   Range: HH represents the hours, MM represents the minutes, SS represents the seconds, leading zeros are not suppressed.
6. **almmsg** – Alarm Message
   A string describing the alarm of the environmental point.
   Note: This string is configurable by the **SET-ATTR-ENV** command.
   Type: text string.
   Range: upper and lower case, up to 32 characters.
   Default: Miscellaneous Discrete.

### Detailed behavior description

Any environmental alarm reported by an autonomous REPT ALM ENV message, which is active when a RTRV-ALM-ENV message is received, is included in the RTRV-ALM-ENV response message.

Environmental alarms of severity NA (warning (ITU) / not alarmed (Telcordia) ) are not included in a RTRV-ALM-ENV response. They are included in the RTRV-COND response.

### Example input/output

The following example shows the successful completion of the **RTRV-ALM-ENV** command by the NE:

```
RTRV-ALM-ENV:LT-UNITE-123::123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   "MISC_IN7:MJ,MISC,01-01,07-49-23,\"Miscellaneous Discrete #7\""
   "MISC_IN5:MN,MISC,01-01,06-32-25,\"stairway 5 temperature\""
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-ALM-ENV** command.

# RTRV-AO: Retrieve autonomous output

The **RTRV-AO** command is used to retrieve copies of past **REPT DBCHG** messages for users in the memory administration user class.

The copies of **REPT DBCHG** messages available for retrieval include those actually reported to the user as well as those that may not have reached the user due to external (for example, DCN failures) or internal (for example, inhibited autonomous TL1 message reporting) conditions.

If messages are inhibited with the **INH-MSG** command, the internal buffering of autonomous messages is unaffected.

The system saves a copy of each **REPT DBCHG** message for users in the memory administration user class (*uidclass* = MEMADMIN). Those copies share one *atag* counter for all users of the memory administration user class. Message is saved even if no user of the memory administration user class is actually logged into the system.

This is in contrast to the autonomous messages which are sent to users of user classes different from memory administration, where the *atag* counter is available per user session.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

User Class: The user must belong to the user class *uidclass* = MEMADMIN (see "RTRV-USER: Retrieve user" (p. 3-3034)).

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-AO**:*tid*::*ctag*[:::*spec_block*];

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition of *tid* in "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **ctag** – Correlation Tag
   See definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2397).

### Spec block parameters

1. **atagseq** – ATAG Sequence
   This parameter specifies one or more *atags* for which the **REPT DBCHG** messages is retrieved from the log.

Examples of ranges that are allowed:

- *atagseq*=10 → Retrieve *atag* message 010
- *atagseq*=10&20 → Retrieve *atag* message 010, 020
- *atagseq*=10&&20 → Retrieve *atag* message 010-020
- *atagseq*=999&&1 → Retrieve *atag* message 999, 000, 001.

If the value is omitted, all messages are retrieved, regardless of *atag*.
Type: (range of) numeric string.
Examples of ranges that are allowed:

- *atagseq*=10 Retrieve **REPT DBCHG** message with *atag* 010
- *atagseq*=10&20 Retrieve **REPT DBCHG** message with *atag* s 010, 020
- *atagseq*=10&&20 Retrieve **REPT DBCHG** message with *atag* s 010-020
- *atagseq*=999&&1 Retrieve **REPT DBCHG** message with *atag* s 999, 000, 001.

Range: 0 .. 999
Default: *null*, if the value is omitted, all messages are retrieved, regardless of *atag*.

2. **msgtype** – Message Type
   Retrieve only atag messages of this specific type.
   Type: Alphanumeric value set.
   Range: DBCHG: Retrieve messages reported by **REPT DBCHG**.
   Default: *null*, if the value is omitted, only DBCHG messages are retrieved.

### Output format

If there are autonomous messages to report, the following response is returned:

```
   sid date time
M  ctag COMPLD
/*
complete autonomous messages without the termination indicator (";")
*/
;
```

### Sorting

If more than one **REPT DBCHG** message is returned, the output is sorted by ascending time order. If the system clock is reset, the output is sorted in the order in which the messages were stored into the log.

For example, if the system originally sent messages 998 through 001, and the user requests those messages, the *atag* numbers in the output will be in the order: 998, 999, 000, 001.

If the *atag* numbers have wrapped and the most recent entry is *atag* 040, and if the user requests *atagseq*=38&&43, the *atag* order in the output will be 041, 042, 043, 038, 039, 040.

### Output parameters

The output parameters reflect the autonomous messages that are retrieved from the database change log, see "RTRV-LOG-NTFCN: Retrieve notification log" (p. 3-2444), in the format of a **REPT DBCHG** message.

### Detailed behavior description

The system returns all **REPT DBCHG** messages matching the *atag* range of the input parameter *atagseq* to the user.

Update affected entities: Execution of this command does not affect other entities in the system.

### Example input/output

The following is an example of the successful execution of a RTRV-AO command:

```
RTRV-AO:LT-UNITE:12:123456;
   LT-UNITE 00-11-01 08:00:00
M  123456 COMPLD
/*
   LT-UNITE 00-11-01 07:50:00
A  012 REPT DBCHG
   "DATE=00-11-01,TIME=07-49-58:ED-NE:::tunstat=ENABLE"
*/
;
```

### Error responses

Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command Error Response section. The error responses listed there also apply to the **RTRV-AO** command.

#### Validation rule: valid *atagseq*

If the NE receives a RTRV-AO command with an invalid *atagseq* value the command is rejected with

Error code: `IDNV – Input Data Not Valid, invalid atagseg`

#### Validation rule: user class

If the NE receives a RTRV-AO command from a user that is not in the memory administration user class, i.e. *uidclass* = MEMADMIN, the command is rejected with

Error code:
`PICC – Privilege, Illegal Command Code, invalid user class`

# RTRV-ASAP-ASGNMT: Retrieve ASAP assignment

The **RTRV-ASAP-ASGNMT** command retrieves a list of AIDs that identifies all users of an ASAP of a specific type and a specific name.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-ASAP-ASGNMT**:*tid*:*aid*:*ctag*::*pftype*,*pfname*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).
3. **aid** – Access Identifier
   Identifies the entity for which and all contained entities the ASAP assignments will be retrieved. Only for a shelf and all its contained entities all ASAP assignments can be retrieved.
   Type: AID.
   Range: ShelfAID.
4. **pftype** – Profile Type
   This parameter indicates the type of the ASAP (ASAP type).
   Type: Alphanumeric value set. A hyphen ("-") is allowed for the alphanumeric values additionally.
   Range:
   - DCN: Data Communications Network
   - DS1: DS1 asynchronous signals
   - DS3: DS3 asynchronous ports
   - ENET: Ethernet
   - ENV: Environmental (Miscellaneous Discrete)
   - EQUIP-PROT: Equipment with Protection State Dependence
   - EQUIP-UNPROT: Equipment unprotected
   - MS-SPRing-BLSR: MS-SPRing and Bilateral Switched Ring protection switch
   - MSP-APS: Automatic protection switch

- OTN: OTN ports.
- PATH: Path MSA/NIM related
- PATHTERM: Path Termination
- PORT: SDH/SONET ports
- SCN: SCN
- SNCP-UPSR: Sub-Network Connection Protection and Unidirectional Path Switched Ring
- TIMING: System Timing
- TRANSPARENCY: Fully Transparent Service

Default Value: There is no default value. The *pftype* does not change.

5. **pfname** – ASAP Profile Name

   This parameter indicates the name of the ASAP. The ASAP name distinguishes ASAPs of the same ASAP type specified by pftype. That means the same name can be used for several ASAP types.

   Type: alphanumeric character string. A hyphen (“-”) is allowed in the name additionally.

   Range: length 1-24 characters.

   For predefined ASAPs is the value of *pfname* "DEFAULT", but it is no default name in general.

## Output format

The following example shows the successful completion of the **RTRV-ASAP-ASGNMT** command by the NE:

```
   sid date time
M  ctag COMPLD
   "aid_output:pftype,pfname"
   (0 or more lines)
;
```

## Output parameters

### Command parameters

1. **aid**_output – Access Identifier

   Access Identifier of an entity which has an ASAP pointer which points to an ASAP of *pftype*, *pfname*.

   Type: AID.

   Range: All AIDs of entities which contain a ASAP pointer. For entities see in the section "Entity – ASAP Relation".

   Default: None.

2. **pftype** – Profile Type

   This parameter indicates the type of the ASAP (ASAP type).

Type: Alphanumeric value set. A hyphen ("-") is allowed for the alphanumeric values additionally.

Range:

- DCN: Data Communications Network
- DS1: DS1 asynchronous signals
- DS3: DS3 asynchronous ports
- ENET: Ethernet
- ENV: Environmental (Miscellaneous Discrete)
- EQUIP-PROT: Equipment with Protection State Dependence
- EQUIP-UNPROT: Equipment unprotected
- MS-SPRing-BLSR: MS-SPRing and Bilateral Switched Ring protection switch
- MSP-APS: Automatic protection switch
- OTN: OTN ports.
- PATH: Path MSA/NIM related
- PATHTERM: Path Termination
- PORT: SDH/SONET ports
- SCN: SCN
- SNCP-UPSR: Sub-Network Connection Protection and Unidirectional Path Switched Ring
- TIMING: System Timing
- TRANSPARENCY: Fully Transparent Service

Default Value: There is no default value. The *pftype* does not change.

3. **pfname** – Profile Name

   This parameter indicates the name of the ASAP. The ASAP name distinguishes ASAPs of the same ASAP type specified by *pftype*. That means the same name can be used for several ASAP types.

   Type: alphanumeric character string. A hyphen ("-") is allowed in the name additionally.

   Range: length 1-24 characters.

   For predefined ASAPs is the value of *pfname* "DEFAULT", but it is no default name in general.

## Detailed behavior description

The *RTRV-ASAP-ASGNMT* command does not generate a **REPT DBCHG** message.

### Behavior: No matching profile name

If the system receives a command with a *pfname* that does not exist, then the command will successfully complete with an empty reply list. Thus no data will be returned. Note: A wrong pftype is handled by the general error response IDNV (RTRV-HDR).

### Behavior with DEFAULT profile

If the system receives a command with pfname = DEFAULT, then the command will successfully complete with an empty reply list.

## Example input/output

The following example shows the successful completion of the **RTRV-ASAP-ASGNMT** command by the NE:

```
RTRV-ASAP-ASGNMT:LT-UNITE-123:1-1:123456::SONET,GTE;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   "1-1-#-#-1-2:SONET,GTE"
   "1-1-#-#-1-3:SONET,GTE"
   "1-1-#-#-4-1:SONET,GTE"
   "1-1-#-#-4-1:SONET,GTE"
;
```

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-ASAP-ASGNMT** command.

## Related TL1 messages

- “DLT-ASAP-PROF: Delete alarm severity assignment profile” (p. 3-136)
- “ED-ASAP-PROF: Edit alarm severity assignment profile” (p. 3-281)
- “RTRV-ASAP-PROF: Retrieve ASAP profile” (p. 3-2236)
- “ENT-ASAP-PROF: Enter alarm severity assignment profile” (p. 3-1439).

# RTRV-ASAP-PROF: Retrieve ASAP profile

The **RTRV-ASAP-PROF** command retrieves information about one or more alarm severity assignment profile(s).

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-ASAP-PROF**:*tid*::*ctag*::*pftype*[,*pfname*];

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).
3. **pftype** – Profile Type
   This parameter indicates the type of the ASAP (ASAP type).
   Type: Alphanumeric value set. A hyphen ("-") is allowed for the alphanumeric values additionally.
   Range:
   - DCN: Data Communications Network
   - DS1: DS1 asynchronous signals
   - DS3: DS3 asynchronous ports
   - ENET: Ethernet
   - ENV: Environmental (Miscellaneous Discrete)
   - EQUIP-PROT: Equipment with Protection State Dependence
   - EQUIP-UNPROT: Equipment unprotected
   - MS-SPRing-BLSR: MS-SPRing and Bilateral Switched Ring protection switch
   - MSP-APS: Automatic protection switch
   - OTN: OTN ports.
   - PATH: Path MSA/NIM related
   - PATHTERM: Path Termination
   - PORT: SDH/SONET ports

- SCN: SCN
- SNCP-UPSR: Sub-Network Connection Protection and Unidirectional Path Switched Ring
- TIMING: System Timing
- TRANSPARENCY: Fully Transparent Service

Default Value: There is no default value. The *pftype* does not change.

4. **pfname** – Profile Name

   This parameter indicates the name of the ASAP. The ASAP name distinguishes ASAPs of the same ASAP type specified by pftype. That means the same name can be used for several ASAP types.

   Type: alphanumeric character string. A hyphen (“-”) is allowed in the name additionally.

   Range: length 1-24 characters.

   For predefined ASAPs is the value of *pfname* "DEFAULT", but it is no default name in general.

### Output format

The following example shows the successful completion of the **RTRV-ASAP-PROF** command by the NE if the *pfname* parameter is omitted:

```
   sid date time
M  ctag COMPLD
   "pftype=pftype,name=DEFAULT"
   "pftype=pftype,name=pfname"
   ...
   "pftype=pftype,name=pfname"
;
```

There may be 0 or more *pfname* lines, where each line gives the name of an ASAP of type *pftype*. Even if ENT-ASAP-PROF has never been used to create a profile for this pftype, RTRV-ASAP-PROF will still return one profile: DEFAULT.

#### Normal completion response if *pfname* is specified

The following example shows the successful completion of the **RTRV-ASAP-PROF** command by the NE if the *pfname* parameter is specified:

```
   sid date time
M  ctag COMPLD
   "pftype=pftype,name=pfname"
   "spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2397).

**Important!** Instead of returning an error message the **RTRV-ASAP-PROF** command returns success with an empty list when the user tries to retrieve non-existing profiles.

## Output parameters

### Command parameters

1. **pftype** – Profile Type

   This parameter indicates the type of the ASAP (ASAP type).

   Type: Alphanumeric value set. A hyphen ("-") is allowed for the alphanumeric values additionally.

   Range:

   - DCN: Data Communications Network
   - DS1: DS1 asynchronous signals
   - DS3: DS3 asynchronous ports
   - ENET: Ethernet
   - ENV: Environmental (Miscellaneous Discrete)
   - EQUIP-PROT: Equipment with Protection State Dependence
   - EQUIP-UNPROT: Equipment unprotected
   - MS-SPRing-BLSR: MS-SPRing and Bilateral Switched Ring protection switch
   - MSP-APS: Automatic protection switch
   - OTN: OTN ports.
   - PATH: Path MSA/NIM related
   - PATHTERM: Path Termination
   - PORT: SDH/SONET ports
   - SCN: SCN
   - SNCP-UPSR: Sub-Network Connection Protection and Unidirectional Path Switched Ring
   - TIMING: System Timing
   - TRANSPARENCY: Fully Transparent Service

   Default Value: There is no default value. The *pftype* does not change.

2. **pfname** – ASAP Profile Name

   This parameter indicates the name of the ASAP. The ASAP name distinguishes ASAPs of the same ASAP type specified by pftype. That means the same name can be used for several ASAP types.

   Type: alphanumeric character string. A hyphen ("-") is allowed in the name additionally.

   Range: length 1-24 characters.

   For predefined ASAPs is the value of *pfname* "DEFAULT", but it is no default name in general.

### Spec block parameters

1. Alarm Severity Profile parameters

   The spec block contains ASAP parameters. Each ASAP parameter defines for a probable cause (*condtype*) the assigned severity which will be reported when the alarm appears. If for one specific probable cause a service affecting (sa) or non service affecting (nsa) alarm can be reported then for each the sa-alarm and nsa-alarm an ASAP parameter exists.

   The severity indicates the urgency of an alarm. The severity of a sa-alarm must be more urgent that of a nsa-alarm for the same *condtype*.

   The description of the ASAP parameters, the relation to the profile types and the default values are described in: "Alarms, events, ASAPs" (p. 6-4).

   All parameters have the same type and value range.

   Type: Alphanumeric value set.

   Range:

   - CR – Critical (ITU / Telcordia)
   - MJ – Major (ITU / Telcordia)
   - MN – Minor (ITU / Telcordia)
   - NA – Warning (ITU) / Not-Alarmed (Telcordia)
   - NR – Non-Alarmed (ITU) / Not-Reported (Telcordia).

   Example: Concrete ASAP parameters are *sa_eqpt* and *nsa_eqpt*. Both refers to the probable cause (*condtype*) EQPT and ASAP type EQUIPPROT. *sa_eqpt* contains the assigned severity for the service affecting alarm of probable cause EQPT and *nsa_eqpt* for the non service affecting alarm. *sa_eqpt* can have the concrete value CR and *nsa_eqpt* MN.

### Detailed behavior description

The sysem returns

- All defined profiles of a specific profile type, if only the profile type is specified
- All profile parameters of a specific profile, if profile type and profile name is specified.

If no profile with the specified name exists, the response is empty.

The **RTRV-ASAP-PROF** command does not generate a **REPT DBCHG** message.

### Example input/output

The following example shows the successful completion of the **RTRV-ASAP-PROF** command by the NE if *pfname* is omitted:

```
RTRV-ASAP-PROF:LT-UNITE-123::123456::ENV;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   "Pftype=ENV,Name=DEFAULT"
```

```
   "Pftype=ENV,Name=GTE"
;
```

The following example shows the successful completion of the **RTRV-ASAP-PROF** command by the NE if *pfname* and *pftype* is specified:

```
RTRV-ASAP-PROF:LT-UNITE-123::123456::ENET,GTE;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   "Pftype=ENET,Name=GTE"
   "sa_vcg_loa=MJ,nsa_vcg_loa=MN,sa_vcg_ssf=MJ,nsa_vcg_ssf=MN,
sa_vcg_plm=MN,nsa_vcg_plm=NA,sa_gfp_lof=CR,nsa_gfp_lof=MJ,sa_lan_los=CR,
   nsa_lan_los=MJ,sa_lan_anm=MN,nsa_lan_anm=NA"
;
```

## Error responses

The **RTRV-ASAP-PROF** command does not generate any special error responses. The general error responses defined in "RTRV-HDR: Retrieve header" (p. 3-2397) are also valid for this command.

## Related TL1 messages

- "DLT-ASAP-PROF: Delete alarm severity assignment profile" (p. 3-136)
- "ED-ASAP-PROF: Edit alarm severity assignment profile" (p. 3-281)

# RTRV-ATTR-CONT: Retrieve attribute control

The **RTRV-ATTR-CONT** command can be initiated by users to retrieve the configuration associated with an miscellaneous output control (MDO port / external discrete control). The assigned descriptions are used for information purposes when a user seeks to operate or release external miscellaneous discrete controls.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-ATTR-CONT**:*tid*:[*aid*]:*ctag*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **aid** – Access Identifier
   This is the address of the MDO port entities on which the command operates. If misc_outall is specified the configuration of all MDO's will be retrieved.
   Type: AID
   Range: Miscellaneous_out_discreteAID
   Default: misc_outall (if the *aid* is omitted).
3. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output format

The following example shows the successful completion of the **RTRV-ATTR-CONT** command by the NE:

```
   sid date time
M  ctag COMPLD
   "aid:contmsg,durmode,initcstat,[asgncond]"
   ...
   "aid:contmsg,durmode,initcstat,[asgncond]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2397).

## Output parameters

### Command parameters

1. **aid** – Access Identifier

   This is the address of the MDO port entity for which the configuration is retrieved or on which an operation is performed.

   Type: AID.

   Range: Miscellaneous_out_discreteAID. misc_outall must not be reported or used.

2. **contmsg** – Control Message

   This is the name associated to a MDO port (environmental control). It is a description which can be retrieved by the management system.

   Type: inner string.

   Range: string up to 26 characters, any character except " and \, upper and lower cases considered. A empty string is allowed. The value would be \"\".

   Default: MDO port #n. n is the number of the port 1 … 8.

3. **durmode** – Duration Mode

   This parameter defines in which mode the device connected to the MDO is expected to be operated. It is a fixed value because this feature will be not supported by the system. This parameter is in for compatibility reason. The system operates only continuous that means if the MDO is operated it is switched on and it is released it is switched off.

   Type: Alphanumeric value set.

   Range: CONTS, continuous duration.

4. **initcstat** – Initial Control State

   This parameter defines the state the MDO must have in order to put the connected device in the "off"-state. For UNITE it is a fixed value because this feature will be not supported. This parameter is in for compatibility reason.

   Type: Alphanumeric value set.

   Range: RLS, release.

5. **asgncond** – Assigned Condition Type

   This parameter identifies the probable cause (type of alarm indication) which is assigned to an MDO port (external control). If one or more alarm(s) of this probable cause appears then the MDO port (external control) will be switched on.

   Type: Alphanumeric value set. Additionally a “-” will be allowed (not the first character).

   Range: All defined probable causes and UNDEF: if no probable cause is assigned.

   Default: UNDEF.

### Detailed behavior description

The **RTRV-ATTR-CONT** command does not generate a **REPT DBCHG** message.

### Example input/output

The following example shows the successful completion of the **RTRV-ATTR-CONT** command by the NE:

```
RTRV-ATTR-CONT:LT-UNITE-123:MISC_OUT3:123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   "MISC_OUT3:\"fan 3\",CONTS,RLS,FANF"
;
```

The following example shows the successful completion of the **RTRV-ATTR-CONT** command by the NE if the aid is omitted:

```
RTRV-ATTR-CONT:LT-UNITE-123::123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   "MISC_OUT2:\"sprinkler 2\",CONTS,RLS"
   "MISC_OUT3:\"fan 3\",CONTS,OPER,FANF"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-ATTR-ENV** command.

### Related TL1 messages

# RTRV-ATTR-ENV: Retrieve attribute environment

The **RTRV-ATTR-ENV** command is used to retrieve the alarm message, name and assigned ASAP of a miscellaneous discrete input (MDI/environmental point).

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-ALM-ENV**:*tid*:[*aid*]:*ctag*;

## Input parameters

### Command parameters

- **tid** – Target Identifier
  See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).
- **aid** – Access Identifier
  This is the address of the MDI port entities for which an alarm condition or the configuration is being reported. If misc_inall is specified the information for all entities will be retrieved.
  Type: AID.
  Range: Miscellaneous_in_discreteAID.
  Default: misc_inall (if the aid is omitted).
- **ctag** – Correlation Tag
  See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output format

The following example shows the successful completion of the **RTRV-ATTR-ENV** command by the NE:

```
   sid date time
M  ctag COMPLD
   "aid:,,envmsg,envname:pfname,envinv"
   (more lines for default AID)
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command parameters

1. **aid** – Access Identifier

   This is the address of the entity for which an alarm condition is being reported.

   Type: AID.

   Range: Miscellaneous_in_discreteAID. The AID misc_inall must not appear.

2. **envinv** – Environmental Alarm Inversion

   This parameter indicates for the MDI (environmental point) whether an alarm is generated if the port is on or if the port is off.

   Type: Alphanumeric value set.

   Range:

   - YES: The alarm will be inverted
   - NO: The alarm will be not inverted.

3. **envmsg** – Environment Message

   This is the condition description which is associated with the MDI port (environmental point). This description will be sent with the alarm generated from the MDI port.

   Type: inner string.

   Range: a string up to 32 characters, any character except " and \, upper and lower cases are considered.

   Default: Miscellaneous Discrete #<N> with N = 1 .. 8 for the different MDI ports.

4. **envname** – Environmental Point Name

   This is the name associated to a MDI port (environmental point). It is a description which can be retrieved by the management system. It is not to be mixed up with the envmsg parameter. The envname is just a name of the MDI port and not reported via the condition description of an alarm.

   Type: inner string

   Range: a string up to 26 characters, any character except " and \, upper and lower cases considered.

   Default: MDI port #n; n is the number of the port 1 … 8.

5. **pfname** – Profile Name

   This is the name of the ASAP that is assigned to the MDI port (environmental point). The ASAP must be of the type ENV.

   Type: alphanumeric character string. A hyphen (“-”) is allowed in the name additionally.

   Range: string up to 24 characters.

   Default: DEFAULT.

## Detailed behavior description

The **RTRV-ATTR-ENV** command does not generate a **REPT DBCHG** message.

### Example input/output

The following example shows the successful completion of the **RTRV-ATTR-ENV** command by the NE:

```
RTRV-ATTR-ENV:LT-UNITE-123:misc_in3:123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   "MISC_IN3:,,\"smoke detected on detector 3\",\"smoke detector 3\":ENV_CR,
   NO"
;
```

The following example shows the successful completion of the **RTRV-ATTR-ENV** command by the NE if all MDI's will be retrieved:

```
RTRV-ATTR-ENV:LT-UNITE-123::123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   "MISC_IN1:,,\"pump on\":ENV_NA,NO"
   "MISC_IN2:,,\"smoke detected on detector 1\",\"smoke detector 1\":ENV_CR,
   NO"
   "MISC_IN3:,,\"smoke detected on detector 2\",\"smoke detector 2\":ENV_CR,
   NO"
   "MISC_IN4:,,\"smoke detected on detector 3\",\"smoke detector 3\::ENV_CR,
   NO"
   "MISC_IN5:,,\"smoke detected on detector 4\",\"smoke detector 4\":ENV_CR,
   NO"
   "MISC_IN6:,,\"fan on\",\"fan\":ENV_NA,YES"
   "MISC_IN7:,,\"open door\",\"door\":DEFAULT,YES"
   "MISC_IN8:,,\"open door\",\"door 2\":DEFAULT,YES"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-ATTR-ENV** command.

### Related TL1 messages

# RTRV-ATTR-MSG: Retrieve attribute message

The **RTRV-ATTR-MSG** command is used to retrieve the current status of the autonomous message reporting, which can be controlled via INH-MSG and ALW-MSG.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: yes

## Input format

Command syntax: **RTRV-ATTR-MSG***:tid::ctag;*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

## Output format

If the RTRV-ATTR-MSG request completes successfully, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "sessions:msgstate"
   . . .
;
```

For each value of parameter *sessions* one line is reported.

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

1. **sessions** – Affected sessions
   This parameter specifies for which sessions the *msgstate* is applied.
   Type: Alphanumeric value set.

Range: CURRENT: affected session is the current session of the user who executed the command.
Default: CURRENT

2. **msgstate** – Message status
   The current state of autonomous message reporting for *sessions*.
   Type: Alphanumeric value set.
   Range:
   - ON: autonomous reporting is enabled for *sessions*
   - OFF: autonomous reporting is disabled for *sessions*.

   Default: ON

### Detailed behavior description

The command retrieves the current status of the autonomous message reporting for all values of parameter *sessions*. Control of this state is via the commands INH-MSG and ALW-MSG.

When a user logs into the system via ACT-USER it is recommended to retrieve the status of autonomous reporting to check whether reporting is OFF for *sessions* = ALL.

### Example input/output

The following is an example of the **RTRV-ATTR-MSG** command:

```
RTRV-ATTR-MSG:LT-UNITE::123456;

   LT-UNITE 00-11-15 08:00:00
M  123456 COMPLD
   "ALL:ON"
   "CURRENT:OFF"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **INH-MSG** command.

### Related TL1 messages

- “ALW-MSG: Allow message” (p. 3-33)
- “INH-MSG: Inhibit message” (p. 3-2001)

# RTRV-AUDLOG: Retrieve audit result log for ONNS connection data

## Overview

The **RTRV-AUDLOG-***mod* command is used to request information about the last audit result on ONNS data that is stored. Note that this command does not perform the audit operation. See AUD-mod TL1 command for the details of audit operation. The modifier of the RTRV-AUDLOG-mod command indicates the scope of data the audit operation was performed on.

**RTRV-AUDLOG-LOCAL**

RTRV-AUDLOG-LOCAL shall retrieve the last audit result based on comparison of ONNS data with the master data from local host NE. Mismatched cross-connects and port objects between two sets of data will be displayed..

**RTRV-AUDLOG-PATHNBR**

RTRV-AUDLOG-PATHNBR shall retrieve the last audit result based on comparison of ONNS path data with neighboring ONNS nodes.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Abortable: No

## Input format

Command Syntax of RTRV-AUDLOG-LOCAL:
**RTRV-AUDLOG-LOCAL:***srcTid:srcAid:ctag;*

Command Syntax of RTRV-AUDLOG-PATHNBR:
**RTRV-AUDLOG-PATHNBR:***srcTid:srcAid:ctag;*

## Input parameters

### Command parameters

1. **srcTid**

   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.

   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.

   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.

2. **srcAid**

Source node ONNS application access identifier of the ONNS controller OS command interface port.

Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn.

3. **ctag**

   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.

   The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ".").

## Output format

If the RTRV-AUDLOG-LOCAL request completes successfully, the following normal completion response is returned:

```
   srcTid date time
M  ctag COMPLD
   "ExtraPortIDs=1portID,2portID,...,N1portID"

   "MissingPortIDs=1portID,2portID,...,N2portID"

   "ExtraNNXcons=1connPtID1,-X-,1connPtID2,1bandwidth,1pathID
   :2connPtID1,-X-,2connPtID2,2bandwidth,2pathID
   :...
   :N3connPtID1,-X-,N3connPtID2,N3bandwidth,N3pathID"

   "MissingNNXcons=1connPtID1,-X-,1connPtID2,1bandwidth
   :2connPtID1,-X-,2connPtID2,2bandwidth
   :...
   :N4connPtID1,-X-,N4connPtID2,N4bandwidth"

   "ExtraNonNNXcons=1connPtID1,-X-,1connPtID2,1bandwidth
   :...
   :N5connPtID1,-X-,N5connPtID2,N5bandwidth"

   "MissingNonNNXcons=1connPtID1,-X-,1connPtID2,1bandwidth
   :...
   :N6connPtID1,-X-,N6connPtID2,N6bandwidth"

   "MultipleNNXcons=1connPtID1,-X-,1connPtID2,1connPtID3,-X-
    ,1connPtID4, 1bandwidth, 1pathID
   :...
   : N7connPtID1,-X-,N7connPtID2,N7connPtID3,-X-
    ,N7connPtID4,N7bandwidth, N7pathID"
;
```

The output shows any mismatched port objects and mismatched cross connect information in comparing NN data and host NE data.

For mismatched port objects, the cases may occur are as follows:

- port object exists only in NN data, but not in host NE data (ExtraPortIDs)
- port object exists only in host NE data, but not in NN.

The cases in the response represent the mismatched port objects or mismatched cross connect information as follows:

- ExtraPortIDs – port object exists only in NN data, but not in host NE data
- MissingPortIDs – pport object exists only in host NE data, but not in NN data
- ExtraNNXcons – NN owned cross-connect exists only in NN data, but not in host NE
- MissingNNXcons – NN owned cross-connect exists only in host NE data, but not in NN data
- ExtraNonNNXcons – non-NN owned cross-connect exists only in NN data, but not in host NE
- MissingNonNNXcons – non-NN owned cross-connect exists only in host NE data, but not in NN data.

The symbol ( -X- ) indicates that a cross-connection is present between the connPtIDs on an output line. See Aud-LOCAL for the details of audit operation.

If the RTRV-AUDLOG-PATHNBR request completes successfully, the following normal completion response is returned:

```
   srcTid date time
M  ctag COMPLD
   "MismatchedPathIDs=1connPtID1,-X-,1connPtID2,1bandwidth,1localpathID,
   1nbrnodeID,1nbrpathID
   :2onnPtID1,-X-,2connPtID2,2bandwidth,2localpathID,2nbrnodeId,2nbrpathID
   :...
   :NconnPtID1,-X-,NconnPtID2,Nbandwidth,NlocalpathID,NnbrnodeID,NnbrpathID"
   "NotReachedNeighborNodes=1nbrnodeId,2nbrnodeID,...,NnbrnodeID"
;
```

The output shall show any mismatched path data in comparing path information at a local NN with its neighboring nodes.

The cases in the response represent the mismatched path information as follows:

- When all the parameters have valid values – local node and neighboring node have different pathIDs for the same path.
- When the parameter for pathID at neighboring node (nbrpathID) is empty – local node has a cross-connect that is connected to a neighboring node, but the neighboring node does not have the corresponding cross-connect or path information.
- When the parameter for pathID at local node (localpathID) is empty – neighboring node has a cross-connect that is connected to a local node, but the local node does not have the corresponding cross-connect or path information.

The symbol ( -X- ) indicates that a cross-connection is present between the connPtIDs on an output line.

All neighbor nodes which are not reachable are be listed. For these neighbor nodes is was not possible to retrieve information for comparison of the ONNS path data.

### Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *conpletion code* and their syntax are included in the section "Output parameters" of the "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683) command.

1. **pathID**
   The PathID of the specific path to be reported.
   Type: character string of length up to 20
   Range: nodeID-Index. *nodeID*: four dot separated numeric strings: each string 0..255 *Index*: numeric string 0-65535.
   The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.
   Example: 29.13.196.203-65111
2. **localpathID**
   The PathID of the local node of the specific path to be reported.
   Type: character string of length up to 20
   Range: nodeID-Index. *nodeID*: four dot separated numeric strings: each string 0..255 *Index*: numeric string 0-65535.
   The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.
   Example: 29.13.196.203-65535
3. **nbrpathID**
   The PathID of the neighbor node of the specific path to be reported.
   Type: character string of length up to 20
   Range: nodeID-Index. *nodeID*: four dot separated numeric strings: each string 0..255 *Index*: numeric string 0-65535.
   The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.
   Example: 29.13.196.203-65111
4. **nbrnodeID**

ONNS node Network Access identifier (nodeID) of the neighbor node. *nodeID* is not changable and may be different from Signaling network IP address.

Type: Four dot separated numeric strings

Range: for each numeric string: 0..255.

5. **bandwidth** – Requested bandwidth/*signalRate*

   ONNS bandwidth is equal to or greater than the minimum cross connect rate (minXCrate) of the port type. Note: Only SONET switching levels in enumeration. For actual cross-connections ONNS adapts to SDH formats automatically if the ingress port is SDH.

   Type: Value set.

   Values: STS1, STS3, STS12, STS48, STS192.

6. **portID** – Port Identifier

   portID of port object discrepancy between NN data and NE data. The *portID* consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # . ONNS assumes a bidirectional port pair.

   Type: dash-separated list of 5 numeric strings.

   Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).

   Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (#), Port # (#), Tributary # (#). This range is valid for protecting connections in M:N connection groups

7. **connPtID1**

   ONNS connection point identifier (connPtID1) for the ingress RX connPt of the cross-connection. It consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary #..

   Type: dash-separated list of 5 numeric strings.

   Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).

   Range: Bay/Frame ## (1), Shelf # (1), Slot/Pack # #, Port # #, Tributary ##. Default tributary AID used for reporting the not existing xcons in the A-node or Z-node for a path associated to a protecting NN connection of an M:N connection group.

   Range: Slot/Pack#*, Port#*, Tributary#*

   Value * for Slot/Pack, Port and Tributary indicates unknown HO tributary AIDs used for reporting that the corresponding HO tributary of an EDGE port (specified in parameter connPtA) is allocated by one or more LO traditional cross-connections.

   Range: Slot/Back#@, Port#@, Tributary#@

   Value @ for Slot/Pack, Port and Tributary indicates that the corresponding HO input and/or output tributary specified by connPtA is involved as EDGE-prt tributary in an OUC.

8. **connPtID2**

   ONNS connection point identifier (connPtID2 ) for the egress TX connPt of the cross-connection. It consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary #.

   Type: dash-separated list of 5 numeric strings.

   Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).

Range: Bay/Frame # (1), Shelf # (1), Slot/Pack ##, Port ##, Tributary ##. Default tributary AID used for reporting the not existing xcons in the A-node or Z-node for a path associated to a protecting NN connection of an M:N connection group.

Range: Slot/Pack#*, Port#*, Tributary#*

Value * for Slot/Pack, Port and Tributary indicates unknown HO tributary AIDs used for reporting that the corresponding HO tributary of an EDGE port (specified in parameter connPtA) is allocated by one or more LO traditional cross-connections.

Range: Slot/Back#@, Port#@, Tributary#@

Value @ for Slot/Pack, Port and Tributary indicates that the corresponding HO input and/or output tributary specified by connPtA is involved as EDGE-prt tributary in an OUC.

9. **connPtID3**

   ONNS connection point identifier (connPtID3 ) for the egress TX connPt of the cross-connection. It consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary #.

   Type: dash-separated list of 5 numeric strings.

   Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).

   Range: Bay/Frame # (1), Shelf # (1), Slot/Pack ##, Port ##, Tributary ##. Default tributary AID used for reporting the not existing xcons in the A-node or Z-node for a path associated to a protecting NN connection of an M:N connection group.

   Range: Slot/Pack#*, Port#*, Tributary#*

   Value * for Slot/Pack, Port and Tributary indicates unknown HO tributary AIDs used for reporting that the corresponding HO tributary of an EDGE port (specified in parameter connPtA) is allocated by one or more LO traditional cross-connections.

   Range: Slot/Back#@, Port#@, Tributary#@

   Value @ for Slot/Pack, Port and Tributary indicates that the corresponding HO input and/or output tributary specified by connPtA is involved as EDGE-prt tributary in an OUC.

10. **connPtID4**

    ONNS connection point identifier (connPtID4 ) for the egress TX connPt of the cross-connection. It consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary #.

    Type: dash-separated list of 5 numeric strings.

    Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).

    Range: Bay/Frame # (1), Shelf # (1), Slot/Pack ##, Port ##, Tributary ##. Default tributary AID used for reporting the not existing xcons in the A-node or Z-node for a path associated to a protecting NN connection of an M:N connection group.

    Range: Slot/Pack#*, Port#*, Tributary#*

    Value * for Slot/Pack, Port and Tributary indicates unknown HO tributary AIDs used for reporting that the corresponding HO tributary of an EDGE port (specified in parameter connPtA) is allocated by one or more LO traditional cross-connections.

    Range: Slot/Back#@, Port#@, Tributary#@

    Value @ for Slot/Pack, Port and Tributary indicates that the corresponding HO input and/or output tributary specified by connPtA is involved as EDGE-prt tributary in an OUC.

### Example input/output

The following example shows a successful completion of a RTRV-AUDLOG command for local ONNS data audit operation by the NE with no data is out-of-sync:

```
RTRV-AUDLOG-LOCAL:LT-ONNS-789:snn:123456;

   LT-ONNS-789 2003-01-01 08:00:00
M  123456 COMPLD
   "ExtraPortIDs=NONE"
   "MissingPortIDs=NONE"
   "ExtraNNXcons=NONE"
   "MissingNNXcons=NONE"
   "ExtraNonNNXcons=NONE"
   "MissingNonNNXcons=NONE"
   "MultipleNNXcons=NONE"
;
```

The following example shows a successful completion of a RTRV-AUDLOG command for local ONNS data audit operation by the NE:

```
RTRV-AUDLOG-LOCAL:LT-ONNS-789:snn:123456;

   LT-ONNS-789 2003-01-01 08:00:00
M  123456 COMPLD
   "ExtraPortIDs=1-1-20-3-5"
   "MissingPortIDs=NONE"
   "ExtraNNXcons=1-6-5-3-1,-X-,1-2-4-3-1,sts48,29.13.196.203-43216
   :1-1-4-4-1,-X-,1-2-1-3-1,sts12,29.13.18.23-12345"
   "MissingNNXcons=1-1-8-10-2,-X-,1-1-3-3-4,sts48"
   "ExtraNonNNXcons=NONE"
   "MissingNonNNXcons=NONE"
   "MultipleNNXcons=NONE"
;
```

The symbol ( -X- ) indicates that a cross-connection is present between the *connPtIDs* on an output line.

The following example shows a successful completion of a RTRV-AUDLOG command for ONNS path neighbor data audit operation by the NE with no data is out-of-sync:

```
RTRV-AUDLOG-PATHNBR:LT-ONNS-789:snn:123456;

   LT-ONNS-789 2003-01-01 08:00:00
M  123456 COMPLD
   "MismatchedPathIDs=NONE"
   "NotReachedNeighborNodes=NONE"
;
```

The following example shows a successful completion of a RTRV-AUDLOG command for ONNS path neighbor data audit operation by the NE:

```
RTRV-AUDLOG-PATHNBR:LT-ONNS-789:snn:123456;

   LT-ONNS-789 2003-01-01 08:00:00
M  123456 COMPLD
   "MismatchedPathIDs=1-1-4-4-1,-X-,1-2-1-3-1,sts12,29.13.18.23-00000,
   168.16.29.111,135.14.196.203-32165
   :1-1-7-4-2,-X-,1-1-3-5-1,sts48,,29.13.18.23,135.14.196.109-12164"
   "NotReachedNeighborNodes=29.12.13.1,29.12.13.2"
;
```

The symbol ( -X- ) indicates that a cross-connection is present between the connPtIDs on an output line.

### Related TL1 messages

- "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683)
- "ED-SYNCDATA: Synchronization of ONNS data" (p. 3-1196)
- "AUD: Perform audit data" (p. 3-46)

### Possible issues when widely using unidirectional ONNS connections

When in an ONNS network unidirectional ONNS connections are widely used, the following misbehavior may occur:

1. Local audit erroneously reports extra NN cross-connections: **AUD-LOCAL** and **RTRV-AUDLOG** may erroneously report extra NN cross-connections, if two unidirectional ONNS connections of differing bandwidth are traversing a node in opposite directions, but with connecting the same timeslots, for example, one connection from timeslot A to timeslot B and the other one from timeslot B to timeslot A.
2. Free bandwidth generally advertised on an INNI link, although no more bandwidth for bidirectional ONNS connections available: Setup of a bidirectional ONNS connection via an INNI link may fail, although for this link enough free bandwidth is generally advertised for example, via **RTRV-NTDR**. This is the case, if the corresponding link is nearly totally filled with a major part being unidirectional connections. The advertised free bandwidth may then refer to differing timeslots for both directions, thus not allowing bidirectional connections to be setup.

# RTRV-BANNER

The **RTRV-BANNER** command can be initiated by users to retrieve the user-provisioned banner for the System.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: No.

## Input format

Command syntax: **RTRV-BANNER**:*tid*::*ctag*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output format

After receiving the **RTRV-BANNER** command, the following normal completion response is returned::

```
   sid date time
M  ctag COMPLD
   ":::spec_block"
    ...
    < 1 line for each Spec Block parameter to be reported >
    ...
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Spec block parameters

1. **line1** – Line 1 of the Customer Provisionable Banner.
   Setting line1 to an empty string will suppress the output of the Customer Provisionable Banner in the response to the **ACT-USER** command.

Type: text string
Range: 2 … 62 characters, case-sensitive. The beginning and ending double quotes are included.
Default: none. The initial value is an empty string.

2. **`line 2`** … line 11 – Line 2 (…Line 11) of the Customer Provisionable Banner.
   Type: text string
   Range: 2 … 62 characters, case-sensitive. The beginning and ending double quotes are included.
   Default: none. The initial value is an empty string.

### Detailed behavior description

The **`RTRV-BANNER`** command shall return one line for each provisioned line of the Customer Provisionable Banner. A line of the Customer Provisionable Banner is provisioned, if the corresponding spec block parameter (line1 … line 11) is not an empty string.

### Example input/output

The following example shows the successful completion of the **`RTRV-BANNER`** command by the network element:

```
RTRV-BANNER:LT-UNITE-123::123456;

   LT-UNITE-123 04-12-23 08:00:00
M  123456 COMPLD
":::LINE1=\"NOTICE: THIS IS A PRIVATE COMPUTER SYSTEM.\""
":::LINE2=\"UNAUTHORIZED ACCESS OR USE MAY LEAD TO PROSECUTION.\""
;
```

### Related TL1 messages

- “ENT-BANNER” (p. 3-1444).

# RTRV-CKT: Retrieve circuit

The **RTRV-CKT** retrieves circuits which use a specified BLSR/MS-SPRing ring channel. The command is only functional in rings with automatic ring discovery enabled.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-CKT**:*tid*:*aid*:*ctag*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **aid** – Access Identifier
   This parameter specifies a tributary of a BLSR/MS-SPRING port for which the circuit information is requested to be retrieved.
   Type: AID
   Range: GenTribAID (not ranged)
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters.
   Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

## Output format

After receiving the **RTRV-CKT** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "rid"
   "ntid,nid,src,dest,[cctype],[rate][:spec_block]"
   ...
   ...
   "ntid,nid,src,dest,[cctype],[rate][:spec_block]"
;
```

## Output parameters

### Command parameters

1. **rid** – Ring Identification

   This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the *rid* to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.

   Type: text string of chars allowed for TID strings

   Range: 1 to 15 characters

2. **ntid** – Node Target Identifier

   This parameter identifies the TID of the node on which the reported cross-connection exists. This is the currently active name of the NE to which the command is addressed. The *tid* is a case insensitive character string.

   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.

   Range: 1 to 20 characters

3. **nid** – Node ID

   This parameter specifies the node ID of the NE within the ring as used by the MS-SPRing/BLSR APS protocol. It shall correspond to the first TID in the *linkid* block.

   Type: Numeric string.

   Range: 0 … 15

4. **src** – Source

   This parameter specifies the tributary which is the source of the cross-connection or displays an error identifier for the input of a missing xconn.

   Type: Value set.

   Range: 20 characters

   The allowed values are:

   - GenTribAID: a tributary AID for a local xconn
   - REM-<AID>TS#: This value is reported as the *aid* in an MS SPRING / BLSR worker port on a remote node. <AID> is replaced by the received worker port AID of a remote node (note: The syntax of the remote AID will be not checked; it is only displayed) and # identifies the timeslot number on the interface. (e.g.: REM-m1-1-TS1)
   - REM-PPORT-TS#: This value is reported as the *aid* in an MS SPRING / BLSR protection port on a remote node.

     # identifies the timeslot number on the interface. (e.g.: REM-PPORT-TS5)

- REMAID: This value is reported as the input aid of an add/drop cross-connection at a remote node.
- PIF (Path Integrity Failure): This value is used to identify the input aid of a missing connection.

5. **dest** – Destination

   This parameter specifies the destination which is the sink of the cross-connection or displays an error identifier for the output of a missing xconn.

   Type: Value set.

   Range: 20 characters

   The allowed values are:

   - GenTribAID: a tributary AID for a local xconn
   - REM-<AID>TS#: This value is reported as the *aid* in an MS SPRING / BLSR worker port on a remote node. <AID> is replaced by the received worker port AID of a remote node (note: The AID can be not in the UNITE syntax; it is only displayed) and # identifies the timeslot number on the interface.
   - REM-PPORT-TS#: This value is reported as the *aid* in an MS SPRING / BLSR protection port on a remote node.

     # identifies the timeslot number on the interface. (e.g.: REM-PPORT-TS5)
   - REMAID: This value is reported as the input aid of an add/drop cross-connection at a remote node.
   - PIF (Path Integrity Failure): This value is used to identify the input aid of a missing connection.

6. **cctype** – Cross Connection Type

   This parameter specifies the type of the cross-connection:

   Type: Alphanumeric value string

   Range: UNIDIR (default)

7. **rate** – Cross Connection Rate

   This parameter indicates the cross-connection rate. For a detailed description please refer to the input parameter *modifier*.

   Type: Alphanumeric value string

   Range: LOVC12, LOVC3, VC3, VC4, VC44C, VC416C, VC464C, LOVT1, STS1, STS3, STS12, STS48, STS192

   Conversion Cross-Connections:

   - AU3TU3 (HO VC3/STS1 input to LO VC3 output)
   - TU3AU3 (LO VC3 input to HO VC3/STS1 output)

### Spec block parameters

1. **loca** – Location-a

   This parameter specifies the TID of the node at which service is added to the BLSR. This parameter is required for BLSR THROUGH, INTER-BLSR and DROP connections.

   The *loca* parameter value is an empty string for ADD and non-BLSR connections.

A 2way cross-connection is considered to be a DROP if the *out_aid* is a non BLSR tributary.The figure "2-way scenario" (p. 3-2305)in RTRV-CRS section (the 3 NEs should be seen as part of an BLSR) depicts the 2way scenario.

*Inter ring cross-connections with collapsed node*: Note that beside the above described THROUGH case there can be also another situation where both *loca* and *locz* are different from the empty string: If two rings are interconnected in a collapsed node then *loca* refers to the (add-node of the) ring where the signal is dropped from, and *locz* refers to the (drop-node of the) ring where the signal is added to. In such cases the cross-connection cannot be provisioned as bidirectional, thus the information is still unambiguous.

A note to the *loca2* parameter: Although *loca2* (Location-a-2) is a parameter which is used in the **ENT-CRS** command, *loca2* is not retrieved explicitly. This is due to the fact that for path-protected cross-connections – and only for those this *loca2* is applicable – the retrieval will be on a leg-basis and not on a leg-pair basis. In other words: If a path-protected cross-connection is retrieved two entries will be sent, one for the working leg (incl. the *loca* and *locz* parameter) and one for the protection leg (incl. the *loca* parameter and the same *locz* parameter, and in this case the *loca* returned is the *loca2* as entered when establishing the path-protected cross-connection).

The parameter loca is also required for EXTRA TRAFFIC connections. (In contrast to incoming references from other commands to this whole chapter it is exclusively applicable for the command **RTRV-CRS**.). For extra traffic the value will be generated automatically and thus it is only retrievable.

For information about the automatic generation of *loca* refer to the parameter *sqfa*. For lower-order cross-connections the parameter *loca* is the TID of that ring node in the direction towards the specified input tributary (upstream), where the HO path termination source function resides. If there is no such function in an upstream ring node then *loca* is the TID of the node where the related HO circuit is first added to the ring. The figure "Lower-order cross-connections" (p. 3-2305) in RTRV-CRS section shows an example of a LO path through as part of a ring.

The LO path is added to/dropped from the ring in NE-1 and NE-2. 2-way cross-connections are considered to be either an Add or a Drop connection depending whether the input or the output tributary is at the ring port. In NE-3 there is a HO through connection, which contains the LO path. In NE-3 there is no HO path termination. In NE-4 there is a LO through connection. Consequently, there are HO path terminations in NE-4.

The fact that *loca* refers to the HO path terminations has the following consequences:

- All LO cross-connections through the same HO path termination at the MS-SPRing port have the same *loca* value.
- Any LO through-connection will be treated as add/drop. *loca* will identify the node of the through connection, and not the node where the LO service is added to the ring.

At the lower-order side of a conversion cross-connection, the same rules for *loca* is applicable as for lower-order cross-connections.

Type: TID or empty-string

Range: Please refer to the TID definition in the RTRV-HDR description

Default: empty string: ""

Note: In output direction the empty string appears as \"\".

2. **locz** – Location-z

   This parameter identifies specifies the TID of the node at which service is dropped from the BLSR. This parameter is required for BLSR THROUGH, INTER-BLSR and ADD connections. The *locz* parameter value is an empty string for DROP and non-BLSR connections.

   A 2-way cross-connection is considered to be a ADD if the *in_aid* is a non BLSR tributary. The figure "2-way scenario" (p. 3-2305)in RTRV-CRS section (the 3 NEs should be seen as part of an BLSR) depicts the 2way scenario.

   *locz* is also required for EXTRA TRAFFIC connections. For extra traffic the value will be generated automatically and thus it is only retrievable. For information about the automatic generation of *locz* refer to the parameter *sqfz*.

   For lower-order cross-connections the parameter *locz* is the TID of that ring node in the direction towards the specified output tributary (downstream), where the HO path termination sink function resides. If there is no such function in a downstream ring node then *locz* is the TID of the node, where the related HO circuit is last dropped from the ring. Refer to the figure "Lower-order cross-connections" (p. 3-2305)in the RTRV-CRS section for further explanation.

   The fact that *locz* refers to the HO path terminations has the following consequences:

   - All LO cross-connections through the same HO path termination at the MS-SPRing port have the same *locz* value.
   - Any LO through-connection will be treated as add/drop. *locz* will identify the node of the through connection, and not the node where the LO service is dropped from the ring.

   At the lower-order side of a conversion cross-connection, the same rules for *locz* is applicable as for lower-order cross-connections.

   Type: TID or empty-string.

   Range: Please refer to the TID definition in the RTRV-HDR description

   Default: empty string: ""

   Note: In output direction the empty string appears as \"\".

3. **rappl** – Ring Application

   The ring application is as given by the contents of the local squelch map in the direction of circuit tracing. This parameter depicts the cross-connection application in the remote nodes and the local node for the direction of the circuit tracing.

   Type: Alphanumeric value set.

   Range: ADD, DROP, THRU, TSI-THRU, DROPMUL, ADDSEL, DROPMUL-PROT, ADDSEL-PROT

## Detailed behavior description

### No cross-connection

If there is no cross-connection at the logical input or output channel/tributary in the local node, the command shall complete, but no circuits are reported.

### Specified tributary does not exist

If the tributary specified in the command does not exist, then the command shall complete with an empty response.

### Only unidirectional cross-connections

A bidirectional (2-way) cross-connection is handled as two unidirectional (1-way) cross-connections.

### Order of circuits and direction of tracing

If the STS-N channel / tributary as input of the Retrieve Circuit command is source and / or destination of more than one local *xconn*, the local *xconns* is sorted as follows:

- a local unidirectional / point_to_multipoint xconn with the given tributary as destination point, tracing direction of the associated circuit is the egressing direction of the port with the given tributary
- a local unidirectional / point_to_multipoint xconn with the given tributary as source point, tracing direction of the associated circuit is the ingressing direction of the port with the given tributary

In this sequence the circuits associated with the local xconns are listed in the reponse of the command.

### Order of xconns in a circuit

The remote and local xconns of a circuit is sorted beginning with the xconn of the source node and ending with the xconn of the destination node whereas source and destination nodes are determined by the direction of tracing. In case that there are more than one local xconn legs contributing to the circuit they is listed consecutively starting with the through part.

For the local NE there are several output lines, one for each cross-connection leg of the circuit. For remote NEs there is only one line reported. The *rappl* values ADDSEL or DROPMUL indicate that there is more than one cross-connection leg in the romote NE.

### Not complete circuits

If a circuit discontinuity is detected, xconn listing shall start/end with the node with the discontinuity using the error indicator PIF for that side continuity was lost.

For the xconn in the node with the discontinuity only the following parameters are returned:

- *ntid* of the node
- *nid* of the node
- *in_aid*
- *out_aid*

#### Not complete circuits

If a circuit discontinuity is detected, xconn listing shall start/end with the node with the discontinuity using the error indicator for that side continuity was lost.

For the xconn in the node with the discontinuity only the following parameters are returned:

- *ntid* of the node
- *nid* of the node
- *in_aid*
- *out_aid*

#### Wrap around circuits

If a wrap around circuit is detected for the local xconn, xconn listing shall start with the local xconn in the direction as given by the STS-N channel/tributary. The xconn input tributary is the error identifier PIF. xconn listing shall comprise xconns in all nodes of the ring and shall end in the neighbor node of the local node with the error identifier PIF for the output tributary.

#### Overlap circuits

If an overlap circuit is detected for the local xconn, xconn listing shall either:

- start in the node with the ADD xconn of the circuit and end in the neighbor node with the error identifier PIF for the output tributary after one complete cycle or
- start in the neighbor node of that with the DROP xconn with an error identifier PIF for the input tributary and end in the node with the DROP xconn after one complete cycle.

### Example input/output

#### Normal output response - no circuit

RTRV-CKT for no circuit:

```
RTRV-CKT:unite:1-1-#-#-1-7:123456;
   unite 04-12-24 08:00:00
M  123456 COMPLD
;
```

#### Circuit in non-TOP+EX Ring with only UNITE NEs

RTRV-CKT for the THRU NE: The unidirectional circuit is added in UNITE0, through connected in UNITE1 and dropped in UNITE2. RTRV-CKT is done on UNITE1

```
RTRV-CKT:UNITE1:1-1-#-#-22-1-1:123;
IP 123
<
```

```
   UNITE1 04-12-28 00:22:15
M  123 COMPLD
   "ring0"
   "UNITE0,1,REMAID,REM-1-1-#-#-22-1-TS1,UNIDIR,STS1:locz=UNITE2,rappl=ADD"
   "UNITE1,0,1-1-#-#-22-1-1,1-1-#-#-23-1-1,UNIDIR,STS1:loca=UNITE0,
   locz=UNITE2, rappl=THRU"
   "UNITE2,2,REM-1-1-#-#-24-1-TS1,REMAID,UNIDIR,STS1:loca=UNITE0,rappl=DROP"
;
```

RTRV-CKT for the ADD NE: The unidirectional circuit is added in UNITE0 and dropped in UNITE1. RTRV-CKT is done on UNITE0.

```
RTRV-CKT:UNITE0:1-1-#-#-01-1-1:123;
IP 123
<

   UNITE0 04-12-28 00:22:15
M  123 COMPLD
   "ring0"
   "UNITE0,1,1-1-#-#-01-1-1,1-1-#-#-22-1-1,UNIDIR,STS1:locz=UNITE1,rappl=ADD"
   "UNITE1,0,REM-1-1-#-#-24-1-TS1,REMAID,UNIDIR,STS1:loca=UNITE0,rappl=DROP"
;
```

#### Circuit in non-TOP+EX Ring with mixed NEs

RTRV-CKT for the THRU NE: The unidirectional circuit is added in UNITE0, through connected in UNITE1 and dropped in DMX. The drop node (DMX) is a non-UNITE NE. RTRV-CKT is done on UNITE1:

```
RTRV-CKT:UNITE1:1-1-#-#-22-1-1:123;
IP 123
<

   UNITE1 04-12-28 00:22:15
M  123 COMPLD
   "ring0"
   "UNITE0,1,REMAID,REM-1-1-#-#-22-1-TS1,UNIDIR,STS1:locz=DMX,rappl=ADD"
   "UNITE1,0,1-1-#-#-22-1-1,1-1-#-#-23-1-1,UNIDIR,STS1:loca=UNITE0,locz=DMX,
    rappl=THRU"
   "DMX,2,REM-m2-1-TS1,REMAID,UNIDIR,STS1:loca=UNITE0, rappl=DROP"
;
```

#### Circuit in TOP+EX Ring with only UNITE NEs

RTRV-CKT for the ADD NE: The unidirectional circuit is added in UNITE0 and dropped in UNITE1. RTRV-CKT is done on UNITE0:

```
RTRV-CKT:UNITE0:1-1-#-#-01-1-1:123;
IP 123
```

```
<

   UNITE0 04-12-28 00:22:15
M  123 COMPLD
   "ring0"

   "UNITE1,0,REM-1-1-#-#-24-1-TS1,REMAID,UNIDIR,STS1:loca=UNITE0,rappl=DROP"
;
```

#### Not complete circuit in non-TOP+EX Ring with only UNITE NEs

RTRV-CKT for the THRU NE: The unidirectional circuit is added in UNITE0, through connected in UNITE1 and ends in UNITE2 without drop or through connection. RTRV-CKT is done on UNITE1:

```
RTRV-CKT:UNITE1:1-1-#-#-22-1-1:123;
IP 123
<

   UNITE1 04-12-28 00:22:15
M  123 COMPLD
   "ring0"
   "UNITE0,1,REMAID,REM-1-1-#-#-22-1-TS1,UNIDIR,STS1:rappl=ADD"
   "UNITE1,0,1-1-#-#-22-1-1,1-1-#-#-23-1-1,UNIDIR,STS1:rappl=THRU"
   "UNITE2,2,REM-1-1-#-#-24-1-TS1,PIF
;
```

## Error responses

#### Validation rule: no BLSR / MS-SPRING tributary

The Retrieve Circuit command is denied if a tributary of a non BLSR / MS-SPRING port is addressed.

Error code:

`IDNV – Input, Data Not Valid, no BLSR / MS SPRING tributary`

#### Validation rule: no automatic squelch map calculation

The Retrieve Circuit command is denied if automatic squelch map calculation is not enabled for the ring.

Error code:

`IDNV – Input, Data Not Valid, no Auto. Squelch Map Calculation`

#### Validation rule: Invalid ring map

The Retrieve Circuit command is denied if no valid ring map exists or the ring circuit map discovery is not yet completed.

Error code:

```
SNVS - Status, Not in Valid State, ring circuit map discovery
not yet completed
```

### TID information in RTRV-CKT is not updated for a TID change of a DMX BLSR node

In a mixed 1665 Data Multiplexer Extend (DMX) / 1675 LambdaUnite MSS BLSR configuration with auto squelch map calculation enabled, a TID change of a DMX node will not be reflected in the response of the TL1 Retrieve Circuit command (RTRV-CKT). The reason is that a TID change of a DMX node does not cause a reboot as for 1675 LambdaUnite MSS and that thus no ring circuit map redistribution is triggered.

#### Workaround

To correct the **RTRV-CKT** result, toggle automatic ring discovery (*ard*) and auto squelch map calculation (*asmc*) to disabled and to enabled again. Now the **RTRV-CKT** response will show the updated TID information.

# RTRV-COND: Retrieve condition

**RTRV-COND** command messages can be initiated by the user to retrieve all active alarms of level NA – Not Alarmed (Telcordia ) / Warning (ITU).

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-COND**[-*modifier*]:*tid*::*ctag*::[*condtype*],,,;

The last three trailing commas are used to specify that the optional parameters *locn*, *dirn*, *tmper* as defined in GR-833 are omitted since these parameters are not supported as input parameters.

## Input parameters

### Command parameters

1. **modifier** – Message Modifier
   This parameter defines for which AID types the conditions will be retrieved. If the value ALL is used, the specified parameter has no impact on the set of retrieved alarms delivered in the retrieve reply.
   Type: Alphanumeric value set.
   Range: ALL, this requests all alarms.
   The modifier can be omitted. In this case the ALL modifier will be set implicit.
2. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).
3. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).
4. **condtype** – Condition Type
   This parameter identifies the type of alarm indication being reported.
   Type: Alphanumeric value set.
   Range: ALL, requests all alarms.
   *condtype* can be omitted. In this case ALL will be set implicit.

## Output format

Normal completion response of successful session termination.

The following example shows the successful completion of the **RTRV-COND** command by the NE:

```
   sid date time
M  ctag COMPLD
   "aid,aidtype:ntfcncde,condtype,srveff,ocrdat,ocrtm
   [,,,,conddescr]"
   (0 or more lines of the above)
;
```

If no alarms are raised only COMPLD will be returned.

## Output parameters

### Command parameters

1. **aid** – Access Identifier

   This is the address of the entity for which an alarm condition is being reported.

   Type: AID

   Range: All defined AIDs are allowed. It should be a valid AID for the specified *modifier*. Refer to the definition of AIDs.

2. **aidtype** – Access Identifier Type

   This parameter defines the AID type to which the alarm belongs.

   Type: Alphanumeric value set.

   Range:

   - COM: Common. An alarm/event that applies to the whole NE system; for example, a processing error.
   - EQPT: An equipment-related alarm/event.
   - SYST: An alarm/event related to system timing.
   - OUTT: An alarm/event related to output timing.
   - STM1E: A facility-related alarm/event for synchronous transport mode 1 (electrical).
   - STM1: A facility-related alarm/event for synchronous transport mode 1.
   - STM4: A facility-related alarm/event for synchronous transport mode 4.
   - STM16: A facility-related alarm/event for synchronous transport mode 16.
   - STM16T: A facility-related alarm/event for fully transparent synchronous transport mode 16.
   - STM64: A facility-related alarm/event for synchronous transport mode 64.
   - STM256: A facility-related alarm/event for synchronous transport mode 256.
   - ODU1: A facility-related alarm/event for optical data units of level 1
   - OC3: A facility-related alarm/event at the optical carrier signal level 3.
   - OC12: A facility-related alarm/event at the optical carrier signal level 12.
   - OC48: A facility-related alarm/event at the optical carrier signal level 48.

- OC48T: A facility-related alarm/event at the fully transparent optical carrier signal level 48.
- OC192: A facility-related alarm/event at the optical carrier signal level 192
- OC768: A facility-related alarm/event at the optical carrier signal level 768
- T3: A facility-related alarm/event at the DS3 level
- TMAT3: A facility-related alarm/event at the DS3 level related to TransMUX function
- EC1: A facility-related alarm/event at the EC1 level
- 1GE: A facility-related alarm/event for 1 Gigabit Ethernet.
- 1GEPL: A facility-related alarm/event for 1 Gigabit Ethernet Private Line.
- 10GEPL: A facility-related alarm/event for 10 Gigabit Ethernet Private Line.
- VC3: A facility-related alarm/event for virtual container 3.
- VCG: A facility-related alarm/event for virtual concatenation group.
- VC4: A facility-related alarm/event for virtual container 4
- VC44C: A facility-related alarm/event for a signal concatenated at 4 times the VC4 rate.
- VC416C: A facility-related alarm/event for a signal concatenated at 16 times the VC4 rate.
- VC464C: A facility-related alarm/event for a signal concatenated at 64 times the VC4 rate.
- STS1: A facility-related alarm/event at synchronous transport signal level 1.
- TMASTS1: A facility-related alarm/event at synchronous transport signal level 1 related to TransMUX function.
- STS3C: A facility-related alarm/event at synchronous transport signal level 3.
- STS12C: A facility-related alarm/event at synchronous transport signal level 12.
- STS48C: A facility-related alarm/event at synchronous transport signal level 48.
- STS192C: A facility-related alarm/event at synchronous transport signal level 192.
- HOVC4 : A facility-related alarm/event for virtual container 4 higher-order path termination.
- HOSTS1: A facility-related alarm/event at synchronous transport signal level 1 higher-order path termination.
- LOVC3: A facility-related alarm/event for virtual container 3 (lower-order path).
- LOVC12: A facility-related alarm/event for virtual container 12
- LOVT1: A facility-related alarm/event at transport level VT1.5.
- TMSVT: A facility-related alarm/event at transport level VT1.5 related to TransMUX function.

- DS1: A facility-related alarm/event at transport level DS1.
- LINK: A signaling communication link related alarm/event for ONNS

Refer to "Alarms, events, ASAPs" (p. 6-4) for the relation of alarm / entity / *aidtype*.

