lower order path protection groups, always a path protection group AID has to be specified. If an input value is specified for *ppgname* and none is specified for *aid*, then the command operates on all protection groups that have the specified path protection group name. If input values are specified for aid and *ppgname* then the command operates on all protection groups that have the specified *aid*, *ppgname* pair. The command will complete successfully if there is no protection group described by *aid*, *ppgname*.
5. **`aid1`** – Access identifier 1
   Together with parameter *aid* this parameter specifies a pair of tributaries in order to execute switches to emulated selector bridges in one command.
   Option: If input values are specified for *aid* and *aid1* then OPR-PROTNSW operates on all protection groups of type PATHDRI that have these specified tributaries as inputs. If input values are specified for *aid* and *aid1*and additionally a

value is specified for *ppgname*, OPR-PROTNSW operates only on those protection groups that additionally match the ppgname value. If aid1 specifies a HO tributary in a port of port class INNI, the command is rejected.
Type: AID
Range: STS1NumAID

Command parameters (Constituent path protection group)

1. **`tid`** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **`aid`** – Access Identifier
   The parameter specifies the constituent member of a path protection group or an input tributary *aid* of a constituent member within the path protection group in combination with *ppgname*.
   If *ppgname* is specified, then aid can be used as an input tributary aid. The parameter *ppgname* is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of *ppgname* is not recommended.
   Type: AID
   Range: STS1NumAID, VCGNumAID
   The use of wild cards is not restricted for STS1NumAID and VCGNumAID. No wildcards are allowed in a GenLOTribAID.
   This range specifies all AIDs, which can be used to identify a constituent path protection group.
3. **`ctag`** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.
4. **`protype`** – Protection Type
   This parameter specifies the protection group type for which the information is retrieved.
   Type: Alphanumeric value set.
   Range: CONSTITUENTPATH

Spec block parameters (1+1 equipment, path protection group)

1. **`sc`** – Switch Command
   This parameter specifies the clear command to be executed by the protection state machine.
   Type: Alphanumeric value set.
   Range: CLEAR
   Default: CLEAR
   Option: If the parameter is omitted the default switch command will be executed.

Spec block parameters (multiplex section/line protection group)

1. **sc** – Switch Command
   This parameter specifies the clear command to be executed by the protection state machine.
   Type: Alphanumeric value set.
   Range: CLEAR
   Default: CLEAR
   Option: If the parameter is omitted the default switch command will be executed.

Spec block parameters (2/4-fibre MS-SPRing/BLSR protection group)

1. **destside** – Destination Side

   This parameter specifies the destination side to which the switch command is applied; i.e.

   - it is EAST for the east ring side
   - it is WEST for the west ring side

   Type: Alphanumeric value set.
   Range: EAST, WEST
2. **sc** – Switch Command
   This parameter specifies the clear command to be executed by the protection state machine.
   Type: Alphanumeric value set.
   Range: CLEAR
   Option: If the parameter is omitted the default switch command will be executed.

Output format

After receiving the **RLS-PROTNSW** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

Detailed behavior description

The command clears the protection switch of the identified protection groups. The clear command is processed according to the state machine behavior for the different protection group types. As consequence, the values of the following attributes of the state machine may be updated:

EQPTSWFBR: *actunit, swreq*

EQPTCTL: *swreq*

EQPTEP155: *actunit, swreq*

EQPTEP51: *actunit, swreq*

EQPTLOXC: *actunit*, *swreq*

EQPTTMUX: *actunit*, *swreq*

EQPTES64U: *actunit*, *swreq*

1+1/1:1: *actunit*, *swreq*

2F: *eswreq*, *wswreq*

4F: *eactunit*, *eswreq*, *wactunit*, *wswreq*,

PATHDRI: *actunit*, *actunitaid*, *swreq*

The update of the attributes is reported by means of a protection switch notification for the corresponding protection group type.

Behavior of path-protected pipe cross-connections

If the protection type specified in the command is PATHDRI, then the command is applied to all constituent members of the path-protected pipe cross-connection. The system shall send protection switch notifications only for those constituent members, where the command leads to a change of the protection state.

Boundary Independence for Constituent Members:

If the protection type specified in the command is CONSTITUENTPATH, then the command is applied to the constituent member of the path-protected pipe cross-connection, which includes the specified tributary AID.

Identification of path protection groups

A set of path protection groups is identified by a path protection group name (*ppgname*). If an input tributary AID (*aid*) is specified in addition to the *ppgname*, then the command operates on the subset of protection groups that share both of these parameters.

The protection group name handling shall only apply to protections groups which have tributaries of high-order signal rates been involved.

The parameter *ppgname* is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of *ppgname* is not recommended.

For PATHDRI, the protection switch applies to all constituents of the identified tributary. For this case, the following table summarizes the use of path protection group names as related to RLS-PROTNSW.

aid	ppgname	comment
not used	ppgname	operation applies to all tributaries that are group members of the ppgname (note 1)

aid	ppgname	comment
grp member (input) logical tributary AID	ppgname	operation applies to all tributaries that are group members of the aid, ppgname subset
path prot grp id (output logical tributary AID)	not used	normal, non-aliasing target identification

Note 1: group members are defined to be the working and protection input logical tributaries of the path protection group.

Example input/output

1+1 Equipment Protection Group

The following example shows an successful clear command for a 1+1 equipment protection group:

```
RLS-PROTNSW:LT-UNITE:1-1-estgrp:123456::EQPTSWFBR;

   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
;
```

Multiplex section/line protection group (1+1)

The following example shows an successful clear command for a 1+1 multiplex section/line protection group:

```
RLS-PROTNSW:LT-UNITE:1-1-o110:123456::1+1;

   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
;
```

2 fibre MS-SPRing/BLSR protection group

The following example shows an successful ’clear’ command for the east side of a 2F MS-SPRing/BLSR protection group:

```
RLS-PROTNSW:LT-UNITE:1-1-t001:123456::2F:sc=CLEAR,destside=EAST;

   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
;
```

4 fibre MS-SPRing/BLSR protection group

The following example shows an successful ’clear’ command for the west side of a 4F MS-SPRing/BLSR protection group:

```
RLS-PROTNSW:LT-UNITE:1-1-f001:123456::4F:sc=CLEAR,destside=WEST;
```

```
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
;
```

Path protection group

The following example shows an successful clear command for a path protection group:

```
RLS-PROTNSW:LT-UNITE:1-1-#-#-10-1-25:123456::PATHDRI;

   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
;
```

The following example shows a successful clear command to both path protection groups forming an emulated selector bridge on input tributaries 1-1-#-#-8-1-25 and 1-1-#-#-6-1-25:

```
RLS-PROTNSW:LT-UNITE:1-1-#-#-8-1-25:123456::PATHDRI,,,
1-1-#-#-6-1-25:;

   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses (general)

Validation rule: consistent *aid* and *protype*

The specified *aid* is consistent with the specified *protype*.

Error code: `IIAC – Input, Invalid ACcess identifier,incorrect syntax`

Error responses (multiplex section/line protection group)

Validation rule: succeeding switch command

The switch command is executed by the protection state machine running on the XC pack.

Error code: `SPFA – Status, Protection unit FAiled`

Error responses (2-/4-fibre MS-SPRing/BLSR protection group)

Validation rule: consistent aid and rid

If both an aid and an rid are specified as input parameters and they are inconsistent, then the following error response is returned

Error code: `IIAC – Input, Invalid ACcess identifier,incorrect syntax`

Validation rule: succeeding switch command

The switch command is executed by the protection state machine running on the XC pack.

Error code: `SPFA – Status, Protection unit FAiled`

Error responses (Path protection group)

Validation rule: Protection Group must exist

If the parameter *aid*, or the combination of the parameters *aid* and *ppgname* does not specify a path protection group, then the following error response is returned:

Error code: `IENE – Input, Entity Not Exists`

Validation rule: Protection Group must exist

If the combination of the parameters *aid* and *aid1* does not specify a path protection group, then the following error response is returned:

Error code: `IENE – Input, Entity Not Exists`

Validation rule: succeeding switch command

The switch command is executed by the protection state machine running on the XC pack.

Error code: `SPFA – Status, Protection unit FAiled`

Validation rule: *ppgname* and low order path protections

If a ppgname is given as input parameter while the aid references a low order tributary, then the following error response is returned:

Error code:
`IDNV – Input, Data Not Valid, ppgname not supported for this transmission rate`

Validation rule: Access via tributary on INNI port

If in input parameter *aid* or *aid1* for access via input or output a tributary is given located on a port of *portclass* INNI, then the following error response is returned:

Error code:
`IDNV – Input, Data Not Valid, No Access via AID located on INNI port`

RLS-SYNCNSW: Release synchronization switch

The **RLS-SYNCNSW** command can be initiated by user to request the management system to release (clear) any existing lockout, forced or manual timing reference switching or external output timing switch or to release the forced request on the timing mode so that it will return to the provisioned locked mode from the holdover mode.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M4

Priority: 1

Abortable: No.

Input format

Command syntax: **RLS-SYNCNSW**-*modifier*:*tid*::*ctag*::*[dest]*;

Input parameters

Command parameters

1. **modifier** – modifier
   This parameter indicates the management system on which the switch request acts. The *modifier* REF specifies the assigned timing reference switch. The *modifier* MOD specifies the clock mode switch of the system clock. The *modifier* OUTREF specifies the external timing output switch (for SDH only).
   Type: Alphanumeric value set.
   Range:
   - REF
   - MOD
   - OUTREF

   Default: Not applicable.
2. **tid** – target identifier
   See definition of *tid – target identifier* in "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **ctag** – correlation tag
   See definition of *ctag – correlation tag* in "RTRV-HDR: Retrieve header" (p. 3-2417).

4. **`dest`** – destination
   When the parameter dest is omitted with modifier REF or OUTREF the system clears a manual or forced timing reference or external output timing switch request state.
   This parameter specifies the assigned timing reference identifier destination. This is the list of timing references available to the system clock or to the timing link switch of the external output timing. This parameter is valid and required for the REF and OUTREF modifiers.
   Type: AID
   Range:
   - *modifier* REF: External_timing_ref_AID, Line_timing_ref_AID
   - *modifier* OUTREF (for SDH only): Line_timing_ref_AID

   Default: Not applicable.

Output format

After receiving the **`RLS-SYNCNSW`** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Detailed behavior description

The **`RLS-SYNCNSW`** command generates no **`REPT DBCHG`** Report Database Change notification. The **`RLS-SYNCNSW`** command returns a REPT EVT Report Event notification in consequence of a protection switch notification.

Clear clock backup request

The system clock leaves the Forced Holdover state by means of the **`RLS-SYNCNSW`** command with *modifier* MOD without parameter. The Clear Mode Switch request removes any active external request and does not affect the state of the automatic protection switching based on synchronization reference failure. The following parameter is affected by release of the clock mode switch Forced Holdover: – clkmod_stat = NORMAL.

Clear system timing reference or output timing switch request

The Clear Reference Switch command removes any active external request as is clear the Lockout, Forced Switch and Manual Switch conditions. The Clear Reference Switch command does not affect the state of the automatic protection switching based on synchronization reference failure, except for its effect on Wait to Restore. The Clear

Reference Switch invokes the management system to terminate the wait to restore period for the specified timing reference and may be used to clear Wait to Restore. The signal status will revert to NORMAL.

Forced Switch: The system leaves the Forced Switch state by means of the **OPR-SYNCNSW** command with *sc* value LOCKOUT, or RLS-SYNCNSW command.

Manual Switch: The system leaves the Manual Switch state by means of the **OPR-SYNCNSW** command with *sc* value LOCKOUT, or OPR-SYNCNSW command with *sc* value FRCD, or RLS-SYNCNSW command.

Lockout: The system leaves the Lockout state by means of the **RLS-SYNCNSW** command. The following parameters are affected by release of the system timing reference switch:

- active_ref = [External_timing_ref_AID, Line_timing_ref_AID]
- refsw_stat = NO-REQUEST
- ref_lock = NO-LOCKOUT
- ref_stat = NORMAL

The following parameters are affected by release of the external output timing switch request:

- active_oref_stat = Line_timing_ref_AID
- orefswr_stat = NO-REQUEST
- sclkref_lockstat = NO-LOCKOUT

Example input/output

The following is an example of the **RLS-SYNCNSW** command for System Timing with *modifier* MOD:

```
RLS-SYNCNSW-MOD:LT-UNITE::123456::;

   LT-UNITE 00-11-09 12:00:00
M  123456 COMPLD
;
```

The following is an example of the **RLS-SYNCNSW** command for System Timing with *modifier* REF:

```
RLS-SYNCNSW-REF:LT-UNITE::123456::EXTREF1;

   LT-UNITE 00-11-09 12:00:00
M  123456 COMPLD
;
```

The following is an example of the **RLS-SYNCNSW** command for Output Timing with *modifier* OUTREF:

```
RLS-SYNCNSW-OUTREF:LT-UNITE::123456::;
```

```
   LT-UNITE 00-11-09 12:00:00
M  123456 COMPLD
;
```

RTRV-ACTL-CONT: Retrieve actual condition types

The **RTRV-ACTL-CONT** command can be initiated by users to retrieve the available condition types which can be assigned to an miscellaneous output control (MDO port / external discrete control).

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-ACTL-CONT**:*tid*::*ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition of “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **ctag** – Correlation Tag
   See definition of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output format

The following example shows the successful completion of the **RTRV-ACTL-CONT** command by the NE:

```
   sid date time
M  ctag COMPLD
   ″pftype:condtype:condinfo″
   ...
   ″pftype:condtype;condinfo″
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Command parameters

1. **pftype** – Profile Type
   This parameter indicates the type of the ASAP (ASAP type).
   Type: Alphanumeric value set. A hyphen (“-”) is allowed for the alphanumeric values additionally.

Range:

- DCN: Data Communications Network
- DS1: DS1 asynchronous signals
- DS3: DS3 asynchronous ports
- ENET: Ethernet
- ENV: Environmental (Miscellaneous Discrete)
- EQUIP-PROT: Equipment with Protection State Dependence
- EQUIP-UNPROT: Equipment unprotected
- MS-SPRing-BLSR: MS-SPRing and Bilateral Switched Ring protection switch
- MSP-APS: Automatic protection switch
- OTN: OTN ports.
- PATH: Path MSA/NIM related
- PATHTERM: Path Termination
- PORT: SDH/SONET ports
- SCN: SCN
- SNCP-UPSR: Sub-Network Connection Protection and Unidirectional Path Switched Ring
- TIMING: System Timing
- TRANSPARENCY: Fully Transparent Service

Default Value: There is no default value. The *pftype* does not change.

2. **`condtype`** – Condition Type
   This parameter identifies the type of alarm indication being reported.
   Type: Alphanumeric value set.
   Range: All defined probable causes..
3. **`condinfo`** – Information Of The Condition
   This is a textual description of the condition.
   Type: inner string of the format: \″<category>, \<description>″
   Range: category: is the category; description: is the alarm description, the string is up to 32 characters.

Detailed behavior description

The **`RTRV-ACTL-CONT`** command does not generate a REPT DBCHG message.

Example input/output

The following example shows the successful completion of the **`RTRV-ATCL-CONT`** command by the NE if the aid is omitted:

```
RTRV-ACTL-CONT:LT-UNITE-123::123456;

   LT-UNITE-123 00-01-01 08:00:00
```

```
M  123456 COMPLD
   ″PORT:OCHLOF: \″Communication-Transport, OCh Loss of Frame\″″
   ″PORT:PREDCMLOS: \″Communication-Transport, Pre DCM Signal Loss\″″
         ...
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-ATCL** command.

Related TL1 messages

RTRV-ACTLCP: Retrieve acceptable circuit pack list

The **RTRV-ACTLCP** command returns all circuit packs (name and qualifier) which are supported in the system; i.e. there is at least one slot, where a circuit pack of that type is accepted to be provisioned/pre-provisioned.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-ACTLCP***:tid:aid:ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   The aid of the system itself.
   Type: AID
   Range: system.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

In response to a valid RTRV-ACTLCP command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

The output shall contain one line per supported circuit pack (name, qualifier pair).

Output parameters

Command parameters

1. **aid** – Access Identifier:
   See definition of *aid* input parameter in Input parameter section above.

Spec block parameters

1. **actlname** – Acceptable Circuit Pack Name
   This parameter specifies the name of a circuit pack supported by system.
   Type: value set.
   Range: 12 character.
2. **actlqual** – Acceptable Circuit Pack Qualifier
   This parameter specifies the qualifier of a circuit pack supported by system.
   Type: value set.
   Range: 7 character.

Note: The TL1-representation of the functional qualifier shall follow the rules as defined in SRD_ConfigurationManagement:

- alphanumeric characters or the special character '-' only
- special characters like '/' and '.' to be omitted.

Example input/output

```
RTRV-ACTLCP:UNITE-NE:system:123456;

   UNITE-NE 00-11-03 08:00:00
M  123456 COMPLD
   ″system:actlname=OP2G5,actlqual=13SR4″
   ″system:actlname=OP10,actlqual=15LR1″
    ...
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also pertain to the **RTRV-ACTLCP** command.

RTRV-ALL: Retrieve all (port)

The **RTRV-ALL** command is used to retrieve all parameters related to SDH/SONET ports.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-ALL**:*tid:aid:ctag[:::spec_block];*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   AID of SDH or SONET port.
   Type: AID.
   Range: SPortAID of STMn ports and OCn ports of supported rates or EC1 port. The keyword **usall** and **all** is allowed for Simple_SlotAID. The keyword **all** is allowed for Simple_SPortAID.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameters

1. **dyn** – Retrieve Dynamic Parameters
   This parameter controls whether dynamic parameters are reported with the command reply or not.

   The following output parameters of a port are affected:

   - strc
   - strcst.

   Type: Alphanumeric value set.
   Range: YES: Report dynamic parameters in the reply as well; NO: Do not report dynamic parameters in the reply.
   Default: NO.

Output format

In response to a valid RTRV-ALL command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   Access Identifier of the SDH or SONET port.
   Type: AID.
   Range:
   - SPortAID for STM***n*** ports and OC***n*** ports of supported rates or EC1 port.
   - APortAID for DS3 ports.
   - TMuxAPortAID, TMuxSPortAID for TransMUX ports.

   The value **`all`** is not allowed.

Spec block parameters

1. **`ptype`** – Port Type
   This identifies the port type of the AID.
   Type: Alphanumeric value set.
   Range:
   - STM1E
   - STM1
   - STM4
   - STM16
   - STM16T
   - STM64
   - STM256
   - OC3
   - OC12
   - OC48

- OC48T
- OC192
- OC768
- EC1
- T3
- TMAT3
- TMST3

2. <others>

Detailed behavior description

The command retrieves the parameters as described above.

The **RTRV-ALL** command does not generate a **REPT DBCHG** message.

Example input/output

The following example shows the successful execution of a RTRV-ALL command. Not all output parameters are listed (missing ones indicated by …):

```
RTRV-ALL:LT-UNITE:1-1-#-#-usall-all:123456;

   LT-UNITE 00-11-27 08:00:00
M  123456 COMPLD
   ″1-1-#-#-4-1:ptype=OC768,frcdus=DISABLE,sfthr=-3,sdthr=-6, pmode=MON,.....
      pmmsneses=15,pmrsneses=30″
   ″1-1-#-#-5-1: ptype=STM64,frcdus=DISABLE,dexcthr=-3,degthr=-6,
      pmode=MON,.....,pmmsneses=15,pmrsneses=30″
;
```

Error Responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-ALL** command.

RTRV-ALL: Retrieve all (tributary)

The **RTRV-ALL** command is used to retrieve all parameters related to the tributaries.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-ALL**:*tid*:*aid*:*ctag*[:::spec_block];

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   AID of SDH/SONET tributary. The keyword **all** is allowed on slot, port and tributary level.
   Type: AID
   Range: STS1NumAID
3. **ctag** – Correlation Tag
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.

Spec block parameter

1. **dyn** – Retrieve Dynamic Parameters
   This parameter controls whether dynamic parameters are reported with the command reply or not.

   The following output parameters of a tributary are affected:

   - ptrc
   - ptrcst
   - siglb
   - trailstate.

   Type: Alphanumeric value set.
   Range: YES, report dynamic parameters in the reply as well; NO, do not report dynamic parameters in the reply.
   Default: NO.

Output format

In response to a valid RTRV-ALL command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   ″aid[:spec_block]″
       ...
       ...
   ″aid[:spec_block]″
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   AID of the SDH/SONET tributary. The keyword **`all`** is not allowed on any level.
   Type: AID.
   Range: STS1NumAID.

Spec block parameters

For the spec block parameters refer to the descriptions of the following commands “RTRV-VC3: Retrieve VC3 tributary” (p. 3-3069) and “RTRV-STS1: Retrieve STS1 tributary” (p. 3-2946).

Detailed behavior description

The command retrieves the spec block parameters for the tributaries specified by the input parameter *aid*.