3. **`conddescr`** – Description of the Condition

   For events which belong to an ASAP profile:

   - This is a textual description of the condition.
   - Type: inner string of the format: <category>, <entity>, <description>, <additional text>, or <category>, <entity>, <description>, <additional text>-cleared (this form is used in REPT ALM/EVT for cleared alarms).
   - Range: category: is the category; entity: is the entity for which the alarm is reported; description: is the Alarm description, the string is up to 32 characters; additional text = additional text. If there is no additional text, then the trailing comma may be omitted.
   - The general format is: category, entity, description, additional text. If there is no additional text, then the trailing comma may be omitted.
   - Type: inner string
   - Range for STM<N>, STM<N>T, OC<N>T and OC<N>: Quality of service, rr port, TCA; where rr is equal to the port rate
   - Range for ODU<N>: Quality of service, rr path, TCA; where rr is equal to the ODU rate (e.g., ODU1)
   - Range for not terminated VC12, VC3, VC4, VC44C, VC416C, VC464C, VT1, STS1, STS3C, STS12C, STS48C and STS192C signals: Quality of service, rr path, TCA; where rr is equal to the signal rate.
   - Range for terminated VC4 and STS1 signals: Quality of service, rr path, TCA; where rr is equal to the Constituent Signal (CS) rate.
   - Range for GE port: Quality of service, {ge_rate}GE, TCA where ge_rate is the signal rate of the GE port.
   - Range for VCG port: Quality of service, VCG, TCA
   - Range for DS3 port: Quality of service, T3 port, TCA
   - Range for TMAT3 port: Quality of service, T3 port, TCA
   - Range for TMASTS1 path termination: Quality of service, {`rr`} path, TCA, where `rr` is equal to STS1 rate
   - Range for not terminated DS1 tributary: Quality of service, DS1 path, TCA

   For ABN conditions see definition of *conddescr*:

   - The general format is: category, description
   - Type: inner string
   - Range, description for a protection group AID: Abnormal condition, forced switch active; Abnormal condition, lockout active

- Range, description for a timing reference AID: Abnormal condition, operate in hold-over; Abnormal condition, operate in free run mode
- Range, description for a port AID: Abnormal condition, facility loopback active
- Range, description for a logical tributary AID: Abnormal condition, cross connect loopback active; Abnormal condition, test access session active
- Range, description for a system AID: – Abnormal condition, System operates in maint. mode

4. **`condtype`** – Condition Type

   For events which belong to an ASAP profile:

   - This parameter identifies the probable cause (type of alarm indication) being reported.
   - Type: Alphanumeric value set.
   - Range: all defined probable causes.
   - This parameter identifies the type of event indication being reported.
   - Type: inner string with the Format: T-<montype>
   - Range for SDH signals

     The following values are for all *STM<N> signals*: T-RS-N-ES, T-RS-N-SES, T-RS-N-BBE, T-RS-N-UAS, T-MS-N-ES, T-MS-N-SES, T-MS-N-BBE, T-MS-N-UAS, T-MS-F-ES, T-MS-F-SES, T-MS-F-BBE, T-MS-F-UAS

     The following values are for all *STM<N>T signals*: T-RS-N-ES, T-RS-N-SES, T-RS-N-BBE, T-RS-N-UAS, T-RS-N-ES-EGR, T-RS-N-SES-EGR, T-RS-N-BBE-EGR, T-RS-N-UAS-EGR

     The following values also are for *STM64 and STM256 signals*: T-MS-N-FECC

     The following values are for *VC3, VC4, VC44C, VC416C and VC464C tributaries*: T-VC-N-ES, T-VC-N-SES, T-VC-N-BBE, T-VC-N-UAS, T-VC-F-ES, T-VC-F-SES, cVC-F-BBE, T-VC-F-UAS, T-PJCPOS, T-PJCNEG

     The following values are for *VC12 tributaries*: T-VC-N-ES, T-VC-N-SES, T-VC-N-BBE, T-VC-N-UAS, T-VC-F-ES, T-VC-F-SES, T-VC-F-BBE, T-VC-F-UAS
   - Range for SONET signals

     The following values are for all *OC<N> and EC1 signals*: T-CVS, T-ESS, T-SESS, T-SEFS-S, T-CVL, T-ESL, T-SESL, T-UASL, T-CV-LFE, T-ES-LFE, T-SES-LFE, T-UAS-LFE

     The following values are for all *OC<N>T signals*: T-CVS, T-ESS, T-SESS, T-SEFS-S, T-CVS-EGR, T-ESS-EGR, T-SESS-EGR, T-SEFS-S-EGR

     The following values are also for *OC192 and OC768 signals*: T-FECC-L

     The following values are for STS1, STS3C, STS12C, STS48C and STS192C tributaries: T-CVP, T-ESP, T-SESP, T-UASP,T-CV-PFE, T-ES-PFE, T-SES-PFE, T-UAS-PFE, PPJC-PDet, NPJC-PDet, NPJC-PDet, NPJC-PGen

     The following values are for *TMASTS1 tributaries*: T-CVP, T-ESP, T-SESP, T-UASP, T-CV-PFE, T-ES-PFE, T-SES-PFE, T-UAS-PFE

The following values are for *VT1 tributaries*: T-CVP, T-ESP, T-SESP, T-UASP,T-CV-PFE, T-ES-PFE, T-SES-PFE, T-UAS-PFE

- Range for DS3/DS1 signals

  The following values are for *DS3 signals with T3 modifier*:

  T-CVL, T-ESL, T-ESA-L, T-ESB-L, T-SESL, T-CVP, T-ESP, T-ESA-P, T-ESB-P, T-SESP, T-UASP, T-SAS-P, T-CV-PFE, T-ES-PFE, T-ESA-PFE, T-ESB-PFE, T-SES-PFE, T-UAS-PFE, T-SAS-PFE, T-CVP-EGR, T-ESP-EGR, T-ESA-P-EGR, T-ESB-P-EGR, T-SESP-EGR, T-UASP-EGR, T-SAS-P-EGR, T-CV-PFE-EGR, T-ES-PFE-EGR, T-ESA-PFE-EGR, T-ESB-PFE-EGR, T-SES-PFE-EGR, T-UAS-PFE-EGR, T-SAS-PFE-EGR

  The following values are for *DS3 signals with TMAT3 modifier*:

  T-CVP-EGR, T-ESP-EGR, T-ESA-P-EGR, T-ESB-P-EGR, T-SESP-EGR, T-UASP-EGR, T-SAS-P-EGR, T-CV-PFE-EGR, T-ES-PFE-EGR, T-ESA-PFE-EGR, T-ESB-PFE-EGR, T-SES-PFE-EGR, T-UAS-PFE-EGR, T-SAS-PFE-EGR

  The following values are for *DS1 signals*:

  T-CVP-EGR, T-ESP-EGR, T-SESP-EGR, T-UASP-EGR, T-SAS-P-EGR

- Range for other signals

  The following values are for all *ODU<N> signals*:

  T-ODU-N-ES, T-ODU-N-SES, T-ODU-N-BBE, T-ODU-N-UAS, T-ODU-F-ES, T-ODU-F-SES, T-ODU-F-BBE, T-ODU-F-UAS

  For *ENET signals*:

  T-PDE, T-EDFE, T-EDFC

Default: None.

For ABN conditions see definition of *condtype* :

- This parameter identifies the type of event indication being reported.
- Type: inner string with the Format: ABN-<abntype>
- Range: ABN-FORCESW, Forced switch active. ABN-LOCKOUT, Lockout active. ABN-HLDOVRSYNC, Holdover synchronization mode. ABN-FREERUNSYNC, Free-run synchronization mode. ABN-LPBKPORT, Facility Loopback. ABN-LPBKXCON, Cross Connect Loopback. ABN-MAINTENANCE, System operates in maintenance mode. ABN-TESTACC, Test access session has been setup

5. **`ntfcncde`** – Notification Code

   This is the alarm level (severity).

   Type: Alphanumeric value set.

   Range: NA – Warning (ITU) / Not-Alarmed (Telcordia)

6. **`ocrdat`** – Occurrence Date

   This parameter indicates the raising / clearing date of the alarm.

   Type: value set of the format MM-DD.

   Range: MM represents the month, DD represents the day, leading zeros are not suppressed.

7. **`ocrtm`** – Occurrence Time

This parameter indicates the raising / clearing time of the alarm. The accuracy should be +/- 1 second.

Type: value set of the format HH-MM-SS.

Range: HH represents the hours, MM represents the minutes, SS represents the seconds, leading zeros are not suppressed.

8. **srveff** – Service Affect

   This parameter identifies the service affect of alarms being reported.

   Type: Alphanumeric value set.

   Range:

   - SA – Service affecting
   - NSA – Non service affecting.

9. **tmper** – Time Period

   This requests PM data for a specified time interval.

   Type: value set.

   Range:

   - 15-MIN: This requests PM data in 15-minute intervals
   - 1-DAY: This requests daily PM data.

### Detailed behavior description

RTRV-COND command messages can be initiated by the user to retrieve all active alarms of level NA – Not Alarmed (Telcordia ) / Warning (ITU) from a NE.

RTRV-COND is closely related to REPT EVT which autonomously reports when an persistent alarm of notification code NA either sets or clears or an transient event occurs (like reporting of protection switch states). RTRV-COND retrieves the REPT EVT events that are still set. protection switching events that are reported by REPT EVT are not reported by RTRV-COND (for example, the lockout of a timing reference is not reported by RTRV-COND).

In addition to reporting all active alarms of level NA previously reported by REPT EVT, RTRV-COND retrieves those reported by other autonomous messages.

The **RTRV-COND** command does not generate a **REPT DBCHG** message.

The **RTRV-COND** command will also report the active TCA-events, for port or trib entities, which work in SDH mode and the user has set the TCA mode tcamd of the entity to TR-RTR. By switching to TR-RTR the TCA events are reported as a standing condition, thus the system creates a raise and clear event. If TR-only is selected the TCA events are handled as a transient condition and therefore never reported by RTRV-COND. The SONET standard supports only TR-only mode.

### Example input/output

The following example shows the successful completion of the **RTRV-COND** command by the NE.

```
RTRV-COND:LT-UNITE-123::123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   "1-1-#-#-6-1,OC48:NA,AIS-L,NSA,01-01,07-59-59,,,,\"Communication-Transport,
    OC48 port, Alarm Indication Signal\""
   "MISC_IN3,COM:NA,MISC,NSA,01-01,07-20-15,,,,\"Environment, Misc Discrete,
   door open\""
;
```

The following example shows the successful completion of the **RTRV-COND** command by the NE if an *aid* is specified:

```
RTRV-COND:LT-UNITE-123:MISC_IN3:123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   "MISC_IN3,COM:NA,MISC,NSA,01-01,07-20-15,,,,\"Environment, Misc Discrete,
   door open\""
;
```

The following example shows the successful completion of the **RTRV-COND** command by the NE if no conditions are raised:

```
RTRV-COND:LT-UNITE-123:MISC_IN3:123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-ALM** command.

GR-833-CORE, Issue 4, June 2000, OTGR Section 12.3, Network Maintenance: NE and Transport Surveillance Messages

# RTRV-CONN: Retrieve data relevant for network connections

## Overview

The **RTRV-CONN** command requests connection information for connections which are addressed via TNAs. This can be connections within one domain or connections via multiple domains requested by TL1 or UNI. This message can be addressed to the ingress node of every involved domain where the specific information of the requested connection are stored in the connection database. The domain ingress node can be the source node of the Network Connection (UNI-N or node receiving the ENT-CONN) or a downstream eNNI node (eNNI-D).

The query must be directed to one of the domain ingress nodes. Querying by the *connID* of an existing ONNS connection of the network connection will return provisioning information about this connection as also signaling information associated with the *connID*.

The command supports querying of all network connections under a *callID* by sending RTRV-CONN with a existing *callID*. When the records of the connection data repository are retrieved by RTRV-CONN with a valid *callID*, each connection record will be in the same format as the RTRV-CONN single *connID* response message format.

Querying by the source TNA will return provisioning information about network connections as also signaling information associated with this TNA as source TNA. This query will be completed only at the originator node (ingress UNI-N or source node receiving this TL1 command) of this network connection.

The command supports querying all connections by sending RTRV-CONN with *connID* = ALL. When all of the records of the connection data repository are retrieved by RTRV-CONN with *connID* = ALL, each connection record will be the same format as the RTRV-CONN single *connID* response message format.

The input parameter settings for *callID*, *connID* and *TNA* from its meaning are mutually exclusive. This exclusion is not explicitly checked.

Minimal one of the input parameters *callID*, *connID* or *TNA* has to be specified in the RTRV request. Otherwise this request is denied. A combination of the input parameters are allowed but this parameters have to match.

### REPT CONNCHG is not generated

The **RTRV-CONN** command does not generate a REPT CONNCHG message.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: NA

Abortable: No

### Input format

Command syntax: **RTRV-CONN**:*srcTid:srcAid:ctag:[callID]:[connID][:specBlock];*

### Input parameters

#### Command parameters

1. **srcTid**

   Target identifier of the source node is the logical name of the Host NE. ONNS uses the same unique *tid* used by Host NE. See also the definition of *tid* in RTRV-HDR.

   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.

   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.

2. **srcAid**

   Source node ONNS application access identifier *srcAid* of the ONNS controller OS command interface port.

   Type: AID.

   Range: snn

   Default: n/a.

3. **ctag**

   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.

   See also the definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2397).

   Type: Alphanumeric string

   Range: The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing "."). It should be a unique value for each new command.

4. **callID**

   The *callID* indicates a call of a logical call / connection separation (call capability). This *callID* can be a operator specific identity of Type = 0x01 (source transport network element address is 4 bytes).

   Type: Alphanumeric value set (12 bytes). The first 4 bytes describe the source transport network element address and the following 8 bytes the local identifier.

   Range: string with 24 hexadecimal numbers (0 .. F)

5. **connID** – Connection ID

   Connection ID for an existing ONNS connection segment of a UNI or Network connection. *ConnID* is formed from the *SrcNodeID*, the Ingress Tributary # and an index # where 1675 LambdaUnite MSS uses bay =1= shelf.

   Type: See definition of output parameter *connID* in "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683).

Range: See definition of output parameter *connID* in "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683).

Default: See definition of output parameter *connID* in "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683).

#### Spec Block Parameters

1. **IPv4TNAaddr**

   Identifier of a TNA address in IPv4 format
   Type: Four dot separated numeric strings
   Range: for each numeric string: 0..255

2. **IPv6TNAaddr**

   Identifier of a TNA address in IPv6 format
   Type: Eight hyphen separated hexadecimal numbers
   Range: for each hexadecimal number: 0..FFFF

3. **NSAPTNAaddr**

   Identifier of a TNA address in NSAP format
   Type: Alphanumeric value set (20 byte)
   Range: up to 20 alphanumeric strings with hexadecimal values 00..FF

## Output format

#### Normal system response to RTRV-CONN for connID, Output Syntax

If the RTRV-CONN request completes successfully, then the following normal completion response is returned to the command:

```
   srcTid date time
M  ctag COMPLD
   "[CallID=callID],ConnID=connID,ServiceLevel=servLevel,dir,bandwidth,
    [protType],[remoteTID]:specBlock:
GenLabelRequest=genLabelRequest,Tspec=tspec";
```

#### System response to RTRV-CONN with connID=ALL for an empty Network Connection Data Repository

If the RTRV-CONN ALL request completes successfully with an empty Network Connection data repository, then the following completion response is returned to the command:

```
   srcTid date time
M  ctag COMPLD
;
```

## Output parameters

#### Command parameters

1. **srcTid**

Target identifier of the source node is the logical name of the Host NE. ONNS uses the same unique *tid* used by Host NE. See also the definition of *tid* in RTRV-HDR.

Type: identifier, in addition the special character underscore "_" and the password characters are allowed.

Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.

2. **date**

   Date. The date parameter is set to the date when the output message is generated.

   Type: Value set.

   Range:

   YY-MM-DD, where

   - YY=00-99,
   - MM=01-12,
   - DD=01-31

   Default: current date

3. **time**

   Time. The time parameter is set to the time when the output message is generated. See also time in "RTRV-HDR: Retrieve header" (p. 3-2397).

   Type: Value set.

   Range:

   HH:MM:SS, where

   - HH=00-23,
   - MM=00-59,
   - SS=00-59

   Default: current time

4. **ctag**

   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.

   See also the definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2397).

   Type: Alphanumeric string

   Range: The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing "."). It should be a unique value for each new command.

5. **completion code**

   Standard TL1 completion code result.

   Type: Value set.

   Range:

   - COMPLD: for success

   Data continuation is indicated by ">".

6. **callID**

   *callID* is an optional parameter for Network Connections setup via UNI.

   The *callID* indicates a call of a logical call / connection separation (call capability). This *callID* can be a operator specific identity of Type = 0x01 (source transport network element address is 4 bytes).

   Type: Alphanumeric value set (12 bytes). The first 4 bytes describe the source transport network element address and the following 8 bytes the local identifier.

   Range: string with 24 hexadecimal numbers (0 .. F)

7. **connID** – Connection ID

   Connection ID for an existing ONNS connection segment of a UNI or Network connection. *ConnID* is formed from the *SrcNodeID*, the Ingress Tributary # and an index # where 1675 LambdaUnite MSS uses bay =1= shelf.

   Type: See definition of output parameter *connID* in "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683).

   Range: See definition of output parameter *connID* in "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683).

   Default: See definition of output parameter *connID* in "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683).

8. **servLevel**

   The service level is mapping the connection type of an ONNS connection segment of the Network Connection. The values of the connection type are representing a mapping of the ONNS parameters *connectionClass*, *disjointness* and *grpSetupType* (for Ethernet connections).

   Type: Numeric string.

   Range: 0..255

9. **dir**

   Path Direction Topology:

   - Unidirectional A-Z (1WAY) or
   - Bidirectional (2WAY)

   For connections of *protectionClass* MBYNWRK and MBYNPRT only the path direction topology Bidirectional (2WAY) is supported.

   Type: Value set.

   Range: 1WAY (default) or 2WAY

10. **bandwidth** – Requested bandwidth / signalRate

    Link *signalRate* is equal to or greater than the minimum cross-connect rate *minXCrate* of the *port_type*.

    Type: Value set.

    Range: STS1, STS3, STS12 STS48, STS192, STS1-pipe, STS3-pipe, STS12-pipe STS48-pipe, STS192-pipe.

    Default: None.

11. **protType**

    The *protType* defines the requested protection of advertised abstract links (interdomain as well as intradomain).

*protType* is the requested setup parameter (via **ENT-CONN**) and is only visible at the source node if requested.

Type: Alphanumeric value set.

Range:

- 0x1: only unprotected links shall be considered for routing
- 1+1: only 1+1 MSP protected links shall be considered for routing)
- N/A: all links shall be considered for routing, irr. of their protection type

12. **remoteTID**

    The *remoteTID* parameter is only visible if provisioned on the eNNI ports. It provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. This parameter is supported by ports of *portClass* ENNI.

    Type: TID or empty string (default)

    Range: Please refer to the TID definition in the RTRV-HDR description.

13. **genLabelRequest**

    The general label request defines characteristics of the connection segments between source UNI-C to UNI-N and destination UNI-N to UNI-C or between domains (eNNI-U and eNNI-D).

    Type: Alphanumeric value set.

    Range:

    General Label Request: three dash separated alphanumeric value sets representing

    - LSPEncType:
      – PACKET: LSP Encoding Type #1
      – ETHERNET: LSP Encoding Type #2
      – PDH: LSP Encoding Type #3
      – SONET/SDH: LSP Encoding Type #5
      – DW: LSP Encoding Type #6
      – LAMBDA: LSP Encoding Type #8
      – FIBER: LSP Encoding Type #9
      – FCHANNEL: LSP Encoding Type #11
    - SwitchingType:
      – PSC-1: Switching Type #1
      – PSC-2: Switching Type #2
      – PSC-3: Switching Type #3
      – PSC-4: Switching Type #4
      – L2SC: Switching Type #51
      – TDM: Switching Type #100
      – LSC: Switching Type #150

– FSC: Switching Type #200

- G-PID:
  – ETHERNET: G-PID #33
  – SONET/SDH: G-PID #34

14. **tspec** – Traffic Parameters

    The range of the traffic parameters depends on the used LSP Encoding Type. The *tspec* defines information about the traffic of the connection segments between source UNI-C to UNI-N and destination UNI-N to UNI-C or between domains (eNNI-U and eNNI-D).

    Type: Character string.

    Range for LSP Encoding Type “SONET/SDH”:

    SONET/SDH tspec: five dash separated numeric strings representing SignalType#, RCC#, NCC#, NVC#, MT# with:

    - SignalType #1..12
    - RCC #0,1
    - NCC #0..255
    - NVC #0..63
    - MT #1..64

    Example for an STS-12c: 6-1-4-0-1-0.

    SONET/SDH Tspec parameters “T” and “Profile” is not stored in NVM.

    Range for LSP Encoding Type “ETHERNET”:

    ETHERNET tspec: five dash separated numeric strings representing Token Bucket Rate#, Token Bucket Size#, Peak Data Rate#, Minimum Policed Unit#, Maximum Packet Size# with:

    - Token Bucket Rate #32-bit IEEE floating point number
    - Token Bucket Size #32-bit IEEE floating point number
    - Peak Data Rate #32-bit IEEE floating point number
      (e.g. 0x4CEE6B28 for 1GE)
    - Minimum Policed Unit #1..FFFFFFFF
    - Maximum Packet Size #1..FFFFFFFF

### Spec Block Parameters

1. **destLabel**

   The destination label defines together with the destination logical port ID the associated egress *connPoint* that connects the destination node of the Network Connection. The *destLabel* is defined in KLM notation. *destLabel* is the requested setup parameter (via ENT-CONN or UNI) and is only visible at the source node of the Network Connection.

   Type: Character string.

   Range:

Generalized Label: five dash separated numeric strings representing S#,U#,K#,L#,M# with:

- S #0..65535
- U #0..15
- K #0..15
- L #0..15
- M #0..15

Example for an STS-12c which uses the 9th STS-3 as first timeslot: 9-0-0-0-0.

Destination Label 65535-15-15-15-15 is reserved for GbE connections.

2. **destLogicalPortID**

   *destLogicalPortID* is the requested setup parameter (via ENT-CONN or UNI) and is only visible on the source node of the Network Connection.

3. **destIPv4TNAAddr**

   *destIPv4TNAAddr* is an optional parameter and is only visible on the source node of the Network Connection if the requested *destTNAType* parameter value (via ENT-CONN or UNI) is *IPV4TNAADDR*.

4. **destIPv6TNAAddr**

   *destIPv6TNAAddr* is an optional parameter and is only visible on the source node of the Network Connection if the requested *destTNAType* parameter value (via ENT-CONN or UNI) is *IPV6TNAADDR*.

5. **destNSAPTNAAddr**

   *destNSAPTNAAddr* is an optional parameter and is only visible on the source node of the Network Connection if the requested *destTNAType* parameter value (via ENT-CONN or UNI) is *NSAPTNAADDR*.

6. **routingList**

   The *routingList* describes the level 1 routing described as a list of level 1 nodeIDs and linkIDs The *routingList* retrieved from an intermediate or destination domain will not show the *localAdvNodeID – localLinkID* combination of preceding domains.

   Type: Character string.

   Range:

   Hyphen separated list of numeric string pairs, where the first numeric string represents a *localAdvNodeID* and the second a *localLinkID* with:

   - *localAdvNodeID*: four dot separated numeric string, each numeric string with the values 0..255
   - *localLinkID*: numeric string, with the values 0..42946967295.

   at maximum 10 *localAdvNodeIDs* and 10 *localLinkIDs*.

   Example for a *routingList* describing level 1 Routing via 3 domains at the source domain: 126.43.231.4-643-1.232.3.1-4209-1.4.23.8-5.

7. **exclLinkResCls**

   The exclude list of *linkResCls* is used to exclude interdomain links from the interdomain routing calculation. *exclLinkResCls* is the requested setup parameter (via ENT-CONN) and is only visible at the source node of the Network Connection.

Type: Alphanumeric value set (4 bytes), every bit defining one link class

Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF

8. **inclLinkResCls**

   The include list of *linkResCls* is used to define interdomain links which has to be included for interdomain routing calculation. *inclLinkResCls* is the requested setup parameter (via ENT-CONN) and is only visible at the source node of the Network Connection.

   Type: Alphanumeric value set (4 bytes), every bit defining one link class

   Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF

9. **ingressLSP**

   Local Connection ID for the connection segment of a Network Connection between source UNI-C to UNI-N or eNNI-U to eNNI-D.

   *srcLSP* is formed from the Tunnel_ID of the UNI_IPv4_SESSION/eNNI_IPv4_SESSION object and the LSP_ID of the LSP_TUNNEL_IPv4_SENDER_TEMPLATE of this connection segment.

   Type: character string of length up to 1

   Range:

   TunnelID-LSPID, with

   - TunnelID: numeric string: 0..65535
   - LSPID: numeric string: 0..65535

   Example: 2319-321

10. **policyData**

    Policy data may in general include credentials identifying users or user classes, account numbers, limits, quotas, etc. to support access policies.

    Type: Alphanumeric value set (60 bytes)

    Range: up to 60 alphanumeric characters with hexadecimal values 00..FF

11. **srcLabel**

    The source label defines together with the source logical port ID the associated ingress *connPoint* that connects the source node of the Network Connection. The *srcLabel* is defined in KLM notation.

    *srcLabel* is the requested setup parameter (via ENT-CONN or UNI) and is only visible on the source node of the Network Connection.

    Type: Character string.

    Range:

    Generalized Label: five dash separated numeric strings representing S#,U#,K#,L#,M# with:

    - S #0..65535
    - U #0..15
    - K #0..15
    - L #0..15
    - M #0..15

    Example for an STS-12c which uses the 9th STS-3 as first timeslot: 9-0-0-0-0.

Source Label 65535-15-15-15-15 is reserved for GbE connections.

12. **srcLogicalPortID**

    Logical Port Identifier related to the TNA address. *srcLogicalPortID* is the requested setup parameter (via ENT-CONN or UNI) and is only visible on the source node of the Network Connection.

    Type: numeric value set

    Range: 0 to 4294967295

13. **srcIPv4TNAAddr**

    *srcIPv4TNAAddr* is an optional parameter and is only visible on the source node of the Network Connection if the requested *srcTNAType* parameter value (via ENT-CONN or UNI) is *IPV4TNAADDR*.

14. **srcIPv6TNAAddr**

    *srcIPv6TNAAddr* is an optional parameter and is only visible on the source node of the Network Connection if the requested *srcTNAType* parameter value (via ENT-CONN or UNI) is *IPV6TNAADDR*.

15. **srcNSAPTNAAddr**

    *srcNSAPTNAAddr* is an optional parameter and is only visible on the source node of the Network Connection if the requested *srcTNAType* parameter value (via ENT-CONN or UNI) is *NSAPTNAADDR*.

16. **tunnelIfID**

    All SDH/SONET connections belonging to the same VCAT group are identified by the LSP Tunnel Interface ID.

    Type: character string of length up to 24

    Range:

    LSRRouterID&InterfaceID - with:

    - *LSRRouterID*: four dot separated numeric strings: each string 0..255
    - *InterfaceID*: Numeric string 0..4294967295

    Example: 117.32.234.13&32439

## Example input/output

### Input/Output example for a Network Connection

The following example shows the successful completion of a RTRV-CONN command by the Network Element for an unprotected STS-12 Network Connection at the source domain:

```
RTRV-CONN:LT-ONNS9:snn:113456::135.13.196.203&1-6-5-3-1&1;

   LT-ONNS9 2006-01-01 08:00:00
M  113456 COMPLD
   "CallID=A123B3EF1345A123B3EF1345,ConnID=135.13.196.203&1-6-5-3-1&1,
ServiceLevel=0,2WAY,STS12c,0x1,LT-ONNS22:IngressLSP=2319-203&
SRCIPV4TNAADDR=135.13.3.119&SrcLogicalPortID=1019&SrcLabel=9-0-0-0-0&
DESTIPV4TNAADDR=135.225.43.128&DestLogicalPortID=2&DestLabel=4-0-0-0-0&
RoutingList=126.43.231.4-13.121.39.21-1.232.3.1-12.38.217.4-1.4.23.8:
```

```
GenLabelRequest=5-100-34,Tspec=6-1-4-0-1-0";
```

### Input/Output example for a Network Connection

The following example shows the successful completion of a RTRV-CONN command by the Network Element for an unprotected STS-12 Network Connection at the intermediate domain:

```
RTRV-CONN:LT-ONNS22:snn:113454::135.13.122.20&1-6-4-3-1&1;

   LT-ONNS22 2006-01-01 08:00:00
M  113454 COMPLD
   "CallID=A123B3EF1345A123B3EF1345,ConnID=135.13.122.20&1-6-4-3-1&1,
ServiceLevel=0,2WAY,STS12c,0x1,LT-ONNS45:IngressLSP=2125-2122&
RoutingList=1.232.3.1-12.38.217.4-1.4.23.8:GenLabelRequest=5-100-34,
Tspec=6-1-4-0-1-0";
```

### Input/Output with multiple Network Connections

The following structure shows the successful completion of a RTRV-CONN command with multiple Network Connections specified by a CallID:

```
RTRV-CONN:LT-ONNS22:snn:113454:A123B3EF1345A123B3EF1345:;

   LT-ONNS22 2006-01-01 08:00:00
M  113454 COMPLD
   "CallID=A123B3EF1345A123B3EF1345,
    .
    .
    Tspec=6-1-4-0-1-0";
    ...
    "CallID=A123B3EF1345A123B3EF1345,
    .
    .
    Tspec=6-1-4-0-1-0";
    ...
    "CallID=A123B3EF1345A123B3EF1345,
    .
    .
    Tspec=6-1-4-0-1-0";
```

## Error responses

### General error responses

A command request without input parameters is denied with:

Error code:
`IPMS - Input, Parameter MiSsing, <parametername> is missing`

**Validation rule: Input Parameter *connID* not valid**

If the value for the input parameter *connID* is not valid, the following error response is returned.

Error code: `IDNV - Input, Data Not Valid, invalid connection ID`

**Validation rule: Input Parameter *TNA address* not valid**

If the value for the input parameter *TNA address* is not valid, the following error response is returned.

Error code: `IDNV - Input, Data Not Valid, invalid TNA address`

**Validation rule: Input Parameters not matching**

If the value for the input parameters *connID*, *TNA address* or *callID* are not matching, the following error response is returned.

Error code:
`IDNV - Input, Data Not Valid, input parameters are not matching`

**Validation rule: Input Parameter *callID* not valid**

If the value for the input parameter *callID* is not valid, the following error response is returned.

Error code: `IDNV - Input, Data Not Valid, invalid callID`

# RTRV-CRS: Retrieve cross-connection

The **RTRV-CRS**-*modifier* command can be initiated by a user to retrieve information on existing cross-connections in the NE.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-CRS**-*modifier*:*tid*:[*in_aid*]:*ctag*[::*ppgname*];

Either the parameter *in_aid* or *ppgname* must be present – refer to the "Detailed behavior description" section for details.

## Input parameters

**Important!** Do not use *ppgname* in **RTRV-CRS** requests. Just use the *in_aid* parameter in **RTRV-CRS** requests.

### Command parameters

1. **modifier**

   This parameter indicates the cross-connection rate on which the retrieve cross-connection command acts.

   A distinction of the *modifier* usage has to be made between the retrieval (RTRV-CRS-*modifier*) and the other CRS-related commands (ENT-CRS-*modifier*, DLT-CRS-*modifier*, ED-CRS-*modifier,* ENT-ROLL-*modifier*):

   - The establishment (ENT-CRS-*modifier*), removal (DLT-CRS-*modifier*), modification (ED-CRS-*modifier*) or rolling (ENT-ROLL-mod) of cross-connections is independent of the provisioned port interface-standard. I.e., either the SDH-rates (VC3, VC4 etc.) or the corresponding SONET-rates (STS1, STS3 etc.) can be used as modifier and no command validation between port interface-standard and *modifier* will be performed.
   - For the RTRV-CRS-*modifier* command the following holds:

     Again, no command validation between port interface-standard and *modifier* will be performed. The output parameter *rate,* however, is filled with the rate which was used with the RTRV-CRS-*modifier* command.

     Example: if a cross-connection was entered as ENT-CRS-VC3 then a RTRV-CRS-ALL as well as a RTRV-CRS-VC3 as well as RTRV-CRS-STS1 will return this cross-connection with the *rate* parameter VC3.

   Rate restriction for AU3/AU4 Conversion Cross-Connections:

AU3/AU4 conversion cross-connections are cross-connections between HO an LO tributaries. From cross-connection processing point of view, these are tributaries with different rates, although the tributaries provide equal bandwidth. Two different modifiers are defined for conversion cross-connections, one for HO input tributary to LO output tributary and another for LO input tributary to HO output tributary. The input and output tributary rates must fit to the modifier.

Type: Alphanumeric value set.

Range:

- ALL
- SDH *modifier*: LOVC12, LOVC3, VC3, VC4, VC44C, VC416C, VC464C.
- SONET *modifier*: LOVT1, STS1, STS3, STS12, STS48, STS192.

Conversion Cross-Connections:

- AU3TU3 (HO VC3/STS1 input to LO VC3 output)
- TU3AU3 (LO VC3 input to HO VC3/STS1 output)

Note that the modifier value ALL can only be used to retrieve all high-order or to retrieve all low-order and conversion cross-connections at once, due to different wildcard AIDs. The **RTRV-CRS-ALL** command considers conversion cross-connections with LO AIDs.

2. **tid** – Target Identifier

   Target Identifier. Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and the description of this parameter.

3. **in_aid** – Input Access Identifier

   This parameter specifies the source of the cross-connection.

   Each cross-connection can be addressed by its input or output tributary. Each atomic cross-connection associated with that input or output will be returned except for input tributaries being part of a path-protected cross-connection (here only one leg will be reported).

   The specified input value of this parameter may be the in_aid or the out_aid parameter of the response depending on how the cross-connection had been created:

   - for 1WAY/1WAYPROT connections, the replied in_aid is always a source of the cross-connection,
   - for 2WAY cross-connections, the replied in_aid is the same as it has been specified as *in_aid* within the **RTRV-CRS** command. If wildcards are used in the AID, then either of the input/output AIDs of the cross-connections will be returned as *in_aid* in the response.

   Examples:

   ENT-CRS-VC4:NEname:1-1-#-#-1-1-1,1-1-#-#-2-1-1:123456:2WAY;

   RTRV-CRS-VC4:NEname:1-1-#-#-2-1-1:123457;

   M 123457 COMPLD "1-1-#-#-2-1-1,1-1-#-#-1-1-1:VC4…..

   ;

   ENT-CRS-VC4:NEname:1-1-#-#-3-1-1,1-1-#-#-4-1-1:123458:1WAY;

   RTRV-CRS-VC4:NEname:1-1-#-#-4-1-1:123459;

M 123459 COMPLD "1-1-#-#-3-1-1,1-1-#-#-4-1-1:VC4…..
;
In case of lower-order cross-connections, the source of the cross-connection has to be provided logically associated a transmission port pack although the physical cross-connection is only present LOXC pack internally. The NE is in charge to map physical to logical representation.
Example:
ENT-CRS-LOVC3:NEname:1-1-#-#-1-1-1-1,1-1-#-#-39-16-1-43:123456:2WAY; M 123456 COMPLD;
RTRV-CRS-LOVC3:NEname:1-1-#-#-1-1-1-1:123457; M 123457 COMPLD "1-1-#-#-1-1-1-1,1-1-#-#-39-16-1-43:LOVC3;
In the case of conversion cross-connections, the *in_aid* specified in the **RTRV-CRS** command must fit to the modifier:

- *modifier* = AU3TU3:*in_aid* = HO tributary AID
- *modifier* = TU3AU3:*in_aid* = LO tributary AID

Conversion cross-connections can be addressed by their input or output tributaries. Each conversion cross-connection associated with that input or output will be returned. The specified input value of *in_aid* in RTRV-CRS may be the *in_aid* or the *out_aid* parameter of the response depending on how the cross-connection had been created:

- for 1WAY conversion cross-connections, the replied *in_aid* is always a source of the cross-connection,
- for 2WAY cross-connections, the replied in_aid is the same as it has been specified as *in_aid* within the **RTRV-CRS** command. If wildcards are used in the AID, then either of the input/output AIDs of the cross-connections will be returned as *in_aid* in the response. The returned *in_aid* is independent, whether the wildcard AID in RTRV-CRS specifies a HO or LO tributary.

Conversion Cross-Connection Examples:
ENT-CRS-AU3TU3:NEname:1-1-#-#-1-1-1,1-1-#-#-2-1-1-1:123456:2WAY;
RTRV-CRS-AU3TU3:NEname:1-1-#-#-1-1-1:123457;
M 123457 COMPLD "1-1-#-#-1-1-1,1-1-#-#-2-1-1:AU3TU3…2WAY…
;
RTRV-CRS-TU3AU3:NEname:1-1-#-#-2-1-1-1:123457;
M 123457 COMPLD "1-1-#-#-2-1-1-1,1-1-#-#-1-1-1:TU3AU3…2WAY…
;
RTRV-CRS-TU3AU3:NEname:1-1-#-#-all-all-all-all:123458;
M 123457 COMPLD "1-1-#-#-1-1-1,1-1-#-#-2-1-1-1:AU3TU3…2WAY…
;
ENT-CRS-TU3AU3:NEname:1-1-#-#-3-1-1-1,1-1-#-#-4-1-1:123458:1WAY;
RTRV-CRS-TU3AU3:NEname:1-1-#-#-3-1-1-1:123459;
M 123459 COMPLD "1-1-#-#-3-1-1-1,1-1-#-#-4-1-1:TU3AU3…1WAY…
;
RTRV-CRS-AU3TU3:NEname:1-1-#-#-4-1-1:123459;

M 123459 COMPLD "1-1-#-#-3-1-1-1,1-1-#-#-4-1-1:TU3AU3…1WAY…
;

Type: GenTribAID or GenLOTribAID.

Range: The *all*-parameter is accepted for the slot-, port- and higher-order and (if applicable) lower-order trib-part of the AID. The *usall*-parameter is accepted additionally for the slot-part of the AID.

The *vall*-parameter is accepted for the port part of the AID alternatively to the *all*-parameter as long as a virtual concatenated tributary will be addressed. Entities having the *all*-parameter as port-part of the AID reside e.g. on OP*n*, EP*n*, TransMUX. Entities having the *vall*-parameter as port-part of the AID reside e.g. on GE*n*, OPT2G5, ES64U.

For example the following *in_aids* are valid:

- 1-1-#-#-all-all-all specifying all high-order tribs of all ports in the whole shelf
- 1-1-#-#-2-1-all specifying all tribs of the first port of the pack in slot 2
- 1-1-#-#-3-vall-all specifying all tribs of all port of the (GE*n*/ES64U) pack in slot 3
- 1-1-#-#-all-all-all-all specifying all low-order of all high-order tribs for all ports in the shelf

However, the following example shows an invalid *aid*:

1-1-#-#-all-vall-all-all there is no low-order tributary on e.g. GE*n*, OPT2G5, ES64U packs.

4. **ctag** – Correlation Tag

   See definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2397).

### Output format

In response to a valid **RTRV-CRS-*mod*** command, the following output is returned:

```
   sid date time
M  ctag COMPLD
   "in_aid,out_aid:rate[,,in_aid2]:spec_block"
       ...
       ...
   "in_aid,out_aid:rate[,,in_aid2]:spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are described in the "Output parameter" section of "RTRV-HDR: Retrieve header" (p. 3-2397).

### Output parameters

#### Command parameters

1. **in_aid** – Input Access Identifier

Description: The parameter *in_aid* specifies the tributary which is the source of the cross-connection. In detail:

- In case of a 1-way cross-connection this parameter specifies the source of the cross-connection.
- In case of a 2-way cross-connection this parameter is identical to the one used as input parameter (please refer also to the description of the input parameter *in_aid* of the "RTRV-CRS: Retrieve cross-connection" (p. 3-2290) command).
- In case that a wildcard AID has been used to retrieve 2-way cross-connections, then either of the input/output AIDs of the cross-connections will be returned as *in_aid* in the response. For conversion cross-connections the returned *in_aid* is independent, whether the wildcard AID in RTRV-CRS specifies a HO or LO tributary.
- In case of a path-protected cross-connection this parameter may specify either the source of the working leg or the source of the protection leg – the distinction is made via the spec-block parameter *repleg* (see below). If *in_aid* specifies the working-leg part than *in_aid2* (see below) specifies the protection-leg part and vice versa.

Type: GenTribAID or GenLOTribAID.
STS1NumAID are used for high-order tributaries on e.g. OP*n*, EP*n* packs;
VCGNumAID are used for high-order tributaries on e.g. GE*n*, OPT2G5 packs;
GenLOTribAID are used for low-order tributaries on I/O packs e.g. OP*n*, EP155.
Range: n.a. (*all* or *usall* or *vall* values shall never occur as part of an output parameter).

2. **`out_aid`** – Output Access Identifier

   This parameter specifies the tributary which is the sink of the cross-connection.
   Type: GenTribAID or GenLOTribAID
   STS1NumAID are used for high-order tributaries on e.g. OP*n*, EP*n* packs;
   VCGNumAID are used for high-order tributaries on e.g. GE*n*, OPT2G5 packs;
   GenLOTribAID are used for low-order tributaries on I/O packs e.g. OP*n*, EP155.
   Range: n.a. (*all* or *usall* or *vall* values shall never occur as part of an output parameter).

3. **`in_aid2`** – Input Access Identifier 2

   This parameter is applicable to and is present for path-protected cross-connections only and specifies either the source of the protection leg or the source of the working leg.
   This depends on the value of the *repleg* parameter:

   - E.g. for the combination: *in_aid* = IN1, *out_aid* = OUT, *in_aid2* = IN2 and *repleg*=1WAYPSW the worker leg is given by IN1 -> OUT and the protection leg is given by IN2 -> OUT;
   - for the combination: *in_aid* = IN1, *out_aid* = OUT, *in_aid2* = IN2 and *repleg*=1WAYPSP the worker leg is given by IN2 -> OUT and the protection leg is given by IN1 -> OUT.

Thus *in_aid* and *out_aid* specify one leg of the legpair of a path-protected cross-connection, while *in_aid2* and *out_aid* specify the second leg.

Type: STS1NumAID, TMuxAPTNumAID, or GenLOTribAID.

STS1NumAID are used for high-order tributaries on e.g. OP*n*, EP*n* packs; TMuxAPTNumAID are used for asynchronous high-order tributaries on TransMUX packs, GenLOTribAID are used for low-order tributaries on e.g. OP*n*, EP155.

Note: Using VCGNumAID (when using e.g. GE*n* packs) is NOT applicable as those packs can not be the input to a path-protected cross-connection. Therefore specific AID types are mentioned instead of GenTribAID.

Range: n.a. (*all* and *usall* values shall never occur as part of an output parameter).

4. **rate**

   This parameter indicates the cross-connection rate. For a detailed description please refer to the input parameter *modifier*.

   Type: Alphanumeric value set.

   Range:

   - LOVC12
   - LOVC3
   - VC3
   - VC4
   - VC44C
   - VC416C
   - VC464C
   - LOVT1
   - STS1
   - STS3
   - STS12
   - STS48
   - STS192.

Conversion Cross-Connections:

- AU3TU3 (HO VC3/STS1 input to LO VC3 output)
- TU3AU3 (LO VC3 input to HO VC3/STS1 output)

### Spec block parameters

1. **loca** – Location-a

   This parameter specifies the TID of the node at which service is added to the BLSR. This parameter is required for BLSR THROUGH, INTER-BLSR and DROP connections only. The *loca* parameter value is an empty string for ADD and non-BLSR connections.

   A 2-way cross-connection is considered to be a DROP if the *out_aid* is a non BLSR tributary.

The figure in "2-way scenario" (p. 3-2305) depicts the 2-way scenario (the 3 NEs should be seen as part of an BLSR).

*Inter Ring Cross-connections with collapsed node*: Note that beside the above described THROUGH case there can be also another situation where both *loca* and *locz* are different from the empty string: If two rings are interconnected in a collapsed node then *loca* refers to the (add-node of the) ring where the signal is dropped from, and *locz* refers to the (drop-node of the) ring where the signal is added to. In such cases the cross-connection cannot be provisioned as bidirectional, thus the information is still unambiguous.

*A note to the loca2 parameter*: Although *loca2* (Location-a-2) is a parameter which is used in the **ENT-CRS** command, *loca2* is not retrieved explicitly. This is due to the fact that for path-protected cross-connections – and only for those this *loca2* is applicable – the retrieval will be on a leg-basis and not on a leg-pair basis. In other words: If a path-protected cross-connection is retrieved two entries will be sent, one for the working leg (incl. the *loca* and *locz* parameter) and one for the protection leg (incl. the *loca* parameter and the same *locz* parameter, and in this case the *loca* returned is the *loca2* as entered when establishing the path-protected cross-connection).

*loca* is also required for EXTRA TRAFFIC connections. In contrast to incoming references from other commands to this whole chapter it is exclusively applicable for the command **RTRV-CRS**. For extra traffic the value will be generated automatically and thus it is only retrievable. For information about the automatic generation of *loca* refer to the parameter *sqfa*.

For lower-order cross-connections the parameter *loca* is the TID of that ring node in the direction towards the specified input tributary (upstream), where the HO path termination source function resides.

If there is no such function in an upstream ring node then *loca* is the TID of the node where the related HO circuit is first added to the ring. The figure "Lower-order cross-connections" (p. 3-2305) shows an example of a LO path through as part of a ring.

The LO path is added to/dropped from the ring in NE-1 and NE-2. 2-way cross-connections are considered to be either an Add or a Drop connection depending whether the input or the output tributary is at the ring port. In NE-3 there is a HO through connection, which contains the LO path. In NE-3 there is no HO path termination. In NE-4 there is a LO through connection. Consequently, there are HO path terminations in NE-4.

The fact that *loca* refers to the HO path terminations has the following consequences:

- All LO cross-connections through the same HO path termination at the MS-SPRing port have the same *loca* value.
- Any LO through-connection will be treated as add/drop. loca will identify the node of the through connection, and not the node where the LO service is added to the ring.

At the lower-order side of a conversion cross-connection, the same rules for *loca* is applicable as for lower-order cross-connections.

Type: TID or empty string.

Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2397) description.

Default: empty string "":

Note: In output direction the empty string appears as \"\".

2. **`locastate`** – Squelch Map Data Status for Location a

   The parameter *locastate* indicates the validity and the source of the *loca* value.

   Type: Alphanumeric value set.

   Range:

   - AUTO-VALID
   - AUTO-INVALID
   - USER-OVERRIDE
   - MANUAL-VALID
   - MANUAL-INVALID
   - UNKNOWN (default).

3. **`locz`** – Location-z

   This parameter specifies the TID of the node at which service is dropped from the BLSR. This parameter is required for BLSR THROUGH, INTER-BLSR and ADD connections. The *locz* parameter value is an empty string for DROP and non-BLSR connections.

   A 2-way cross-connection is considered to be a ADD if the *in_aid* is a non BLSR tributary.

   Refer to the figure in "2-way scenario" (p. 3-2305) for further explanation.

   *locz* is also required for EXTRA TRAFFIC connections. For extra traffic the value will be generated automatically and thus it is only retrievable. For information about the automatic generation of *locz* refer to the parameter *sqfz*.

   For lower-order cross-connections the parameter *locz* is the TID of that ring node in the direction towards the specified output tributary (downstream), where the HO path termination sink function resides.

   If there is no such function in a downstream ring node then *locz* is the TID of the node, where the related HO circuit is last dropped from the ring. Refer to the figure in "Lower-order cross-connections" (p. 3-2305) for further explanation.

   The fact that locz refers to the HO path terminations has the following consequences:

   - All LO cross-connections through the same HO path termination at the MS-SPRing port have the same *locz* value.
   - Any LO through-connection will be treated as add/drop. *locz* will identify the node of the through connection, and not the node where the LO service is dropped from the ring.

   At the lower-order side of a conversion cross-connection, the same rules for *locz* is applicable as for lower-order cross-connections.

   Type: TID or empty string.

   Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2397) description.

Default: empty string "":
Note: In output direction the empty string appears as \"\".

4. **loczstate** – Squelch Map Data Status for Location z
   This parameter indicates the validity and the source of the *locz* value.
   Type: Alphanumeric value set.
   Range:
   - AUTO-VALID
   - AUTO-INVALID
   - USER-OVERRIDE
   - MANUAL-VALID
   - MANUAL-INVALID
   - UNKNOWN (default).
5. **lpbkstat** – Loopback-Status
   This parameter specifies whether a cross-connection loopback exists on the input tributary or the output tributary of the cross-connection.
   Type: Alphanumeric value set.
   Range: YES, NO (default).
6. **omode** – Output Mode
   This parameter specifies the output mode of the cross-connection:
   - for a 1-way cross-connection the output is clearly defined by the destination (*out_aid*)
   - for a 2-way cross-connection the output is defined as the source-to-destination direction (*in_aid* to *out_aid*)
   - NORM: this is the normal output i.e. the signal from the *in_aid* is passed through to the *out_aid*;
   - IDLE/UNEQ: this mode outputs an unequipped signal;
   - AIS: this mode outputs an AIS signal.

   *omode and adaptive-mode*: In case a SONET-port is provisioned to adaptive-mode setting the *omode* to IDLE/UNEQ or AIS will be lead to transmitting the corresponding signal (UNEQ or AIS) on STS1 base for all the STS1 tributary comprising the STS-N signal. Thus for an output of an STS3 cross-connection, if either AIS or IDLE/UNEQ is selected each of the 3 STS1 will output the AIS or IDLE/UNEQ signal. When switching the *omode* back to NORM the original STS3 cross-connection-signal will re-appear again.
   *omode in case of path-protected cross-connection*: In case of a path-protected cross-connection the *omode* affects the output of the path selector and is thus not setable on a per leg base. In other words the *omode* insertion is done after (downstream direction) the selector function.
   Type: Alphanumeric value set.

Range:

- NORM (default)
- IDLE/UNEQ
- AIS

7. **onnsConnControl** – ONNS Connection Control

   This parameter indicates for cross-connections of *xconcls* NN, whether the ONNS connection a cross-connection is assigned to is controlled by ONNS directly or by an external control (setup via UNI or eNNI or as SPC connection).

   For cross-connections of *xconcls* TRADITIONAL the value UNKNOWN is reported for this parameter.

   The value UNKNOWN shall also be reported for cross-connections of *xconcls* NN, the onnsConnControl of which cannot be determined.

   Type: Alphanumeric value set.

   Range:

   - UNKNOWN
   - ONNS
   - EXT

8. **onnsPathID** – ONNS Path Identity

   This parameter indicates for cross-connections of *xconcls* NN the path ID of the ONNS path a cross-connection is assigned to.

   For cross-connections of *xconcls* TRADITIONAL an empty string is reported for this parameter.

   Type: character string of length up to 20 or empty string

   Range:

   nodeID-Index

   - nodeID: four dot separated numeric strings: each string 0..255
   - Index: Numeric string 0-65535

   Example: 29.13.196.203-65111

   Default: empty string

9. **repleg** – Reported Leg Pair

This parameter provides compact information about the leg(s) of cross-connections and is derived, as shown in the table below, from a combination of the following elementary parameter:

- atomic cross-connection topology
- leg status
- path-protected group working leg (if applicable i.e. being part of a protection group).

| Atomic cross-connection Topology | Path Protection Leg Role | Leg Status | Reported Legpair (*repleg*) |
|---|---|---|---|
| point-to-point | n.a. | 1-way | 1WAY |
| point-to-point | n.a. | 2-way | 2WAY |
| path-protected | W | 1-way | 1WAYPSW |
| path-protected | P | 1-way | 1WAYPSP |

**Atomic cross-connection topology:**

Two atomic cross-connection topologies are supported:

- Point to point: The point to point cross-connection consists of one leg only, which is defined by its source-trib (*in_aid*) and its destination-trib (*out_aid*) and its particular transmission rate.
- path-protected: The path-protected cross-connection consists of a path protection group with two legs, a working leg and a protection leg – the declaration of working respectively protection is made when establishing the cross-connection (ENT-CRS command).

  The two legs are defined by two input tributaries and one output tributary – thus one input tributary and the output tributary form the working leg while the other input tributary and the output tributary form the protection leg.

  Note that:

  both input tributaries must belong to ports with the same interface standard (either SONET or SDH), due to different switch criteria;

  both legs must be at the same cross-connection rate.

**Leg status**:

The leg status indicates whether a leg is monitored and reported as a 1-way cross-connection or a leg pair i.e. a 2-way cross-connection.

1-way: The leg status for a path-protected cross-connection is always defined as 1-way.

2-way: The leg status for a (non path-protected) cross-connection is set to 2-way if all the following conditions are fulfilled: there are 2 cross-connections in opposite direction between the same tributaries; both of these cross-connections have the same rate (independent if the SONET or SDH rate was used when establishing i.e. VC3 is equivalent to STS1, VC4 is equivalent to STS3 etc); the source and destination TIDs do match i.e. the source TID of one leg is the destination TID of the other leg and vice versa (this condition of course holds only in case of BLSR cross-connections).

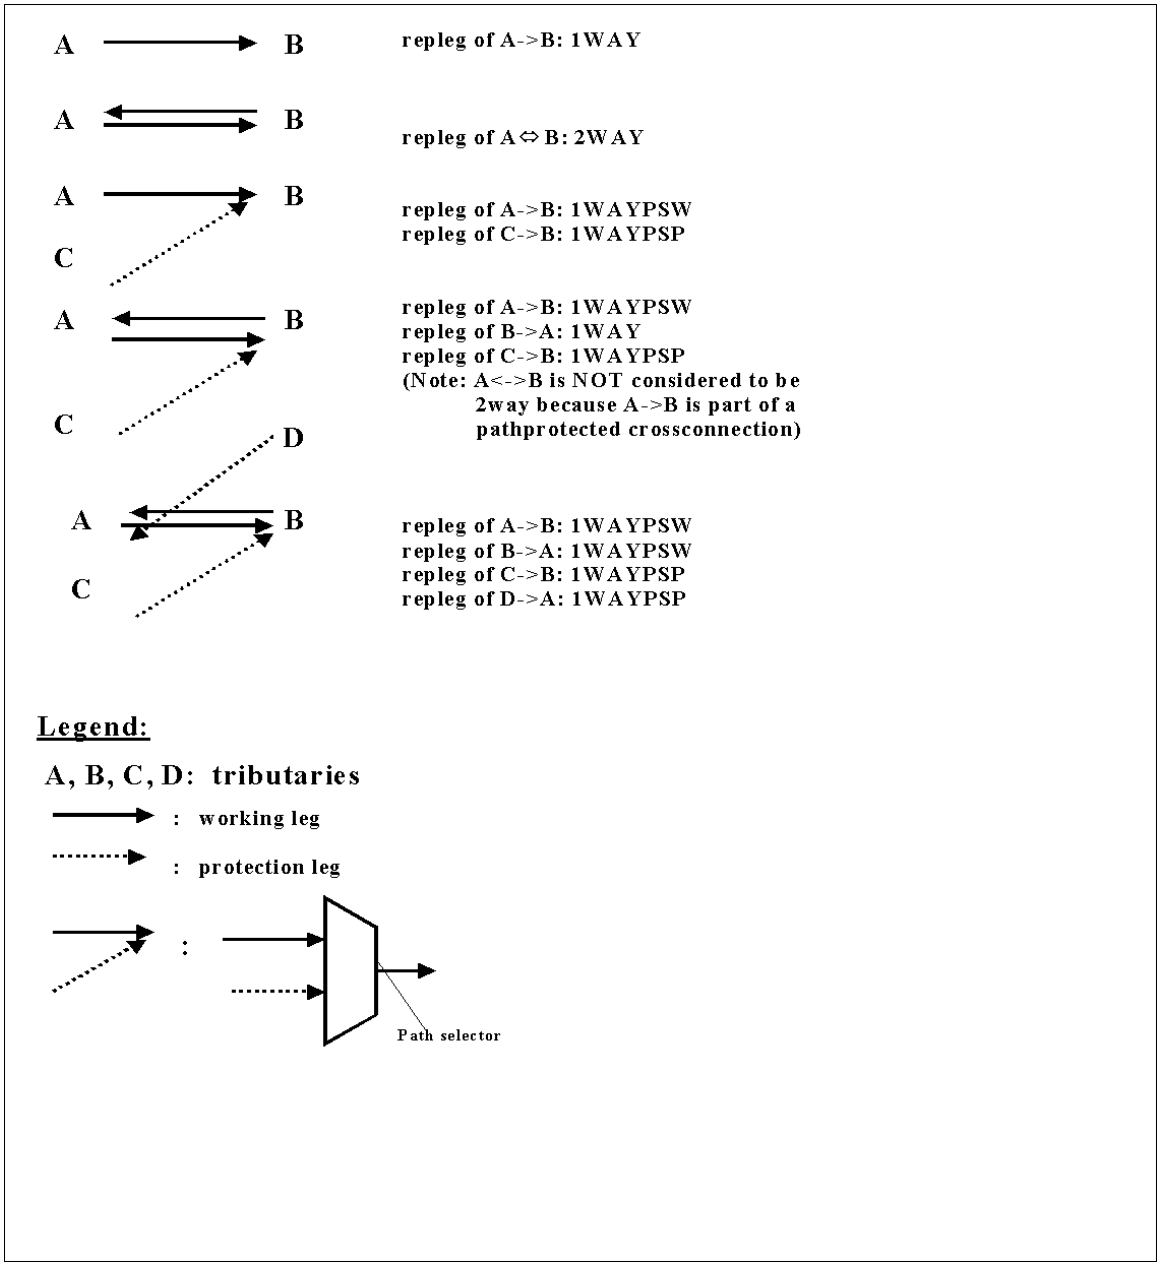
Note that the criteria for a 2-way leg-pair do not depend on whether the two legs were set up at the same time, nor on whether either leg was set up as part of a 2-way cross-connection topology.

**Path Protection leg role**:

This indicates if the leg of a path protection group is defined as the working (W) leg or the protection (P) leg.

1WAYPSW and 1WAYPSP stands for 1-way path switched working and 1-way path switched protection respectively.

The following figure shows examples for the *repleg* parameter for several cross-connection configurations including compound cross-connection.



Type: Alphanumeric value set.
Range

- 1WAY
- 2WAY
- 1WAYPSW
- 1WAYPSP.

The values 1WAYPAP and 1WAYPAW are not supported in the initial release.

10. **`rtnomode`** – Return Output Mode

    This parameter specifies the output mode for the return direction of the cross-connection.

    - for a 2-way cross-connection the return output mode is defined as the destination-to-source direction (*out_aid* to *in_aid*) For the meaning of the values please refer to *omode* description.
    - for a 1-way cross-connection and path protected cross-connection this parameter is omitted.

    Type: Alphanumeric value set.
    Range: NORM (default), IDLE/UNEQ, AIS.

11. **`rtntaccstat`** – Return Test Access Status

    This parameter indicates indicates whether the input tributary of the return direction (destination-to-source) of a 2-way cross-connection is cross-connected or bridged to a test access tributary of a test session. In the case of a 1-way cross-connection the parameter is omitted.
    Type: Alphanumeric value set.
    Range: YES, NO (default).

12. **`rtnxcappl`** – Return cross-connection application

    This parameter is a numeric value which indicates the application for which the return cross-connection is used in the context of compound cross-connection topologies.

    - for a 1-way cross-connection this parameter is not applicable and will thus be omitted.
    - for a 2-way cross-connection the parameter is present.

    Type: same as *xcappl*.
    Range: same as *xcappl*.
    Default: The default value is 0.

13. **`rtnxcnum`** – Return cross-connection number

    This parameter is a multiple-digit number identifying the cross-connection number for the return direction (destination to source i.e. *out_aid* to *in_aid*) of a 2-way cross-connection.

    - for a 1-way cross-connection this parameter is not applicable and will thus be omitted.
    - for a 2-way cross-connection the parameter is present.

Type: same as *xcnum*.

Range: same as *xcnum*.

Default: same as *xcnum*

14. **taccstat** – Test Access Status

    This parameter indicates whether the input tributary of a 1-way cross-connection or the input tributary of the source-to-destination direction of a 2-way cross-connection is crossconnected or bridged to a test access tributary of a test session.

    Type: Alphanumeric value set.

    Range: YES, NO (default).

15. **xcappl** – cross-connection application

    This parameter is a numeric value which indicates the application for which the cross-connection is used in the context of compound cross-connection topologies.

    The parameter is not further processed in the NE, but only stored (when establishing or modifying the cross-connection) and returned when retrieving the cross-connection.

    The numeric values are assigned to appropriate text strings (see Range below) and the manager should display these value in case of a "RTRV-CRS: Retrieve cross-connection" (p. 3-2290).

    As a possible assignment proposal the following may serve:

    - 0) Unknown
    - 1) 1-Way Point-to-Point
    - 2) 1-Way Path-Protected
    - 3) 1-Way Adjunct Path-Protected
    - 4) 1-Way Conversion Cross-Connection
    - 10) 2-Way Point-to-Point
    - 11) 2-Way Conversion Cross-Connection
    - 20) UPSR (or SNCP Ring) Add, Drop
    - 21) UPSR (or SNCP) Ring-to-Ring, Single Node Interconnection, Same NE
    - 22) UPSR (or SNCP) Drop, 1-Way Broadcast
    - 23) UPSR (or SNCP Ring) Add, Drop connection (Broadcast)
    - 30) Logical Ring (or SNCP) Add, Drop
    - 40) Ring Interworking, Drop-and-Continue, BLSR (or MS-SPRing) Primary Node
    - 41) Ring Interworking, Drop-and-Continue, BLSR (or MS-SPRing) Primary Nodes in same NE
    - 42) Ring Interworking, Dual Transmit, BLSR (or MS-SPRing) Terminating Node
    - 50) Ring Interworking, Drop-and-Continue, UPSR (or SNCP Ring)
    - 51) Ring Interworking, Drop-and-Continue, UPSR (or SNCP Ring) Nodes in same NE
    - 60) 1-Way Broadcast -- note: this is with N greater than or equal to 2.

Type: numerical value set.

Range: {0, 1, 2,…, 255}.

Default: The default value is 0.

16. **xcnum** – cross-connection number

    This parameter is a multiple digit number, identifying each leg in a specific compound cross-connection. (Compound cross-connection are a composition of several atomic cross-connection in order to form complex scenarios like e.g. described in "Example input/output" section of the **RTRV-CRS** command like UPSR, DRI etc.).

    Like the *xcappl* parameter the *xcnum* parameter is not further processed in the NE, but only stored (when establishing or modifying the cross-connection) and returned when retrieving the cross-connection. It may be used by a manager to characterize and group cross-connections belonging to complex cross-connection topology (e.g. compound cross-connections as used in ring interworking scenarios).

    The following format for the twelve digits is recommended:

    - two digits for the bay
    - one digit for the shelf
    - two digits for the slot
    - two digits for the port
    - three digits for the high-order tributary
    - two digits for the low-order tributary.

    If a high-order tributary is addressed then the last two digits are set to 00. The digits values pertain to the *out_aid*.

    Type: numeric value set (12 digit).

    Range: 000000000000 .. 999999999999.

    Default: The default value is 000000000000.

17. **xconcls** – cross-connection class

    This parameter identifies, whether the cross-connection has been setup in the TRADITIONAL way by an operator via the **ENT-CRS** command or via the NN application as part of an ENT-PATH command. This parameter therefore also indicates who is the owner of the cross-connection and can modify or delete it.

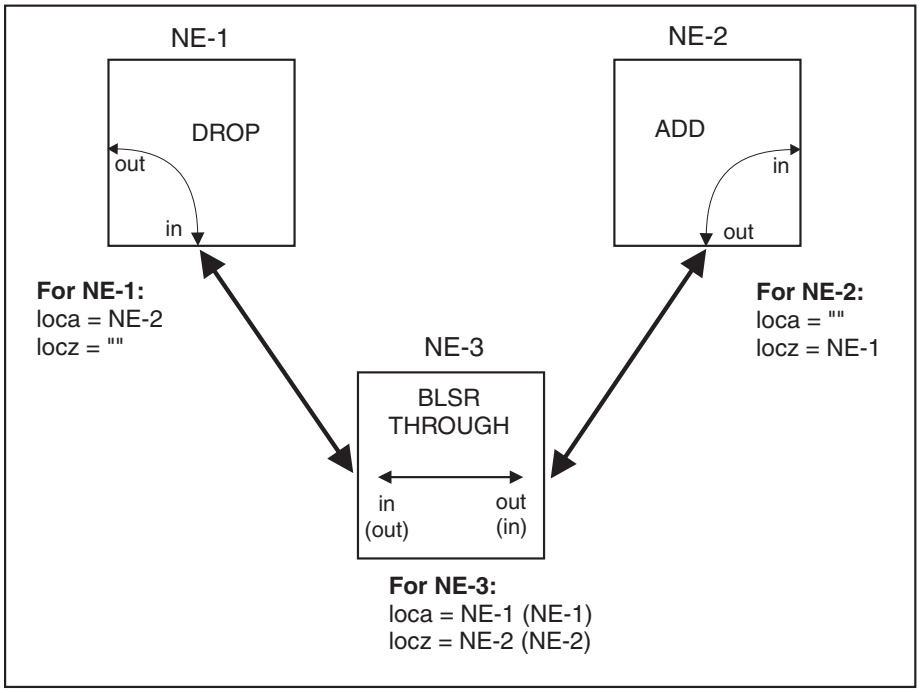
    Note: Refer to the NN TL1 catalogue for the **ENT-PATH** command.

    Type: Alphanumeric value set.

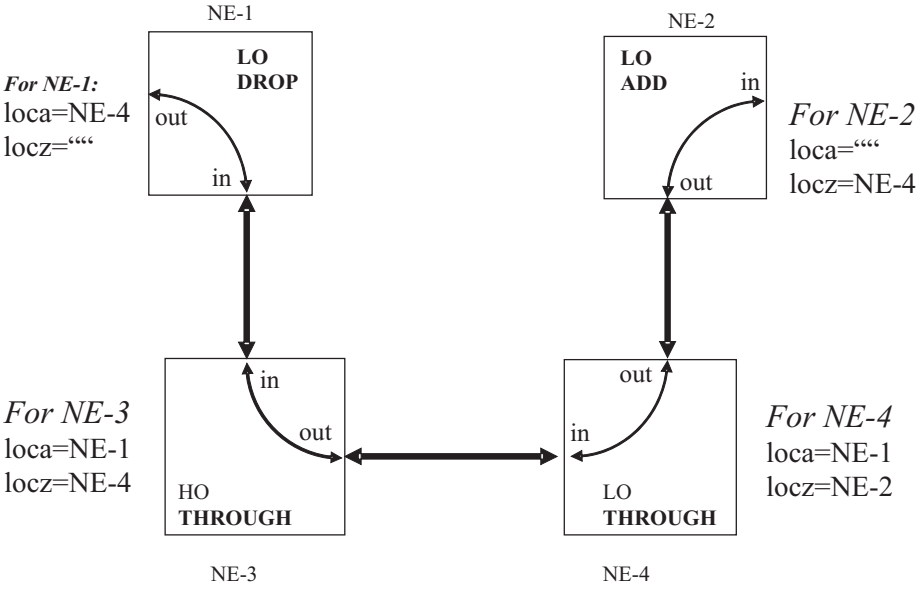
    Range: TRADITIONAL, NN.

    For low order cross-connections, the value range is limited to TRADITIONAL.

### 2-way scenario



### Lower-order cross-connections



### Derivation of repleg

| Atomic cross-connection Topology | Path Protection Leg Role | Leg Status | Reported Legpair (*repleg*) |
|---|---|---|---|

| | | | |
|---|---|---|---|
| point-to-point | n.a. | 1-way | 1WAY |
| point-to-point | n.a. | 2-way | 2WAY |
| path-protected | W | 1-way | 1WAYPSW |
| path-protected | P | 1-way | 1WAYPSP |

## Detailed behavior description

The **RTRV-CRS** command allows the retrieval of existing cross-connection according to the following characteristics:

- rate (via the mandatory *modifier* parameter)
- input or output tributary (via the optional/mandatory [in case *ppgname* is omitted] *in_aid* parameter).

For the rate and input/output tributary, either concrete value or the ranging via *all* (and *vall* for the port-part of the *aid* in case of using the GE*n*, OPTG5, ES64U and *usall* for the slot-part of the *aid*) can be used.

The *ppgname* is applicable for high-order cross-connections and is allowed for compatibility reasons only. The parameter *ppgname* is not evaluated during command processing, i.e. the command returns all cross-connections with the specified rate.

The use of *in_aid* AND *ppgname* in one command request is not allowed; i.e. their use is mutually exclusive.

### Number of atomic cross-connections in the response

In case the given set of input parameter does not match with any existing cross-connection(s), the command is accepted BUT no information is returned i.e. the output contains the empty string "".

In case the given set of input parameters matches to a 1way or 2way cross-connection, a single entry will be returned.

In case the given set of input parameters matches to several cross-connections, then one entry per matching cross-connection will be returned.

In case the given set of input parameters matches to one or more path-protected cross-connection up to two entries will be returned for each path protected cross-connection (one entry for the worker-leg and the second one for the protection-leg if the output tributary has been specified as in_aid parameter, otherwise only the addressed leg). This implies that only the legs meeting the characteristics of the request will be in the reply in case of path-protected XC. The NE will only add matching legs which form together with the reported legs a path-protected XC topology.