Example input/output

```
RTRV-ALL:LT-UNITE:1-1-#-#-ALL-ALL-ALL:123456;

   LT-UNITE 00-11-27 08:00:00

RTRV-ALM: Retrieve alarm

The **RTRV-ALM** command messages can be initiated by the user to retrieve all active alarms with properties defined by command parameters of level critical, major or minor from a NE.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-ALM**[-*modifier*]:*tid*::*ctag*::[*ntfcncde*],[*condtype*],[*srveff*],,,;

The last three trailing commas are used to specify that the optional parameters *locn*, *dirn*, *tmper* as defined in GR-833 are omitted since these parameters are not supported as input parameters.

Input parameters

Command parameters

1. **modifier** – Message Modifier
   This parameter defines for which AID types the conditions will be retrieved. If the value 'ALL' is used, the specified parameter has no impact on the set of retrieved alarms delivered in the retrieve reply.
   Type: Alphanumeric value set.
   Range: ALL. This requests all alarms.
   The modifier can be omitted. In this case the ALL modifier will be set implicit.
2. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
4. **ntfcncde** – Notification Code
   This is the alarm severity (alarm level) for which the current alarms are requested.
   Type: Alphanumeric value set.
   Range: ALL, requests all alarms.
   ntfcncde can be omitted. In this case ALL will be set implicit.

5. **condtype** – Condition Type
   This parameter identifies the type of alarm indication being reported.
   Type: Alphanumeric value set.
   Range: ALL, requests all alarms.
   condtype can be omitted. In this case ALL will be set implicit.
6. **srveff** – Service Effect
   This parameter identifies the service affect of alarms being reported.
   Type: Alphanumeric value set.
   Range: ALL, requests all alarms.
   srveff can be omitted. In this case ALL will be set implicit.

Output format

The following example shows the successful completion of the **RTRV-ALM** command by the NE:

```
   sid date time
M  ctag COMPLD
   ″aid,aidtype:ntfcncde,condtype,srveff,ocrdat,ocrtm:conddescr″
   (0 or more lines of the above)
;
```

If no alarms are raised only COMPLD will be returned.

The alarms are reported one line per condition, similar to the autonomous messages conveyed by REPT ALM.

Output parameters

Command parameters

1. **aid** – Access Identifier
   This is the address of the entity for which an alarm condition is being reported.
   Type: AID.
   Range: All defined AIDs are allowed. It should be a valid AID for the specified *modifier*. Refer to the definition of AIDs.
2. **aidtype** – Access Identifier Type
   This parameter defines the AID type to which the alarm belongs.
   Type: Alphanumeric value set.
   Range:
   - COM: Common. An alarm/event that applies to the whole NE system; for example, a processing error.
   - EQPT: An equipment-related alarm/event.
   - SYST: An alarm/event related to system timing.
   - OUTT: An alarm/event related to output timing.

- STM1E: A facility-related alarm/event for synchronous transport mode 1 (electrical).
- STM1: A facility-related alarm/event for synchronous transport mode 1.
- STM4: A facility-related alarm/event for synchronous transport mode 4.
- STM16: A facility-related alarm/event for synchronous transport mode 16.
- STM16T: A facility-related alarm/event for fully transparent synchronous transport mode 16.
- STM64: A facility-related alarm/event for synchronous transport mode 64.
- STM256: A facility-related alarm/event for synchronous transport mode 256.
- ODU1: A facility-related alarm/event for optical data units of level 1
- OC3: A facility-related alarm/event at the optical carrier signal level 3.
- OC12: A facility-related alarm/event at the optical carrier signal level 12.
- OC48: A facility-related alarm/event at the optical carrier signal level 48.
- OC48T: A facility-related alarm/event at the fully transparent optical carrier signal level 48.
- OC192: A facility-related alarm/event at the optical carrier signal level 192
- OC768: A facility-related alarm/event at the optical carrier signal level 768
- T3: A facility-related alarm/event at the DS3 level
- TMAT3: A facility-related alarm/event at the DS3 level related to TransMUX function
- EC1: A facility-related alarm/event at the EC1 level
- 1GE: A facility-related alarm/event for 1 Gigabit Ethernet.
- 1GEPL: A facility-related alarm/event for 1 Gigabit Ethernet Private Line.
- 10GEPL: A facility-related alarm/event for 10 Gigabit Ethernet Private Line.
- VC3: A facility-related alarm/event for virtual container 3.
- VCG: A facility-related alarm/event for virtual concatenation group.
- VC4: A facility-related alarm/event for virtual container 4
- VC44C: A facility-related alarm/event for a signal concatenated at 4 times the VC4 rate.
- VC416C: A facility-related alarm/event for a signal concatenated at 16 times the VC4 rate.
- VC464C: A facility-related alarm/event for a signal concatenated at 64 times the VC4 rate.
- STS1: A facility-related alarm/event at synchronous transport signal level 1.
- TMASTS1: A facility-related alarm/event at synchronous transport signal level 1 related to TransMUX function.
- STS3C: A facility-related alarm/event at synchronous transport signal level 3.

- STS12C: A facility-related alarm/event at synchronous transport signal level 12.
- STS48C: A facility-related alarm/event at synchronous transport signal level 48.
- STS192C: A facility-related alarm/event at synchronous transport signal level 192.
- HOVC4 : A facility-related alarm/event for virtual container 4 higher-order path termination.
- HOSTS1: A facility-related alarm/event at synchronous transport signal level 1 higher-order path termination.
- LOVC3: A facility-related alarm/event for virtual container 3 (lower-order path).
- LOVC12: A facility-related alarm/event for virtual container 12
- LOVT1: A facility-related alarm/event at transport level VT1.5.
- TMSVT: A facility-related alarm/event at transport level VT1.5 related to TransMUX function.
- DS1: A facility-related alarm/event at transport level DS1.
- LINK: A signaling communication link related alarm/event for ONNS

Refer to "Alarms, events, ASAPs" (p. 6-4) for the relation of alarm / entity / *aidtype*.

3. **`conddescr`** – Description of the Condition
   This is a textual Description of the Condition.
   Type: inner string of the format:
   \″<category>, <entity>, <description>, <additional text>\″ or
   \″<category>, <entity>, <description>, <additional text>-cleared\″ (this form is used in REPT ALM/EVT for cleared alarms)
   Range:
   - category: is the category
   - entity: is the entity for which the alarm is reported
   - description: is the Alarm description, the string is up to 32 characters
   - additional text: additional text.

   If there is no additional text, then the trailing comma may be omitted.
4. **`condtype`** – Condition Type
   This parameter identifies the probable cause (type of alarm indication) being reported.
   Type: Alphanumeric value set.
   Range: All defined probable causes.
5. **`ntfcncde`** – Notification Code
   This is the alarm severity (alarm level) or if the alarm is cleared.
   Type: Alphanumeric value set.
   Range:
   - CR – Critical (ITU / Telcordia)
   - MJ – Major (ITU / Telcordia)

- MN – Minor (ITU / Telcordia)
- CL – Cleared.

6. **`srveff`** – Service Effect
   This parameter identifies the service affect of alarms being reported. It presents the "best guess" from a local system point of view.
   Type: Alphanumeric value set.
   Range:
   - SA: Service-Affecting alarm condition
   - NSA: Non-Service-Affecting alarm condition.
7. **`ocrdat`** – Occurrence Date
   This parameter indicates the raising / clearing date of the alarm.
   Type: value set of the format MM-DD.
   Range: MM represents the month, DD represents the day, leading zeros are not suppressed.
8. **`ocrtm`** – Occurrence Time
   This parameter indicates the raising / clearing time of the alarm. The accuracy should be +/- 1 second.
   Type: value set of the format HH-MM-SS.
   Range: HH represents the hours, MM represents the minutes, SS represents the seconds, leading zeros are not suppressed.

Detailed behavior description

RTRV-ALM retrieves all active alarms of level CR, MJ, MN.

Any alarm reported by an autonomous REPT ALM message which is active when a RTRV-ALM message is received, is included in the RTRV-ALM response message. Alarms of level NA are reported by RTRV-COND and not by RTRV-ALM.

RTRV-ALM is an on-demand version of the autonomous REPT ALM. The on-demand command only report alarms that are still set when the command is executed.

The **`REPT-ALM`** command does not generate a **`REPT DBCHG`** message.

```
RTRV-ALM:LT-UNITE-123::123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   ″1-1-#-#-4-1,STM16:CR,LOS,SA,01-01,07-29-13:\″Communication-Transport, STM16
      port, Loss Of Signal\″″
   ″1-1-#-#-1-3,STM4:MJ,LOF,SA,12-31,03-50-32:\″Communication-Transport, STM4 port,
      Loss of Frame\″″
;
```

Example input/output

The following example shows the successful completion of the **RTRV-ALM** command by the NE if no *modifier* is specified and all alarms will be retrieved for the whole NE:

The following example shows the successful completion of the **RTRV-ALM** command by the NE if the alarms for a specified *aid* will be retrieved:

```
RTRV-ALM:LT-UNITE-123:1-1-#-#-4-1:123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   ″1-1-#-#-4-1,STM16:CR,LOS,SA,01-01,07-29-13:\″Communication-Transport, STM16
      port, Loss Of Signal\″″
;
```

The following example shows the successful completion of the **RTRV-ALM** command by the NE if no alarms are raised on the NE:

```
RTRV-ALM:LT-UNITE-123:1-1-#-#-3-1:123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-ALM** command.

RTRV-ALM-ENV: Retrieve alarm environment

The **RTRV-ALM-ENV** command retrieves active environmental alarms of the severity CR, MJ, MN (Critical, Major, or Minor (ITU/Telcordia)).

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-ALM-ENV**:*tid*:[*aid*]:*ctag*::[*ptfcncde*],[*almtype*];

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   This is the address of the MDI port entities for which an alarm condition or the configuration is being reported. If misc_inall is specified the information for all entities will be retrieved.
   Type: AID.
   Range: Miscellaneous_in_discreteAID.
   Default: misc_inall (if the aid is omitted).
3. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
4. **ntfcncde** – Notification Code
   This is the alarm severity (alarm level) for which the current alarms are requested.
   Type: Alphanumeric value set.
   Range: ALL, requests all alarms.
   ntfcncde can be omitted. In this case ALL will be set implicit.
5. **almtype** – Alarm Type
   This parameter identifies the type of alarm indication being reported.
   Type: Alphanumeric value set.
   Range: MISC (default), an event that applies to the miscellaneous discrete outputs inputs.

Output format

The following example shows the successful completion of the **RTRV-ALM-ENV** command by the NE:

```
   sid date time
M  ctag COMPLD
   "aid:ntfcncde,almtype,ocrdat,ocrtm[,almmsg]"
   (0 or more lines of the above)
;
```

If no alarms are raised only COMPLD will be returned.

Output parameters

Command parameters

1. **aid** – Access Identifier
   This is the address of the entity for which an alarm condition is being reported.
   Type: AID.
   Range: Miscellaneous_in_discreteAID. The AID misc_inall must not appear.
2. **almtype** – Alarm Type
   This parameter identifies the type of alarm indication being reported.
   Type: Alphanumeric value set.
   Range: MISC (default), an event that applies to the miscellaneous discrete outputs inputs.
3. **ntfcncde** – Notification Code
   This is the alarm severity (alarm level) for which the current alarms are requested.
   Type: Alphanumeric value set.
   Range: ALL, requests all alarms.
   ntfcncde can be omitted. In this case ALL will be set implicit.
4. **ocrdat** – Occurrence Date
   This parameter indicates the raising / clearing date of the alarm.
   Type: value set of the format MM-DD.
   Range: MM represents the month, DD represents the day, leading zeros are not suppressed.
5. **ocrtm** – Occurrence Time
   This parameter indicates the raising / clearing time of the alarm. The accuracy should be +/- 1 second.
   Type: value set of the format HH-MM-SS.
   Range: HH represents the hours, MM represents the minutes, SS represents the seconds, leading zeros are not suppressed.
6. **almmsg** – Alarm Message
   A string describing the alarm of the environmental point.
   Note: This string is configurable by the **SET-ATTR-ENV** command.
   Type: text string.
   Range: upper and lower case, up to 32 characters.
   Default: Miscellaneous Discrete.

Detailed behavior description

Any environmental alarm reported by an autonomous REPT ALM ENV message, which is active when a RTRV-ALM-ENV message is received, is included in the RTRV-ALM-ENV response message.

Environmental alarms of severity NA (warning (ITU) / not alarmed (Telcordia)) are not included in a RTRV-ALM-ENV response. They are included in the RTRV-COND response.

Example input/output

The following example shows the successful completion of the **RTRV-ALM-ENV** command by the NE:

```
RTRV-ALM-ENV:LT-UNITE-123::123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   ″MISC_IN7:MJ,MISC,01-01,07-49-23,\″Miscellaneous Discrete #7\″″
   ″MISC_IN5:MN,MISC,01-01,06-32-25,\″stairway 5 temperature\″″
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-ALM-ENV** command.

RTRV-AO: Retrieve autonomous output

The **RTRV-AO** command is used to retrieve copies of past **REPT DBCHG** messages for users in the memory administration user class.

The copies of **REPT DBCHG** messages available for retrieval include those actually reported to the user as well as those that may not have reached the user due to external (for example, DCN failures) or internal (for example, inhibited autonomous TL1 message reporting) conditions.

If messages are inhibited with the **INH-MSG** command, the internal buffering of autonomous messages is unaffected.

The system saves a copy of each **REPT DBCHG** message for users in the memory administration user class (*uidclass* = MEMADMIN). Those copies share one *atag* counter for all users of the memory administration user class. Message is saved even if no user of the memory administration user class is actually logged into the system.

This is in contrast to the autonomous messages which are sent to users of user classes different from memory administration, where the *atag* counter is available per user session.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

User Class: The user must belong to the user class *uidclass* = MEMADMIN (see "RTRV-USER: Retrieve user" (p. 3-3059)).

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-AO**:*tid*::*ctag*[:::*spec_block*];

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition of *tid* in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **ctag** – Correlation Tag
   See definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2417).

Spec block parameters

1. **atagseq** – ATAG Sequence
   This parameter specifies one or more *atags* for which the **REPT DBCHG** messages is retrieved from the log.

Examples of ranges that are allowed:

- *atagseq*=10 → Retrieve *atag* message 010
- *atagseq*=10&20 → Retrieve *atag* message 010, 020
- *atagseq*=10&&20 → Retrieve *atag* message 010-020
- *atagseq*=999&&1 → Retrieve *atag* message 999, 000, 001.

If the value is omitted, all messages are retrieved, regardless of *atag*.
Type: (range of) numeric string.
Examples of ranges that are allowed:

- *atagseq*=10 Retrieve **REPT DBCHG** message with *atag* 010
- *atagseq*=10&20 Retrieve **REPT DBCHG** message with *atag* s 010, 020
- *atagseq*=10&&20 Retrieve **REPT DBCHG** message with *atag* s 010-020
- *atagseq*=999&&1 Retrieve **REPT DBCHG** message with *atag* s 999, 000, 001.

Range: 0 .. 999
Default: *null*, if the value is omitted, all messages are retrieved, regardless of *atag*.

2. **msgtype** – Message Type
Retrieve only atag messages of this specific type.
Type: Alphanumeric value set.
Range: DBCHG: Retrieve messages reported by **REPT DBCHG**.
Default: *null*, if the value is omitted, only DBCHG messages are retrieved.

Output format

If there are autonomous messages to report, the following response is returned:

```
   sid date time
M  ctag COMPLD
/*
complete autonomous messages without the termination indicator (”;”)
*/
;
```

Sorting

If more than one **REPT DBCHG** message is returned, the output is sorted by ascending time order. If the system clock is reset, the output is sorted in the order in which the messages were stored into the log.

For example, if the system originally sent messages 998 through 001, and the user requests those messages, the *atag* numbers in the output will be in the order: 998, 999, 000, 001.

If the *atag* numbers have wrapped and the most recent entry is *atag* 040, and if the user requests *atagseq*=38&&43, the *atag* order in the output will be 041, 042, 043, 038, 039, 040.

Detailed behavior description

The system returns all **REPT DBCHG** messages matching the *atag* range of the input parameter *atagseq* to the user.

Update affected entities: Execution of this command does not affect other entities in the system.

Example input/output

The following is an example of the successful execution of a RTRV-AO command:

```
RTRV-AO:LT-UNITE:12:123456;
   LT-UNITE 00-11-01 08:00:00
M  123456 COMPLD
/*
   LT-UNITE 00-11-01 07:50:00
A  012 REPT DBCHG
   ″DATE=00-11-01,TIME=07-49-58:ED-NE:::tunstat=ENABLE″
*/
;
```

Error responses

Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command Error Response section. The error responses listed there also apply to the **RTRV-AO** command.

Validation rule: valid *atagseq*

If the NE receives a RTRV-AO command with an invalid *atagseq* value the command is rejected with

Error code: `IDNV – Input Data Not Valid, invalid` *`atagseg`*

Validation rule: user class

If the NE receives a RTRV-AO command from a user that is not in the memory administration user class, i.e. *uidclass* = MEMADMIN, the command is rejected with

Error code: `PICC – Privilege, Illegal Command Code, invalid user class`

RTRV-ASAP-ASGNMT: Retrieve ASAP assignment

The **RTRV-ASAP-ASGNMT** command retrieves a list of AIDs that identifies all users of an ASAP of a specific type and a specific name.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-ASAP-ASGNMT**:*tid*:*aid*:*ctag*::*pftype*,*pfname*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition of “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **ctag** – Correlation Tag
   See definition of “RTRV-HDR: Retrieve header” (p. 3-2417).
3. **aid** – Access Identifier
   Identifies the entity for which and all contained entities the ASAP assignments will be retrieved. Only for a shelf and all its contained entities all ASAP assignments can be retrieved.
   Type: AID.
   Range: ShelfAID.
4. **pftype** – Profile Type
   This parameter indicates the type of the ASAP (ASAP type).
   Type: Alphanumeric value set. A hyphen (“-”) is allowed for the alphanumeric values additionally.
   Range:
   - DCN: Data Communications Network
   - DS1: DS1 asynchronous signals
   - DS3: DS3 asynchronous ports
   - ENET: Ethernet
   - ENV: Environmental (Miscellaneous Discrete)
   - EQUIP-PROT: Equipment with Protection State Dependence
   - EQUIP-UNPROT: Equipment unprotected
   - MS-SPRing-BLSR: MS-SPRing and Bilateral Switched Ring protection switch
   - MSP-APS: Automatic protection switch

- OTN: OTN ports.
- PATH: Path MSA/NIM related
- PATHTERM: Path Termination
- PORT: SDH/SONET ports
- SCN: SCN
- SNCP-UPSR: Sub-Network Connection Protection and Unidirectional Path Switched Ring
- TIMING: System Timing
- TRANSPARENCY: Fully Transparent Service

Default Value: There is no default value. The *pftype* does not change.

5. **`pfname`** – ASAP Profile Name
   This parameter indicates the name of the ASAP. The ASAP name distinguishes ASAPs of the same ASAP type specified by pftype. That means the same name can be used for several ASAP types.
   Type: alphanumeric character string. A hyphen (“-”) is allowed in the name additionally.
   Range: length 1-24 characters.
   For predefined ASAPs is the value of *pfname* ″DEFAULT″, but it is no default name in general.

Output format

The following example shows the successful completion of the **`RTRV-ASAP-ASGNMT`** command by the NE:

```
   sid date time
M  ctag COMPLD
   ″aid_output:pftype,pfname″
   (0 or more lines)
;
```

Output parameters

Command parameters

1. **`aid`**_output – Access Identifier
   Access Identifier of an entity which has an ASAP pointer which points to an ASAP of *pftype*, *pfname*.
   Type: AID.
   Range: All AIDs of entities which contain a ASAP pointer. For entities see in the section ″Entity – ASAP Relation″.
   Default: None.
2. **`pftype`** – Profile Type
   This parameter indicates the type of the ASAP (ASAP type).
   Type: Alphanumeric value set. A hyphen (“-”) is allowed for the alphanumeric values additionally.
   Range:
   - DCN: Data Communications Network
   - DS1: DS1 asynchronous signals
   - DS3: DS3 asynchronous ports
   - ENET: Ethernet
   - ENV: Environmental (Miscellaneous Discrete)
   - EQUIP-PROT: Equipment with Protection State Dependence
   - EQUIP-UNPROT: Equipment unprotected
   - MS-SPRing-BLSR: MS-SPRing and Bilateral Switched Ring protection switch
   - MSP-APS: Automatic protection switch
   - OTN: OTN ports.
   - PATH: Path MSA/NIM related
   - PATHTERM: Path Termination
   - PORT: SDH/SONET ports
   - SCN: SCN
   - SNCP-UPSR: Sub-Network Connection Protection and Unidirectional Path Switched Ring

- TIMING: System Timing
- TRANSPARENCY: Fully Transparent Service

Default Value: There is no default value. The *pftype* does not change.

3. **pfname** – ASAP Profile Name
   This parameter indicates the name of the ASAP. The ASAP name distinguishes ASAPs of the same ASAP type specified by *pftype*. That means the same name can be used for several ASAP types.
   Type: alphanumeric character string. A hyphen (“-”) is allowed in the name additionally.
   Range: length 1-24 characters.
   For predefined ASAPs is the value of *pfname* ″DEFAULT″, but it is no default name in general.

Detailed behavior description

The *RTRV-ASAP-ASGNMT* command does not generate a REPT DBCHG message.

Behavior: No matching profile name

If the system receives a command with a *pfname* that does not exist, then the command will successfully complete with an empty reply list. Thus no data will be returned. Note: A wrong pftype is handled by the general error response IDNV (RTRV-HDR).

Behavior with DEFAULT profile

If the system receives a command with pfname = DEFAULT, then the command will successfully complete with an empty reply list.

Example input/output

The following example shows the successful completion of the **RTRV-ASAP-ASGNMT** command by the NE:

```
RTRV-ASAP-ASGNMT:LT-UNITE-123:1-1:123456::SONET,GTE;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   ″1-1-#-#-1-2:SONET,GTE″
   ″1-1-#-#-1-3:SONET,GTE″
   ″1-1-#-#-4-1:SONET,GTE″
   ″1-1-#-#-4-1:SONET,GTE″
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-ASAP-ASGNMT** command.

Related TL1 messages

- “DLT-ASAP-PROF: Delete alarm severity assignment profile” (p. 3-134)
- “ED-ASAP-PROF: Edit alarm severity assignment profile” (p. 3-284)
- “RTRV-ASAP-PROF: Retrieve ASAP profile” (p. 3-2249)
- “ENT-ASAP-PROF: Enter alarm severity assignment profile” (p. 3-1446).

RTRV-ASAP-PROF: Retrieve ASAP profile

The **RTRV-ASAP-PROF** command retrieves information about one or more alarm severity assignment profile(s).

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-ASAP-PROF**:*tid*::*ctag*::*pftype*[,*pfname*];

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2417).
3. **pftype** – Profile Type
   This parameter indicates the type of the ASAP (ASAP type).
   Type: Alphanumeric value set. A hyphen ("-") is allowed for the alphanumeric values additionally.
   Range:
   - DCN: Data Communications Network
   - DS1: DS1 asynchronous signals
   - DS3: DS3 asynchronous ports
   - ENET: Ethernet
   - ENV: Environmental (Miscellaneous Discrete)
   - EQUIP-PROT: Equipment with Protection State Dependence
   - EQUIP-UNPROT: Equipment unprotected
   - MS-SPRing-BLSR: MS-SPRing and Bilateral Switched Ring protection switch
   - MSP-APS: Automatic protection switch
   - OTN: OTN ports.
   - PATH: Path MSA/NIM related
   - PATHTERM: Path Termination
   - PORT: SDH/SONET ports
   - SCN: SCN

- SNCP-UPSR: Sub-Network Connection Protection and Unidirectional Path Switched Ring
- TIMING: System Timing
- TRANSPARENCY: Fully Transparent Service

Default Value: There is no default value. The *pftype* does not change.

4. **`pfname`** – ASAP Profile Name
   This parameter indicates the name of the ASAP. The ASAP name distinguishes ASAPs of the same ASAP type specified by pftype. That means the same name can be used for several ASAP types.
   Type: alphanumeric character string. A hyphen ("-") is allowed in the name additionally.
   Range: length 1-24 characters.
   For predefined ASAPs is the value of *pfname* ″DEFAULT″, but it is no default name in general.

Output format

The following example shows the successful completion of the **`RTRV-ASAP-PROF`** command by the NE if the *pfname* parameter is omitted:

```
   sid date time
M  ctag COMPLD
   ″pftype=pftype,name=DEFAULT″
   ″pftype=pftype,name=pfname″
   ...
   ″pftype=pftype,name=pfname″
;
```

There may be 0 or more *pfname* lines, where each line gives the name of an ASAP of type *pftype*. Even if ENT-ASAP-PROF has never been used to create a profile for this pftype, RTRV-ASAP-PROF will still return one profile: DEFAULT.