In the following, examples are given for the number of cross-connections (xc's) to be returned while tributaries A, B, C, D are cross-connected (disconnected if not mentioned in a specific sceanrio):

- A to B 1WAY1100
- A to B 1WAY + B to A 1WAY2200 (not converted to 2WAY)
- A to B 1WAY + B to C 1WAY1210
- A to B 2WAY1100
- B to A and C to A 1WAYPROT2110
- B to A and C to A 1WAYPROT + A to B 1WAY3210
- B to A and C to A 1WAYPROT + A to B 1WAY + A to C 1 WAY4220
- B to A and C to A 1WAYPROT + A to D 1WAY3111
- B to A and C to A 1WAYPROT + A to B 1WAY + A to D 1WAY4211

### AID boundary independence

The system shall allow to retrieve a higher-order cross-connection using the AID of any tributary within the AID boundaries determined by the cross-connection rate.

Example: A STS-3c cross-connection has been established at the tributary 1-1-#-#-2-1-4.

This cross-connection can be retrieved with one of the AIDs

- 1-1-#-#-2-1-4
- 1-1-#-#-2-1-5
- 1-1-#-#-2-1-6

### AID boundary and rate dependency for LOVC3 cross-connection retrieval

The system shall return a response with the existing LOVC3 cross-connection if the specified LO tributary is within the boundaries of an existing LOVC3 cross-connection and one of the modifiers LOVC3 or ALL is used in the command.

If other modifiers are used or no LOVC3 cross-connection exists at the tributary, then no LOVC3 cross-connection is returned with the response. If no other LO cross-connection exists at the specified tributary, the response will be empty.

If a field of the specified LO tributary AID is set to a value outside the allowed range for this field, then the command is denied. In this case, the generic validation rule for unknown AID sall be applied.

### Identification of VCG tributaries

The system shall allow to retrieve cross-connections at VCG tributaries using the AID format of an AU-3/STS-1 Tributary. I.e. the VCG number specified in the port field of the AID is allowed with or without the leading "v".

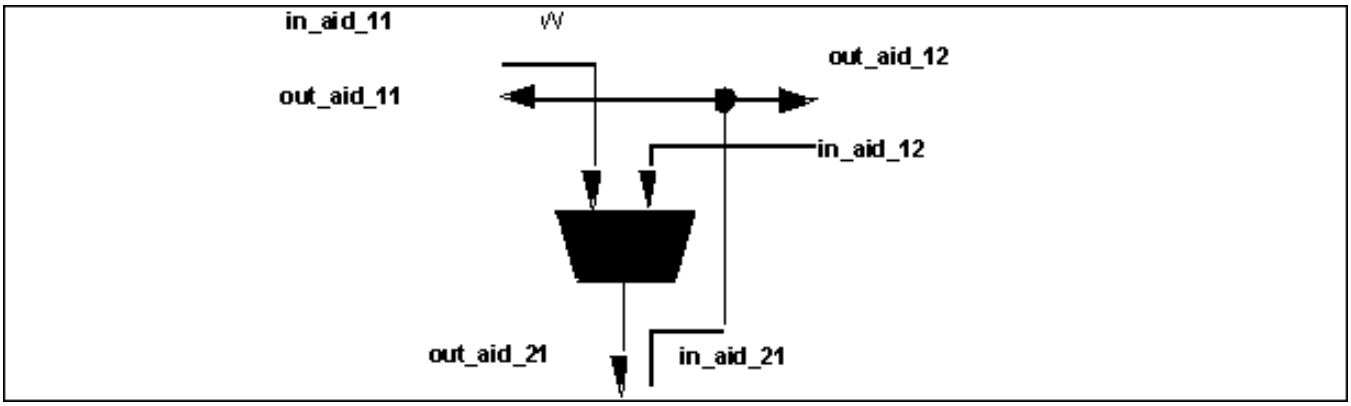
### Update affected entities

The **RTRV-CRS** command does not generate a **REPT DBCHG** message.

## Example input/output

### Example 1

Suppose the following compound cross-connection, as used in UPSR application, is given:



RTRV-CRS-all:UNITE-NE:1-1-#-#-all-all-all:123456; will then output (the blank lines are for better reading):

in_aid_11,out_aid_21:vc4,,in_aid_12:lpblstat=NO,omode=NORM,repleg=1WAYPSW, xcappl=20,xcnum=123456789012;

in_aid_12,out_aid_21:vc4,,in_aid_11:lpblstat=NO,omode=NORM,repleg=1WAYPSP, xcappl=20,xcnum=123456789012;

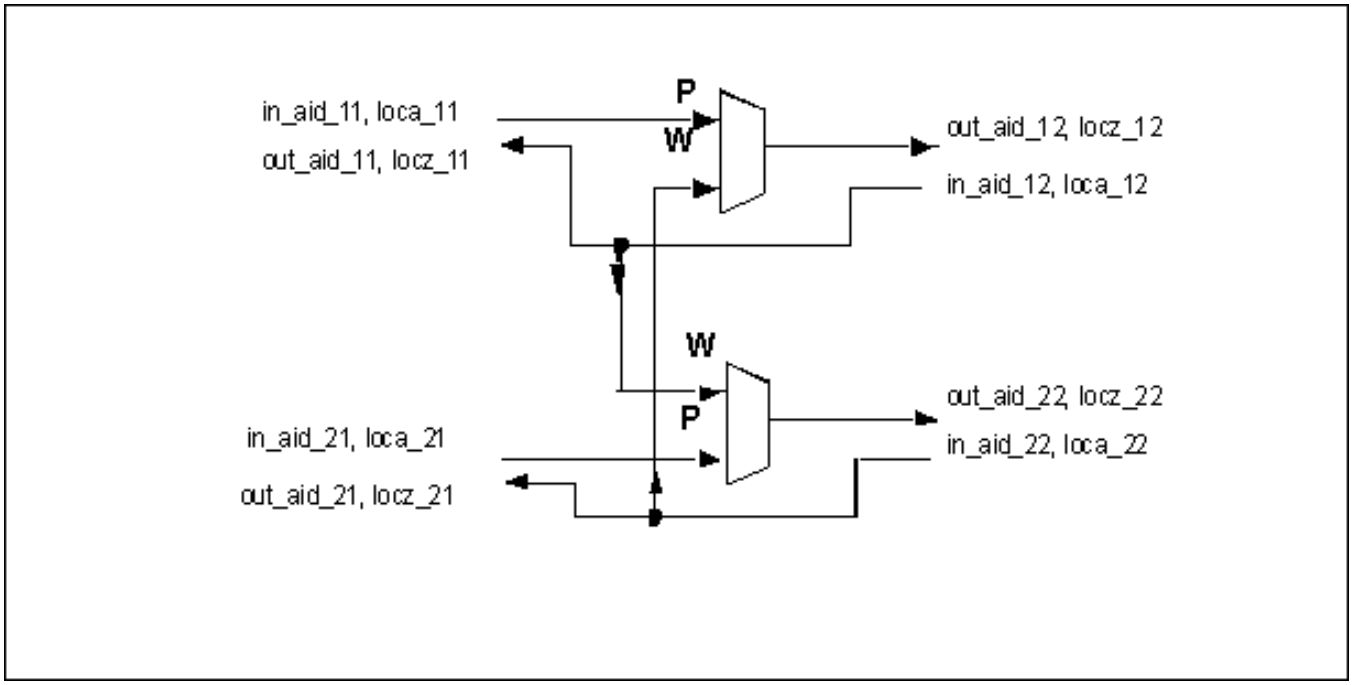
in_aid-21,out_aid_11:vc4:omode=NORM,repleg=1WAY,xcappl=20,xc-num=123456789012;

in_aid-21,out_aid_12:vc4:omode=NORM,repleg=1WAY,xcappl=20,xc-num=123456789012;

The upper 2 outputs specify the path-protected cross-connection, consisting of 2 legs. The lower 2 outputs specify the 2 legs of the bridge.

### Example 2

Suppose the following compound cross-connection configuration is given:



A ring interworking with drop and continue for a BLSR with primary nodes in the same NE. RTRV-CRS-all:UNITE-NE:1-1-#-#-all-all-all:123456; will then output (the blank lines are for better reading):

in_aid_11,out_aid_12:vc4,,in_aid_22:loca=loc_a11,locz=locz_12,lpblstat=NO, omode=NORM,repleg=1WAYPSP,xcappl=41,xcnum=011031111222;

in_aid_22,out_aid_12:vc4,,in_aid_11:loca=22,locz_12,lpbkstat=NO,omode=NORM, repleg=1WAYPSW,xcappl=41,xcnum=011031111222;

in_aid_12,out_aid_11:vc4:loca=loca_12,locz=locz_11,omode=NORM,repleg=1WAY, xcappl=41,xcnum=011031111222;

in_aid_12,out_aid_22:vc4,,in_aid_21:loca=loc_a12,locz=locz_22,lpblstat=NO, omode=NORM,repleg=1WAYPSW,xcappl=41,xcnum=011031111222;

in_aid_21,out_aid_22:vc4,,in_aid_12:loca=21,locz_22,lpbkstat=NO,omode=NORM, repleg=1WAYPSP,xcappl=41,xcnum=011031111222;

in_aid_22,out_aid_21:vc4:loca=loca_22,locz=locz_21,omode=NORM,repleg=1WAY, xcappl=41,xcnum=011031111222;

The first 3 outputs specify the upper part of the configuration while the last 3 outputs specify the lower part.

### Example 3

Suppose no cross-connections do exist, or the input data do not match with existing cross-connections, then the output would be an empty string: "".

RTRV-CRS for a cross-connection established via ENT-CRS-VC4 with a specified in_aid:

```
RTRV-CRS-VC4:LT-UNITE-123:1-1-#-#-1-1-1:123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   "1-1-#-#-1-1-1,1-1-#-#-2-1-1:VC4:\
    lpbkstat=NO,omode=NORM,repleg=2WAY,rtnomode=NORM,\
    rtnxcappl=20,rtnxcnum=123456789012,xconcls=TRADITIONAL,\
    xcappl=20,xcnum=123456789012"
;
```

RTRV-CRS for a cross-connection established via ENT-CRS-STS1 at a BLSR port where the Automatic Squelch Map Calculation is enabled:

```
RTRV-CRS-STS1:LT-UNITE-123:1-1-#-#-1-1-1:123456;

   LT-UNITE-123 05-05-31 08:00:00
M  123456 COMPLD
   "1-1-#-#-1-1-1,1-1-#-#-2-1-1:STS1:\
    loca=\"LT-UNITE-124\",locastate=AUTO-VALID,\
    locz=\"LT-UNITE-124\",loczstate=AUTO-VALID,lpbkstat=NO,\
    omode=NORM,repleg=2WAY,rtnomode=NORM,rtnxcappl=20,\
    rtnxcnum=123456789012,xconcls=TRADITIONAL,xcappl=20,\
    xcnum=123456789012"
;
```

RTRV-CRS for a cross-connection established via ENT-PATH with a specified in_aid:

```
RTRV-CRS-VC4:LT-UNITE-123:1-1-#-#-1-1-1:123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   "1-1-#-#-1-1-1,1-1-#-#-2-1-1:VC4:\
    lpbkstat=NO,omode=NORM,repleg=2WAY,rtnomode=NORM,\
    rtnxcappl=0,rtnxcnum=000000000000,xconcls=NN,xcappl=0,\
    xcnum=000000000000"
;
```

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-CRS** command.

# RTRV-CRS-FECOM: Retrieve transparent DCC cross-connection

The **RTRV-CRS-FECOM** command can be initiated by the users to retrieve the established transparent DCC cross-connections.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-CRS-FECOM***:tid:[port_aid][,dcctype]:ctag;*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for input parameter syntax and description of this parameter.
3. **port_aid** – DCC port
   This parameter indicates the port AID of a circuit pack which is used together with *dcctype* to identify the DCC channel which is involved in a transparent DCC cross-connection. If this field is omitted, the report will include the DCC parameters of all ports belonging to the NE and being provisioned with transparent DCC.
   Type: AID
   Range: SPortAID, the keyword **all** is allowed on slot and port level.
4. **dcctype**
   This parameter specifies whether the LINE/MS or SECTION/RS transparent DCC cross-connection parameters of the OP*n* port is reported by the command. If this parameter is omitted, LINE and SECTION DCC parameters will be considered for the output.
   Type: Alphanumeric value set.
   Range: LINE, SECTION.

## Output format

In response to a valid RTRV-CRS-FECOM command, the following output is returned:

```
   sid date time
M  ctag COMPLD
   "port_aid1,port_aid2,dcctype"
```

```
      .....
    "port_aid1,port_aid2,dcctype"
;
```

The output will not be sorted.

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

**Important!** The NE responses partially with duplicate lines, if the user retrieves transparent DCC connections by specifing an AID range. The NE lists every port with transparent DCC connections in this AID range. Thus, if both connected DCC ports are in the range, the connection is listed two times. The duplicate lines should be ignored.

## Output parameters

### Command parameters

1. **port_aid1** – DCC port 1
   This parameter indicates one (first) optical port AID of an OP*n* circuit pack which is used together with dcctype to identify the DCC channel which is involved in a transparent DCC cross-connection.
   Type: AID
   Range: SPortAID. The keyword **all** is allowed not.
2. **port_aid2** – DCC port 2
   This parameter indicates one (second) optical port AID of an OP*n* circuit pack which is used together with dcctype to identify the DCC channel which is involved in a transparent DCC cross-connection.
   Type: AID.
   Range: SPortAID. The keyword **all** is allowed not.
3. **dcctype**
   This parameter specifies whether the LINE/MS or SECTION/RS transparent DCC cross-connection parameters of the OP*n* port is reported by the command.
   Type: Alphanumeric value set.
   Range: LINE, SECTION.

## Detailed behavior description

The System supports only bidirectional transparent DCC cross-connections. Each reported transparent DCC cross-connection is bidirectional.

The command reports all transparent DCC cross-connections. That means only DCC channels are shown with *dccstat* = TRANSPARENT or *scn_dccstat* = TRANSPARENT.

If an AID range is specified, then the DCC cross-connections are reported for all ports in the AID range, i.e. a DCC cross-connection will be reported twice, if both involved ports are in the AID range.

### Update affected entities

The **RTRV-CRS-FECOM** command does not generate a **REPT DBCHG** message.

## Example input/output

The following example shows a RTRV-CRS-FECOM command there two transparent DCC cross-connections are reported one for *dcctype* = SECTION and one for *dcctype* = LINE:

```
RTRV-CRS-FECOM:NE-UNITE:1-1-#-#-2-1:12345;
    NE-UNITE 00-12-24 11:00:00
 M  123456 COMPLD
    "1-1-#-#-1-1,1-1-#-#-2-1,LINE"
    "1-1-#-#-1-1,1-1-#-#-2-1,SECTION"
;
```

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-CRS-FECOM** command.

# RTRV-EC1: Retrieve EC1 port

The **RTRV-EC1** command is used to retrieve all parameters related to the electrical EC1 port.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

## Input format

Command syntax:

**RTRV-EC1**:*tid:aid:ctag;*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **aid** – Access Identifier
   Access Identifier of a EC1 port.
   Type: AID
   Range: SPortAID of EC1 port. The keyword **all** is allowed up to shelf level.
3. **ctag** – Correlation Tag
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output format

In response to a valid RTRV-EC1 command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section for the **RTRV-HDR** command.

## Output parameters

### Command parameters

1. **aid** – access identifier
   Type: AID
   Range: EC1 port AID

### Spec block parameters

1. **crstat** – Constituent Rates Status list
   This parameter shows the rates of the port signal.
   Type: numeric value set
   Range: 11, (1 x STS1).
2. **eif** – Electrical Interface Type
   The parameter eif indicates the type of input the port has been provisioned to receive.
   Type: Alphanumeric string.
   Range: EC1
3. **felpm** – Far-end Line PM Enable
   Enable or disable of the performance monitoring of the multiplex section/line.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default)
4. **frcdus** – Force to DUS
   Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message “do not use” will be transmitted from that optical interface.
   Type: Alphanumeric value set.
   Range:
   - ENABLE: (set a forced DUS/DNU)
   - DISABLe (default): (clear a forced DUS/DNU)
5. **fsflpbkstat** – Far Side Facility Loopback Status
   This parameter specifies the current far-side facility loopback status of the considered output *aid*. A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback exististing for the aid.
   Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time
   Type: Alphanumeric value set.
   Range: YES, NO (default)
6. **inputsig** – Tributary Input Signal Rate List
   This parameter is a list of STSn rates across the port's bandwidth.
   Type: numeric value set.
   Range: 11 (default), (1 x STS1).
7. **istd** – Interface Standard
   Interface standard of the synchronous EC1 interface.
   Type: Alphanumeric value set.

Range: SONET

8. **lbo** – Line Build Out

   This parameter defines the cable length applicable for the EC1 port.

   Type: Alphanumeric value set.

   Range:

   - SHORT (default): 0 … 68.5 m (0 … 225 ft)
   - LONG: 68.5 … 137 m (225 … 450 ft).

9. **lpbk** – Loopback

   This parameter specifies the current near-side loopback status of the considered output *aid*.

   A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.

   Type: Alphanumeric value set.

   Range:

   - YES
   - NO (default).

10. **nelpm** – Near-End Line PM Enable

    Enable or disable near-end multiplex section (near-end line) performance monitoring.

    Type: Alphanumeric value set.

    Range: ENABLE, DISABLE (default).

11. **pmmsfeses** – Performance Monitoring Line Far-End SES Threshold

    This parameter describes the Line Far-End SES threshold value. It indicates the number of code violations per second to declare a second as severely errored.

    Type: Alphanumeric value set.

    Range: 1 – 64000; default = 51

12. **pmmsneses** – Performance Monitoring Line Near-End SES Threshold

    This parameter describes the Line Far-End SES threshold value. It indicates the number of code violations per second to declare a second as severely errored.

    Type: numeric value set

    Range: 1 – 64000; default = 51

13. **pmode** – Port Mode

    This parameter sets the mode of the port. In the case of AUTO the *pmode* state transitions to MON if the loss-of-signal alarm of this port is cleared.

    Type: Alphanumeric value set.

    Range: AUTO (default): indicates that, when a signal is detected at the port, then alarm monitoring will start. MON: indicates that alarm monitoring is taking place on the port. NMON: means that alarm monitoring is not occurring on the port.

14. **pmrsneses** – Performance Monitoring Section Near-End SES Threshold

    This parameter describes the Section Near-End SES threshold value. It indicates the number of code violations per second to declare a second as severely errored.

Type: numeric value set.
Range: 1 … 64000
Default: 52

15. **portClass** – Port Class
    This identifies the port class of the AID.
    Type: Alphanumeric value set.
    Range: TRADITIONAL
16. **portControl** – Port Control (PortAdministrative Mode)
    This identifies the administrative mode of the EC1 port. This parameter is not relevant for EC1 ports, because the portClass is always TRADITIONAL. The parameter can only be retrieved but not changed.
    Type: Alphanumeric value set.
    Range: NORMAL (default), LOCKOUT
17. **ptype** – Port Type
    This identifies the port type of the AID.
    Type: Alphanumeric value set.
    Range: EC1
18. **sdthr** – Signal Degrade Threshold
    Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when sdsfmode=POISSON.
    Type: numeric value set.
    Range: (as exponents of 10): -5 -6 (default), -7, -8, -9
19. **servcond** – Service Condition
    This parameter indicates its status concerning service involvement.
    Type: Alphanumeric value set.
    Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
20. **sfthr** – Signal Failure Threshold
    Retrieving of the excessive degrade/signal failure threshold in exponent of 10. This parameter is available when sdsfmode=POISSON
    Type: numeric value set
    Range: (as exponents of 10): -3 efault), -4, -5
21. **sltca** – Section and Line TCA Profile Pointer
    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.
    Type: Alphanumeric string
    Range: String with maximum of 24 characters
    Default: DEFAULT0
22. **sonet** – SONET ASAP

SONET Alarm Severity Assignment Profile. This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH Alarm Severity Assignment Profile for SDH ports of corresponding line rate (see RTRV-STM4, output parameter sdhpn) to be compatible with current generation applications.

Type: Alphanumeric string

Range: String with a maximum of 24 characters. A hyphen ("-") is allowed in the name additionally.

Default: DEFAULT

23. **spm** – Section PM Enable

    Enable or disable regenerator section (section) performance monitoring.

    Type: Alphanumeric value set.

    RANGE: ENABLE, DISABLE (default)

24. **strc** – Value of incoming J0

    This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If strcst indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter strc is omitted from the response.

    Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D)

    Range: 1 byte string

25. **strcfmt** – Format of incoming J0

    The read format of J0, the incoming section trace (strc).

    Type: Numeric string.

    Range: 1 (default) for specific repeating byte (SONET)

26. **strcout** – Value of outgoing J0

    This identifies the section trace message to be transmitted.

    Type: Hexadecimal digits

    Range: 1 byte string. One byte is expressed as two hexadecimal digits (example value: 6D).

    Default: 01Hex

27. **strcst** – Status of incoming J0

    This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.

    Type: Alphanumeric value set.

    Range:

    - NORMAL: strc contains a valid value
    - UNAVAILABLE: no value for strc could be obtained by the system
    - AIS: no value for strc due to an SF condition.

28. **strcwfmt** – Format of outgoing J0

The write format of J0, the outgoing section trace (strcout).

Type: Numeric string.

Range: 1 (default) for specific repeating byte (SONET)

29. **trbmd** – Tributary mode

    The parameter trbmd indicates the tributary mode of the port. In the case of EC1 port, the only possible value is FIXED.

    Type: Alphanumeric value set.

    Range: FIXED

30. **unequiposig** – Unequipped Output Signal List

    Tributary Unequipped Output Signal Rate List. This parameter is a list of STSn rates across the port's bandwidth. It determines the rate(s) of the “unequipped” signal that will be transmitted if there is no cross-connection.

    Type: numeric value set

    Range: 11 (default), 1 xSTS1)

## Detailed behavior description

The command shall retrieve the parameters as described above. The command **RTRV-EC1** do not generate a REPT DBCHG message.

## Example input/output

The following example shows the successful execution of a RTRV-EC1 command. Not all output parameters are listed (missing ones indicated by … ).

```
RTRV-EC1:LT-UNITE:1-1-#-#-1-36:123456;

   LT-UNITE 04-12-23 08:00:00
M  123456 COMPLD
   "1-1-#-#-1-36:eif=EC1,ptype=EC1,sfthr=-3,sdthr=-6, pmode=MON,
   ..... pmmsneses=51,pmrsneses=52"
;
```

## Error responses

See definition in “RTRV-HDR: Retrieve header” (p. 3-2397) command error responses section for general validation rules. The error responses listed there also apply to the RTRV-EC1 command.

### Validation rule: Check CCB against *ptype* and *eif*

Check wether the CCB fits to *ptype* and *eif*.

Error code: `IENE - Input, Entity Not Exists`

# RTRV-ELDR: Retrieve ONNS external link data repository

The **RTRV-ELDR** command requests information of the ONNS ELDR data repository, which contains ONNS information about external links to associated neighbor domains.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: NA

Abortable: No.

## Input format

The **RTRV-ELDR** command has an input parameter *dataType* that defines what type of information is expected in the *componentID* field that determines what portion of the data repository records is retrieved.

Command syntax: **RTRV-ELDR**:*srcTid:srcAid:ctag::dataType[,componentID];*

## Description

The **RTRV-ELDR** command retrieves information stored in the external link data repository that is in RAM Memory. The **RTRV-ELDR** command operates on the current, active-memory-resident, ONNS data. The NVM data from NNDM is used during initialization to recover the ONNS local external link data repository. Data from other ONNS nodes is acquired by the flooding and exchange of LSAs.

### Retrieving ALL external link data repository records

When the *dataType* = ALL, Network Navigator shall respond to a request to retrieve its external link data repository by sending a complete report of the contents of the data repository specified. The request shall cause the ONNS node to send all information in the specified data repository. When the external link data repository is retrieved, each TL1 response message contains a record with all of the data relevant to an external link or LSA.

### Retrieving external link data repository records for any ASTN node ID

The command **RTRV-ELDR** with *dataType* = LSAID and *componentID* = ASTNNodeID shall retrieve the ELDR LSA records that relate to all of the external links from the specified node with the ASTNNodeID to adjacent domains. This ASTNNodeID can be the address of any node in the ONNS domain.

### REPT PTHCHG or REPT NNCHG is not generated

The **RTRV-ELDR** command shall not generate a REPT PTHCHG or REPT NNCHG notification.

## Input parameters

### Command parameters

1. **srcTid**

   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same unique *tid* used by Host NE.

   See also the definition of *tid* in "RTRV-HDR: Retrieve header" (p. 3-2397).

   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.

   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.

2. **srcAid**

   Source node ONNS application access identifier of the ONNS controller OS command interface port.

   Type: AID

   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn (default).

3. **ctag**

   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.

   See also the definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2397).

   Type: Alphanumeric string

   Range: The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ".").

   It should be a unique value for each new command.

4. **dataType**

   This parameter specifies, which part of the ELDR is to be retrieved. Furthermore it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.

   Type: Alphanumeric value set.

   Range:

   - *ALL*: retrieves the entire external link data repository in RAM
   - *LSAID*: retrieves the LSA in ELDR related to the ASTN node ID, *componentID* must be an *ASTNnodeID*

5. **componentID**

   *componentID* depends on the previous *dataType* parameter and is one of:

   - not represented when *datatype* = ALL
   - *nodeID*: when *datatype* = LSAID

     Description: Identifier of an ASTN node

     Type: Four dot separated numeric string

Range: 0 … 255, for each numeric string

## Output format

### The external link data repository record structure

The complete ELDR of one node consists of LSARecords for all nodes with external links (including the reporting node itself) within the same ONNS domain. Within a LSARecord all external links to neighbor domains are kept in LinkRecords (one record for each neighbor domain relation).

### External link data repository (ELDR) without data

An addressed node without data in the ELDR shall response only the HeaderRecord with *NumberOfLSAs* = 0. The external link data repository record is composed of an *ELDR_HeaderRecord* and multiple *LSARecords* which are described below:

**ELDR_Record** ::=

<ELDR_HeaderRecord>

<LSARecord_1>

…

<LSARecord_n>

**ELDR_HeaderRecord** ::=

*eldrID,dataType[=componentID],srcNodeASTNNodeID,NumberOfLSAs= LSA_Count*

**LSARecord** ::=

<LSAHeaderRecord>

<LSARecord_1>

…

<LSARecord_n>

**LSAHeaderRecord** ::=

LSAAdvertisedRouter=*origNodeASTNNodeID*,LinkCount=*linkCount*

**LinkRecord** ::=

LocalNodeID=*localAdvNodeID*,RemoteNodeID=*remoteAdvNodeID*,LocalLinkID=

*localLinkID*,RemoteLinkID=*remoteLinkID,remoteTID*,RemoteRAID=*remoteRAID*,

SRLG=*srlgList*,LinkMetric=*adminCost*,LinkResourceClass=*linkResCls*,

LinkProtType=*protType*,Bandwidth=*bandwidthList*

### Output format with normal data retrieve completion report for dataType=ALL

If the **RTRV-ELDR** request completes successfully, then the following normal completion response is returned:

```
   srcTid date time
M  ctag RTRV
   "eldrID,ALL,srcNodeASTNNodeID,NumberOfLSAs=LSA_Count"
   "LSAHeaderRecord_1:
    LinkRecord_1_1"
   ...
   "LSAHeaderRecord_n:
    LinkRecord_n_1,
    LinkRecord_n_2"
>
   srcTid date time
M  ctag COMPLD
   "LSAHeaderRecord_n+1:
    LinkRecord_n+1_1"
   ...
   "LSAHeaderRecord_m:
     LinkRecord_m_1,
   ...
    LinkRecord_m_n"
;
```

## Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completion code* and their syntax are included in the OUTPUT PARAMETERS section of the **RTRV-PATH** command.

### ELDR_HeaderRecord

1. **eldrID**

   ONNS Data Repository dataID to be returned

   Type: Alphanumeric value set.

   Range: ELDRexternal link data repository in RAM

   Default: ELDR

2. **dataType**

   This parameter specifies, which part of the ELDR is to be retrieved. Furthermore it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.

   Type: Alphanumeric value set.

   Range: ALL retrieves the entire external link data repository in RAM. LSAID retrieves the LSA in ELDR related to the ASTN node ID, *componentID* must be an *ASTNnodeID*.

3. **componentID**

*componentID* depends on the previous *dataType* parameter and is one of:

- not represented when *datatype* = ALL
- *nodeID*: when *datatype* = LSAID
  Description: Identifier of an ASTN node.
  Type: Four dot separated numeric string
  Range: 0 … 255, for each numeric string
  Note: If *dataType* = ALL, *componentID* and the "=" sign are not reported.

4. **srcNodeASTNNodeID** – Reporting Node ID
   ASTN node ID of the ONNS node replying to this command.
   Type: Four dot separated numeric strings
   Range: for each numeric string: 0 … 255
5. **LSACount**
   This parameter indicates the number of LSA records in the report. Also equals number of NE nodes in the network for *dataType* = ALL.
   Type: Integer
   Range:
   - >0: number of LSAs with external link records
   - 0: no ENNI port(s) are defined at this node or within the network

**LSARecord**

For each reported node of the topology one LSARecord is reported.

1. **LSAHeaderRecord**
   All parameters in the LSAHeaderRecord describe properties of the *origNodeASTNNodeID*.
   **origNodeASTNNodeID**
   Description: The ASTN node ID of the advertiser of the LSA with the external link data following the LSAHeaderRecord
   Type: four dot separated numeric string
   Range: 0 … 255, for each numeric string
   **linkCount**
   Description: Number of reported links of *origNodeASTNNodeID* towards other nodes in the network.
   Type: Integer
   Range: >0
2. **LinkRecord**
   For each external domain neighborship of the *origNodeASTNNodeID* one LinkRecord is reported.
   **localAdvNodeID**
   Node ID of own domain for level 1 Routing
   Type: four dot separated numeric string
   Range: 0 … 255, for each numeric string
   **remoteAdvNodeID**

Corresponding Node ID of neighbor domain for level 1 Routing.

Type: four dot separated numeric string

Range: 0 … 255, for each numeric string

**localLinkID**

Link ID from own domain for level 1 Routing.

Type: Numeric string.

Range: 0..42946967295

**remoteLinkID**

Corresponding Link ID from neighbor domain for level 1 Routing.

Type: Numeric string.

Range: 0..42946967295

**remoteTID**

The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. This parameter is supported by ports of *portClass* ENNI.

Type: TID or empty string (default).

Range: Please refer to the TID definition in the RTRV-HDR description.

**remRAID**

The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:

The port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* ENNI.

Type: four dot separated numeric string

Range: 0 … 255, for each numeric string

Default: 0.0.0.0

**srlgList**

Shared Risk Link Group Identifier list.

See also parameter *srlgList* in RTRV-rr.

The max. number of identities that can be provisioned per port may be release dependent.

Type: Up to ten &-separated Integers

Examples:

198&233&0&0&0&0&0&0&0&0

10&20&30&40&0&0&0&=&0&0

89&1000&4&10&20&31&111&231&300&777

Range: 0 … 65535

Default. 0 (means no SRLG provisioned)

SRLG list is not applicable for EDGE and UNI ports and is set to the default value.

**adminCost** – Administrative Cost

Provisioned administrative cost of the port connection when used in a connection path. See also parameter *adminCost* in RTRV-rr.

Type: Integer

Range: 1 (default) … 65535

Administrative cost parameter is not applicable for EDGE and UNI ports and is set to the default value.

**linkResCls**

The *linkResCls* globally classifies routing purposes the link of the corresponding port is assigned to.

Type: Alphanumeric value set (4 bytes), every bit defining one link class

Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF

**linkProtType**

The *linkProtType* globally classifies routing purposes the link of the corresponding port is assigned to.

Type: Alphanumeric value set.

Range:

- 0x1 (unprotected)
- 1+1-W (1+1 MSP)

**bandwidthList**

The *bandwidthList* indicates the available bandwidth per signal rate.

Type: Character string.

Range:

Bandwidth List: five dash separated numeric strings representing STS1 #, STS3c #, STS12c #, STS48c #, STS192c # with:

- STS1 #0..4097
- STS3c #0..1023
- STS12c #0..255
- STS48c #0..63
- STS192c #0..15

Example for an available bandwidth of 2 STS48c and a defined minimal XC STS3c: 0-32-8-2-0.

## Example input/output

The **RTRV-ELDR** command with *dataType* = ALL produces this example output result:

```
RTRV-ELDR:LT-ONNS-61::123456::ALL;

## Error responses

### Invalid *componentID* parameter

The command is rejected when for the datatype=LSAID the received ASTNNodeID is invalid.

Error code: `E511 - IINO - Input, Invalid Node ID`

### Access to the database is not possible I

Access to the database is not possible due to internal problems.

Error code:
`E002 - SICE - Status, Inter-Processor Communication Error caused cmd failure`

### Access to the database is not possible II

Access to the database is not possible due to internal problems.

Error code:
`E003 - SNTT - Status, Network Topology database Timed out`

# RTRV-ENNIMANROUTE: Retrieve all manual routes of the E-NNI node

The **RTRV-ENNIMANROUTE** command is used to retrieve all manual route entries known by the E-NNI node.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-ENNIMANROUTE**:*modifier:tid*::*ctag*;

## Input parameters

### Command parameters

1. **modifier**
   The parameter modifier indicates whether the manual route is used to reach a signaling controller (SC) or a routing controller (RC) subnet.
   Type: Alphanumeric value set.
   Range: SC or RC
2. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters.
   Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

## Output format

If the RTRV-ENNIMANROUT is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "spec_block"
       ...
   "spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section for the "RTRV-HDR: Retrieve header" (p. 3-2397) command.

## Output parameters

### Spec block parameters

1. **neighborSIGPCIPAddress** – Neighbor Signaling Controller IP Address

   This parameter is used to indicate the IP address of a neighboring signaling controller that is connected via a LAN interface.

   The term "neighbor" refers to logical neighborship. The neighboring SC is not necessarily a physical neighbor.

   The IP address and ID of a signaling controller connected via a point-to-point interfaces is provisioned as part of port provisioning.

   Type: Four dot separated numeric strings.

   Range: Each numeric string: 0 .. 255.

   The values 0.0.0.0, 1.1.1.1 and 127.0.0.1 are not allowed.

   Optional parameter: This parameter must be present if the command modifier has the value *SC* and must not be present if the command modifier has the value *RC*.

2. **neighborSIGPCID** – Neighbor Signaling Controller Identifier

   This parameter is used to indicate the identifier of a neighboring signaling controller that is connected via a LAN interface.

   The IP address and ID of a signaling controller connected via a point-to-point interfaces is provisioned as part of port provisioning.

   Type: Four dot separated numeric strings.

   Range: Each numeric string: 0 .. 255.

   Optional parameter: This parameter must be present if the command modifier has the value *SC* and must not be present if the command modifier has the value *RC*.

3. **neighborRCIPAddress** – Neighbor Route Controller IP Address

   This parameter is used to indicate the IP address of a neighboring route controller.

   Type: Four dot separated numeric strings.

   Range: Each numeric string: 0 .. 255.

   The values 0.0.0.0, 1.1.1.1 and 127.0.0.1 are not allowed.

   Optional parameter: This parameter must be present if the command modifier has the value *RC* and must not be present if the command modifier has the value *SC*.

4. **neighborRCIPSubnetMask** – Neighbor Route Controller IP Subnet Mask

   This parameter is used to indicate the subnet mask of the IP subnet of a neighboring route controller.

   The IP subnet that can be reached via the manual route is described by the tuple neighborRCIPAddress + neighborRCIPSubnetMask.

   Type: Four dot separated numeric strings.

   Range: Each numeric string: 0 .. 255.

Optional parameter: This parameter must be present if the command modifier has the value *RC* and must not be present if the command modifier has the value *SC*.

5. **lan_nh_ifipad** – Next Hop Interface IP Address for LAN Interfaces

   This parameter is used to indicate the interface IP address of the next hop of a manual route using a LAN. This parameter is insignificant for point-to-point interfaces.

   Type: Four dot separated numeric strings.

   Range: Each numeric string: 0 .. 255.

   The values 0.0.0.0, 1.1.1.1 and 127.0.0.1 are not allowed.

   Optional parameter: This parameter must be present if the interface *if_type* is a LAN. It must not be present, if the interface *if_type* is a point-to-point interface.

6. **if_id** – interface id

   This parameter is used to indicate the interface associated with the manual route.

   Type: AID

   Range: SPortAID or LanPort AID (the keyword “all” is not used)

7. **dcctype** – DCC type

   This parameter is used to further specify the DCC type, in case the *if_id* refers to a DCC channel.

   Type: Alphanumeric value set.

   Range: LINE or SECTION

   Optional parameter: This parameter must be present if the interface *if_id* is a DCC. It must not be present, if the interface *if_id* is no DCC.

8. **if_type** – interface type

   This parameter is used to indicate whether the interface with the interface id if_id is a point-to-point interface (e.g. a DCC) or a point to multi-point interface, i.e. a LAN.

   Type: Alphanumeric value set.

   Range: P2P or LAN

### Detailed behavior description

The **RTRV-ENNIMANROUTE** command shall retrieve manual routes of the E-NNI node. The SC list of routes also includes the manual routes that are implicitely created when setting the neighbor SC on a point-to-point interface (via the edit port commands).

### Example input/output

The following example shows the result of RTRV-ENNIMANROUTE-SC:

```
ENT-MANROUTE-LAN:LT-UNITE:1-1-lan2:123456:::ip_ad=135.168.90.4,
   ip_ad_uni=135.168.90.4,ip_snm=255.255.0.0,osinode=uninode;

   LT-UNITE 06-06-30 08:00:00
M  123456 COMPLD
;
```

The following example shows the result of RTRV-ENNIMANROUTE-RC:

```
ENT-MANROUTE-LAN:LT-UNITE:1-1-lan2:123456:::ip_ad=135.168.90.4,
   ip_ad_uni=135.168.90.4,ip_snm=255.255.0.0,osinode=uninode;

   LT-UNITE 06-06-30 08:00:00
M  123456 COMPLD
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-ENNIMANROUTE** command.

#### Validation rule: E-NNI Node must be created

If the E-NNI node is not created (by provisioning of the *sigPCIP_Address* in **ENT-ULS**), then the command is denied.

Error code:

```
SNVS - Status, Not in Valid State, E-NNI Node not created
```

### Related TL1 messages

- “DLT-ENNIMANROUTE: Delete manual route from the E-NNI node” (p. 3-166)

# RTRV-EPM: Ethernet performance monitoring

The **RTRV-EPM** command is initiated by a user to request the NE to send the current and/or historical Performance Monitoring (PM) data associated with one or more Ethernet ports. For each value in the *emontype* parameter of the **RTRV-EPM** input Parameters section, PM counter values will be stored in the current 15-minute period, the 32 previous 15-minute periods (past 8 hours worth of data), current day, and previous day periods.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): PM1

Priority: 1

Abortable: Yes.

## Input format

Command syntax:

**RTRV-EPM**-*modifier*:*tid*:*aid*:*ctag*::[*emontype*], [*monlev*],*tmper*, [*mondat*], [*montm*];

## Input parameters

### Command parameters

1. **modifier**
   This parameter indicates the Ethernet port on which the **RTRV-EPM** command is to act on.
   Type: Alphanumeric value set.
   Range: ENET, 1GEPL, 10GEPL.
2. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
3. **aid** – Access Identifier
   Type: AID.
   Range: EPortAID, VCGAID.
   Range is supported up to shelf level or system level; i.e.
   ALL-ALL-#-#-ALL-ALL (range over EPortAID)
   ALL-ALL-#-#-ALL-vALL (range over VCGAID).
4. **ctag** – Correlation Tag
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397) in the input parameters section.
5. **emontype** – Monitored Parameter Type
   This is the monitored parameter type for which data is requested. If the value is omitted, this parameter defaults to ALL.
   Type: value set.
   Range for modifier ENET: CBR, CBS, PDE.

Range for modifiers 1GEPL and 10GEPL: EINB, EONB, EINF, EONF, EDFE, EDFC
The following value is for input monitored type only: ALL.
Default: ALL.

6. **monlev** – Monitored Level

   This parameter provides the level for the monitored PM parameter. The parameter is only evaluated if the value of *montype* parameter is ALL.

   Type: value set.

   Range:

   - 1-UP: Means the NE will report all non-zero data and all data which is marked as non-valid (parameter validity).
   - 0-UP: Means the NE will report zero and all positive data.

   Default: 1-UP.

7. **tmper** – Time Period

   This requests PM data for a specified time interval.

   Type: value set.

   Range:

   - 15-MIN: This requests PM data in 15-minute intervals
   - 1-DAY: This requests daily PM data.

8. **mondat** – Monitored Date

   This requests the beginning date of the interval for which the PM data is to be reported. For both values of tmper parameter, the maximum allowable range of valid dates includes the current and previous one day.

   Type: value set.

   Range:

   - MM-DD: Month-Day. A leading zero (first M or first D) is optional and may be omitted.
   - ALL: Current and previous day.

   Default: Current date

9. **montm** – Monitored Time

   This parameter specifies the beginning time of day of the requested PM period that was set by *tmper* parameter. The user is able to specify a monitored time in three modes:

   a. A monitored time interval (i.e., from hour-minutes to hour-minutes: HOD-MOH&&THOD-TMOH).

   b. A single time interval (i.e., the hour and minutes for the appropriate 15 minute data: HOD-MOH).

   c. All applicable beginning times for the given *mondat* value (i.e., all).

   Where HOD-MOH represents the start of the requested PM retrieval period (hours and minutes) and THOD-TMOH represents the end of the requested PM retrieval period. The value ALL must be used if the *mondat* value provided is ALL.

   Type: Character string.

Range:

- HOD-MOH: This specifies the beginning time of day of the requested PM period that was set by *tmper* parameter. This parameter may be omitted or have one of the following values: Hour Of Day- Minute Of Hour, where HOD ranges from 0 to 23 and MOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0.
- THOD-TMOH: To Hour Of Day-To Minute Of Hour, where THOD ranges from 0 to 23 and TMOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0. Parameter grouping is used when specifying THOD-TMOH. For example, 08-15&&09-00 specifies the HOD-MOH and THOD-TMOH of 08-15 and 09-00, respectively. THOD-TMOH of $$-$$indicates the current Hour Of Day-Minute Of Hour. THOD-TMOH of ##-##indicates the previous 15-min interval.
- ALL: All applicable beginning times for the given *mondat* value.

If the *tmper* value is 1-DAY, the *montm* parameter will not be used.

Default:

If THOD-TMOH is not specified, only the PM data for the retrieval period specified by HOD-MOH will be retrieved.

If HOD-MOH is omitted, the PM period for the current time will be reported.

## Output format

### Normal completion message

If the NE fully complies with the RTRV-PM request, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "aid,aidtype:emontype,monval,[validity],[tca],tmper,[mondat],[montm]"
;
```

The output parameters *sid, date, time* and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2397).

### Normal completion message - empty reply

If there is no PM data stored within the NE, then the following response is returned:

```
   sid date time
M  ctag COMPLD
;
```

### Output parameters

1. **aid** – Access Identifier
   Description: Access identifier.
   Type: AID.
   Range: EPortAID, VCGAID.
2. **aid**type – Aid type
   Type: value set.
   Range: ENET
3. **emontype** – Monitored Parameter Type
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397) in the input parameters section.
4. **monval** – Monitored Value
   This parameter contains the measured value of the parameter specified in *montype*.
   Type: Integer.
   Range: 0-108000000000000
   The specified range is the maximal range taking all PM parameters into consideration. Specific PM parameters may have a smaller range.
   W.r.t. value range for the specific PM parameters see
   - TCA profile section (if thresholding is applicable for that parameter)
   - PM parameter introduction section (if thresholding is not applicable for that parameter).
5. **validity** – validity indicator
   This parameter indicates the validity of the PM data.
   Type: Integer.
   Range: 1: valid; (omitted): non-valid.
6. **tca** – Threshold Crossing Alert
   Type: value set.
   Range for the current interval:
   - in TCA mode TR, that the current value exceeds the provisioned threshold
   - in TCA mode TR-RTR, that a *tca* occurred since the beginning of this; interval or that the tca reset condition was not fulfilled in any previous; interval since the last tca occurred

   f the value is omitted, it indicates
   - in TCA mode TR, that the current value is below the provisioned threshold
   - in TCA mode TR-RTR, that no tca occurred since the beginning of this; interval and that the tca reset condition was fulfilled at least in one previous , interval

   For previous intervals, the tca parameter indicates the state at the end of the interval.
7. **tmper** – Time Period
   This requests PM data for a specified time interval.
   Type: value set.

Range:

- 15-MIN: This requests PM data in 15-minute intervals
- 1-DAY: This requests daily PM data.

8. **mondat** – Monitored Date

   This parameter specifies the beginning date of the interval for which the PM data is reported. The parameter can be omitted in case of current date.

   Type: value set.

   Range: MM-DD: Month-Day

   Default: Current date

9. **montm** – Monitored Time

   This parameter specifies the beginning time of day for the reported pm register. The parameter is optional and may be omitted for the reporting of current bins (registers).

   Type: Character string.

   Range: HOD-MOH: HOD ranges from 0 to 23; MOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0.

### Example input/output

The following example shows the successful completion of a **RTRV-EPM** command by the NE:

```
RTRV-EPM-ENET:UNITE-NE:1-1-#-#-01-1:123456::PDE,,15-MIN,01-01,08-00;
   UNITE-NE 00-01-01 08:00:00
M  123456 COMPLD
   "1-1-#-#-01-1,ENET:PDE,2,,,15-MIN,01-01,08-00"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-EPM** command.

# RTRV-EPORT: Retrieve Ethernet port

The **RTRV-EPORT** command retrieves the attributes of one or more Ethernet ports.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-EPORT**-*modifier*:*tid*:*aid*:*ctag*[:::*spec_block*];

## Input parameters

### Command parameters

1. **modifier**
   This parameter specifies the type of the Ethernet port at the LAN side of the unit.
   Type: Alphanumeric value set.
   Range:
   - 1GE representing a 1 GE port on a GE1 pack
   - 1GEPL representing a 1 GE port on a GE10PL1 pack
   - 10GEPL representing a 10 GE port on a GE10PL1 pack.
2. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
3. **aid** – Access Identifier
   This parameter specifies the Ethernet port to be operated on.
   Type: AID
   Range: EPortAID as defined in AID structure. The values
   - vall for Simple_EPortAID
   - usall for Simple_UnivSlotAID
   - all for Simple_UnivSlotAID
   - all for Simple_ShelfAID and
   - all for BayAID

   are accepted.
4. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string

Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

### Spec block parameter

1. **dyn** – Retrieve Dynamic Parameters

   This parameter controls whether dynamic parameters are reported with the command reply or not. It is given only when using any of the wildcard values *all* or *usall* at the appropriate positions of the input AID. For input AIDs not using *all* or *usall* this parameter is not allowed. This implies that with such input AIDs the dynamic parameters are always returned.

   The following output parameters of an Ethernet port are affected:

   - anegst
   - fcmdo
   - macaddr
   - rfltst
   - stmd
   - stpop
   - stpid
   - stprole
   - vss
   - vvidlsd.

   Note that not only those parameters have to be returned which are supported by the related Ethernet pack. Not all Ethernet packs support all listed parameters. For details refer to the detailed specification of those output parameters.

   Type: Alphanumeric value set.

   Range: YES: Report dynamic parameters in the reply as well; NO (default): Do not report dynamic parameters in the reply.

## Output format

After receiving the **RTRV-EPORT** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "aid,modifier::spec_block"
       ...
       ...
   "aid,modifier::spec_block"
;
```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command parameters

1. **aid** – Access Identifier

   This parameter specifies the Ethernet port to be operated on.

   Type: AID.

   Range: EPortAID as defined in AID structure. The usage of the following values are excluded:

   - all in the BayAID definition
   - all in the Simple_ShelfAID definition
   - usall in the Simple_UnivSlotAID definition
   - all in the Simple_UnivSlotAID definition
   - all in the Simple_EPortAID definition.

2. **modifier**

   This parameter specifies the type of the Ethernet port at the LAN side of the unit.

   Type: Alphanumeric value set.

   Range: 1GE representing a 1 GE port on a GE1 pack, 1GEPL representing a 1 GE port on a GE10PL1 pack, 10GEPL representing a 10 GE ports on a GE10PL1 pack.

### Spec block parameters

1. **anegst** – Auto Negotiation Status

   This parameter reports the result of the autonegotiation process (e.g. flow control) of this port with its link partner.

   This parameter is not supported if the input parameter *modifier* = 10GEPL. If the parameter *anegst* is not supported, then the parameter is omitted.

   Type: Alphanumeric value set.

   Range:

   - ANER, for auto negotiation error
   - CFG, for configuring
   - CPL, for complete
   - UNAVAILABLE, for not available/unavailable
   - DISABLE, for being disabled.

   Restrictions: The value DISABLE is not returned if the input parameter *modifier* = 1GE. The values ANER, CFG, CPL and UNAVAILABLE is not returned if the input parameter *modifier* = 1GEPL and the parameter *autoneg* = DISABLE.

2. **autoneg** – Auto Negotiation Mode

   This parameter controls auto-negotiation process to be enabled or disabled. This parameter is not supported if the input parameter *modifier* = 1GE or 10GEPL. If the parameter *autoneg* is not supported, then the parameter is omitted.

   Type: Alphanumeric value set.

   Range: ENABLE (default); DISABLE.

3. **cnprole** – Customer/Network Port Role

This parameter specifies whether the addressed port is used as a customer LAN port or a network LAN port.

This parameter is not supported if the input parameter *modifier* = 1GEPL, or modifier = 10GEPL. If the parameter *cnprole* is not supported, then the parameter is omitted.

Type: Alphanumeric value set.

Range: CUSTOMER (default), for a customer LAN port; NETWORK, for a network LAN port.

4. **dftpri** – Default User Priority

   This parameter specifies the default user priority acc. the IEEE 802.1Q tagging scheme.

   This parameter is not supported if the input parameter *modifier* = 1GEPL, or modifier = 10GEPL. If the parameter *dftpri* is not supported, then the parameter is omitted.

   Type: Alphanumeric value set.

   Range:

   - HIGH
   - LOW (default).

5. **dftvlan** – Default VLAN Identifier

   This parameter specifies the value of the VLAN identifier which is applied to frames (tagging) at LAN ingress (i.e. from LAN into the Ethernet-port). This only applies to frames carrying no VLAN identifier, yet. This parameter is also used to provision the customer tag (CID) to be used in transparent tagging mode.

   This parameter is not supported if the input parameter *modifier* = 1GEPL, or modifier = 10GEPL. If the parameter *dftvlan* is not supported, then the parameter is omitted.

   Type: Alphanumeric value set.

   Range:

   - 1, 2, 3, … 4092, 4093
   - UNAVAILABLE (default).

   To express the state UNAVAILABLE system internally the invalid VLAN ID 4094 is used.

6. **droppause** – Drop Incoming Pause Frames

   This parameter controls whether incoming pause frames are dropped (value = ENABLE) or not (value = DISABLE). This parameter is not supported if the input parameter *modifier* = 1GE. If the parameter droppause is not supported, then the parameter is omitted.

   Type: Alphanumeric value set.

   Range: ENABLE (default), DISABLE

   Default: DEFAULT.

7. **enetpn** – Ethernet Alarm Severity Assignment Profile Name

   This parameter points to an ASAP profile name of type ENET for the designated AID.

   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.

   Range: 1 … 24 characters length.

   Default: DEFAULT.

8. **enettca** – Ethernet TCA Profile Name

   This parameter specifies the name of the threshold crossing alert (TCA) profile used for Ethernet ports.

   Type: Alphanumeric string.

   Range: 1 … 24 characters length.

   Default: DEFAULT0.

9. **epmode** – Ethernet Port Monitoring Mode

   This parameter specifies the monitoring mode of the Ethernet port. Alarms for this port will be reported if in state MON otherwise not. The configuration of epmode will change from AUTO to MON if a valid signal is applied to that port.

   Type: Alphanumeric value set.

   Range:

   - AUTO (default), for automatic
   - MON, for monitored
   - NMON, for not monitored.

10. **eppm** – Ethernet Port Performance Monitoring

    This parameter specifies whether the performance monitoring is enabled or disabled for this port.

    Type: Alphanumeric value set.

    Range:

    - DISABLE (default)
    - ENABLE

11. **fcmd** – Flow Control Mode

    This parameter specifies the configuration for the pause operation of this port. If the input parameter *modifier* = 1GE, then the parameter *fcmd* is supported only in case that the bridge operates in backward-compatible mode (*vlantagmd* = BCMD).

    Type: Alphanumeric value set.

    Range:

    - AUTO, for auto-negotiate
    - DISABLE, for pause mode bidirectionally disabled
    - ASYMTOPARTNER, for pause mode having receive disabled, transmit enabled
    - ASYMTOLOCAL, for pause mode having transmit disabled, receive enabled
    - SYM, for pause mode bidirectionally enabled.

    Restrictions: If the parameter *fcmd* is not supported, then the parameter is omitted. The values ASYMTOPARTNER, ASYMTOLOCAL and SYM is not supported if the input parameter *modifier* = 1GE.

    The values ASYMTOPARTNER, ASYMTOLOCAL and SYM is not supported if the input parameter *modifier* = 1GEPL and the parameter *autoneg* = ENABLE. The value AUTO is notsupported if the input parameter *modifier* = 1GEPL and the parameter *autoneg* = DISABLE.

    The value AUTO is not supported, if the input parameter *modifier* = 10GEPL.

Possible combinations of the parameters *modifier*, *autoneg*, *vlantagmd* (parameter of the referring circuit pack entity, see "RTRV-EQPT (CP): Retrieve equipment (circuit pack)" (p. 3-2356) for definition) and *fcmd* are as follows:

| Input parameter *modifier* | In-/output parameter *autoneg* | In-/output parameter *vlantagmd* | In-/output parameter *fcmd* |
|---|---|---|---|
| 1GE | not supported | BCMD | AUTO, DISABLE |
| | | other than BCMD | DISABLE |
| 1GEPL | ENABLE | not supported | AUTO, DISABLE |
| | DISABLE | | DISABLE, ASYMTOPARTNER, ASYMTOLOCAL, SYM |
| 10GEPL | not supported | not supported | DISABLE, ASYMTOPARTNER, ASYMTOLOCAL, SYM |

Default:

- AUTO (for *modifier* 1GE or 1GEPL)
- SYM (for *modifier* 10GEPL).

12. **fcmdo** – Flow Control Mode Operation

    This parameter reports the status of the pause operation at this port. If the input parameter modifier = 1GE, then the parameter fcmdo is meaningful only in case that the bridge operates in backward-compatible mode (*vlantagmd* = BCMD).

    Type: Alphanumeric value set.

    Range:

    - DISABLE, for Transmit and Receive Disabled
    - ENABLE, for Transmit and Receive Enabled
    - ENXDISR, for Transmit Enabled, Receive Disabled
    - DISXENR, for Transmit Disabled, Receive Enabled
    - UNAVAILABLE, for anegst equal ANER or CFG or if the value can not be retrieved.

13. **fsflpbkstat** – Far Side Facility Loopback Status

    This parameter reports the configuration of the far-side facility loopback of this port. A far-side loopback means that the signal on the outgoing port is looped to the incoming port (Tx -> Rx). For GE1 there is only this type of facility loopback.

    Type: Alphanumeric value set.

    Range:

    - YES, for enabled loopback
    - NO (default), for disabled loopback.

14. **macaddr** – Port MAC Address

    This parameter specifies the MAC address of the port.

    Type: Alphanumeric value set.

Range: 000000000000 to FFFFFFFFFFFF or UNAVAILABLE if the value cannot be retrieved.

15. **`rcf_htmr`** – Remote Client Fail Hold Off Timer

    The parameter specifies the hold-off time for applying the LPT consequent action to disable the laser at the LAN port. The hold-off timer is only applicable if there is a strict one-to-one relationship between the LAN port in question and its related WAN port.

    This parameter is not supported if the input parameter *modifier* = 1GE. If the parameter *rcf_htmr* is not supported, then the parameter is omitted.

    Type: numeric string [ms].

    Range: 0 … 10000 ms in 100 ms steps

    Default: 0.

16. **`rcf_linkdown`** – Link Pass Through Mode

    This parameter controls the consequent action (to switch off the laser upon receipt of a client signal fail [CSF] indication) to be enabled or disabled. This parameter is not supported if the input parameter *modifier* = 1GE. If the parameter *rcf_linkdown* is not supported, then the parameter is omitted.

    Type: Alphanumeric value set.

    Range: ENABLE, DISABLE.

    Default: ENABLE.

17. **`rfltst`** – Remote Fault Status

    This parameter reports the fault status of the remote link partner.

    Type: Alphanumeric value set.

    Range for modifiers 1GE and 1GEPL:

    - ANER, for auto negotiation error
    - LNKFL, for link failure
    - UNAVAILABLE, for not available/unavailable
    - NOER, for no error
    - OFFL, for offline.

    Range for modifier 10GEPL:

    - REMOTEFLT, for remote fault
    - UNAVAILABLE, for not available/unavailable
    - NOER, for no error
    - LOCALFLT, for local fault.

18. **`rptmode`** – Repeater Mode

    This parameter sets the bridge device for this LAN port into the repeater mode (promiscuous mode), valid for a point to point connection between one LAN and one WAN port. Operating in repeater mode imposes some restrictions. See detailed behavior section.

If the input parameter *modifier* = 1GE, then the parameter *rptmode* is meaningful only if in case that the bridge operates in backward-compatible mode (*vlantagmd* = BCMD).

This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter rptmode is not supported, then the parameter is omitted.

Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

19. **servcond** – Service Condition

    This parameter specifies the service condition for this port. Some configuration possibilities like loopbacks may be dependent on the state of *servcond*.

    Type: Alphanumeric value set.

    Range:

    - INSERVICE (default)
    - OUTOFSERVICE.

20. **stdis** – Spanning Tree Protocol Disable

    This parameter allows to enable or disable the Spanning Tree Protocol for the given port. If the input parameter modifier = 1GE, then this parameter is meaningful only if the port is a network port (cnprole = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.

    This parameter is not supported if the input parameter *modifier* = 1GEPL, or modifier = 10GEPL. If the parameter stdis is not supported, then the parameter is omitted.

    Type: Alphanumeric value set.

    Range:

    - DISABLE, STP is disabled, i.e. the port is not used in the spanning tree protocol
    - ENABLE (default), STP is enabled, i.e. the port is used in the spanning tree protocol.

21. **stmd** – Spanning Tree Protocol Mode

    This parameter returns whether the normal STP according to IEEE802.1D or the rapid spanning tree protocol rSTP according to IEEE802.1w is used on the given port. If the input parameter modifier = 1GE, then this parameter is meaningful only if the port is a network port (cnprole = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.

    This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter stmd is not supported, then the parameter is omitted.

    Type: Alphanumeric value set.

    Range:

    - 802.1D, for the normal ST
    - 802.1W, for rSTP
    - UNAVAILABLE if the value can not be retrieved.

Default: There is no default value.

22. **stpcost** – Spanning Tree Path Cost

    The parameter *stpcost* specifies the STP-related cost of the path egressing the given port.

    If the input parameter *modifier* is omitted, then this parameter is supported but applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.

    This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL.

    If the parameter *stpcost* is not supported, then the parameter is omitted.

    Type: Integer.

    Range: 1 to 200000000.

    Default: 20000.

    The default value depends on the provisioned VCG size. As currently only a fix size of 7 VC4s or 21 STS1s corresponding to approximately 1 Gbit is supported, the default value is as shown above.

23. **stpid** – Spanning Tree Port Identifier

    The port identifier is a 16 bit parameter consisting of the port priority (high-order bits) and the port number (low-order bits). The port number is assigned by the system to a port and is not provisionable. If the input parameter *modifier* = 1GE, then this parameter is applicable only if the port is a network port (*cnprole* = NETWORK).. For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.

    This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter stpcost is not supported, then the parameter is omitted.

    Type: Alphanumeric value set.

    Range: 0 to 65535 and UNAVAILABLE if the value can not be retrieved.

24. **stpop** – Spanning Tree Protocol Operational

    This parameter indicates whether the Spanning Tree Protocol is operational or not. If the input parameter *modifier* = 1GE, then this parameter is applicable only if the port is a network port (*cnprole* = NETWORK).. For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.

    This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter stpcost is not supported, then the parameter is omitted.

    Type: Alphanumeric value set.

    Range: YES, operational; NO, not operational, UNAVAILABLE if the value can not be retrieved.

25. **stpp** – Spanning Tree Port Priority

    This parameter specifies the priority of the given port for the Spanning Tree Protocol. If the input parameter *modifier* = 1GE, then this parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.

This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter stpcost is not supported, then the parameter is omitted.

Type: Integer.

Range: 0 to 255.

The stepping as recommended by the standard (steps of 16 starting at 0) should be implemented by the management system. The NE will accept any value in the range described above. This has the consequence, that also the range restriction "0 to 240" is not done by the NE.

Default: 128.

26. **stprole** – Spanning Tree Protocol Role

    This parameter reports the role of the given port in rSTP. If the input parameter *modifier* = 1GE, then this parameter is applicable only if the port is a network port (*cnprole* = NETWORK) and operates in rSTP mode (stmd = 802.1W). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.

    This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter stpcost is not supported, then the parameter is omitted.

    Type: Alphanumeric value set.

    Range:

    - ROOT, root
    - DESG, designated
    - ALT, alternative
    - BACKUP, backup
    - UNAVAILABLE if the value can not be retrieved.

27. **tcamd** – TCA mode

    This parameter shows the modus of the PM thresholding. Two thresholding methods are applicable: TR-only. (also known as the implicit reset method), TR-RTR. (also known as the explicit reset method).

    Type: Alphanumeric value set.

    Range: TR, TRRTR (default).

28. **vrtswid** – Virtual Switch Identifier

    This parameter is not supported if the input parameter

    - *modifier* = 1GEPL, or *modifier* = 10GEPL.

    This parameter identifiers the instance of the virtual switch.

    - A Virtual Switch ID is unique within a single circuit pack. When creating a new Virtual Switch, the system automatically assigns a unique ID to it.
    - There will be one virtual switch per physical switch, implicitly all LAN ports and all WAN ports on the physical switch are part of the single virtual switch. The ID of this virtual switch is fixed to 1. A future release may support multiple virtual switches per physical switch.

    Type: Integer.

    Range: 1 – Currently this is the only allowed value.

Default: 1.

This parameter is not supported if the input parameter *modifier* = 1GEPL, or modifier = 10GEPL.

Option: If the parameter vrtswid is not supported, then the parameter is omitted. If not generally omitted, then this parameter is reported only if the virtual switch entity exists (i.e. the VLAN tagging mode *vlantagmd* of the circuit pack the addressed EPort belongs to is set to 802.1TAG).

29. **vss** – Spanning Tree Status

    This parameter returns the status of the spanning tree protocol for the given port. If the input parameter modifier = 1GE, then this parameter is applicable only if the port is a network port (cnprole = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.

    This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL.

    The name of this parameter originally stands for VCG STP status which is somewhat misleading for an EPORT but is kept for consistency reasons with other products. (When using an EPORT as a network port it participates in STP and therefore also has status information.) If the parameter vss is not supported, then the parameter is omitted.

    Type: Alphanumeric value set.

    Range:

    - FWG, Forwarding
    - LRG, Learning
    - LIS, Listening (IEEE8102.D/STP only)
    - BLK, Blocking (IEEE8102.D/STP only)
    - DISF, Disabled due to a failure (IEEE8102.D/STP only)
    - DISA, Disabled via provisioning
    - BRK, Broken (IEEE8102.w/rSTP only)
    - DCD, Discarding (IEEE8102.w/rSTP only)
    - UNAVAILABLE if the value can not be retrieved.

30. **vvidls** – Valid VLAN Identifier List (static)

    This parameter specifies a list of all static VLAN identifiers allowed for this port. The list is ampersand grouped (& and &&). The list is packed by the NE and the management systems as good as possible by using '&' and '&&' . The vlan identifier of an incoming frame must be a member of this static VLAN Id list or the dynamic VLAN Id list *vvidlsd*. Frames tagged by a vlan identifier not member of these lists will be discarded. The port VLAN identifier (refer to parameter dftvlan of RTRV-EPORT Output Parameters) is not part of this list. This parameter is also used in transparent tagging mode to specify the list of valid customer tags (CIDs) for network ports (cnprole = NETWORK).

    This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter vvidls is not supported, then the parameter is omitted.

Type: Alphanumeric string and the character '&'.

Range:

- Value of each single member (valid VLAN identifier) in the list 1, 2, …, 4092, 4093
- In case the list has no members (empty list) -1.

The length of the list is limited by the usual system limitations like e.g. TL1 line length and some NE internal restrictions as described below. The number of entries in this list is limited to 64 by some NE-internal restrictions. Ranging and grouping by using the operators '&' and '&&' has no impact on the number of entries, it only reduces the length of the list being transported to/from CIT/EMS.

Default: -1.

Example 1:

vvidls=-1. The list has no members (empty list).

Example 2:

vvidls=3&5&40&&45. This list has the members 3, 5, 40, 41, 42, 43, 44 and 45.

Example 3:

vvidls=1&&4093 This list has the members 1,2, 3, …, 4092, 4093.

31. **vvidlsd** – Valid VLAN Identifier List (dynamic)

This parameter gives the list of all dynamic VLAN identifiers allowed for this port as gathered autonomously via GVRP. The list is ampersand grouped (& and &&). The vlan identifier of an incoming frame must be a member of this dynamic VLAN Id list or the static VLAN Id list vvidls. Frames tagged by a vlan identifier not member of these lists will be discarded. This parameter is also used in transparent tagging mode to report the list of valid customer tags (CIDs) for network ports (cnprole = NETWORK) collected by GVRP.

This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL. If the parameter vvidlsd is generally not supported, then the parameter is always omitted.

Otherwise, this parameter is reported only if

- the virtual switch entity exists (i.e. the VLAN tagging mode vlantagmd of the slot the addressed EPort belongs to is set to 802.1TAG) AND
- GVRP is enabled on the virtual switch (*gvrpmode* = ENABLED)
- the port is a NETWORK port (*cnprole* = NETWORK).

Type: Alphanumeric string and the character '&'.

Range:

- Value of each single member (valid VLAN identifier) in the list 1, 2, …, 4092, 4093
- In case the list has no members (empty list) -1.

The length of the list is limited by the usual system limitations like e.g. TL1 line length and some NE internal restrictions as described below. The number of entries in this list is limited to 247 by some NE-internal restrictions. Ranging and grouping by using the operators '&' and '&&' has no impact on the number of entries, it only reduces the length of the list being transported to/from CIT/EMS.

Default: There is no default value.-1
Example 1:
vvidlsd=-1 The list has no members (empty list).
Example 2:
vvidlsd=3&5&40&&45 This list has the members 3, 5, 40, 41, 42, 43, 44 and 45.

### Detailed behavior description

The values of the following parameters are directly requested form the hardware:

- anegst
- fcmdo
- macaddr
- rfltst
- stmd
- stpop
- stpid
- stprole
- vss
- vvidlsd.

Thus the value "UNAVAILABLE" is reported, if the CP HW is not available in the system.

Note that not only those parameters have to be returned which are supported by the related Ethernet pack. Not all Ethernet packs support all listed parameters. For details refer to the detailed specification of those output parameters.

### Example input/output

Example for a 10GE port of a GE10PL1 pack:

```
RTRV-EPORT-10GEPL:LT-UNITE:1-1-#-#-1-9:123456;
   LT-UNITE 02-05-21 11:11:00
M  123456 COMPLD
   "1-1-#-#-1-9,10GEPL::droppause=ENABLE,\
    enetpn=DEFAULT,enettca=DEFAULT,epmode=AUTO,eppm=DISABLE,fcmd=SYM,\
    fcmdo=UNAVAILABLE,fsflpbkstat=NO, \
    rcf_htmr=2000,rcf_linkdown=DISABLE, \
    macaddr=112233445566,rfltst=UNAVAILABLE, \
    servcond=INSERVICE,tcamd=TR"
;
```

## Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2397). The error responses listed there also apply to the **RTRV-EPORT** command.

### Validation rule: *modifier* consistent with given port-rate

The system shall verify that the modifier parameter is consistent with the rate of the port (given by the input aid parameter). Refer to the Range definition of the input parameter modifier of the **RTRV-EPORT** command for applicable combinations.

Error code:

```
IDNC – Input, Data Not Consistent, modifier is inconsistent with
existing port rate
```

### Validation rule: *modifier* consistent with the related circuit pack type

The system shall verify that the modifier parameter is consistent with the related pack type (given by the input aid parameter). Refer to the Range definition of the input parameter modifier of the **RTRV-EPORT** command for applicable combinations.

Error code:

```
IDNC – Input, Data Not Consistent, modifier is inconsistent with
the related circuit pack type
```

# RTRV-EQPT (bay): Retrieve equipment (bay)

The **RTRV-EQPT** command retrieves information associated with the bay level.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-EQPT***:tid:aid:ctag;*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Description: The AID of the bay/rack.
   Type: AID.
   Range: **all**
   Default: none.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

## Output format

In response to a valid RTRV-EQPT command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### aid - Access Identifier

Description: The AID of the bay/rack.

Type: AID

Range: BayAID. The keyword **all** is not allowed as output parameter.

Default: 1

### Detailed behavior description

The system supplies a normal completion response with the AID of the bay/subrack.

### Example input/output

```
RTRV-EQPT:UNITE-NE:all:123456;

   UNITE-NE 07-12-23 08:00:00
M  123456 COMPLD
   "1"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to RTRV-EQPT (bay) command.