Normal completion response if *pfname* is specified

The following example shows the successful completion of the **`RTRV-ASAP-PROF`** command by the NE if the *pfname* parameter is specified:

```
   sid date time
M  ctag COMPLD
   ″pftype=pftype,name=pfname″
   ″spec_block″
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2417).

Important! Instead of returning an error message the **`RTRV-ASAP-PROF`** command returns success with an empty list when the user tries to retrieve non-existing profiles.

Output parameters

Command parameters

1. **`pftype`** – Profile Type
   This parameter indicates the type of the ASAP (ASAP type).
   Type: Alphanumeric value set. A hyphen (“-”) is allowed for the alphanumeric values additionally.
   Range:
   - DCN: Data Communications Network
   - DS1: DS1 asynchronous signals
   - DS3: DS3 asynchronous ports
   - ENET: Ethernet
   - ENV: Environmental (Miscellaneous Discrete)
   - EQUIP-PROT: Equipment with Protection State Dependence
   - EQUIP-UNPROT: Equipment unprotected
   - MS-SPRing-BLSR: MS-SPRing and Bilateral Switched Ring protection switch
   - MSP-APS: Automatic protection switch
   - OTN: OTN ports.
   - PATH: Path MSA/NIM related
   - PATHTERM: Path Termination
   - PORT: SDH/SONET ports
   - SCN: SCN
   - SNCP-UPSR: Sub-Network Connection Protection and Unidirectional Path Switched Ring
   - TIMING: System Timing
   - TRANSPARENCY: Fully Transparent Service

   Default Value: There is no default value. The *pftype* does not change.
2. **`pfname`** – ASAP Profile Name
   This parameter indicates the name of the ASAP. The ASAP name distinguishes ASAPs of the same ASAP type specified by pftype. That means the same name can be used for several ASAP types.
   Type: alphanumeric character string. A hyphen (“-”) is allowed in the name additionally.
   Range: length 1-24 characters.
   For predefined ASAPs is the value of *pfname* ″DEFAULT″, but it is no default name in general.

Spec block parameters

1. Alarm Severity Profile parameters
   The spec block contains ASAP parameters. Each ASAP parameter defines for a probable cause (*condtype*) the assigned severity which will be reported when the alarm appears. If for one specific probable cause a service affecting (sa) or non service affecting (nsa) alarm can be reported then for each the sa-alarm and nsa-alarm an ASAP parameter exists.
   The severity indicates the urgency of an alarm. The severity of a sa-alarm must be more urgent that of a nsa-alarm for the same *condtype*.
   The description of the ASAP parameters, the relation to the profile types and the default values are described in: “Alarms, events, ASAPs” (p. 6-4).
   All parameters have the same type and value range.
   Type: Alphanumeric value set.
   Range:
   - CR – Critical (ITU / Telcordia)
   - MJ – Major (ITU / Telcordia)
   - MN – Minor (ITU / Telcordia)
   - NA – Warning (ITU) / Not-Alarmed (Telcordia)
   - NR – Non-Alarmed (ITU) / Not-Reported (Telcordia).

   Example: Concrete ASAP parameters are *sa_eqpt* and *nsa_eqpt*. Both refers to the probable cause (*condtype*) EQPT and ASAP type EQUIPPROT. *sa_eqpt* contains the assigned severity for the service affecting alarm of probable cause EQPT and *nsa_eqpt* for the non service affecting alarm. *sa_eqpt* can have the concrete value CR and *nsa_eqpt* MN.

Detailed behavior description

The sysem returns

- All defined profiles of a specific profile type, if only the profile type is specified
- All profile parameters of a specific profile, if profile type and profile name is specified.

If no profile with the specified name exists, the response is empty.

The **RTRV-ASAP-PROF** command does not generate a REPT DBCHG message.

Example input/output

The following example shows the successful completion of the **RTRV-ASAP-PROF** command by the NE if *pfname* is omitted:

```
RTRV-ASAP-PROF:LT-UNITE-123::123456::ENV;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   ”Pftype=ENV,Name=DEFAULT”
```

```
   ”Pftype=ENV,Name=GTE”
;
```

The following example shows the successful completion of the **RTRV-ASAP-PROF** command by the NE if *pfname* and *pftype* is specified:

```
RTRV-ASAP-PROF:LT-UNITE-123::123456::ENET,GTE;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   ”Pftype=ENET,Name=GTE”
   ”sa_vcg_loa=MJ,nsa_vcg_loa=MN,sa_vcg_ssf=MJ,nsa_vcg_ssf=MN,
sa_vcg_plm=MN,nsa_vcg_plm=NA,sa_gfp_lof=CR,nsa_gfp_lof=MJ,sa_lan_los=CR,nsa_lan_
      los=MJ,sa_lan_anm=MN,nsa_lan_anm=NA”
;
```

Error responses

The **RTRV-ASAP-PROF** command does not generate any special error responses. The general error responses defined in "RTRV-HDR: Retrieve header" (p. 3-2417) are also valid for this command.

Related TL1 messages

- "DLT-ASAP-PROF: Delete alarm severity assignment profile" (p. 3-134)
- "ED-ASAP-PROF: Edit alarm severity assignment profile" (p. 3-284)

- "RTRV-ASAP-ASGNMT: Retrieve ASAP assignment" (p. 3-2244)

RTRV-ATTR-CONT: Retrieve attribute control

The **RTRV-ATTR-CONT** command can be initiated by users to retrieve the configuration associated with an miscellaneous output control (MDO port / external discrete control). The assigned descriptions are used for information purposes when a user seeks to operate or release external miscellaneous discrete controls.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-ATTR-CONT**:*tid*:[*aid*]:*ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition of “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **aid** – Access Identifier
   This is the address of the MDO port entities on which the command operates. If misc_outall is specified the configuration of all MDO’s will be retrieved.
   Type: AID
   Range: Miscellaneous_out_discreteAID
   Default: misc_outall (if the *aid* is omitted).
3. **ctag** – Correlation Tag
   See definition of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output format

The following example shows the successful completion of the **RTRV-ATTR-CONT** command by the NE:

```
   sid date time
M  ctag COMPLD
   ”aid:contmsg,durmode,initcstat,[asgncond]”
   ...
   ”aid:contmsg,durmode,initcstat,[asgncond]”
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Command parameters

1. **aid** – Access Identifier
   This is the address of the MDO port entity for which the configuration is retrieved or on which an operation is performed.
   Type: AID.
   Range: Miscellaneous_out_discreteAID. misc_outall must not be reported or used.
2. **contmsg** – Control Message
   This is the name associated to a MDO port (environmental control). It is a description which can be retrieved by the management system.
   Type: inner string.
   Range: string up to 26 characters, any character except ″ and \, upper and lower cases considered. A empty string is allowed. The value would be \″\″.
   Default: MDO port #n. n is the number of the port 1 … 8.
3. **durmode** – Duration Mode
   This parameter defines in which mode the device connected to the MDO is expected to be operated. It is a fixed value because this feature will be not supported by the system. This parameter is in for compatibility reason. The system operates only continuous that means if the MDO is operated it is switched on and it is released it is switched off.
   Type: Alphanumeric value set.
   Range: CONTS, continuous duration.
4. **initcstat** – Initial Control State
   This parameter defines the state the MDO must have in order to put the connected device in the ″off″-state. For UNITE it is a fixed value because this feature will be not supported. This parameter is in for compatibility reason.
   Type: Alphanumeric value set.
   Range: RLS, release.
5. **asgncond** – Assigned Condition Type
   This parameter identifies the probable cause (type of alarm indication) which is assigned to an MDO port (external control). If one or more alarm(s) of this probable cause appears then the MDO port (external control) will be switched on.
   Type: Alphanumeric value set. Additionally a “-” will be allowed (not the first character).
   Range: All defined probable causes and UNDEF: if no probable cause is assigned.
   Default: UNDEF.

Detailed behavior description

The **RTRV-ATTR-CONT** command does not generate a REPT DBCHG message.

Example input/output

The following example shows the successful completion of the **RTRV-ATTR-CONT** command by the NE:

```
RTRV-ATTR-CONT:LT-UNITE-123:MISC_OUT3:123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   ”MISC_OUT3:\”fan 3\”,CONTS,RLS,FANF”
;
```

The following example shows the successful completion of the **RTRV-ATTR-CONT** command by the NE if the aid is omitted:

```
RTRV-ATTR-CONT:LT-UNITE-123::123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   ”MISC_OUT2:\”sprinkler 2\”,CONTS,RLS”
   ”MISC_OUT3:\”fan 3\”,CONTS,OPER,FANF”
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-ATTR-ENV** command.

RTRV-ATTR-ENV: Retrieve attribute environment

The **RTRV-ATTR-ENV** command is used to retrieve the alarm message, name and assigned ASAP of a miscellaneous discrete input (MDI/environmental point).

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-ALM-ENV**:*tid*:[*aid*]:*ctag*;

Input parameters

Command parameters

- **tid** – Target Identifier
  See definition of “RTRV-HDR: Retrieve header” (p. 3-2417).
- **aid** – Access Identifier
  This is the address of the MDI port entities for which an alarm condition or the configuration is being reported. If misc_inall is specified the information for all entities will be retrieved.
  Type: AID.
  Range: Miscellaneous_in_discreteAID.
  Default: misc_inall (if the aid is omitted).
- **ctag** – Correlation Tag
  See definition of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output format

The following example shows the successful completion of the **RTRV-ATTR-ENV** command by the NE:

```
   sid date time
M  ctag COMPLD
   "aid:,,envmsg,envname:pfname,envinv"
   (more lines for default AID)
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   This is the address of the entity for which an alarm condition is being reported.
   Type: AID.
   Range: Miscellaneous_in_discreteAID. The AID misc_inall must not appear.
2. **`envinv`** – Environmental Alarm Inversion
   This parameter indicates for the MDI (environmental point) whether an alarm is generated if the port is on or if the port is off.
   Type: Alphanumeric value set.
   Range:
   - YES: The alarm will be inverted
   - NO: The alarm will be not inverted.
3. **`envmsg`** – Environment Message
   This is the condition description which is associated with the MDI port (environmental point). This description will be sent with the alarm generated from the MDI port.
   Type: inner string.
   Range: a string up to 32 characters, any character except ″ and \, upper and lower cases are considered.
   Default: Miscellaneous Discrete #<N> with N = 1 .. 8 for the different MDI ports.
4. **`envname`** – Environmental Point Name
   This is the name associated to a MDI port (environmental point). It is a description which can be retrieved by the management system. It is not to be mixed up with the envmsg parameter. The envname is just a name of the MDI port and not reported via the condition description of an alarm.
   Type: inner string
   Range: a string up to 26 characters, any character except ″ and \, upper and lower cases considered.
   Default: MDI port #n; n is the number of the port 1 … 8.
5. **`pfname`** – Profile Name
   This is the name of the ASAP that is assigned to the MDI port (environmental point). The ASAP must be of the type ENV.
   Type: alphanumeric character string. A hyphen (“-”) is allowed in the name additionally.
   Range: string up to 24 characters.
   Default: DEFAULT.

Detailed behavior description

The **`RTRV-ATTR-ENV`** command does not generate a REPT DBCHG message.

Example input/output

The following example shows the successful completion of the **RTRV-ATTR-ENV** command by the NE:

```
RTRV-ATTR-ENV:LT-UNITE-123:misc_in3:123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   ″MISC_IN3:,,\″smoke detected on detector 3\″,\″smoke detector 3\″:ENV_CR,NO″
;
```

The following example shows the successful completion of the **RTRV-ATTR-ENV** command by the NE if all MDI's will be retrieved:

```
RTRV-ATTR-ENV:LT-UNITE-123::123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   ″MISC_IN1:,,\″pump on\″:ENV_NA,NO″
   ″MISC_IN2:,,\″smoke detected on detector 1\″,\″smoke detector 1\″:ENV_CR,NO″
   ″MISC_IN3:,,\″smoke detected on detector 2\″,\″smoke detector 2\″:ENV_CR,NO″
   ″MISC_IN4:,,\″smoke detected on detector 3\″,\″smoke detector 3\::ENV_CR,NO″
   ″MISC_IN5:,,\″smoke detected on detector 4\″,\″smoke detector 4\″:ENV_CR,NO″
   ″MISC_IN6:,,\″fan on\″,\″fan\″:ENV_NA,YES″
   ″MISC_IN7:,,\″open door\″,\″door\″:DEFAULT,YES″
   ″MISC_IN8:,,\″open door\″,\″door 2\″:DEFAULT,YES″
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **RTRV-ATTR-ENV** command.

Related TL1 messages

- "REPT-ALM-ENV: Report alarm environment" (p. 3-2101)
- "RTRV-ALM-ENV: Retrieve alarm environment" (p. 3-2238)
- "SET-ATTR-ENV: Set attribute environment" (p. 3-3137).

RTRV-ATTR-MSG: Retrieve attribute message

The **RTRV-ATTR-MSG** command is used to retrieve the current status of the autonomous message reporting, which can be controlled via INH-MSG and ALW-MSG.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: yes

Input format

Command syntax: **RTRV-ATTR-MSG***:tid::ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the “RTRV-HDR: Retrieve header” (p. 3-2417) command for the input parameter syntax and description of this parameter.

Output format

If the RTRV-ATTR-MSG request completes successfully, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   ″sessions:msgstate″
   . . .
;
```

For each value of parameter *sessions* one line is reported.

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

1. **`sessions`** – Affected sessions
   This parameter specifies for which sessions the *msgstate* is applied.
   Type: Alphanumeric value set.
   Range: CURRENT: affected session is the current session of the user who executed the command.
   Default: CURRENT
2. **`msgstate`** – Message status
   The current state of autonomous message reporting for *sessions*.
   Type: Alphanumeric value set.
   Range:
   - ON: autonomous reporting is enabled for *sessions*
   - OFF: autonomous reporting is disabled for *sessions*.

   Default: ON

Detailed behavior description

The command retrieves the current status of the autonomous message reporting for all values of parameter *sessions*. Control of this state is via the commands INH-MSG and ALW-MSG.

When a user logs into the system via ACT-USER it is recommended to retrieve the status of autonomous reporting to check whether reporting is OFF for *sessions* = ALL.

Example input/output

The following is an example of the **`RTRV-ATTR-MSG`** command:

```
RTRV-ATTR-MSG:LT-UNITE::123456;

   LT-UNITE 00-11-15 08:00:00
M  123456 COMPLD
   ″ALL:ON″
   ″CURRENT:OFF″
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **`INH-MSG`** command.

Related TL1 messages

- “ALW-MSG: Allow message” (p. 3-33)
- “INH-MSG: Inhibit message” (p. 3-2021)

GR-833-CORE

RTRV-AUDLOG: Retrieve audit result log for ONNS connection data

Overview

The **RTRV-AUDLOG**-*mod* command is used to request information about the last audit result on ONNS data that is stored. Note that this command does not perform the audit operation. See AUD-mod TL1 command for the details of audit operation. The modifier of the RTRV-AUDLOG-mod command indicates the scope of data the audit operation was performed on.

RTRV-AUDLOG-LOCAL

RTRV-AUDLOG-LOCAL shall retrieve the last audit result based on comparison of ONNS data with the master data from local host NE. Mismatched cross-connects and port objects between two sets of data will be displayed..

RTRV-AUDLOG-PATHNBR

RTRV-AUDLOG-PATHNBR shall retrieve the last audit result based on comparison of ONNS path data with neighboring ONNS nodes.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Abortable: No

Input format

Command Syntax of RTRV-AUDLOG-LOCAL:
RTRV-AUDLOG-LOCAL:*srcTid:srcAid:ctag;*

Command Syntax of RTRV-AUDLOG-PATHNBR:
RTRV-AUDLOG-PATHNBR:*srcTid:srcAid:ctag;*

Input parameters

Command parameters

1. **srcTid**
   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **srcAid**
   Source node ONNS application access identifier of the ONNS controller OS command interface port.
   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn.
3. **ctag**
   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ".").

Output format

If the RTRV-AUDLOG-LOCAL request completes successfully, the following normal completion response is returned:

```
   srcTid date time
M  ctag COMPLD
   ″ExtraPortIDs=1portID,2portID,...,N1portID″

   ″MissingPortIDs=1portID,2portID,...,N2portID″

   ″ExtraNNXcons=1connPtID1,-X-,1connPtID2,1bandwidth,1pathID
   :2connPtID1,-X-,2connPtID2,2bandwidth,2pathID
   :...
   :N3connPtID1,-X-,N3connPtID2,N3bandwidth,N3pathID″

   ″MissingNNXcons=1connPtID1,-X-,1connPtID2,1bandwidth
   :2connPtID1,-X-,2connPtID2,2bandwidth
   :...
   :N4connPtID1,-X-,N4connPtID2,N4bandwidth″

   ″ExtraNonNNXcons=1connPtID1,-X-,1connPtID2,1bandwidth
   :...
   :N5connPtID1,-X-,N5connPtID2,N5bandwidth″
```

```
   ″MissingNonNNXcons=1connPtID1,-X-,1connPtID2,1bandwidth
   :...
   :N6connPtID1,-X-,N6connPtID2,N6bandwidth″

   ″MultipleNNXcons=1connPtID1,-X-,1connPtID2,1connPtID3,-X-
    ,1connPtID4, 1bandwidth, 1pathID
   :...
   : N7connPtID1,-X-,N7connPtID2,N7connPtID3,-X-
    ,N7connPtID4,N7bandwidth, N7pathID″
;
```

The output shows any mismatched port objects and mismatched cross connect information in comparing NN data and host NE data.

For mismatched port objects, the cases may occur are as follows:

- port object exists only in NN data, but not in host NE data (ExtraPortIDs)
- port object exists only in host NE data, but not in NN.

The cases in the response represent the mismatched port objects or mismatched cross connect information as follows:

- ExtraPortIDs – port object exists only in NN data, but not in host NE data
- MissingPortIDs – pport object exists only in host NE data, but not in NN data
- ExtraNNXcons – NN owned cross-connect exists only in NN data, but not in host NE
- MissingNNXcons – NN owned cross-connect exists only in host NE data, but not in NN data
- ExtraNonNNXcons – non-NN owned cross-connect exists only in NN data, but not in host NE
- MissingNonNNXcons – non-NN owned cross-connect exists only in host NE data, but not in NN data.

The symbol (-X-) indicates that a cross-connection is present between the connPtIDs on an output line. See Aud-LOCAL for the details of audit operation.

If the RTRV-AUDLOG-PATHNBR request completes successfully, the following normal completion response is returned:

```
   srcTid date time
M  ctag COMPLD
   ″MismatchedPathIDs=1connPtID1,-X-
      ,1connPtID2,1bandwidth,1localpathID,1nbrnodeID,1nbrpathID
   :2onnPtID1,-X-,2connPtID2,2bandwidth,2localpathID,2nbrnodeId,2nbrpathID
   :...
   :NconnPtID1,-X-,NconnPtID2,Nbandwidth,NlocalpathID,NnbrnodeID,NnbrpathID″
   ″NotReachedNeighborNodes=1nbrnodeId,2nbrnodeID,...,NnbrnodeID″
```

;

The output shall show any mismatched path data in comparing path information at a local NN with its neighboring nodes.

The cases in the response represent the mismatched path information as follows:

- When all the parameters have valid values – local node and neighboring node have different pathIDs for the same path.
- When the parameter for pathID at neighboring node (nbrpathID) is empty – local node has a cross-connect that is connected to a neighboring node, but the neighboring node does not have the corresponding cross-connect or path information.
- When the parameter for pathID at local node (localpathID) is empty – neighboring node has a cross-connect that is connected to a local node, but the local node does not have the corresponding cross-connect or path information.

The symbol (-X-) indicates that a cross-connection is present between the connPtIDs on an output line.

All neighbor nodes which are not reachable are be listed. For these neighbor nodes is was not possible to retrieve information for comparison of the ONNS path data.

Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *conpletion code* and their syntax are included in the section “Output parameters” of the “RTRV-PATH: Retrieve ONNS connection data” (p. 3-2698) command.

1. **`pathID`**
   The PathID of the specific path to be reported.
   Type: character string of length up to 20
   Range: nodeID-Index. *nodeID*: four dot separated numeric strings: each string 0..255 *Index*: numeric string 0-65535.
   The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.
   Example: 29.13.196.203-65111
2. **`localpathID`**
   The PathID of the local node of the specific path to be reported.
   Type: character string of length up to 20
   Range: nodeID-Index. *nodeID*: four dot separated numeric strings: each string 0..255 *Index*: numeric string 0-65535.
   The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.
   Example: 29.13.196.203-65535

3. **`nbrpathID`**
   The PathID of the neighbor node of the specific path to be reported.
   Type: character string of length up to 20
   Range: nodeID-Index. *nodeID*: four dot separated numeric strings: each string 0..255 *Index*: numeric string 0-65535.
   The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.
   Example: 29.13.196.203-65111

4. **`nbrnodeID`**
   ONNS node Network Access identifier (nodeID) of the neighbor node. *nodeID* is not changable and may be different from Signaling network IP address.
   Type: Four dot separated numeric strings
   Range: for each numeric string: 0..255.

5. **`bandwidth`** – Requested bandwidth / connection *signalRate*
   ONNS bandwidth is equal to or greater than the minimum cross connect rate (minXCrate) of the port type. Note: Only SONET switching levels in enumeration. For actual cross-connections ONNS adapts to SDH formats automatically if the ingress port is SDH.
   Type: Value set.
   Values: STS1, STS3, STS12, STS48, STS192.

6. **`portID`**
   portID of port object discrepancy between NN data and NE data. The *portID* consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # . ONNS assumes a bidirectional port pair.
   Type: dash-separated list of 5 numeric strings.
   Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).
   Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (#), Port # (#), Tributary # (#). This range is valid for protecting connections in M:N connection groups

7. **`connPtID1`**
   ONNS connection point identifier (connPtID1) for the ingress RX connPt of the cross-connection. It consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary #..
   Type: dash-separated list of 5 numeric strings.
   Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).
   Range: Bay/Frame ## (1), Shelf # (1), Slot/Pack # #, Port # #, Tributary ##. Default tributary AID used for reporting the not existing xcons in the A-node or Z-node for a path associated to a protecting NN connection of an M:N connection group.
   Range: Slot/Pack#*, Port#*, Tributary#*
   Value * for Slot/Pack, Port and Tributary indicates unknown HO tributary AIDs used for reporting that the corresponding HO tributary of an EDGE port (specified in parameter connPtA) is allocated by one or more LO traditional

cross-connections.
Range: Slot/Back#@, Port#@, Tributary#@
Value @ for Slot/Pack, Port and Tributary indicates that the corresponding HO input and/or output tributary specified by connPtA is involved as EDGE-prt tributary in an OUC.

8. **connPtID2**
ONNS connection point identifier (connPtID2) for the egress TX connPt of the cross-connection. It consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary #.
Type: dash-separated list of 5 numeric strings.
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack ##, Port ##, Tributary ##. Default tributary AID used for reporting the not existing xcons in the A-node or Z-node for a path associated to a protecting NN connection of an M:N connection group.
Range: Slot/Pack#*, Port#*, Tributary#*
Value * for Slot/Pack, Port and Tributary indicates unknown HO tributary AIDs used for reporting that the corresponding HO tributary of an EDGE port (specified in parameter connPtA) is allocated by one or more LO traditional cross-connections.
Range: Slot/Back#@, Port#@, Tributary#@
Value @ for Slot/Pack, Port and Tributary indicates that the corresponding HO input and/or output tributary specified by connPtA is involved as EDGE-prt tributary in an OUC.

9. **connPtID3**
ONNS connection point identifier (connPtID3) for the egress TX connPt of the cross-connection. It consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary #.
Type: dash-separated list of 5 numeric strings.
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack ##, Port ##, Tributary ##. Default tributary AID used for reporting the not existing xcons in the A-node or Z-node for a path associated to a protecting NN connection of an M:N connection group.
Range: Slot/Pack#*, Port#*, Tributary#*
Value * for Slot/Pack, Port and Tributary indicates unknown HO tributary AIDs used for reporting that the corresponding HO tributary of an EDGE port (specified in parameter connPtA) is allocated by one or more LO traditional

cross-connections.
Range: Slot/Back#@, Port#@, Tributary#@
Value @ for Slot/Pack, Port and Tributary indicates that the corresponding HO input and/or output tributary specified by connPtA is involved as EDGE-prt tributary in an OUC.

10. **connPtID4**
ONNS connection point identifier (connPtID4) for the egress TX connPt of the cross-connection. It consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary #.
Type: dash-separated list of 5 numeric strings.
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).
Range: Bay/Frame # (1), Shelf # (1), Slot/Pack ##, Port ##, Tributary ##. Default tributary AID used for reporting the not existing xcons in the A-node or Z-node for a path associated to a protecting NN connection of an M:N connection group.
Range: Slot/Pack#*, Port#*, Tributary#*
Value * for Slot/Pack, Port and Tributary indicates unknown HO tributary AIDs used for reporting that the corresponding HO tributary of an EDGE port (specified in parameter connPtA) is allocated by one or more LO traditional cross-connections.
Range: Slot/Back#@, Port#@, Tributary#@
Value @ for Slot/Pack, Port and Tributary indicates that the corresponding HO input and/or output tributary specified by connPtA is involved as EDGE-prt tributary in an OUC.

Example input/output

The following example shows a successful completion of a RTRV-AUDLOG command for local ONNS data audit operation by the NE with no data is out-of-sync:

```
RTRV-AUDLOG-LOCAL:LT-ONNS-789:snn:123456;

   LT-ONNS-789 2003-01-01 08:00:00
M  123456 COMPLD
   ″ExtraPortIDs=NONE″
   ″MissingPortIDs=NONE″
   ″ExtraNNXcons=NONE″
   ″MissingNNXcons=NONE″
   ″ExtraNonNNXcons=NONE″
   ″MissingNonNNXcons=NONE″
   ″MultipleNNXcons=NONE″
;
```

The following example shows a successful completion of a RTRV-AUDLOG command for local ONNS data audit operation by the NE:

```
RTRV-AUDLOG-LOCAL:LT-ONNS-789:snn:123456;
```

```
   LT-ONNS-789 2003-01-01 08:00:00
M  123456 COMPLD
   ″ExtraPortIDs=1-1-20-3-5″
   ″MissingPortIDs=NONE″
   ″ExtraNNXcons=1-6-5-3-1,-X-,1-2-4-3-1,sts48,29.13.196.203-43216
   :1-1-4-4-1,-X-,1-2-1-3-1,sts12,29.13.18.23-12345″
   ″MissingNNXcons=1-1-8-10-2,-X-,1-1-3-3-4,sts48″
   ″ExtraNonNNXcons=NONE″
   ″MissingNonNNXcons=NONE″
   ″MultipleNNXcons=NONE″
;
```

The symbol (-X-) indicates that a cross-connection is present between the *connPtIDs* on an output line.

The following example shows a successful completion of a RTRV-AUDLOG command for ONNS path neighbor data audit operation by the NE with no data is out-of-sync:

```
RTRV-AUDLOG-PATHNBR:LT-ONNS-789:snn:123456;

   LT-ONNS-789 2003-01-01 08:00:00
M  123456 COMPLD
   ″MismatchedPathIDs=NONE″
   ″NotReachedNeighborNodes=NONE″
;
```

The following example shows a successful completion of a RTRV-AUDLOG command for ONNS path neighbor data audit operation by the NE:

```
RTRV-AUDLOG-PATHNBR:LT-ONNS-789:snn:123456;

   LT-ONNS-789 2003-01-01 08:00:00
M  123456 COMPLD
   ″MismatchedPathIDs=1-1-4-4-1,-X-,1-2-1-3-1,sts12,29.13.18.23-
      00000,168.16.29.111,135.14.196.203-32165
   :1-1-7-4-2,-X-,1-1-3-5-1,sts48,,29.13.18.23,135.14.196.109-12164″
   ″NotReachedNeighborNodes=29.12.13.1,29.12.13.2″
;
```

The symbol (-X-) indicates that a cross-connection is present between the connPtIDs on an output line.

Possible issues when widely using unidirectional ONNS connections

When in an ONNS network unidirectional ONNS connections are widely used, the following misbehavior may occur:

1. Local audit erroneously reports extra NN cross-connections: **AUD-LOCAL** and **RTRV-AUDLOG** may erroneously report extra NN cross-connections, if two unidirectional ONNS connections of differing bandwidth are traversing a node in opposite directions, but with connecting the same timeslots, for example, one connection from timeslot A to timeslot B and the other one from timeslot B to timeslot A.
2. Free bandwidth generally advertised on an INNI link, although no more bandwidth for bidirectional ONNS connections available: Setup of a bidirectional ONNS connection via an INNI link may fail, although for this link enough free bandwidth is generally advertised for example, via **RTRV-NTDR**. This is the case, if the corresponding link is nearly totally filled with a major part being unidirectional connections. The advertised free bandwidth may then refer to differing timeslots for both directions, thus not allowing bidirectional connections to be setup.

RTRV-BANNER

The **RTRV-BANNER** command can be initiated by users to retrieve the user-provisioned banner for the System.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: No.

Input format

Command syntax: **RTRV-BANNER**:*tid*::*ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition of “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **ctag** – Correlation Tag
   See definition of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output format

After receiving the **RTRV-BANNER** command, the following normal completion response is returned::

```
   sid date time
M  ctag COMPLD
   ":::spec_block"
    ...
    < 1 line for each Spec Block parameter to be reported >
    ...
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Spec block parameters

1. **`line1`** – Line 1 of the Customer Provisionable Banner.
   Setting line1 to an empty string will suppress the output of the Customer Provisionable Banner in the response to the **`ACT-USER`** command.
   Type: text string
   Range: 2 … 62 characters, case-sensitive. The beginning and ending double quotes are included.
   Default: none. The initial value is an empty string.
2. **`line 2`** … line 11 – Line 2 (…Line 11) of the Customer Provisionable Banner.
   Type: text string
   Range: 2 … 62 characters, case-sensitive. The beginning and ending double quotes are included.
   Default: none. The initial value is an empty string.

Detailed behavior description

The **`RTRV-BANNER`** command shall return one line for each provisioned line of the Customer Provisionable Banner. A line of the Customer Provisionable Banner is provisioned, if the corresponding spec block parameter (line1 … line 11) is not an empty string.

Example input/output

The following example shows the successful completion of the **`RTRV-BANNER`** command by the network element:

```
RTRV-BANNER:LT-UNITE-123::123456;

   LT-UNITE-123 04-12-23 08:00:00
M  123456 COMPLD
″:::LINE1=\″NOTICE: THIS IS A PRIVATE COMPUTER SYSTEM.\″″
″:::LINE2=\″UNAUTHORIZED ACCESS OR USE MAY LEAD TO PROSECUTION.\″″
;
```

- "ENT-BANNER" (p. 3-1452).

RTRV-CKT: Retrieve circuit

The **RTRV-CKT** retrieves circuits which use a specified BLSR/MS-SPRing ring channel. The command is only functional in rings with automatic ring discovery enabled.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-CKT**:*tid*:*aid*:*ctag*;

Input parameters

Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2417).
2. **aid** – Access Identifier
   This parameter specifies a tributary of a BLSR/MS-SPRING port for which the circuit information is requested to be retrieved.
   Type: AID
   Range: GenTribAID (not ranged)
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters.
   Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

Output format

After receiving the **RTRV-CKT** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "rid"
   "ntid,nid,src,dest,[cctype],[rate][:spec_block]"
   ...
   ...
   "ntid,nid,src,dest,[cctype],[rate][:spec_block]"
;
```

Output parameters

Command parameters

1. **`rid`** – Ring Identification
   This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the *rid* to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
   Type: text string of chars allowed for TID strings
   Range: 1 to 15 characters
2. **`ntid`** – Node Target Identifier
   This parameter identifies the TID of the node on which the reported cross-connection exists. This is the currently active name of the NE to which the command is addressed. The *tid* is a case insensitive character string.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: 1 to 20 characters
3. **`nid`** – Node ID
   This parameter specifies the node ID of the NE within the ring as used by the MS-SPRing/BLSR APS protocol. It shall correspond to the first TID in the *linkid* block.
   Type: Numeric string.
   Range: 0 … 15
4. **`src`** – Source
   This parameter specifies the tributary which is the source of the cross-connection or displays an error identifier for the input of a missing xconn.
   Type: Value set.
   Range: 20 characters

   The allowed values are:

   - GenTribAID: a tributary AID for a local xconn
   - REM-<AID>TS#: This value is reported as the *aid* in an MS SPRING / BLSR worker port on a remote node. <AID> is replaced by the received worker port AID of a remote node (note: The syntax of the remote AID will be not checked; it is only displayed) and # identifies the timeslot number on the interface. (e.g.: REM-m1-1-TS1)
   - REM-PPORT-TS#: This value is reported as the *aid* in an MS SPRING / BLSR protection port on a remote node.

     # identifies the timeslot number on the interface. (e.g.: REM-PPORT-TS5)

- REMAID: This value is reported as the input aid of an add/drop cross-connection at a remote node.
- PIF (Path Integrity Failure): This value is used to identify the input aid of a missing connection.

5. **`dest`** – Destination
   This parameter specifies the destination which is the sink of the cross-connection or displays an error identifier for the output of a missing xconn.
   Type: Value set.
   Range: 20 characters
   The allowed values are:
   - GenTribAID: a tributary AID for a local xconn
   - REM-<AID>TS#: This value is reported as the *aid* in an MS SPRING / BLSR worker port on a remote node. <AID> is replaced by the received worker port AID of a remote node (note: The AID can be not in the UNITE syntax; it is only displayed) and # identifies the timeslot number on the interface.
   - REM-PPORT-TS#: This value is reported as the *aid* in an MS SPRING / BLSR protection port on a remote node.
     # identifies the timeslot number on the interface. (e.g.: REM-PPORT-TS5)
   - REMAID: This value is reported as the input aid of an add/drop cross-connection at a remote node.
   - PIF (Path Integrity Failure): This value is used to identify the input aid of a missing connection.
6. **`cctype`** – Cross Connection Type
   This parameter specifies the type of the cross-connection:
   Type: Alphanumeric value string
   Range: UNIDIR (default)
7. **`rate`** – Cross Connection Rate
   This parameter indicates the cross-connection rate. For a detailed description please refer to the input parameter *modifier*.
   Type: Alphanumeric value string
   Range: LOVC12, LOVC3, VC3, VC4, VC44C, VC416C, VC464C, LOVT1, STS1, STS3, STS12, STS48, STS192
   Conversion Cross-Connections:
   - AU3TU3 (HO VC3/STS1 input to LO VC3 output)
   - TU3AU3 (LO VC3 input to HO VC3/STS1 output)

Spec block parameters

1. **exreestbl** – Extra Traffic Channel Reestablishment
   The parameter exreestbl shall indicate, whether the extra traffic circuit is a candidate for reestablishment wrt ring switching or span switching for the addressed span. The parameter is only supported for protection groups in the local node with protection switch mode TOPEX. For remote nodes or protection groups other than TOPEX the parameter is omitted.
   Type: Alphanumeric value set.
   Range:
   - NONE: no candidate for reestablishment
   - RING: a candidate for reestablishment via ring switching
   - SPAN: a candidate for reestablishment via span switching
   - RINGSPAN: a candidate for reestablishment via ring and span switching
   - NA: Not Applicable (for service traffic channels)
2. **loca** – Location-a
   This parameter specifies the TID of the node at which service is added to the BLSR. This parameter is required for BLSR THROUGH, INTER-BLSR and DROP connections.
   The *loca* parameter value is an empty string for ADD and non-BLSR connections. A 2way cross-connection is considered to be a DROP if the *out_aid* is a non BLSR tributary.The figure “2-way scenario” (p. 3-2322)in RTRV-CRS section (the 3 NEs should be seen as part of an BLSR) depicts the 2way scenario.
   Inter ring cross-connections with collapsed node: Note that beside the above described THROUGH case there can be also another situation where both *loca* and *locz* are different from the empty string: If two rings are interconnected in a collapsed node then *loca* refers to the (add-node of the) ring where the signal is dropped from, and *locz* refers to the (drop-node of the) ring where the signal is added to. In such cases the cross-connection cannot be provisioned as bidirectional, thus the information is still unambiguous.
   A note to the *loca2* parameter: Although *loca2* (Location-a-2) is a parameter which is used in the **ENT-CRS** command, *loca2* is not retrieved explicitly. This is due to the fact that for path-protected cross-connections – and only for those this *loca2* is applicable – the retrieval will be on a leg-basis and not on a leg-pair basis. In other words: If a path-protected cross-connection is retrieved two entries will be sent, one for the working leg (incl. the *loca* and *locz* parameter) and one for the protection leg (incl. the *loca* parameter and the same *locz* parameter, and in this case the *loca* returned is the *loca2* as entered when establishing the path-protected cross-connection).
   The parameter loca is also required for EXTRA TRAFFIC connections. (In contrast to incoming references from other commands to this whole chapter it is exclusively applicable for the command **RTRV-CRS**.). For extra traffic the value will be generated automatically and thus it is only retrievable.
   For information about the automatic generation of *loca* refer to the parameter *sqfa*.

For lower-order cross-connections the parameter *loca* is the TID of that ring node in the direction towards the specified input tributary (upstream), where the HO path termination source function resides. If there is no such function in an upstream ring node then *loca* is the TID of the node where the related HO circuit is first added to the ring. The figure "Lower-order cross-connections" (p. 3-2322) in RTRV-CRS section shows an example of a LO path through as part of a ring.
The LO path is added to/dropped from the ring in NE-1 and NE-2. 2-way cross-connections are considered to be either an Add or a Drop connection depending whether the input or the output tributary is at the ring port. In NE-3 there is a HO through connection, which contains the LO path. In NE-3 there is no HO path termination. In NE-4 there is a LO through connection. Consequently, there are HO path terminations in NE-4.

The fact that *loca* refers to the HO path terminations has the following consequences:

- All LO cross-connections through the same HO path termination at the MS-SPRing port have the same *loca* value.
- Any LO through-connection will be treated as add/drop. *loca* will identify the node of the through connection, and not the node where the LO service is added to the ring.

At the lower-order side of a conversion cross-connection, the same rules for *loca* is applicable as for lower-order cross-connections.
Type: TID or empty-string
Range: Please refer to the TID definition in the RTRV-HDR description
Default: empty string: ″″
Note: In output direction the empty string appears as \″\″.

3. **locz** – Location-z
This parameter identifies specifies the TID of the node at which service is dropped from the BLSR. This parameter is required for BLSR THROUGH, INTER-BLSR and ADD connections. The *locz* parameter value is an empty string for DROP and non-BLSR connections.
A 2-way cross-connection is considered to be a ADD if the *in_aid* is a non BLSR tributary. The figure "2-way scenario" (p. 3-2322)in RTRV-CRS section (the 3 NEs should be seen as part of an BLSR) depicts the 2way scenario.
locz is also required for EXTRA TRAFFIC connections. For extra traffic the value will be generated automatically and thus it is only retrievable. For information about the automatic generation of *locz* refer to the parameter *sqfz*.
For lower-order cross-connections the parameter *locz* is the TID of that ring node in the direction towards the specified output tributary (downstream), where the HO path termination sink function resides. If there is no such function in a downstream ring node then *locz* is the TID of the node, where the related HO circuit is last dropped from the ring. Refer to the figure "Lower-order cross-connections" (p. 3-2322)in the RTRV-CRS section for further explanation.

The fact that *locz* refers to the HO path terminations has the following consequences:

- All LO cross-connections through the same HO path termination at the MS-SPRing port have the same *locz* value.
- Any LO through-connection will be treated as add/drop. *locz* will identify the node of the through connection, and not the node where the LO service is dropped from the ring.

At the lower-order side of a conversion cross-connection, the same rules for *locz* is applicable as for lower-order cross-connections.
Type: TID or empty-string.
Range: Please refer to the TID definition in the RTRV-HDR description
Default: empty string: ""
Note: In output direction the empty string appears as \"\".

4. **`rappl`** – Ring Application
The ring application is as given by the contents of the local squelch map in the direction of circuit tracing. This parameter depicts the cross-connection application in the remote nodes and the local node for the direction of the circuit tracing.
Type: Alphanumeric value set.
Range: ADD, DROP, THRU, TSI-THRU, DROPMUL, ADDSEL, DROPMUL-PROT, ADDSEL-PROT

5. **`srvcrest`** – Service Channel Restoration
The parameter indicates, whether the service traffic circuit is a candidate for restoration wrt. ring switching or span switching for the addressed span. The parameter is only supported for protection groups in the local node with protection switch mode TOPEX. For remote nodes or protection groups other than TOPEX the parameter is omitted.
Type: Alphanumeric value set.
Range:
   - NONE: no candidate for reestablishment
   - RING: a candidate for reestablishment via ring switching
   - SPAN: a candidate for reestablishment via span switching
   - RINGSPAN: a candidate for reestablishment via ring and span switching
   - NA: Not Applicable (for service traffic channels)

Detailed behavior description

No cross-connection

If there is no cross-connection at the logical input or output channel/tributary in the local node, the command shall complete, but no circuits are reported.

Specified tributary does not exist

If the tributary specified in the command does not exist, then the command shall complete with an empty response.

Only unidirectional cross-connections

A bidirectional (2-way) cross-connection is handled as two unidirectional (1-way) cross-connections.

Order of circuits and direction of tracing

If the STS-N channel / tributary as input of the Retrieve Circuit command is source and / or destination of more than one local *xconn*, the local *xconns* is sorted as follows:

- a local unidirectional / point_to_multipoint xconn with the given tributary as destination point, tracing direction of the associated circuit is the egressing direction of the port with the given tributary
- a local unidirectional / point_to_multipoint xconn with the given tributary as source point, tracing direction of the associated circuit is the ingressing direction of the port with the given tributary

In this sequence the circuits associated with the local xconns are listed in the reponse of the command.

Order of xconns in a circuit

The remote and local xconns of a circuit is sorted beginning with the xconn of the source node and ending with the xconn of the destination node whereas source and destination nodes are determined by the direction of tracing. In case that there are more than one local xconn legs contributing to the circuit they is listed consecutively starting with the through part.

For the local NE there are several output lines, one for each cross-connection leg of the circuit. For remote NEs there is only one line reported. The *rappl* values ADDSEL or DROPMUL indicate that there is more than one cross-connection leg in the romote NE.

Not complete circuits

If a circuit discontinuity is detected, xconn listing shall start/end with the node with the discontinuity using the error indicator PIF for that side continuity was lost.

For the xconn in the node with the discontinuity only the following parameters are returned:

- *ntid* of the node
- *nid* of the node
- *in_aid*
- *out_aid*

Not complete circuits

If a circuit discontinuity is detected, xconn listing shall start/end with the node with the discontinuity using the error indicator for that side continuity was lost.

For the xconn in the node with the discontinuity only the following parameters are returned:

- *ntid* of the node
- *nid* of the node
- *in_aid*
- *out_aid*

Wrap around circuits

If a wrap around circuit is detected for the local xconn, xconn listing shall start with the local xconn in the direction as given by the STS-N channel/tributary. The xconn input tributary is the error identifier PIF. xconn listing shall comprise xconns in all nodes of the ring and shall end in the neighbor node of the local node with the error identifier PIF for the output tributary.

Overlap circuits

If an overlap circuit is detected for the local xconn, xconn listing shall either:

- start in the node with the ADD xconn of the circuit and end in the neighbor node with the error identifier PIF for the output tributary after one complete cycle or
- start in the neighbor node of that with the DROP xconn with an error identifier PIF for the input tributary and end in the node with the DROP xconn after one complete cycle.

Example input/output

Normal output response – no circuit

RTRV-CKT for no circuit:

```
RTRV-CKT:unite:1-1-#-#-1-7:123456;
   unite 04-12-24 08:00:00
M  123456 COMPLD
;
```

Circuit in non-TOP+EX Ring with only UNITE NEs

RTRV-CKT for the THRU NE: The unidirectional circuit is added in UNITE0, through connected in UNITE1 and dropped in UNITE2. RTRV-CKT is done on UNITE1

```
RTRV-CKT:UNITE1:1-1-#-#-22-1-1:123;
IP 123
<

   UNITE1 04-12-28 00:22:15
M  123 COMPLD
   ″ring0″
   ″UNITE0,1,REMAID,REM-1-1-#-#-22-1-TS1,UNIDIR,STS1:locz=UNITE2,rappl=ADD″
```

```
   "UNITE1,0,1-1-#-#-22-1-1,1-1-#-#-23-1-1,UNIDIR,STS1:loca=UNITE0,locz=UNITE2,
      rappl=THRU"
   "UNITE2,2,REM-1-1-#-#-24-1-TS1,REMAID,UNIDIR,STS1:loca=UNITE0,rappl=DROP"
;
```

RTRV-CKT for the ADD NE: The unidirectional circuit is added in UNITE0 and dropped in UNITE1. RTRV-CKT is done on UNITE0.

```
RTRV-CKT:UNITE0:1-1-#-#-01-1-1:123;
IP 123
<

   UNITE0 04-12-28 00:22:15
M  123 COMPLD
   "ring0"
   "UNITE0,1,1-1-#-#-01-1-1,1-1-#-#-22-1-1,UNIDIR,STS1:locz=UNITE1,rappl=ADD"
   "UNITE1,0,REM-1-1-#-#-24-1-TS1,REMAID,UNIDIR,STS1:loca=UNITE0,rappl=DROP"
;
```

Circuit in non-TOP+EX Ring with mixed NEs

RTRV-CKT for the THRU NE: The unidirectional circuit is added in UNITE0, through connected in UNITE1 and dropped in DMX. The drop node (DMX) is a non-UNITE NE. RTRV-CKT is done on UNITE1:

```
RTRV-CKT:UNITE1:1-1-#-#-22-1-1:123;
IP 123
<

   UNITE1 04-12-28 00:22:15
M  123 COMPLD
   "ring0"
   "UNITE0,1,REMAID,REM-1-1-#-#-22-1-TS1,UNIDIR,STS1:locz=DMX,rappl=ADD"
   "UNITE1,0,1-1-#-#-22-1-1,1-1-#-#-23-1-1,UNIDIR,STS1:loca=UNITE0,locz=DMX,
      rappl=THRU"
   "DMX,2,REM-m2-1-TS1,REMAID,UNIDIR,STS1:loca=UNITE0, rappl=DROP"
;
```

Circuit in TOP+EX Ring with only UNITE NEs

RTRV-CKT for the ADD NE: The unidirectional circuit is added in UNITE0 and dropped in UNITE1. RTRV-CKT is done on UNITE0:

```
RTRV-CKT:UNITE0:1-1-#-#-01-1-1:123;
IP 123
<

   UNITE0 04-12-28 00:22:15
```

```
M  123 COMPLD

   ″UNITE1,0,1-1-#-#-22-1-1,1-1-#-#-23-1-1,UNIDIR,STS1:rappl=THRU″
   ″UNITE2,2,REM-1-1-#-#-24-1-TS1,PIF
;
```

Error responses

Validation rule: no BLSR / MS-SPRING tributary

The Retrieve Circuit command is denied if a tributary of a non BLSR / MS-SPRING port is addressed.

Error code: `IDNV – Input, Data Not Valid, no BLSR / MS SPRING tributary`

Validation rule: no automatic squelch map calculation

The Retrieve Circuit command is denied if automatic squelch map calculation is not enabled for the ring.

Error code: `IDNV – Input, Data Not Valid, no Auto. Squelch Map Calculation`

Validation rule: Invalid ring map

The Retrieve Circuit command is denied if no valid ring map exists or the ring circuit map discovery is not yet completed.

Error code:

`SNVS – Status, Not in Valid State, ring circuit map discovery not yet completed`

TID information in RTRV-CKT is not updated for a TID change of a DMX BLSR node

In a mixed 1665 Data Multiplexer Extend (DMX) / 1675 LambdaUnite MSS BLSR configuration with auto squelch map calculation enabled, a TID change of a DMX node will not be reflected in the response of the TL1 Retrieve Circuit command (RTRV-CKT). The reason is that a TID change of a DMX node does not cause a reboot as for 1675 LambdaUnite MSS and that thus no ring circuit map redistribution is triggered.

Workaround

To correct the **RTRV-CKT** result, toggle automatic ring discovery (*ard*) and auto squelch map calculation (*asmc*) to disabled and to enabled again. Now the **RTRV-CKT** response will show the updated TID information.

RTRV-COND: Retrieve condition

RTRV-COND command messages can be initiated by the user to retrieve all active alarms of level NA – Not Alarmed (Telcordia) / Warning (ITU).

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-COND**[-*modifier*]:*tid*::*ctag*::[*condtype*],,,;

The last three trailing commas are used to specify that the optional parameters *locn*, *dirn*, *tmper* as defined in GR-833 are omitted since these parameters are not supported as input parameters.

Input parameters

Command parameters

1. **modifier** – Message Modifier
This parameter defines for which AID types the conditions will be retrieved. If the value ALL is used, the specified parameter has no impact on the set of retrieved alarms delivered in the retrieve reply.
Type: Alphanumeric value set.
Range: ALL, this requests all alarms.
The modifier can be omitted. In this case the ALL modifier will be set implicit.
2. **tid** – Target Identifier
See definition of “RTRV-HDR: Retrieve header” (p. 3-2417).
3. **ctag** – Correlation Tag
See definition of “RTRV-HDR: Retrieve header” (p. 3-2417).
4. **condtype** – Condition Type
This parameter identifies the type of alarm indication being reported.
Type: Alphanumeric value set.
Range: ALL, requests all alarms.
condtype can be omitted. In this case ALL will be set implicit.

Output format

Normal completion response of successful session termination.

The following example shows the successful completion of the **RTRV-COND** command by the NE:

```
   sid date time
M  ctag COMPLD
   ”aid,aidtype:ntfcncde,condtype,srveff,ocrdat,ocrtm
   [,,,,conddescr]”
   (0 or more lines of the above)
;
```

If no alarms are raised only COMPLD will be returned.

Output parameters

Command parameters

1. **`aid`** – Access Identifier
   This is the address of the entity for which an alarm condition is being reported.
   Type: AID
   Range: All defined AIDs are allowed. It should be a valid AID for the specified *modifier*. Refer to the definition of AIDs.
2. **`aidtype`** – Access Identifier Type
   This parameter defines the AID type to which the alarm belongs.
   Type: Alphanumeric value set.
   Range:
   - COM: Common. An alarm/event that applies to the whole NE system; for example, a processing error.
   - EQPT: An equipment-related alarm/event.
   - SYST: An alarm/event related to system timing.
   - OUTT: An alarm/event related to output timing.
   - STM1E: A facility-related alarm/event for synchronous transport mode 1 (electrical).
   - STM1: A facility-related alarm/event for synchronous transport mode 1.
   - STM4: A facility-related alarm/event for synchronous transport mode 4.
   - STM16: A facility-related alarm/event for synchronous transport mode 16.
   - STM16T: A facility-related alarm/event for fully transparent synchronous transport mode 16.
   - STM64: A facility-related alarm/event for synchronous transport mode 64.
   - STM256: A facility-related alarm/event for synchronous transport mode 256.
   - ODU1: A facility-related alarm/event for optical data units of level 1
   - OC3: A facility-related alarm/event at the optical carrier signal level 3.
   - OC12: A facility-related alarm/event at the optical carrier signal level 12.
   - OC48: A facility-related alarm/event at the optical carrier signal level 48.
   - OC48T: A facility-related alarm/event at the fully transparent optical carrier signal level 48.

- OC192: A facility-related alarm/event at the optical carrier signal level 192
- OC768: A facility-related alarm/event at the optical carrier signal level 768
- T3: A facility-related alarm/event at the DS3 level
- TMAT3: A facility-related alarm/event at the DS3 level related to TransMUX function
- EC1: A facility-related alarm/event at the EC1 level
- 1GE: A facility-related alarm/event for 1 Gigabit Ethernet.
- 1GEPL: A facility-related alarm/event for 1 Gigabit Ethernet Private Line.
- 10GEPL: A facility-related alarm/event for 10 Gigabit Ethernet Private Line.
- VC3: A facility-related alarm/event for virtual container 3.
- VCG: A facility-related alarm/event for virtual concatenation group.
- VC4: A facility-related alarm/event for virtual container 4
- VC44C: A facility-related alarm/event for a signal concatenated at 4 times the VC4 rate.
- VC416C: A facility-related alarm/event for a signal concatenated at 16 times the VC4 rate.
- VC464C: A facility-related alarm/event for a signal concatenated at 64 times the VC4 rate.
- STS1: A facility-related alarm/event at synchronous transport signal level 1.
- TMASTS1: A facility-related alarm/event at synchronous transport signal level 1 related to TransMUX function.
- STS3C: A facility-related alarm/event at synchronous transport signal level 3.
- STS12C: A facility-related alarm/event at synchronous transport signal level 12.
- STS48C: A facility-related alarm/event at synchronous transport signal level 48.
- STS192C: A facility-related alarm/event at synchronous transport signal level 192.
- HOVC4 : A facility-related alarm/event for virtual container 4 higher-order path termination.
- HOSTS1: A facility-related alarm/event at synchronous transport signal level 1 higher-order path termination.
- LOVC3: A facility-related alarm/event for virtual container 3 (lower-order path).
- LOVC12: A facility-related alarm/event for virtual container 12
- LOVT1: A facility-related alarm/event at transport level VT1.5.
- TMSVT: A facility-related alarm/event at transport level VT1.5 related to TransMUX function.

- DS1: A facility-related alarm/event at transport level DS1.
- LINK: A signaling communication link related alarm/event for ONNS

Refer to "Alarms, events, ASAPs" (p. 6-4) for the relation of alarm / entity / *aidtype*.

3. **conddescr** – Description of the Condition

   For events which belong to an ASAP profile:

   - This is a textual description of the condition.
   - Type: inner string of the format: <category>, <entity>, <description>, <additional text>, or <category>, <entity>, <description>, <additional text>-cleared (this form is used in REPT ALM/EVT for cleared alarms).
   - Range: category: is the category; entity: is the entity for which the alarm is reported; description: is the Alarm description, the string is up to 32 characters; additional text = additional text. If there is no additional text, then the trailing comma may be omitted.
   - The general format is: category, entity, description, additional text. If there is no additional text, then the trailing comma may be omitted.
   - Type: inner string
   - Range for STM<N>, STM<N>T, OC<N>T and OC<N>: Quality of service, rr port, TCA; where rr is equal to the port rate
   - Range for ODU<N>: Quality of service, rr path, TCA; where rr is equal to the ODU rate (e.g., ODU1)
   - Range for not terminated VC12, VC3, VC4, VC44C, VC416C, VC464C, VT1, STS1, STS3C, STS12C, STS48C and STS192C signals: Quality of service, rr path, TCA; where rr is equal to the signal rate.
   - Range for terminated VC4 and STS1 signals: Quality of service, rr path, TCA; where rr is equal to the Constituent Signal (CS) rate.
   - Range for GE port: Quality of service, {ge_rate}GE, TCA where ge_rate is the signal rate of the GE port.
   - Range for VCG port: Quality of service, VCG, TCA
   - Range for DS3 port: Quality of service, T3 port, TCA
   - Range for TMAT3 port: Quality of service, T3 port, TCA
   - Range for TMASTS1 path termination: Quality of service, {***rr***} path, TCA, where ***rr*** is equal to STS1 rate
   - Range for not terminated DS1 tributary: Quality of service, DS1 path, TCA

   For ABN conditions see definition of *conddescr*:

   - The general format is: category, description
   - Type: inner string
   - Range, description for a protection group AID: Abnormal condition, forced switch active; Abnormal condition, lockout active

- Range, description for a timing reference AID: Abnormal condition, operate in hold-over; Abnormal condition, operate in free run mode
- Range, description for a port AID: Abnormal condition, facility loopback active
- Range, description for a logical tributary AID: Abnormal condition, cross connect loopback active; Abnormal condition, test access session active
- Range, description for a system AID: – Abnormal condition, System operates in maint. mode

4. **`condtype`** – Condition Type

   For events which belong to an ASAP profile:

   - This parameter identifies the probable cause (type of alarm indication) being reported.
   - Type: Alphanumeric value set.
   - Range: all defined probable causes.
   - This parameter identifies the type of event indication being reported.
   - Type: inner string with the Format: T-<montype>
   - Range for SDH signals

     The following values are for all *STM<N> signals*: T-RS-N-ES, T-RS-N-SES, T-RS-N-BBE, T-RS-N-UAS, T-MS-N-ES, T-MS-N-SES, T-MS-N-BBE, T-MS-N-UAS, T-MS-F-ES, T-MS-F-SES, T-MS-F-BBE, T-MS-F-UAS

     The following values are for all *STM<N>T signals*: T-RS-N-ES, T-RS-N-SES, T-RS-N-BBE, T-RS-N-UAS, T-RS-N-ES-EGR, T-RS-N-SES-EGR, T-RS-N-BBE-EGR, T-RS-N-UAS-EGR

     The following values also are for *STM64 and STM256 signals*: T-MS-N-FECC

     The following values are for *VC3, VC4, VC44C, VC416C and VC464C tributaries*: T-VC-N-ES, T-VC-N-SES, T-VC-N-BBE, T-VC-N-UAS, T-VC-F-ES, T-VC-F-SES, cVC-F-BBE, T-VC-F-UAS, T-PJCPOS, T-PJCNEG

     The following values are for *VC12 tributaries*: T-VC-N-ES, T-VC-N-SES, T-VC-N-BBE, T-VC-N-UAS, T-VC-F-ES, T-VC-F-SES, T-VC-F-BBE, T-VC-F-UAS
   - Range for SONET signals

     The following values are for all *OC<N> and EC1 signals*: T-CVS, T-ESS, T-SESS, T-SEFS-S, T-CVL, T-ESL, T-SESL, T-UASL, T-CV-LFE, T-ES-LFE, T-SES-LFE, T-UAS-LFE

     The following values are for all *OC<N>T signals*: T-CVS, T-ESS, T-SESS, T-SEFS-S, T-CVS-EGR, T-ESS-EGR, T-SESS-EGR, T-SEFS-S-EGR

     The following values are also for *OC192 and OC768 signals*: T-FECC-L

     The following values are for STS1, STS3C, STS12C, STS48C and STS192C tributaries: T-CVP, T-ESP, T-SESP, T-UASP,T-CV-PFE, T-ES-PFE, T-SES-PFE, T-UAS-PFE, PPJC-PDet, NPJC-PDet, NPJC-PDet, NPJC-PGen

     The following values are for *TMASTS1 tributaries*: T-CVP, T-ESP, T-SESP, T-UASP, T-CV-PFE, T-ES-PFE, T-SES-PFE, T-UAS-PFE

The following values are for *VT1 tributaries*: T-CVP, T-ESP, T-SESP, T-UASP,T-CV-PFE, T-ES-PFE, T-SES-PFE, T-UAS-PFE

- Range for DS3/DS1 signals

  The following values are for *DS3 signals with T3 modifier*:

  T-CVL, T-ESL, T-ESA-L, T-ESB-L, T-SESL, T-CVP, T-ESP, T-ESA-P, T-ESB-P, T-SESP, T-UASP, T-SAS-P, T-CV-PFE, T-ES-PFE, T-ESA-PFE, T-ESB-PFE, T-SES-PFE, T-UAS-PFE, T-SAS-PFE, T-CVP-EGR, T-ESP-EGR, T-ESA-P-EGR, T-ESB-P-EGR, T-SESP-EGR, T-UASP-EGR, T-SAS-P-EGR, T-CV-PFE-EGR, T-ES-PFE-EGR, T-ESA-PFE-EGR, T-ESB-PFE-EGR, T-SES-PFE-EGR, T-UAS-PFE-EGR, T-SAS-PFE-EGR

  The following values are for *DS3 signals with TMAT3 modifier*:

  T-CVP-EGR, T-ESP-EGR, T-ESA-P-EGR, T-ESB-P-EGR, T-SESP-EGR, T-UASP-EGR, T-SAS-P-EGR, T-CV-PFE-EGR, T-ES-PFE-EGR, T-ESA-PFE-EGR, T-ESB-PFE-EGR, T-SES-PFE-EGR, T-UAS-PFE-EGR, T-SAS-PFE-EGR

  The following values are for *DS1 signals*:

  T-CVP-EGR, T-ESP-EGR, T-SESP-EGR, T-UASP-EGR, T-SAS-P-EGR

- Range for other signals

  The following values are for all *ODU<N> signals*:

  T-ODU-N-ES, T-ODU-N-SES, T-ODU-N-BBE, T-ODU-N-UAS, T-ODU-F-ES, T-ODU-F-SES, T-ODU-F-BBE, T-ODU-F-UAS

  For *ENET signals*:

  T-PDE, T-EDFE, T-EDFC

Default: None.

For ABN conditions see definition of *condtype* :

- This parameter identifies the type of event indication being reported.
- Type: inner string with the Format: ABN-<abntype>
- Range: ABN-FORCESW, Forced switch active. ABN-LOCKOUT, Lockout active. ABN-HLDOVRSYNC, Holdover synchronization mode. ABN-FREERUNSYNC, Free-run synchronization mode. ABN-LPBKPORT, Facility Loopback. ABN-LPBKXCON, Cross Connect Loopback. ABN-MAINTENANCE, System operates in maintenance mode. ABN-TESTACC, Test access session has been setup

5. **`ntfcncde`** – Notification Code
   This is the alarm level (severity).
   Type: Alphanumeric value set.
   Range: NA – Warning (ITU) / Not-Alarmed (Telcordia)
6. **`ocrdat`** – Occurrence Date
   This parameter indicates the raising / clearing date of the alarm.
   Type: value set of the format MM-DD.
   Range: MM represents the month, DD represents the day, leading zeros are not suppressed.

7. **`ocrtm`** – Occurrence Time
   This parameter indicates the raising / clearing time of the alarm. The accuracy should be +/- 1 second.
   Type: value set of the format HH-MM-SS.
   Range: HH represents the hours, MM represents the minutes, SS represents the seconds, leading zeros are not suppressed.
8. **`srveff`** – Service Affect
   This parameter identifies the service affect of alarms being reported.
   Type: Alphanumeric value set.
   Range:
   - SA – Service affecting
   - NSA – Non service affecting.
9. **`tmper`** – Time Period
   This requests PM data for a specified time interval.
   Type: value set.
   Range:
   - 15-MIN: This requests PM data in 15-minute intervals
   - 1-DAY: This requests daily PM data.

Detailed behavior description

RTRV-COND command messages can be initiated by the user to retrieve all active alarms of level NA – Not Alarmed (Telcordia) / Warning (ITU) from a NE.

RTRV-COND is closely related to REPT EVT which autonomously reports when an persistent alarm of notification code NA either sets or clears or an transient event occurs (like reporting of protection switch states). RTRV-COND retrieves the REPT EVT events that are still set. protection switching events that are reported by REPT EVT are not reported by RTRV-COND (for example, the lockout of a timing reference is not reported by RTRV-COND).

In addition to reporting all active alarms of level NA previously reported by REPT EVT, RTRV-COND retrieves those reported by other autonomous messages.

The **`RTRV-COND`** command does not generate a **`REPT DBCHG`** message.

The **`RTRV-COND`** command will also report the active TCA-events, for port or trib entities, which work in SDH mode and the user has set the TCA mode tcamd of the entity to TR-RTR. By switching to TR-RTR the TCA events are reported as a standing condition, thus the system creates a raise and clear event. If TR-only is selected the TCA events are handled as a transient condition and therefore never reported by RTRV-COND. The SONET standard supports only TR-only mode.

Example input/output

The following example shows the successful completion of the **RTRV-COND** command by the NE.

```
RTRV-COND:LT-UNITE-123::123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   "1-1-#-#-6-1,OC48:NA,AIS-L,NSA,01-01,07-59-59,,,,\"Communication-Transport, OC48
      port, Alarm Indication Signal\""
   "MISC_IN3,COM:NA,MISC,NSA,01-01,07-20-15,,,,\"Environment, Misc Discrete,door
      open\""
;
```

The following example shows the successful completion of the **RTRV-COND** command by the NE if an *aid* is specified:

```
RTRV-COND:LT-UNITE-123:MISC_IN3:123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   "MISC_IN3,COM:NA,MISC,NSA,01-01,07-20-15,,,,\"Environment, Misc Discrete,door
      open\""
;
```

The following example shows the successful completion of the **RTRV-COND** command by the NE if no conditions are raised:

```
RTRV-COND:LT-UNITE-123:MISC_IN3:123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-ALM** command.

RTRV-CONN: Retrieve data relevant for network connections

Overview

The **RTRV-CONN** command requests connection information for connections which are addressed via TNAs. This can be connections within one domain or connections via multiple domains requested by TL1 or UNI. This message can be addressed to the ingress node of every involved domain where the specific information of the requested connection are stored in the connection database. The domain ingress node can be the source node of the Network Connection (UNI-N or node receiving the ENT-CONN) or a downstream eNNI node (eNNI-D).

The query must be directed to one of the domain ingress nodes. Querying by the *connID* of an existing ONNS connection of the network connection will return provisioning information about this connection as also signaling information associated with the *connID*.

The command supports querying of all network connections under a *callID* by sending RTRV-CONN with a existing *callID*. When the records of the connection data repository are retrieved by RTRV-CONN with a valid *callID*, each connection record will be in the same format as the RTRV-CONN single *connID* response message format.

Querying by the source TNA will return provisioning information about network connections as also signaling information associated with this TNA as source TNA. This query will be completed only at the originator node (ingress UNI-N or source node receiving this TL1 command) of this network connection.

The command supports querying all connections by sending RTRV-CONN with *connID* = ALL. When all of the records of the connection data repository are retrieved by RTRV-CONN with *connID* = ALL, each connection record will be the same format as the RTRV-CONN single *connID* response message format.

The input parameter settings for *callID*, *connID* and *TNA* from its meaning are mutually exclusive. This exclusion is not explicitly checked.

Minimal one of the input parameters *callID*, *connID* or *TNA* has to be specified in the RTRV request. Otherwise this request is denied. A combination of the input parameters are allowed but this parameters have to match.

REPT CONNCHG is not generated

The **RTRV-CONN** command does not generate a REPT CONNCHG message.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: NA

Abortable: No

Input format

Command syntax: **`RTRV-CONN`**:*srcTid:srcAid:ctag:[callID]:[connID][:specBlock];*

Input parameters

Command parameters

1. **`srcTid`**
   Target identifier of the source node is the logical name of the Host NE. ONNS uses the same unique *tid* used by Host NE. See also the definition of *tid* in RTRV-HDR.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **`srcAid`**
   Source node ONNS application access identifier *srcAid* of the ONNS controller OS command interface port.
   Type: AID.
   Range: snn
   Default: n/a.
3. **`ctag`**
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   See also the definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: Alphanumeric string
   Range: The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ″.″). It should be a unique value for each new command.
4. **`callID`**
   The *callID* indicates a call of a logical call / connection separation (call capability). This *callID* can be a operator specific identity of Type = 0x01 (source transport network element address is 4 bytes).
   Type: Alphanumeric value set (12 bytes). The first 4 bytes describe the source transport network element address and the following 8 bytes the local identifier.
   Range: string with 24 hexadecimal numbers (0 .. F)
5. **`connID`** – Connection ID
   Connection ID for an existing ONNS connection segment of a UNI or Network connection. *ConnID* is formed from the *SrcNodeID*, the Ingress Tributary # and an index # where 1675 LambdaUnite MSS uses bay =1= shelf.

Spec Block Parameters

1. **IPv4TNAaddr**
   Identifier of a TNA address in IPv4 format
   Type: Four dot separated numeric strings
   Range: for each numeric string: 0..255
2. **IPv6TNAaddr**
   Identifier of a TNA address in IPv6 format
   Type: Eight hyphen separated hexadecimal numbers
   Range: for each hexadecimal number: 0..FFFF
3. **NSAPTNAaddr**
   Identifier of a TNA address in NSAP format
   Type: Alphanumeric value set (20 byte)
   Range: up to 20 alphanumeric strings with hexadecimal values 00..FF

Output format

Normal system response to RTRV-CONN for connID, Output Syntax

If the RTRV-CONN request completes successfully, then the following normal completion response is returned to the command:

```
   srcTid date time
M  ctag COMPLD
   "[CallID=callID],ConnID=connID,ServiceLevel=servLevel,dir,bandwidth,
      [protType],[remoteTID]:specBlock:
GenLabelRequest=genLabelRequest,Tspec=tspec";
```

System response to RTRV-CONN with connID=ALL for an empty Network Connection Data Repository

If the RTRV-CONN ALL request completes successfully with an empty Network Connection data repository, then the following completion response is returned to the command:

```
   srcTid date time
M  ctag COMPLD
;
```

Output parameters

Command parameters

1. **`srcTid`**
   Target identifier of the source node is the logical name of the Host NE. ONNS uses the same unique *tid* used by Host NE. See also the definition of *tid* in RTRV-HDR.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.
   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.
2. **`date`**
   Date. The date parameter is set to the date when the output message is generated.
   Type: Value set.
   Range:
   YY-MM-DD, where
   - YY=00-99,
   - MM=01-12,
   - DD=01-31

   Default: current date
3. **`time`**
   Time. The time parameter is set to the time when the output message is generated.
   See also time in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: Value set.
   Range:
   HH:MM:SS, where
   - HH=00-23,
   - MM=00-59,
   - SS=00-59

   Default: current time
4. **`ctag`**
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   See also the definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2417).
   Type: Alphanumeric string
   Range: The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing "."). It should be a unique value for each new command.
5. **`completion code`**
   Standard TL1 completion code result.
   Type: Value set.