### References

# RTRV-EQPT (CP): Retrieve equipment (circuit pack)

The **RTRV-EQPT** command retrieves the provisioning information associated with a circuit pack. The **RTRV-EQPT** command retrieves the inventory information associated with other replaceable units.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-EQPT***:tid:aid:ctag*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   The AID of a circuit pack, the backplane or another replaceable unit (e.g. user panel or fan unit).
   Type: AID
   Range:
   - CpAID ::= UnivSlotAID-cp for universal circuit packs
   - CpAID ::= XCSlotAID-cp for cross-connect circuit packs
   - CpAID ::= CTLSlotAID-cp for controller circuit packs
   - CpAID ::= SlotAID-cp for any circuit pack
   - LoxcAID::=UnivSlotAID-loxc for LOXC packs in universal slots
   - CpAllAID::= UnivSlotAID-cpall for any circuit pack in universal slots
   - CpAllAID::=SlotAID-cpall for any circuit pack in any slot
     The keyword **xcall** is allowed for Simple_XCSlotAID.
     The keyword **ctlall** is allowed for Simple_CTLSlotAID.
     The keyword **all** is allowed for Simple_SlotAID
   - BackplaneAID for backplane. The keyword **all** is not allowed for the backplane AID.
   - UserPanelAID for user panel. The keyword **all** is not allowed for the user panel AID.
   - FanAID for fan. The keyword **fanall** is not allowed for FanAID.

- TimingInterfaceAID for TI Interface board. The keyword **tiall** is allowed for TimingInterfaceAID.
- CiCtlAID for CI-CTL Interface board. The keyword **all** is not allowed for the CiCtl AID
- PowerAID for power interface The keyword **piall** is allowed for PowerAID.
- EciAID for Electrical Connector interface The keyword **eciall** is allowed for EciAID.

The keyword **all** is not allowed on bay/shelf level.

3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

### Output format

In response to a valid RTRV-EQPT command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

### Output parameters

1. **aid** – Access Identifier
   The AID of a circuit pack, the backplane or another replaceable unit (e.g. user panel or fan unit).
   Type: AID
   Range:
   - CpAID ::= SlotAID-cp for any slot
   - LoxcAID ::= UnivSlotAID loxc for LOXC pack in universal slots
     The keyword **usall** is allowed for Simple_UnivSlotAID.
     The keyword **xcall** is allowed for Simple_XCSlotAID.
     The keyword **ctlall** is allowed for Simple_CTLSlotAID.
     The keyword **all** is allowed for Simple_SlotAID
   - BackplaneAID for backplane. The keyword **all** is not allowed for the backplane AID.
   - UserPanelAID for user panel. The keyword **all** is not allowed for the user panel AID.

- FanAID for fan. The keyword **fanall** is not allowed for FanAID.
- TimingInterfaceAID for TI Interface board. The keyword **tiall** is allowed for TimingInterfaceAID.
- CiCtlAID for CI-CTL Interface board. The keyword **all** is not allowed for the CiCtl AID
- PowerAID for power interface The keyword **piall** is allowed for PowerAID.
- EciAID for Electrical Connector interface The keyword **eciall** is allowed for EciAID.

Refer to the AID syntax description.

### Spec block parameters

1. **name** – Circuit Pack Name

   Circuit Pack Name as stored in the EEPROM of the replaceable unit.

   This parameter should be reported for the AID for the backplane, AID for the user panel , AID for CI-CTL, AID for TI-Interface, AID for the fan, AID for power interface, AID for ECI, if equipped and supported.

   This parameter is not reported for a CpAID. The *name* parameter is not reported for an LOXCAID.

   Type: value set.

   Range: up to 12 characters.

2. **qual** – Circuit Pack Qualifier

   Circuit Pack Qualifier as stored in the EEPROM of the replaceable unit.

   This parameter should be reported for the AID for the backplane, AID for the user panel , AID for CI-CTL, AID for TI-Interface, AID for the fan, AID for power interface, if equipped and supported.

   This parameter is not reported for a CpAID. The *qual* parameter is not reported for an LOXCAID.

   Type: value set.

   Range: up to 7 characters.

   Note: The TL1-representation of the functional qualifier follows the rules as defined in SRD_ConfigurationManagement:

   - alphanumeric characters or the special character '-' only
   - special characters like '/' and '.' to be omitted.

3. **app** – Apparatus Code

   Apparatus code as stored in the EEPROM of the replaceable unit.

   This parameter should be reported for the AID for the backplane, AID for the user panel , AID for CI-CTL, AID for TI-Interface, AID for the fan, AID for power interface, AID for ECI, if equipped and supported.

   This parameter is not reported for a CpAID. The *app* parameter is not reported for an LOXCAID.

   Type: Alphanumeric string.

   Range: up to 9 characters.

4. **ssn** – Series Number

Series number as stored in the EEPROM of the replaceable unit.

This parameter should be reported for the AID for the backplane, AID for the user panel , AID for CI-CTL, AID for TI-Interface, AID for the fan, AID for power interface, AID for ECI, if equipped and supported.

This parameter is not reported for a CpAID. The *ssn* parameter is not reported for an LOXCAID.

Type: value set.

Range: up to 6 characters.

Note: A dash (-) is used instead of a colon (:) for the series number in TL1.

5. **clei** – Common Language Equipment

   Common Language Equipment as stored in the EEPROM of the replaceable unit.

   This parameter should be reported for the AID for the backplane, AID for the user-panel , AID for CI-CTL, AID for TI-Interface, AID for the fan, AID for power interface, AID for ECI, if equipped and supported.

   This parameter is not reported for a CpAID. The *clei* parameter is not reported for an LOXCAID.

   Type: value set.

   Range: 10 characters.

6. **eci** – Equipment Catalog Item

   Equipment Catalog Item as stored in the EEPROM of the replaceable unit.

   This parameter should be reported for the AID for the backplane, AID for the user panel , AID for CI-CTL, AID for TI-Interface, AID for the fan, AID for power interface, AID for ECI, if equipped and supported.

   This parameter is not reported for a CpAID. The *eci* parameter is not reported for an LOXCAID.

   Type: value set.

   Range: 6 digits.

7. **sln** – Serial Number

   Serial number as stored in the EEPROM on the circuit pack to identify the replaceable unit and indicate the date and place of manufacture.

   This parameter should be reported for the AID for the backplane, AID for the user panel , AID for CI-CTL, AID for TI-Interface, AID for the fan, AID for power interface, AID for ECI, if equipped and supported.

   This parameter is not reported for a CpAID. The *sln* parameter is not reported for an LOXCAID.

   Type: Alphanumeric string.

   Range: 12 characters.

8. **dcn_ipad** – DCN IP address for CLI/SNMP

   DCN IP address for CLI/SNMP management of the card.

   This parameter is relevant only for circuit packs of type ES64U (that means, *nvmname* = ES64U). The parameter shall be omitted for other packs.

   Type: Four dot separated numeric strings.

   Range: Each numeric string: 0 … 255.

   The values 0.0.0.0, 1.1.1.1, 127.0.0.1, and 224.0.0.0 to 255.255.255.255 are excluded.

Default: Empty string.

9. **eqptpn** – Equipment ASAP Profile Name

   The name of the current ASAP profile of type EQUIP-UNPROT of the circuit pack. This parameter is reported for a CpAID , PowerAID, EciAID, imingInterfaceAID and LoxcAID.

   Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.

   Range: up to 24 characters.

   Default: DEFAULT.

10. **eqptprotpn** – Protected Equipment ASAP Profile Name

    The name of the current ASAP profile of type EQUIP-PROT for the equipment.

    Option: This parameter is only reported for a CpAID, LoxcAID or PowerAID.

    Type: Alphanumeric string.

    Range: up to 24 characters. A hyphen ("-") is allowed in the name additionally.

    Default: DEFAULT.

11. **es64ucap** – ES64U capacity

    Switch capacity of the ES64U pack.

    This parameter is relevant only for circuit packs of type ES64U (that means, *nvmname* = ES64U). The parameter shall be omitted for other packs.

    Type: Value set.

    Range:

    - 0 – ES64U in suspended state, initial value after ES64U CP creation.
    - 20 – ES64U active or member of equipment protection group, capacity 20 Gbit/s.

    Default: 0.

12. **vlantgmd** – VLAN Tagging Mode

    VLAN tagging mode of the circuit pack. This parameter is relevant only for circuit packs of type GE1 (i.e. nvmname = GE1).

    Type: Value set.

    Range:

    - BCMD (default), for the backward compatible mode
    - 802.1tag, for the VLAN tag based mode according to IEEE802.1Q.

13. **loswcap** – LOXC switch capacity

    Switch capacity of the LOXC pack. This parameter is relevant only for circuit packs of type LOXC, thus the parameter shall be omitted for other packs.

    Type: value set.

    Range, if *nvmname* = LOXC

    - 0: LOXC in suspended state, initial value after LOXC CP creation
    - 15: LOXC active or member of equipment protection group, switch capacity 15 Gbit/s.

Range, if *nvmname* = LOXC40G2S or LOXC40G3S:

- 0: LOXC in suspended state, initial value after LOXC CP creation
- 15: LOXC active or member of equipment protection group, switch capacity 15 Gbit/s
- 40: LOXC active or member of equipment protection group, switch capacity 40 Gbit/s

Default: 0.

14. **lostd** – LO tributary standard

    LO tributary standard supported by the LOXC pack. This parameter is relevant only for circuit packs of type LOXC (i.e. *nvmname* = LOXC).

    Type: value set.

    Range:

    - SDH: LOXC supports SDH LO tributaries (VC3, VC12)
    - SONET: LOXC supports SONET LO tributaries (VT1.5)
    - UNDEFINED (default): no LO tributaries (loswcap = 0).

    LO VC3 tributaries provided with *lostd* = SDH support LO cross-connections and AU3/AU4 conversion cross-connections.

15. **tmuxcap** – TransMUX capacity

    Switch capacity of the TransMUX pack.

    This parameter is relevant only for circuit packs of type TransMUX (that means, *nvmname* = TransMUX), thus the parameter shall be omitted for other packs.

    Type: Value set.

    Range:

    - 0: TransMUX in suspended state, initial value after TransMUX CP creation.
    - 2G5: TransMUX active or member of equipment protection group, capacity 2.5 Gbit/s

    Default: 0

16. **istd** – Interface Standard of the Circuit Pack

    Interface standard supported by the circuit pack. This parameter is supported on GE10PL1 and ES64U circuit packs. On the circuit packs, the parameter *istd* defines the interface standard of the virtual concatenation groups.

    Option: If the parameter *istd* is not supported, then the parameter is omitted.

    Type: Value set.

    Range:

    - for GE10PL1: SDH or SONET
    - for ES64U: SONET or UNDEFINED (ES64U not used, *es64ucap* = 0)

    Default:

    - for GE10PL1: The default is derived from the system parameter *istddflt*.
    - for ES64U: UNDEFINED.

## Detailed behavior description

*Omit Inventory Data parameters if not accessible*

If the system cannot access inventory data of a circuit pack, e.g. due to a missing or defect pack or a system-internal communication outage, the following parameters are omitted from the command response:

- **app**
- **clei**
- **eci**
- **name**
- **qual**
- **sln**
- **ssn**.

## Example input/output

The following shows the successful execution of the command for a replaceable unit (non CpAID):

```
RTRV-EQPT:UNITE-NE:1-1-usrpnl:123456;

   UNITE-NE 00-11-03 08:00:00
M  123456 COMPLD
   "1-1-usrpnl:name=UPL,qual=-"
   "1-1-usrpnl:app=XYZ,ssn=S1-3,clei=WMMYABJDAA"
   "1-1-usrpnl:eci=437442,sln=00NB02160832
;
```

The following shows the successful execution of the command for a circuit pack (CpAID):

```
RTRV-EQPT:UNITE-NE:1-1-#-#-5-cp:123456;

   UNITE-NE 00-11-03 08:00:00
M  123456 COMPLD
   "1-1-#-#-5-cp:eqptpn=DEFAULT,eqptprotpn=DEFAULT"
;
```

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-EQPT** command.

## Related TL1 messages

- "DLT-EQPT (slot): Delete equipment (slot)" (p. 3-173)
- "RTRV-STATE-EQPT (CP): Retrieve equipment state (circuit pack)" (p. 3-2817)

## References

GR-199-CORE

# RTRV-EQPT (shelf): Retrieve equipment (shelf)

The **RTRV-EQPT** command retrieves the provisioning information associated with the shelf level.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-EQPT***:tid:aid:ctag;*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   The AID of the shelf/subrack.
   Type: AID
   Range: ShelfAID. The keyword **all** is allowed on bay AID and shelf AID level.
   Default: 1-1.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

## Output format

In response to a valid RTRV-EQPT command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "1-1[:spec_block]"
       ...
       ...
   "1-1[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

### Output parameters

1. **aid** – Access Identifier
   The AID of the shelf/subrack.
   Type: AID
   Range: ShelfAID. The keyword **all** is not allowed on bay AID and shelf AID level.
   Default: 1-1.

#### Spec block parameters

1. **eqptpn** – Equipment ASAP Profile Name
   The name of the current ASAP profile of type EQUIP-UNPROT of the shelf level.
   Type: Alphanumeric string.
   Range: up to 24 characters. A hyphen (-) is additionally allowed in the name.
   Default: DEFAULT.
2. **eqptprotpn** – Protected Equipment ASAP Profile Name
   The name of the current ASAP profile of type EQUIP-PROT of the shelf level.
   Type: Alphanumeric string.
   Range: up to 24 characters. A hyphen (-) is additionally allowed in the name.
   Default: DEFAULT.
3. **shlftp** – Shelf Type
   The shelf type of the addressed NE is provided.
   Type: Alphanumeric value set.
   Range: LXC40.
   Default: none.
4. **ssoride** – SS Bits Overrides
   This parameter determines the value to be inserted into the SS bits of the pointer of every AU-N or STS-N signal in the output direction of every SDH or SONET port in the shelf.
   The terms *override*, *enable* and *disable* are used since:
   - the default value of the SS bits in 00
   - the parameter allows you to diverge from that default.

   Type: Alphanumeric value set.
   Range: ENABLE insert value 00 into SS bits, DISABLE insert value 10 into SS bits.
   Default: DISABLE.

### Detailed behavior description

The system retrieves the output parameters as described above.

The shelf type is derived from the inventory data of the subrack.

### Example input/output

```
RTRV-EQPT:UNITE-NE:1-1:123456;

   UNITE-NE 00-11-03 08:00:00
```

```
M  123456 COMPLD
   "1-1:eqptpn=DEFAULT,eqptprotpn=DEFAULT,shlftp=LXC40"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to RTRV-EQPT (shelf) command.

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-EQPT***:tid:aid:ctag;*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   The AID of a slot.
   Type: AID
   Range:
   - SlotAID
   - UnivSlotAID
   - XCSlotAID
   - CTLSlotAID.

   The keyword **usall** is allowed for Simple_UnivSlotAID.
   The keyword **xcall** is allowed for Simple_XCSlotAID.
   The keyword **ctlall** is allowed for Simple_CTLSlotAID.
   The keyword **all** is allowed for Simple_SlotAID.
   The keyword **all** is not allowed on bay/shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

## Output format

In response to a valid RTRV-EQPT command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
```

```
        ...
    "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

### Output parameters

The output actlname is an attribute list per slot and nvmname/nvmqual is an optional pair of attributes per slot.

1. **aid** – Access Identifier

   Description: The AID of a slot.

   Type: AID

   Range: SlotAID

   The keyword **usall** is not allowed for Simple_UnivSlotAID.

   The keyword **xcall** is not allowed for Simple_XCSlotAID.

   The keyword **ctlall** is not allowed for Simple_CTLSlotAID.

   The keyword **all** is not allowed for Simple_SlotAID, Simple_UnivSlotAID, Simple_XCSlotAID, Simple_CTLSlotAID.

   The keyword **all** is not allowed on bay/shelf level.

#### Spec block parameters

1. **actlname** – Acceptable Circuit Pack Name

   This parameter is reported by itself The line is repeated for all groups of acceptable circuit packs in the slot. This list specifies the groups of circuit packs which can be provisioned for that slot. The detailed information about the groups can be requested via RTRV-ACTLCP.

   Type: value set.

   Range: 12 character.

2. **app** – Apparatus Code

   Apparatus Code as stored in the EEPROM on the circuit pack.

   This parameter should be reported for a SlotAID, if the value of *holdst* is VALID or UNEXPECTED.

   Type: Alphanumeric string.

   Range: up to 9 characters.

3. **clei** – Common Language Equipment

   Common Language Equipment as stored in the EEPROM on the circuit pack.

   This parameter should be reported for a SlotAID, if the value of *holdst* is VALID or UNEXPECTED.

   Type: Value set.

   Range: 10 characters

4. **eci** – Equipment Catalog Item

Equipment Catalog Item as stored in the EEPROM on the circuit pack.
This parameter should be reported for a SlotAID, if the value of *holdst* is VALID or UNEXPECTED.
Type: value set.
Range: 6 digits.
Default: none.

5. **eqptpn** – Equipment ASAP Profile Name
   The name of the current ASAP profile of type EQUIP-PROT on slot level
   Type: Alphanumeric string
   Range: up to 24 characters. A hyphen (-) is additionally allowed in the name.
   Default: DEFAULT.
   Note: *eqptpn* is used on system, shelf and circuit pack level for a profile of type EQUIP-UNPROT.
6. **name** – Circuit Pack Name
   Circuit Pack Name as stored in the EEPROM on the circuit pack.
   This parameter should be reported for a SlotAID, if the value of *holdst* is VALID or UNEXPECTED.
   Type: value set.
   Range: up to 12 characters.
7. **nvmname** – Circuit Pack Name
   This parameter specifies the name of the provisioned circuit pack of the slot. If no circuit pack is provisioned the default value is reported.
   Type: value set.
   Range: 12 character.
   Default: UNDEFINED.
8. **nvmqual** – Circuit Pack Qualifier
   This parameter specifies the qualifier of the provisioned circuit pack of the slot. If no circuit pack is provisioned the value UNDEF is reported.
   Type: value set.
   Range: 7 characters.
   The allowed values are:
   - UNDEF (default)
   - EXTD
   - all values as defined in SRD_ConfigurationManagement

   Note: The TL1-representation of the functional qualifier follows the following rules:
   - alphanumeric characters or the special character '-' only
   - special characters like '/' and '.' to be omitted.
9. **nvmsize** – NVM Size
   This parameter indicates the size of the NVM installed on the CTL pack. The parameter is reported only for a CTLSlotAID.
   Type: Alphanumeric value set.

Range:

- 256MB
- 512MB
- 1GB
- 2GB
- 4GB
- UNKNOWN

The value UNKNOWN is returned, if the NVM size cannot be determined.

10. **qual** – Circuit Pack Qualifier

    Circuit Pack Qualifier as stored in the EEPROM on the circuit pack.

    This parameter should be reported for a SlotAID, if the value of *holdst* is VALID or UNEXPECTED.

    Type: value set.

    Range: up to 7 characters.

    Note: The TL1-representation of the functional qualifier follows the following rules:

    - alphanumeric characters or the special character '-' only
    - special characters like '/' and '.' to be omitted.

11. **sln** – Serial Number

    Serial number as stored in the EEPROM on the circuit pack to identify each circuit pack and indicate the date and place of manufacture.

    This parameter should be reported for a SlotAID, if the value of *holdst* is VALID or UNEXPECTED.

    Type: Alphanumeric string.

    Range: 12 characters.

12. **ssn** – Series Number

    Series Number as stored in the EEPROM on the circuit pack.

    This parameter should be reported for a SlotAID, if the value of *holdst* is VALID or UNEXPECTED.

    Type: value set.

    Range: up to 6 characters.

    Note: A dash (-) is used instead of a colon (:) for the series number in TL1.

### Example input/output

```
RTRV-EQPT:UNITE-NE:1-1-#-#-5:123456;

   UNITE-NE 00-11-03 08:00:00
M  123456 COMPLD
   "1-1-#-#-5:actlname=OP2G5"
   "1-1-#-#-5:actlname=OP10"
    ...
   "1-1-#-#-5:nvmname=OP2G5,nvmqual=13SR4,eqptpn=DEFAULT"
   "1-1-#-#-5:name=OP2G5,qual=13SR4,app=KFA12"
```

```
   "1-1-#-#-5:clei=SN49CRTBAB,eci=255694"
   "1-1-#-#-5:sln=00NB01002333,ssn=1-1"
;
```

The following example shows the case when it is not possible to provision slot 5, because *actlname* is empty:

```
RTRV-EQPT:UNITE-NE:1-1-#-#-5:123456;

   UNITE-NE 00-11-03 08:00:00
M  123456 COMPLD
   "1-1-#-#-5:actlname=\"\""
    ...
   "1-1-#-#-5:nvmname=OP40,nvmqual=EXTD,eqptpn=DEFAULT"
   "1-1-#-#-5:name=\"\",qual=\"\",app=\"\""
   "1-1-#-#-5:clei=\"\",eci=\"\""
   "1-1-#-#-5:sln=\"\",ssn=\"\""
;
```

## Error responses

Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command in the Error responses section. The error responses listed there also pertain to the **RTRV-EQPT** command.

# RTRV-EQPT (socket): Retrieve equipment (socket)

The **RTRV-EQPT** command shall retrieve the provisioning information associated with socket.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-EQPT***:tid:aid:ctag*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   The AID of a socket.
   Type: AID.
   Range: SocketAID. The keyword *usall* or *all* is allowed for Simple_UnivSlotAID. The keyword *scall* is allowed for Simple_SocketAID. The keyword **all** is not allowed on bay/shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

## Output format

In response to a valid RTRV-EQPT command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_ block]"
   ... ...
   "aid[:spec_ block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

### Output parameters

The output *actlname*/*actlqual* is a list of attribute pairs per socket and *nvmname*/*nvmqual* is an optional pair of attributes per socket.

1. **aid** – Access Identifier

   The AID of a socket.

   Type: AID.

   Range: SocketAID. The keywords *all* / *usall* / *scall* shall are not allowed on any level.

#### Spec block parameters

1. **actlname** – Acceptable Module Name

   This parameter is reported by itself together with actlmodqual. The line is repeated for all acceptable modules in the socket. This list specifies the modules which can be provisioned for that socket.

   Type: value set.

   Range: 12 characters.

2. **actlqual** – Acceptable Module Qualifier

   This parameter is reported by itself together with actlmodname. The line is repeated for all acceptable modules in the socket. This list specifies the modules which can be provisioned for that socket.

   Type: value set.

   Range: 7 characters.

   Note: The TL1-representation of the functional qualifier shall follow the rules as defined in SRD_ConfigurationManagement:

   - alphanumeric characters or the special character '-' only
   - special characters like '/' and '.' to be omitted

3. **app** – Apparatus Code

   Apparatus Code as stored in the EEPROM. This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED. The 9 character Apparatus Code string is represented left aligned and padded on the right with ASCII spaces (20HEX) to a 12 character alphanumeric string.

   Type: Alphanumeric string.

   Range: 12 characters alphanumeric string or empty string (default).

   The default is reported when the Apparatus Code value cannot be derived from the EEPROM content. Note: In TL1 output direction the quotes have to escaped \"\".

4. **ccode** – Commercial Code

   Commercial code + suffix as stored in the EEPROM on the module. This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFPEEPROM Format.

   Type: numeric string.

   Range: up to 12 digits.

5. **compatibilitybyte** – Compatibility Byte

The Compatibility Byte indicates the compatibility of the module with the system. This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM format.

Type: numeric string.

Range: 0…255.

6. **clei** – Common Language Equipment

   Common Language Equipment as stored in the EEPROM on the module.

   This parameter should be reported for a SocketAID, if the value of *holdst* is VALID or UNEXPECTED.

   Type: value set.

   Range: 10 characters.

7. **connectortype** – Connector Type

   This parameter indicates the type of connector at the module plugged into the socket. (E.g. 07 for LC) This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM format.

   Type: Hexadecimal number

   Range: 1 byte which is represented as 2 hexadecimal digits.

8. **datecde** – Date Code

   Vendor Date Code. This parameter is kept for compatibility reasons only and is reported with the fixed value empty string "" for the SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.

   Type: Text string.

   Range: empty string.

9. **eci** – Equipment Catalog Item

   Equipment Catalog Item as stored in the EEPROM on the module.

   This parameter should be reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED.

   Type: value set.

   Range: 6 digits.

10. **eqptpn** – Equipment ASAP Profile Name

    The name of the current ASAP profile of type EQUIP-PROT on socket level.

    Type: Alphanumeric string.

    Range: up to 24 characters. A hyphen (“-”) is allowed in the name additionally.

    Default: DEFAULT.

11. **interchangemarker** – Interchangeability Marker

    This parameter is derived from the EEPROM content on the module and reported for the SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.

    Type: Test string.

    Range: 6 characters

Default: "S1-1"

The default is reported when the Interchangeability Marker value is not available in the EEPROM.

Note: A dash (-) is used instead of a colon (:) for the interchangeability marker in TL1.

12. **name** – Module Name

    Circuit Pack Name as stored in the EEPROM on the module.

    This parameter should be reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED.

    Type: value set.

    Range: up to 12 characters.

13. **nvmname** – Provisioned Module Name

    This parameter specifies the name of the provisioned module of the socket. If no module is provisioned the default value is reported.

    Type: value set.

    Range: 12 character.

    Default: UNDEFINED.

14. **nvmqual** – Provisioned Module Qualifier

    This parameter specifies the qualifier of the provisioned module of the slot. If no module is provisioned the default value is reported.

    Type: value set.

    Range: 7 characters.

    Default: UNDEF.

    Note: The TL1-representation of the functional qualifier shall follow the rules as defined in SRD_ConfigurationManagement:

    - alphanumeric characters or the special character '-' only
    - special characters like '/' and '.' to be omitted.

15. **physicalidentifier** – Physical Identifier

    This parameter indicates the type of module plugged into the socket. (e.g. 03 for SFP). This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM format.

    Type: Hexadecimal number.

    Range: 1 byte which is represented as 2 hexadecimal digits.

16. **prodid** – Product Line Id

    Binary Compatibility + Alcatel-Lucent Unique Number as stored in the EEPROM on the module. This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.

    Type: Text string.

    Range: empty string "" Note: In TL1 output direction the quotes have to escaped \"\".

17. **qual** – Module Qualifier

Circuit Pack Qualifier as stored in the EEPROM on the module.

This parameter should be reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED.

Type: value set.

Range: up to 7 characters.

Note: The TL1-representation of the functional qualifier shall follow the rules as defined in SRD_ConfigurationManagement:

- Alphanumeric characters or the special character '-' only
- Special characters like '/' and '.' to be omitted.

18. **sln** – Serial Number

    Serial number as stored in the EEPROM on the module to identify each module and indicate the date and place of manufacture.

    This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the Small EEPROM Format.

    Type: Alphanumeric string

    Range: 12 characters.

19. **ssn** – Series Number

    Series Number as stored in the EEPROM on the module.

    This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the Small EEPROM Format.

    Type: value set.

    Range: up to 6 characters.

    Note: A dash (-) is used instead of a colon (:) for the series number in TL1.

20. **transceivercode** – Transceiver Code

    This parameter indicates indicates the type of transceiver at the module plugged into the socket. This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM format.

    Type: Hexadecimal number or text string

    Range: 8 bytes where each byte is represented as 2 hexadecimal digits.

21. **uniquenumber** – Lucent Unique Number

    Alcatel-Lucent Unique Number as stored in the EEPROM. This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED. The Alcatel-Lucent Unique Number is represented right aligned and padded on the left with ASCII spaces (20HEX) to a 12 character numeric string.

    Type: Numeric string.

    Range: 12 characters alphanumeric string or empty string.

22. **vendorname** – Vendor Name

This parameter is kept for compatibility reasons only and is reported with the fixed value empty string "" for the SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.

Type: Text string

Range: empty string ""

23. **vendoroui** – Vendor Company Identifier

    This parameter is kept for compatibility reasons only and is reported with the fixed value empty string "" for the SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.

    Type: Text string

    Range: empty string ""

24. **vendorpartno** – Vendor Part Number

    This parameter is kept for compatibility reasons only and is reported with the fixed value empty string "" for the SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.

    Type: Text string

    Range: empty string ""

25. **vendorrevlvl** – Vendor Revision Level

    Vendor Revision Level as stored in the EEPROM on the module. This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.

    Type: Text string.

    Range: 4 characters.

26. **vendorsln** – Vendor Serial Number

    Vendor Serial Number + WES Vendor Identifier as stored in the EEPROM on the module. This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.

    Type: Text string.

    Range: 20 characters.

27. **wesserialno** – WES Serial Number

    This parameter is read from the EEPROM on the module and reported for the SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.

    Type: Text string.

    Range: 18 characters.

    Default: empty string "". The default is reported when the WES Serial Number value is not available in the EEPROM.

28. **wesvendorid** – WES Vendor ID

WES Vendor Identifier as stored in the EEPROM on the module. This parameter is reported for a SocketAID, if the value of holdst is VALID or UNEXPECTED and the data in the EEPROM is stored according to the SFP/XFP EEPROM Format.

Type: Text string.

Range: 4 characters.

## Detailed behavior description

### Omit inventory data parameters if not accessible.

If the system cannot access inventory data related to the addressed socket, e.g. due to a missing or defect pack or a system-internal communication outage, the following parameters are omitted from the command response:

- *app*
- *ccode*
- *clei*
- *compatibilitybyte*
- *connectortype*
- *datecde*
- *eci*
- *interchangemarker*
- *name*
- *physicalid*
- *prodid*
- *qual*
- *sln*
- *ssn*
- *transceivercode*
- *uniquenumber*
- *vendorname*
- *vendoroui*
- *vendorpartno*
- *vendorrevlvl*
- *vendorsln*
- *wesserialno*
- *wesvendorid*.

### Reporting of inventory data for different module types

Different module types will support a different set of inventory data.

Modules with a Alcatel-Lucent specific specification will support following parameters:

- *clei*
- *eci*
- *name*
- *qual*
- *sln*
- *ssn*.

For SFP and XFP modules the following parameters will be supported:

- *ccode*
- *clei*
- *compatibilitybyte*
- *connectortype*
- *datecde*
- *interchangemarker*
- *name*
- *physicalid*
- *prodid*
- *qual*
- *transceivercode*
- *uniquenumber*
- *vendorname*
- *vendoroui*
- *vendorpartno*
- *vendorrevlvl*
- *vendorsln*
- *wesserialno*
- *wesvendorid*.

**Reporting of inventory data based on defined format of EEPROM content**

As long as the Inventory Data on the Optical Modules is accessible and readable, the parameters are reported as they are extracted from the EEPROM according to the format definitions. If the data in the EEPROM is not according to the defined format, then for each parameter the defined number of bytes is taken from the defined location in the EEPROM without any check of the extracted data.

## Example input/output

The following exampleb shows a normal response for RTRV-EQPT for one socket when a module is plugged in with data stored in Small EEPROM format:

```
RTRV-EQPT:UNITE-NE:1-1-#-#-5-sc2:123456;

   UNITE- NE 00-11-03 08:00:00
M  123456 COMPLD
   "1- 1-#-#-5-sc2:actlname=OM2G5,actlqual=13LR1"
   "1- 1-#-#-5-sc2:actlname=OM2G5,actlqual=15LR1"
   "1- 1-#-#-5-sc2:nvmname=OM2G5,nvmqual=13SR4,eqptpn=DEFAULT"
   "1- 1-#-#-5:name=OM2G5,qual=15LR1,comcde=109192278000,clei=WM3ILPEDAA,
   eci=255694,
sln=00NB01002333,ssn=1-1"
;
```

The following example shows a response if a module is not plugged into a socket:

```
RTRV -EQPT:UNITE-NE:1-1-#-#-5-sc2:123456;

   UNITE- NE 00-11-03 08:00:00
M  123456 COMPLD
   "1- 1-#-#-5-sc2:actlname=OM2G5,actlqual=13LR1"
   "1- 1-#-#-5-sc2:actlname=OM2G5,actlqual=15LR1"
   "1- 1-#-#-5-sc2:nvmname=OP2G5,nvmqual=13SR4,eqptpn=DEFAULT"
   "1- 1-#-#-5:name=OM2G5,qual=CL61L1,app=\"\",ccode=109496869,
   clei=WM1T37KBAA,compatibilitybyte=128,connectortype=07,datecde=\"\",
   interchangemarker=\"S1:1\",physicalidentifier=03,prodid=\"\",
   transceivercode=0000000140400C01,uniquenumber=000000009424,vendorname=\"\",
   vendoroui=\"\",vendorpartno=\"\",vendorrevlvl=\"00.1\",
   vendorsln=\"00000000040155775OIFTN\",wesserialno=\"\",
   wesvendorid=\"IFTN\""
;
```

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-EQPT** command.

# RTRV-EQPT (system): Retrieve Equipment (system)

The **RTRV-EQPT** command retrieves the provisioning information on system (NE) level.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-EQPT***:tid:aid:ctag*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   The aid of the system itself.
   Type: AID
   Range: system. The usage of the keyword **all** on system level is not allowed.
   Default: system
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

## Output format

In response to a valid RTRV-EQPT command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "system:spec_block"
       ...
       ...
   "system:spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

### Output parameters

1. **aid** – Access Identifier
   The aid of the system itself.
   Type: AID
   Range: system. The usage of the keyword **all** on system level is not allowed.
   Default: system

#### Spec block parameters

1. **eqptpn** – Equipment ASAP Profile Name
   The name of the current ASAP profile on the system level
   Type: Alphanumeric string
   Range: up to 24 characters. A hyphen (-) is additionally allowed in the name.
   Default: DEFAULT
2. **istddflt** – Interface Standard Default
   Defining the predominantly used interface standard for a port.
   Type: Alphanumeric value set.
   Range:
   - SONET
   - SDH

   Default: SDH
3. **mondelay** – Port Auto to Mon Delay
   The switch of the port mode from the value AUTO to the value MON is delayed by this timer. It requires that a valid signal is present for the set timer period prior to the port transitioning to monitored. If during the timer period the signal is interrupted, the time should reset and begin another period when a valid signal is once again presented.
   Type: Numeric string.
   Range:
   - 0 = no timer will be started
   - 1…480 = in steps of 1 representing a switch delay of the port mode in minutes.

   Default: 0
4. **portclassdflt** – Port Class Default
   Defines the default port class, which is used when a new port is created and xcsetup=SWISS. When xcsetup=TRADITIONAL this parameter is not evaluated.
   Type: Alphanumeric value set.
   Range:
   - TRADITIONAL
   - EDGE

   Default: TRADITIONAL.
5. **trbmddflt** – Tributary Mode Default
   Defining the predominantly used tributary mode for a port.

Type: Alphanumeric value set.

Range:

- FIXED
- ADAPTIVE

Default: FIXED.

6. **swmaxcap** – Maximum Switch Capacity

   This parameter indicates the maximum switch capacity of the system that the user intends to use.

   Type: value set.

   Range:

   - LXC160 (default), 160 GBit/s switch capacity
   - LXC320, 320 GBit/s switch capacity
   - LXC640, 640 GBit/s switch capacity.

7. **synccrtc** – System Synchronization Characteristic

   This parameter specifies whether the NE uses the SDH or SONET timing function for synchronization.

   Type: Alphanumeric value set.

   Range:

   - SONET
   - SDH.

   Default: SDH.

8. **systype** – System Type

   This parameter specifies the type of NE.

   Type: Alphanumeric value set.

   Range: WaveStar_UNITE.

   Default: WaveStar_UNITE

9. **upsrportalarming** – Enh. SA/NSA Detection for UPSR and SNCP

   The parameter specifies whether the Enhanced SA/NSA Detection for UPSR Rings The parameter specifies whether the Enhanced SA/NSA Detection for UPSR Rings is switched on or off.

   Type: Alphanumeric value set.

   Range: ENABLE, DISABLE (default).

10. **xcsetup** – Cross Connect Setup

    This parameter indicates whether the system supports the set-up of cross-connections via the ONNS application.

    Type: value set.

    Range: TRADITIONAL ONNS application is disabled.

    Default: TRADITIONAL.

11. **ASTNNodeID** – ASTN node ID

This parameter shows the unique identification of the NE as used by the ONNS application. The value will be read from backplane, if DB is empty.
Type: Four dot separated numeric string.
Range: Each numeric string: 0…255.

### Detailed behavior description

The command retrieves the parameters as indicated in the output parameter section from the system.

### Example input/output

```
RTRV-EQPT:UNITE-NE:system:123456;

   UNITE-NE 00-11-03 08:00:00
M  123456 COMPLD
   "system:systype=WaveStar_UNITE"
   "system:istddflt=SDH"
   "system:trbmddflt=FIXED"
   "system:synccrtc=SDH"
   "system:eqptpn=DEFAULT"
;
```

### Error responses

Refer to “RTRV-HDR: Retrieve header” (p. 3-2397) command Error Response section. The generic error responses listed there also apply to the **RTRV-EQPT** command.

### Related TL1 messages

- “ENT-EQPT (slot): Enter equipment (slot)” (p. 3-1534)
- “ED-EQPT (system): Edit equipment (system)” (p. 3-387)
- “DLT-EQPT (slot): Delete equipment (slot)” (p. 3-173)

# RTRV-EXT-CONT: Retrieve external control

The **RTRV-EXT-CONT** command instructs an NE to send the control state of MDO ports (external controls). The command can be used to audit the result of an **OPR-EXT-CONT** or an **RLS-EXT-CONT** command.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-EXT-CONT**:*tid*:[*aid*]:*ctag*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **aid** – Access Identifier
   This is the address of the MDO port entities on which the command operates. If misc_outall is specified the configuration of all MDO's will be retrieved.
   Type: AID
   Range: Miscellaneous_out_discreteAID
   Default: misc_outall (if the *aid* is omitted).
3. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output format

The following example shows the successful completion of the **RTRV-EXT-CONT** command by the NE:

```
   sid date time
M  ctag COMPLD
   "aid:,dur,contstate"
   ...
   "aid:,dur,contstate"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command parameters

1. **aid** – Access Identifier

   This is the address of the MDO port entity for which the configuration is retrieved or on which an operation is performed.

   Type: AID.

   Range: Miscellaneous_out_discreteAID. misc_outall must not be reported or used.

2. **dur** – Duration

   This parameter defines in which mode the device connected to the MDO is expected to be operated. It is a fixed value because this feature will be not supported by the system. This parameter is in for compatibility reason. The system operates only continuous that means if the MDO is operated it is switched on and it is released it is switched off.

   Type: Alphanumeric value set.

   Range: CONTS, continuous duration.

3. **contstate** – Control State

   This is the state of the MDO (external control)

   Type: Alphanumeric value set.

   Range:

   - OPER – Operated, that means the MDO is switched on
   - RLS – Released (default), that means the MDO is switched off.

## Detailed behavior description

The **RTRV-EXT-CONT** command does not generate a **REPT DBCHG** message.

## Example input/output

The following example shows the successful completion of the **RTRV-EXT-CONT** command by the NE:

```
RTRV-EXT-CONT:LT-UNITE-123:MISC_OUT3:123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   "MISC_OUT3:,CONTS,RLS"
;
```

The following example shows the successful completion of the **RTRV-EXT-CONT** command by the NE if the aid is omitted:

```
RTRV-EXT-CONT:LT-UNITE-123::123456;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   "MISC_OUT1:,CONTS,RLS"
```

```
   "MISC_OUT2:,CONTS,OPER"
   "MISC_OUT3:,CONTS,OPER"
   "MISC_OUT4:,CONTS,RLS"
   "MISC_OUT5:,CONTS,RLS"
   "MISC_OUT6:,CONTS,OPER"
   "MISC_OUT7:,CONTS,RLS"
   "MISC_OUT8:,CONTS,RLS"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-EXT-CONT** command.

### Related TL1 messages

- “OPR-EXT-CONT: Operate external control” (p. 3-2012)
- “RLS-EXT-CONT: Release external control” (p. 3-2178).

# RTRV-FECOM: Retrieve DCC related parameters

The **RTRV-FECOM** command can be initiated by a user to retrieve parameters of Data Communication Channels (DCC) and its attachment to specific OSI nodes.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-FECOM***:tid::ctag::[port],[dcctype],[networktype];*

## Input parameters

### Command parameters

1. **tid** – Target Identifier

   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for input parameter syntax and description of this parameter.

2. **ctag** – Correlation Tag

   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for input parameter syntax and description of this parameter.

3. **port** – DCC port

   This parameter indicates the port AID of a circuit pack which is used together with *dcctype* to identify the DCC channel.

   Type: AID.

   Range: SPortAID.

   Default: If this field is omitted, the report will include the DCC parameters of all transmission ports belonging to the NE.

4. **dcctype**

   This parameter specifies whether the LINE/MS or SECTION/RS DCC parameters of the *port* is reported by the command.

   Type: Alphanumeric value set.

   Range: LINE, SECTION.

   Default: If this parameter is omitted, LINE and SECTION DCC parameters will be considered for the output.

5. **networktype** – Network Type

   This parameter specifies whether the MCN or SCN related DCC parameters of the port is reported by the command.

   Type: Alphanumeric value set.

   Range: MCN, SCN.

Default: If this parameter is omitted, MCN and SCN related parameters will be considered for the output.

### Output format

If the RTRV-FECOM is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "port,dcctype:spec_block"
       ...
       ...
       ...
   "port,dcctype:spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

### Output parameters

#### Command parameters

1. **port** – DCC port

   This parameter indicates the port AID of a circuit pack which is used together with *dcctype* to identify the DCC channel.

   Type: AID.

   Range: SPortAID.

   Default: If this field is omitted, the report will include the DCC parameters of all transmission ports belonging to the NE.

2. **dcctype**

   This parameter specifies whether the LINE/MS or SECTION/RS DCC parameters of the *port* is reported by the command.

   Type: Alphanumeric value set.

   Range: LINE, SECTION.

   Default: If this parameter is omitted, LINE and SECTION DCC parameters will be considered for the output.

#### Spec block parameters

1. **dccprottp**

   This parameter reports the protection type of the DCC channel. 0X1 means the port is not involved in a protection group or DCC protection switching is disabled. 1+1 means DCC protection switching is enabled: In these case only the active worker line is shown.

   Type: Alphanumeric value set.

Range: 0X1 (default), 1+1.

2. **dccstat**

   This parameter indicates whether MCN communication over the DCC channel is enabled or if it is used in a Transparent DCC Cross Connection.

   Type: Alphanumeric value set.

   Range: DISABLE, ENABLE (default), TRANSPARENT.

   Note: Output responses with dccstat=DISABLE will only sent when either *scn_dccstat* = ENABLE or *uni_dccstat* = ENABLE or *enni_dccstat* = ENABLE, see also Detailed behavior description below.

3. **lapdmode**

   This parameter indicates the type of LAPD service. Modes are AITS and UITS. Starting with R2.0 this parameter is also used to determine the service for the LinkID protocol.

   If the DCC channel is involved in a transparent DCC connection or if either *scn_dccstat* or *uni_dccstat* is set to ENABLE, or *enni_dccstat* is set to ENABLE, this parameter has no meaning and will not be reported.

   Type: Alphanumeric value set..

   Range:

   - UITS (default)
   - AITS.

4. **lapdrl**

   This parameter indicates the LAPD role. This parameter is also used to determine the service for the LinkID protocol.

   If the DCC channel is involved in a transparent DCC connection or if either *scn_dccstat* or *uni_dccstat* is set to ENABLE or *enni_dccstat* is set to ENABLE, this parameter has no meaning and will not be reported.

   Type: Alphanumeric value set.

   Range:

   - USER-SIDE (default)
   - NETWORK-SIDE.

5. **osinode**

   Assignment of a DCC channel to an MCN node in the NE. The parameter is omitted when *dccstat* = ENABLE.

   An NE can have up to 8 instances of the OSI stack. Node-1 is default and has a NSAP. Nodes 2-8 have a NET and no SEL (NSAP = NET + SEL, for NET: SEL=00). Nodes 2-8 can be created and configured, see command **ENT-ULSDCC-L3**.

   Type: AID.

   Range: osinode{1-8}

6. **scn_dccstat**

   This parameter indicates whether the DCC channel is used for communication over the SCN or is involved in a transparent DCC cross-connection.

   Type: Alphanumeric value set.

Range: DISABLE (default), ENABLE, TRANSPARENT.

Note: Output responses with *scn_dccstat* = DISABLE will only sent when either *dccstat* = ENABLE or *uni_dccstat* = ENABLE, or *enni_dccstat* = ENABLE, see also Detailed behavior description below.

7. **uni_dccstat**

   This parameter indicates whether the DCC channel is used for UNI communication.

   Type: Alphanumeric value set.

   Range: DISABLE (default), ENABLE, TRANSPARENT

   Note: Output responses with *uni_dccstat* = DISABLE will only sent when either *dccstat* = ENABLE or *scn_dccstat* = ENABLE, or *enni_dccstat* = ENABLE, see also Detailed behavior description below.

8. **enni_dccstat**

   This parameter indicates whether the DCC channel is used for E-NNI communication.

   Type: Alphanumeric value set.

   Range: DISABLE (default), ENABLE, TRANSPARENT

   Note: Output responses with *enni_dccstat* = DISABLE will only be sent when either *dccstat* = ENABLE or *scn_dccstat* = ENABLE or *uni_dccstat* = ENABLE, see also Detailed Behavior Description below.

### Detailed behavior description

The command retrieves the system parameter as described in the Output Parameter Section.

Output responses will only be delivered for DCC channels with

- *dccstat!* = DISABLE or

- *scn_dccstat!* = DISABLE or

– *uni_dccstat*!=DISABLE or

– *enni_dccstat*!=DISABLE.

The command shall return an empty response, if there is no data matching the criteria given by the input parameters of the command.

The command processing uses the input parameters as filter criteria to search for data to be retrieved. If no data is found, an empty response is returned. Error messages are only returned for general syntax and range errors.

The command is not able to retrieve DCC characteristics parameters from the protecting port of a 1+1 MSP group, if DCC protection switching is enabled.

### Example input/output

The following example shows the result of RTRV-FECOM:

```
RTRV-FECOM:NE-UNITE::123456::1-1-#-#-5-all,line;
   NE-UNITE 00-12-24 11:00:00
```

```
M  123456 COMPLD
   "1-1-#-#-5-1,LINE:dccstat=ENABLE,lapdmode=UITS,osinode=osinode1,
dccprottp=0X1,"
;
```

The following example shows the result of RTRV-FECOM for a port which is used by the SCN:

```
RTRV-FECOM:NE-UNITE::123456::1-1-#-#-5-all,line;
   NE-UNITE 00-12-24 11:00:00
M  123456 COMPLD
   "1-1-#-#-5-1,LINE:dccstat=DISABLE,dccprottp=0X1,scn_dccstat=ENABLE,
    uni_dccstat=DISABLE, enni_dccstate=DISABLE"
;
```

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-FECOM** command.

# RTRV-FECOM-LAN: Retrieve LAN channel related parameters

The **RTRV-FECOM-LAN** command can be initiated by users to retrieve the provisioned state of the LAN ports (LAN1, LAN2, and LAN3).

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-FECOM-LAN***:tid:[aid]:ctag;*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **aid** – Access Identifier
   This parameter indicates the LAN port AID.
   Type: AID.
   Range: LanPort AID.
   Default: If this field is omitted, the report will display the status of all lan ports belonging to the *tid*.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for input parameter syntax and description of this parameter.

## Output format

If the **RTRV-FECOM-LAN** is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "aid:spec_block"
       ...
   "aid:spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output Parameter section for the "RTRV-HDR: Retrieve header" (p. 3-2397) command.

## Output parameters

### Command parameters

1. **aid** – Target Identifier

   This parameter indicates the LAN port AID. The value *lanall* is not allowed.

   Type: AID.

   Range: LanPort AID.

### Spec block parameters

1. **ip_ad** – IP Address

   This parameter indicates the assigned IP address for the LAN interface. The IP-address includes both, a router address and a HOST address. The HOST address that will be used for FTP depends on the LAN interface where the related TCP connection request originates.

   The CIT is expected to use the HOST address of LAN1. The *Navis*® Optical EMS is expected to use the HOST address of LAN2 (or LAN3 in later releases).

   Type: 32-bit IPv4 address: Four dot separated numeric strings OR empty string The empty string value is used as indication for an invalid/undefined IP address.

   Range: For first numeric string: 0 .. 223; for second to fourth numeric string: 0 .. 255.

   The values 0.0.0.0 and 1.1.1.1 are excluded.

   Default: For LAN1, LAN2 and LAN3: empty string.

2. **ip_lanstat** – IP-LAN Status

   This parameter indicates whether IP communication over the external LAN channel is enabled or disabled. Note: Enabling has no effect if *lanstat* is disabled for that interface.

   Type: Alphanumeric value set.

   Range: ENABLE or DISABLE for LAN1, LAN2, LAN3

   Default: DISABLE for LAN1, LAN2, LAN3.

3. **ip_snm** – IP Subnet Mask

   This parameter indicates the assigned IP subnet mask (32-bit IPv4) for the LAN interface. The full IP-address is needed as host-address. Each LAN needs its own IP-address and IP-mask, indicating that all IP-addresses that match the prefix (Unmasked part) are grouped as the subnet-ID for this LAN-subnet.

   If the LAN interface is used for UNI, then the parameter ip_snm is used to define a subnet for multiple UNI-Cs which belong to the same customer.

   Type: 32-bit IPv4 address: Four dot separated numeric strings or empty string. The empty string value is used as indication for an invalid/undefined IP subnet mask.

   Range: For each numeric string: 0 .. 255.

   Default: For LAN1, LAN2, and LAN3: empty string.

4. **isis_stat** – (I) IS-IS Status

   This parameter indicates whether (integrated) IS-IS is enabled or disabled on the LAN port specified by the input *aid*.

   Note: Enabling has no effect if *lanstat* is disabled for that interface.

   Type: Alphanumeric value set.

   Range: ENABLE (default), DISABLE.

5. **lanrpri** – LAN Designated Router Priority

   This parameter sets the relative priority for the node in the election for designed router on this LAN. There is a separate election for each separate LAN to which the node is connected. A higher value indicates a higher probability to be selected as designated router. A designated router is selected per area (between the nodes on that LAN with the same area address) and for the Level-2 nodes on the LAN.

   Note: When *osinode* = scnnode modification of this parameter has no effect.

   Note: When *osinode* = uninode this parameter has no effect.

   Note: When *osinode* = enninode this parameter has no effect.

   Type: numeric string.

   Range: 1 – 127.

   Default: 64.

6. **lanstat** – LAN Status

   This parameter indicates whether physical communication over the external channel is enabled or disabled.

   Note: Disabling of an interface also affects usage of protocols over this interface, see *lan_stat* and *osi_stat*.

   Type: Alphanumeric value set.

   Range: ENABLE for lan1; ENABLE, DISABLE for lan2, lan3:

   Default: ENABLE for lan1 and lan2; DISABLE for lan3.

7. **lantlss** – LAN TARP Storm Suppression

   This parameter indicates the enhanced TARP propagation rules that suppress TARP LAN storms.

   Note: When *osinode* = uninode this parameter has no effect.

   Note: When *osinode* = enninode this parameter has no effect.

   Type: Alphanumeric value set.

   Range:

   - ENABLE (default)
   - DISABLE.

8. **osinode**

   Assignment of LAN port to an OSI-node, the SCN node, the UNI node, or the E-NNI node in the NE. A UNITE NE can have up to 8 instances of the OSI stack, has one SCN node, one UNI node, and one E-NNI node.

   Node-1 is the default and has a NSAP. Nodes 2-8 have a NET and no SEL (NSAP = NET + SEL, for NET: SEL=00).

   Node 1 is always present. The SCN node is created when the ASTN IP address is configured, the UNI node is created when the UNI IP address is configured, the SC node (ENNI node) is created when the SC IP address and the SC ID is configured.

   Node 2-8 can be created and configured, see command **ENT-ULSDCC-L3**.

   Type: AID.

   Range:

   For LAN1: osinode1 (fixed value).

   For LAN2 and LAN3: osinode{1-8} | scnnode | uninode | enninode.

Note: If this parameter is set to scnnode or uninode or enninode, then *lanstat* and *ip_lanstat* must be ENABLED.

Default: osinode1.

9. **osi_lanstat** – OSI LAN Status

   This parameter indicates whether OSI communication over the external channel is enabled or disabled.

   Type: Alphanumeric value set.

   Range: ENABLE for LAN1, LAN2, LAN3

### Detailed behavior description

The command retrieves system parameter as described in the Output parameter section.

### Example input/output

The following example shows the result of RTRV-FECOM-LAN:

```
RTRV-FECOM-LAN:NE-UNITE:1-1-lan1:123456;
   NE-UNITE 00-12-24 11:01:00
M  123456 COMPLD
   "1-1-lan1:ip_lanstat=ENABLE,ip_ad=135.248.206.72,ip_snm=255.255.0.0,
lanstat=ENABLE,lanrpri=64,lantlss=ENABLE,osinode=osinode1,osi_lanstat=ENABLE"
;
```

The following example shows the result of RTRV-FECOM-LAN:

```
RTRV-FECOM-LAN:NE-UNITE:1-1-lan1:123456;
   NE-UNITE 00-12-24 11:01:00
M  123456 COMPLD
   "1-1-lan2:ip_lanstat=ENABLE,ip_ad=135.248.206.72,ip_snm=255.255.0.0,
lanstat=ENABLE,lanrpri=64,lantlss=ENABLE,osinode=enninode,osi_lanstat=ENABLE"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-FECOM-LAN** command.

### Related TL1 messages

- “ENT-FECOM-LAN: Enter LAN related parameters” (p. 3-1567)

# RTRV-HDR: Retrieve header

## Description

The **RTRV-HDR** command can be initiated by a user to request that the NE returns a normal completion response.

## Parameters

In TL1 terminology, a parameter block always follows a colon ':'. Any trailing colons at the end of a command line may be omitted if they do not contain any parameters. A parameter block can be either a block of position-defined parameters or it can be a spec_block (a block of name-defined parameters). In a block of position-defined parameters, the parameter values are supplied at predefined positions within the parameter block. Two parameter values are separated by a comma. If the default value for a parameter is to be used, a null value is placed in the command line and the position of the parameter is maintained by keeping the comma. When default values are used for parameters at the end of the parameter block, it is not necessary to include all the trailing commas. In all the TL1 command pages, for position-defined parameter blocks, simplified notation such as: [d],[e],[f],[g] is used to represent the following format: [d][,[e][,[f][,g]]]. The following notation is also equivalent: [d],[e],[f][,g]. In a specification block (spec_block), every parameter name is followed by an equal sign and the parameter value. The command line does not have to use all of the spec_block parameters. Also, spec_block parameters can appear in any order.

## NULL parameter value

The word NULL is used for some of the parameter values in TL1 messages. For both input and output parameters, NULL means that the parameter is omitted.

## Quoted text strings

Some string-valued parameters, like NENAME, allow any printable character within the double-quoted string (""). On output (RTRV and **REPT DBCHG**), the string is surrounded by escaped quotes \"\". Those parameters can contain any printable characters, including the TL1 parse characters (; : , "). Spaces and upper/lowercase are also preserved. Using two double-quotes "" will set the parameter to an empty string. But according to GR-831, within a quoted string, a double-quote character is escaped as \" and the backslash is escaped as \\\. Within a backslash-quoted string (\"\"), the double-quote character is escaped as "" and the backslash is escaped as \\\. Another caveat is that while that parameter can contain any printable character, in networks using a Telcordia OS, the TL1 parse characters (; : , ") should not be used. Particularly, the semicolon (;), less-than (<), and greater-than (>) characters must not be used in the string.

### Other notational conventions

The following conventions are used in the description of RTRV-HDR itself to visualize non-printable characters (in all other commands those characters are indicated by a blank).

**<cr>**

A carriage return in ASCII

**<lf>**

A line feed in ASCII

**< >**

The brackets are used to enclose one or more information items, e.g., <date>, <time>, <source identifier>, etc. The brackets are not transmitted.

**^**

The character ^ indicates a blank that must appear in the message.

### Properties

Login privilege: User Privilege Code (UCFC/UCAL): Any

Priority: 1

Abortable: Yes

### Input format

Syntax: **RTRV-HDR***:tid::ctag*;

### Input parameters

#### Command parameters

1. **tid** – Target Identifier
   This is the currently active name of the NE to which the command is addressed. The *tid* is a case insensitive character string.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed
   Range: 1 to 20 characters
   Default: UNITE-NE
2. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string.
   Range: non-zero decimal number or identifier of up to 6 characters.
   Note: Current implementation also allows '0' as valid *ctag*, which is an extension to GR-831.

## Output format

### Normal system response

After receiving the **RTRV-HDR** command, the following normal completion response is returned:

```
IP^ctag<cr><lf>
<cr><lf><lf><lf>
^^^sid^date^time<cr><lf>
M^^ctag^COMPLD<cr><lf>
;
```

The format definition shows only the minimum of <CR> characters needed for the response. The response may contain additional <CR> characters at the beginning or end of lines. These <CR> characters have no effect on the visible formatting of the response message.

### RL Acknowledgment

If a command cannot be executed at the present time, the following RL (Repeat Later) Acknowledgment is returned:

```
RL^ctag<cr><lf>
<cr><lf><lf>
```

### Continuation responses and IP acknowledgments

For commands that generate output, if the output response is less than or equal to 4096 bytes, the response will be terminated by the semicolon (;) character. If the output response is greater than 4096 bytes, the response lines will be partitioned into multiple responses. The continuation response will have another set of header lines with the same ctag, along with additional output response lines. Each response will be terminated with the greater than (>) character, except the last one which will be terminated by the semicolon (;) character.

## Output parameters

1. **sid** – Source Identifier
   This is the currently active name of the NE to which responses to the command. See definition of *tid* input parameter in "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **date** – Date
   Date when output message is generated. This has the format YY-MM-DD (year-month-day).
   Type: value set.

Range:

- for YY: 00 to 99
- for MM: 01 to 12
- for DD: 01 to 31

2-digit years

TL1 messages use YY-MM-DD for the format of a date, meaning that the year only has two digits. This is consistent with Telcordia requirements. Internally, however, the system does use a 4-digit year. When the year appears in a response, the internal 4-digit year is truncated to two digits. When the year appears as an input parameter, for example in the **ED-DAT** command, years in the range 90-99 will represent 1990-1999, and years in the range 00-37 will represent 2000-2037.

Default: 00-01-01

3. **time** – Time

   Time when output message is generated. This has the format HH:MM:SS (hours:minutes:seconds).

   Type: Value set.

   Range:

   - for HH: 00 to 23
   - for MM: 00 to 59
   - for SS: 00 to 59

   Default: 00:00:00

4. **M** – Message

   This parameter indicates that the output message is generated in response to a manual command.

   Type: Value set.

   Range: M

5. **ctag** – Correlation Tag

   See definition of *ctag* input parameter in "RTRV-HDR: Retrieve header" (p. 3-2397).

6. **IP** – In Progress

   IP is sent in response to all commands with the exception of commands that result in error code output.

   Type: value set.

   Range: IP

7. **RL** – Repeat Later

   The requested command cannot be executed due to unavailable system resources. The command may be entered again later.

   Type: value set.

   Range: RL.

8. **COMPLD** – Completion Code

   This parameter indicates that the command has been completed.

COMPLD for successful command execution For a command that is decomposed into a set of atomic commands a COMPLD completion code means that the command was successful for all atomic commands (e.g. AID ranges, group alias).

COMPLD for no changes If a parameter has a current value, and a provisioning command attempts to reprovision the parameter with a value that is the same as its current value, the command will return a COMPLD completion code.

Type: value set.

Range: COMPLD.

### Detailed behavior description

The **RTRV-HDR** command returns a normal completion response with *sid*, *date* and *time* output parameter as described above.

### Example input/output

```
RTRV-HDR:LT-UNITE::123456;
IP 123456
<
   LT-UNITE 00-11-03 08:00:00
M  123456 COMPLD
;
```

### Error responses

The following error conditions are not unique to the **RTRV-HDR** command but may apply to any TL1 command. Other commands will use the defined command specific error codes with additional error texts.

If there is a specific error behavior defined for another command, e.g. other error code or the suppression of error responses in some cases, then the specific error behavior, which is defined together with the command, shall overrule the generic behavior defined in this chapter.

There is no implied priority order of error checking suggested by this list of error responses.

In general the *sid* value in the error responses is that of the addressed NE. This is true even if a TL1-GNE sends an error message on behalf of an RNE. Some exceptions are noted for some error codes below (e.g. IITA). If the TL1-GNE forwards a command to a remote NE and a communication failure occurs before the remote NE is able to respond, it is understood that no response may be returned.

When an error response is returned, there may not be an in-progress (IP) acknowledgment in the response.

Note, that validation rules for the generic error conditions described below are not repeated for each specific command in the Error response section.

### General format

The general output format is shown below, where <error code> is a 4-character code and <error text> is a text string.

```
<cr><lf><lf>
   sid date time<cr><lf>
M  ctag^DENY<cr><lf>
   <error code><cr><lf>
   /*<error text[, additional command specific error text]>*/<cr><lf>
;
```

### Validation rule: Input failure (ICNV)

If there was an input failure because the command cannot be processed, the following error response is returned:

Error code: `ICNV – Input, Command Not Valid`

```
   sid date time
M  ctag DENY
   ICNV
   /* Input, Command Not Valid */
;
```

### Validation rule: Input failure for omitted TID

If a *tid* value is required but no *tid* value is included, the following error response is returned, using the *sid* of the system that detected the error:

Error code: `ICNV – Input, Command Not Valid, missing TID`

```
   sid date time<cr><lf>
M  ctag DENY
   ICNV
   /*Input, Command Not Valid, missing TID*/
;
```

### Validation rule: Command not recognized (SCNF)

If the command is not recognized or command parameters are not valid, the following error response is returned:

Error code:
`SCNF – Status, Command Not Found, command not recognized or command parameters not valid`

```
   sid date time
M  ctag DENY
   SCNF
   /* Status, Command Not Found, command not recognized
or command parameters not valid */
```

```
;
```

**Validation rule: Syntax or Punctuation Error (IISP)**

If the command cannot be parsed due to a syntax or punctuation error, the following error response is returned. If the command cannot be parsed for at least 3 colons, and no more than the maximum number of colons allowed before the TL1 end-of-message semicolon, the following error response is returned:

Error code: `IISP - Input, Invalid Syntax or Punctuation`

```
   sid date time
M  ctag DENY
   IISP
   /* Input, Invalid Syntax or Punctuation */
;
```

**Validation rule: Command too long**

If the command is longer than 4096 characters, the following error response is returned:

Error code:
`IISP - Input, Invalid Syntax or Punctuation, command too long`

**Validation rule: Parameter Input Failure (INUP)**

If there is an input failure due to the parameter types, the following error response is returned:

Error code: `INUP - Input, Non-null Unimplemented Parameter`

```
   sid date time<cr><lf>
M  ctag DENY
   INUP
   /* Input, Non-null Unimplemented Parameter */
;
```

**Validation rule: Parameter Missing (IPMS)**

If an input parameter value is missing, the following error response is returned.

Error code:
`IPMS - Input, Parameter MiSsing,<parameter_name> is missing`

```
   sid date time
M  ctag DENY
   IPMS
   /* Input, Parameter MiSsing */
;
```

**Validation rule: Any Input Parameter not valid (IDNV)**

If any one or more of the input parameter values are not valid, the following error response is returned:

Error code: `IDNV - Input, Data Not Valid`

```
   sid date time
M  ctag DENY
   IDNV
   /* Input, Data Not Valid */
;
```

**Validation rule: Input Parameter not valid (IDNV)**

If an input parameter value is not valid, the following error response is returned. This is the preferred error response.

Error code: `IDNV - Input, Data Not Valid, invalid <parameter_name>`

```
   sid date time<cr><lf>
M  ctag DENY
   IDNV
   /* Input, Data Not Valid, invalid <parameter name> */
;
```

**Validation rule: Invalid Entity (IENE)**

If there is an input failure due to an invalid entity, the following error response is returned:

Error code: `IENE - Input, Entity Not Exists`

```
   sid date time
M  ctag DENY
   IENE
   /* Input, Entity Not Exists  */
;
```

**Validation rule: Invalid Command Qualifier (IPNC)**

If there is an input failure due to an invalid command qualifier, the following error response is returned:

Error code. `IPNC - Input, Parameter Not Consistent`

```
   sid date time
M  ctag DENY
   IPNC
   /* Input, Parameter Not Consistent */
;
```

**Validation rule: Invalid Instance (SDNC)**

If there is an input failure due to an invalid instance of an entity, the following error response is returned:

Error code:
`SDNC – Status, Data Not Consistent, invalid instance of entity`

```
   sid date time
M  ctag DENY
   SDNC
   /* Status, Data Not Consistent,invalid instance of entity */
;
```

**Validation rule: Incorrect TID (IITA)**

If the command has a syntactically incorrect *tid*, the following error response is returned, using the *sid* of the system that detected the error:

Error code:
`IITA – Input, Invalid TArget identifier, incorrect syntax`

```
   sid date time
M  ctag DENY
   IITA
   /* Input, Invalid TArget identifier,incorrect syntax */
;
```

**Validation rule: Unknown TID (IITA)**

If a command contains an unknown tid value (a *tid* value that does not exist in the network), the following error response is returned, using the *sid* of the system that detected the error:

Error code: `IITA – Input, Invalid TID, Unknown TID`

```
   sid date time
M  ctag DENY
   IITA
   /* Input, Invalid TID, Unknown TID */
;
```

**Validation rule: Not reachable TID (IITA)**

If a command has a valid *tid* value but the addressed remote NE is temporarily unable to communicate with the TL1-GNE, the following error response is returned, using the *sid* of the addressed system:

Error code: `IITA – Input, Invalid TID, Communications Failure`

```
   sid date time
M  ctag DENY
   IITA
   /* Input, Invalid TID,Communications Failure */
```

```
;
```

**Validation rule: Too much AID parameters (ICNV)**

If the command line has more aid parameters in the *aid* block than are allowed for that command, the following error response is returned:

Error code: `ICNV - Input, Command Not Valid, extra AID`

```
   sid date time
M  ctag DENY
   ICNV
   /* Input, Command Not Valid, extra AID */
;
```

**Validation rule: Missing AID (ICNV)**

If the command line has fewer aid parameters in the *aid* block than are required for the command, the following error response is returned:

Error code: `ICNV - Input, Command Not Valid, required AID missing`

```
   sid date time
M  ctag DENY
   ICNV
   /* Input, Command Not Valid, required AID missing */
;
```

**Validation rule: Incorrect AID Syntax (IIAC)**

For commands that have aid input parameters in the *aid* block, if the aid is syntactically incorrect, the following error response is returned:

Error code:
`IIAC - Input, Invalid ACcess identifier, incorrect syntax`

```
   sid date time
M  ctag DENY
   IIAC
   /* Input, Invalid ACcess identifier, incorrect syntax */
;
```

**Validation rule: Unknown AID (IIAC)**

For commands that have aid input parameters in the *aid* block, if the aid is valid syntactically but has an unknown value, the following error response is returned:

Error code: `IIAC - Input, Invalid ACcess identifier, unknown AID`

```
   sid date time
M  ctag DENY
   IIAC
   /* Input, Invalid ACcess identifier, unknown AID */
```

```
;
```

**Validation rule: Missing CTAG (ICNV)**

If the *ctag* value is missing, the following error response is returned. Note that the *ctag* value is 0 in the error response:

Error code: `ICNV - Input, Command Not Valid,missing CTAG`

```
   sid date time
M  0 DENY
   ICNV
   /* Input, Command Not Valid,missing CTAG */
;
```

**Validation rule: Invalid CTAG (IICT)**

If the *ctag* value is non-NULL but invalid, the following error response is returned. Note that the same invalid *ctag* value is used for the *ctag* field in the error response:

Error code:
`IICT - Input, Invalid Correlation Tag (CTAG), incorrect syntax`

```
   sid date time
M  ctag DENY
   IICT
   /* Input, Invalid Correlation Tag (CTAG), incorrect syntax */
;
```

**Validation rule: Input Parameter Range Incorrect (IDRG)**

If an input parameter accepts a range but the given range is incorrect, the following error response is returned:

Error code: `IDRG - Input, Data Range Error`

```
   sid date time
M  ctag DENY
   IDRG
   /* Input, Data, Range Error */
;
```

**Validation rule: Invalid File or Directory Name (SDNC)**

If the command failed due to an invalid file or directory name, the following error response is returned:

Error code:
`SDNC - Status, Data Not Consistent, invalid file or directory`

```
   sid date time
M  ctag DENY
   SDNC
   /* Status, Data Not Consistent, invalid file or directory */
```

```
;
```

**Validation rule: Invalid Input Parameter Value Combination (IDNC)**

If a command has more than one input parameter, but the combination of values is not valid, the following error response is returned:

Error code `IDNC - Input, Data Not Consistent`

```
   sid date time
M  ctag DENY
   IDNC
   /* Input, Data Not Consistent */
;
```

**Validation rule: Missing Equipage (ENEQ)**

If the command failed due to equipage that is missing, the following error response is returned:

Error code: `ENEQ - Equipage, Not EQuipped`

```
   sid date time
M  ctag DENY
   ENEQ
   /* Equipage, Not EQuipped */
;
```

**Validation rule: Insufficient File Space (ENEQ)**

If the command failed due to insufficient file space, the following error response is returned:

Error code: `ENEQ - Equipage, Not EQuipped, insufficient file space`

```
   sid date time
M  ctag DENY
   ENEQ
   /* Equipage, Not EQuipped, insufficient file space */
;
```

**Validation rule: Incorrect Equipage (EATN)**

If the command failed due to incorrect equipage, the following error response is returned:

Error code:
`EATN - Equipage, not valid for Access Type, incorrect equipage`

```
   sid date time
M  ctag DENY
   EATN
   /* Equipage, not valid for Access Type, incorrect equipage */
;
```

**Validation rule: TID Mismatch in retrieved File (EATN)**

If the command failed due to a TID mismatch in a retrieved file, the following error response is returned:

Error code:
`EATN – Equipage, Not Valid for Access Type, retrieved file TID mismatch`

```
   sid date time
M  ctag DENY
   EATN
   /* Equipage, Not Valid for Access Type, retrieved file TID mismatch    */
;
```

**Validation rule: Product Mismatch (SRAC)**

If the command failed due to a product mismatch in the retrieved file, the following error response is returned:

Error code:
`SRAC – Status, Requested Access Configuration is invalid, retrieved file NE mismatch`

```
   sid date time
M  ctag DENY
   SRAC
   /* Status, Requested Access Configuration is invalid, retrieved    file NE
      mismatch */
;
```

**Validation rule: Failed Target Hardware (SSTP)**

If the command failed due to failed target hardware, the following error response is returned:

Error code: `SSTP – Status, Stopped, failed target hardware`

```
   sid date time
M  ctag DENY
   SSTP
   /* Status, Stopped, failed target hardware */
;
```

**Validation rule: Command denied based on Mode, State or Status (SNVS)**

If the command is denied based on mode, state, or status, the following error response is returned:

Error code: `SNVS – Status, Not in Valid State`

```
   sid date time
M  ctag DENY
   SNVS
```

```
   /* Status, Not in Valid State */
;
```

**Validation rule: Command denied based on Maintenance Condition (SNVS)**

If the command is denied based on the maintenance condition, the following error response is returned:

Error code:
`SNVS - Status, Not in Valid State, not in Maintenance Condition`

```
   sid date time
M  ctag DENY
   SNVS
   /* Status, Not in Valid State, not in Maintenance Condition */
;
```

**Validation rule: Entity already exists (IEAE)**

If an entity already exists, the following error response is returned:

Error code: `IEAE - Input, Entity Already Exists`

```
   sid date time
M  ctag DENY
   IEAE
   /* Input, Entity Already Exists */
;
```

**Validation rule: Session is not initiated (PLNA)**

If a user issues a command before a session is initiated with ACT-USER, the following error response is returned:

Error code: `PLNA - Privilege, Login Not Active`

```
   sid date time
M  ctag DENY
   PLNA
   /* Privilege, Login Not Active */
;
```

**Validation rule: Command requires higher privilege (PICC)**

If a command requires a privilege higher than that of the user issuing the command, or for any other security-related problems, the following error response is returned:

Error code: `PICC - Privilege, Illegal Command Code`

```
   sid date time
M  ctag DENY
   PICC
   /* Privilege, Illegal Command Code */
```

```
;
```

**Validation rule: System Initializing not completed (SNVS)**

If a command is not allowed because the system has not completed initializing, the following error response is returned:

Error code: `SNVS - Status, Not in Valid State, system initializing`

```
   sid date time
M  ctag DENY
   SNVS
   /* Status, Not in Valid State, system initializing */
;
```

**Validation rule: System Limit exceeded (SARB)**

If the system is experiencing temporary exhaustion of allocated resources, the following error response is returned:

Error code: `SARB - Status, All Resources Busy, system limit exceeded`

```
   sid date time
M  ctag DENY
   SARB
   /* Status, All Resources Busy, system limit exceeded */
;
```

**Validation rule: System Busy with SW Generic Installation (SARB)**

If the command cannot be executed because the system is prepared for a SW Generic installation with fall-back option, the following error response is returned:

Error code: `SARB - Status, All Resources Busy`

```
   sid date time
M  ctag DENY
   SARB
   /* Status, All Resources Busy */
;
```

**Validation rule: Internal Limit exceeded (SSRE)**

If a command attempts to exceed an internal limit, the following error response is returned:

Error code:
`SSRE - Status, System Resources Exceeded, allowed limit exceeded`

```
   sid date time
M  ctag DENY
   SSRE
   /* Status, System Resources Exceeded, allowed limit exceeded */
```

```
;
```

**Validation rule: Operation Failed (SROF)**

If the command cannot be completed due to system difficulties other than hardware or equipment, the following error response is returned:

Error code: `SROF – Status, Requested Operation Failed`

```
   sid date time
M  ctag DENY
   SROF
   /* Status, Requested Operation Failed */
;
```

**Validation rule: Processing Failed (SROF)**

If the command cannot be completed due to internal system processing problems, the following error response is returned:

Error code:
`SROF – Status, Requested Operation Failed, processing failure`

```
   sid date time
M  ctag DENY
   SROF
   /* Status, Requested Operation Failed, processing failure */
;
```

**Validation rule: Hardware Failed (SWFA)**

If the command failed because the control hardware is failed, missing, or initializing, the following error response is returned:

Error code:
`SWFA – Status, Working unit Failed, control hardware failed, missing or initializing`

```
   sid date time
M  ctag DENY
   SWFA
   /* Status, Working unit Failed, control hardware failed, missing or
   initializing */
;
```

**Validation rule: Communication Failure (SROF)**

If the command failed due to an external communications failure, the following error response is returned:

Error code:
`SROF – Status, Requested Operation Failed, external communications failure`

```
   sid date time
M  ctag DENY
   SROF
   /* Status, Requested Operation Failed, external communications
   failure */
;
```

**Validation rule: Generic not available (ENSG)**

If the command failed because the generic is not available, the following error response is returned:

Error code:
`ENSG – Equipage, Not Software Generic, generic not available`

```
   sid date time
M  ctag DENY
   ENSG
   /* Equipage, Not Software Generic, generic not available */
;
```

**Validation rule: Command Aborted (SABT)**

If a user or outside agent has aborted the command, the following error response is returned:

Error code: `SABT – Status, Aborted`

```
   sid date time
M  ctag DENY
   SABT
   /* Status, Aborted */
;
```

**Partial successful completion of a set of atomic commands**

For provisioning commands (non-RTRV commands) that operate on a range of entities (e.g. AID range, or via an group alias) range as input, if the command succeeded on only a non-empty subset of the AIDs or another set of atomic commands, the following error response is returned for the AIDs or atomic commands that were not completed successfully. Note that the completion code is PRTL, not DENY.

```
   sid date time
M  ctag PRTL
   "aid"
   <error code>
   /* <error text> */
   "aid"
   <error code>
   /* <error text> */
   ...
   "aid"
```

```
   <error code>
   /* <error text> */
;
```

The error codes and error text fields are as defined in the other error responses above. If the command failed on all the AIDs, the completion code will be DENY, and there will only be a single error code and error text in the response.

#### Partial completion on RTRV commands

For RTRV commands that take an AID range as input, if the command fails on a non-empty subset of the AIDs, and the failure is not related to filtering, the entire command will fail and one error response is returned. If the error is related to filtering, the command completes successfully but only the data that matches is returned.

If there is no data matching the filter criteria, the NE just responds with an empty reply.

For example, RTRV-OC48 with an **all** AID range for all the ports on a shelf will return the data for the existing OP2G5 circuit packs. RTRV-OC48 with a single AID of a non-OC48 port will fail.

If during the processing of a RTRV command which reports output responses for a number of AIDs an internal error occurs while the system has already started to send response data, the system does not terminate the output response with the ";" character.

This behavior will lead to a time-out of the manager and cause him to abort the command.

### Related TL1 messages

All other TL1 commands refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for common requirements.

### Additional notes

#### Compliance of output parameter blocks with GR-833

For commands that have output parameter blocks, like the following one. The block may have optional trailing commas on a line.

```
   sid date time
M  ctag COMPLD
   "aid:<parameter block>"
   ...
;
```

#### AID grouping of output lines

For commands where the output has the AID prepended to each line, like this:

```
   sid date time
M  ctag COMPLD
   "aid:block"
```

```
   ...
;
```

If the parameters for the same AID value are on separate lines, those lines are grouped together.

**spec_blocks continued on another line**

For commands that have spec_blocks in the output, like this:

```
   sid date time
M  ctag COMPLD
   "aid:spec_block"
   ...
;
```

If the output line becomes too long, the keywords may be continued on another line, but the AID is repeated on the continuation line. In addition, the output lines are not limited to 80 characters, and there are no requirements as to how many parameters appear on a line.

Refer to the following example

```
RTRV-EQPT:UNITE-NE:system:123456;

   UNITE-NE 00-11-03 08:00:00
M  123456 COMPLD
   "system:systype=LXC40"
   "system:istddflt=SDH"
   "system:trbmddflt=FIXED"
   "system:synccrtc=SDH"
;
```

# RTRV-IP-MAP: Retrieve TCP/IP map

The **RTRV-IP-MAP** command retrieves the entries from the IP map.

The *tl1tcpipgw* parameter in the **RTRV-NE** command indicates whether or not the mapping feature is enabled.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-IP-MAP**:tid*::ctag;*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for input parameter syntax and description of this parameter.

## Output format

If the RTRV-IP-MAP request is successful, the following normal completion message is returned:

```
   sid date time
M  ctag COMPLD
   "system::spec_block"
   ...
   "system::spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of the "RTRV-HDR: Retrieve header" (p. 3-2397) command.

## Output parameters

1. **system** – system AID
   This parameter shall denote the system AID of the NE.

Type: AID

Range: system (default).

2. **ip** – IP Address

   This parameter is used to set or retrieve the IP address(es) of the manager(s) of the NE.

   Type: IPv4 address: four dot separated numeric strings.

   Values: IPv4 address: Each numeric string: 0 .. 255. Number of entries: Mmaximum of 20 entries allowed.

   Default: null.

3. **acid** – Application Context ID

   This parameter is used to set or retrieve the application context ID to be assigned to a particular manager IP address.

   Type: Alphanumeric string of length 0 .. 23.

   Range: TL1MAINTENANCE, TL1MEMORYADMINISTRATION, TL1TEST, TL1OTHER1, TL1PEERCOMM.

   Default: TL1PEERCOMM.

   Although acid is a mandatory parameter it will not be evaluated in the NE. The parameter is present for backward compatibility.

### Detailed behavior description

The command shall retrieve the spec_block parameters as described in the Output parameter section.

Sorting: If several managers are entered, the system shall respond with one line per *ip* parameter and sort the output according the *ip* parameter.

### Example input/output

The following example shows the result of a RTRV-IP-MAP command with one manager entered:

```
RTRV-IP-MAP:LT-UNITE::123456;
   LT-UNITE 00-11-01 08:00:00
M  123456 COMPLD
      "system::ip=198.78.46.8,acid=TL1MAINTENANCE"
      "system::ip=198.78.46.13,acid=TL1TEST"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-NE-IP-MAP** command.

**Related TL1 Messages**

- "DLT-IP-MAP: Delete TCP/IP map" (p. 3-195)
- "ENT-IP-MAP: Enter TCP/IP map" (p. 3-1580)

# RTRV-L1ADR: Retrieve level 1 Address Data Repository

The command **RTRV-L1ADR** requests information of the level 1 topology data repository, which contains information about available TNAs of a connected multi-domain network. The level 1 topology data repository is only available on ONNS nodes defined as level 1 routing controllers.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: NA

Abortable: No.

## Input format

Command syntax: **RTRV-L1ADR**:*srcTid:srcAid:ctag::dataType[,componentID];*

## Description

The command **RTRV-L1ADR** retrieves information stored in the ONNS data repository of level 1 routing controllers that is in RAM Memory. The command **RTRV-L1ADR** operates on the current, active-memory-resident, ONNS data. The NVM data from NNDM is used during initialization to recover the ONNS local data repository. Data from other level 1 routing controllers is acquired by the flooding and exchange of LSAs.

### Retrieving ALL level 1 address data repository records

When the *dataType* = ALL, Network Navigator shall respond to a request to retrieve its level 1 address data repository by sending a complete report of the contents of the data repository specified. The request shall cause the ONNS node with level 1 routing controller functionality to send all information in the specified data repository.

### Retrieving level 1 address data repository records for any routing controller ID

The command **RTRV-L1ADR** with *dataType* = LSAID and *componentID* = L1RCID shall retrieve the L1ADR LSA records of the adjacent routing controllers of neighbor domains related to the specified routing controller with the L1RCID. This L1RCID can be the address of any domain of the connected multi-domain network.

### Notification is not generated

The command **RTRV-L1ADR** shall not generate any kind of notification.

## Input parameters

### Command parameters

1. **srcTid**

Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same unique *tid* used by Host NE.

See also the definition of *tid* in "RTRV-HDR: Retrieve header" (p. 3-2397).

Type: identifier, in addition the special character underscore "_" and the password characters are allowed.

Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.

2. **srcAid**

   Source node ONNS application access identifier of the ONNS controller OS command interface port.

   Type: AID

   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn (default).

3. **ctag**

   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.

   See also the definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2397).

   Type: Alphanumeric string

   Range: The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ".").

   It should be a unique value for each new command.

4. **dataType**

   This parameter specifies, which part of the data repository is to be retrieved. Furthermore it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.

   Type: Alphanumeric value set.

   Range:

   - *ALL*: retrieves the entire (L1TDR) level 1 Topology data repository in RAM
   - *LSAID*: retrieves the LSA in level 1 topology data repository related to the routing controller ID, *componentID* must be a L1RCID

5. **componentID**

   *componentID* depends on the previous *dataType* parameter and is one of:

   - not represented when *datatype* = ALL
   - *L1RCID*: when *datatype* = LSAID

     Description: *routeControlID* defines the identity of the level 1 routing controller

     Type: Four dot separated numeric string

     Range: 0 … 255, for each numeric string

## Output format

### The level 1 Topology data repository (L1ADR) record structure

The complete L1ADR of one routing controller consists of LSARecords for all known routing controllers (including the reporting routing controller itself) in the multi-domain topology. Within a LSARecord all (direct) neighbor domain releationships are kept in TNARecords (one record for each neighbor domain relation).

### Level 1 address data repository (L1ADR) without data

An addressed node without data in the L1ADR shall response only the HeaderRecord with *NumberOfLSAs* = 0. The level 1 address data repository record is composed of an *L1ADRHeaderRecord* and multiple *LSARecords* which are described below:

**L1ADRRecord** ::=

<L1ADRHeaderRecord>

<LSARecord_1>

…

<LSARecord_n>

**L1ADRHeaderRecord** ::=

*"l1tdrID,dataType[=componentID],srcNodeASTNNodeID*, NumberOfLSAs=*LSA_Count"*

**LSARecord** ::=

<LSAHeaderRecord>

<TNARecord_1>

…

<TNARecord_n>

**LSAHeaderRecord** ::=

"LSAAdvertisedRouter=*L1RcID*,TNACount=*TNAcount"*

**TNARecord** ::=

LocAdvNodeID=*locAdvNodeID*,NumberTNAs=*numberTNAs"*

*"TNAtype_1=TNAaddress_1[,TNAtype_2=TNAaddress_2]"*

*"TNAtype_3=TNAaddress_3[,TNAtype_3=TNAaddress_3]"*

…

*"TNAtype_n-1=TNAaddress_n-1[,TNAtype_n=TNAaddress_n]"*

### Output format with normal data retrieve completion report for dataType=ALL

If the RTRV-L1ADR request completes successfully, then the following normal completion response is returned:

```
   srcTid date time
M  ctag RTRV
   "L1ADR_HeaderRecord"
   "LSAHeaderRecord_1"
     "TNARecord_1_1"
   ...
   "LSAHeaderRecord_n"
     "TNARecord_n_1"
     "TNARecord_n_2"
>
   srcTid date time
M  ctag COMPLD
   "LSAHeaderRecord_n+1"
     "TNARecord_n+1_1"
   ...
   "LSAAddr_HeaderRecord_m"
     "TNARecord_m_1"
     "TNARecord_m_2"
;
```

## Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completion code* and their syntax are included in the OUTPUT PARAMETERS section of the **RTRV-PATH** command.

### L1ADRHeader_Record

1. **l1adrID**

   NN Data Repository dataID to be returned
   Type: Alphanumeric value set.
   Range: L1ADRLevel 1 Address Data Repository in RAM
   Default: L1ADR

2. **dataType**

   This parameter specifies, which part of the data repository is to be retrieved. Furthermore it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.
   Type: Alphanumeric value set.
   Range: ALL retrieves the entire (L1ADR) level 1 Topology data repository in RAM. LSAID retrieves the LSA in level 1 topology data repository related to the routing controller ID, *componentID* must be a L1RCID.

3. **componentID**

   *componentID* depends on the previous *dataType* parameter and is one of:

   - not represented when *datatype* = ALL
   - *L1RCID*: when *datatype* = LSAID

Description: *routeControlID* defines the identity of the level 1 routing controller
Type: Four dot separated numeric string
Range: 0 … 255, for each numeric string
Note: If *dataType* = ALL, *componentID* and the "=" sign are not reported.

4. **srcNodeASTNNodeID** – Reporting Node ID
   ASTN node ID of the ONNS node replying to this command.
   Type: Four dot separated numeric strings
   Range: for each numeric string: 0 … 255

**LSARecord**

For each reported primary routing controller of the level 1 topology one LSARecord is reported.

1. **LSAHeaderRecord**
   All parameters in the LSAHeaderRecord describe properties of the *LSAAdvertisedRouter*.
   **L1RcID** – ID of Advertising Routing Controller
   Description: *routeControlID* defines the identity of the level 1 routing controller
   Type: four dot separated numeric string
   Range: 0 … 255, for each numeric string
2. **TNARecord**
   **localAdvNodeID** – Local Advertised Node ID
   The *localAdvNodeID* of the advertiser of the LSA with the address data following in this TNARecord.
   Type: four dot separated numeric string
   Range: 0 … 255, for each numeric string
   **numberTNAs**
   Number of reported TNAs known in the advertising level 1 node.
   Type: Integer
   Range: ≥0
   **TNAType**
   *TNAType* specifies the address type of the TNA address.
   Type: Alphanumeric value set.
   Range:
   - IPV4TNAADDR (default): TNA address is a IPv4 address
   - IPV6TNAADDR: TNA address is a IPv6 address
   - NSAPTNAADDR: TNA address is a NSAP address

   **TNA address**
   TNAAddress depends on the previous *TNAtype* parameter and is one of:
   - IPv4TNAAddress (when TNAtype=IPV4TNAADDR)
   - IPv6TNAAddress (when TNAtype=IPV6TNAADDR)
   - NSAPTNAAddress (when TNAtype=NSAPTNAADDR)

**IPv4TNAAddress**
Identifier of a TNA address in IPv4 format.
Type: four dot separated numeric string
Range: 0 … 255, for each numeric string
**IPv6TNAAddress**
Identifier of a TNA address in IPv6 format.
Type: Eight hyphen separated hexadecimal numbers
Range: for each hexadecimal number: 0..FFFF
**NSAPTNAAddress**
Identifier of a TNA address in NSAP format.
Type: Alphanumeric value set (20 byte)
Range: up to 20 alphanumeric strings with hexadecimal values 00..FF

## Example input/output

The **RTRV-L1ADR** command with *dataType* = ALL produces this example output result:

```
RTRV-L1ADR:LT-ONNS-61::123456::ALL;

LT-ONNS-61 2006-10-04 09:45:35
M  123456 RTRV
"L1ADR,ALL,135.13.44.61,"
"LSAAdvertisedRouter=218.3.45.56,"
"LocAdvNodeID=128.32.14.32,"
"IPV4TNAADDR=135.13.3.119,IPV6TNAADDR=
3ED-2FC2-3-F365-F290-119-45-A360"
    "LSAAdvertisedRouter=139.38.28.84,"
"LocAdvNodeID=148.43.56.95,"
"NSAPTNAADDR=13F323EFCA45DABC34698723FEAC45CF289364ED"
>
LT-ONNS-61 2006-10-04 09:45:35

M  123456 COMPLD
    "LSAAdvertisedRouter=129.34.93.2,"
"LocAdvNodeNodeID=118.23.59.15,"
"IPV4TNAADDR=176.113.5.119,IPV4TNAADDR=135.16.3.120,IPV6TNAADDR=
1ED-2FC2-3-F365-E290-119-45-A321"
;
```

## Error responses

### No Routing Controller available

The command is rejected when no routing controller is available on the addressed NE.

Error code: `IDNV - Input, Data Not Valid, RC node not created`

### Invalid *componentID* parameter

The command is rejected when the received *componentID* is invalid.

Error code: `IRCI - Input, Invalid Routing Controller ID`

# RTRV-L1TDR: Retrieve level 1 topology data repository

The command **RTRV-L1TDR** requests information of the level 1 topology data repository, which contains information about abstract nodes, abstract links of a connected multi-domain network. The level 1 topology data repository is only available on ONNS nodes defined as level 1 routing controllers.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: NA

Abortable: No.

## Input format

Command syntax: **RTRV-L1TDR**:*srcTid:srcAid:ctag::dataType[,componentID];*

## Description

The command **RTRV-L1TDR** retrieves information stored in the ONNS data repository of level 1 routing controllers that is in RAM Memory. The command **RTRV-L1TDR** operates on the current, active-memory-resident, ONNS data. The NVM data from NNDM is used during initialization to recover the ONNS local data repository. Data from other level 1 routing controllers is acquired by the flooding and exchange of LSAs.

### Retrieving ALL level 1 topology data repository records

When the *dataType* = ALL, Network Navigator shall respond to a request to retrieve its level 1 topology data repository by sending a complete report of the contents of the data repository specified. The request shall cause the ONNS node with level 1 routing controller functionality to send all information in the specified data repository.

### Retrieving level 1 topology data repository records for any routing controller ID

The command **RTRV-L1TDR** with *dataType* = LSAID and *componentID* = L1RCID shall retrieve the L1TDR LSA records that relate to all of the links from the specified routing controller with the L1RCID to adjacent routing controllers of neighbor domains. This RCID can be the address of any domain of the connected multi-domain network.

### Notification is not generated

The command **RTRV-L1TDR** shall not generate any kind of notification.

## Input parameters

### Command parameters

1. **srcTid**

Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same unique *tid* used by Host NE.

See also the definition of *tid* in "RTRV-HDR: Retrieve header" (p. 3-2397).

Type: identifier, in addition the special character underscore "_" and the password characters are allowed.

Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.

2. **srcAid**

   Source node ONNS application access identifier of the ONNS controller OS command interface port.

   Type: AID

   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn (default).

3. **ctag**

   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.

   See also the definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2397).

   Type: Alphanumeric string

   Range: The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ".").

   It should be a unique value for each new command.

4. **dataType**

   This parameter specifies, which part of the data repository is to be retrieved. Furthermore it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.

   Type: Alphanumeric value set.

   Range:

   - *ALL*: retrieves the entire (L1TDR) level 1 Topology data repository in RAM
   - *LSAID*: retrieves the LSA in level 1 topology data repository related to the routing controller ID, *componentID* must be a L1RCID

5. **componentID**

   *componentID* depends on the previous *dataType* parameter and is one of:

   - not represented when *datatype* = ALL
   - *L1RCID*: when *datatype* = LSAID

     Description: *routeControlID* defines the identity of the level 1 routing controller

     Type: Four dot separated numeric string

     Range: 0 … 255, for each numeric string

## Output format

### The level 1 Topology data repository (L1TDR) record structure

The complete L1TDR of one routing controller consists of LSARecords for all known routing controllers (including the reporting routing controller itself) in the multi-domain topology. Within a LSARecord all (direct) neighbor domain releationships are kept in LinkRecords (one record for each neighbor domain relation).

### Level 1 Topology data repository (L1TDR) without data

An addressed node without data in the L1TDR shall response only the HeaderRecord with *NumberOfLSAs* = 0. The level 1 topology data repository record is composed of an *L1TDRHeaderRecord* and multiple *LSARecords* which are described below:

**L1TDRRecord** ::=

<L1TDRHeaderRecord>

<LSARecord_1>

…

<LSARecord_n>

**L1TDRHeaderRecord** ::=

*"l1tdrID,dataType[=componentID],srcNodeASTNNodeID*, NumberOfLSAs=*LSA_Count"*

**LSARecord** ::=

<LSAHeaderRecord>

<LSARecord_1>

…

<LSARecord_n>

**LSAHeaderRecord** ::=

"LSAAdvertisedRouter=*L1RcID*,LinkCount=*linkCount"*

**LinkRecord** ::=

"LocNodeID=*locNodeID*,RemoteNodeID=*remoteNodeID*,

LocLinkID=*locLinkID*,RemoteLinkId=*remoteLinkID*,

LinkType=*linkType*,LinkID=*linkID*,LinkMetric=*adminCost*,

SRLG=*srlgList*,LinkResourceClass=*linkReCls*,

LinkProtType=*linkProtType*,SwitchCapDesc=*bandwidthList"*

### Output format with normal data retrieve completion report for dataType=ALL

If the RTRV-L1TDR request completes successfully, then the following normal completion response is returned:

```
   srcTid date time
M  ctag RTRV
   "L1TDR_HeaderRecord"
   "LSAHeaderRecord_1"
     "LinkRecord_1_1"
     "LinkRecord_1_2"
   ...
   "LSAHeaderRecord_n"
     "LinkRecord_n_1"
     "LinkRecord_n_2"
     "LinkRecord_n_3"
>
   srcTid date time
M  ctag COMPLD
   "LSAHeaderRecord_n+1"
     "LinkRecord_n+1_1"
     "LinkRecord_n+1_2"
     "LinkRecord_n+1_3"
     "LinkRecord_n+1_4"
   ...
   "LSAAddr_HeaderRecord_m"
     "LinkRecord_m_1"
;
```

## Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completion code* and their syntax are included in the OUTPUT PARAMETERS section of the **RTRV-PATH** command.

### L1TDRHeader_Record

1. **l1tdrID**

   NN Data Repository dataID to be returned

   Type: Alphanumeric value set.

   Range: L1TDRLevel 1 Topology data repository in RAM

   Default: L1TDR

2. **dataType**

   This parameter specifies, which part of the data repository is to be retrieved. Furthermore it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.

   Type: Alphanumeric value set.

   Range: ALL retrieves the entire (L1TDR) level 1 Topology data repository in RAM. LSAID retrieves the LSA in level 1 topology data repository related to the routing controller ID, *componentID* must be a L1RCID.

3. **componentID**

*componentID* depends on the previous *dataType* parameter and is one of:

- not represented when *datatype* = ALL
- *L1RCID*: when *datatype* = LSAID
  Description: *routeControlID* defines the identity of the level 1 routing controller
  Type: Four dot separated numeric string
  Range: 0 … 255, for each numeric string
  Note: If *dataType* = ALL, *componentID* and the "=" sign are not reported.

4. **srcNodeASTNNodeID** – Reporting Node ID
   ASTN node ID of the ONNS node replying to this command.
   Type: Four dot separated numeric strings
   Range: for each numeric string: 0 … 255

**LSARecord**

For each reported primary routing controller of the level 1 topology one LSARecord is reported.

1. **LSAHeaderRecord**
   All parameters in the LSAHeaderRecord describe properties of the *LSAAdvertisedRouter*.
   **L1RcID** – ID of Advertising Routing Controller
   *routeControlID* defines the identity of the level 1 routing controller
   Type: four dot separated numeric string
   Range: 0 … 255, for each numeric string
2. **LinkRecord**
   **locNodeID**
   The *locNodeID* is the representation of a physical node of the local domain for the level 1 routing.
   Type: four dot separated numeric string
   Range: 0 … 255, for each numeric string
   **remoteNodeID**
   The *remoteNodeID* is the representation of a physical node of a neighbor domain for the level 1 routing.
   Type: four dot separated numeric string
   Range: 0 … 255, for each numeric string
   **locLinkID**
   The *locLinkID* specifies from the local domain's point-of-view the identification for the link the corresponding port is assigned to.
   Type: Numeric string.
   Range: 0..42946967295
   **remoteLinkID**
   The *remoteLinkID* specifies from the neighbor domain's point-of-view the identification for the link the corresponding port is assigned to.
   Type: Numeric string.

Range: 0..42946967295

**linkType**

The *linkType* defines the type of the link.

Type: Alphanumeric value set.

Range: PtP (point to point)

**linkID**

The *linkID* identifies the level 1 Routing Controller at the other end of the link.

Type: four dot separated numeric string

Range: 0 … 255, for each numeric string

**adminCost** – Administrative Cost

Provisioned administrative cost of the port connection when used in a connection path. See also parameter *adminCost* in RTRV-rr.

Type: Integer

Range: 1 (default) … 65535

Administrative cost parameter is not applicable for EDGE and UNI ports and is set to the default value.

**srlgList**

Shared Risk Link Group Identifier list.

See also parameter *srlgList* in RTRV-rr.

The max. number of identities that can be provisioned per port may be release dependent.

Type: Up to ten &-separated Integers

Examples:

198&233&0&0&0&0&0&0&0&0

10&20&30&40&0&0&0&0&=&0&0

89&1000&4&10&20&31&111&231&300&777

Range: 0 … 65535

Default. 0 (means no SRLG provisioned)

SRLG list is not applicable for EDGE and UNI ports and is set to the default value.

**linkResCls**

The *linkResCls* globally classifies routing purposes the link of the corresponding port is assigned to.

Type: Alphanumeric value set (4 bytes), every bit defining one link class

Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF

**linkProtType**

The *linkProtType* globally classifies routing purposes the link of the corresponding port is assigned to.

Type: Set of alphanumeric values, separated by “&”.

Range for each alphanumeric value:

- NONE: value specifying that no link protection type is set
- ET: value specifying that link is for extra traffic
- 0x1: value specifying that “unprotected” link protection type is set

- 1:1-W: value specifying that “1:1” link protection type is set
- 1+1-W: value specifying that “1+1” link protection type is set
- ENH: value specifying that an enhanced protection type is set
- RESV1: reserved value for further use)
- RESV2: reserved value for further use

Examples:

- “0x1&1+1-W” will be reported if both “unprotected” and “1+1” are set.
- “NONE” will be reported only without additional values.

Note:
Multiple values or values different from “0x1” and “1+1-W” will only occur for links between domains from “foreign” vendors, as for “own” links either “0x1” or “1+1-W” will only be specified.

**bandwidthList**

The *bandwidthList* indicates the available bandwidth per signal rate.

Type: Character string.

Range:
Bandwidth List: five dash separated numeric strings representing STS1 #, STS3c #, STS12c #, STS48c #, STS192c # with:

- STS1 #0..4097
- STS3c #0..1023
- STS12c #0..255
- STS48c #0..63
- STS192c #0..15

Example for an available bandwidth of 2 STS48c and a defined minimal XC STS3c: 0-32-8-2-0.

## Example input/output

The **RTRV-L1TDR** command with *dataType* = ALL produces this example output result:

```
RTRV-L1TDR:LT-ONNS-61::123456::ALL;

## Error responses

### IDNV - Input, Data Not Valid, RC node not created

The command is rejected when no routing controller is available on the addressed NE.

Error code: `INRC - Input, No Routing Controller`

### Invalid *componentID* parameter

The command is rejected when the received *componentID* is invalid.

Error code: `IRCI - Input, Invalid Routing Controller ID`

# RTRV-LOG-ALM: Retrieve log alarm

The **RTRV-LOG-ALM** command retrieves the alarm log.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-LOG-ALM**:*tid*::*ctag*::[*startdate*],[*starttime*],[*replytype*];

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).
3. **startdate** – Start Date
   The date for the starting point of the report. If both startdate and starttime are omitted, the entire log is retrieved. Both startdate and starttime must be specified, or both must be omitted.
   Type: value set of the format YY-MM-DD.
   Range: Y, M, D are digits. Leading zeros are not suppressed. YY represents the last two digits of the year, MM the month, DD the day.
4. **starttime** – Start Time
   The time for the starting point of the report. If both startdate and starttime are omitted, the entire log is retrieved. Both startdate and starttime must be specified, or both must be omitted.
   Type: value set of the format HH-MM-SS.
   Range: H, M, S are digits. Leading zeros are not suppressed. HH represents the hours, MM the minutes, SS the seconds.
5. **replytype** – Type of Reply
   This parameter defines the kind of log retrieving.
   Type: Alphanumeric value set.
   Range:
   - BROWSE (User Browsing) – If the requested *startdate* and *starttime* is in the log, those entries and any subsequent log entries are returned. If the requested *startdate* and *starttime* is NOT in the log, the first log entry in the log with a timestamp later than the *startdate* and *starttime* plus subsequent log entries will be returned.

**Important**: If there are no alarm entries in the specified interval the system returns with the error code
`SNVS /* Status, Not in Valid State, no matching log entry */`
. Instead of this an empty log with a COMPLD message should be returned.

- DBSYNC – This value provides the same function as BROWSE. The value DBSYNC is allowed for compatibility reasons.

Default: BROWSE, if the parameter is omitted.

## Output format

Normal completion response of successful session termination

The following example shows the successful completion of the **RTRV-LOG-ALM** command by the NE:

```
   sid date time
M  ctag COMPLD
        "aid,aidtype:[ntfcncde],condtype,[srveff],ocrdat,ocrtm,
   [condeff][:conddescr]"

        ...
   "aid,aidtype:[ntfcncde],condtype,[srveff],ocrdat,ocrtm,
   [condeff][:conddescr]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2397).

## Output parameters

### Command parameters

1. **aid** – Access Identifier
   This is the address of the entity for which an alarm condition is being reported.
   Type: AID.
   Range: All defined AIDs are allowed. It should be a valid AID for the specified *modifier*. Refer to the definition of AIDs.
2. **aidtype** – Access Identifier Type
   This parameter defines the AID type to which the alarm belongs.
   Type: Alphanumeric value set.
   Range:
   - COM: Common. An alarm/event that applies to the whole NE system; for example, a processing error.
   - EQPT: An equipment-related alarm/event.
   - SYST: An alarm/event related to system timing.
   - OUTT: An alarm/event related to output timing.

- STM1E: A facility-related alarm/event for synchronous transport mode 1 (electrical).
- STM1: A facility-related alarm/event for synchronous transport mode 1.
- STM4: A facility-related alarm/event for synchronous transport mode 4.
- STM16: A facility-related alarm/event for synchronous transport mode 16.
- STM16T: A facility-related alarm/event for fully transparent synchronous transport mode 16.
- STM64: A facility-related alarm/event for synchronous transport mode 64.
- STM256: A facility-related alarm/event for synchronous transport mode 256.
- ODU1: A facility-related alarm/event for optical data units of level 1
- OC3: A facility-related alarm/event at the optical carrier signal level 3.
- OC12: A facility-related alarm/event at the optical carrier signal level 12.
- OC48: A facility-related alarm/event at the optical carrier signal level 48.
- OC48T: A facility-related alarm/event at the fully transparent optical carrier signal level 48.
- OC192: A facility-related alarm/event at the optical carrier signal level 192
- OC768: A facility-related alarm/event at the optical carrier signal level 768
- T3: A facility-related alarm/event at the DS3 level
- TMAT3: A facility-related alarm/event at the DS3 level related to TransMUX function
- EC1: A facility-related alarm/event at the EC1 level
- 1GE: A facility-related alarm/event for 1 Gigabit Ethernet.
- 1GEPL: A facility-related alarm/event for 1 Gigabit Ethernet Private Line.
- 10GEPL: A facility-related alarm/event for 10 Gigabit Ethernet Private Line.
- VC3: A facility-related alarm/event for virtual container 3.
- VCG: A facility-related alarm/event for virtual concatenation group.
- VC4: A facility-related alarm/event for virtual container 4
- VC44C: A facility-related alarm/event for a signal concatenated at 4 times the VC4 rate.
- VC416C: A facility-related alarm/event for a signal concatenated at 16 times the VC4 rate.
- VC464C: A facility-related alarm/event for a signal concatenated at 64 times the VC4 rate.
- STS1: A facility-related alarm/event at synchronous transport signal level 1.
- TMASTS1: A facility-related alarm/event at synchronous transport signal level 1 related to TransMUX function.
- STS3C: A facility-related alarm/event at synchronous transport signal level 3.

- STS12C: A facility-related alarm/event at synchronous transport signal level 12.
- STS48C: A facility-related alarm/event at synchronous transport signal level 48.
- STS192C: A facility-related alarm/event at synchronous transport signal level 192.
- HOVC4 : A facility-related alarm/event for virtual container 4 higher-order path termination.
- HOSTS1: A facility-related alarm/event at synchronous transport signal level 1 higher-order path termination.
- LOVC3: A facility-related alarm/event for virtual container 3 (lower-order path).
- LOVC12: A facility-related alarm/event for virtual container 12
- LOVT1: A facility-related alarm/event at transport level VT1.5.
- TMSVT: A facility-related alarm/event at transport level VT1.5 related to TransMUX function.
- DS1: A facility-related alarm/event at transport level DS1.
- LINK: A signaling communication link related alarm/event for ONNS

Refer to "Alarms, events, ASAPs" (p. 6-4) for the relation of alarm / entity / *aidtype*.

3. **`ntfcncde`** – Notification Code

   This is the alarm severity (alarm level).

   Type: Alphanumeric value set.

   Range:

   - CR – Critical (ITU / Telcordia)
   - MJ – Major (ITU / Telcordia)
   - MN – Minor (ITU / Telcordia)
   - SC – Standing condition – Warning (ITU) / not alarmed (Telcordia)
   - CL – Cleared

   The abnormal condition is always a standing condition, this means it has a beginning and an end ( SC and CL). The severity of a abnormal condition is not provisionable. It is always NA – warning (ITU) / not alarmed (Telcordia) which implies ABN messages are always reported via REPT EVT.

4. **`condtype`** – Condition Type

   This parameter identifies the probable cause (type of alarm indication) being reported.

   Type: Alphanumeric value set.

   Range: All defined probable causes.

   For ABN conditions see definition of *condtype* in the output parameters section of "REPT EVT: Report event" (p. 3-2109).

5. **`srveff`** – Service Effect

   This parameter identifies the service affect of alarms being reported. It presents the "best guess" from a local system point of view.

   Type: Alphanumeric value set.

Range:

- SA: Service-Affecting alarm condition
- NSA: Non-Service-Affecting alarm condition.

Abnormal condition event messages are always handled as NSA.

6. **ocrdat** – Occurrence Date

   This parameter indicates the raising / clearing date of the alarm.

   Type: value set of the format YY-MM-DD.

   Range: Y, M, D are digits. Leading zeros are not suppressed. YY represents the last two digits of the year, MM the month, DD the day.

7. **ocrtm** – Occurrence Time

   This parameter indicates the raising / clearing time of the alarm. The accuracy should be +/- 1 second.

   Type: value set of the format HH-MM-SS.

   Range: HH represents the hours, MM represents the minutes, SS represents the seconds, leading zeros are not suppressed.

8. **condeff** – Condition Effect

   This indicates the effect of the reported event on the network element. It shall be used to distinguish between persistent and transient alarms/events.

   Two state transitions can be distinguished for a persistent alarm/event:

   - raise transition: state change from not present to present
   - clear transition: state change from present to not present

   A transient alarm/event has no “presence” state; that means, just the occurrence of that event/alarm is reported.

   ABN conditions are always persistent and not transient.

   Type: Alphanumeric value set.

   Range:

   - CL: Standing condition cleared for a persistent alarm/event
   - SC: Standing condition raised for a persistent alarm/event
   - TC: Transient condition occurred for a transient alarms/events

   Default: None.

9. **conddescr** – Description of the Condition

   This is a textual description of the condition.

   Type: inner string of the format: “<category>, <entity>, <description>, <additional text>” or “<category>, <entity>, <description>, <additional text>-cleared” (this form is used in REPT ALM/EVT for cleared alarms).

   Range: :

   - category
   - entity: the entity for which the alarm is reported

- description: the alarm description, the string is up to 32 characters
- additional text. If there is no additional text, then the trailing comma may be omitted.

Default: None.

Range:

Description for a protection group AID:

- Abnormal condition, forced switch active
- Abnormal condition, lockout active

Description for a timing reference AID:

- Abnormal condition, operate in hold-over
- Abnormal condition, operate in free run mode

Description for a port AID:

- Abnormal condition, facility loopback active

Description for a logical tributary AID:

- Abnormal condition, cross-connect loopback active
- Abnormal condition, test access session active

Description for a system AID:

- Abnormal condition, System operates in maintenance mode

### Detailed behavior description

This log gives the user a history and time sequence of all of the most recent alarm detected by the system regarding equipment or facilities attached to the system.

TCAs are not stored within the alarm log.

Storage Order Dependency: If the storage order of entries in the alarm log is not in line with the occurrence date and time, then the command may retrieve entries which are older than the specified date and time. A storage order, which is not in line with the date and time of the entries can occur after setting the system date and time.

The **RTRV-LOG-ALM** command does not generate a **REPT DBCHG** message.

### Example input/output

The following example shows the successful completion of the **RTRV-LOG-ALM** command by the NE:

```
RTRV-LOG-ALM:LT-UNITE-123::123456::;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   "1-1-#-#-3-1,OC48:CR,LOS,SA,01-01,07-29-13:\"Communication-Transport,
    OC48 port, LOS of Signal\""
```

;

## Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2397). The error responses listed there also apply to the **RTRV-LOG-ALM** command.

### Validation rule: Request cannot be completed within 15 minutes

If the system cannot return the requested data from the log file within 15 minutes the request isterminated and the following error code is returned:

Error code: `SARB - Status, All Resources Busy, system limit exceeded`

# RTRV-LOG-NNEVT: Retrieve NN event log

The **RTRV-LOG-NNEVT** command retrieves the NN event log which is used to store the most recent NN events non volatile.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-LOG-NNEVT**:*tid::ctag::[startdate],[starttime];*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters.
   Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.
3. **startdate** – Date for the Starting point
   The format is YY-MM-DD. If both *startdate* and *starttime* are omitted, the entire log is retrieved. Both *startdate* and *starttime* must be specified, or both must be omitted.
   Type: value set.
   Range:
   - for YY: 00 to 99
   - for MM: 01 to 12
   - for DD: 01 to 31.
4. **starttime** – Time for the Starting point
   The format is HH-MM-SS. If both *startdate* and *starttime* are omitted, the entire log is retrieved. Both *startdate* and *starttime* must be specified, or both must be omitted.
   Type: value set.

Range:

- for HH: 00 to 23
- for MM: 00 to 59
- for SS: 00 to 59.

### Output format

If the RTRV-LOG-NNEVT request completes successfully, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "Time=time,Date=date:nnevt"
    ...
   "Time=time,Date=date:nnevt"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2397).

### Output parameters

1. **`date`** – Date
   This parameter shows the occurrence date of the NN event. .
   Type: Value set.
   Range: YY-MM-DD
2. **`time`** – Time
   This parameter shows the occurrence time of the NN event. .
   Type: value set.
   Range: HH-MM-SS.
3. **`nnevt`** – NN Event
   This parameter shall provide the details of the ONNS event. It consists of the text block without the date/time information of the ONNS event enclosed in double quotes (").
   Note: The following ONNS event types are stored in this log:
   REPT PTHCHG
   REPT PTHEVT
   REPT NNCHG
   REPT NNEVT
   REPT CONNCHG
   The detailed TL1 specification can be found in SRD_TL1_ONNS.
   Type: inner string.
   Range: a string of arbitrary length, any character except " and \, upper and lower cases are considered.

### Detailed behavior description

If the NN event log of the system does not contain any records at all or no records exist matching the specified start date and start time, an empty reply is returned. Note: The log contains the last 5000 ONNS events.

### Example input/output

The following is an example of the **RTRV-LOG-NNEVT** command:

```
RTRV-LOG-NNEVT:LT-UNITE::123456::;

   LT-UNITE 02-02-05 08:00:00
M  123456 COMPLD
    "TIME=07-59-59,
   DATE=02-07-01:CCB=PATH:125.114.48.12:SNN:C015:
   \" Connection restored and Saved in NVM \":"
   "ConnID=125.114.48.12&1-1-3-4-1&1,ConnStatus=CON&OK,2WAY,AUTONR,STS192,
   connAlias=AEXP-NY-BOS-ckt,
   MaxDelay=199,,,SrlgExclude=630&820&720,IncludeID=0,RstrPriority=3,,
   SrcNID=125.114.48.12,1-1-3-4-1,DestNID=125.6.19.43,1-1-14-2-1:
   PathID=125.114.48.12-12123,State=CON &OK,
   NodeList=125.114.48.12&nodeIP1&nodeIP2&...&125.6.19.43:
   PathID=125.114.48.12-11013,State=CON &TRDOWN,
   NodeList=125.114.48.12&nodeIP4&nodeIP5&...&125.6.19.43"
   . . .
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-LOG-NNEVT** command.

#### Validation rule: Request cannot be completed within 15 minutes

If the system cannot return the requested data from the log file within 15 minutes the request is terminated and the following error code is returned:

Error code: `SARB - Status, All Resources Busy, system limit exceeded`

# RTRV-LOG-NTFCN: Retrieve notification log

The **RTRV-LOG-NTFCN** command retrieves the notification log, which is used to store the most recent notification reported via **REPT DBCHG**. This log allows the user to see the most recent activity that has caused updates to the system database. This is useful in solving database audit problems. This information can also be used to re-synchronize a management system with the NE after a communications outage between the two.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-LOG-NTFCN***:tid::ctag::[startdate],[starttime],[replytype]*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
3. **startdate** – Date for the Starting point
   The format is YY-MM-DD. If both *startdate* and *starttime* are omitted, the entire log is retrieved. Both *startdate* and *starttime* must be specified, or both must be omitted.
   Type: value set.
   Range:
   - for YY: 00 to 99
   - for MM: 01 to 12
   - for DD: 01 to 31.
4. **starttime** – Time for the Starting point
   The format is HH-MM-SS. If both *startdate* and *starttime* are omitted, the entire log is retrieved. Both *startdate* and *starttime* must be specified, or both must be omitted.
   Type: value set.

Range:

- for HH: 00 to 23
- for MM: 00 to 59
- for SS: 00 to 59.

5. **replytype** – Type of Reply
   Defines the kind of log retrieving.
   Type: Alphanumeric value set
   Range:
   - BROWSE
     User Browsing. If the requested *startdate* and *starttime* is in the log, those entries and any subsequent log entries are returned. If the requested *startdate* and *starttime* is NOT in the log, the first log entry in the log with a timestamp later than the *startdate* and *starttime* plus subsequent log entries will be returned.
   - DBSYNC.
     This value provides the same function as BROWSE. The value DBSYNC is allowed for compatibility reasons.

   Default: BROWSE.

### Output format

If the RTRV-LOG-NTFCN request completes successfully, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "Time=time,Date=date:[ccb]:[aid]:[com_block]:[spec_block]"
   ["aux_block"]
   ["aux_block"]
        ...
   "Time=time,Date=date:[ccb]:[aid]:[com_block]:[spec_block]"
   ["aux_block"]
   ["aux_block"]
        ...
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2397).

### Output parameters

1. **date** – Date
   Type: Value set.
   Range: YY-MM-DD
2. **time** – Time

Type: value set.

Range: HH-MM-SS.

3. **ccb** – Command Code Block

   This field will be set to the TL1 command that causes that database change. The *com_block* and *spec_block* fields will be set according to the parameters that changed.

   Type: Alphanumeric value set verb-modifier[-modifier].

4. **aid** – Access Identifier

   AID of the entity for which the change is reported

   Type: AID.

   Range: As defined by the *aid* input parameter of the corresponding command, defined by *ccb*.

5. **com_block** – Common Block

   This is a position-defined field. If the database change is the result of a TL1 command which contains parameters in this block, the parameter values are included in this block in the same order as the corresponding TL1 command.

   As exception to this rule are some commands in the protection fragment, where the aliases *rid* and *ppgname* are not reported in the **REPT DBCHG** notification.

   If the database change is the result of a TL1 command, then the parameter *ctag* from the TL1 command is not included in the *com_block*.

   Type: As defined in the input *com_block* of the corresponding command, defined by *ccb*.

   Range: As defined in the input *com_block* of the corresponding command, defined by *ccb*.

   Default: As defined in the input *com_block* of the corresponding command, defined by *ccb*.

6. **spec_block** – Specific Block

   This is a name-defined field. If the database change is the result of a TL1 command which contains parameters in this block, the parameter names and values are included in this block. parameters within the specific block are positionally independent and are specified using a name-defined construct of *parameter* = value in a comma-separated list. The parameter names are the same as those for the corresponding TL1 command.

   Type: As defined in the input *spec_block* of the corresponding command, defined by *ccb*.

   Range: As defined in the input *spec_block* of the corresponding command, defined by *ccb*.

   Default: As defined in the input *spec_block* of the corresponding command, defined by *ccb*.

7. **aux_block** – Auxiliary Block

   The auxiliary block is optional. The format of the auxiliary block depends on the notification which caused the log entry.

   **Auxiliary block for path protection group related entries**

In the case of a path protection group related notification, the auxiliary block shall have the format of the CML Block. The CML block format is defined in the output format definition of the ENT-PROTN-GRP notification and the ED-PROTN-GRP notification.

### Example input/output

The following is an example of the **RTRV-LOG-NTFCN** command:

```
RTRV-LOG-NTFCN:LT-UNITE::123456::;

   LT-UNITE 00-11-15 08:00:00
M  123456 COMPLD
   "TIME=07-59-59,DATE=00-11-15:ENT-EQPT:1-1::shlftp=DUR"
   ...
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-LOG-NTFCN** command.

#### Validation rule: matching log entry

There is at least one matching log entry for the specified *startdate* and *starttime* if reply type equals DBSYNC.

Error code: `SNVS - Status, Not in Valid State, no matching log entry`

#### Validation rule: Request cannot be completed within 15 minutes

If the system cannot return the requested data from the log file within 15 minutes the request is terminated and the following error code is returned:

Error code: `SARB - Status, All Resources Busy, system limit exceeded`

### Related TL1 messages

# RTRV-LOG-PROTNSW: Retrieve log protection switch

The **RTRV-LOG-PROTNSW** command retrieves the protection switch log. This log gives a complete time-ordered list of switching activity which has occurred at the NE covering all different protection groups, system timing reference, station clock output timing reference and system clock.

The protection switch log is a circular buffer that should hold at least 500 entries.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-LOG-PROTNSW**:*tid*::*ctag*::[*startdate*],[*starttime*],[*replytype*];

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **ctag** – Correlation Tag
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2397).
3. **startdate** – Start Date
   This parameter specifies a date used as filter criteria in order to determine the set of switch events being returned.
   See description of parameter *replytype* for more precise semantics definition.
   Type: value set of format YY-MM-DD
   Range: Y, M, D are digits. Leading zeros are not suppressed. YY represents the year, MM represents month, DD the day.
4. **starttime** – Start Time
   This parameter specifies a time used as filter criteria in order to determine the set of switch events being returned.
   See description of parameter *replytype* for more precise semantics definition.
   Type: value set of format HH-MM-SS
   Range: H, M, S are digits. Leading zeros are not suppressed. HH represents hours, MM minutes, SS seconds.
5. **replytype** – Type of Reply
   Defines the kind of log retrieving.
   Type: Alphanumeric value set.
   Range:

BROWSE: User Browsing. If the requested *startdate* and *starttime* is in the log, those entries and any subsequent log entries are returned. If the requested *startdate* and *starttime* is NOT in the log, the first log entry in the log with a *timestamp* later than the *startdate* and *starttime* plus subsequent log entries will be returned.

DBSYNC: This value provides the same function as BROWSE. The value DBSYNC is allowed for compatibility reasons.

Default: BROWSE

### Output format

The returned log entries are ordered ascending according to their timestamp. After receiving the **RTRV-LOG-PROTNSW** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "aid,aidtype:EVT,condtype,condeff,ocrdat,ocrtm[:\"conddescr\"]"
        <0 or more of the line above>
   "aid:SW,,,ocrdat,ocrtm"
        <0 or more of the line above>
        <0 or more repetitions of this entire block>
;
```

The output parameters of the log entry are derived/correspond from/to the parameters in the protection switch notification. The parameter definition will reference to the corresponding parameter in the protection switch notification section. Log entry parameters are not splitted within this section w.r.t. protection type. Therefore the protection type has to be considered in order to look-up the proper definition.

### Output parameters

#### Command parameters

1. **aid** – Access Identifier
2. **aidtype** – Access Identifier Type
3. **condtype** – Condition Type
4. **condeff** – Condition Effect

   This parameter indicates the effect of the reported event on the network element. The value TC (Transient Condition) is used for all protection switch events. Type alphanumeric value set Range TC

   Type: Alphanumeric value set.

   Range: TC

   a. ocrdat – Occurrence Date

The parameter shall indicate the date of the switch event being reported. Type: value set of the format YY-MM-DD. Range: Y, M, D are digits. Leading zeros are not suppressed. YY represents the last two digits of the year, MM the month, DD the day.

b. ocrtm – Occurrence Time

This parameter indicates the time of the switch event being reported. Type: value set of format HH-MM-SS. Range: H, M, S are digits. Leading zeros are not suppressed. HH represents hours, MM minutes, SS seconds.

5. **conddescr** – Condition Description

## Detailed behavior description

If both *startdate* and *starttime* are omitted, the entire log is retrieved. Both *startdate* and *starttime* must be specified, or both must be omitted. If *replytype* is specified, then *startdate* and *starttime* are present.

The log shows the same information as it could be derived from looking on the protection switches reported by means of REPT EVT and REPT SW.

Note: In case of a 1+1 equipment protection switching causing one REPT SW notification and one REPT EVT notification, then two entries are reported in the retrieve log reply.

## Example input/output

### 1+1 Equipment protection group

The following example retrieves a manual switch to protection circuit pack for 1+1 equipment protection group:

```
RTRV-LOG-PROTNSW:LT-UNITE::123456;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   "1-1-#-#-xcp-cp:SW,,,01-10,08-12-00"
   "1-1-estgrp,COM:EVT,GP,TC,01-10,08-12-00:\"Protection Switch, EQPT,
    Manual switch\""
;
```

### Multiplex section/line protection group (1+1 and 1:1)

The following example retrieves a lockout switch for a 1+1 multiplex section/line protection group:

```
RTRV-LOG-PROTNSW:LT-UNITE::123456;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   "1-1-#-#-10-2,OC3:EVT,WKSWBK,TC,01-10,08-12-00:\"Protection Switch,
    OC3 port, Lockout switch,, 1+1/1x1\""
;
```

### 2 fibre MS-SPRing/BLSR protection group

The following example retrieves a manual ring switch of the east side for a 2F MS-SPRing/BLSR protection group:

```
RTRV-LOG-PROTNSW:LT-UNITE::123456;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   "1-1-#-#-10-2,OC48:EVT,WKSWPR-2,TC,01-10,08-12-00:\"Protection Switch,
    OC48 port, Manual switch, MSR, 2F\""
;
```

### 4 fibre MS-SPRing/BLSR protection group

The following example retrieves a manual ring switch of the east side for a 4F MS-SPRing/BLSR protection group:

```
RTRV-LOG-PROTNSW:LT-UNITE::123456;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   "1-1-#-#-10-1,OC192:EVT,WKSWPR-2,TC,01-10,08-12-00:\"Protection Switch,
    OC192 port, Manual switch, MSS, 4F\""
;
```

### Path protection group

The following example retrieves an autonomous switch to protection for a 1+1 path protection group:

```
RTRV-LOG-PROTNSW:LT-UNITE::123456;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   "1-1-#-#-10-1-25,STS1:EVT,WKSWPR-2,TC,01-10,08-12-00:\"Protection Switch,
    STS1 CS, SF\""
;
```

### System clock

The following example retrieves a switch event for clock mode protection type:

```
RTRV-LOG-PROTNSW:LT-UNITE::123456;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   "SYSTEM,SYST:EVT,HLDOVRSYNC,TC,11-09,12-00-00,,,:\"Protection switch,
   clock mode,Forced Holdover\""
```

```
;
```

#### System timing reference

The following example retrieves a switch event for system timing reference protection type:

```
RTRV-LOG-PROTNSW:LT-UNITE::123456;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   "EXTREF1,SYST:EVT,PS,TC,11-09,12-00-00,,,:\"Protection switch,
   sync reference,Manual switch\""
;
```

#### Station timing reference

The following example retrieves a switch event for output timing reference protection type:

```
RTRV-LOG-PROTNSW:LT-UNITE::123456;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   "LINE2,OUTT:EVT,INHSWPR,SC,11-09,12-00-00,,,:\"Protection switch,
   output reference,Lockout\""
;
```

### Error responses

#### Validation rule: matching log entry

There is at least one matching log entry for the specified *startdate* and *starttime* if replytype equals DBSYNC.

Error code: `SNVS - Status, Not in Valid State, no matching log entry`

#### Validation rule: Request cannot be completed within 15 minutes

If the system cannot return the requested data from the log file within 15 minutes the request is terminated and the following error code is returned:

Error code: `SARB - Status, All Resources Busy, system limit exceeded`

# RTRV-LOG-SECU: Retrieve log security

The **RTRV-LOG-SECU** command can be initiated by a user to retrieve the security information log activity from the NE.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S5

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-LOG-SECU**:*tid*::*ctag*::*[startdate,starttime]*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).
3. **startdate** – Start Date
   The date for the starting point of the report. If both *startdate* and *starttime* are omitted, the entire log is retrieved. Both *startdate* and *starttime* must be specified, or both must be omitted.
   Type: value set of the format YY-MM-DD
   Range: Y, M, D are digits. Leading zeros are not suppressed. YY represents the last two digits of the year, MM the month, DD the day.
4. **starttime** – Start Time
   The time for the starting point of the report. If both *startdate* and *starttime* are omitted, the entire log is retrieved. Both *startdate* and *starttime* must be specified, or both must be omitted.
   Type: value set of the format HH-MM-SS
   Range: H, M, S are digits. Leading zeros are not suppressed. HH represents the hours, MM the minutes, SS the seconds.
   Default: none

## Output format

After receiving the **RTRV-LOG-SECU** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "login_id:umb:action:ccb:[uid_block]:[com_block]:[spec_block]:ccde"
```

```
      ...
   "login_id:umb:action:ccb:[uid_block]:[com_block]:[spec_block]:ccde"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command parameters

1. **login_id** – Login ID
   The login identification of the user. It is the same as the user ID uid. See definition of *uid* in "ACT-USER: Activate user" (p. 3-24).
2. umb – Update Management Block
   The parameters within this block are positionally independent and are specified using a name-defined construct of parameter=value in a comma-separated list.
   - date
     The date of the user action.
     Type: value set of the format YY-MM-DD
     Range: Y, M, D are digits. Leading zeros are not suppressed. YY represents the last two digits of the year, MM the month, DD the day.
   - time
     The time of the user action
     Type: value set of the format HH-MM-SS
     Range: H, M, S are digits. Leading zeros are not suppressed. HH represents the hours, MM the minutes, SS the seconds.
3. **action** – Action
   This parameter indicates the reason for the log entry.
   Type: text string.
   Range:
   - For reasons for a logout entry following values are defined: "inactivity timeout" "forced logout" "self logout"
     For reason for login failure following values are defined: "expired passwd" "invalid uid" "invalid passwd" "locked out uid"
     For other reasons following values are defined: "NE security variable change"
4. **ccb** – Command Code Block
   This parameter contains the name of the command.
   Type: Character string.
   Range: The names of the commands described in the Administration & Security except the RTRV -Commands.
5. **uid_block** – User ID Block

This parameter contains the user ID of the user, who is affected by the logged action. If the action does not affect a specific user (e.g. modification of NE security parameters) the uid_block is empty.

Type: Character string.

Range: 1 – 10 character string or empty string.

6. com_block – Common Block

   It contains the common block of the command which is logged in the log. Please refer to the specifications of the commands. There exist only one exception: Passwords will be not logged.

7. spec_block – Specific Block

   It contains the specific block of the command which is logged in the log. Please refer to the specifications of the commands.

8. state_block – State Block

   It contains the state b lock of the command which is logged in the log. Please refer to the specifications of the commands.

   Note: The state block is not used in the commands to be logged. This parameter will be always empty.

9. **ccde** – Completion Code

   The completion code of the command.

   Type: Alphanumeric string

   Range: COMPLD or the 4-character error code.

### Detailed behavior description

If the error log of the system does not contain any records at all or no records exist matching the specified startdate and starttime an empty reply is returned.

### Example input/output

The following example shows the successful completion of **RTRV-LOG-SECU** command by the NE:

**RTRV-LOG-SECU:LT-UNITE-123::123456;**

```
   LT-UNITE-123 00-01-05 08:00:00
M  123456 COMPLD
   "hugo:DATE=00-01-02,
   TIME=07-59-59:\"NE security variable change\":ED-NE-SECU:::thrshld=30,
   intrvl=60,age=90:COMPLD"
   "nbguser1:DATE=00-01-03,TIME=06-59-59:\"inactivity timeout\":::::COMPLD"
   "Admin1:DATE=00-01-04,TIME=09-59-59:\"invalid passwd\":ACT-USER::::IDNV"
;
```

# RTRV-LOG-TL1CMD: Retrieve TL1 command log

The **RTRV-LOG-TL1CMD** command can be initiated by a user to retrieve the TL1 command information log activity from the NE.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S5

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-LOG-TL1CMD**:*tid*::*ctag*::*[startdate,starttime]*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).
   Default: none
3. **startdate** – Start Date
   The date for the starting point of the report. If both *startdate* and *starttime* are omitted, the entire log is retrieved. Both *startdate* and *starttime* must be specified, or both must be omitted.
   Type: value set of the format YY-MM-DD
   Range: Y, M, D are digits. Leading zeros are not suppressed. YY represents the last two digits of the year, MM the month, DD the day.
   Default: none
4. **starttime** – Start Time
   The time for the starting point of the report. If both *startdate* and *starttime* are omitted, the entire log is retrieved. Both *startdate* and *starttime* must be specified, or both must be omitted.
   Type: value set of the format HH-MM-SS
   Range: H, M, S are digits. Leading zeros are not suppressed. HH represents the hours, MM the minutes, SS the seconds.
   Default: none

## Output format

After receiving the **RTRV-LOG-TL1CMD** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "login_id:umb:ccb:tid:ctag:[aid_block]:[payload_block]:ccde"
        ...
   "login_id:umb:ccb:tid:ctag:[aid_block]:[payload_block]:ccde"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command parameters

1. **login_id** – Login ID

   The login identification of the user. It is the same as the user ID uid. See definition of *uid* in "ACT-USER: Activate user" (p. 3-24).

2. umb – Update Management Block

   The parameters within this block are positionally independent and are specified using a name-defined construct of parameter = value in a comma-separated list.

   - date

     The date of the user action.

     Type: value set of the format YY-MM-DD

     Range: Y, M, D are digits. Leading zeros are not suppressed. YY represents the last two digits of the year, MM the month, DD the day.

     Default: n/a

   - time

     The time of the user action

     Type: value set of the format HH-MM-SS

     Range: H, M, S are digits. Leading zeros are not suppressed. HH represents the hours, MM the minutes, SS the seconds.

     Default: n/a

3. **ccb** – Command Code Block

   This parameter contains the name of the command.

   Type: Character string.

   Range: The names of the commands described in the Administration & Security except the **RTRV-HDR**, **RTRV-PRMTR-SFTWR**, and the **RTRV-PRMTR-DATA** commands.

   Default: n/a

4. **aid_block** – User ID Block

   This parameter contains the AID of the entity, which is affected by the action. Some TL1 commands use this location for the ID of the user, who is affected by the action, if this is the case the UID shall be logged in this block.

   Type: Character string.

Range: 1 – 128 character string or empty string.

5. **payload_block** – Payload Block
   The payload block is a direct copy of the remaining part of the TL1 command and contains all parameters of the message with some exceptions (e.g. passwords will be replaced by general strings). The payload block itself may consist of zero or more data blocks in the following general form: **RTRV-LOG-TL1CMD***:::[[px],px]*:]**
   For each "px"an own block is created as follows:
   - Each data block is delimited by colons ":",
   - Each data block may have an unlimited number of data items, each delimited by commas ","
   - Empty data blocks are allowed, also at the end of the string. (Due to the fact, that it is a direct copy of the users input)
   - The data items within a data block may either be name-defined or position-defined parameters.

   For example a payload block with four data blocks:
   **p1,p2:p3=xx:p4,p5,p6:p7=aa,p8=bb,p9=cc**
   Type: Character string
   Range: 1...4096 character strings or empty string.
   Default: n/a
6. **ccde** – Completion Code
   The completion code of the command.
   Type: Alphanumeric string
   Range: COMPLD or the 4-character error code.
   Default: n/a

## Detailed behavior description

If the error log of the system does not contain any records at all or no records exist matching the specified *startdate* and *starttime*, an empty reply is returned.

### Need for multiple retrieve commands to get the complete log file content

If the log file contains an amount of entries which cannot be returned by the system within five minutes, the **RTRV-LOG-TL1CMD** command is aborted with an error response "SSRE", see below.

In such a case proceed according to the following steps to get the complete log file contents:

1. Send another **RTRV-LOG-TL1CMD** with a *startdate* and *starttime* equal to a slightly later date and time than the timestamp of the last successfully reported log file entry of the previous **RTRV-LOG-TL1CMD**.
2. If this command succeeds with completion code "CPMPLD", the complete log file has been reported by the NE.
   If the command aborts again with error response "SSRE", repeat step 1 above.

Note that the TL1 command log file may contain up to about 220000 entries, depending on the length of the logged commands.

### Example input/output

The following example shows the successful completion of **RTRV-LOG-TL1CMD** command by the NE:

**RTRV-LOG-TL1CMD:UNITE-123::123456;**

```
   UNITE-NE 00-01-01 00:16:01
M  1 COMPLD
   "LUC01:TIME=00-00-34,
   DATE=00-01-01:ED-STM16:UNITE-NE:1-1-#-#-26-1:57:::portClass=ENNI:IDNV"
   "LUC01:TIME=00-01-24,DATE=00-01-01:RTRV-LOG-TL1CMD:UNITE-NE::1:COMPLD"
   "LUC01:TIME=00-04-50,
   DATE=00-01-01:ACT-USER:UNITE-NE:LUC01:12::********:COMPLD"
   "LUC01:TIME=00-05-30,DATE=00-01-01:ED-PID:UNITE-NE::23::********,
   *******:COMPLD"
   "LUC01:TIME=00-05-37,DATE=00-01-01:ED-PID:UNITE-NE::23::*******,
   ********:COMPLD"
   "LUC01:TIME=00-06-34,
   DATE=00-01-01:ENT-USER-SECU:UNITE-NE:LUC03:34::*******,,
   P3&M3:screen=DBCHG&STCHG&PSCHG,page=345,tmout=360:COMPLD"
   "LUC01:TIME=00-35-25,
   DATE=00-01-01:ED-STM16:UNITE-NE:1-1-#-#-26-1:57:::ndetmd=AUTO:COMPLD"
   "LUC01:TIME=00-39-23,
   DATE=00-01-01:ED-STM16:UNITE-NE:1-1-#-#-26-1:57:::portControl=NORMAL,
   networkTNAType=IPV4,networkTNAAddress=172.16.1.250,localLPID=123,
   clientNodeID=172.16.1.249,linkResCls=22222222:COMPLD"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-LOG-TL1CMD** command.