Range:

- COMPLD: for success

Data continuation is indicated by “>”.

6. **callID**
   callID is an optional parameter for Network Connections setup via UNI.
   The *callID* indicates a call of a logical call / connection separation (call capability).
   This *callID* can be a operator specific identity of Type = 0x01 (source transport network element address is 4 bytes).
   Type: Alphanumeric value set (12 bytes). The first 4 bytes describe the source transport network element address and the following 8 bytes the local identifier.
   Range: string with 24 hexadecimal numbers (0 .. F)
7. **connID – Connection ID**
   Connection ID for an existing ONNS connection segment of a UNI or Network connection. *ConnID* is formed from the *SrcNodeID*, the Ingress Tributary # and an index # where 1675 LambdaUnite MSS uses bay =1= shelf.
8. **servLevel**
   The service level is mapping the connection type of an ONNS connection segment of the Network Connection. The values of the connection type are representing a mapping of the ONNS parameters *connectionClass*, *disjointness* and *grpSetupType* (for Ethernet connections).
   Type: Numeric string.
   Range: 0..255
9. **dir**
   Path Direction Topology:
   - Unidirectional A-Z (1WAY) or
   - Bidirectional (2WAY)

   For connections of *protectionClass* MBYNWRK and MBYNPRT only the path direction topology Bidirectional (2WAY) is supported.
   Type: Value set.
   Range: 1WAY (default) or 2WAY
10. **bandwidth** – Requested bandwidth / signalRate
    Link *signalRate* is equal to or greater than the minimum cross-connect rate *minXCrate* of the *port_type*.
    Type: Value set.
    Range: STS1, STS3, STS12 STS48, STS192, STS1-pipe, STS3-pipe, STS12-pipe STS48-pipe, STS192-pipe.
    Default: None.
11. **protType**
    The *protType* defines the requested protection of advertised abstract links (interdomain as well as intradomain).
    protType is the requested setup parameter (via **ENT-CONN**) and is only visible at the source node if requested.
    Type: Alphanumeric value set.

Range:

- 0x1: only unprotected links shall be considered for routing
- 1+1: only 1+1 MSP protected links shall be considered for routing)
- N/A: all links shall be considered for routing, irr. of their protection type

12. **`remoteTID`**
The *remoteTID* parameter is only visible if provisioned on the eNNI ports. It provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.
For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. This parameter is supported by ports of *portClass* ENNI.
Type: TID or empty string (default)
Range: Please refer to the TID definition in the RTRV-HDR description.

13. **`genLabelRequest`**
The general label request defines characteristics of the connection segments between source UNI-C to UNI-N and destination UNI-N to UNI-C or between domains (eNNI-U and eNNI-D).
Type: Alphanumeric value set.
Range:

General Label Request: three dash separated alphanumeric value sets representing

- LSPEncType:
  – PACKET: LSP Encoding Type #1
  – ETHERNET: LSP Encoding Type #2
  – PDH: LSP Encoding Type #3
  – SONET/SDH: LSP Encoding Type #5
  – DW: LSP Encoding Type #6
  – LAMBDA: LSP Encoding Type #8
  – FIBER: LSP Encoding Type #9
  – FCHANNEL: LSP Encoding Type #11
- SwitchingType:
  – PSC-1: Switching Type #1
  – PSC-2: Switching Type #2
  – PSC-3: Switching Type #3
  – PSC-4: Switching Type #4
  – L2SC: Switching Type #51
  – TDM: Switching Type #100
  – LSC: Switching Type #150
  – FSC: Switching Type #200
- G-PID:
  – ETHERNET: G-PID #33

– SONET/SDH: G-PID #34

14. **`tspec`** – Traffic Parameters

    The range of the traffic parameters depends on the used LSP Encoding Type. The *tspec* defines information about the traffic of the connection segments between source UNI-C to UNI-N and destination UNI-N to UNI-C or between domains (eNNI-U and eNNI-D).

    Type: Character string.

    Range for LSP Encoding Type “SONET/SDH”:

    SONET/SDH tspec: five dash separated numeric strings representing SignalType#, RCC#, NCC#, NVC#, MT# with:

    - SignalType #1..12
    - RCC #0,1
    - NCC #0..255
    - NVC #0..63
    - MT #1..64

    Example for an STS-12c: 6-1-4-0-1-0.

    SONET/SDH Tspec parameters “T” and “Profile” is not stored in NVM.

    Range for LSP Encoding Type “ETHERNET”:

    ETHERNET tspec: five dash separated numeric strings representing Token Bucket Rate#, Token Bucket Size#, Peak Data Rate#, Minimum Policed Unit#, Maximum Packet Size# with:

    - Token Bucket Rate #32-bit IEEE floating point number
    - Token Bucket Size #32-bit IEEE floating point number
    - Peak Data Rate #32-bit IEEE floating point number
      (e.g. 0x4CEE6B28 for 1GE)
    - Minimum Policed Unit #1..FFFFFFFF
    - Maximum Packet Size #1..FFFFFFFF

Spec Block Parameters

1. **`destLabel`**

   The destination label defines together with the destination logical port ID the associated egress *connPoint* that connects the destination node of the Network Connection. The *destLabel* is defined in KLM notation. *destLabel* is the requested setup parameter (via ENT-CONN or UNI) and is only visible at the source node of the Network Connection.

   Type: Character string.

   Range:

   Generalized Label: five dash separated numeric strings representing S#,U#,K#,L#,M# with:

   - S #0..65535
   - U #0..15

- K #0..15
- L #0..15
- M #0..15

Example for an STS-12c which uses the 9th STS-3 as first timeslot: 9-0-0-0-0.
Destination Label 65535-15-15-15-15 is reserved for GbE connections.

2. **`destLogicalPortID`**
   destLogicalPortID is the requested setup parameter (via ENT-CONN or UNI) and is only visible on the source node of the Network Connection.
3. **`destIPv4TNAAddr`**
   destIPv4TNAAddr is an optional parameter and is only visible on the source node of the Network Connection if the requested *destTNAType* parameter value (via ENT-CONN or UNI) is *IPV4TNAADDR*.
4. **`destIPv6TNAAddr`**
   destIPv6TNAAddr is an optional parameter and is only visible on the source node of the Network Connection if the requested *destTNAType* parameter value (via ENT-CONN or UNI) is *IPV6TNAADDR*.
5. **`destNSAPTNAAddr`**
   destNSAPTNAAddr is an optional parameter and is only visible on the source node of the Network Connection if the requested *destTNAType* parameter value (via ENT-CONN or UNI) is *NSAPTNAADDR*.
6. **`routingList`**
   The *routingList* describes the level 1 routing described as a list of level 1 nodeIDs and linkIDs The *routingList* retrieved from an intermediate or destination domain will not show the *localAdvNodeID – localLinkID* combination of preceding domains.
   Type: Character string.
   Range:

   Hyphen separated list of numeric string pairs, where the first numeric string represents a *localAdvNodeID* and the second a *localLinkID* with:

   - *localAdvNodeID*: four dot separated numeric string, each numeric string with the values 0..255
   - *localLinkID*: numeric string, with the values 0..42946967295.

   at maximum 10 *localAdvNodeIDs* and 10 *localLinkIDs*.
   Example for a *routingList* describing level 1 Routing via 3 domains at the source domain: 126.43.231.4-643-1.232.3.1-4209-1.4.23.8-5.
7. **`exclLinkResCls`**
   The exclude list of *linkResCls* is used to exclude interdomain links from the interdomain routing calculation. *exclLinkResCls* is the requested setup parameter (via ENT-CONN) and is only visible at the source node of the Network Connection.
   Type: Alphanumeric value set (4 bytes), every bit defining one link class
   Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF

8. **`inclLinkResCls`**
   The include list of *linkResCls* is used to define interdomain links which has to be included for interdomain routing calculation. *inclLinkResCls* is the requested setup parameter (via ENT-CONN) and is only visible at the source node of the Network Connection.
   Type: Alphanumeric value set (4 bytes), every bit defining one link class
   Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF

9. **`ingressLSP`**
   Local Connection ID for the connection segment of a Network Connection between source UNI-C to UNI-N or eNNI-U to eNNI-D.
   srcLSP is formed from the Tunnel_ID of the UNI_IPv4_SESSION/eNNI_IPv4_SESSION object and the LSP_ID of the LSP_TUNNEL_IPv4_SENDER_TEMPLATE of this connection segment.
   Type: character string of length up to 1
   Range:

   TunnelID-LSPID, with

   - TunnelID: numeric string: 0..65535
   - LSPID: numeric string: 0..65535

   Example: 2319-321

10. **`policyData`**
    Policy data may in general include credentials identifying users or user classes, account numbers, limits, quotas, etc. to support access policies.
    Type: Alphanumeric value set (60 bytes)
    Range: up to 60 alphanumeric characters with hexadecimal values 00..FF

11. **`srcLabel`**
    The source label defines together with the source logical port ID the associated ingress *connPoint* that connects the source node of the Network Connection. The *srcLabel* is defined in KLM notation.
    srcLabel is the requested setup parameter (via ENT-CONN or UNI) and is only visible on the source node of the Network Connection.
    Type: Character string.
    Range:

    Generalized Label: five dash separated numeric strings representing S#,U#,K#,L#,M# with:

    - S #0..65535
    - U #0..15
    - K #0..15
    - L #0..15
    - M #0..15

    Example for an STS-12c which uses the 9th STS-3 as first timeslot: 9-0-0-0-0.
    Source Label 65535-15-15-15-15 is reserved for GbE connections.

12. **`srcLogicalPortID`**
    Logical Port Identifier related to the TNA address. *srcLogicalPortID* is the requested setup parameter (via ENT-CONN or UNI) and is only visible on the source node of the Network Connection.
    Type: numeric value set
    Range: 0 to 4294967295
13. **`srcIPv4TNAAddr`**
    srcIPv4TNAAddr is an optional parameter and is only visible on the source node of the Network Connection if the requested *srcTNAType* parameter value (via ENT-CONN or UNI) is *IPV4TNAADDR*.
14. **`srcIPv6TNAAddr`**
    srcIPv6TNAAddr is an optional parameter and is only visible on the source node of the Network Connection if the requested *srcTNAType* parameter value (via ENT-CONN or UNI) is *IPV6TNAADDR*.
15. **`srcNSAPTNAAddr`**
    srcNSAPTNAAddr is an optional parameter and is only visible on the source node of the Network Connection if the requested *srcTNAType* parameter value (via ENT-CONN or UNI) is *NSAPTNAADDR*.
16. **`tunnelIfID`**
    All SDH/SONET connections belonging to the same VCAT group are identified by the LSP Tunnel Interface ID.
    Type: character string of length up to 24
    Range:
    LSRRouterID&InterfaceID - with:
    - *LSRRouterID*: four dot separated numeric strings: each string 0..255
    - *InterfaceID*: Numeric string 0..4294967295

    Example: 117.32.234.13&32439

Example input/output

Input/Output example for a Network Connection

The following example shows the successful completion of a RTRV-CONN command by the Network Element for an unprotected STS-12 Network Connection at the source domain:

```
RTRV-CONN:LT-ONNS9:snn:113456::135.13.196.203&1-6-5-3-1&1;

   LT-ONNS9 2006-01-01 08:00:00
M  113456 COMPLD
   ″CallID=A123B3EF1345A123B3EF1345,ConnID=135.13.196.203&1-6-5-3-1&1,
ServiceLevel=0,2WAY,STS12c,0x1,LT-ONNS22:IngressLSP=2319-203&
SRCIPV4TNAADDR=135.13.3.119&SrcLogicalPortID=1019&SrcLabel=9-0-0-0-0&
DESTIPV4TNAADDR=135.225.43.128&DestLogicalPortID=2&DestLabel=4-0-0-0-0&
RoutingList=126.43.231.4-13.121.39.21-1.232.3.1-12.38.217.4-1.4.23.8:
GenLabelRequest=5-100-34,Tspec=6-1-4-0-1-0″;
```

Input/Output example for a Network Connection

The following example shows the successful completion of a RTRV-CONN command by the Network Element for an unprotected STS-12 Network Connection at the intermediate domain:

```
RTRV-CONN:LT-ONNS22:snn:113454::135.13.122.20&1-6-4-3-1&1;

   LT-ONNS22 2006-01-01 08:00:00
M  113454 COMPLD
   ″CallID=A123B3EF1345A123B3EF1345,ConnID=135.13.122.20&1-6-4-3-1&1,
ServiceLevel=0,2WAY,STS12c,0x1,LT-ONNS45:IngressLSP=2125-2122&
RoutingList=1.232.3.1-12.38.217.4-1.4.23.8:GenLabelRequest=5-100-34,
Tspec=6-1-4-0-1-0″;
```

Input/Output with multiple Network Connections

The following structure shows the successful completion of a RTRV-CONN command with multiple Network Connections specified by a CallID:

```
RTRV-CONN:LT-ONNS22:snn:113454:A123B3EF1345A123B3EF1345:;

   LT-ONNS22 2006-01-01 08:00:00
M  113454 COMPLD
   ″CallID=A123B3EF1345A123B3EF1345,
    .
    .
    Tspec=6-1-4-0-1-0″;
    ...
    ″CallID=A123B3EF1345A123B3EF1345,
    .
    .
    Tspec=6-1-4-0-1-0″;
    ...
    ″CallID=A123B3EF1345A123B3EF1345,
    .
    .
    Tspec=6-1-4-0-1-0″;
```

Error responses

General error responses

A command request without input parameters is denied with:

Error code: `IPMS – Input, Parameter MiSsing, <parametername> is missing`

Validation rule: Input Parameter *connID* not valid

If the value for the input parameter *connID* is not valid, the following error response is returned.

Error code: `IDNV – Input, Data Not Valid, invalid connection ID`

Validation rule: Input Parameter *TNA address* not valid

If the value for the input parameter *TNA address* is not valid, the following error response is returned.

Error code: `IDNV – Input, Data Not Valid, invalid TNA address`

Validation rule: Input Parameters not matching

If the value for the input parameters *connID*, *TNA address* or *callID* are not matching, the following error response is returned.

Error code:
`IDNV – Input, Data Not Valid, input parameters are not matching`

Validation rule: Input Parameter *callID* not valid

If the value for the input parameter *callID* is not valid, the following error response is returned.

Error code: `IDNV – Input, Data Not Valid, invalid callID`

RTRV-CRS: Retrieve cross-connection

The **RTRV-CRS**-*modifier* command can be initiated by a user to retrieve information on existing cross-connections in the NE.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

Input format

Command syntax: **RTRV-CRS**-*modifier*:*tid*:[*in_aid*]:*ctag*[::*ppgname*];

Either the parameter *in_aid* or *ppgname* must be present – refer to the ″Detailed behavior description″ section for details.

Input parameters

Important! Do not use *ppgname* in **RTRV-CRS** requests. Just use the *in_aid* parameter in **RTRV-CRS** requests.

Command parameters

1. **modifier**
This parameter indicates the cross-connection rate on which the retrieve cross-connection command acts.
A distinction of the *modifier* usage has to be made between the retrieval (RTRV-CRS-*modifier*) and the other CRS-related commands (ENT-CRS-*modifier*, DLT-CRS-*modifier*, ED-CRS-*modifier*, ENT-ROLL-*modifier*):
   - The establishment (ENT-CRS-*modifier*), removal (DLT-CRS-*modifier*), modification (ED-CRS-*modifier*) or rolling (ENT-ROLL-mod) of cross-connections is independent of the provisioned port interface-standard. I.e., either the SDH-rates (VC3, VC4 etc.) or the corresponding SONET-rates (STS1, STS3 etc.) can be used as modifier and no command validation between port interface-standard and *modifier* will be performed.
   - For the RTRV-CRS-*modifier* command the following holds:
     Again, no command validation between port interface-standard and *modifier* will be performed. The output parameter *rate*, however, is filled with the rate which was used with the RTRV-CRS-*modifier* command.
     Example: if a cross-connection was entered as ENT-CRS-VC3 then a RTRV-CRS-ALL as well as a RTRV-CRS-VC3 as well as RTRV-CRS-STS1 will return this cross-connection with the *rate* parameter VC3.

   Rate restriction for AU3/AU4 Conversion Cross-Connections:
   AU3/AU4 conversion cross-connections are cross-connections between HO an LO tributaries. From cross-connection processing point of view, these are tributaries

with different rates, although the tributaries provide equal bandwidth. Two different modifiers are defined for conversion cross-connections, one for HO input tributary to LO output tributary and another for LO input tributary to HO output tributary. The input and output tributary rates must fit to the modifier.
Type: Alphanumeric value set.
Range:

- ALL
- SDH *modifier*: LOVC12, LOVC3, VC3, VC4, VC44C, VC416C, VC464C.
- SONET *modifier*: LOVT1, STS1, STS3, STS12, STS48, STS192.

Conversion Cross-Connections:

- AU3TU3 (HO VC3/STS1 input to LO VC3 output)
- TU3AU3 (LO VC3 input to HO VC3/STS1 output)

Note that the modifier value ALL can only be used to retrieve all high-order or to retrieve all low-order and conversion cross-connections at once, due to different wildcard AIDs. The **RTRV-CRS-ALL** command considers conversion cross-connections with LO AIDs.

2. **tid** – Target Identifier
Target Identifier. Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for the input parameter syntax and the description of this parameter.

3. **in_aid** – Input Access Identifier
This parameter specifies the source of the cross-connection.
Each cross-connection can be addressed by its input or output tributary. Each atomic cross-connection associated with that input or output will be returned except for input tributaries being part of a path-protected cross-connection (here only one leg will be reported).
The specified input value of this parameter may be the in_aid or the out_aid parameter of the response depending on how the cross-connection had been created:

- for 1WAY/1WAYPROT connections, the replied in_aid is always a source of the cross-connection,
- for 2WAY cross-connections, the replied in_aid is the same as it has been specified as *in_aid* within the **RTRV-CRS** command. If wildcards are used in the AID, then either of the input/output AIDs of the cross-connections will be returned as *in_aid* in the response.

Examples:
ENT-CRS-VC4:NEname:1-1-#-#-1-1-1,1-1-#-#-2-1-1:123456:2WAY;
RTRV-CRS-VC4:NEname:1-1-#-#-2-1-1:123457;
M 123457 COMPLD ″1-1-#-#-2-1-1,1-1-#-#-1-1-1:VC4.....
;
ENT-CRS-VC4:NEname:1-1-#-#-3-1-1,1-1-#-#-4-1-1:123458:1WAY;
RTRV-CRS-VC4:NEname:1-1-#-#-4-1-1:123459;
M 123459 COMPLD ″1-1-#-#-3-1-1,1-1-#-#-4-1-1:VC4.....
;

In case of lower-order cross-connections, the source of the cross-connection has to be provided logically associated a transmission port pack although the physical cross-connection is only present LOXC pack internally. The NE is in charge to map physical to logical representation.
Example:
ENT-CRS-LOVC3:NEname:1-1-#-#-1-1-1-1,1-1-#-#-39-16-1-43:123456:2WAY; M 123456 COMPLD;
RTRV-CRS-LOVC3:NEname:1-1-#-#-1-1-1-1:123457; M 123457 COMPLD ″1-1-#-#-1-1-1-1,1-1-#-#-39-16-1-43:LOVC3;

In the case of conversion cross-connections, the *in_aid* specified in the **RTRV-CRS** command must fit to the modifier:

- *modifier* = AU3TU3:*in_aid* = HO tributary AID
- *modifier* = TU3AU3:*in_aid* = LO tributary AID

Conversion cross-connections can be addressed by their input or output tributaries. Each conversion cross-connection associated with that input or output will be returned. The specified input value of *in_aid* in RTRV-CRS may be the *in_aid* or the *out_aid* parameter of the response depending on how the cross-connection had been created:

- for 1WAY conversion cross-connections, the replied *in_aid* is always a source of the cross-connection,
- for 2WAY cross-connections, the replied in_aid is the same as it has been specified as *in_aid* within the **RTRV-CRS** command. If wildcards are used in the AID, then either of the input/output AIDs of the cross-connections will be returned as *in_aid* in the response. The returned *in_aid* is independent, whether the wildcard AID in RTRV-CRS specifies a HO or LO tributary.

Conversion Cross-Connection Examples:
ENT-CRS-AU3TU3:NEname:1-1-#-#-1-1-1,1-1-#-#-2-1-1-1:123456:2WAY;
RTRV-CRS-AU3TU3:NEname:1-1-#-#-1-1-1:123457;
M 123457 COMPLD ″1-1-#-#-1-1-1,1-1-#-#-2-1-1:AU3TU3…2WAY…
;
RTRV-CRS-TU3AU3:NEname:1-1-#-#-2-1-1-1:123457;
M 123457 COMPLD ″1-1-#-#-2-1-1-1,1-1-#-#-1-1-1:TU3AU3…2WAY…
;
RTRV-CRS-TU3AU3:NEname:1-1-#-#-all-all-all-all:123458;
M 123457 COMPLD ″1-1-#-#-1-1-1,1-1-#-#-2-1-1-1:AU3TU3…2WAY…
;
ENT-CRS-TU3AU3:NEname:1-1-#-#-3-1-1-1,1-1-#-#-4-1-1:123458:1WAY;
RTRV-CRS-TU3AU3:NEname:1-1-#-#-3-1-1-1:123459;
M 123459 COMPLD ″1-1-#-#-3-1-1-1,1-1-#-#-4-1-1:TU3AU3…1WAY…
;
RTRV-CRS-AU3TU3:NEname:1-1-#-#-4-1-1:123459;
M 123459 COMPLD ″1-1-#-#-3-1-1-1,1-1-#-#-4-1-1:TU3AU3…1WAY…
;
Type: GenTribAID or GenLOTribAID.

Range: The *all*-parameter is accepted for the slot-, port- and higher-order and (if applicable) lower-order trib-part of the AID. The *usall*-parameter is accepted additionally for the slot-part of the AID.
The *vall*-parameter is accepted for the port part of the AID alternatively to the *all*-parameter as long as a virtual concatenated tributary will be addressed. Entities having the *all*-parameter as port-part of the AID reside e.g. on OP***n***, EP***n***, TransMUX. Entities having the *vall*-parameter as port-part of the AID reside e.g. on GE***n***, OPT2G5, ES64U.

For example the following *in_aids* are valid:

- 1-1-#-#-all-all-all specifying all high-order tribs of all ports in the whole shelf
- 1-1-#-#-2-1-all specifying all tribs of the first port of the pack in slot 2
- 1-1-#-#-3-vall-all specifying all tribs of all port of the (GE***n***/ES64U) pack in slot 3
- 1-1-#-#-all-all-all-all specifying all low-order of all high-order tribs for all ports in the shelf

However, the following example shows an invalid *aid*:
1-1-#-#-all-vall-all-all there is no low-order tributary on e.g. GE***n***, OPT2G5, ES64U packs.

4. **`ctag`** – Correlation Tag
See definition of *ctag* in “RTRV-HDR: Retrieve header” (p. 3-2417).