#### Validation rule: Request cannot be completed within 5 minutes

If the system cannot return the requested data from the log file within 5 minutes, the request will be terminated and the following error code is returned:

Error code:

```
SSRE - Status, System Resources Exceeded, send another retrieve
command with a startdate to get next portion of data
```

# RTRV-LOPTF: Retrieve low-order path termination function

The **RTRV-PTF** command retrieves the attributes of a low-order path termination function (PTF) located on a TransMUX pack

VT1.5 LOPTF entities exist by changing the TransMUX capacity to 2G5. 28 LOVT instances will be created.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-LOPTF**-*modifier:tid:aid:ctag[:::spec_block];*

## Input parameters

### Command parameters

1. **modifier**
   The modifier specifies the type of the low-order tributary.
   Type: Alphanumeric value set.
   Range: TMSVT.
   Default: None.
2. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
3. **aid** – Access Identifier
   The access identifier specifies a low-order tributary to be operated on.
   Type: AID
   Range: TMuxSLONumAID.
   The following wildcard values are accepted:
   - **all**, **usall** for Simple_UnivSlotAID
   - **all** for Simple_UnivSlotAID
   - **all** for Simple_TMuxSPTNumAID
   - **all** for Simple_TMuxSLONumAID

   Default: None.
4. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

### Spec block parameters

1. **dyn** – Retrieve Dynamic Parameters

   his parameter controls whether dynamic data (output parameters) is reported with the command reply or not. It is only possible to retrieve those data if the aid input parameter does not address multiple entities at the same time (no wildcarding allowed). If omitted, the default value is assumed.

   The following output parameters are considered to be dynamic:

   - *ptrc*, *ptrcst*, *rsiglb*, *trailstate*

   Type: Alphanumeric value set.

   Range:

   - YES: Report dynamic parameters in the reply as well
   - NO: Do not report dynamic parameters in the reply.

   Default: NO.

## Output format

If the NE fully complies with the **RTRV-LOPTF** request, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "aid,aidtype[::spec_block]"
   <1 or more of the line above>
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2397).

## Output parameters

### Command parameters

1. **aid** – Access Identifier

   The access identifier specifies the low-order tributary whose attributes are reported.

   Type: AID

   Range: TMuxSLONumAID.

   The following values are not used:

   - **all**, **usall** for Simple_UnivSlotAID
   - **all** for Simple_UnivSlotAID
   - **all** for Simple_TMuxSPTNumAID
   - **all** for Simple_TMuxSLONumAID

   No wildcards are allowed.

Default: None.

2. **aidtype** – Access Identifier Type

   The *aidtype* specifies the type of the tributary.

   Type: Alphanumeric value set.

   Range: TMSVT.

   Default: None.

**Spec block parameters**

1. **degthr** – Signal Degrade Threshold

   This parameter specifies the exponent to base 10 for building the degraded threshold level. Note that only the POISSON mode is supported by HW for low-order tributaries. Therefore this parameter will be always valid (in contrast to **RTRV-VCGTRIB**, **RTRV-VC3**, **RTRV-STS1**).

   This parameter is not supported for the following modifiers:

   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.

   Type: Integer.

   Range (as exponents of 10): –5; –6; –7; –8; –9, that means, the range is $10^{-9}$ to $10^{-5}$.

   Default: –6.

2. **dexcthr** – Excessive Degrade Threshold

   This parameter specifies the exponent to base 10 for building the excessive threshold level. Note that only the POISSON mode is supported by HW for low-order tributaries. Therefore this parameter will be always valid (in contrast to **RTRV-VCGTRIB**, **RTRV-VC3**, **RTRV-STS1**).

   This parameter is not supported for the following modifiers:

   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.

   Type: Integer.

   Range (as exponents of 10): –3; –4; –5, that means, the range is $10^{-5}$ to $10^{-3}$.

   Default: –3.

3. **explptrc** – Expected LO Path Trace Identifier

   This parameter specifies the Expected Low Order Path Trace Identifier (J1 or J2). The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is only useful if *ptrcrfmt* is set to 16.

   This parameter is not supported for the following modifiers:

   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.

   Type: Hexadecimal number without a preceding “H”.

   Range: length: 32 hexadecimal digits; value: specific string acc. ITU/ETSI mode 1.

   Default: 89000000000000000000000000000000

4. **lopn** – LO ASA Profile Name

This parameter points to a tributary ASAP profile name *pfname* for the designated AID. For *modifier* = TMSVT, an ASAP profile of type *PATHTERM* is required.

Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.

Range: 1 to 24 characters.

Default: DEFAULT.

5. **lptimais** – LO Trace Identifier Mismatch AIS Insertion

   This parameter specifies whether a detected TIM will cause AIS insertion. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte specific-string mode).

   Type: Alphanumeric value set.

   Range:

   - DISABLE
   - ENABLE

   Default: The default value depends on interface standard:

   - SONET: DISABLE.

6. **lptimmon** – LO Path Trace Identifier Mismatch Monitor

   This parameter specifies the mode of the TIM detection. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte specific-string mode).

   This parameter is not supported for the following modifiers:

   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.

   Type: Alphanumeric value set.

   Range:

   - DISABLE
   - ENABLE

   Default: DISABLE

7. **ptrc** – Incoming Path Trace

   This parameter reports the accepted low-order path trace identifier (J1 or J2). The length depends on the value of the parameter *ptrcrfmt*. The status of this value is contained in parameter *ptrcst*. If *ptrcst* indicates NORMAL, then *ptrc* contains a valid value. If *ptrcst* indicates UNAVAILABLE or AIS, then no valid incoming path trace identifier could be obtained by the system, e.g. due to not meeting the basic acceptance criteria or intra-NE communication problems, and the output parameter *ptrc* is omitted from the response.

   This parameter is not supported for the following modifiers:

   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.

   Type: Hexadecimal

Range: the range depends on the parameter *ptrcrfmt* specified in **RTRV-PTF** output parameters:

- 2: hexadecimal digits if *ptrcrfmt* = 2
- 32: hexadecimal digits if *ptrcrfmt* = 16
- 128: hexadecimal digits if *ptrcrfmt* = 64.

Default: None.

8. **ptrcrfmt** – Path Trace Read Format

   The parameter *ptrcrfmt* specifies the format of the path trace (J1 or J2 byte) to be received (sink).

   The parameter is not supported for the following modifiers:

   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.

   Type: Numeric string.

   Range:

   - 2: for non-specific repeating byte
   - 16: for 16-byte specific string
   - 64: for 64-byte string.

   To check whether the entity represents a LO-VC3 tributary or not, the parameter *inputsig* of the related PTF entity must be checked.

   Default: 2.

9. **ptrcst** – Status of Incoming Path Trace

   This parameter shows the status of the value of the incoming Path Trace Identifier (J1 or J2) which is available with parameter *ptrc*.

   The parameter is not supported for modifier:

   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.

   Type: Alphanumeric value set.

   Range:

   - NORMAL, *ptrc* contains a valid value
   - UNAVAILABLE, no valid value for *ptrc* could be obtained by the system
   - AIS, no valid value for *ptrc* could be obtained due to SF condition

   Default: None.

10. **ptrcwfmt** – Path Trace Write Format

    This parameter specifies the format of the path trace (J2 byte) to be sent (source).

    Type: Numeric string.

    Range:

    - 2: for non-specific repeating byte
    - 16: for 16-byte specific string

    Default: 2.

11. **rsiglb** – Received Signal Label

    This parameter reports the accepted trail signal label (C2 or V5). The parameter is not reported if the *trailst* parameter indicates a fail condition, that means, if it has the value AIS or UNAVAILABLE.

    The parameter is not supported for the following modifiers:

    - DS1

    Option: If the parameter is not supported, then the parameter is omitted.

    Type: Alphanumeric value set.

    Range: 00, 01, …, FE, FF, that means two hexadecimal digits.

    Default: None.

12. **tmonmd** – Tributary Monitoring Mode

    This parameter specifies the monitoring mode for the tributary.

    Type: Alphanumeric value set.

    Range:

    - MON
    - NMON

    Default: NMON.

13. **trailst** – Trail Status

    This parameter reports the accepted trail status value.

    Type: Alphanumeric value set.

    Range:

    - AIS for Alarm Indication Signal in case of Trail Signal Fail Condition
    - UNAVAILABLE for unavailable
    - NORMAL

    Default: None.

14. **trc** – Outgoing Path Trace

    This parameter specifies the path trace (J2) to be sent (source). For the 16-byte path trace format, the following syntactical rule is applied: The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is irrelevant if the format is non-specific repeating byte (*ptrcwfmt* = 2).

    Type: Hexadecimal number without a preceding “H”.

    Range: The range depends on the parameter *ptrcwfmt* specified in **RTRV-PTF** output parameters

    - length: 32 hexadecimal digits.
    - value: specific string acc. ITU/ETSI mode 1.

    Default: 00.

### Detailed behavior description

The **RTRV-LOPTF** does not generate a **REPT DBCHG** message. The command retrieves all port parameter as described in section “Output parameters”. It does not matter whether the entity is really in use or not.

### Example input/output

Retrieval of all LO tributaries of a STS1 being substructured to 28 VT1.5:

```
RTRV-LOPTF-TMSVT:UNITE-NE:1-1-#-#-39-tms16-1-all:123456;

   UNITE-NE 08-03-01 11:11:00
M  123456 COMPLD
   "1-1-#-#-39-tms16-1-1, TMSVT::\
    degthr=-6,dexcthr=-3,\
    explptrc=8900000000000000000000000000000,\
    lopn=DEFAULT,lptimais=DISABLE,lptimmon=DISABLE,\
    ptrcrfmt=2,ptrcwfmt=2,tmonmd=NMON,trc=00"
   "1-1-#-#-39-tms16-1-2, TMSVT::\
    degthr=-6,dexcthr=-3,\
    explptrc=8900000000000000000000000000000,\
    lopn=DEFAULT,lptimais=DISABLE,lptimmon=DISABLE,\
    ptrcrfmt=2,ptrcwfmt=2,tmonmd=NMON,trc=00"

          <listing of more VT1.5 related LONIM's of this HO Trib>
          <ending with>

   "1-1-#-#-39-tms16-1-28, TMSVT::\
    degthr=-6,dexcthr=-3,\
    explptrc=8900000000000000000000000000000,\
    lopn=DEFAULT,lptimais=DISABLE,lptimmon=DISABLE,\
    ptrcrfmt=2,ptrcwfmt=2,tmonmd=NMON,trc=00"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-LOPTF** command.

#### Validation rule: Check *aid* and *dyn* consistency

If the command is applied with an **aid** parameter containing wildcards (**all** at any position) and the **dyn** parameter is set to YES, then the command is denied.

Error code: `IDRG – Input, Data Range Error`

Example: Given the *aid* refers to 1-1-#-#-39-tms16-1-all and the *dyn* parameter is set to YES, then the command will be rejected.

**Related TL1 messages**

- “ED-LOPTF notification” (p. 3-428)
- “ENT-LOPTF notification” (p. 3-1591)
- “DLT-LOPTF notification ” (p. 3-199)

# RTRV-LONIM: Low-order non-intrusive monitor

The **RTRV-LONIM** command retrieves the attributes of a low-order non-intrusive monitor (LONIM, for example, OP*n*, EP155, or TransMUX).

The existence of the LONIM entities depends on the functionality:

**LOXC**

LONIM entities exist as long as a high-order tributary has been substructured. They are represented by entities only on lowest transmission rate with the maximum number of instances. The substructure depends on the interface standard of the related high-order tributary.

As result of a substructure creation low-order instances will be created.

The LONIM entities can be:

- SDH: 63 LOVC instances,
- SONET: 28 LOVT instances.

All of those entities can be always retrieved or modified although settings will only take effect for those entities which are indicated in the actual substructure.

**TransMUX**

DS1 LONIM entities exist as long as the TransMUX capacity of the approriate TransMUX card (where the DS1s are located) is unequal 0.

The LONIM entities can be:

- SONET: 28 DS1 instances

**Example for LOXC**

Assuming a VC4 (1st VC4 of port 1 in slot 1) is substructured to 3 VC3 (inputsig=33) since three unidirectional LOVC3 cross-connections have been established with that VC3s as input each. A RTRV-LONIM command with the input aid 1-1-#-#-1-1-1-all would deliver 63 responses although only 3 of them are in use (1-1-#-#-1-1-1-1, 1-1-#-#-1-1-1-22 and 1-1-#-#-1-1-1-43). The LONIM 1-1-#-#-1-1-1-2 can be modified without having any effect.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

## Input format

Command syntax:

**RTRV-LONIM**-*modifier*:*tid*:*aid*:*ctag*::[*:::spec_block*],

## Input parameters

### Command parameters

1. **modifier**

   The modifier specifies the type of the low-order tributary. The purpose is to distinguish between: – SDH/SONET tributaries.

   Type: Alphanumeric value set.

   Range:

   - ALL
   - LOVC
   - LOVT
   - DS1

   The *modifier* value **ALL** does not include DS1 tributaries.

   The **ALL** modifier is only useful if AIDs with wildcards are used which have a bigger range than one single port or if the interface standard of the LONIM entities is unknown.

2. **tid** – Target Identifier

   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).

3. **aid** – Access Identifier

   The access identifier specifies a low-order tributary to be operated on.

   Type: AID

   Range: GenLOTribAID, DS1NumAID.

   The following wildcard values are accepted:

   - *all*, *usall* for Simple_UnivSlotAID,
   - *all* for Simple_SPortAID, Simple_TMuxAPortAID, Simple_TMuxSPortAID
   - *all* for Simple_PTNumAID, Simple_TMuxAPTNumAID, Simple_TMuxSPTNumAID
   - *all* for Simple_LONumAID, Simple_DS1NumAID, Simple_TMuxSLONumAID

4. **ctag** – Correlation Tag

   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).

### Spec Block Parameters

1. **dyn** – Retrieve Dynamic Parameters

   This parameter controls whether dynamic data (output parameters) is reported with the command reply or not. It is only possible to retrieve those data if the aid input parameter does not address multiple entities at the same time (no wildcarding allowed). If omitted the default value is assumed.

The following output parameters are considered to be dynamic:

- ptrc
- ptrcst
- rsiglb
- trailst

Type: Alphanumeric value set.
Range:

- YES: Report dynamic parameters in the reply as well
- NO: Do not report dynamic parameters in the reply.

### Output format

If the network element fully complies with the RTRV-LONIM request, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "aid,aidtype[::spec_block]"
   <1 or more of the line above>
;
```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the Output Parameter section for the **RTRV-HDR** command.

### Output parameters

#### Command Parameters

1. **aid** – Access Identifier
   The access identifier specifies the low-order tributary whose attributes are reported.
   Type: AID
   Range: GenLOTribAID, DS1NumAID.
   The following values is not used:
   - *all*, *usall* for Simple_UnivSlotAID,
   - *all* for Simple_SPortAID, Simple_TMuxAPortAID, Simple_TMuxSPortAID
   - *all* for Simple_PTNumAID, Simple_TMuxAPTNumAID, Simple_TMuxSPTNumAID
   - *all* for Simple_LONumAID, Simple_DS1NumAID, Simple_TMuxSLONumAID

   No wildcards are allowed.
2. **aidtype** – Access Identifier Type
   The *aidtype* specifies the type of the tributary.
   Type: Alphanumeric value set.
   Range: LOVC, LOVT, DS1

### Spec Block Parameters

If a third of a high-order tributary has been substructured to a low-order VC-3 then only the first of the 21 referring LOVC entities will contain VC3 related contents – the other 20 entities will represent (currently unused) VC12 related contents. VC3 contents differs from VC12 contents e.g. in the range of the path trace receive format (VC3 allows 64 byte mode exclusively).

Configurations of unused entities is possible – even for performance monitoring. However, performance monitoring bins are not retrievable.

If a used entity changes its contents from VC3 to VC12 related contents or vice versa then all parameter for this entity will be set back to the referring default (note that the default values are transmission rate dependent) except for performance monitoring:

- Possibly enabled performance monitoring will not be stopped,
- SES threshold settings will be set back to default (since different)
- TCA profile assignment remains unchanged.

Other (VC12 related) entities of the same third within the referring high-order cross-connection (VC4) will not be changed at all.

1. **`crslpbkstat`** – Cross-connect Loopback Status

   This parameter shall report the configuration of the cross-connection loopback of this tributary. For changing the loopback operation refer to "OPR-LPBK: Operate cross-connection loopback" (p. 3-2015).

   The parameter is not supported for modifier:

   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.

   Type: Alphanumeric value set.

   Range:

   - YES: for enabled loopback
   - NO: for disabled loopback.

   Default: NO.

2. **`degthr`** – Signal Degrade Threshold

   This parameter specifies the exponent to base 10 for building the degraded threshold level. Note that only the POISSON mode is supported by HW for low-order tributaries. Therefore this parameter will be always valid (i.e. in contrast to RTRV-VCGTRIB, RTRV-VC3, RTRV-STS1).

   The parameter is not supported for modifier:

   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.

   Type: Integer.

   Range: –5, –6, –7, –8, –9; i.e. range is $10^{-9}$ to $10^{-5}$.

   Default: –6.

3. **dexcthr** – Excessive Degrade Threshold

   This parameter specifies the exponent to base 10 for building the excessive threshold level. Note that only the POISSON mode is supported by HW for low0order tributaries. Therefore this parameter will be always valid (i.e. in contrast to RTRV-VCGTRIB, RTRV-VC3, RTRV-STS1).

   The parameter is not supported for modifier:

   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.

   Type: Integer.

   Range: –3, –4, –5; i.e. range is $10^{-5}$ to $10^{-3}$.

   Default: –3.

4. **explptrc** – Expected LO Path Trace Identifier

   This parameter specifies the Expected Low Order Path Trace Identifier (J1 or J2). The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is only useful if *ptrcrfmt* is set to 16.

   The parameter is not supported for modifier:

   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.

   Type: Hexadecimal number without a preceding “H”.

   Range: length: 32 hexadecimal digits; value: specific string acc. ITU/ETSI mode 1

   Default: 89000000000000000000000000000000

5. **feppm** – Far End Path PM Enable

   This parameter specifies whether the performance monitoring for the far end is enabled or disabled for this tributary.

   The parameter is not supported for modifier:

   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.

   Type: Alphanumeric value set.

   Range: DISABLE, ENABLE.

   Default: DISABLE.

6. **fmt** – Digital Signal Format for DS1

   This parameter is used to specify the digital signal format expected to be received from the DS1 at the specified port(s). The TransMUX circuit pack supports DS1 path PM; it does not support DS1 line PM.

   The parameter is only supported for modifier:

   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.

   Type: Alphanumeric value set.

Range:

- SF: Super Frame, supports near-end DS1 path and line PM only.
- ESF: Extended Super Frame, supports near-end and far-end DS1 path and line PM.

Default: ESF.

7. **lonimpn** – LO NIM ASAP Profile Name

   This parameter points to a tributary ASAP profile name *pfname* for the designated AID.

   The ASAP type depends on the *modifier*:

   - for LOVC/LOVT modifier, an ASAP of type PATH is required
   - for DS1 modifier, an ASAP of type DS1 is required

   Type: Alphanumeric string. A hyphen (" – -") is allowed in the name additionally.

   Range: 1 to 24 characters

   Default: DEFAULT.

8. **lptimmon** – LO Path Trace Identifier Mismatch Monitor

   This parameter specifies if the mode of the TIM detection. This parameter is relevant only if the related trace read format ptrcrfmt is set to 16 (16-byte-specific-string mode).

   The parameter is not supported for modifier:

   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.

   Type: Alphanumeric value set.

   Range: DISABLE, ENABLE.

   Default: DISABLE.

9. **neppm** – Near End Path PM Enable

   This parameter specifies whether the performance monitoring for the near end is enabled or disabled for this tributary.

   The parameter is not supported for modifier:

   - DS1

   Option: If the parameter is not supported, then the parameter is omitted.

   Type: Alphanumeric value set.

   Range: DISABLE, ENABLE

   Default: DISABLE.

10. **outpm** – Outgoing Near End Path PM Enable

    The parameter *outpm* specifies whether the performance monitoring for the near end in outgoing direction is enabled or disabled for this tributary.

    The parameter is only supported for modifier:

    - DS1

    Option: If the parameter is not supported, then the parameter is omitted.

    Type: Alphanumeric value set.

    Range: DISABLE, ENABLE

Default: DISABLE.

11. **pmlpfeses** – PM LO Path Far End SES Threshold

    This parameter specifies the Low Order Path Far End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the far end.

    The behavior depends on *modifier* and the transmission rate of this low-order tributary. For modifiers which include more than one transmission rate, the transmission rate can be derived from the parameter *inputsig* of the related PTF entity.

    The parameter is not supported for modifier:

    - DS1

    Option: If the parameter is not supported, then the parameter is omitted.

    Type: Integer.

    Range:

    The range depends on the tributary type in input direction, which can be derived from inputsig of the related PTF:

    - 1, 2, 3, …, 7998, 7999, 8000 (if the entity represents a LO-VC3 tributary)
    - 1, 2, 3, …, 1998, 1999, 2000 (if the entity represents a VC12 tributary)
    - 1, 2, 3, …, 3998, 3999, 4000 (if the entity represents a VT1.5 tributary)

    Default: The default value depends on the tributary type in input direction, which can be derived from *inputsig* of the related PTF: 2400 (if the entity represents a LO-VC3 tributary); 600 (if the entity represents a VC12 or VT1.5 tributary).

12. **pmlpneses** – PM LO Path Near End SES Threshold

    This parameter specifies the Low Order Path Near End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the near end.

    The behavior depends on *modifier* and the transmission rate of this low-order tributary. For modifiers which include more than one transmission rate, the transmission rate can be derived from the parameter *inputsig* of the related PTF entity.

    The parameter is not supported for modifier:

    - DS1

    Option: If the parameter is not supported, then the parameter is omitted.

    Type: Integer.

    Range:

    The range depends on the tributary type in input direction, which can be derived from *inputsig* of the related PTF:

    - 1, 2, 3, …, 7998, 7999, 8000 (if the entity represents a LO-VC3 tributary)
    - 1, 2, 3, …, 1998, 1999, 2000 (if the entity represents a VC12 tributary)
    - 1, 2, 3, …, 3998, 3999, 4000 (if the entity represents a VT1.5 tributary).
    - 1, 2, 3, …, 7998, 7999, 8000 (if the entity represents a DS1 tributary).

Default: The default value depends on the tributary type in input direction, which can be derived from *inputsig* of the related PTF: 2400 (if the entity represents a LO-VC3 tributary); 600 (if the entity represents a VC12 or VT1.5 tributary); 1544 (if the entity represents a DS1 tributary).

13. **ptca** – Path TCA Profile Pointer

    The parameter *ptca* specifies the name of the threshold crossing alert (TCA) profile used for this tributary.

    The TCA Profile type depends on the modifier.

    - for LOVC *modifier*, a TCA Profile of type LOVC is required
    - for LOVT *modifier*, a TCA Profile of type LOPATH is required
    - for DS1 *modifier*, a TCA Profile of type DS1 is required

    Type: Alphanumeric string.

    Range: 1 … 24 characters.

    Default: DEFAULT0.

14. **ptrc** – Incoming Path Trace

    The parameter ptrc shall report the accepted low order path trace identifier (J1 or J2). The length depends on the value of the parameter ptrcrfmt. The status of this value is contained in parameter ptrcst. If ptrcst indicates NORMAL, then ptrc contains a valid value. If ptrcst indicates UNAVAILABLE or AIS, then no valid incoming path trace identifier could be obtained by the system, e.g. due to not meeting the basic acceptance criteria or intra-NE communication problems, and the output parameter ptrc is omitted from the response.

    The parameter is not supported for modifier:

    - DS1

    Option: If the parameter is not supported, then the parameter is omitted.

    Type: Hexadecimal

    Range: the range depends on the parameter ptrcrfmt specified in RTRV-LONIM Output Parameters

    - 2, hexadecimal digits if *ptrcrfmt* = 2
    - 32, hexadecimal digits if *ptrcrfmt* = 16
    - 128, hexadecimal digits if *ptrcrfmt* = 64.

15. **ptrcrfmt** – Path Trace Read Format

    This parameter specifies the format of the path trace (J1 or J2 byte) to be received (sink).

    The parameter is not supported for modifier:

    - DS1

    Option: If the parameter is not supported, then the parameter is omitted.

    Type: Numeric string.

Range:

- 2 (default), for non-specific repeating byte
- 16, for 16 byte specific string
- 64, for 64 byte string (only applicable if the entity represents a LO-VC3 tributary).

To check whether the entity represents a LO-VC3 tributary or not, the parameter *inputsig* of the related PTF entity must be checked.

16. **`ptrcst`** – Status of Incoming Path Trace

    This parameter shows the status of the value of the incoming Path Trace Identifier (J1 or J2) which is available with parameter *ptrc*.

    The parameter is not supported for modifier:

    - DS1

    Option: If the parameter is not supported, then the parameter is omitted.

    Type: Alphanumeric value set.

    Range:

    - NORMAL, *ptrc* contains a valid value
    - UNAVAILABLE, no valid value for *ptrc* could be obtained by the system
    - AIS, no valid value for *ptrc* could be obtained due to SF condition

    Default: None.

17. **`rsiglb`** – Received Signal Label

    This parameter shall report the accepted trail signal label (C2 or V5). The parameter is not reported if the trailst parameter indicates a fail condition, i.e. has the value AIS or UNAVAILABLE.

    The parameter is not supported for modifier:

    - DS1

    Option: If the parameter is not supported, then the parameter is omitted.

    Type: Alphanumeric value set.

    Range: 00, 01, …, FE, FF, i.e. two hexadecimal digits.

    Default: None.

18. **`tcamd`** – TCA mode

    This parameter is only available for SDH mode and will therefore only be reported if the output parameter *aidtype* is LOVC. The parameter shows the modus of the PM thresholding.

    Two thresholding methods are applicable for SDH:

    - TR-only. (also known as the implicit reset method)
    - TR-RTR. (also known as the explicit reset method).

    For SONET, the parameter *tcamd* is not supported. SONET ports only support "TR-only" mode. Thus the mode must be internally set to "TR-only".

    The parameter is not supported for modifier:

    - DS1
    - LOVT

Option: If the parameter is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range: TR, TRRTR
Default:

- SDH mode: TRRTR
- SONET mode: TR (internal).

For SONET the parameter tcamd does not exist. SONET ports only support "TR-only" mode. Thus the mode must be internally set to "TR-only".

19. **tmonmd** – Tributary Monitoring Mode
    This parameter specifies the monitoring mode for the tributary.
    Type: Alphanumeric value set.
    Range: MON, NMON.
    Default: NMON.
20. **trailst** – Trail Status
    This parameter shall report the accepted trail status value.
    The parameter is not supported for modifier:
    - DS1

    Option: If the parameter is not supported, then the parameter is omitted.
    Type: Alphanumeric string
    Range:
    - AIS for Alarm Indication Signal in case of Trail Signal Fail Condition
    - UNAVAILABLE for unavailable
    - NORMAL.

    Default: None.

### Detailed behavior description

The RTRV-LONIM does not generate a **REPT DBCHG** message. The command shall retrieve all low order tributary parameter related to specified AID as described in section Output Parameters. It does not matter whether the entity is really in use or not.

No LO NIMs exist at the HO side of a conversion cross-connection. Therefore RTRV-LONIM does not return any values related to the HO side of a conversion cross-connection.

### Example input/output

Retrieval of all LO tributaries of a VC4 being substructured to 3 VC3:

```
RTRV-LONIM-LOVC:LT-UNITE:1-1-#-#-39-16-1-all:123456;

;
```

Retrieval of all LO tributaries of an STS1 being substructured to 28 VT1.5:

```
RTRV-LONIM-LOVT:LT-UNITE:1-1-#-#-39-16-1-all:123456;

   LT-UNITE 00-11-11 11:11:00
M  123456 COMPLD
   "1-1-#-#-39-16-1-1,LOVT::crslpbkstat=NO,degthr=-6,\
    dexcthr=-3,explptrc=8900000000000000000000000000000000,\
    feppm=DISABLE,lonimpn=DEFAULT,lptimmon=DISABLE,\
    neppm=DISABLE,pmlpfeses=600,pmlpneses=600,ptca=DEFAULT0,\
    ptrcrfmt=2,tmonmd=NMON"
   "1-1-#-#-39-16-1-2,LOVT::crslpbkstat=NO,degthr=-6,\
    dexcthr=-3,explptrc=8900000000000000000000000000000000,\
    feppm=DISABLE,lonimpn=DEFAULT,lptimmon=DISABLE,\
    neppm=DISABLE,pmlpfeses=600,pmlpneses=600,ptca=DEFAULT0,\
    ptrcrfmt=2,tmonmd=NMON"

          <listing of more VT1.5 related LONIM's of this HO Trib>
          <ending with>

   "1-1-#-#-39-16-1-28,LOVT::crslpbkstat=NO,degthr=-6,\
    dexcthr=-3,explptrc=8900000000000000000000000000000000,\
    feppm=DISABLE,lonimpn=DEFAULT,lptimmon=DISABLE,\
```

```
    neppm=DISABLE,pmlpfeses=600,pmlpneses=600,ptca=DEFAULT0,\
    ptrcrfmt=2,tmonmd=NMON"
;
```

Retrieval of a single VC3 with dynamic parameters:

```
RTRV-LONIM-LOVC:LT-UNITE:1-1-#-#-39-16-1-43:123456::dyn=YES;

   LT-UNITE 00-11-11 11:11:00
M  123456 COMPLD

   outpm=ENABLE,pmlpneses=1544,ptca=DEFAULT0,tmonmd=NMON"
;
```

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-LONIM** command.

### Validation rule: Check LONIM::modifier against PTF::ptfstd

If the command is applied with a modifier which does not match to the interface standard parameter *ptfstd* of the owning PTF entity, then the command is denied.

Error code: `IENE – Input, Entity Not Exists`

The following combinations are allowed (*modifier istd*):

- LOVC, SDH
- LOVT, SONET
- DS1, SONET
- ALL, SDH or SONET

### Validation rule: Check *aid* and *dyn* consistency

If the command is applied with an *aid* parameter containing wildcards (all at any position) and the *dyn* parameter is set to YES, then the command is denied.

Error code: `IDRG – Input, Data Range Error`

Example: Given the aid refers to 1-1-#-#-39-16-1-all and the dyn parameter is set to YES then the command will be rejected.

# RTRV-LOXCPM: Retrieve performance monitoring data of LOXC pack

The **RTRV-LOXCPM** command is initiated by a user to request the network element to send the current and/or historical Performance Monitoring (PM) data associated with performance monitoring points located on an LOXC pack. For each value in the *montype* parameter of the **RTRV-PM** input Parameters section, PM counter values will be stored in the current 15-minute period, the 32 previous 15-minute periods (past 8 hours worth of data), current day, and previous day periods.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): PM1

Priority: 1

Abortable: Yes.

## Input format

Command syntax:

**RTRV-LOXCPM**-*modifier*:*tid*:*aid*:*ctag*::[*montype*], [*monlev*], [*locn*],,*tmper*, [*mondat*], [*montm*];

## Input parameters

### Command parameters

1. **modifier**
   This parameter defines the type of performance monitoring point.
   Type: Alphanumeric value set.
   Range: The following value is for SONET only: LOVT1.
   The following values are for SDH only: LOVC3, LOVC12.
2. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
3. **aid** – Access Identifier
   Type: AID
   Range: GenLOTribAID
   Wildcard values in parts of both AIDs are usable as follows:
   - *all*, *usall* in Simple_UnivSlotAID,
   - *all* in Simple_SPortAID,
   - *all* in Simple_PTNumAID,
   - *all* in Simple_LONumAID.
   - *all* in Simple_TMuxSLONumAID.

Default: None.

4. **ctag** – Correlation Tag
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
5. **montype** – Monitored Parameter Type
   This is the monitored parameter type for which data is requested. If the value is omitted, this parameter defaults to ALL.
   Type: value set.
   Range:
   - The following values are for LOVT1 modifiers only: CVP, ESP, SESP, UASP, FC-P, CV-PFE, ES-PFE, SES-PFE, UAS-PFE, FC-PFE
   - The following values are for LOVC3 and LOVC12 modifiers only: VC-N-ES, VC-N-SES, VC-N-BBE, VC-N-UAS, VC-F-ES, VC-F-SES, VC-F-BBE, VC-F-UAS

   The following value is also allowed for all input modifiers: ALL.
   Default: ALL.
6. **monlev** – Monitored Level
   This parameter provides the level for the monitored PM parameter. The parameter is only evaluated if the value of *montype* parameter is ALL.
   Type: value set.
   Range:
   - 1-UP: Means the NE will report all non-zero data and all data which is marked as non-valid (parameter validity).
   - 0-UP: Means the NE will report zero and all positive data.

   Default: 1-UP.
7. **locn** – Location
   Location for which the PM data is monitored. The parameter value is only considered if the *montype* value is ALL; otherwise it is ignored for the calculation of the command reply (i.e has no impact on the command).
   Type: value set.
   Range:
   - NEND: Near-End PM data is requested.
   - FEND: Far-End PM data is requested.
   - ALL: All near-end and far-end data is requested. It applies only to input direction.

   Default: ALL.
8. **tmper** – Time Period
   This requests PM data for a specified time interval.
   Type: value set.
   Range:
   - 15-MIN: This requests PM data in 15-minute intervals
   - 1-DAY: This requests daily PM data.

9. **mondat** – Monitored Date

   This requests the beginning date of the interval for which the PM data is to be reported. For both values of tmper parameter, the maximum allowable range of valid dates includes the current and previous one day.

   Type: value set.

   Range:

   - MM-DD: Month-Day. A leading zero (first M or first D) is optional and may be omitted.
   - ALL: Current and previous day.

   Default: Current date

10. **montm** – Monitored Time

    This parameter specifies the beginning time of day of the requested PM period that was set by *tmper* parameter. The user is able to specify a monitored time in three modes:

    a. A monitored time interval (i.e., from hour-minutes to hour-minutes: HOD-MOH&&THOD-TMOH).

    b. A single time interval (i.e., the hour and minutes for the appropriate 15 minute data: HOD-MOH).

    c. All applicable beginning times for the given *mondat* value (i.e., all).

    Where HOD-MOH represents the start of the requested PM retrieval period (hours and minutes) and THOD-TMOH represents the end of the requested PM retrieval period. The value ALL must be used if the *mondat* value provided is ALL.

    Type: Character string.

    Range:

    - HOD-MOH: This specifies the beginning time of day of the requested PM period that was set by *tmper* parameter. This parameter may be omitted or have one of the following values: Hour Of Day- Minute Of Hour, where HOD ranges from 0 to 23 and MOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0.
    - THOD-TMOH: To Hour Of Day-To Minute Of Hour, where THOD ranges from 0 to 23 and TMOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0. Parameter grouping is used when specifying THOD-TMOH. For example, 08-15&&09-00 specifies the HOD-MOH and THOD-TMOH of 08-15 and 09-00, respectively. THOD-TMOH of $$-$$ indicates the current Hour Of Day-Minute Of Hour. THOD-TMOH of ##- ## indicates the previous 15-min interval.
    - ALL: All applicable beginning times for the given *mondat* value.

    If the *tmper* value is 1-DAY, the *montm* parameter will not be used.

    Default:

    If THOD-TMOH is not specified, only the PM data for the retrieval period specified by HOD-MOH will be retrieved.

    If HOD-MOH is omitted, the PM period for the current time will be reported.

### Output format

If the NE fully complies with the RTRV-LOXCPM request, the following normal completion response is returned:

```
    sid date time
M  ctag COMPLD
   "aid:montype,monval,[validity],[tca],[locn],,tmper,[mondat],[montm]"
   . . . . .
   . . . . .
   . . . . .
;
```

Note: The trailing comma has to be present even if the optional parameter is not supported for a dedicated release.

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the Output Parameter section for the **RTRV-HDR** command.

#### Normal completion message - empty reply

If there is no PM data stored within the NE, then the following response is returned:

```
   sid date time
M  ctag COMPLD
;
```

### Output parameters

1. **aid** – Access Identifier
   Description: Access identifier.
   Type: AID
   Range: GenLOTribAID
   Wildcard values (e.g. *all* or *usall*) in any parts of both AIDs is not used.
2. **montype** – Monitored Parameter Type
   See montype in the input parameters section.
3. **monval** – Monitored Value
   This parameter contains the measured value of the parameter specified in montype.
   Type: Integer.
   Range: 0-4294967295
   The specified range is the maximal range taking all PM parameters into consideration. Specific PM parameters may have a smaller range.

W.r.t. value range for the specific PM parameters see

- "Output parameters" section in "RTRV-TCA-PROF: Retrieve TCA profile" (p. 3-2958) (if thresholding is applicable for that parameter)
- PM parameter introduction section (if thresholding is not applicable for that parameter).

4. **validity** – validity indicator

   This parameter indicates the validity of the PM data.

   Type: Integer.

   Range: 1: valid; (omitted): non-valid.

   If the value is omitted, it indicates that the validity is "non valid".

5. **tca** – Threshold Crossing Alert

   Type: value set.

   Range:

   For the current interval: *tca* indicates:

   - in TCA mode TR, that the current value exceeds the provisioned threshold
   - in TCA mode TR-RTR, that a *tca* occurred since the beginning of this interval or that the *tca* reset condition was not fulfilled in any previous interval since the last tca occurred.

   If the value is omitted, it indicates

   - in TCA mode TR, that the current value is below the provisioned threshold
   - in TCA mode TR-RTR, that no tca occurred since the beginning of this interval and that the *tca* reset condition was fulfilled at least in one previous interval.

   For previous intervals, the *tca* parameter indicates the state at the end of the interval.

6. **locn** – Location

   Location for which the PM data is monitored.

   Type: value set.

   Range:

   - NEND: Near-End PM data is requested
   - FEND: Far-End PM data is requested.

7. **tmper** – Time Period

   See in the input parameters section.

8. **mondat** – Monitored Date

   This parameter specifies the beginning date of the interval for which the PM data is reported. The parameter can be omitted in case of current date.

   Type: value set.

   Range: MM-DD: Month-Day

   Default: Current date

9. **montm** – Monitored Time

   This parameter specifies the beginning time of day for the reported pm register. The parameter is optional and may be omitted for the reporting of current bins (registers).

Type: Character string.
Range: HOD-MOH: HOD ranges from 0 to 23; MOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0.

### Detailed behavior description

This parameter shall

- only return those parameters, which are specified by the input parameters
- omit parts of the response (maybe to return an empty response) if related performance monitoring has not been enabled (independent whether this occurs due to a specific or wildcard query)
- omit parts of the response due to a wildcard query (maybe to return an empty response) if the related entity does not exist
- omit an entity within the response if the entity is not in use for the specified transmission rate or if the entity is currently not in use at all (LOVC12 only)
- return an empty response for non-existing LONIM entities.

Examples:

If a command is executed for a specific existing LOVT1 entity to retrieve all parameters but the entity has only near-end (thus no far-end) performance monitoring enabled, then a response will be returned containing only the near-end values.

If a command is executed for all LOVC3 entities of a specific VC4 PTF but this PTF is substructured into 1 VC3 and 42 VC12 then a response will be returned containing only the parameters for the one existing VC3.

If a command is executed for a specific LOVC12 entity but the related PTF is substructure into 3 VC3 signals then an empty response will be returned.

Further examples leading to empty responses:

- A command with a specific AID containing a GenLOTribAID for a DS3 port
- A command with a specific AID and modifier LOVC3 containing a Simple_LONumAID different than 1, 22, 43
- A command with a specific AID and modifier LOVC12 containing a Simple_LONumAID equal to 1, 22 or 43 and the related third of the VC4 substructure indicates a VC3 signal rate
- A command with a specific AID and modifier LOVT1 containing a Simple_LONumAID greater than 28.

### Example input/output

The following example shows the successful completion of a **RTRV-LOXCPM** command by the network element for a LOVT1:

```
RTRV-LOXCPM-LOVT1:UNITE-NE:1-1-#-#-39-16-3-28:123456::\
vc-f-es,1-up,,,15-min ,,00-00&&08-00;
```

```
   UNITE-NE 00-01-01 08:00:00
M  123456 COMPLD
   "1-1-#-#-39-16-3-28:vc-f-es,17,,tca,,,15-min,,00-00"
   "1-1-#-#-39-16-3-28:vc-f-es,10,,tca,,,15-min,,00-15"
   . . .
   "1-1-#-#-39-16-3-28:vc-f-es,15,,tca,,,15-min,,08-00"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-LOXCPM** command. See also subsection 'Partial Completion on RTRV Commands' w.r.t. handling of internal error (for example, communication to XCn fails) for a subset of replies.

# RTRV-LPBK (cross-connection): Retrieve loopback (cross-connection)

The **RTRV-LPBK**-*modifier* command can be initiated by a user to retrieve information on cross-connection loopback(s) in the NE.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): T1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-LPBK**-*modifier*:*tid*:*aid*:*ctag*;

## Input parameters

### Command parameters

1. **modifier**

   This parameter indicates the rate of the currently active cross-connection loopback for the specified tributary on which the **RTRV-LPBK** command acts on.

   For the adaptive rate case this means that the *modifier* does not specify the rate (constituent signal type) of the tributary, but the cross-connection loopback rate.

   Type: Alphanumeric value set.

   Range:

   - ALL
   - VC3
   - VC4
   - VC44C
   - VC416C
   - VC464C
   - STS1
   - STS3
   - STS12
   - STS48
   - STS192
   - LOVC3

- LOVC12
- LOVT1.

2. **tid** – Target Identifier

   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and the description of this parameter.

3. **aid** – Access Identifier

   This parameter specifies the tributary for which loopback information is requested to be retrieved.

   Type: GenTribAID or GenLOTribAID.

   Range: The **all**-parameter is accepted for the slot-, port-, high-order trib- and optionally for the low-order-trib-part of the AID. In addition, the value **vall** is accepted for the high-order trib-part and the value **usall** is accepted for the slot-part of the AID. If the slot-/port-/high-order trib-part is set to **all** or **usall** then all high-order loopbacks are retrieved but those referring to GE*n*, ES64U, and OPT*n*. To get those, the **vall** value must be used at high-order trib-part of the AID. If the low-order-trib-part is set to **all** then all low-order loopbacks of the system are retrieved. The value **vall** for the high-order trib-part of the AID is not allowed in this case.

   For example the following *aids* are valid:

   - 1-1-#-#-all-all-all specifying all HO tribs for all ports in the whole shelf
   - 1-1-#-#-2-1-all specifying all HO tribs of the first port of the pack in slot-number=02
   - 1-1-#-#-3-vall-all specifying all HO tribs of all ports of the (GE*n*, ES64U, or OPT*n*) pack in slot-number=03
   - 1-1-#-#-all-all-all-all specifying all LO tribs for all HO tribs and ports in the whole shelf

   However the following example shows an invalid aid: 1-1-#-#-all-vall-all-all there is no low order tributary on GE*n* or OPT*n* packs:

   1-1-#-#-all-vall-all-all: there is no lower-order tributary on GE*n*, ES64U, or OPT*n* packs

4. **ctag** – Correlation Tag

   See definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output format

Normal completion message

In response to a valid **RTRV-LPBK-***modifier* command, the following output is returned:

```
   sid date time
M  ctag COMPLD
   "aid:rate:spec_block"
       ...
       ...
   "aid:rate:spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command parameters

1. **`aid`** – Access Identifier

   This parameter specifies the tributary for which loopback information is retrieved.
   Type: GenTribAID or GenLOTribAID.
   Range: No **`all`** or **`usall`** or **`vall`** value shell be possible for any part of the aid..

2. **`rate`**

   This parameter indicates the cross-connection rate. For a detailed description please refer to parameter *rate* in "RTRV-CRS: Retrieve cross-connection" (p. 3-2290).
   Type: Alphanumeric value set.
   Range:

   - VC3
   - VC4
   - VC44C
   - VC416C
   - VC464C
   - STS1
   - STS3
   - STS12
   - STS48
   - STS192
   - LOVC3
   - LOVC12
   - LOVT1.

### Spec block parameters

1. **`crslpbkstat`** – Cross-connect Loopback Status

   This parameter specifies the current cross-connection loopback status of the considered tributary *aid*.
   The value *YES* will be used in case the tributary is loop-backed.
   Note that the tributary does not need to be involved in a cross-connection – but can be in loopback also without cross-connection.

Note that no dedicated value is specified for the case of a non loop-backed tributary since such a tributary will no be in output.

Type: Alphanumeric value set.

Range: YES.

## Detailed behavior description

The **RTRV-LPBK** command allows the retrieval of loopback information for tributaries, regardless if they are involved in cross-connections or not. Tributaries which are not involved in a cross-connection loopback are not present in the reply output.

### Interface Standard Independence

No command validation between port interface-standard and modifier will be performed. The output parameter *rate*, however, is filled with the rate according to the interface standard of the port.

### Update affected entities

The **RTRV-LPBK** command does not affect other entities.

### Identification of VCG Tributaries

The system shall allow to retrieve cross-connection loopbacks involving VCG Tributaries using the AID format of an AU-3/STS-1 Tributary. I.e. the VCG number specified in the port field of the AID shall be allowed with or without the leading “v”.

## Example Input/output

### Example:

The example shows the loopback status for the 13th trib of the pack in slot 07, which has an existing loopback:

```
RTRV-LPBK-VC3:UNITE-NE:1-1-#-#-7-1-13:123456

   sid date time
M  ctag COMPLD
   "1-1-#-#-7-1-13:STS1:crslpbkstate=YES"
;
```

## References

GR-199-CORE

# RTRV-LPBK (facility): Retrieve loopback (facility)

The **RTRV-LPBK**-*modifier* command can be initiated by a user to retrieve information on facility loopback(s) in the NE. Facility herein is identical to port – either an optical port of an OP*n* pack or the optical port of a GE*n* pack – no other ports (like timing ports, UserByte ports etc) are settable to loopback.

As long as there is loopback active on a port, the *abnormal* LED lights.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): T1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-LPBK**-*modifier:tid:aid:ctag;*

## Input parameters

### Command parameters

1. **modifier**

   This parameter indicates the port rate on which the **RTRV-LPBK** command acts on. (In principle this parameter is redundant, because the port-rate is implicitly given by the port-AID (*SPortAID*), but in order to align the facility loopback command with the tributary loopback command this parameter is retained.)

   Type: Alphanumeric value set.

   Range:

   - ALL
   - STM1E
   - STM1
   - STM4
   - STM16
   - STM16T
   - STM64
   - STM256
   - EC1
   - OC3
   - OC12
   - OC48
   - OC48T

- OC192
- OC768
- 1GE
- 1GEPL
- 10GEPL
- T3

2. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
3. **aid** – Access Identifier
   Access Identifier of the port for which the loopback state is returned.
   Type: AID
   Range: SPortAID (when using OP*n*, EP155, OPT*n* packs or EC1 interfaces on the EP51 pack) as defined in AID structure. The values:
   - all for Simple_SPortAID, usall for Simple_UnivSlotAID, all for Simple_UnivSlotAID, all for Simple_ShelfAID and all for BayAID is accepted.

   APortAID (when using DS3 interfcaes on the EP51 pack) as defined in AID structure. The values:
   - all for Simple_APortAID, usall for Simple_UnivSlotAID, all for Simple_UnivSlotAID, all for Simple_ShelfAID and all for BayAID is accepted.

   EPortAID (when using GE*n* packs) as defined in AID structure. The values:
   - all for Simple_EPortAID, usall for Simple_UnivSlotAID, all for Simple_UnivSlotAID, all for Simple_ShelfAID and all for BayAID is accepted.
4. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

### Output format

In response to a valid RTRV-LPBK command, the following output is returned:

```
   sid date time
M ctag COMPLD
   "aid:rate:spec_block"
       ...
       ...
   "aid:rate:spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command parameters

1. **`aid`** – Access Identifier

   Access Identifier of the port for which the loopback state is returned.
   Type: AID
   Range: SPortAID (when using OP*n*, EP155, OPT*n* packs or EC1 interfaces on the EP51 pack) as defined in AID structure. The values:

   - all for Simple_SPortAID, usall for Simple_UnivSlotAID, all for Simple_UnivSlotAID, all for Simple_ShelfAID and all for BayAID is excluded.

   APortAID (when using DS3 interfcaes on the EP51 pack) as defined in AID structure. The values:

   - all for Simple_APortAID, usall for Simple_UnivSlotAID, all for Simple_UnivSlotAID, all for Simple_ShelfAID and all for BayAID is excluded.

   EPortAID (when using GE*n* packs) as defined in AID structure. The values:

   - all for Simple_EPortAID, usall for Simple_UnivSlotAID, all for Simple_UnivSlotAID, all for Simple_ShelfAID and all for BayAID is excluded.

2. **`rate`**

   This parameter indicates the port *rate*.
   Type: Alphanumeric value set.
   Range:

   - STM1E
   - STM1
   - STM4
   - STM16
   - STM16T
   - STM64
   - STM256
   - EC1
   - OC3
   - OC12
   - OC48
   - OC48T
   - OC192
   - OC768

- 1GE
- 1GEPL
- 10GEPL
- T3.

### Spec block parameters

1. **lpbk** – Loopback

   This parameter specifies the current near-side loopback status of the output *aid*. A near-side loopback means that the signal on the incoming port is looped to the outgoing port.

   If *lpbk* = YES then the port is (near-side) loop-backed.

   If *lpbk* = NO then there is no (near-side) loopback existing for the port.

   Note: At most one loopback (*lpbk* or *fsflpbkstat*) can be set to YES for the same port at the same time.

   Type: Alphanumeric value set.

   Range:

   - YES
   - NO (default).

2. **fsflpbkstat** – Far-Side-Facility-Loopback-Status

   This parameter specifies the current far-side facility loopback status of the output *aid*. A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port.

   If *fsflpbkstat* = YES then the port is (far-side) loop-backed. If *fsflpbkstat* = NO then there is no (far-side) loopback existing for the port.

   Note: At most one loopback (*lpbk* or *fsflpbkstat*) can be set to YES for the same port at the same time.

   Type: Alphanumeric value set.

   Range:

   - YES
   - NO (default).

## Detailed behavior description

The **RTRV-LPBK** command allows the retrieval of near-side and far-side loopback information for ports.

If no port exists with the specified interface standard, rate, and type (*modifier*) at the AID or in the AID range, then the command shall complete and return an empty response.

For the GE*n* the lpbk parameter is always set to NO due to the fact that the GE (EPort) only allows the far-side loopback possibility.

### Example input/output

Suppose the port 1 of the pack in slot 7 has a existing near-side loopback:

```
RTRV-LPBK-ALL:UNITE-NE:1-1-#-#-7-1:123456

   sid date time
M  ctag COMPLD
   "1-1-#-#-7-1:OC48:lpbk=YES,fsflpbkstat=NO"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-LPBK** command.

# RTRV-MANROUTE-LAN: Retrieve manual route at LAN port

The **RTRV-MANROUTE-LAN** command is used to retrieve manual route entries at LAN ports, which are used as UNI control channels.

## Properties

Priority: S1

Abortable: Yes

## Input format

Command syntax: **RTRV-MANROUTE-LAN***:tid:[aid]:ctag;*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **aid** – Access Identifier
   This parameter indicates the LAN port AID.
   Type: AID.
   Range: LanPort AID.
   Default: If this field is omitted, the report will display the manual route entries of all lan ports assigned to the UNI node.
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*.

## Output format

If the **RTRV-MANROUTE-LAN** is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "aid:spec_block"
       ...
   "aid:spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output Parameter section for the "RTRV-HDR: Retrieve header" (p. 3-2397) command.

## Output parameters

### Command parameters

1. **aid** – Target Identifier
   This parameter indicates the LAN port AID. The value *lanall* is not allowed.
   Type: AID.
   Range: LanPort AID.

### Spec block parameters

1. **ip_ad** – destination IP Address
   This parameter is used o indicate the destination IP address to which a manual route is created. This is the LAN i/f address of UNI-C
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255. The values 0.0.0.0 and 1.1.1.1 are not allowed.
2. **ip_ad_uni** – Node ID of UNI-C
   This parameter is usedo indicate the router ID of the UNI-C to which a manual route is created.
   Type: Four dot separated numeric strings
   Range: Each numeric string: 0 .. 255.
3. **osinode**
   This parameter is used to indicate the OSI node assigned to the LAN port.
   Type: AID.
   Range: uninode.

## Detailed behavior description

The command shall retrieve the manual route entries for LAN ports which are used for UNI control channel, i.e. are assigned to UNI node. If no manual route entries exist, the command shall return an empty list. The initial value of the manual routes it an empty list.

## Example input/output

The following example shows the result of RTRV-MANROUTE-LAN:

```
RTRV-MANROUTE-LAN:NE-UNITE:1-1-lan2:123456;
   NE-UNITE 06-06-30 11:01:00
M  123456 COMPLD
   "1-1-lan2:ip_ad=135.248.206.72,ip_ad=135.248.143.102,ip_snm=255.255.0.0,
   osinode=uninode"
;
```

## Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2397). The error responses listed there also apply to the **RTRV-MANROUTE-LAN** command.

### Validation rule: Not allowed to use LAN1 for UNI

If LAN1 is specified in the AID, then the command is denied.

Error code: `IDNV - Input, Data Not Valid, LAN1 not allowed for UNI`

### Validation rule: LAN port not used for UNI

If the LANport specified in the AID is not in use for UNI, i.e. is not assigned to the uninode, then the command is denied.

Error code:
`SNVS - Status, Not in Valid State, LAN port not in use for UNI`

## Related TL1 messages

# RTRV-MANROUTE-MCN: Retrieve manual IP route for management communication

The **RTRV-MANROUTE-MCN** command is used to retrieve the provisioned manual MCN IP routes from a gateway NE.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-MANROUTE-MCN***:tid:[aid]:ctag;*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **aid** – Access Identifier
   This parameter indicates the LAN port AID.
   Type: AID.
   Range: LanPort AID.
   The keyword "lanall" is allowed for Simple_LANPortAID.
   Default: Omitting this field has the same effect as the keyword "lanall", that means, the report will display the manual MCN route entries of all possible LAN ports assigned to the MCN.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

## Output format

If the **RTRV-MANROUTE-MCN** request is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "aid:spec_block"
       .
       .
     <one line for each Manual MCN IP Route entry>
       .
   "aid:spec_block"
```

;

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command parameters

1. **aid** – Target Identifier
   This parameter indicates the LAN port AID. The value *lanall* is not allowed.
   Type: AID.
   Range: LanPort AID.

### Spec block parameters

1. **dest_ipad** – Destination IP Address
   The IP address of an IP node which can be reached via one of the LAN ports.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 … 255. The values 0.0.0.0, 1.1.1.1, and 127.0.0.1 are not allowed.
   Default: None.
2. **dest_ipmask** – Destination IP Subnet Mask
   The IP subnet mask of the IP node which can be reached via the LAN port.
   Type: Four dot separated numeric strings
   Range: Each numeric string: 0 … 255.
   Default: None.
3. **nexthop_ipad** – Next Hop IP Address
   The IP address of the next hop routing node via which the Destination IP Address can be reached.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 … 255. The value 0.0.0.0 is used if the IP node defined by *dest_ipad* is connected to the LAN port directly. The values 1.1.1.1 and 127.0.0.1 are not allowed.
   Default: None.

## Detailed behavior description

The command retrieves all provisioned manual MCN IP routes. The output of the command is not sorted.

## Example input/output

The following example shows the result of **RTRV-MANROUTE-MCN**:

```
RTRV-MANROUTE-MCN:UNITE-NE::123456;
   NE-UNITE 08-06-20 11:01:00
M  123456 COMPLD
   "1-1-lan2:dest_ipad=192.168.100.72,dest_ipmask=255.255.0.0,
   nexthop_ipad=192.168.1.83"
   "1-1-lan2:dest_ipad=192.168.200.165,dest_ipmask=255.255.0.0,
   nexthop_ipad=192.168.1.83"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-MANROUTE-MCN** command.

### Related TL1 messages

# RTRV-MAP-NEIGHBOR: Retrieve map neighbor

The **RTRV-MAP-NEIGHBOR** command will retrieve a list of all immediate OSI neighbors to the local NE (node or NE). This can include other NEs, as well as neighbors on the LAN, such as the CIT.

A neighbor entry will not appear in the report for channels allocated to the SCN_node_AID or the UNI_node_AID or the ENNI_node_AID.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-MAP-NEIGHBOR***:tid*::*ctag*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
   Type: TID
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
   Type: CTAG

## Output format

If the **RTRV-MAP-NEIGHBOR** request is successful, the following normal completion message is returned:

```
   sid date time
M  ctag COMPLD
   "[rate]:thru[,lpaid]:spec_block"
   ...
   "[rate]:thru[,lpaid]:spec_block"
;
```

Ordering of output lines: Output is sorted in ascending order first by *lpaid*.

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command parameters

1. **`rate`** – DCC Port Rate

   This parameter is only available for a DCC neighbor and provides the optical port rate as used in RTRV-*rr*.

   Type: Value set.

   Range:

   - STM1
   - STM4
   - STM16
   - STM64
   - STM256
   - OC3
   - OC12
   - OC48
   - OC192
   - OC768.

   Default: n/a – as determined by the port type.

2. **`thru`** – Connected Through

   This parameter specifies the type of connectivity between the NE and its neighbor.

   Type: value set.

   Range: DCC, LAN.

   Default: n/a – as determined by the type of connection.

3. **`lpaid`** – Local Port AID

   This parameter provides the SPortAID of the optical port in case thru=DCC or the LanPortAID in case thru=LAN.

   Type: AID.

   Range: SPortAID in case thru=DCC or LanPortAID in case thru=LAN as defined in section AID Structure.

### Spec block parameters

1. **`nsap`** – Network Service Access Point

   This filed defines the ASAP of the neighbor.

   Type: 20 byte octet string in 40 digit hex representation.

Range: The NSAP address/NET is composed of the following components:

- l3idp (l3afi and l3idi)
- l3dfi,
- l3org,
- l3res,
- l3rd,
- l3area,
- l3sys,
- l3se.l

See "RTRV-ULSDCC-L3: Retrieve layer 3 related parameters" (p. 3-3024) for details.

2. **npaid** – Neighbor Port AID

   This parameter is only available for DCC neighbors and provides the port AID of the optical port of the OSI neighbor. (Peer of *lpaid*)

   Since the neighbor NE might have a different AID structure it is interpreted as a string.

   Type: AID string.

   Range: up to 20 characters-

3. **tid** – Neighbor TID

   This parameter is only available for DCC neighbors. It provides the TID value of the neighbor NE.

   Type: TID

   Range: Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for legal values and a general description of TIDs.

4. **dcctype** – DCC Type

   This parameter is only available for DCC neighbors. It specifies whether the values displayed in the *spec_block* refer to the MS/LINE or RS/SECTION DCC.

   Type: value set.

   Range:

   - SECTION
   - LINE

   Default: n/a – depends on DCC channel type for which *spec_block* parameters are reported.

### Detailed behavior description

The command retrieves per NE information about all neighbors which are physically connected to the local NE via DCC or LAN and about details of the connection as specified in the output command and *spec_block* parameters.

If there is a link failure between the local NE and its neighboring NE, or if the DCC is disabled, the neighbor NE entry will not appear in the report.

The command will not retrieve the neighborship between the internal osinodes of the NE. This is only relevant for the network level design and RTRV-MAP-NETWORK can be used for it.

A neighbor node entry shall not appear in the report for DCC channels allocated to the CN_node_AID or the UNI_node_AID. A neighbor node entry shall not appear in the report for LANs allocated to the SCN_node_AID or the UNI_node_AID or the ENNI_node_AID.

This command does not generate a **REPT DBCHG** notification.

### Example input/output

The following example shows the result of a RTRV-MAP-NEIGHBOR command for an NE which has all DCCs (RS/MS) enabled for the port on an OP40 and the CIT LAN:

```
RTRV-MAP-NEIGHBOR:LT-UNITE::123456;
   LT-UNITE 00-11-01 15:00:00
M  123456 COMPLD
   "STM256:DCC,1-1-#-#-1-1:
nsap=39840F8000000000000000000000000000a400,npaid=1-1-#-#-1-1,tid=LT-UNITE2,
   dcctype=SECTION"
   "STM256:DCC,1-1-#-#-1-1:
nsap=39840F8000000000000000000000000000a400,npaid=1-1-#-#-1-1,tid=LT-UNITE2,
   dcctype=LINE"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-MAP-NEIGHBOR** command.

### Related TL1 messages

- “ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack” (p. 3-1308)

- “RTRV-MAP-NETWORK: Retrieve network map” (p. 3-2511)

# RTRV-MAP-NETWORK: Retrieve network map

The **RTRV-MAP-NETWORK** command will retrieve a list of OSI nodes, reachable from the local NE (NE). This can include other NEs, other nodes on the local NE, as well as neighbors on the LAN, such as the CIT.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-MAP-NETWORK**:*tid*:*aid*:*ctag*[::*level2*];

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
   Type: TID.
2. **aid** – Access Identifier
   This parameter specifies the osinode for which the OSI nodes is retrieved. The value *osinodeall* is not allowed.
   Type: AID.
   Range: OSI_node_AID | SCN_node_AID. The value *osinodeall* is not allowed.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
   Type: CTAG.
4. **level2** – IS Routing Level
   If set to N(o), report will list only the nodes in the local level 1 area of this node.
   If set to Y(es), report will list the nodes in the level 2 sub-domain (when *aid* specifies a level 2 node).
   If set to N(o) the list will include level-1-only and level-1+2 nodes.
   Note: For nodes where level 2 routing is not supported, the output will be empty when *level2* = Y.
   Note: The previous note implies that level2 is set to N, if info for osinode=scnnode is requested.
   Type: value set.

Range:

- N (default)
- Y.

## Output format

If the RTRV-MAP-NETWORK request is successful, the following normal completion message is returned:

```
   sid date time
M  ctag COMPLD
   "spec_block"
   ...
   "spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Spec block parameters

1. **level1** – level 1 Router

   This parameter specifies whether reachable node is level 1 router.

   Type: Value set.

   Range:

   - Y (es)
   - N (o).

2. **level2** – Level 2 Router

   This parameter specifies whether reachable node is level 2 router.

   Type: Value set.

   Range:

   - Y (es)
   - N (o).

3. **ip_ad1** – IP Address 1

   This parameter is used to retrieve the IPv4 address of a reachable SCN node or LAN interface in the network map. This output parameter is only available when input aid is of type SCN_node_AID.

   Note: The IP address can be a host address or one of up to two LAN interfaces addresses. There is no order or semantics (i.e. whether IP address belongs to SCN node or LAN interface) specified for ip_ad1, ip_ad2, ip_ad3.

   Type: Four dot separated numeric strings or empty string.

Range: Each numeric string: 0 .. 255 or empty string.

Note: The empty string is reported when the IP address can not be retrieved. In output direction it is represented as \"\".

4. **ip_ad2** – IP Address 2

   This parameter is used to retrieve the IPv4 address of a reachable SCN node or LAN interface in the network map. This output parameter is only available when input aid is of type SCN_node_AID.

   Note: The IP address can be a host address or one of up to two LAN interfaces addresses. There is no order or semantics (i.e. whether IP address belongs to SCN node or LAN interface) specified for ip_ad1, ip_ad2, ip_ad3.

   Type: Four dot separated numeric strings or empty string.

   Range: Each numeric string: 0 .. 255 or empty string.

   Note: The empty string is reported when the IP address can not be retrieved. In output direction it is represented as as \"\".

5. **ip_ad3** – IP Address 3

   This parameter is used to retrieve the IPv4 address of a reachable SCN node or LAN interface in the network map. This output parameter is only available when input aid is of type SCN_node_AID.

   Note: The IP address can be a host address or one of up to two LAN interfaces addresses. There is no order or semantics (i.e. whether IP address belongs to SCN node or LAN interface) specified for ip_ad1, ip_ad2, ip_ad3.

   Type: Four dot separated numeric strings or empty string.

   Range: Each numeric string: 0 .. 255 or empty string.

   Note: The empty string is reported when the IP address can not be retrieved. In output direction it is represented as \"\".

6. **ip_sid** – SID

   This parameter is used to display the SID of a reachable SCN node in the network map. This output parameter is only available when input aid is of type SCN_node_AID.

   Note: Since the SID (MAC address) is unique it might be used to detect misconfigurations of duplicate IP addresses.