Output format

In response to a valid RTRV-CRS-mod command, the following output is returned:

```
   sid date time
M  ctag COMPLD
   ″in_aid,out_aid:rate[,,in_aid2]:spec_block″
       ...
       ...
   ″in_aid,out_aid:rate[,,in_aid2]:spec_block″
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are described in the Output parameter section of “RTRV-HDR: Retrieve header” (p. 3-2417).

Output parameters

Command parameters

1. **`in_aid`** – Input Access Identifier

Description: The parameter *in_aid* specifies the tributary which is the source of the cross-connection. In detail:

- In case of a 1-way cross-connection this parameter specifies the source of the cross-connection.
- In case of a 2-way cross-connection this parameter is identical to the one used as input parameter (please refer also to the description of the input parameter *in_aid* of the "RTRV-CRS: Retrieve cross-connection" (p. 3-2306) command).
- In case that a wildcard AID has been used to retrieve 2-way cross-connections, then either of the input/output AIDs of the cross-connections will be returned as *in_aid* in the response. For conversion cross-connections the returned *in_aid* is independent, whether the wildcard AID in RTRV-CRS specifies a HO or LO tributary.
- In case of a path-protected cross-connection this parameter may specify either the source of the working leg or the source of the protection leg – the distinction is made via the spec-block parameter *repleg* (see below). If *in_aid* specifies the working-leg part than *in_aid2* (see below) specifies the protection-leg part and vice versa.

Type: GenTribAID or GenLOTribAID.
STS1NumAID are used for high-order tributaries on e.g. OP***n***, EP***n*** packs;
VCGNumAID are used for high-order tributaries on e.g. GE***n***, OPT2G5 packs;
GenLOTribAID are used for low-order tributaries on I/O packs e.g. OP***n***, EP155.
Range: n.a. (*all* or *usall* or *vall* values shall never occur as part of an output parameter).

2. **`out_aid`** – Output Identifier
   This parameter specifies the tributary which is the sink of the cross-connection.
   Type: GenTribAID or GenLOTribAID
   STS1NumAID are used for high-order tributaries on e.g. OP***n***, EP***n*** packs;
   VCGNumAID are used for high-order tributaries on e.g. GE***n***, OPT2G5 packs;
   GenLOTribAID are used for low-order tributaries on I/O packs e.g. OP***n***, EP155.
   Range: n.a. (*all* or *usall* or *vall* values shall never occur as part of an output parameter).

3. **`in_aid2`** – Input Access Identifier 2
   This parameter is applicable to and is present for path-protected cross-connections only and specifies either the source of the protection leg or the source of the working leg.

This depends on the value of the *repleg* parameter:

- E.g. for the combination: *in_aid* = IN1, *out_aid* = OUT, *in_aid2* = IN2 and *repleg*=1WAYPSW the worker leg is given by IN1 -> OUT and the protection leg is given by IN2 -> OUT;
- for the combination: *in_aid* = IN1, *out_aid* = OUT, *in_aid2* = IN2 and *repleg*=1WAYPSP the worker leg is given by IN2 -> OUT and the protection leg is given by IN1 -> OUT.

Thus *in_aid* and *out_aid* specify one leg of the legpair of a path-protected cross-connection, while *in_aid2* and *out_aid* specify the second leg.
Type: STS1NumAID, TMuxAPTNumAID, or GenLOTribAID.
STS1NumAID are used for high-order tributaries on e.g. OP***n***, EP***n*** packs; TMuxAPTNumAID are used for asynchronous high-order tributaries on TransMUX packs, GenLOTribAID are used for low-order tributaries on e.g. OP***n***, EP155.
Note: Using VCGNumAID (when using e.g. GE***n*** packs) is NOT applicable as those packs can not be the input to a path-protected cross-connection. Therefore specific AID types are mentioned instead of GenTribAID.
Range: n.a. (*all* and *usall* values shall never occur as part of an output parameter).

4. `rate`
This parameter indicates the cross-connection rate. For a detailed description please refer to the input parameter *modifier*.
Type: Alphanumeric value set.
Range:

- LOVC12
- LOVC3
- VC3
- VC4
- VC44C
- VC416C
- VC464C
- LOVT1
- STS1
- STS3
- STS12
- STS48
- STS192.

Conversion Cross-Connections:

- AU3TU3 (HO VC3/STS1 input to LO VC3 output)
- TU3AU3 (LO VC3 input to HO VC3/STS1 output)

Spec block parameters

1. **loca** – Location-a

   This parameter specifies the TID of the node at which service is added to the BLSR. This parameter is required for BLSR THROUGH, INTER-BLSR and DROP connections only. The *loca* parameter value is an empty string for ADD and non-BLSR connections.

   A 2-way cross-connection is considered to be a DROP if the *out_aid* is a non BLSR tributary.

   The figure in "2-way scenario" (p. 3-2322) depicts the 2-way scenario (the 3 NEs should be seen as part of an BLSR).

   Inter Ring Cross-connections with collapsed node: Note that beside the above described THROUGH case there can be also another situation where both *loca* and *locz* are different from the empty string: If two rings are interconnected in a collapsed node then *loca* refers to the (add-node of the) ring where the signal is dropped from, and *locz* refers to the (drop-node of the) ring where the signal is added to. In such cases the cross-connection cannot be provisioned as bidirectional, thus the information is still unambiguous.

   A note to the loca2 parameter: Although *loca2* (Location-a-2) is a parameter which is used in the **ENT-CRS** command, *loca2* is not retrieved explicitly. This is due to the fact that for path-protected cross-connections – and only for those this *loca2* is applicable – the retrieval will be on a leg-basis and not on a leg-pair basis. In other words: If a path-protected cross-connection is retrieved two entries will be sent, one for the working leg (incl. the *loca* and *locz* parameter) and one for the protection leg (incl. the *loca* parameter and the same *locz* parameter, and in this case the *loca* returned is the *loca2* as entered when establishing the path-protected cross-connection).

   loca is also required for EXTRA TRAFFIC connections. In contrast to incoming references from other commands to this whole chapter it is exclusively applicable for the command **RTRV-CRS**. For extra traffic the value will be generated automatically and thus it is only retrievable. For information about the automatic generation of *loca* refer to the parameter *sqfa*.

   For lower-order cross-connections the parameter *loca* is the TID of that ring node in the direction towards the specified input tributary (upstream), where the HO path termination source function resides.

   If there is no such function in an upstream ring node then *loca* is the TID of the node where the related HO circuit is first added to the ring. The figure "Lower-order cross-connections" (p. 3-2322) shows an example of a LO path through as part of a ring.

   The LO path is added to/dropped from the ring in NE-1 and NE-2. 2-way cross-connections are considered to be either an Add or a Drop connection depending whether the input or the output tributary is at the ring port. In NE-3 there is a HO through connection, which contains the LO path. In NE-3 there is no HO path termination. In NE-4 there is a LO through connection. Consequently, there are HO path terminations in NE-4.

The fact that *loca* refers to the HO path terminations has the following consequences:

- All LO cross-connections through the same HO path termination at the MS-SPRing port have the same *loca* value.
- Any LO through-connection will be treated as add/drop. loca will identify the node of the through connection, and not the node where the LO service is added to the ring.

At the lower-order side of a conversion cross-connection, the same rules for *loca* is applicable as for lower-order cross-connections.
Type: TID or empty string.
Range: Please refer to the TID definition in the “RTRV-HDR: Retrieve header” (p. 3-2417) description.
Default: empty string ″″:
Note: In output direction the empty string appears as \″\″.

2. **`locastate`** – Squelch Map Data Status for Location a
   The parameter *locastate* indicates the validity and the source of the *loca* value.
   Type: Alphanumeric value set.
   Range:
   - AUTO-VALID
   - AUTO-INVALID
   - USER-OVERRIDE
   - MANUAL-VALID
   - MANUAL-INVALID
   - UNKNOWN (default).
3. **`locz`** – Location-z
   This parameter specifies the TID of the node at which service is dropped from the BLSR. This parameter is required for BLSR THROUGH, INTER-BLSR and ADD connections. The *locz* parameter value is an empty string for DROP and non-BLSR connections.
   A 2-way cross-connection is considered to be a ADD if the *in_aid* is a non BLSR tributary.
   Refer to the figure in “2-way scenario” (p. 3-2322) for further explanation.
   locz is also required for EXTRA TRAFFIC connections. For extra traffic the value will be generated automatically and thus it is only retrievable. For information about the automatic generation of *locz* refer to the parameter *sqfz*.
   For lower-order cross-connections the parameter *locz* is the TID of that ring node in the direction towards the specified output tributary (downstream), where the HO path termination sink function resides.
   If there is no such function in a downstream ring node then *locz* is the TID of the node, where the related HO circuit is last dropped from the ring. Refer to the figure in “Lower-order cross-connections” (p. 3-2322) for further explanation.

The fact that locz refers to the HO path terminations has the following consequences:

- All LO cross-connections through the same HO path termination at the MS-SPRing port have the same *locz* value.
- Any LO through-connection will be treated as add/drop. *locz* will identify the node of the through connection, and not the node where the LO service is dropped from the ring.

At the lower-order side of a conversion cross-connection, the same rules for *locz* is applicable as for lower-order cross-connections.
Type: TID or empty string.
Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2417) description.
Default: empty string ″″:
Note: In output direction the empty string appears as \″\″.

4. **`loczstate`** – Squelch Map Data Status for Location z
   This parameter indicates the validity and the source of the *locz* value.
   Type: Alphanumeric value set.
   Range:
   - AUTO-VALID
   - AUTO-INVALID
   - USER-OVERRIDE
   - MANUAL-VALID
   - MANUAL-INVALID
   - UNKNOWN (default).
5. **`lpbkstat`** – Loopback-Status
   This parameter specifies whether a cross-connection loopback exists on the input tributary or the output tributary of the cross-connection.
   Type: Alphanumeric value set.
   Range: YES, NO (default).
6. **`omode`** – Output Mode
   This parameter specifies the output mode of the cross-connection:
   - for a 1-way cross-connection the output is clearly defined by the destination (*out_aid*)
   - for a 2-way cross-connection the output is defined as the source-to-destination direction (*in_aid* to *out_aid*)
   - NORM: this is the normal output i.e. the signal from the *in_aid* is passed through to the *out_aid*;

- IDLE/UNEQ: this mode outputs an unequipped signal;
- AIS: this mode outputs an AIS signal.

omode and adaptive-mode: In case a SONET-port is provisioned to adaptive-mode setting the *omode* to IDLE/UNEQ or AIS will be lead to transmitting the corresponding signal (UNEQ or AIS) on STS1 base for all the STS1 tributary comprising the STS-N signal. Thus for an output of an STS3 cross-connection, if either AIS or IDLE/UNEQ is selected each of the 3 STS1 will output the AIS or IDLE/UNEQ signal. When switching the *omode* back to NORM the original STS3 cross-connection-signal will re-appear again.
omode in case of path-protected cross-connection: In case of a path-protected cross-connection the *omode* affects the output of the path selector and is thus not setable on a per leg base. In other words the *omode* insertion is done after (downstream direction) the selector function.
Type: Alphanumeric value set.

Range:

- NORM (default)
- IDLE/UNEQ
- AIS

7. **`onnsConnControl`** – ONNS Connection Control
This parameter indicates for cross-connections of *xconcls* NN, whether the ONNS connection a cross-connection is assigned to is controlled by ONNS directly or by an external control (setup via UNI or eNNI or as SPC connection).
For cross-connections of *xconcls* TRADITIONAL the value UNKNOWN is reported for this parameter.
The value UNKNOWN shall also be reported for cross-connections of *xconcls* NN, the onnsConnControl of which cannot be determined.
Type: Alphanumeric value set.

Range:

- UNKNOWN
- ONNS
- EXT

8. **`onnsPathID`** – ONNS Path Identity
This parameter indicates for cross-connections of *xconcls* NN the path ID of the ONNS path a cross-connection is assigned to.
For cross-connections of *xconcls* TRADITIONAL an empty string is reported for this parameter.
Type: character string of length up to 20 or empty string
Range:

nodeID-Index

- nodeID: four dot separated numeric strings: each string 0..255
- Index: Numeric string 0-65535

Example: 29.13.196.203-65111
Default: empty string

9. **`repleg`** – Reported Leg Pair

This parameter provides compact information about the leg(s) of cross-connections and is derived, as shown in the table below, from a combination of the following elementary parameter:

- atomic cross-connection topology
- leg status
- path-protected group working leg (if applicable i.e. being part of a protection group).

Atomic cross-connection Topology	Path Protection Leg Role	Leg Status	Reported Legpair (*repleg*)
point-to-point	n.a.	1-way	1WAY
point-to-point	n.a.	2-way	2WAY
path-protected	W	1-way	1WAYPSW
path-protected	P	1-way	1WAYPSP

Atomic cross-connection topology:
Two atomic cross-connection topologies are supported:

- Point to point: The point to point cross-connection consists of one leg only, which is defined by its source-trib (*in_aid*) and its destination-trib (*out_aid*) and its particular transmission rate.
- path-protected: The path-protected cross-connection consists of a path protection group with two legs, a working leg and a protection leg – the declaration of working respectively protection is made when establishing the cross-connection (ENT-CRS command).

  The two legs are defined by two input tributaries and one output tributary – thus one input tributary and the output tributary form the working leg while the other input tributary and the output tributary form the protection leg.

  Note that:

  both input tributaries must belong to ports with the same interface standard (either SONET or SDH), due to different switch criteria;

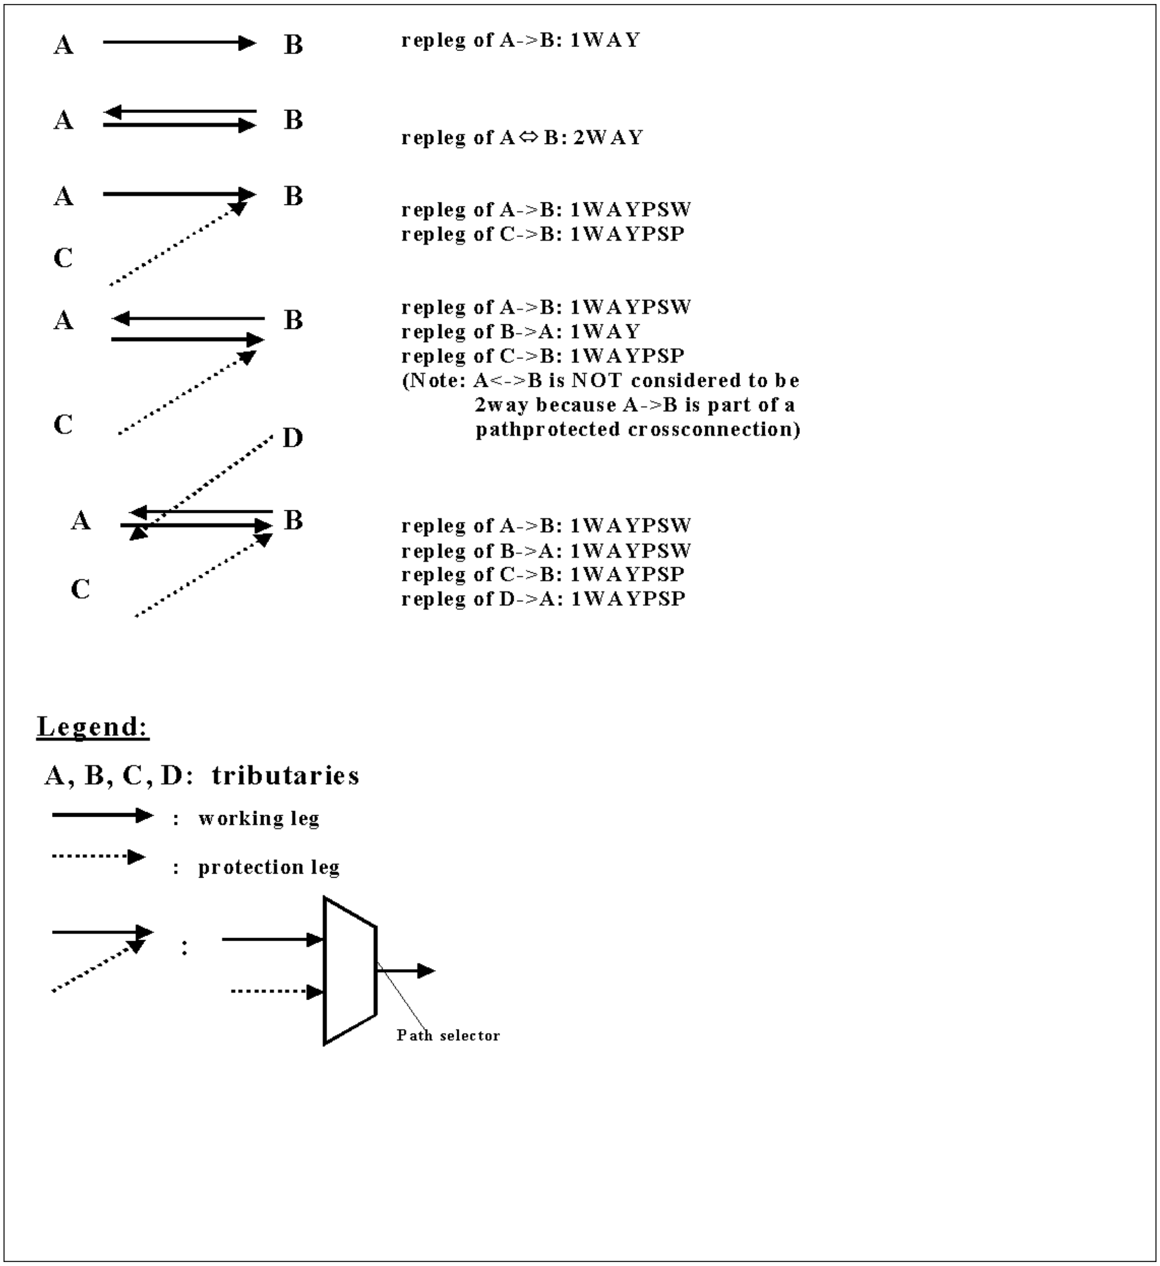
  both legs must be at the same cross-connection rate.

Leg status:
The leg status indicates whether a leg is monitored and reported as a 1-way cross-connection or a leg pair i.e. a 2-way cross-connection.
1-way: The leg status for a path-protected cross-connection is always defined as 1-way.

2-way: The leg status for a (non path-protected) cross-connection is set to 2-way if all the following conditions are fulfilled: there are 2 cross-connections in opposite direction between the same tributaries; both of these cross-connections have the same rate (independent if the SONET or SDH rate was used when establishing i.e. VC3 is equivalent to STS1, VC4 is equivalent to STS3 etc); the source and destination TIDs do match i.e. the source TID of one leg is the destination TID of the other leg and vice versa (this condition of course holds only in case of BLSR cross-connections).
Note that the criteria for a 2-way leg-pair do not depend on whether the two legs were set up at the same time, nor on whether either leg was set up as part of a 2-way cross-connection topology.

Path Protection leg role:

This indicates if the leg of a path protection group is defined as the working (W) leg or the protection (P) leg.
1WAYPSW and 1WAYPSP stands for 1-way path switched working and 1-way path switched protection respectively.
The following figure shows examples for the *repleg* parameter for several cross-connection configurations including compound cross-connection.



Range

- 1WAY
- 2WAY
- 1WAYPSW
- 1WAYPSP.

The values 1WAYPAP and 1WAYPAW are not supported in the initial release.

10. **`rtnomode`** – Return Output Mode

This parameter specifies the output mode for the return direction of the cross-connection.

- for a 2-way cross-connection the return output mode is defined as the destination-to-source direction (*out_aid* to *in_aid*) For the meaning of the values please refer to *omode* description.
- for a 1-way cross-connection and path protected cross-connection this parameter is omitted.

Type: Alphanumeric value set.
Range: NORM (default), IDLE/UNEQ, AIS.

11. **`rtntaccstat`** – Return Test Access Status
This parameter indicates indicates whether the input tributary of the return direction (destination-to-source) of a 2-way cross-connection is cross-connected or bridged to a test access tributary of a test session. In the case of a 1-way cross-connection the parameter is omitted.
Type: Alphanumeric value set.
Range: YES, NO (default).
12. **`rtnxcappl`** – Return cross-connection application
This parameter is a numeric value which indicates the application for which the return cross-connection is used in the context of compound cross-connection topologies.
   - for a 1-way cross-connection this parameter is not applicable and will thus be omitted.
   - for a 2-way cross-connection the parameter is present.

   Type: same as *xcappl*.
Range: same as *xcappl*.
Default: The default value is 0.
13. **`rtnxcnum`** – Return cross-connection number
This parameter is a multiple-digit number identifying the cross-connection number for the return direction (destination to source i.e. *out_aid* to *in_aid*) of a 2-way cross-connection.
   - for a 1-way cross-connection this parameter is not applicable and will thus be omitted.
   - for a 2-way cross-connection the parameter is present.

   Type: same as *xcnum*.
Range: same as *xcnum*.
Default: same as *xcnum*
14. **`taccstat`** – Test Access Status
This parameter indicates whether the input tributary of a 1-way cross-connection or the input tributary of the source-to-destination direction of a 2-way cross-connection is crossconnected or bridged to a test access tributary of a test session.
Type: Alphanumeric value set.
Range: YES, NO (default).

15. **`xcappl`** – cross-connection application
    This parameter is a numeric value which indicates the application for which the cross-connection is used in the context of compound cross-connection topologies.
    The parameter is not further processed in the NE, but only stored (when establishing or modifying the cross-connection) and returned when retrieving the cross-connection.
    The numeric values are assigned to appropriate text strings (see Range below) and the manager should display these value in case of a "RTRV-CRS: Retrieve cross-connection" (p. 3-2306).

    As a possible assignment proposal the following may serve:

    - 0) Unknown
    - 1) 1-Way Point-to-Point
    - 2) 1-Way Path-Protected
    - 3) 1-Way Adjunct Path-Protected
    - 4) 1-Way Conversion Cross-Connection
    - 10) 2-Way Point-to-Point
    - 11) 2-Way Conversion Cross-Connection
    - 20) UPSR (or SNCP Ring) Add, Drop
    - 21) UPSR (or SNCP) Ring-to-Ring, Single Node Interconnection, Same NE
    - 22) UPSR (or SNCP) Drop, 1-Way Broadcast
    - 23) UPSR (or SNCP Ring) Add, Drop connection (Broadcast)
    - 30) Logical Ring (or SNCP) Add, Drop
    - 40) Ring Interworking, Drop-and-Continue, BLSR (or MS-SPRing) Primary Node
    - 41) Ring Interworking, Drop-and-Continue, BLSR (or MS-SPRing) Primary Nodes in same NE
    - 42) Ring Interworking, Dual Transmit, BLSR (or MS-SPRing) Terminating Node
    - 50) Ring Interworking, Drop-and-Continue, UPSR (or SNCP Ring)
    - 51) Ring Interworking, Drop-and-Continue, UPSR (or SNCP Ring) Nodes in same NE
    - 60) 1-Way Broadcast -- note: this is with N greater than or equal to 2.

    Type: numerical value set.
    Range: {0, 1, 2,…, 255}.
    Default: The default value is 0.

16. **`xcnum`** – cross-connection number
    This parameter is a multiple digit number, identifying each leg in a specific compound cross-connection. (Compound cross-connection are a composition of several atomic cross-connection in order to form complex scenarios like e.g. described in ″Example input/output″ section of the **`RTRV-CRS`** command like UPSR, DRI etc.).

Like the *xcappl* parameter the *xcnum* parameter is not further processed in the NE, but only stored (when establishing or modifying the cross-connection) and returned when retrieving the cross-connection. It may be used by a manager to characterize and group cross-connections belonging to complex cross-connection topology (e.g. compound cross-connections as used in ring interworking scenarios).

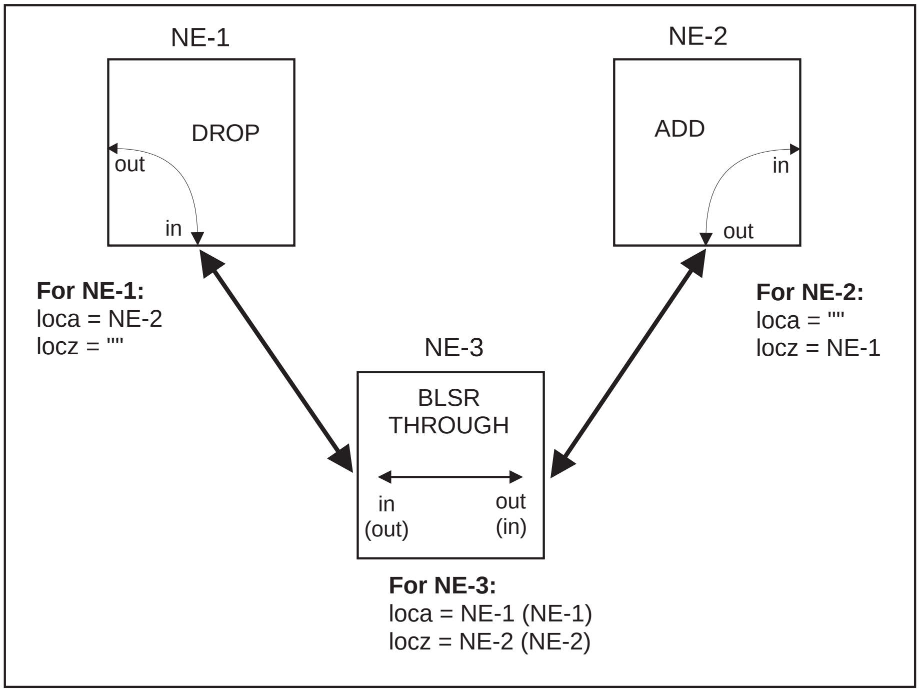
The following format for the twelve digits is recommended:

- two digits for the bay
- one digit for the shelf
- two digits for the slot
- two digits for the port
- three digits for the high-order tributary
- two digits for the low-order tributary.

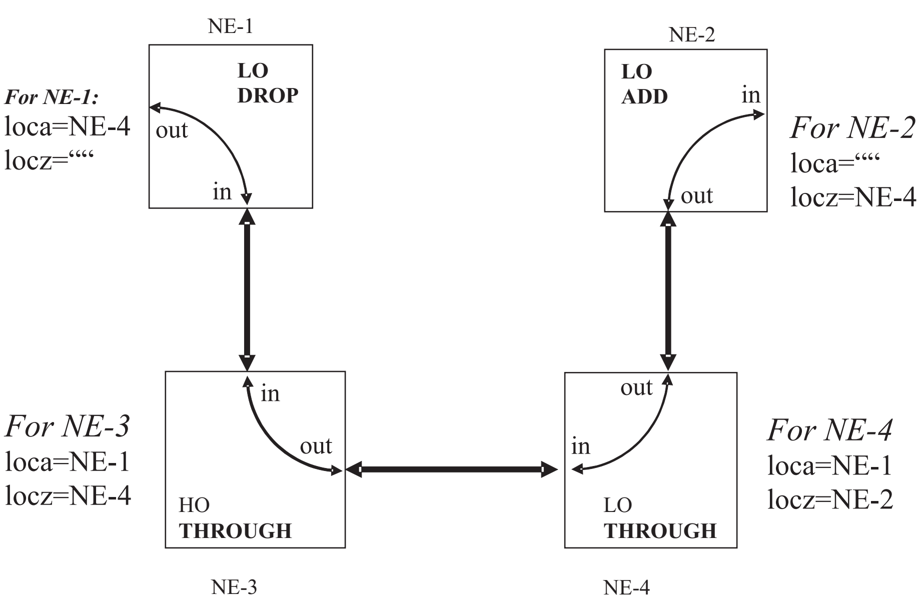
If a high-order tributary is addressed then the last two digits are set to 00. The digits values pertain to the *out_aid*.
Type: numeric value set (12 digit).
Range: 000000000000 .. 999999999999.
Default: The default value is 000000000000.

17. **`xconcls`** – cross-connection class
This parameter identifies, whether the cross-connection has been setup in the TRADITIONAL way by an operator via the **`ENT-CRS`** command or via the NN application as part of an ENT-PATH command. This parameter therefore also indicates who is the owner of the cross-connection and can modify or delete it.
Note: Refer to the NN TL1 catalogue for the **`ENT-PATH`** command.
Type: Alphanumeric value set.
Range: TRADITIONAL, NN.
For low order cross-connections, the value range is limited to TRADITIONAL.

2-way scenario



Lower-order cross-connections



Derivation of repleg

Atomic cross-connection Topology	Path Protection Leg Role	Leg Status	Reported Legpair (*repleg*)

point-to-point	n.a.	1-way	1WAY
point-to-point	n.a.	2-way	2WAY
path-protected	W	1-way	1WAYPSW
path-protected	P	1-way	1WAYPSP

Detailed behavior description

The **RTRV-CRS** command allows the retrieval of existing cross-connection according to the following characteristics:

- rate (via the mandatory *modifier* parameter)
- input or output tributary (via the optional/mandatory [in case *ppgname* is omitted] *in_aid* parameter).

For the rate and input/output tributary, either concrete value or the ranging via *all* (and *vall* for the port-part of the *aid* in case of using the GE***n***, OPTG5, ES64U and *usall* for the slot-part of the *aid*) can be used.

The *ppgname* is applicable for high-order cross-connections and is allowed for compatibility reasons only. The parameter *ppgname* is not evaluated during command processing, i.e. the command returns all cross-connections with the specified rate.

The use of *in_aid* AND *ppgname* in one command request is not allowed; i.e. their use is mutually exclusive.

Number of atomic cross-connections in the response

In case the given set of input parameter does not match with any existing cross-connection(s), the command is accepted BUT no information is returned i.e. the output contains the empty string "".

In case the given set of input parameters matches to a 1way or 2way cross-connection, a single entry will be returned.

In case the given set of input parameters matches to several cross-connections, then one entry per matching cross-connection will be returned.

In case the given set of input parameters matches to one or more pathprotected cross-connection up to two entries will be returned for each path protected cross-connection (one entry for the worker-leg and the second one for the protection-leg if the output tributary has been specified as in_aid parameter, otherwise only the addressed leg). This implies that only the legs meeting the characteristics of the request will be in the reply in case of path-protected XC. The NE will only add matching legs which form together with the reported legs a path-protected XC topology.

In the following, examples are given for the number of cross-connections (xc's) to be returned while tributaries A, B, C, D are cross-connected (disconnected if not mentioned in a specific sceanrio):

- A to B 1WAY1100
- A to B 1WAY + B to A 1WAY2200 (not converted to 2WAY)
- A to B 1WAY + B to C 1WAY1210
- A to B 2WAY1100
- B to A and C to A 1WAYPROT2110
- B to A and C to A 1WAYPROT + A to B 1WAY3210
- B to A and C to A 1WAYPROT + A to B 1WAY + A to C 1 WAY4220
- B to A and C to A 1WAYPROT + A to D 1WAY3111
- B to A and C to A 1WAYPROT + A to B 1WAY + A to D 1WAY4211

AID boundary independence

The system shall allow to retrieve a higher order cross-connection using the AID of any tributary within the AID boundaries determined by the cross-connection rate.

Example: A STS-3c cross-connection has been established at the tributary 1-1-#-#-2-1-4.

This cross-connection can be retrieved with one of the AIDs

- 1-1-#-#-2-1-4
- 1-1-#-#-2-1-5
- 1-1-#-#-2-1-6

AID boundary and rate dependency for LOVC3 cross-connection retrieval

The system shall return a response with the existing LOVC3 cross-connection if the specified LO tributary is within the boundaries of an existing LOVC3 cross-connection and one of the modifiers LOVC3 or ALL is used in the command.

If other modifiers are used or no LOVC3 cross-connection exists at the tributary, then no LOVC3 cross-connection is returned with the response. If no other LO cross-connection exists at the specified tributary, the response will be empty.

If a field of the specified LO tributary AID is set to a value outside the allowed range for this field, then the command is denied. In this case, the generic validation rule for unknown AID sall be applied.

Identification of VCG tributaries

The system shall allow to retrieve cross-connections at VCG tributaries using the AID format of an AU-3/STS-1 Tributary. I.e. the VCG number specified in the port field of the AID is allowed with or without the leading ″v″.

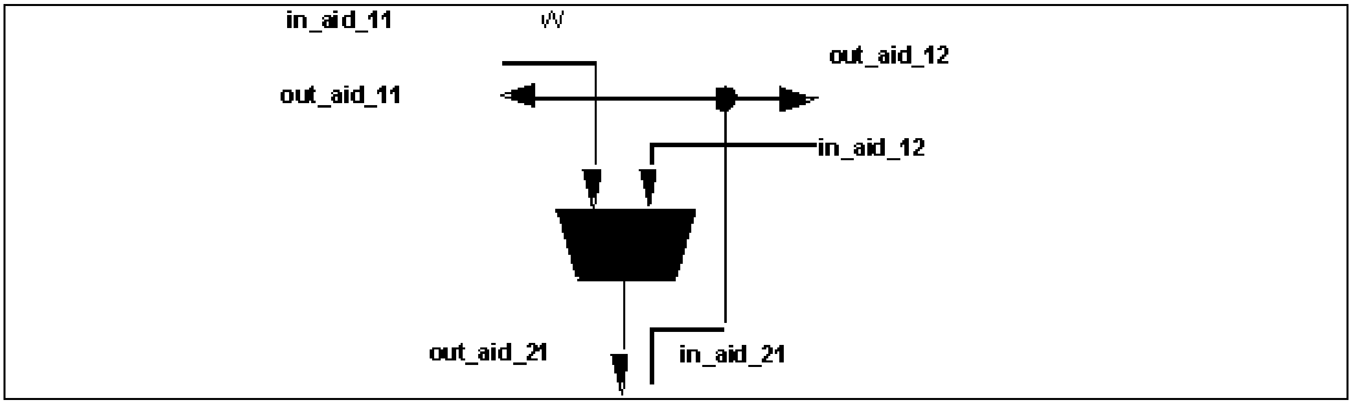
Update affected entities

The **RTRV-CRS** command does not generate a **REPT DBCHG** message.

Example input/output

Example 1

Suppose the following compound cross-connection, as used in UPSR application, is given:



RTRV-CRS-all:UNITE-NE:1-1-#-#-all-all-all:123456; will then output (the blank lines are for better reading):

in_aid_11,out_aid_21:vc4,,in_aid_12:lpblstat=NO,omode=NORM,repleg=1WAYPSW, xcappl=20,xcnum=123456789012;

in_aid_12,out_aid_21:vc4,,in_aid_11:lpblstat=NO,omode=NORM,repleg=1WAYPSP, xcappl=20,xcnum=123456789012;

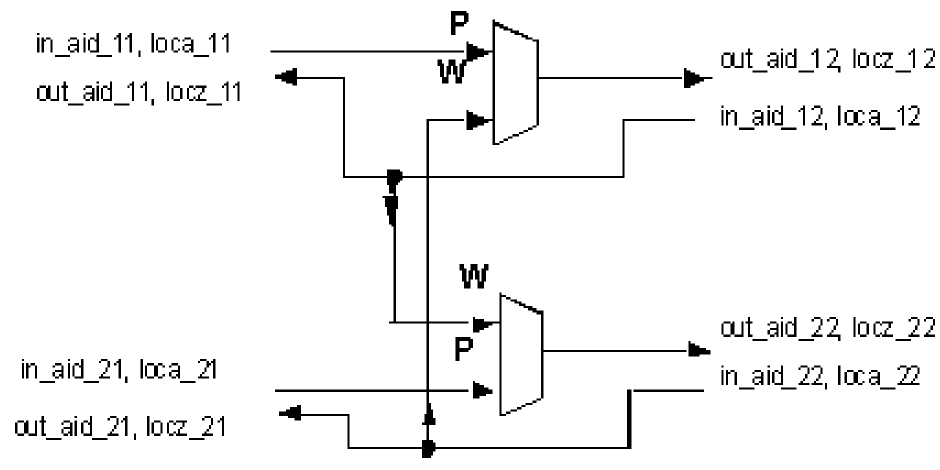
in_aid-21,out_aid_11:vc4:omode=NORM,repleg=1WAY,xcappl=20,xc-num=123456789012;

in_aid-21,out_aid_12:vc4:omode=NORM,repleg=1WAY,xcappl=20,xc-num=123456789012;

The upper 2 outputs specify the path-protected cross-connection, consisting of 2 legs. The lower 2 outputs specify the 2 legs of the bridge.

Example 2

Suppose the following compound cross-connection configuration is given:



A ring interworking with drop and continue for a BLSR with primary nodes in the same NE. RTRV-CRS-all:UNITE-NE:1-1-#-#-all-all-all:123456; will then output (the blank lines are for better reading):

in_aid_11,out_aid_12:vc4,,in_aid_22:loca=loc_a11,locz=locz_12,lpblstat=NO, omode=NORM,repleg=1WAYPSP,xcappl=41,xcnum=011031111222;

in_aid_22,out_aid_12:vc4,,in_aid_11:loca=22,locz_12,lpbkstat=NO,omode=NORM, repleg=1WAYPSW,xcappl=41,xcnum=011031111222;

in_aid_12,out_aid_11:vc4:loca=loca_12,locz=locz_11,omode=NORM,repleg=1WAY, xcappl=41,xcnum=011031111222;

in_aid_12,out_aid_22:vc4,,in_aid_21:loca=loc_a12,locz=locz_22,lpblstat=NO, omode=NORM,repleg=1WAYPSW,xcappl=41,xcnum=011031111222;

in_aid_21,out_aid_22:vc4,,in_aid_12:loca=21,locz_22,lpbkstat=NO,omode=NORM, repleg=1WAYPSP,xcappl=41,xcnum=011031111222;

in_aid_22,out_aid_21:vc4:loca=loca_22,locz=locz_21,omode=NORM,repleg=1WAY, xcappl=41,xcnum=011031111222;

The first 3 outputs specify the upper part of the configuration while the last 3 outputs specify the lower part.

Example 3

Suppose no cross-connections do exist, or the input data do not match with existing cross-connections, then the output would be an empty string: ″″.

RTRV-CRS for a cross-connection established via ENT-CRS-VC4 with a specified in_aid:

```
RTRV-CRS-VC4:LT-UNITE-123:1-1-#-#-1-1-1:123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   ″1-1-#-#-1-1-1,1-1-#-#-2-1-1:VC4:\
    lpbkstat=NO,omode=NORM,repleg=2WAY,rtnomode=NORM,\
    rtnxcappl=20,rtnxcnum=123456789012,xconcls=TRADITIONAL,\
    xcappl=20,xcnum=123456789012″
;
```

RTRV-CRS for a cross-connection established via ENT-CRS-STS1 at a BLSR port where the Automatic Squelch Map Calculation is enabled:

```
RTRV-CRS-STS1:LT-UNITE-123:1-1-#-#-1-1-1:123456;

   LT-UNITE-123 05-05-31 08:00:00
M  123456 COMPLD
   ″1-1-#-#-1-1-1,1-1-#-#-2-1-1:STS1:\
    loca=\″LT-UNITE-124\″,locastate=AUTO-VALID,\
    locz=\″LT-UNITE-124\″,loczstate=AUTO-VALID,lpbkstat=NO,\
    omode=NORM,repleg=2WAY,rtnomode=NORM,rtnxcappl=20,\
    rtnxcnum=123456789012,xconcls=TRADITIONAL,xcappl=20,\
    xcnum=123456789012″
;
```

RTRV-CRS for a cross-connection established via ENT-PATH with a specified in_aid:

```
RTRV-CRS-VC4:LT-UNITE-123:1-1-#-#-1-1-1:123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   ″1-1-#-#-1-1-1,1-1-#-#-2-1-1:VC4:\
    lpbkstat=NO,omode=NORM,repleg=2WAY,rtnomode=NORM,\
    rtnxcappl=0,rtnxcnum=000000000000,xconcls=NN,xcappl=0,\
    xcnum=000000000000″
;
```

Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2417). The error responses listed there also apply to the **RTRV-CRS** command.

RTRV-CRS-FECOM: Retrieve transparent DCC cross-connection

The **RTRV-CRS-FECOM** command can be initiated by the users to retrieve the established transparent DCC cross-connections.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes.

Input format

Command syntax: **RTRV-CRS-FECOM***:tid:[port_aid][,dcctype]:ctag;*

Input parameters

Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2417) command for input parameter syntax and description of this parameter.
3. **port_aid** – DCC port
   This parameter indicates the port AID of a circuit pack which is used together with *dcctype* to identify the DCC channel which is involved in a transparent DCC cross-connection. If this field is omitted, the report will include the DCC parameters of all ports belonging to the NE and being provisioned with transparent DCC.
   Type: AID
   Range: SPortAID, the keyword **all** is allowed on slot and port level.
4. **dcctype**
   This parameter specifies whether the LINE/MS or SECTION/RS transparent DCC cross-connection parameters of the OP***n*** port is reported by the command. If this parameter is omitted, LINE and SECTION DCC parameters will be considered for the output.
   Type: Alphanumeric value set.
   Range: LINE, SECTION.

Output format

In response to a valid RTRV-CRS-FECOM command, the following output is returned:

```
    sid date time
 M  ctag COMPLD
    ″port_aid1,port_aid2,dcctype″
      .....
    ″port_aid1,port_aid2,dcctype″
;
```

The output will not be sorted.

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2417).

Important! The NE responses partially with duplicate lines, if the user retrieves transparent DCC connections by specifing an AID range. The NE lists every port with transparent DCC connections in this AID range. Thus, if both connected DCC ports are in the range, the connection is listed two times. The duplicate lines should be ignored.

Output parameters

Command parameters

1. **port_aid1** – DCC port 1
   This parameter indicates one (first) optical port AID of an OP***n*** circuit pack which is used together with dcctype to identify the DCC channel which is involved in a transparent DCC cross-connection.
   Type: AID
   Range: SPortAID. The keyword **all** is allowed not.
2. **port_aid2** – DCC port 2
   This parameter indicates one (second) optical port AID of an OP***n*** circuit pack which is used together with dcctype to identify the DCC channel which is involved in a transparent DCC cross-connection.
   Type: AID.
   Range: SPortAID. The keyword **all** is allowed not.
3. **dcctype**
   This parameter specifies whether the LINE/MS or SECTION/RS transparent DCC cross-connection parameters of the OP***n*** port is reported by the command.
   Type: Alphanumeric value set.
   Range: LINE, SECTION.

Detailed behavior description

The System supports only bidirectional transparent DCC cross-connections. Each reported transparent DCC cross-connection is bidirectional.

The command reports all transparent DCC cross-connections. That means only DCC channels are shown with *dccstat* = TRANSPARENT or *scn_dccstat* = TRANSPARENT.

If an AID range is specified, then the DCC cross-connections are reported for all ports in the AID range, i.e. a DCC cross-connection will be reported twice, if both involved ports are in the AID range.

Update affected entities

The **RTRV-CRS-FECOM** command does not generate a REPT DBCHG message.

Example input/output

The following example shows a RTRV-CRS-FECOM command there two transparent DCC cross-connections are reported one for *dcctype* = SECTION and one for *dcctype* = LINE:

```
RTRV-CRS-FECOM:LUCENT-UNITE-NE:1-1-#-#-2-1:12345;
    NE-UNITE 00-12-24 11:00:00
 M  123456 COMPLD
    "1-1-#-#-1-1,1-1-#-#-2-1,LINE"
    "1-1-#-#-1-1,1-1-#-#-2-1,SECTION"
;
```

Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2417). The error responses listed there also apply to the **RTRV-CRS-FECOM** command.

RTRV-EC1: Retrieve EC1 port

The **`RTRV-EC1`** command is used to retrieve all parameters related to the electrical EC1 port.

Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

Input format

Command syntax:

`RTRV-EC1`:*tid:aid:ctag;*

Input parameters

Command parameters

1. **`tid`** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).
2. **`aid`** – Access Identifier
   Access Identifier of a EC1 port.
   Type: AID
   Range: SPortAID of EC1 port. The keyword **`all`** is allowed up to shelf level.
3. **`ctag`** – Correlation Tag
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2417).

Output format

In response to a valid RTRV-EC1 command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   ″aid[:spec_block]″
       ...
       ...
   ″aid[:spec_block]″
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section for the **`RTRV-HDR`** command.

Output parameters

Command parameters

1. **`aid`** – access identifier
   Type: AID
   Range: EC1 port AID

Spec block parameters

1. **`crstat`** – Constituent Rates Status list
   This parameter shows the rates of the port signal.
   Type: numeric value set
   Range: 11, (1 x STS1).
2. **`eif`** – Electrical Interface Type
   The parameter eif indicates the type of input the port has been provisioned to receive.
   Type: Alphanumeric string.
   Range: EC1
3. **`felpm`** – Far-end Line PM Enable
   Enable or disable of the performance monitoring of the multiplex section/line.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default)
4. **`frcdus`** – Force to DUS
   Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message “do not use” will be transmitted from that optical interface.
   Type: Alphanumeric value set.

   Range:
   - ENABLE: (set a forced DUS/DNU)
   - DISABLe (default): (clear a forced DUS/DNU)
5. **`fsflpbkstat`** – Far Side Facility Loopback Status
   This parameter specifies the current far-side facility loopback status of the considered output *aid*. A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback exististing for the aid.
   Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time
   Type: Alphanumeric value set.
   Range: YES, NO (default)
6. **`inputsig`** – Tributary Input Signal Rate List
   This parameter is a list of STSn rates across the port’s bandwidth.
   Type: numeric value set.
   Range: 11 (default), (1 x STS1).

7. **`istd`** – Interface Standard
Interface standard of the synchronous EC1 interface.
Type: Alphanumeric value set.
Range: SONET
8. **`lbo`** – Line Build Out
This parameter defines the cable length applicable for the EC1 port.
Type: Alphanumeric value set.
Range:
   - SHORT (default): 0 … 68.5 m (0 … 225 ft)
   - LONG: 68.5 … 137 m (225 … 450 ft).
9. **`lpbk`** – Loopback
This parameter specifies the current near-side loopback status of the considered output *aid*.
A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.
Type: Alphanumeric value set.
Range:
   - YES
   - NO (default).
10. **`nelpm`** – Near-End Line PM Enable
Enable or disable near-end multiplex section (near-end line) performance monitoring.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE (default).
11. **`pmmsfeses`** – Performance Monitoring Line Far-End SES Threshold