   Type: Hexadecimal number.

   Range: 000000000000 – FFFFFFFFFFFF.

7. **net** – Network Entity Title

   This field is the Network Entity Title (NET) of one reachable OSI node. The NET is the same as the NSAP with the last byte set to 00 (hex).

   This output parameter is only available when input aid is of type OSI_node_AID.

   Type: 20 byte octet string in 40 digit hex representation.

   Range: The NET is composed of the following components:

   - l3idp (l3afi and l3idi)
   - l3dfi,
   - l3org,
   - l3res,

- l3rd,
- l3area,
- l3sys,
- l3sel = 00 (hex).

See "RTRV-ULSDCC-L3: Retrieve layer 3 related parameters" (p. 3-3024) for details.

8. **tid** – Target Identifier

   This parameter specifies the TID of the NE. This parameter is reported for entries of the local and remote NEs if OSI node 1 is specified as AID in the command. For OSI nodes 2 – 8 and the SCN node, the parameter is only reported for entries of the local NE.

   Type: TID

   Range:

   - Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for legal values of TIDs
   - "?" when the TID cannot be determined.

## Detailed behavior description

The **RTRV-MAP-NETWORK** command retrieves per node a list of OSI or SCN nodes (depending on the input aid), reachable from the local network element (NE) via the OSI or SCN stack(s). This can include other network elements, other nodes of the local NE, as well as other systems on the LAN, such as the CIT.

In contrast to RTRV-MAP-NEIGHBOR or RTRV-SCN-NEIGHBOR, which retrieve info about physical neighbors and properties of the physical connection, this command shall retrieve info with respect to (I)IS-IS routing.

If the node specified by aid is provisioned as level 2 and level2=Y, the report shall list the level 2 nodes across the level 2 subdomain and the nodes in the local level 1 area of the selected node. The output parameters level1 and level2 contain the correct level 1, 2 indication.

If level2=N, the report shall list only the nodes in the local level 1 area of the selected node (including the default level 2 node and other level 2 nodes in the local level 1 area). The output parameters level1 and level2 are meaningless.

The local OSI system is also listed in the report.

### OSI node not in created state

If the specified OSI node is not in created state, then the system shall return no response.

This command does not generate a **REPT DBCHG** notification.

### Example input/output

The following example shows the result of a RTRV-MAP-NETWORK command for an input aid of type OSI_node_AID:

```
RTRV-MAP-NETWORK:LT-UNITE:osinode1:123456;
   LT-UNITE 00-11-01 15:00:00
M  123456 COMPLD
   "tid=LT-UNITE-A,
   net=39840F8000000000000000000000601D0d56e000,
   ip_ad1=\"\",ip_ad2=\"\",ip_ad3=\"\",level1=Y,level2=N"
   "tid=?,net=39840F800000000000000000000108334F1E600,
   ip_ad1=\"\",ip_ad2=\"\",ip_ad3=\"\",level1=Y,level2=N"
   "tid=?,net=39840F80000000000000000000A0D103189900,
   ip_ad1=\"\",ip_ad2=\"\",ip_ad3=\"\",level1=Y,level2=N"
   "tid=LT-UNITE-B,
   net=39840F8000000000000000000000601D0D52D000,
   ip_ad1=\"\",ip_ad2=\"\",ip_ad3=\"\",level1=Y,level2=N"
   "tid=LT-UNITE-C,
   net=39840F8000000000000000000000601D0D562000,
   ip_ad1=\"\",ip_ad2=\"\",ip_ad3=\"\",level1=Y,level2=N"

;
```

The following example shows the result of a RTRV-MAP-NETWORK command for an input aid of type SCN_node_AID:

```
RTRV-MAP-NETWORK:LT-UNITE:scnnode:123456;
   LT-UNITE 00-11-01 15:00:00
M  123456 COMPLD
   "tid=LT-UNITE,ip_ad1=192.168.200.1,ip_sid=123456789012,level1=Y,level2=N"
   "ip_ad1=192.168.200.8,ip_ad2=\"\",ip_ad3=\"\",ip_sid=123456789012,level1=Y,
   level2=N"
   "ip_ad1=192.168.200.17,ip_ad2=\"\",ip_ad3=\"\",ip_sid=123456789123,
   level1=Y,level2=N"
   "ip_ad1=192.168.200.23,ip_ad2=192.168.200.26,ip_ad3=192.168.200.29,
   ip_sid=123456789576,level1=Y,level2=N"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-MAP-NETWORK** command.

#### Validation rule: level2 parameter must not be present when *osinode* = scnnode

If the osinode parameter for which the network map should be retrieved is the *scnnode* the input parameter level2 is not allowed.

Error code:

```
IDNC- Input, Data Not Consistent, level2 not allowed for scnnode
```

# RTRV-MAP-RING: Retrieve map ring

The **RTRV-MAP-RING** command retrieves the ring map for one MS-SPRing/BLSR protection group.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-MAP-RING**:*tid*:[*aid*]:*ctag*::[*rid*],*[mapsrc]*;

**Important!** To make sure that the complete ring map information will be given the **RTRV-RING-MAP** command should always be issued against the UNITE NE within the ring.

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **aid** – Access Identifier
   This parameter specifies the aid of an MS-SPRing/BLSR protection group or an port aid being a member of the group.
   Option: If *rid* is specified, then *aid* can be omitted.
   Type: AID.
   Range: TwoFibre_ProtGrpAID (not ranged) or FourFibre_ProtGrpAID (not ranged) or SPortAID (not ranged)
3. **ctag** – Correlation Tag
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2397).
4. **rid** – Ring Identification
   This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
   Type: text string of chars allowed for TID strings.
   Range: 1 to 15 characters.
   Default: NONE.
5. **mapsrc** – Map source

This parameter specifies, how the ring map is derived. The value DCCEI is used if the ring map is derived via the DCF function. The value NVMRING is used if the ring map is derived from non-volatile memory as used by the MS-SPRing/BLSR protection group. The value MANUAL is used, if the ring map data which was manually populated by the user and stored in RAM is shown.

Note: If NVMRING is specified and there is a valid and complete ringmap in NVM, it will be reported. Otherwise, nothing will be reported.

Type: Alphanumeric value set.

Range: DCCEI, NVMRING, MANUAL.

Default: DCCEI.

## Output format

After receiving the **RTRV-MAP-RING** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "aid:rid,localnid:spec_block"
    ...
    ...
   "aid:rid,localnid:spec_block"
;
```

## Output parameters

### Command parameters

1. **aid** – Access Identifier

   This parameter specifies the aid of 2F-/4F MS-SPRing/BLSR protection.

   Type: AID

   Range: TwoFibre_ProtGrpAID or FourFibre_ProtGrpAID

2. **rid** – Ring Identification

   This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.

   Type: text string of chars allowed for TID strings.

   Range: 1 to 15 characters.

   Default: NONE.

3. **localnid** – Local Node ID

   This parameter specifies the local node ID of the NE receiving the retrieve request (i.e. the node which has been addressed within RTRV-MAP-Ring command) as used by the MS-SPRing/BLSR APS protocol.

   Type: Numeric string.

Range: 0 .. 15

### Spec block parameters

1. **nid** – Node ID

   This parameter specifies the node ID of the NE within the ring as used by the MS-SPRing/BLSR APS protocol. It shall correspond to the first TID in the *linkid* block.

   Type: Numeric string.

   Range: 0 .. 15

2. **linkId** – Link Identifier

   This parameter specifies a link connecting two NEs within the ring. It has the following format:

   *linkid*=\"*{nename*,[*port*],*direction*},{*nename*,[*port*],*direction*}\"

   The first value set of *nename*, *port, direction* corresponds to the NE as indicated by parameter *nid*.

   The second value set of *nename*, *port, direction* corresponds to the NE reachable via the link.

   The port and direction may be omitted, if the value *mapsrc* is MANUAL.

   Type: inner string

   Range: see parameter description for *nename*, *port, direction* below.

   Note: The *linkID* as used in the ring map will refer to the ports of that link which is used for the automatic detection of the ring topology (i.e. to protection ports for asymmetric spans and to worker ports for symmetric spans).

3. **nename** – NE Name

   See definition of parameter *tid* "RTRV-HDR: Retrieve header" (p. 3-2397).

4. **port** – port AID

   This parameter specifies the port being a member within the 2-/4-fibre MS-SPRing/BLSR protection group.

   Type: AID, in case *nename* denotes the local NE; AID string, in case nename denotes another NE in the ring.

   Range: SPortAID, in case of an AID; up to 20 characters otherwise

   Option: The parameter may be omitted if unknown due to link failure.

5. **direction** – Direction

   This parameter specifies the side role of the corresponding port within the protection group. The value E is used for the east side. The value W is used for the west side.

   Type: Alphanumeric value set.

   Range: E, W

   Option: The parameter may be omitted if unknown due to link failure.

6. **continuity** – Link Continuity Status

   This parameter specifies the link continuity status of a port. The following values are supported:

   - UP – The link is working.
   - DOWN – The link has failed.

- OPEN – The link is non-existent, as in an open ring.
- UNKNOWN – The link ID has not been established.
- ISOLATED – The link is in an isolated part of a segmented ring.

Type: Alphanumeric value set.
Range: UP, DOWN, OPEN, UNKNOWN, ISOLATED.

7. **`net`** – Network Entity Title
   This parameter specifies the NSAP (Network Service Access Point) with the last byte (SEL byte – see NSAP format) set to 00 (hex) for the node with TID as specified for the first *nename* within *linkid* list.
   Type: Hexadecimal digit string
   Range: 40 characters

### Detailed behavior description

For open rings, the output starts at the end with the lower *nid* value and continuous to the other end. For closed rings, the output starts at the node with the lowest *nid* value and continues in the direction of the first node's east neighbor.

# RTRV-NADR: Retrieve ONNS network (domain) address data repository

## Overview

The **RTRV-NADR** command requests information of the ONNS network (domain) address data repository, which contains address information of the own domain about TNA type, TNA address, logical port IDs for UNI and EDGE ports and associated client nodes for UNI ports.

The **RTRV-NADR** command operates on the current, active-memory-resident, ONNS data. The NVM data from NNDM is used during initialization to recover the ONNS local data repository. Data from other ONNS nodes is acquired by the flooding and exchange of LSAs.

### Retrieving ALL Network address data repository (NADR) records

When the *dataType* = ALL, Network Navigator shall respond to a request to retrieve its Network Address Data Repository (NADR) by sending a complete report of the contents of the data repository specified. The request shall cause the ONNS node to send all information in the specified data repository. When the Network address data repository is retrieved, each TL1 response message contains a record with all of the data relevant to the address information part of the LSA.

### Retrieving Network address data repository (NADR) records for any ASTN node ID

The command **RTRV-NADR** with *dataType* = LSAID and *componentID* = ASTNNodeID shall retrieve the LSA address records that relates to the specified node with the ASTNNodeID. This ASTNNodeID can be the address of any node in the ONNS domain.

### Retrieving Network address data repository (NADR) records for a specific port class

The command **RTRV-NADR** with *dataType* = portClass and *componentID* = UNI or EDGE shall retrieve the LSA address records that relates to the specified portClass.

### REPT PTHCHG or REPT NNCHG is not generated

The **RTRV-NADR** command shall not generate a REPT PTHCHG or REPT NNCHG notification.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: NA

Abortable: No

## Input format

The **RTRV-NADR** command has an input parameter *dataType* that defines what type of information is expected in the *componentID* field that determines what portion of the data repository records is retrieved.

Command syntax: **RTRV-NADR**:*srcTid:srcAid:ctag::dataType[,componentID]*;

## Input parameters

### Command parameters

1. **srcTid**

   Target identifier of the source node is the logical name of the Host NE. ONNS uses the same unique Tid used by Host NE. See also the definition of tid in RTRV-HDR.

   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.

   Range: The srcTid parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.

2. **srcAid**

   Source node ONNS application access identifier *srcAid* of the ONNS controller OS command interface port.

   Type: AID.

   Range: snn

   The keyword **all** is allowed up to shelf level.

3. **ctag**

   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

4. **dataType**

   This parameter specifies, which part of the address information is to be retrieved. Furthermore it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.

   Type: Alphanumeric value set.

   Range: ALL – retrieves the entire (NADR) Network address data repository in RAM; LSAID – retrieves the LSA address record related to the ASTN node ID specified in the *componentID* must be an *ASTNnodeID,* PORTUSAGE – retrieves the LSA address records related to the port class specified in the *componentID* must be UNI or EDGE.

5. **componentID**

   *componentID* depends on the previous *dataType* parameter and is one of:

   not represented, when *datatype* = ALL

   *nodeID*, when *datatype* = LSAID (any ASTN node ID)

   *portClass*, when *datatype* = PORTUSAGE

   **nodeID – Node Identifier**:

   Identifier of an ASTN node.

   Type: Four dot separated numeric strings.

Range: 0..255, for each numeric string.

**portClass** – port class

Ports used by ONNS with additional address information.

Type: Alphanumeric value set.

Range:

- EDGE ONNS client port, where the signal enters/leaves the ONNS domain, unmanaged by ONNS, but used as the source or destination port of an ONNS connection
- UNI ONNS client port, where the signal enters/leaves the ONNS domain from/to a UNI client, used as the source or destination port of an ONNS connection

## Output format

### The Network address data repository (NADR) record structure

The complete NADR of one node consists of *LSAAddrRecords* for all known nodes (including the reporting node itself) in the topology. Within a *LSAAddrRecord* all individual TNARecords with the associated logical port IDs are listed.

### Network address data repository (NADR) without data

An addressed node without data in the NADR shall response only the HeaderRecord with *NumberOfLSAs* = 0. The network address data repository (NADR) Record is composed of an NADR_HeaderRecord and multiple *LSAAddrRecords* which are described below:

- **NADR_Record ::=**
  <NADR_HeaderRecord>
  <LSAAddrRecord_l>
  …
  <LSAAddrRecord_m>
- **NADR_HeaderRecord ::=**
  *"nadrID,dataType[=componentID],srcNodeASTNNodeID, NumberOfLSAs=LSA_Count"*
- **LSAAddrRecord ::=**
  <LSAAddr_HeaderRecord>
  <TNARecord_1>
  <LogicalPortIDList_1>
  …
  <TNARecord_n>
  <LigicalPoerList_n>
- **LSAAddr_HeaderRecord ::=**
  *"LSAAdvertisedRouter=origNodeASTNNodeID,TNACount=TNAcount, portclass"*
- **TNARecord ::=**
  *"TNAtype=TNAaddress[,ClientNodeID=nodeID]"*
- **LogicalPortIDList ::=**

"LogicalPortIDs=lpid_1[&lpid_2&…&lpid_5]"
["LogicalPortIDs=lpid_6&lpid_7&…&lpid_10"]
…
["LogicalPortIDs=lpid_n-4&lpid_n-3&…&lpid_n"]
There is not more then 5 logical port IDs per line to avoid a line break.

**Output format with normal data retrieve completion report for *dataType* = ALL**

If the RTRV-NADR request completes successfully, then the following normal completion response is returned:

```
   srcTid date time
M  ctag RTRV
   "NADR_HeaderRecord"
   "LSAAddr_HeaderRecord1"
     "TNARecord_1-1"
       "LogicalPortIDList_1-1"
     "TNARecord_1-2"
       "LogicalPortIDList_1-2"
   ...
   "LSAAddr_HeaderRecord4"
     "TNARecord_4-1"
       "LogicalPortIDList_4-1"
     "TNARecord_4-2"
       "LogicalPortIDList_4-2"
     "TNARecord_4-3"
       "LogicalPortIDList_4-3"
>
   srcTid date time
M  ctag COMPLD
   "LSAAddr_HeaderRecord5"
     "TNARecord_5-1"
       "LogicalPortIDList_5-1"
     "TNARecord_5-2"
       "LogicalPortIDList_5-2"
     "TNARecord_5-3"
       "LogicalPortIDList_5-3"
     "TNARecord_5-4"
       "LogicalPortIDList_5-4"
   ...
   "LSAAddr_HeaderRecord9"
     "TNARecord_9-1"
       "LogicalPortIDList_9-1"
;
```

## Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completionCode* and their syntax are included in the section "Output parameters" of the "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683) command.

### NADR_HeaderRecord

1. **nadrID**

   Indicator for the responded data repository

   Type: Alphanumeric value set.

   Range: NADR, Network address data repository in RAM.

2. **dataType**

   This parameter specifies, which part of the address information is to be retrieved. Furtherore it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.

   Type: Alphanumeric value set.

   Range:

   - ALL: retrieves the entire (NADR) Network address data repository in RAM.
   - LSAID: retrieves the LSA address records related to the ASTN *nodeID* specified in the *componentID* must be an *ASTNnodeID*
   - PORTUSAGE: retrieves the LSA address records related to the port class specified in the *componentID* must be UNI or EDGE

3. **componentID**

   This parameter depends on the previous dataType parameter and is one of: not represented (when *datatype* = ALL), nodeID (when datatype = LSAIP (any node ID), portClass (when *datatype* = PORTUSAGE).

   **nodeID** – Node Identifier

   Identifier of an ASTN node.

   Type: Four dot separated numeric strings.

   Range: for each numeric string: 0..255

   **portClass** – port class

   Ports used by ONNS with additional address information.

   Type: Alphanumeric value set.

   Range:

   - EDGE ONNS client port, where the signal enters/leaves the ONNS domain, unmanaged by ONNS, but used as the source or destination port of an ONNS connection
   - UNI ONNS client port, where the signal enters/leaves the ONNS domain from/to a UNI client, used as the source or destination port of an ONNS connection

   Note: If *dataType* = ALL, *componentID* and the "=" sign are not reported.

4. **srcNodeASTNNodeID** – Reporting Node ID

   This parameter is the ASTN node ID of the ONNS node replying to this command.

   Values: Four dot separated numeric strings, 0 – 255 for each numeric string.

5. **LSA_Count**

   This parameter indicates the number of LSA address records in the report.

   Type: Integer

   Range:

   - >0: number of LSAs with address records
   - 0: no EDGE or UNI port(s) with additional address information are defined at this node or within the network

   In case of LSA_Count = 0 only the *NADR_HeaderRecord* is displayed in the output.

### LSAAddrRecord

For each reported node of the topology one LSAAddrRecord per reported port class are reported.

1. LSAAddrHeaderRecord

   All parameters in the LSAAddrHeaderRecord describe properties of the *LSAAdvertisedRouter*.

   a. **origNodeASTNNodeID**

      The ASTN node ID of the advertiser of the LSA with the address data following the *LSAAddrHeaderRecord*.

      Type: Four dot separated numeric strings.

      Range: 0 – 255 for each numeric string.

   b. **TNACount**

      Number of reported TNAs of *LSAAdvertisedRouter* are provisioned on this node.

      Range: >0

   c. **portClass** – port class

      Ports used by ONNS with additional address information.

      Type: Alphanumeric value set.

      Range:

      – EDGE ONNS client port, where the signal enters/leaves the ONNS domain, unmanaged by ONNS, but used as the source or destination port of an ONNS connection

      – UNI ONNS client port, where the signal enters/leaves the ONNS domain from/to a UNI client, used as the source or destination port of an ONNS connection

### TNARecord

For each TNA within the LSAAddrRecord one TNARecord is reported.

1. **TNAType**

   This parameter specifies the address type of the TNA address.

   Type: Alphanumeric value set.

Range:

- IPV4TNAADDR (default), TNA address is a IPv4 address
- IPV6TNAADDR, TNA address is a IPv6 address
- NSAPTNAADDR, TNA address is a NSAP address

2. **TNAAddress**

   TNAAddress depends on the previous TNAtype parameter and is one of:

   - IPv4TNAAddress, when TNAtype=IPV4TNAADDR
     Identifier of a TNA address in IPv4 format.
     Type: Four dot separated numeric strings.
     Range: 0 … 255, for each numeric string.
   - IPv6TNAAddress, when TNAtype=IPV6TNAADDR
     Identifier of a TNA address in IPv6 format.
     Type: Eight hyphen separated hexadecimal numbers.
     Range: 0 … FFFF, for each hexadecimal number.
   - NSAPTNAAddress, when TNAtype=NSAPTNAADDR
     Identifier of a TNA address in NSAP format.
     Type: Alphanumeric value set (20byte)
     Range: up to 20 alphanumeric strings with hexadecimal values 00..FF.

3. **nodeID** – Client Node ID

   IP address of the UNI client derived from the TNAAddress. This parameter is optional and only available for ports of portClass UNI.

   Type: Four dot separated numeric strings. Example: 135.13.44.61

   Range: 0 … 255, for each numeric string.

4. **LogicalPortIDList**

   The list of *LogicalPortIDs* is a list of numeric values indicating specific physical ports within a TNAaddress. The *logicalPortID* values are shown in the form: lpid1([&lpid2& …&lpidx]).

   Type: &-separated list of numeric strings.

   Range: lpid1([&lpidX ])* where X <= 512 where lpidn = 0 … 42946967295. The value 512 for X results as theoretical value from the number of slots multiplied by number of possible ports per slot in 1675 LambdaUnite MSS.

## Example input/output

Example NADR output for the **RTRV-NADR** command with ALL

The **RTRV-NADR** command with *dataType* = ALL produces this example output result:

**RTRV-NADR:LT-ONNS-61::123456::ALL;**

```
   LT-ONNS-61 2002-07-14 09:45:28
M  123456 RTRV
   "NADR,ALL,135.13.44.61,NumberOfLSAs=4"
   "LSAAdvertisedRouter=135.13.44.61,TNACount=4,UNI”
     “IPV4TNAADDR=135.13.3.119,ClientNodeID=135.13.44.61”

;
```

## Error responses

### Validation rule: Invalid componentID parameter I

The command is rejected when for the *datatype* = LSAID the received *ASTNNodeID* is invalid.

Error code: `E511 - IINO - Input, Invalid NOde_ID`

### Validation rule: Access to the database is not possible I

Access to the database is not possible due to internal problems.

Error code:
`E002 - SICE - Status, Inter-Processor Communication Error caused cmd failure`

### Validation rule: Access to the database is not possible II

Access to the database is not possible due to internal problems.

Error code:
`E003 - SNTT - Status, Network Topology database Timed out`

# RTRV-NE: Retrieve NE

The **RTRV-NE** command retrieves DCN attributes associated with the NE at the system level but not associated with any particular facility or equipment unit.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-NE**:*tid*::*ctag;*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Description: Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Description: Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
   Type: CTAG.

## Output format

If the **RTRV-NE** request is successful, the following normal completion message is returned:

```
   sid date time
M  ctag COMPLD
   ":spec_block"
   .    .    .
   .    .    .
   .    .    .
   ":spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Spec block parameters

1. **ftamftpgw** – File Transfer Translation Device (FT-TD) function

   This parameter is used to enable or disable the File Transfer Translation Device (FT-TD) function.

   Type: Value set.

   Range: ENABLE, DISABLE (default).

2. **tl1tcpipgw** – TL1 Translation Device (T-TD) function

   This parameter is used to enable or disable the TL1 Translation Device (T-TD) function.

   Type: Value set.

   Range: ENABLE, DISABLE (default).

3. **dcnpn** – DCN ASAP Profile Name

   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.

   Range: up to 24 characters.

   Default: DEFAULT.

4. **scnpn** – SCN ASAP Profile Name

   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.

   Range: up to 24 characters.

   Default: DEFAULT.

## Detailed behavior description

The command retrieves system parameters as described in the Output parameter section.

## Example input/output

The following example shows the result of a **RTRV-NE** command:

```
RTRV-NE:LT-UNITE::123456;
   LT-UNITE 00-11-01 08:00:00
M  123456 COMPLD
   ":ftamftpgw=DISABLE"
   ":tl1tcpipgw=DISABLE"
   ":dcnpn=DEFAULT"
   ":scnpn=DEFAULT"
;
```

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-NE** command.

### Related TL1 messages

"ED-NE: Edit NE" (p. 3-438)

# RTRV-NE-SECU: Retrieve NE security

The **RTRV-NE-SECU** command can be initiated by a user to retrieve global security information in the NE. The current login sessions in the NE identified by the *uid* which established the session will also be retrieved using the **RTRV-NE-SECU** command.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: No

## Input format

Command syntax: **RTRV-NE-SECU***:tid::ctag;*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output format

There is one output line for each session. The first line contains user information for the user and session that issued the **RTRV-NE-SECU** command.

After receiving the **RTRV-NE-SECU** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "uid::spec_block"
   "uid"
   .
   .
   "uid"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command parameters

1. **uid** – User ID

   ID of the user that initiated the **RTRV-NE-SECU** command. Listed below this *uid* are *uids* of all the other sessions. If the user from which the **RTRV-NE-SECU** command was issued is logged on via other sessions, the *uid* list will contain each other instance of the *uid*, but the additional listing is just like the listing of any other user, without the additional user information.

### Spec block parameters

1. **age** – Lockout Aging Period

   The time interval during which the number of invalid login attempts are counted. When *age* expires after the last invalid login attempt, the counter of invalid login attempts by that *uid* is reset to zero.

   Type: Numeric string.

   Range: 1 – 999 [minute]

   Default: 60

2. **intrvl** – Lockout Period

   The time during which login attempts using that *uid* will not be allowed. This occurs when the number of consecutive invalid login attempts by a *uid* reaches *thrshld*. When *intrvl* expires, login attempts will again be allowed from that *uid*. If this parameter is set to 0 (zero), the lockout feature is disabled.

   Type: Numeric string.

   Range: 0 – 99 [minute]

   Default: 10

3. **thrshld** – Lockout Threshold

   The maximum number of consecutive invalid login attempts that are allowed by a *uid*. If the count of invalid login attempts is equal to the threshold, the *uid* is locked out for *intrvl* period of time. If a login attempt is successful, the count of *invalid* login attempts by that *uid* is reset to zero.

   Type: Numeric string.

   Range: 2 – 99

   Default: 5

4. **usrage** – User ID Aging Period

   If a *uid* has never been used to perform a successful login during a specified time interval it is disabled. A value of 0 disables user ID aging.

   The *usrage* does not apply to the super-users. Super-users will be never disabled.

   Type: Numeric string.

   Range: 0 – 999 [days]

   Default: 10

### Example input/output

The following example shows the successful completion of the **RTRV-NE-SECU** command by the NE:

**RTRV-NE-SECU:LT-UNITE-123::123456;**

```
   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
   "nbguser1::thrshld=3,intrvl=1,age=60,usrage=10"
   "njsmith"
   "hugo"
   "airmail"
;
```

# RTRV-NNCNFG: Retrieve ONNS configuration data

## Overview

The **RTRV-NNCNFG** command retrieves ONNS system configuration parameters (fixed and user-provisionable). It also retrieves ONNS software version information. The data is retrieved from the ONNS system configuration data repository.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Abortable: No

## Input format

Command syntax: **RTRV-NNCNFG:***srcTid:[srcAid]:ctag;*

## Input parameters

### Command parameters

1. **srcTid** – Source Target Identifier.
   The TID of the NE to which the command is addressed.
   See the parameter description in the "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683) Input parameters section. NN uses the same *tid* used by the Host NE.
2. **srcAid**
   ONNS application access identifier: *snn*.
3. **ctag** – Correlation Tag
   The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ".").
   It should be a unique value for each new command.

## Output format

If the RTRV-NNCNFG request completes successfully, then the following normal completion response is returned:

```
   srcTid date time
M  ctag COMPLD
   "specBlock"
;
```

## Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completion code* and their syntax are included in the OUTPUT PARAMETERS section of the "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683) command.

### Spec block parameters

This block contains the descriptions and allowed values for the reported output parameters.

1. **AdminCostEscalation**

   Determines whether a cost escalation algorithm is applied or not. This algorithm raises the cost of a link bundle to reduce the attractiveness when the link bundle fills up.

   Type: Alphanumeric value set.

   Range: DISABLE, ENABLE (default).

2. **DefaultRstrPriority**

   Determines the connection restoration priority default to be used if a value is not specified in the **ENT-PATH** command. Lower values denote higher priority.

   Note: Though the parameter *DefaultRstrPriority* can be set via ED-NNCNFG, it is for future use only, i.e. an actual value different from 0 will not be considered on connection setup. If no restoration priority is given via the **ENT-PATH** command, the priorty of the corresponding connection is always 0, no matter of the actual value of *DefaultRstrPriority*.

   Type: Integer

   Range: 0 – 7 (default = 0, highest priority).

3. **LBA_Threshold**

   The LinkBundle Availability threshold determines the percent change in bandwidth availability necessary to trigger an immediate LSA distribution.

   Type. Integer

   Range: 10 – 65 %

   Default: 50 %

4. **LBA_UpdateTimer**

   LinkBundleAvailability Update Timer determines the maximum interval for LSA distribution of bandwidth availability changes which have not exceeded threshold.

   Type. Integer

   Range: 1 – 25 minutes

   Default: 15 minutes

5. **LB_UsageThreshold**

   The LinkBundle usage threshold determines the percent link bundle usage that triggers cost escalation on the bundle.

   Type. Integer

   Range: 50 – 95 %

   Default: 70 %

6. **MaxExplicitNodeList**

This parameter determines the maximum number of intermediate nodes that will be accepted in the ENT-PATH explicit node list.

Type. Integer

Range: 25 (default).

7. **MaxExcludeNodeList**

   Determines the maximum number of nodes that will be accepted in the ENT-PATH exclude *nodeList*.

   Type. Integer

   Range: 25 (default).

8. **MaxSRLGList**

   Determines the maximum number of SRLG values that will be accepted in the ENT-PATH SRLG exclude list.

   Type. Integer

   Range: 25 (default).

9. **NN_BldInfo**

   Version of path calculation engine. Consists of:

   - NEtype
   - NN_SWVersion
   - Operating system

   Type. alphanumeric string

   Range: *ORPx.y* for NEtype, x, y digits, *LU-NNx.y.z* for NN_SWVersion, x, y, z digits, *Chorus* for Operating System

10. **NN_BldVersion**

    ONNS Build version and date in format *xxx-mmddyy*, since there is no difference any longer between the ONNS and host build version, this field is set to a default value. See corresponding parameters in RTRV-PRMTR-SWTFR and ACT-USER.

    Type: two – separated numeric strings

    Range: 000-000000 (default).

11. **NNFunctionUpgradeState**

    After a software upgrade, new ONNS functionality must be explicitly enabled. This parameter indicates whether this has been done or not.

    Type: Alphanumeric value set.

    Range:

    - DISABLE: New ONNS functionality not yet enabled
    - ENABLE: New ONNS functionality already enabled.

    Default: ENABLE.

12. **NN_HostName**

    Host name of the Host NE.

    Type: Alphanumeric string

    Range: 1675 LambdaUnite MSS (default).

13. **NN_SigIpAddress**

Signaling IP address of the SCN.
Type: Four dot separated integers.
Range: 0 – 255 for each integer.

14. **NN_SWVersion**
    ONNS software version number in the format *x.y.z*, where
    - *x* = release,
    - *y* = point release,
    - *z* = development integration release.

    Type: Three dot separated integers.
    Range: 0 … 99 for each integer.
15. **NN_SystemMode**
    NN system mode status describes the operational state of ONNS.
    Type: Alphanumeric value set
    Range:
    - INIT: Initializing
    - MAINT: in maintenance condition (MCOND)
    - RUNNING: in normal operation
16. **NN_UiIpAddress**
    UI IP address (currently not used).
    Type: Four dot separated integers.
    Range: 0 – 255 for each integer.
17. **NodeID**
    Identifier of the ASTN node to which the **RTRV-NNDR** command is sent.
    Type: Four dot separated numeric string
    Range: 0 – 255 for each numeric string.
18. **PathRestoreRetryMax**
    Determines how many retries ONNS makes during the path restoration
    Type: Integer
    Range: 0 – 5
    Default: 1
19. **PathSetupRetryMax** – Maximum Path Restoration Retries
    Determines how many retries ONNS makes after the initial path setup.
    Type: Integer
    Range: 0 – 5
    Default: 1
20. **Perm1plus1HoldOffTimer** – Permanent 1+1 Hold Off Timer
    Determines how long a worker or protection path of a permanent 1+1 connection must be steadily failed before the failed path is restored non-revertively by a new path. Applies only to a permanent 1+1 connections.
    Type: Integer

Range: 15 – 600 seconds in 1 second steps.

Default: 360 seconds

21. **RestorationRetryTimer**

    Path Restoration Queue timer, sets the time between checks to restore from the queue.

    Type: Integer

    Range: 90 – 700 seconds

    Default: 324 seconds

22. **TCAThresholdHigh**

    Upper threshold in percent for the supervision of the unavailable bandwidth in the link bundles. Exceeding this threshold for a link bundle results in a TCA status HIGH for this link bundle

    Type: Integer

    Range: 10 – 100 %

    Default: 70 %

23. **TCAThresholdLow**

    Lower threshold in percent for the supervision of the unavailable bandwidth in the link bundles. Exceeding this threshold for a link bundle results in a TCA status LOW or HIGH for this link bundle.

    Type: Integer

    Range: 10 – 100 %

    Default: 40 %

24. **tid** – Node Target Identifier

    Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same unique *tid* used by Host NE.

    See also the definition of *tid* in RTRV-HDR.

    Type: identifier, in addition the special character underscore "_" and the password characters are allowed.

    Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.

25. **WaitToRevertTimer**

    Determines how long an original path must be steadily OK before it is made active again through tear-down of the restoration path. Applies to auto-reroute revertive connections. This parameter shall apply to M:N protected connections as well.

    Type: Integer

    Range: 90 – 1800 seconds

    Default: 300 seconds

## Example input/output

The following is an example shows a successful execution of the **RTRV-NNCNFG** command:

```
RTRV-NNCNFG:DIETMAR:snn:C1;
```

```
   DIETMAR 2003-06-06 10:21:57
M  C1 COMPLD
   "TID = DIETMAR,
   NodeId = 29.54.174.87,
   NN_SWVersion = 2.0.0,
   NN_BldVersion = 042-032603,
   NN_BldInfo = ORP2.0, LU-NN2.0.0, Sun/Chorus,
   NN_HostName = LambdaUnite,
   NN_SystemMode = RUNNING,
   NN_SigIpAddress = 172.16.1.250,
   NN_UiIpAddress = 0.0.0.0,
   AdminCostEscalation = DISABLE,
   PathSetupRetryMax = 1,
   PathRestoreRetryMax = 1,
   DefaultRstrPriority = 0,
   RestorationRetryTimer = 324 seconds,
   Perm1plus1HoldOffTimer = 15 seconds,
   WaitToRevertTimer = 300 seconds,
   LBA_UpdateTimer = 15 minutes,
   LBA_Threshold = 50 %,
   LB_UsageThreshold = 70 %,
   TCAThresholdLow = 42 %,
   TCAThresholdHigh = 69 %,
   MaxExplicitNodeList = 8,
   MaxExcludeNodeList = 15,
   MaxSRLGList = 10,
   NNFunctionUpgradeState = ENABLE"
;
```

# RTRV-NNDR: Retrieve ONNS neighbor nodal data repository

## Overview

The **RTRV-NNDR** command retrieves information stored in the NNDR data repository that is in RAM memory. The **RTRV-NNDR** command operates on the current, active-memory-resident, ONNS data. ONNS writes port/connPt/pathID data to NVM shortly after each cross-connect setup of a path transaction completes. The NVM data is used in conjunction with port update messages from the NE during initialization to recover the ONNS NNDR data repository.

### The NNDR record structure

The NNDR record is composed of an NNDR_HeaderRecord and multiple PortRecords which are described below, see the Output format and Output parameter sections for more detail.

### Retrieving the NNDR records by ALL or by *portID*

ONNS responds to a RTRV-NNDR request to retrieve its NNDR by sending a report of the contents of the data repository. The command **RTRV-NNDR** with *dataType* = ALL shall cause the ONNS node to send all information in the NNDR data repository. When the NNDR is retrieved, each TL1 response message contains multiple PortRecords. If *dataType* = ALL, there must be no *componentID*. When *dataType* = PORT and a *componentID* = portID are specified as input parameters in RTRV-NNDR, the NNDR data repository records relating to that *portID* is returned

### Retrieving the NNDR records by *neighborASTNNodeID* or *UNIclientNodeID*

When *dataType* = NBRIP and *componentID* = neighborASTNNodeID is specified, the response returns all NNDR PortRecords related to the link bundles between the reporting node and its neighbor node with the *neighborASTNNodeID*.

When *dataType* = NBRID and *componentID* = UNIClientNodeID is specified, the response returns all Neighbor Nodal data repository (NNDR) PortRecords related to the port connections between the reporting node and its neighbor node with the *UNIClientNodeID*.

The command will fail if the *neighborASTNNodeID* or the *UNIClientNodeID* is not a neighbor of the reporting node.

### Retrieving the NNDR records by *PortUsage*

When *dataType* = PORTUSAGE and a *componentID* = portClass is specified, the response returns all NNDR records relating to ports with the *portClass* specified in the *componentID* field.

The **RTRV-NNDR** command sends a maximum of 4 PortRecords per block of data returned if there are no associated cross connects on the ports. PortRecords with *TribConnRecords* will be send in data blocks that are less than 4096 characters. On all messages but the last,

a RTRV completion code is used and the semicolon (;) is replaced with a (>) terminator. Then, on the last record block, the COMPLD completion code is used with the final semicolon (;) terminator.

Data blocks in PortRecords with TribConnRecords shall contain complete TribConnRecords only including leading and trailing double quotes (").

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Abortable: No

## Input format

Command syntax: **RTRV-NNDR:***srcTid:[srcAid]:ctag::dataType[,componentID];*

## Input parameters

### Command parameters

1. **srcTid** – Target Identifier.

   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.

   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.

   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.

2. **srcAid**

   Source node ONNS application access identifier of the ONNS controller OS command interface port.

   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn.

3. **ctag** – Correlation Tag

   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.

   The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ".").

4. **dataType**

   This parameter specifies, which part of the NNDR is to be retrieved. Furtheron it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.

Values:

- ALL: retrieves the entire NNDR in RAM.
- PORT: retrieves NNDR port data, *componentID* must be a *portID*.
- NBRID: retrieves all NNDR port data for link bundles and port connections respectively between the local and neighbor node, *componentID* must be a *neighborASTNNodeID* or a *UNIClientNodeID*.
- PORTUSAGE: retrieves all NNDR port data of ports of a specified port class, *componentID* must be a *portClass*.

5. **ComponentID**

   This parameter depends on the previous *dataType* parameter and is one of: not represented (when *datatype* = ALL), *portID* (when *datatype* = PORT, see definition of output parameter *portID* in RTRV-PATH), *nodeID* (when *datatype* = NBRID), *portClass* (when *datatype* = PORTUSAGE).

   The detailed parameter format of the choices is described below:

   - **portID** – Port Identifier

     Port ID for which the NNDR data is retrieved. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #.

     Type: dash-separated list of 4 numeric strings

     Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16).

   - **nodeID** – Neighbor Node Identifier

     This parameter identifies a neighbor ASTN node or a neighbor UNI client.

     Type: Four dot separated numeric strings (0 – 255 for each numeric string).

   - **portClass**

     This parameter specifies which type of port to include in the report, it determines how ONNS uses the port: EDGE (ONNS client port, where the signal enters/leaves the ONNS domain); INNI (ONNS port within the ONNS domain, topology relevant); ENNI (ONNS port, where the signal enters/leaves the ONNS domain from/to a other domain), UNI (ONNS client port, where the signal enters/leaves the ONNS domain from/to a UNI client).

## Output format

### RTRV-NNDR output format without TribConnRecords

If the **RTRV-NNDR** request completes successfully, then the following normal NNDR_Report without TribConnRecords will be returned, when no tributary connections exists:

```
   srcTid date time
M  ctag RTRV
   "NNDR_HeaderRecord"
   "PR:PortStatusRecord_1,PortAttributeRecord_1"
   ...
   "PR:PortStatusRecord_4,PortAttributeRecord_4"
>
```

```
   srcTid  date  time
M  ctag COMPLD
   "PR:PortStatusRecord_5,PortAttributeRecord_5"
   ...
   "PR:PortStatusRecord_8,PortAttributeRecord_8"
;
```

The **RTRV-NNDR** command will send a maximum of 4 port records per block. On all messages but the last, a RTRV completion code is used and the semicolon (;) is replaced with a (>) terminator. Then, on the last record block, the COMPLD completion code is used with the final semicolon (;) terminator.

**RTRV-NNDR output format with TribConnRecords**

If the **RTRV-NNDR** request completes successfully, then the following normal NNDR_Report with TribConnRecords will be returned, when there are tributary connections:

```
   srcTid date time
M  ctag RTRV
   "NNDR,ALL,srcNodeASTNNodeID,NumberOfRecords=portCount"
   "PR:PortStatusRecord1,PortAttributeRecord1"
   ["TR:TribPathRecord_1[:TribPathRecord_1b]"]
   ...
   ["TR:TribPathRecord_n[:TribPathRecord_nb]"]
   .....
   .....
   "PR:PortStatusRecord4,PortAttributeRecord4"
   ["TR:TribPathRecord_1[:TribPathRecord_1b]"]
   ["TR:TribPathRecord_2[:TribPathRecord_2b]"]
   ["TR:TribPathRecord_3[:TribPathRecord_3b]"]
   ["TR:TribPathRecord_4[:TribPathRecord_4b]"]
>

   srcTid  date  time
M  ctag COMPLD
   "PR:PortStatusRecord5,PortAttributeRecord5"
   ["TR:TribPathRecord_1[:TribPathRecord_1b]"]
   ...
   ["TR:TribPathRecord_n[:TribPathRecord_nb]"]
   .....
   .....
   "PortStatusRecord8,PortAttributeRecord8"
   ["TR:TribPathRecord_1[:TribPathRecord_1b]"]
   ["TR:TribPathRecord_2[:TribPathRecord_2b]"]
   ["TR:TribPathRecord_3[:TribPathRecord_3b]"]
   ["TR:TribPathRecord_4[:TribPathRecord_4b]"]
   ["TR:TribPathRecord_5[:TribPathRecord_5b]"]
```

```
;
```

### Output syntax example with normal data retrieve report for one port with cross-connections

If the **RTRV-NNDR** request completes successfully, then the following port retrieve response is returned. The response is shown in terms of the variables that form the response record:

```
   srcTid  date  time
M  ctag COMPLD
   "NNDR,dataType=componentID,srcNodeASTNNodeID,Number0fRecords=portCount"
   "PR:portID,portClass,pdir,neighborNodeID&neighborPortID,lineSigStatus,
   portEqptStatus,portConnSigStatus,,portAdminMode,xconnMaintMode,
   portRate,monitorCap,propagationDelay,Cost=adminCost,,SRLG=srlgList,
   IncludeID=linkIncludeID,XCRate=minXCrate&maxXCrate,BundleID=linkBundleID"
   "TR:tribID1,pathID1,connPtA1,-X-,connPtB1,RsvStatus=rsvStatus1,
   XCStatus= xcStatus1,tribWidth1,tribSigStatus1
   :tribID1b,pathID1b,connPtA1b,-X-,connPtB1b,RsvStatus=rsvStatus1b,
   XCStatus= xcStatus1b,tribWidth1b,tribSigStatus1b"
   .........
   "TR:tribIDn,pathIDn,xconnAn,-X-,xconnBn,RsvStatus=rsvStatusn,
   XCStatus= xcStatusn,tribWidthn,tribSigStatusn"
;
```

The *portCount* = n is shown in this example indicating that there are n tributary paths on this port.

## Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completionCode* and their syntax are included in the section “Output parameters” of the “RTRV-PATH: Retrieve ONNS connection data” (p. 3-2683) command.

### NNDR_HeaderRecord

1. **nndrID**

   ONNS Data Repository *dataID* to be returned: NNDR, Neighbor Nodal data repository in RAM.

2. **dataType**

   This parameter specifies, which part of the NNDR is to be retrieved. Furtheron it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.

   Values:

   - ALL: retrieves the entire NNDR in RAM.
   - PORT: retrieves NNDR port data, *componentID* must be a *portID*.

- NBRIP: retrieves all NNDR port data for link bundles and port connections respectively between the local and neighbor node, *componentID* must be a *neighborASTNNodeID* or a *UNIClientNodeID*.
- PORTUSAGE: retrieves all NNDR port data of ports of a specified port class, *componentID* must be a *portClass*.

3. **componentID**

   This parameter depends on the previous *dataType* parameter and is one of: not represented (when *datatype* = ALL), *portID* (when *datatype* = PORT, see definition of output parameter *portID* in RTRV-PATH), *nodeID* (when *datatype* = NBRIP), *portClass* (when *datatype* = PORTUSAGE).

   The detailed parameter format of the choices is described below:

   - **portID** – Port Identifier

     Port ID for which the NNDR data is retrieved. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #.

     Type: dash-separated list of 4 numeric strings

     Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16).
   - **nodeID** – Neighbor Node Identifier

     This parameter identifies a neighbor ASTN node.

     Type: Four dot separated numeric strings (0 – 255 for each numeric string).
   - **portClass**

     This parameter specifies which type of port to include in the report, it determines how ONNS uses the port: EDGE (ONNS client port, where the signal enters/leaves the ONNS domain), INNI (ONNS port within the ONNS domain, topology relevant), ENNI (ONNS port, where the signal enters/leaves the ONNS domain from/to a other domain), UNI (ONNS client port, where the signal enters/leaves the ONNS domain from/to a UNI client).

4. **srcNodeASTNNodeID** – Source Node ASTN Node ID

   Identifier of the ASTN node to which the **RTRV-NNDR** command is sent.

   Range:Four dot separated numeric strings, 0 – 255 for each numeric string.

5. **NumberOfRecords**

   This parameter indicates the number of PortRecords returned in this query.

   Values: number of NNDR records 0 – 1000.

**PortRecord - PortStatusRecord**

Two PortStatusRecords are present per reported port, one for each direction (see parameter pdir below).

1. **portID** – port identifier

   *portID* for which the NNDR data is retrieved. The *portID* consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #.

   Type: dash-separated list of 4 numeric strings.

   Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16).

2. **portClass**

The *portClass* specifies how ONNS uses the port.

Values:

- INNI, ONNS port within the ONNS domain, topology relevant, bandwidth on this port is managed by ONNS
- EDGE, ONNS client port, where the signal enters/leaves the ONNS domain, unmanaged by ONNS, but used as the source or destination port of an ONNS connection.
- ENNI, ONNS port, where the signal enters/leaves the ONNS domain from/to another domain
- UNI, ONNS client port, where the signal enters/leaves the ONNS domain from/to a UNI client, used as the source or destination port of an ONNS connection
- NA, Traditional (non-NN) port, they are normally not included in the ONNS data repository (exception: connections with EDGE ports exist).

3. **pdir** – Port Direction

   This parameter specifies whether the PortRecord is for the port in receive or transmit direction.

   Values:

   - TX: PortRecord is for transmit side of port
   - RX: PortRecord is for receive side of port

4. **neighbor** – Neighbor Information

   The neighbor information consists of &-separated *neighborNodeID* and *neighborPortID* parameter.

   - **neighborNodeID**

     Identifier of the peer node (neighbor node) with respect to output parameter *portID*. This peer node can be a peer ASTN node or a peer UNI client node. The special value 0.0.0.0 indicates that the neighbor node ID is unknown. The *neighborNodeID* shall get the value “0.0.0.0” if the neighbor node is node of another domain.

     Type: Four dot separated numeric strings, (0 – 255) for each numeric string

   - **neighborPortID**

     *PortID* for which the NNDR data is retrieved. The *portID* consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #..

     Type: dash-separated list of 4 numeric strings.

     Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16).

     The special value 0-0-0-0 indicates that the neighbor *portID* of an ASTN node is unknown. The *neighborPortID* shall get the value “0-0-0-0” if the neighbor node is a UNI client node or a node of an other domain.

5. **lineSigStatus** – Port Line Signal Status

   Line Signal Status indicates the fault status of the line signal on the port as reported to ONNS from the Host..

Values:

- GOOD (ONNS assumes that the port can be used for transmission)
- BAD (ONNS assumes that the port can not be used for transmission)
- UNKNOWN (ONNS couldn't derive status information from the Host).

6. **portEqptState**
   This parameter indicates the fault status of the equipment associated with the port as reported to ONNS by the Host..
   Values: OK ( ONNS assumes that the equipment is ok and that the associated port can be used for transmission), FAILED (ONNS assumes that the equipment is failed and that the associated port can not be used for transmission), UNKNOWN (ONNS couldn't derive status information from the Host).
7. **portAdminMode** – Port Control
   This attribute determines the mode of operation of this port.
   Values: NORMAL (Port is for unrestricted use by ONNS), LOCKOUT (ONNS is not allowed to use the port for new connections, note: ONNS might delete existing connections from that port).

**PortRecord - PortAttributeRecord**

Two PortAttributeRecords are present per reported port, one for each direction (see parameter *pdir* above).

1. **portRate**
   This parameter specifies the bandwidth / port rate of the port.
   Range:
   - STS3 (STM1E, STM1, OC3 port)
   - STS12 (STM4, OC12 port)
   - STS48 (STM16, OC48 port)
   - STS192 (STM64, OC192 port)
   - GE1 (GE1 port)
   - GE10 (GE10 port)
   - STS3-adaptive (STM1E, STM1, OC3 iNNI port; OC3 EDGE or eNNI port in adaptive mode)
   - STS12-adaptive (STM4, OC12 iNNI port; OC12 EDGE or eNNI port in adaptive mode)
   - STS48-adaptive (STM16, OC48 iNNI port; OC48 EDGE or eNNI port in adaptive mode)
   - STS192-adaptive (STM64, OC192 iNNI port; OC192 EDGE or eNNI port in adaptive mode)
2. **propagationDelay**

Propagation delay in milliseconds through the port connection between the pair of ports on the path. The time needed for a signal to traverse from this node to the neighbor node. A propagation delay of 1 milliseconds corresponds to about 450 km of fiber length.

Range: 0 – 255, default = 0.

Propagation delay parameter is not applicable for EDGE, ENNI and UNI ports and is set to the default value.

3. **Cost** – Administrative Cost

   Provisioned administrative cost of the port connection when used in a connection path.

   Range: 1 – 65535

   Administrative cost parameter is not applicable for EDGE ports and is set to the default value. Administrative cost parameter is not applicable for UNI ports and is set to the default value.

4. **SRLG** – SRLG list

   Shared Risk Link Group Identifier list. See also parameter srlgList in RTRV-rr. The max. number of identities that can be provisioned per port may be release dependent.

   Type: Up to ten &-separated integers

   Examples:

   198&233&0&0&0&0&0&0&0

   10&20&30&40&0&0&0&=&0&0

   89&1000&4&10&20&31&111&231&300&777

   Range: Each value: 0 – 65535.

   Default: 0, means no SRLG provisioned.

   SRLG list is not applicable for EDGE ports and is set to the default value. SRLG list is not applicable for UNI ports and is set to the default value.

5. **IncludeID** – VPN ID

   Values: 0 – 65535. default: = 0, means *includeID* provisioned.

   VPN ID is not applicable for EDGE, ENNI and UNI ports and is set to the default value.

6. **XCRate** (minXCrate)- Cross-connection rate

   The XCRate consists of minXCrate&maxXCrate with

   - *minXCrate* denotes the smallest signal rate granularity used to provision a port into trib's,
   - *maxXCrate* denotes the largest signal rate granularity used to provision a port into trib's.

   Type: two &-separated alphanumeric value sets

   Range *minXCrate*:

   - STS1 (for all STM*m*, OC*n* ports)
   - STS3 (for all STM*m*, OC*n* ports)
   - STS12 (for all STM*m*, OC*n* ports, with m = 4, 16, 64 and *n* = 12, 48, 192)
   - STS48 (for all STM*m*, OC*n* ports, with m = 16, 64 and *n* = 48, 192)

- STS192 (for all STM*m*, OC*n* ports, with *m* = 64 and *n* = 192)
- STS1 (for 1 GbE ports in SONET mode)
- STS3 (for 1 GbE ports in SDH mode)
- STS1(for 1 GEPL ports in SONET mode)
- STS3 (for 1 GEPL ports in SDH mode)
- STS3 (for 10GEPL ports)

Range *maxXCrate*:

- STS1 (for all STM*m*, OC*n* ports)
- STS3 (for all STM*m*, OC*n* ports)
- STS12 (for all STM*m*, OC*n* ports, with *m* = 4, 16, 64 and *n* = 12, 48, 192)
- STS48 (for all STM*m*, OC*n* ports, with *m* = 16, 64 and *n* = 48, 192)
- STS192 for all STM*m*, OC*n* ports, with *m* = 64 and *n* = 192)
- STS1 (for 1 GbE ports in SONET mode)
- STS3 (for 1 GbE ports in SDH mode)
- STS1(for 1 GEPL ports in SONET mode)
- STS3 (for 1 GEPL ports in SDH mode)
- STS3 (for 10GEPL ports)

7. **`BundleID`** – Link Bundle identifier

   This parameter is a unique numeric ID assigned to a link bundle or TNA address on this node.

   There are two preconditions for link bundling:

   - A number of parameters with same values, e.g. propagationDelay, provisioned on iNNI ports. See **`RTRV-rr`**.
   - Same TNA address, provisioned as network TNA Address on EDGE ports or SDH/SONET UNI ports or as EPL TNA Address on GbE UNI ports. See **`RTRV-rr`** or "RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3052).

   Range: 1 .. 32767 (valid BundleID), 0 (for EDGE ports without network TNA address and for eNNI ports).

   Type: Integer.

### TribPathRecord

For ports with *portClass* = INNI one TribPathRecord is present per cross-connection associated with the port. For ports with *portClass* = EDGE, *portClass* = UNI or *portClass* = ENNI two TribPathRecords are present per bridged cross-connection and one TribPathRecord is present per non-bridged cross-connection associated with the port.

1. **`tribID`** – Tributary Identifier

   Identifier of the tributary whose *pathID* and cross-connect information is included below. The *tribID* also denotes the timeslot of the reported cross-connection in the reported port.

Range: 1 - n

- with n=3 for STM1E, STM1, OC3 ports
- with n=12 for STM4, OC12 ports
- with n=48 for STM16, OC48 ports
- with n=192 for STM64, OC192 ports
- with n=21 for GE1 ports

2. **pathID** – Path Identifier

   The *pathID* of the associated cross-connection. The special value 0.0.0.0-0 indicates, that there is no associated pathID, i.e. the port has a non-ONNS cross-connection.

   Type: character string of length up to 20.

   Range: nodeID-Index; nodeID: four dot separated numeric strings: each string 0..255, Index: Numeric string.

   Example: 135.13.196.203-432165

3. **connPtA** – Connection Point A

   The *connPoint* on the reporting port of the cross-connection connPoint pair. The connPtA consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # .

   Type: dash-separated list of 5 numeric strings.

   Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).

   Special values for slot/pack, port, and tributary

   Slot/Pack # #

   Port # #

   Tributary # #

   Value "#" for slot/pack, port, and tributary indicates default tributary AID used for reporting the open end in not existing cross-connections in the A-node or Z-node for a protecting NN connection of an M:N protected connection group.

   Slot/Pack # *

   Port # *

   Tributary # *

   Value "*" for slot/pack, port, and tributary indicates unknown HO tributary AIDs used for reporting that the corresponding HO tributary of an EDGE port (specified in parameter *connPtA*) is allocated by one or more LO traditional cross-connections.

   Slot/Pack # @

   Port # @

   Tributary # @

   Value "@" for slot/pack, port, and tributary indicates that the corresponding HO input and/or output tributary specified by *connPtA* is involved as EDGE-prt tributary in an OUC.

   Slot/Pack # $

   Port # $

   Tributary # $

Value “$” for slot/pack, port, and tributary indicates a temporary reservation of an output tributary of an ENNI port needed for a network connection setup.

Slot/Pack # %

Port # %

Tributary # %

Value “%” Port and Tributary indicates a reservation of the iNNI tributary indicated by connPtA in case this tributary is used by a path associated to an unprotected transferred **DLT-FL** connection.

Slot/Pack # R(emote)

Port # T(ributary)

Tributary # O(ccupied)

Values “R(emote)” for Slot/Pack, “T(ributary)” for Port and “O(ccupied)” for Tributary indicate a temporary blocking state of the iNNI tributary indicated by connPtA, because on the remote side it is occupied or blocked while locally it would be available. Therefore this iNNI tributary is marked as temporarily not available for path setup.

4. **connInd** – Connection Indicator

   Seperator for better readability.

   Range: -X- (cross-connection setup)

5. **connPtB**

   The *connPoint* opposite to the reporting port of the cross-connection *connPoint* pair. The *connPtB* consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary #.

   Type: dash-separated list of 5 numeric strings.

   Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128)

   Special values for slot/pack, port, and tributary

   Slot/Pack # #

   Port # #

   Tributary # #

   Value “#” for slot/pack, port, and tributary indicates default tributary AID used for reporting the open end in not existing cross-connections in the A-node or Z-node for a protecting NN connection of an M:N protected connection group.

   Slot/Pack # *

   Port # *

   Tributary # *

   Value “*” for slot/pack, port, and tributary indicates unknown HO tributary AIDs used for reporting that the corresponding HO tributary of an EDGE port (specified in parameter *connPtA*) is allocated by one or more LO traditional cross-connections.

   Slot/Pack # @

   Port # @

   Tributary # @

   Value “@” for slot/pack, port, and tributary indicates that the corresponding HO input and/or output tributary specified by *connPtA* is involved as EDGE-prt tributary in an OUC.

Slot/Pack # $

Port # $

Tributary # $

Value “$” for slot/pack, port, and tributary indicates a temporary reservation of an output tributary of an ENNI port needed for a network connection setup.

Slot/Pack # %

Port # %

Tributary # %

Value “%” Port and Tributary indicates a reservation of the iNNI tributary indicated by connPtA in case this tributary is used by a path associated to an unprotected transferred **DLT-FL** connection.

Slot/Pack # R(emote)

Port # T(ributary)

Tributary # O(ccupied)

Values “R(emote)” for Slot/Pack, “T(ributary)” for Port and “O(ccupied)” for Tributary indicate a temporary blocking state of the iNNI tributary indicated by connPtA, because on the remote side it is occupied or blocked while locally it would be available. Therefore this iNNI tributary is marked as temporarily not available for path setup.

6. **RsvStatus** – Reservation Status

   Indicator whether the cross-connection has been allocated to a path by ONNS.. When *RsvStatus* = 0 and *XCStatus* = 1, this is a Host NE initiated cross-connection. Reserved (by ONNS) = 1; Unreserved = 0; default = 1.

7. **XCStatus**

   Indicator whether the cross-connect operation was successful.

   When *RsvStatus* = 0 and *XCStatus* = 1, this is a Host NE initiated cross-connection.

   Range: Success = 1 (default); Failed = 0

   2 = Reserved, for cross-connections, that are not physically switched, i.e. cross-connections in A- and Z-node for protecting NN connections within M:N protected connection groups.

   3 = Reserved, for cross-connections, that are not switched on higher-order, but the corresponding HO tributary is blocked by a LO cross-connection on a substructure.

   4 = Reserved, for cross-connections, that are switched to/from an EDGE tributary involved as EDGE-prt in an OUC.

8. **tribWidth** – Tributary Width

   The used bandwidth of the cross-connections expressed in multiples of STS1s.

   Range: STS1, STS3, STS12, STS48, STS192.

9. **tribSigStatus** – Tributary Signal Status

   This parameter indicates the fault status of the *connPtA* incoming signal on a path.

   Range: OK, FAILED.

Note: In the reply to the TL1 command **RTRV-NNDR** the parameter *tribSigStatus* is missing. This parameter is sent per tributary path record being sent for all connected tributaries of all ports reported and gives the state of the incoming signal at the

corresponding tributary (value OK or FAILED). As tributary record information from RTRV-NNDR is not displayed at the GUI, this issue is only recognized when checking TL1 logfiles. Workaround: To get state information at least for paths as a whole, RTRV-PATH can be executed or the corresponding GUI screens can be used.

## Example input/output

### Example NNDR output for the RTRV-NNDR command with an INNI *portID*:

The following example shows the output of a **RTRV-NNDR** command for an INNI portID:

```
RTRV-NNDR:LT-ONNS-319::123456::PORT,1-1-3-4;

   LT-ONNS-319 2002-01-14 09:45:28
M  123456 COMPLD
   "NNDR,PORT=1-1-3-4,172.41.18.0,NumberOfRecords=2"
   "PR:1-1-3-4,INNI,TX,172.41.19.1&1-1-1-2,,OK,OK,,NORMAL,,
   STS48,MON,10,Cost=1,,SRLG=0&0&0&0&0&0&0&0&0&0,IncludeID=0,

   "TR:25,172.3.19.65-51,1-1-3-4-25,-X-,1-1-3-1-7,RsvStatus=1,XCStatus=1,STS3,
   OK"
   "TR:28,172.3.19.53-91,1-1-3-4-28,-X-,1-1-3-4-4,RsvStatus=1,XCStatus=1,STS3,
   OK"
;
```

Newlines between PortRecords are optional. The label -X- indicates the cross-connection between connPtA and connPtB on the TribPathRecord.

### Example NNDR output for the RTRV-NNDR command with an INNI portID with protecting connection involved

The following example shows the output of a **RTRV-NNDR** command for an INNI portID with one tributary being allocated for a protecting connection in the A-node for this connection:

```
RTRV-NNDR:LT-ONNS-319::123456::PORT,1-1-3-4;

   LT-ONNS-319 2002-01-14 09:45:28
M  123456 COMPLD
   "NNDR,PORT=1-1-3-4,172.41.18.0,NumberOfRecords=2"
   "PR:1-1-3-4,INNI,TX,172.41.19.1&1-1-1-2,,OK,OK,,NORMAL,,
   STS48,MON,10,Cost=1,,SRLG=0&0&0&0&0&0&0&0&0&0,IncludeID=0,
   XCRate=STS1&STS48,BundleID=39"
   "TR:1,172.3.19.0-1011,1-1-3-4-1,-X-,1-1-2-1-1,RsvStatus=1,XCStatus=1,STS12,
   OK"
   "TR:13,172.3.19.0-1251,1-1-3-4-13,-X-,

   OK"
;
```

### Example NNDR output for the RTRV-NNDR command with an EDGE *portID*

The following example shows the output of a **RTRV-NNDR** command for an EDGE *portID*:

```
RTRV-NNDR:LT-ONNS-319::123456::PORT,1-1-3-4;

   LT-ONNS-319 2002-01-14 09:45:28
M  123456 COMPLD
   "NNDR,PORT=1-1-3-4,172.3.19.0,NumberOfRecords=2"
   "PR:1-1-3-4,EDGE,TX,0.0.0.0&0-0-0-0,,OK,OK,,NORMAL,,
   STS48,MON,0,Cost=1,,SRLG=0&0&0&0&0&0&0&0&0&0,IncludeID=0,XCRate=STS1&STS48,
   BundleID=0"
```

```
   "TR:1,172.3.19.0-211,1-1-3-4-1,-X-,1-1-2-1-1,RsvStatus=1,XCStatus=1,STS48,
   OK"
   "TR:1,172.3.19.0-1011,1-1-3-4-1,-X-,1-1-3-2-1,RsvStatus=1,XCStatus=1,STS48,
   OK"

   "PR:1-1-3-4,EDGE,RX,0.0.0.0&0-0-0-0,,OK,UNKNOWN,,NORMAL,,
   STS48,MON,0,Cost=1,,SRLG=0&0&0&0&0&0&0&0&0&0,IncludeID=0,XCRate=STS1&STS48,
   BundleID=0"
   "TR:1,172.3.19.0-211,1-1-3-4-1,-X-,1-1-2-1-1,RsvStatus=1,XCStatus=1,STS48,
   OK"
   "TR:1,172.3.19.0-1011,1-1-3-4-1,-X-,1-1-3-2-1,RsvStatus=1,XCStatus=1,STS48,
   OK"
;
```

This example shows two TribPathRecords for two bridged paths of a connection on an EDGE port.

### Example NNDR output for the RTRV-NNDR command with an EDGE portID of EDGE port configured for adaptive mode

The following example shows the output of a **RTRV-NNDR** command for an EDGE *portID* in adaptive mode:

```
RTRV-NNDR:LT-ONNS-319::123456::PORT,1-1-3-4;

   LT-ONNS-319 2002-01-14 09:45:28

   "TR:49,192.168.3.5-54,1-1-6-1-49,-X-,1-1-5-1-49,RsvStatus=1,XCStatus=1,
   STS48,OK"
;
```

The command **RTRV-NNDR** will send a maximum of 4 bidirectional port records per block. This produces a list of port records for all ports connected to the node with neighborASTNnodeID = 172.3.19.69 that may require blocking the data with the continuation RTRV completion code and replacing the semicolon (;) with a (>) terminator until the last block.

### Example NNDR output for the RTRV-NNDR command with a neighbor ASTN node ID

The following example shows the output of a **RTRV-NNDR** command with an input UNIclientNodeID:

```
RTRV-NNDR:LT-ONNS-319::123456::NBRID,172.3.19.69;

   LT-ONNS-319 2002-01-14 09:45:28

;
```

## Error responses

### Validation rule: Invalid *PortID* or *componentID* parameter

A RTRV-NNDR request for a specific port ID with a port number < 1 or > 16 is denied with the error response

```
Syntax, Parameter Data Invalid
```

instead of

`E410 - Input, Invalid PortID.`

The following list identifies conditions that will cause a similar error response:

Error code: `E512 - Input, Invalid Neighbor node ID`

### Incorrect bandwidth reporting

In case a *unidirectional* Signal Degrade (SD) condition occurs on an INNI port connection within an ONNS domain, this SD condition leads to a near-end-failure condition being raised for the affected port connection by the detecting node for the corresponding direction only. This leads to the following behavior:

- For the direction opposite to the direction of the corresponding SD condition the bandwidth of the affected port connection is removed of the available bandwidth advertised for the corresponding INNI link bundle, although in this direction no failure condition at all is present.
- Asymmetric available bandwidth is reported for the affected INNI link bundle via **`RTRV-NTDR`**, but just the other way round as the actual failure condition would suggest.
- For the setup of a unidirectional ONNS path (due to connection setup or restoration) via the affected link bundle in the direction opposite to the SD condition the affected port connection will not be selected, although in this direction no failure condition exists and the setup would succeed.
- The setup of a unidirectional path in the direction of the SD condition or of a bidirectional path in any of both directions via the affected port connection would be possible and would succeed in first place, but might afterwards still fail with E022 due to the fact, that the SD condition on port connection level induced an SD condition on path level.

This is due to the fact, that for path level an SD condition raises a failure condition that causes a path setup to fail.

**Workaround**

In case such asymmetric behavior occurs, INNI link bundles in the affected ONNS domain could be checked for SD conditions via **RTRV-NTDR**, **RTRV-NNDR**, and **RTRV-rr**. Additionally, an SD alarm should have been raised for the affected port, if not suppressed.

# RTRV-NNEVT-TCA

## Overview

The **RTRV-NNEVT-TCA** command retrieves the threshold control alert (TCA) status of the link bundles and operates on the current neighbor nodal data repository (NNDR) based local view on the bandwidth availability.

### Retrieving all TCA status records

Network Navigator responds to a request to retrieve its TCA Status by sending a complete report of the corresponding contents of the NNDR for the local node.

The command **RTRV-NNEVT-TCA** ALL is supported, and it retrieves the entire TCA Status of the local node when the dataType field = ALL.

The **RTRV-NNEVT-TCA** command sends a maximum of 64 output lines per block. If possible, the next block shall start with the next LSA_Link_Record.

### Retrieving TCA status by neighbor ASTN node ID

The command **RTRV-NNEVT-TCA** with dataType = NBRID and a neighborASTNNodeID as componentID retrieves all of the TCA status records that relate to the link between the local node and the neighbor node with that neighborASTNNodeID. The componentID is a single specific ASTN node ID of a neighbor node (ONNS adjacent node).

### REPT PTHCHG or REPT NNCHG is not generated

The **RTRV-NNEVT-TCA** command do not generate a REPT PTHCHG or REPT NNCHG message.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Abortable: No

## Input format

The **RTRV-NNEVT-TCA** command has a parameter dataType that defines what type of information is expected in the componentID field that determines what portion of the data repository records is retrieved.

Command syntax: **RTRV-NNEVT-TCA:***srcTid:[srcAid]:ctag::dataType[,componentID];*

## Input parameters

### Command parameters

1. **srcTid** – Source Target Identifier

   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.

Type: identifier, in addition the special character underscore "_" and the password characters are allowed.

Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set.

2. **srcAid**

   Source node ONNS application access identifier of the ONNS controller OS command interface port.

   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn.

3. **ctag** – Correlation Tag

   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.

   The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ".").

4. **dataType**

   This parameter indicates the data input parameter type of the *componentID* in the next field. The input parameters in the next field may change with each *dataType* to suit the requirements of the requested *dataType*. ALL is supported in this field and requires no *componentID* in the next field.

   Type: Alphanumeric value set.

   Range:

   - *ALL*: retrieve all TCA Status information
   - *NBRID*: next field will contain a Neighbor ASTN node ID, not valid without a matching appropriate value in the *componentID* field except for dataType = ALL.

5. **componentID**

   This parameter allows the user to specify a portion of TCA Status information such as an ASTN node ID for a neighbor node to return the TCA Status for all bundles of a link. The TCA Status records for the specified *componentID* will be returned.

   *componentID* depends on the previous dataType parameter and is one of:

   - not represented when datatype=ALL, to get all TCA Status information
   - *nodeID*: when datatype=NBRID, to get the part of the TCA status of the link between that neighbor node and this node.

     Description of nodeID (Neighbor Node Identifier):

     Identifier of a neighbor ASTN node or a neighbor UNI client.

     Type: Four dot separated numeric strings.

     Range: 0 … 255, for each numeric string.

### Output format

The **RTRV-NNEVT-TCA** with *dataType* = ALL produces this example output result with the complete TCA status information of the local node:

```
RTRV-NNEVT-TCA:LT-ONN61:snn:123456::ALL;

   LT-ONN61 2002-01-14 09:45:28
M  123456 COMPLD
   "nndrID,ALL,srcNodeASTNNodeID"
   "LinkId=origNodeASTNNodeID&neighborASTNNodeID1"
    ":BundleID=bundleID1,TCAStatus=TCA_Status1"
    ":BundleID=bundleID3,TCAStatus=TCA_Status3"
   "LinkId=origNodeASTNNodeID&neighborASTNNodeID9"
    ":BundleID=bundleID9,TCAStatus=TCA_Status9"
   "LinkId=origNodeASTNNodeID&neighborASTNNodeID2"
    ":BundleID=bundleID2,TCAStatus=TCA_Status2"
    ":BundleID=bundleID7,TCAStatus=TCA_Status7"
;
```

The **RTRV-NNEVT-TCA** command with *dataType* = NBRID produces this example output result:

```
RTRV-NNEVT-TCA:LT-ONN61:snn:123456::NBRID,neighborASTNNodeID;

   LT-ONN61 2002-01-14 09:45:28
M  123456 COMPLD
   "nndrID,NBRID=neighborASTNNodeID,origNodeASTNNodeID"
   "LinkId=origNodeASTNNodeID&neighborASTNNodeID"
    ":BundleID=bundleID1,TCAStatus=TCA_Status1"
    ":BundleID=bundleID4,TCAStatus=TCA_Status4"
    ":BundleID=bundleID3,TCAStatus=TCA_Status3"
;
```

### Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completionCode* and their syntax are included in the section “Output parameters” of the “RTRV-PATH: Retrieve ONNS connection data” (p. 3-2683) command.

#### Header_Record

1. **nndrID** – ONNS Data Repository dataID to be returned
   Type: Alphanumeric value set.
   Range: NNDR-TCA: TCA portion of Neighbour Nodal data repository.
2. **dataType**
   See definition of *dataType* in Input parameters section above.

3. **componentID**
   See definition of *componentID* in Input parameters section above.
4. **nodeID** - Neighbor Node Identifier
   Identifier of a neighbor ASTN node or a neighbor UNI client.
   Type: Four dot separated numeric strings
   Range: for each numeric string: 0 … 255
5. **origNodeASTNNodeID** – ASTN node ID of the originating node.
   Type: Four dot separated numeric strings.
   Range: for each numeric string: 0..255.

**Link_Header_Record**

1. **LinkID**
   LinkID is the ASTN node ID of the originating node plus that of the neighbor node that uniquely identifies the link.
   Type: Two &-separated node IDs, each node ID consists of four dot separated numeric strings.
   Example: 135.13.44.61&135.13.3.86
   Range: for each numeric string: 0..255.

**LinkBundle_Data Record**

1. **BundleID**
   This parameter is a unique numeric ID assigned to the link bundle on this node..
   Type: Integer.
   Range: >0.
2. **TCAStatus** – Status of the TCA of this link bundle
   Type: Alphanumeric value set.
   Range: INACTIVE (default), LOW, HIGH

## Example input/output

Output for the **RTRV-NNEVT-TCA** command by neighbor ASTN node ID.

The **RTRV-NNEVT-TCA** command with *datatype* = NBRID produces this example output result with all bundles between two neighbor nodes:

```
RTRV-NNEVT-TCA:LT-ONNS61:snn:123456::NBRID,135.13.44.86;

   LT-ONNS61 2001-01-14 09:45:28
M  123456 COMPLD
   "NNDR-TCA,NBRID=135.13.44.86,135.13.44.61"
   "LinkId=135.13.44.61&135.13.3.86"
    ":BundleId=1,TCAStatus=INACTIVE"
    ":BundleId=2,TCAStatus=LOW"
    ":BundleId=4,TCAStatus=HIGH"
;
```

The **RTRV-NNEVT-TCA** command with *datatype* = ALL produces this example output result:

```
RTRV-NNEVT-TCA:LT-ONNS-61:snn:123456::ALL;

   LT-ONNS-61 2002-07-14 09:45:28
M  123456 RTRV
   "NNDR-TCA,ALL,135.13.44.61"
   "LinkId=135.13.44.61&135.13.3.86"
    ":BundleId=1,TCAStatus=INACTIVE"
    ":BundleId=2,TCAStatus=LOW"
    ":BundleId=4,TCAStatus=HIGH"

....
   "LinkId=135.13.44.61&135.13.3.89"
    ":BundleId=3,TCAStatus=INACTIVE"
    ":BundleId=11,TCAStatus=LOW"
    ":BundleId=17,TCAStatus=LOW"
>

    ":BundleId=9,TCAStatus=INACTIVE"
    ":BundleId=13,TCAStatus=INACTIVE"
    ":BundleId=5,TCAStatus=INACTIVE"

....
   "LinkId=135.13.44.61&135.13.3.99"
    ":BundleId=19,TCAStatus=INACTIVE"
    ":BundleId=14,TCAStatus=LOW"
    ":BundleId=18,TCAStatus=LOW"

>    ....
   LT-ONNS-61   2002-01-14   09:45:30
M  123456 COMPLD
   "LinkId=135.13.44.61&135.13.3.105"
    ":BundleId=7,TCAStatus=LOW"
    ":BundleId=15,TCAStatus=LOW"
    ":BundleId=8,TCAStatus=HIGH"
;
```

The **RTRV-NNEVT-TCA** command will send a maximum of 64 lines per block.

## Error responses

### Validation rule: Invalid *componentID* parameter

The validity of the *componentID* parameter is checked. If it is invalid an appropriate error response is returned.

The following error responses is returned for an ASTN node ID which is not that of a neighbor:

Error code: `E512 - IINI Error - Input, Invalid Neighbor node ID`

# RTRV-NTDR: Retrieve ONNS network topology data repository

## Overview

The **RTRV-NTDR** command retrieves information stored in the NTDR data repository that is in RAM memory. The **RTRV-NTDR** command operates on the current, active-memory-resident, ONNS data. The NVM data from NNDM is used during initialization to recover the ONNS local NTDR data repository. Data from other ONNS nodes is acquired by the flooding and exchange of LSAs.

### Retrieving all NTDR records

When the *dataType* = ALL, Network Navigator responds to a request to retrieve its NTDR by sending a complete report of the contents of the data repository specified. The request causes the ONNS node to send all information in the specified data repository. When the NTDR is retrieved, each TL1 response message contains a record with all of the data relevant to a ONNS link group or LSA. The **RTRV-NTDR** command will send a maximum of 14 LSA linkBundle records per block.

### Retrieving NTDR records for any ASTN node ID

The command **RTRV-NTDR** with *dataType* = LSAID and *componentID* = ASTNNodeID retrieves the NTDR LSA records that relate to all of the links from the specified node with the *ASTNNodeID* to adjacent nodes. This *ASTNNodeID* can be the address of any node in the ONNS domain.

### Retrieving NTDR records for a neighbor ASTN node ID

The command **RTRV-NTDR** with *dataType* = NBRID and *componentID* = neighborASTNNodeID retrieves all of the NTDR LSA records that relate to the links between the current node and the neighbor node with the *neighborASTNNodeID*. The *componentID* is a single specific ASTNNodeID. The *neighborASTNNodeID* must be the ID of a neighbor node (ONNS adjacent node).

### REPT PTHCHG or REPT NNCHG is not generated

The **RTRV-NTDR** command shall not generate a REPT PTHCHG or REPT NNCHG notification.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Abortable: No

## Input format

Command syntax: **RTRV-NTDR**:*srcTid:srcAid:ctag::dataType[,componentID];*

## Input parameters

### Command parameters

1. **srcTid** – Source Target Identifier

   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.

   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.

   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set.

2. **srcAid**

   Source node ONNS application access identifier of the ONNS controller OS command interface port.

   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn.

3. **ctag** – Correlation Tag

   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.

   The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ".").

4. **dataType**

   This parameter specifies, which part of the NNTR is to be retrieved. Furtheron it determines the expected input parameter type of the componentID input parameter. When datatype = ALL componentID must not be specified.

   Values:

   - ALL: retrieves the entire NTDR in RAM.
   - LSAID: retrieves the LSA in NTDR related to the ASTN node ID, *componentID* must be an *ASTNnodeID*
   - NBRID: retrieves the LSA in NTDR between the current and the specified neighbor node, *componentID* must be a *neighborASTNNodeID*.

5. **componentID**

   This parameter depends on the previous *dataType* parameter and is one of:

   - not represented (when *datatype* = ALL)
   - *nodeID* (when *datatype* = LSAID (any node ID) or *datatype* = NBRID (neighbornode ID)

   The details for *nodeId* are described below.

**nodeID** – Node Identifier

- Identifier of an ASTN node.
- Type: Four dot separated numeric strings
- Range: for each numeric string: 0..255.

Note: If *dataType* = ALL, *componentID* and the = sign are not reported.

## Output format

### The Neighbor Topology data repository (NTDR) record structure

The complete NTDR of one node consists of LSARecords for all known nodes (including the reporting node itself) in the topology. Within a LSARecord level 1 Routing Controller information is kept in L1Routing and all (direct) neighborship relationships are kept in LinkRecords (one record for each neighbor relation). Within a LinkRecord the individual LinkBundleRecords are listed.

### Neighbor Topology data repository (NTDR) without data

An addressed node without data in the NTDR shall response only the HeaderRecord with NumberOfLSAs = 0. The Neighbor Topology data repository (NTDR) Record is composed of an NTDR_HeaderRecord and multiple LSARecords which are described below:

**NTDR_Record** ::=

<NTDR_HeaderRecord>

<LSARecord_1>

…

<LSARecord_n>

**NTDR_HeaderRecord** ::=

*nndrID,dataType[=componentID],srcNodeASTNNodeID,NumberOfLSAs=LSA_Count*

**LSARecord** ::=

<LSAHeaderRecord>

<L1Routing>

<LinkRecord_1>

…

<LinkRecord_n>

**LSAHeaderRecord** ::=

*LSAAdvertisedRouter=origNodeASTNNodeID,LinkCount=linkCount,nodeTid, UIipAddr=nodeUI_IPaddr,SIGipAddr=nodeIPaddr*

**L1Routing**::=

*L1Routing=routeFunc,RoutingAreaID=routeAreaID,ParentRoutingAreaID =prouteAreaID,L1RoutingControllerID=routeControlID,L1RoutingControllerIPAddr= routeControlIPAddr,AbstractModel=abstractModel,AbstractNodeID=abstractNodeID*

**LinkRecord** ::=

<Link_HeaderRecord>

<LinkBundleRecord_1>

…

<LinkBundleRecord_o>

**Link_HeaderRecord** ::=

*LinkId=LsaLinkID,BundleCount=bundleCount*

**LinkBundleRecord** ::=

*BundleID=linkBundleID,Delay=delay,Cost=adminCost,*

*SRLG=srlgList1,IncludeId=0,AtMinRate=minXCrate,*

*TotalBandwidth=totalBandwidth,AvailBandwidth=availableBandwidth,*

*AtMaxRate=maxXCrate,AvailBandwidth=availableBW_MaxXCrate*

**Output format with normal data retrieve completion report for dataType=ALL**

If the RTRV-NTDR request completes successfully, then the following normal completion response is returned:

```
   srcTid date time
M  ctag RTRV
   "nndrID,ALL,srcNodeASTNNodeID,NumberOfLSAs=LSA_Count"
   "LSAHeaderRecord_1::
   Link_HeaderRecord_1:
   LinkBundleRecord_1-1
   ...
   LinkBundleRecord_1-n"
   ...
   "LSAHeaderRecord_4:L1Routing_4:
   Link_HeaderRecord_4:
   LinkBundleRecord_4-1"
>
   srcTid date time
M  ctag COMPLD
   "LSAHeaderRecord_5::
   Link_HeaderRecord_5:
   LinkBundleRecord_5-1
   ...
   LinkBundleRecord_5-n"
```

```
   ...
   "LSAHeaderRecord_m::
   Link_HeaderRecord_m:
   LinkBundleRecord_m-1
   ...
   LinkBundleRecord_m-n"
;
```

## Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completionCode* and their syntax are included in the section "Output parameters" of the "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683) command.

### NTDR_HeaderRecord

1. **nndrID**

   NN Data Repository *dataID* to be returned

   Type: Alphanumeric value set.

   Range: NTDR, Network Topology data repository in RAM

2. **dataType**

   This parameter specifies, which part of the ELDR is to be retrieved. Furthermore it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.

   Type: Alphanumeric value set.

   Range:

   - ALL: retrieves the entire external link data repository in RAM
   - LSAID: retrieves the LSA in ELDR related to the ASTN node ID, *componentID* must be an *ASTNnodeID*
   - NBRID: retrieves the LSA in NTDR between the current and the specified neighbor node, *componentID* must be a *neighborASTNNodeID*.

   This parameter specifies, which part of the NNTR is to be retrieved. Furthermore it determines the expected input parameter type of the *componentID* input parameter. When *datatype* = ALL *componentID* must not be specified.

   Type: Alphanumeric value set

   Range:

   - ALL: retrieves the entire (NTDR) Neighbor Topology data repository in RAM
   - LSAID: retrieves the LSA in NTDR related to the ASTN node ID, *componentID* must be an *ASTNnodeID*
   - NBRID: retrieves the LSA in NTDR between the current and the specified neighbor node, *componentID* must be a *neighborASTNNodeID*.

3. **componentID**

This parameter depends on the previous *dataType* parameter and is one of:

- not represented (when *datatype* = ALL)
- *nodeID* (when *datatype* = LSAID (any node ID) or *datatype* = NBRID (neighbornode ID)

The details for *nodeId* are described below.

**nodeID** – Node Identifier

- Identifier of an ASTN node.
- Type: Four dot separated numeric strings
- Range: for each numeric string: 0..255.

Note: If *dataType* = ALL, *componentID* and the = sign are not reported.

Note: If *dataType* = ALL, *componentID* and the "=" sign are not reported.

4. **srcNodeASTNNodeID** – Reporting Node ID

   ASTN node ID of the ONNS node replying to this command.

   Type: Four dot separated numeric strings

   Range: for each numeric string: 0..255

5. **LSA_Count**

   The parameter indicates the number of LSA records in the report. Also equals number of NE nodes in the network for *dataType* = ALL.

   Type: Integer

   Range:

   - >0: number of LSAs with topology data records
   - 0: no topology data at this node or within the network available

**LSARecord**

For each reported node of the topology one LSARecord is reported.

1. LSAHeaderRecord

   a. **origNodeASTNNodeASTNNodeID** – Node ID of Advertising Node

      This is the ASTN node ID of the node advertising this LSA data record.

      Type: Four dot separated numeric strings.

      Range: 0 – 255 for each numeric string.

   b. **linkCount**

      Number of reported links of *LSAAdvertisedRouter* towards other nodes in the network.

      Type: Integer

      Range: >0

   c. **nodeTid**

      Target identifier of the source node is the logical name of the Host NE. ONNS uses the same unique *tid* used by Host NE.

      See also the definition of *tid* in RTRV-HDR.

      Type: identifier, in addition the special character underscore "_" and the password characters are allowed.

Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.

2. L1Routing

   The L1Routing object is optional and only visible for the *LSAAdvertisedRouter* with the value PRIMARY for the parameter *routeFunc*.

   a. **routeFunc** – level 1 Routing Function

      *routeFunc* defines if the *LSAAdvertisedRouter* has level 1 routing controller functionality.

      Type: Alphanumeric value set.

      Range: PRIMARY (ONNS node is the primary level 1 routing controller)

   b. **routeAreaID** – Routing Area ID

      *routeAreaID* defines the identity of the routing area.

      Type: four dot separated numeric string

      Range: 0 – 255 for each numeric string.

   c. **prouteAreaID** – Parent Routing Area ID

      *prouteAreaID* defines the identity of the parent routing area.

      Type: four dot separated numeric string

      Range: 0 – 255 for each numeric string.

   d. **routeControlID** – level 1 Routing Controller ID

      *routeControlID* defines the identity of the level 1 routing controller.

      Type: four dot separated numeric string

      Range: 0 – 255 for each numeric string.

   e. **routeControlIPAddr** – level 1 Routing Controller IP Address

      *routeControlIPAddr* defines the IP address for this routing controller node as level 1 routing controller address.

      Type: four dot separated numeric string

      Range:

      For first numeric string: 0 … 223

      For second to fourth numeric string: 0 … 255

      The values 0.0.0.0 and 1.1.1.1 are excluded.

   f. **abstractModel** – Abstraction Model

      *abstractModel* defines the abstraction model used by the level 1 routing controller.

      Type: Alphanumeric value set.

      Range: ABSTRACTNODE

   g. **abstractNodeID**

      *abstractNodeID* is defined in case the *abstractModel* is ABSTRACTNODE. This parameter specifies the abstract node ID, which is advertised in the level 1 area.

      Type: four dot separated numeric string

      Range: 0 – 255 for each numeric string.

**LinkRecord**

For each neighborship of the *LSAAdvertisedRouter* one LinkRecord is reported.

1. Link_HeaderRecord
   a. **`LsaLinkID`**
      *LsaLinkID* consists of the advertising ASTN nodeID and a neighbor ASTN nodeID, which together uniquely identify a link. The two IDs are separated by a &.
      Type: Two times four dot separated numeric strings, separated by &.
      Example: 135.13.44.61&135.13.3.86
      Range: 0 – 255 for each numeric string.
   b. **`bundleCount`**
      Number of LinkBundles within the LinkRecord.
      Type: Integer
      Range: >0
2. LinkBundleRecord
   For each link bundle within the LinkRecord one LinkBundleRecord is reported.
   a. **`linkBundleID`**
      This parameter is a unique numeric ID assigned to the link bundle on this node.
      Range: 0 .. 32767
   b. **`delay`**- Propagation Delay
      Propagation delay in milliseconds through the port connection between the pair of ports on the path. The time needed for a signal to traverse from this node to the neighbor node. A propagation delay of 1 milliseconds corresponds to about 450 km of fiber length.
      Type: Integer
      Range: 0 (default) – 255
      Propagation delay parameter is not applicable for EDGE, ENNI and UNI ports and is set to the default value.
   c. **`adminCost`** – Administrative Cost
      Provisioned administrative cost of the port connection when used in a connection path.
      Type: Integer
      Range; 1 (default) – 65535
      Administrative cost parameter is not applicable for EDGE ports and is set to the default value. Administrative cost parameter is not applicable for UNI ports and is set to the default value.
   d. **`slrgList`** – Shared Risk Link Group Identifier list.
      The max. number of identities that can be provisioned per port may be release dependent.
      Type: Up to ten &-separated integers
      Examples:
      198&233&0&0&0&0&0&0&0&0

10&20&30&40&0&0&0&=&0&0

89&1000&4&10&20&31&111&231&300&777

Range: Each value: 0 (default) – 65535. 0 means no SRLG provisioned

SRLG list is not applicable for EDGE ports and is set to the default value. SRLG list is not applicable for UNI ports and is set to the default value.

e. **IncludeID** – VPN ID

Type: Integer

Range: 0 (default) – 65535. 0 means no includeID provisioned

VPN ID is not applicable for EDGE, ENNI and UNI ports and is set to the default value.

f. **minXCrate**

*minXCrate* denotes the smallest signal rate granularity used to provision a port into trib's.

Values: STS1 (link bundle consists of STMm, OCn ports), STS3 (link bundle consists of GE1 ports in SDH mode), STS1 (link bundle consists of GE1 ports in SONET mode).

g. **totalBandwidth**

This parameter is a numeric value indicating the total bandwidth in this linkBundle as multiples of *minXCrate*.

Type: Integer

Range: >2

h. **availableBandwidth** (for *minXCrate*)

This parameter is a numeric value indicating the available (i.e. non-used) bandwidth in this *linkBundle* as multiples of *minXCrate*.

Type: Integer

Range: ≥0

i. **maxXCrate**

This parameter denotes the largest signal rate granularity used to provision a port into trib's.

Type: Alphanumeric value set.

Range: STS1, STS3, STS12, STS48, STS192 (link bundle consists of all STMm, OCn ports), STS1 (link bundle consists of GE1 ports in SONET mode), STS3 (link bundle consists of GE1 ports in SDH mode).

j. **availableBW_MaxXCrate**

This parameter is a numeric value indicating the available (i.e. non-used) bandwidth in this *linkBundle* as multiples of *maxXCrate*.

Type: Integer

Range: ≥0

## Example input/output

Example output for the **RTRV-NTDR** command by Neighbor ASTN node ID:

```
RTRV-NTDR:LT-ONNS-61::123456::NBRID,135.13.44.86;
```

```
   LT-ONNS-61 2001-01-14 09:45:28

```

Newlines between LinkID's are optional.

## Error responses

### Validation rule: Invalid componentID parameter II

The command is rejected when for the *datatype* = LSAID the received *ASTNNodeID* is invalid.

Error code: `E511 - IINO - Input, Invalid NOde_ID`

Error code: `E512 - IINI Error - Input, Invalid Neighbor node ID`

### Validation rule: Invalid componentID parameter II

The following list identifies conditions that will be returned, if access to the topology database is not possible due to internal problems:

Error code:
E002 - SICE Error - Status, Inter-Processor Communication Error caused cmd failure

Error code:
E003 - SNTT Error - Status, Network Topology database Timed out

### Possible issues when widely using unidirectional ONNS connections

When in an ONNS network unidirectional ONNS connections are widely used, the following misbehavior may occur:

1. Local audit erroneously reports extra NN cross-connections: **AUD-LOCAL** and **RTRV-AUDLOG** may erroneously report extra NN cross-connections, if two unidirectional ONNS connections of differing bandwidth are traversing a node in opposite directions, but with connecting the same timeslots, for example, one connection from timeslot A to timeslot B and the other one from timeslot B to timeslot A.
2. Free bandwidth generally advertised on an INNI link, although no more bandwidth for bidirectional ONNS connections available: Setup of a bidirectional ONNS connection via an INNI link may fail, although for this link enough free bandwidth is generally advertised for example, via **RTRV-NTDR**. This is the case, if the corresponding link is nearly totally filled with a major part being unidirectional connections. The advertised free bandwidth may then refer to differing timeslots for both directions, thus not allowing bidirectional connections to be setup.

### Incorrect bandwidth reporting

In case a *unidirectional* Signal Degrade (SD) condition occurs on an INNI port connection within an ONNS domain, this SD condition leads to a near-end-failure condition being raised for the affected port connection by the detecting node for the corresponding direction only. This leads to the following behavior:

- For the direction opposite to the direction of the corresponding SD condition the bandwidth of the affected port connection is removed of the available bandwidth advertised for the corresponding INNI link bundle, although in this direction no failure condition at all is present.
- Asymmetric available bandwidth is reported for the affected INNI link bundle via **RTRV-NTDR**, but just the other way round as the actual failure condition would suggest.
- For the setup of a unidirectional ONNS path (due to connection setup or restoration) via the affected link bundle in the direction opposite to the SD condition the affected port connection will not be selected, although in this direction no failure condition exists and the setup would succeed.
- The setup of a unidirectional path in the direction of the SD condition or of a bidirectional path in any of both directions via the affected port connection would be possible and would succeed in first place, but might afterwards still fail with E022 due to the fact, that the SD condition on port connection level induced an SD condition on path level.

  This is due to the fact, that for path level an SD condition raises a failure condition that causes a path setup to fail.

#### Workaround

In case such asymmetric behavior occurs, INNI link bundles in the affected ONNS domain could be checked for SD conditions via **RTRV-NTDR**, **RTRV-NNDR**, and **RTRV-rr**. Additionally, an SD alarm should have been raised for the affected port, if not suppressed.

# RTRV-OC3: Retrieve OC3 port

The command **RTRV-OC3** is used to retrieve all parameters related to the optical OC3 port.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-OC3**:*tid:aid:ctag*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Access Identifier of an OC3 port.
   Type: AID.
   Range: SPortAID of OC3 port.
   The keyword **all** is allowed up to shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

## Output format

In response to a valid **RTRV-OC3** command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command parameters

1. **aid** – Access Identifier

   Type: AID.

   Range: OC3 port AID.

### Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)

   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

   This parameter is supported by ports of *portClass* INNI.

   This parameter is supported by ports of *portClass* ENNI.

   Type: Numeric string.

   Range: 1(default)…65535

2. **brstintvl**– Bursty Interval

   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.

   Type: numeric value set.

   Range: 2 to 10.

   Default: 7.

3. **brstthr** – Bursty Error Threshold

   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.

   Type: numeric value set.

   Range (as percentage ): 5, 10, … 50.

   Default: 30.

4. **clientNodeID** – Client Node IDentifier

   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.

   This parameter is supported by ports of *portClass* UNI.

   Type: IPv4 format: Four dot separated numeric string.

   Range: Each numeric string: 0…255

   Default: 0.0.0.0

5. **crstat** – Constituent Rates Status list

This parameter shows the rates of the port signals. It is the pointer processor setup if adaptive mode (*trbmd* = ADAPTIVE) is selected.

When switching *trbmd* from FIXED to ADAPTIVE or when creating a port newly *crstat* inherits the current value of *inputsig* until the system delivers an up-to-date value from the pointer processor. If no value is available from the pointer processor the latest known value is retained.

For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.

Type: numeric value set.

Range: NX-NX-NX-…

N is the number of Xs. X can be 1 or 3 representing STS1 or STS3C.

6. **exprstrc** – Value of Expected J0

   Expected regenerator section trace identifier.

   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.

   Type: Hexadecimal digits

   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

   Default: 89hex followed by 15 bytes 00hex

7. **felpm** – Far-end Line PM Enable

   Enable or disable of the performance monitoring of the Far-end Line.

   Type: Alphanumeric value set.

   Range:

   - ENABLE
   - DISABLE (default).

8. **frcdus** – Force to DUS

   Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message "do not use" will be transmitted from that optical interface.

   Type: Alphanumeric value set.

   Range:

   - ENABLE , set a forced DUS/DNU
   - DISABLE (default), clear a forced DUS/DNU

9. **fsflpbkstat** – Far Side Facility Loopback Status

   This parameter specifies the current far-side facility loopback status of the considered output *aid*.

   A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.

Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.

Type: Alphanumeric value set.

Range:

- YES
- NO (default).

10. **inputsig** – Tributary Input Signal Rate List

    This parameter is a list of STSn rates across the port's bandwidth.

    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then *inputsig* is setable and retrievable as in fixed mode but does not influence the port behavior.

    Type: numeric value set.

    Range: NX-NX-NX-…

    N is the number of Xs. X can be 1 or 3 representing STS1 or STS3C.

    Default: 31.

    Example: An O-3 signal might be represented by 31 which implies 3 STS1's or 13 which implies 1 STS3C.

11. **istd** – Interface Standard

    Each synchronous optical interface can be set to SDH or SONET.

    Type: Alphanumeric value set.

    Range: SONET.

    Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2381).

12. **linkResCls** – Link Resource Class

    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set (4 bytes), every bit defining one link class

    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF

    Default: 00 for each alphanumeric character

13. **localLinkID** – Local Link IDentity

    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

14. **`localLPID`** – Local Logical Port IDentity

    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.

    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *portClass* UNI.

    This parameter is supported by ports of *portClass* EDGE.

    Type: numeric value set.

    Range: 0 (default) to 4294967295

    The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

15. **`lpbk`** – Loopback

    This parameter specifies the current near-side loopback status of the considered output *aid*.

    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.

    Type: Alphanumeric value set.

    Range:

    - YES
    - NO (default).

16. **`maxNNXCRate`** – Maximum NN Cross Connect Rate

    The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* INNI.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set.

    Range: STS1 or STS3 (default)

17. **`minNNXCRate`** – Minimum NN Cross Connect Rate

The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* INNI.

This parameter is supported by ports of *portClass* ENNI.

Type: Alphanumeric value set.

Range: STS1 (default) or STS3.

18. **ndetmd** – Neighbor Detection Mode

    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* INNI.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set.

    Range:

    AUTO, MAN

    Default:

    For *portClass* = INNI: AUTO

    For *portClass* = ENNI: MAN

19. **neighborASTNNodeID** – Neighbor ASTN Node Id

    This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.

    If ndetmd=MAN, this parameter shall indicate the value set by the operator. If ndetmd=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

    *neighborASTNNodeID* is used by the ONNS application.

    Type: Four dot separated numeric string.

    Range: Each numeric string: 0…255.

    Default: 0.0.0.0 If portClass = INNI, the default value shall have the meaning of "no neighbor discovered".

20. **neighborNodeID** – Neighbor Node Id

This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

*neighborNodeID* is used by the ONNS application.

Type: Four dot separated numeric string.

Range: Each numeric string: 0…255.

Default: 0.0.0.0

If *portClass* = INNI, the default value shall have the meaning of "no neighbor discovered"

21. **neighborPortID** – Neighbor Port Id

    This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.

    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

    *neighborPortID* is used by the ONNS application.

    Type: Four dash separated numeric string.

    Range: Each numeric string: 0…255.

    Default: 0-0-0-0.

    Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

22. **neighborSigPCID** – Neighbor Signaling PC IDentity

    The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Four dot separated numeric string

    Range: Each numeric string: 0…255

    Default: 0.0.0.0

23. **neighborSigPCIPAddr** – Neighbor Signaling PC IP Address

    The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* ENNI.

Type: IPv4 format: Four dot separated numeric string

Range: Each numeric string: 0…255

Default: 0.0.0.0

24. **nelpm** – Near-End Line PM Enable

    Enable or disable near-end multiplex section (near-end line) performance monitoring.

    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).

25. **networkTNAType** – Network TNA Type

    The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *portClass* UNI.

    This parameter is supported by ports of *portClass* EDGE.

    Type: Alphanumeric value set.

    Range:

    - IPV4 (default)
    - IPV6
    - NSAP

26. **networkTNAAddress** – Network TNA Address

    The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *portClass* UNI.

    This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number: 00000000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 00000000000000000000000000000000000000000000

The default value shall have the meaning of "no TNA Address provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

27. **`opdis`** – Optical Distance

    It shows the type of application for which the optical transmitter on this port is suited. The value NA is reported for client ports.

    Type: Alphanumeric value set.

    Range:

    - VERY-SHORT-REACH
    - SHORT-REACH
    - INTERMEDIATE-REACH
    - LONG-REACH
    - VERY-LONG-REACH
    - OLS_PASSIVE
    - OLS_400G
    - OLS_800G
    - XTREME.
    - NA.

28. **`opwl`** – Optical Wavelength

Optical Wavelength in nanometers. It shows the type of optics that is used on this port.

Type: Alphanumeric value set.

Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 … 1562.640 (i.e. C-Band); 1553.731 … 1608.329 (i.e. L-Band), 1471 … 1611 (for CWDM) NA (for client ports).

The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

29. **`outql`** – Outgoing timing quality

    This parameter provides the outgoing quality level message on the S1 SONET line overhead byte.

    Type: Alphanumeric value set.

    Range:

    - PRS
    - STU
    - ST2
    - ST3
    - DUS (default).

30. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold

    This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-1/OC-3: 1 – 192000.

    Default: The default values differ for SDH and SONET:

    - STM1: 28800
    - OC3: 154.

31. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold

    This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-1/OC-3: 1 – 192000.

Default: The default values differ for SDH and SONET and the different rates:

- STM1: 28800
- OC3: 154.

32. **pmode** – Port Mode

    This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.

    Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

33. **pmrsneses** – Performance Monitoring Section/RS Near-End SES Threshold

    This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set.

    Range (superset of allowed ranges for SDH and SONET):1 – 64000

    Default: The default values differ for SDH and SONET and the different rates:

    - SDH (all rates): 2400
    - SONET OC48: 2392
    - SONET OC192: 8554
    - SONET OC768: 22776.

34. **portClass** – Port Class

    This parameter identifies the port class of the AID.

    In which role the port is used by the ONNS application is specified by this parameter *portClass*.

    Type: Alphanumeric value set.

    Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.

    Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

35. **portControl** – Port Control (PortAdministrative Mode)

    The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.

    Type: Alphanumeric value set.

    Range: NORMAL (default), LOCKOUT

36. **propagationDelay** – Propagation Delay

    This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.

    *propagationDelay* is used by the ONNS application.

    Type: Numeric string.

    Range: 0 (default) …25. The unit of this value is "milliseconds".

37. **ptype** – Port Type

    This identifies the port type of the AID.

    Type: Alphanumeric value set.

    Range: OC3.

38. **remAdvNodeID** – Remote Advertised Node IDentity

    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition:

    The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.

    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Four dot separated numeric string

    Range: Each numeric string: 0…255

    Default: 0.0.0.0

39. **remLinkID** – Remote Link IDentity

    The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: numeric value set

    Range: 0 (default) to 4294967295

40. **remRAID** – Remote Routing Area IDentity

    The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:

    The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0…255

Default: 0.0.0.0

41. **`remTID`** – Remote TID

    The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: TID or empty-string

    Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2397) description.

    Default: empty string: ""

42. **`rstimca`** – RS TIM Consequent Action Enable

    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).

    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).

    Type: Alphanumeric value set.

    Range:

    - ENABLE: enable consequent action for TIM
    - DISABLE (default): disable consequent action for TIM.

43. **`rstimmon`** – RS TIM Monitor Enable

    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).

    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.

    Type: Alphanumeric value set.

    Range:

    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor

44. **`sdsfmode`** – Signal Degrade/Signal Fail Mode

    The degraded state is detected in Burst or Poisson mode.

    Type: Alphanumeric value set.

    Range:

    - BURST
    - POISSON (default).

45. **`sdthr`** – Signal Degrade Threshold

Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.

Type: numeric value set.

Range (as exponents of 10): –5; –6; –7; –8; –9.

46. **servcond** – Service Condition

    This parameter indicates its status concerning service involvement.

    Type: Alphanumeric value set.

    Range:

    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.

47. **sfthr** – Signal Failure Threshold

    Signal failureb threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.

    Type: numeric value set.

    Range (as exponents of 10): –5; –6; –7; –8; –9.

    Default: –6.

48. **sltca** – Section and Line TCA Profile Pointer

    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.

    Type: Alphanumeric string.

    Range: String with maximum of 24 characters.

    Default: DEFAULT0.

49. **sonet** – SONET ASAP

    SONET Alarm Severity Assignment Profile. This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH ASAP for SDH ports of corresponding line rate (see "RTRV-STM4: Retrieve STM4 port" (p. 3-2860), output parameter *sdhpn*) to be compatible with current generation applications.

    Type: Alphanumeric string.

    Range: String with a maximum of 24 characters. A hyphen ("-") is allowed in the name additionally.

    Default: DEFAULT.

50. **spm** – Section PM Enable

    Enable or disable regenerator section (section) performance monitoring.

    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).

51. **srlgList** – Shared Risk Link Group Identities List

    The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.

If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.

This parameter is supported by ports of *portClass* INNI.

This parameter is supported by ports of *portClass* ENNI.

Type: Ten numeric strings separated by dashes.

Range: Each numeric string: 0…65535.

Default: 0-0-0-0-0-0-0-0-0-0.

52. **strc** – Value of incoming J0

    This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter strc is omitted from the response.

    Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

    Range: 1 byte string, 16 byte string, 64 byte string (dependent on the strcfmt parameter).

53. **strcfmt** – Format of incoming J0

    The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.

    Type: Numeric string.

    Range:

    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

54. **strcout** – Value of outgoing J0

    This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.

    If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.

    Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string.

Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

Default: 01Hex

55. **strcst** – Status of incoming J0

    This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.

    Type: Alphanumeric value set.

    Range: NORMAL: strc contains a valid value; UNAVAILABLE: no value for strc could be obtained by the system; AIS: no value for strc due to an SF condition.

56. **strcwfmt** – Format of outgoing J0

    The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.

    Type: Numeric string.

    Range:

    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

57. **trbmd** – Tributary mode

    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* and *unequiposig* have no effect. See definition of output parameter *trbmd* in "RTRV-STM16: Retrieve STM16 port" (p. 3-2877) for SDH equivalent.

    Type: Alphanumeric value set.

    Range:

    - ADAPTIVE
    - FIXED.

    Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2381) command.

58. **unequiposig** – Unequipped Output Signal List

This parameter is a list of STSn rates across the port's bandwidth. It determines the rate(s) of the “unequipped” signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need to have the identical setting. Mixed rates for tx and rx side of the port are allowed. If *trbmd* is ADAPTIVE, then *unequiposig* is settable and retrievable as in fixed mode but does not influence the port behavior.

Type: numeric value set.

Range: NX-NX-NX-…

N is the number of Xs. X can be 1 or 3 representing STS1 or STS3C.

Default: 3 1 = all STS1.

59. **z0outmode** – Mode of outgoing Z0 byte insertion

    The Z0 insertion is configurable to support interworking with old SONET equipment for STS-M interfaces (M=3, 12, 48).

    Type: Alphanumeric value set.

    Range:

    - FIXEDCC (default): for inserting the fixed value CChex
    - STSID: for inserting the STS-Id of the current frame.

### Detailed behavior description

The command retrieves the parameters as described above.

The command **RTRV-OC3** does not generate a **REPT DBCHG** message.

### Example input/output

The following example shows the successful execution of a **RTRV-OC3** command. Not all output parameters are listed (missing ones indicated by … ):

```
RTRV-OC3:LT-UNITE:1-1-#-#-1-1:123456;

   LT-UNITE 00-11-27 08:00:00
M  123456 COMPLD
   "1-1-#-#-1-1:ptype=OC3,frcdus=DISABLE,sfthr=-3,sdthr=-6, pmode=MON,
   ..... pmmsneses=15,pmrsneses=30"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the RTRV-OC3 command.

#### Check CCB against *ptype* and *istd*

See definition of error response in “RTRV-STM16: Retrieve STM16 port” (p. 3-2877).

## References

GR-199-CORE (RTRV-*rr*)

# RTRV-OC12: Retrieve OC12 port

The command **RTRV-OC12** is used to retrieve all parameters related to the optical OC12 port.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-OC12**:*tid:aid:ctag*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Access Identifier of an OC12 port.
   Type: AID.
   Range: SPortAID of OC12 port.
   The keyword **all** is allowed up to shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

## Output format

In response to a valid **RTRV-OC12** command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command parameters

1. **aid** – Access Identifier

   Type: AID.

   Range: OC-12 port AID.

### Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)

   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

   This parameter is supported by ports of *portClass* INNI.

   This parameter is supported by ports of *portClass* ENNI.

   Type: Numeric string.

   Range: 1(default)…65535

2. **brstintvl**– Bursty Interval

   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.

   Type: numeric value set.

   Range: 2 to 10.

   Default: 7.

3. **brstthr** – Bursty Error Threshold

   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.

   Type: numeric value set.

   Range (as percentage ): 5, 10, … 50.

   Default: 30.

4. **clientNodeID** – Client Node IDentifier

   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.

   This parameter is supported by ports of *portClass* UNI.

   Type: IPv4 format: Four dot separated numeric string.

   Range: Each numeric string: 0…255

   Default: 0.0.0.0

5. **crstat** – Constituent Rates Status list

This parameter shows the rates of the port signals. It is the pointer processor setup if adaptive mode (*trbmd* = ADAPTIVE) is selected.

When switching *trbmd* from FIXED to ADAPTIVE or when creating a port newly *crstat* inherits the current value of *inputsig* until the system delivers an up-to-date value from the pointer processor. If no value is available from the pointer processor the latest known value is retained.

For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.

Type: numeric value set.

Range: NX-NX-NX-…

N is the number of Xs. X can be 1, 3 or 12 representing STS1, STS3C or STS12C.

6. **exprstrc** – Value of Expected J0

   Expected regenerator section trace identifier.

   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.

   Type: Hexadecimal digits

   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

   Default: 89hex followed by 15 bytes 00hex

7. **felpm** – Far-end Line PM Enable

   Enable or disable of the performance monitoring of the Far-end line.

   Type: Alphanumeric value set.

   Range:

   - ENABLE
   - DISABLE (default).

8. **frcdus** – Force to DUS

   Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message "do not use" will be transmitted from that optical interface.

   Type: Alphanumeric value set.

   Range:

   - ENABLE , set a forced DUS/DNU
   - DISABLE (default), clear a forced DUS/DNU

9. **fsflpbkstat** – Far Side Facility Loopback Status

   This parameter specifies the current far-side facility loopback status of the considered output *aid*.

   A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.

Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.

Type: Alphanumeric value set.

Range:

- YES
- NO (default).

10. **inputsig** – Tributary Input Signal Rate List

    This parameter is a list of STSn rates across the port's bandwidth.

    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then *inputsig* is settable and retrievable as in fixed mode but does not influence the port behavior.

    Type: numeric value set.

    Range: NX-NX-NX-…

    N is the number of Xs. X can be 1, 3 or 12 representing STS1, STS3C or STS12C.

    Default: 121.

    Example:

    An OC12 signal might be represented by 31-33 which implies 3 STS1's, 3 STS3C's.

11. **istd** – Interface Standard

    Each synchronous optical interface can be set to SDH or SONET.

    Type: Alphanumeric value set.

    Range: SONET.

    Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2381).

12. **linkResCls** – Link Resource Class

    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set (4 bytes), every bit defining one link class

    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF

    Default: 00 for each alphanumeric character

13. **localLinkID** – Local Link IDentity

    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

14. **`localLPID`** – Local Logical Port IDentity

    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.

    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *portClass* UNI.

    This parameter is supported by ports of *portClass* EDGE.

    Type: numeric value set.

    Range: 0 (default) to 4294967295

    The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

15. **`lpbk`** – Loopback

    This parameter specifies the current near-side loopback status of the considered output *aid*.

    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.

    Type: Alphanumeric value set.

    Range:

    - YES
    - NO (default).

16. **`maxNNXCRate`** – Maximum NN Cross Connect Rate

    The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* INNI.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set.

    Range: STS1, STS3 or STS12 (default)

17. **`minNNXCRate`** – Minimum NN Cross Connect Rate

The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* INNI.

This parameter is supported by ports of *portClass* ENNI.

Type: Alphanumeric value set.

Range: STS1 (default), STS3 or STS12.

18. **ndetmd** – Neighbor Detection Mode

    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* INNI.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set.

    Range:

    AUTO, MAN

    Default:

    For *portClass* = INNI: AUTO

    For *portClass* = ENNI: MAN

19. **neighborASTNNodeID** – Neighbor ASTN Node Id

    This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.

    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

    *neighborASTNNodeID* is used by the ONNS application.

    Type: Four dot separated numeric string.

    Range: Each numeric string: 0…255.

    Default: 0.0.0.0 If portClass = INNI, the default value shall have the meaning of "no neighbor discovered".

20. **neighborNodeID** – Neighbor Node Id

This parameter identifies the IP address of the neighbor node of ports of portClass = INNI. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until portClass is INNI. This parameter can only be modified, if ndetmd=MAN. If ndetmd=MAN, this parameter shall indicate the value set by the operator. If ndetmd=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

*neighborNodeID* is used by the ONNS application.

Type: Four dot separated numeric string.

Range: Each numeric string: 0…255.

Default: 0.0.0.0

If *portClass* = INNI, the default value shall have the meaning of "no neighbor discovered"

21. **neighborPortID** – Neighbor Port Id

    This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.

    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

    *neighborPortID* is used by the ONNS application.

    Type: Four dash separated numeric string.

    Range: Each numeric string: 0…255.

    Default: 0-0-0-0.

    Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

22. **neighborSigPCID** – Neighbor Signaling PC IDentity

    The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Four dot separated numeric string

    Range: Each numeric string: 0…255

    Default: 0.0.0.0

23. **neighborSigPCIPAddr** – Neighbor Signaling PC IP Address

    The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* ENNI.

Type: IPv4 format: Four dot separated numeric string

Range: Each numeric string: 0…255

Default: 0.0.0.0

24. **nelpm** – Near-End Line PM Enable

    Enable or disable near-end multiplex section (near-end line) performance monitoring.

    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).

25. **networkTNAType** – Network TNA Type

    The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *portClass* UNI.

    This parameter is supported by ports of *portClass* EDGE.

    Type: Alphanumeric value set.

    Range:

    - IPV4 (default)
    - IPV6
    - NSAP

26. **networkTNAAddress** – Network TNA Address

    The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *portClass* UNI.

    This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number: 00000000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 00000000000000000000000000000000000000000000

The default value shall have the meaning of "no TNA Address provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

27. **`opdis`** – Optical Distance

    It shows the type of application for which the optical transmitter on this port is suited. The value NA is reported for client ports.

    Type: Alphanumeric value set.

    Range:

    - VERY-SHORT-REACH
    - SHORT-REACH
    - INTERMEDIATE-REACH
    - LONG-REACH
    - VERY-LONG-REACH
    - OLS_PASSIVE
    - OLS_400G
    - OLS_800G
    - XTREME
    - NA.

28. **`opwl`** – Optical Wavelength

Optical Wavelength in nanometers. It shows the type of optics that is used on this port.

Type: Alphanumeric value set.

Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 … 1562.640 (i.e. C-Band); 1553.731 … 1608.329 (i.e. L-Band), 1471 … 1611 (for CWDM) NA (for client ports).

The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

29. **`outql`** – Outgoing timing quality

    This parameter provides the outgoing quality level message on the S1 SONET line overhead byte.

    Type: Alphanumeric value set.

    Range:

    - PRS
    - STU
    - ST2
    - ST3
    - DUS (default).

30. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold

    This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-4/OC-12: 1 – 768000.

    Default: The default values differ for SDH and SONET:

    - STM4: 115200
    - OC12: 615.

31. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold

    This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-4/OC-12: 1 – 768000.

Default: The default values differ for SDH and SONET and the different rates:

- STM4: 115200
- OC3: 615.

32. **pmode** – Port Mode

    This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.

    Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

33. **pmrsneses** – Performance Monitoring Section/RS Near-End SES Threshold

    This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set.

    Range (superset of allowed ranges for SDH and SONET):1 – 64000

    Default: The default values differ for SDH and SONET and the different rates:

    - SDH (all rates): 2400
    - SONET OC48: 2392
    - SONET OC192: 8554
    - SONET OC768: 22776.

34. **portClass** – Port Class

    This parameter identifies the port class of the AID.

    In which role the port is used by the ONNS application is specified by this parameter *portClass*.

    Type: Alphanumeric value set.

    Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.

    Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

35. **portControl** – Port Control (PortAdministrative Mode)

    The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.

    Type: Alphanumeric value set.

    Range: NORMAL (default), LOCKOUT

36. **propagationDelay** – Propagation Delay

    This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.

    *propagationDelay* is used by the ONNS application.

    Type: Numeric string.

    Range: 0(default) …25. The unit of this value is "milliseconds".

37. **ptype** – Port Type

    This identifies the port type of the AID.

    Type: Alphanumeric value set.

    Range: OC12.

38. **remAdvNodeID** – Remote Advertised Node IDentity

    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition:

    The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.

    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Four dot separated numeric string

    Range: Each numeric string: 0…255

    Default: 0.0.0.0

39. **remLinkID** – Remote Link IDentity

    The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: numeric value set

    Range: 0 (default) to 4294967295

40. **remRAID** – Remote Routing Area IDentity

    The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:

    The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0…255

Default: 0.0.0.0

41. **`remTID`** – Remote TID

    The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: TID or empty-string

    Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2397) description.

    Default: empty string: ""

42. **`rstimca`** – RS TIM Consequent Action Enable

    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).

    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).

    Type: Alphanumeric value set.

    Range:

    - ENABLE: enable consequent action for TIM
    - DISABLE (default): disable consequent action for TIM.

43. **`rstimmon`** – RS TIM Monitor Enable

    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).

    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.

    Type: Alphanumeric value set.

    Range:

    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor

44. **`sdsfmode`** – Signal Degrade/Signal Fail Mode

    The degraded state is detected in Burst or Poisson mode.

    Type: Alphanumeric value set.

    Range:

    - BURST
    - POISSON (default).

45. **`sdthr`** – Signal Degrade Threshold

Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.

Type: numeric value set.

Range (as exponents of 10): –5; –6; –7; –8; –9.

Default: –6.

46. **servcond** – Service Condition

    This parameter indicates its status concerning service involvement.

    Type: Alphanumeric value set.

    Range:

    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.

47. **sfthr** – Signal Failure Threshold

    Signal failure threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.

    Type: numeric value set.

    Range (as exponents of 10): –5; –6; –7; –8; –9.

48. **sltca** – Section and Line TCA Profile Pointer

    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.

    Type: Alphanumeric string.

    Range: String with maximum of 24 characters.

    Default: DEFAULT0.

49. **sonet** – SONET ASAP

    SONET Alarm Severity Assignment Profile. This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH ASAP for SDH ports of corresponding line rate (see "RTRV-STM4: Retrieve STM4 port" (p. 3-2860), output parameter *sdhpn*) to be compatible with current generation applications.

    Type: Alphanumeric string.

    Range: String with a maximum of 24 characters. A hyphen ("-") is allowed in the name additionally.

    Default: DEFAULT.

50. **spm** – Section PM Enable

    Enable or disable regenerator section (section) performance monitoring.

    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).

51. **srlgList** – Shared Risk Link Group Identities List

    The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.

If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.

This parameter is supported by ports of *portClass* INNI.

This parameter is supported by ports of *portClass* ENNI.

Type: Ten numeric strings separated by dashes.

Range: Each numeric string: 0…65535.

Default: 0-0-0-0-0-0-0-0-0-0.

52. **strc** – Value of incoming J0

    This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter strc is omitted from the response.

    Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

    Range: 1 byte string, 16 byte string, 64 byte string (dependent on the strcfmt parameter).

53. **strcfmt** – Format of incoming J0

    The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.

    Type: Numeric string.

    Range:

    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

54. **strcout** – Value of outgoing J0

    This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.

    If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.

    Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string.

Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

Default: 01Hex

55. **strcst** – Status of incoming J0

    This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.

    Type: Alphanumeric value set.

    Range: NORMAL: strc contains a valid value; UNAVAILABLE: no value for strc could be obtained by the system; AIS: no value for strc due to an SF condition.

56. **strcwfmt** – Format of outgoing J0

    The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.

    Type: Numeric string.

    Range:

    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

57. **trbmd** – Tributary mode

    If *trbmd* is FIXED, then inputsig constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* and *unequiposig* have no effect. See definition of output parameter *trbmd* in RTRV-STM16 for SDH equivalent.

    Type: Alphanumeric value set.

    Range:

    - ADAPTIVE
    - FIXED.

    Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2381) command.

58. **unequiposig** – Unequipped Output Signal List

This parameter is a list of STSn rates across the port's bandwidth. It determines the rate(s) of the “unequipped” signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need to have the identical setting. Mixed rates for tx and rx side of the port are allowed. If *trbmd* is ADAPTIVE, then *unequiposig* is settable and retrievable as in fixed mode but does not influence the port behavior.

Type: numeric value set.

Range: NX-NX-NX-…

N is the number of Xs. X can be 1, 3 or 12 representing STS1, STS3C or STS12C.

Default: 121 = all STS1 (fixed).

59. **z0outmode** – Mode of outgoing Z0 byte insertion

    The Z0 insertion is configurable to support interworking with old SONET equipment for STS-M interfaces (M=3, 12, 48).

    Type: Alphanumeric value set.

    Range:

    - FIXEDCC (default): for inserting the fixed value CChex
    - STSID: for inserting the STS-Id of the current frame.

### Detailed behavior description

The command retrieves the parameters as described above.

The command **RTRV-OC12** does not generate a **REPT DBCHG** message.

### Example input/output

The following example shows the successful execution of a **RTRV-OC12** command. Not all output parameters are listed (missing ones indicated by … ):

```
RTRV-OC12:LT-UNITE:1-1-#-#-1-1:123456;

   LT-UNITE 00-11-27 08:00:00
M  123456 COMPLD
   "1-1-#-#-1-1:ptype=OC12,frcdus=DISABLE,sfthr=-3,sdthr=-6, pmode=MON,
   ..... pmmsneses=15,pmrsneses=30"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the RTRV-OC12 command.

#### Check CCB against ptype and istd

See definition of error response in “RTRV-STM16: Retrieve STM16 port” (p. 3-2877).

## References

GR-199-CORE (RTRV-*rr*)

# RTRV-OC48: Retrieve OC48 port

The command **RTRV-OC48** is used to retrieve all parameters related to the optical OC48 port.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-OC48**:*tid:aid:ctag*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Access Identifier of an OC-48 port.
   Type: AID.
   Range: SPortAID of OC48 port.
   The keyword **all** is allowed up to shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

## Output format

In response to a valid **RTRV-OC48** command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command parameters

1. **aid** – Access Identifier

   Type: AID.

   Range: OC-48 port AID.

### Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)

   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

   This parameter is supported by ports of *portClass* INNI.

   This parameter is supported by ports of *portClass* ENNI.

   Type: Numeric string.

   Range: 1(default)…65535

2. **brstintvl**– Bursty Interval

   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.

   Type: numeric value set.

   Range: 2 to 10.

   Default: 7.

3. **brstthr** – Bursty Error Threshold

   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.

   Type: numeric value set.

   Range (as percentage ): 5, 10, … 50.

   Default: 30.

4. **clientNodeID** – Client Node IDentifier

   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.

   This parameter is supported by ports of *portClass* UNI.

   Type: IPv4 format: Four dot separated numeric string.

   Range: Each numeric string: 0…255

   Default: 0.0.0.0

5. **crstat** – Constituent Rates Status list

This parameter shows the rates of the port signals. It is the pointer processor setup if adaptive mode (*trbmd* = ADAPTIVE) is selected.

When switching *trbmd* from FIXED to ADAPTIVE or when creating a port newly *crstat* inherits the current value of *inputsig* until the system delivers an up-to-date value from the pointer processor. If no value is available from the pointer processor the latest known value is retained.

For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.

Type: numeric value set.

Range: NX-NX-NX-…

N is the number of Xs. X can be 1, 3, 12, 48 representing STS1, STS3C, STS12C, STS48C.

6. **exprstrc** – Value of Expected J0

   Expected regenerator section trace identifier.

   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.

   Type: Hexadecimal digits

   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

   Default: 89hex followed by 15 bytes 00hex

7. **felpm** – Far-end Line PM Enable

   Enable or disable of the performance monitoring of the Far-end Line.

   Type: Alphanumeric value set.

   Range:

   - ENABLE
   - DISABLE (default).

8. **frcdus** – Force to DUS

   Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message "do not use" will be transmitted from that optical interface.

   Type: Alphanumeric value set.

   Range:

   - ENABLE , set a forced DUS/DNU
   - DISABLE (default), clear a forced DUS/DNU

9. **fsflpbkstat** – Far Side Facility Loopback Status

   This parameter specifies the current far-side facility loopback status of the considered output *aid*.

A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.

Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.

Type: Alphanumeric value set.

Range:

- YES
- NO (default).

10. **inputsig** – Tributary Input Signal Rate List

    This parameter is a list of STSn rates across the port's bandwidth.

    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then *inputsig* is settable and retrievable as in fixed mode but does not influence the port behavior.

    Type: numeric value set.

    Range: NX-NX-NX-…

    N is the number of Xs. X can be 1, 3, 12 or 48 representing STS1, STS3C, STS12C or STS48C.

    Default: 481.

    Example: An OC-48 signal might be represented by 91-13-112-241 which implies 9 STS1's, 1 STS3C, 1 STS12C, 24 STS1's.

11. **istd** – Interface Standard

    Each synchronous optical interface can be set to SDH or SONET.

    Type: Alphanumeric value set.

    Range: SONET.

    Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2381).

12. **linkResCls** – Link Resource Class

    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set (4 bytes), every bit defining one link class

    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF

    Default: 00 for each alphanumeric character

13. **localLinkID** – Local Link IDentity

    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

14. **`localLPID`** – Local Logical Port IDentity

    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.

    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *portClass* UNI.

    This parameter is supported by ports of *portClass* EDGE.

    Type: numeric value set.

    Range: 0 (default) to 4294967295

    The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

15. **`lpbk`** – Loopback

    This parameter specifies the current near-side loopback status of the considered output *aid*.

    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.

    Type: Alphanumeric value set.

    Range:

    - YES
    - NO (default).

16. **`maxNNXCRate`** – Maximum NN Cross Connect Rate

    The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* INNI.

This parameter is supported by ports of *portClass* ENNI.

Type: Alphanumeric value set.

Range: STS1, STS3, STS12 or STS48 (default)

17. **minNNXCRate** – Minimum NN Cross Connect Rate

    The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* INNI.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set.

    Range: STS1 (default), STS3, STS12 or STS48.

18. **ndetmd** – Neighbor Detection Mode

    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* INNI.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set.

    Range:

    AUTO, MAN

    Default:

    For *portClass* = INNI: AUTO

    For *portClass* = ENNI: MAN

19. **neighborASTNNodeID** – Neighbor ASTN Node Id

    This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.

    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

    *neighborASTNNodeID* is used by the ONNS application.

    Type: Four dot separated numeric string.

    Range: Each numeric string: 0…255.

    Default: 0.0.0.0 If portClass = INNI, the default value shall have the meaning of "no neighbor discovered".

20. **neighborNodeID** – Neighbor Node Id

This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN. If ndetmd=MAN, this parameter shall indicate the value set by the operator. If ndetmd=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

*neighborNodeID* is used by the ONNS application.

Type: Four dot separated numeric string.

Range: Each numeric string: 0…255.

Default: 0.0.0.0

If *portClass* = INNI, the default value shall have the meaning of "no neighbor discovered"

21. **neighborPortID** – Neighbor Port Id

    This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.

    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

    *neighborPortID* is used by the ONNS application.

    Type: Four dash separated numeric string.

    Range: Each numeric string: 0…255.

    Default: 0-0-0-0.

    Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

22. **neighborSigPCID** – Neighbor Signaling PC IDentity

    The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Four dot separated numeric string

    Range: Each numeric string: 0…255

    Default: 0.0.0.0

23. **neighborSigPCIPAddr** – Neighbor Signaling PC IP Address

    The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* ENNI.

Type: IPv4 format: Four dot separated numeric string

Range: Each numeric string: 0…255

Default: 0.0.0.0

24. **nelpm** – Near-End Line PM Enable

    Enable or disable near-end multiplex section (near-end line) performance monitoring.

    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).

25. **networkTNAType** – Network TNA Type

    The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *portClass* UNI.

    This parameter is supported by ports of *portClass* EDGE.

    Type: Alphanumeric value set.

    Range:

    - IPV4 (default)
    - IPV6
    - NSAP

26. **networkTNAAddress** – Network TNA Address

    The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *portClass* UNI.

    This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number: 00000000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 00000000000000000000000000000000000000000000

The default value shall have the meaning of "no TNA Address provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

27. **opdis** – Optical Distance

    It shows the type of application for which the optical transmitter on this port is suited. The value NA is reported for client ports.

    Type: Alphanumeric value set.

    Range:

    - VERY-SHORT-REACH
    - SHORT-REACH
    - INTERMEDIATE-REACH
    - LONG-REACH
    - VERY-LONG-REACH
    - OLS_PASSIVE
    - OLS_400G
    - OLS_800G
    - XTREME
    - NA.

28. **opwl** – Optical Wavelength

Optical Wavelength in nanometers. It shows the type of optics that is used on this port.

Type: Alphanumeric value set.

Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 … 1562.640 (i.e. C-Band); 1553.731 … 1608.329 (i.e. L-Band), 1471 … 1611 (for CWDM) NA (for client ports).

The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

29. **outql** – Outgoing timing quality

    This parameter provides the outgoing quality level message on the S1 SONET line overhead byte.

    Type: Alphanumeric value set.

    Range:

    - PRS
    - STU
    - ST2
    - ST3
    - DUS (default).

30. **pmmsfeses** – Performance Monitoring Line/MS Far-End SES Threshold

    This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-16/OC-48: 1 – 3072000
    - STM-64/OC-192: 1 – 12288000
    - STM-256/OC-768: 1 – 49152000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM16: 460800
    - STM64: 1843200
    - STM256: 7372800
    - SONET OC48: 2459
    - SONET OC192: 9835
    - SONET OC768: 39340.

31. **pmmsneses** – Performance Monitoring Line/MS Near-End SES Threshold

This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-16/OC-48: 1 – 3072000
- STM-64/OC-192: 1 – 12288000
- STM-256/OC-768: 1 – 49152000.

Default: The default values differ for SDH and SONET and the different rates:

- STM16: 460800
- STM64: 1843200
- STM256: 7372800
- SONET OC48: 2459
- SONET OC192: 9835
- SONET OC768: 39340.

32. **pmode** – Port Mode

    This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.

    Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

33. **pmrsneses** – Performance Monitoring Section/RS Near-End SES Threshold

    This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set.

    Range (superset of allowed ranges for SDH and SONET):1 – 64000

    Default: The default values differ for SDH and SONET and the different rates:

    - SDH (all rates): 2400
    - SONET OC48: 2392
    - SONET OC192: 8554
    - SONET OC768: 22776.

34. **portClass** – Port Class

    This parameter identifies the port class of the AID.

    In which role the port is used by the ONNS application is specified by this parameter *portClass*.

    Type: Alphanumeric value set.

    Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.

    Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

35. **portControl** – Port Control (PortAdministrative Mode)

    The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.

    Type: Alphanumeric value set.

    Range: NORMAL (default), LOCKOUT

36. **propagationDelay** – Propagation Delay

    This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.

    *propagationDelay* is used by the ONNS application.

    Type: Numeric string.

    Range: 0(default) …25. The unit of this value is "milliseconds".

37. **ptype** – Port Type

    This identifies the port type of the AID.

    Type: Alphanumeric value set.

    Range: OC48.

38. **remAdvNodeID** – Remote Advertised Node IDentity

    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition:

    The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.

    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Four dot separated numeric string

    Range: Each numeric string: 0…255

    Default: 0.0.0.0

39. **remLinkID** – Remote Link IDentity

The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

40. **remRAID** – Remote Routing Area IDentity

    The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:

    The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Four dot separated numeric string

    Range: Each numeric string: 0…255

    Default: 0.0.0.0

41. **remTID** – Remote TID

    The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: TID or empty-string

    Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2397) description.

    Default: empty string: ""

42. **rstimca** – RS TIM Consequent Action Enable

    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).

    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).

    Type: Alphanumeric value set.

    Range:

    - ENABLE: enable consequent action for TIM
    - DISABLE (default): disable consequent action for TIM.

43. **rstimmon** – RS TIM Monitor Enable

    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).

This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.

Type: Alphanumeric value set.

Range:

- ENABLE: enable TIM Monitor
- DISABLE (default): disable TIM Monitor

44. **sdsfmode** – Signal Degrade/Signal Fail Mode

    The degraded state is detected in Burst or Poisson mode.

    Type: Alphanumeric value set.

    Range:

    - BURST
    - POISSON (default).

45. **sdthr** – Signal Degrade Threshold

    Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.

    Type: numeric value set.

    Range (as exponents of 10): –5; –6; –7; –8; –9.

    Default: –6.

46. **servcond** – Service Condition

    This parameter indicates its status concerning service involvement.

    Type: Alphanumeric value set.

    Range:

    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.

47. **sfthr** – Signal Failure Threshold

    Signal failure threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.

    Type: numeric value set.

    Range (as exponents of 10): –5; –6; –7; –8; –9.

    Default: –6.

48. **sltca** – Section and Line TCA Profile Pointer

    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.

    Type: Alphanumeric string.

    Range: String with maximum of 24 characters.

    Default: DEFAULT0.

49. **sonet** – SONET ASAP

This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH Alarm Severity Assignment Profile for SDH ports (see "RTRV-STM16: Retrieve STM16 port" (p. 3-2877), output parameter *sdhpn*) to be compatible with current generation applications.

Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.

Range: String with a maximum of 24 characters.

Default: DEFAULT.

50. **spm** – Section PM Enable

    Enable or disable regenerator section (section) performance monitoring.

    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).

51. **srlgList** – Shared Risk Link Group Identities List

    The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.

    If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.

    This parameter is supported by ports of *portClass* INNI.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Ten numeric strings separated by dashes.

    Range: Each numeric string: 0…65535.

    Default: 0-0-0-0-0-0-0-0-0-0.

52. **strc** – Value of incoming J0

    This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter strc is omitted from the response.

    Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

    Range: 1 byte string, 16 byte string, 64 byte string (dependent on the strcfmt parameter).

53. **strcfmt** – Format of incoming J0

The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.

Type: Numeric string.

Range:

- 1: for specific repeating byte (SONET)
- 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

54. **strcout** – Value of outgoing J0

    This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.

    If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.

    Type: Hexadecimal digits.

    Range:

    - 1 byte string
    - 16 bytes string
    - 64 bytes string.

    Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

    Default: 01Hex

55. **strcst** – Status of incoming J0

    This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.

    Type: Alphanumeric value set.

    Range: NORMAL: strc contains a valid value; UNAVAILABLE: no value for strc could be obtained by the system; AIS: no value for strc due to an SF condition.

56. **strcwfmt** – Format of outgoing J0

    The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.

    Type: Numeric string.

    Range:

    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

57. **trbmd** – Tributary mode

    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* and *unequiposig* have no effect.

    Type: Alphanumeric value set.

    Range:

    - ADAPTIVE
    - FIXED.

    Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2381) command.

58. **unequiposig** – Unequipped Output Signal List

    This parameter is a list of STSn rates across the port's bandwidth. It determines the rate(s) of the *unequipped* signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need to have the identical setting. Mixed rates for *tx* and *rx* side of the port are allowed. If *trbmd* is ADAPTIVE, then *unequiposig* is settable and retrievable as in fixed mode but does not influence the port behavior.

    Type: numeric value set.

    Range: NX-NX-NX-…

    N is the number of Xs. X can be 1, 3, 12 or 48 representing STS1, STS3C, STS12C or STS48C.

    Default: 481 = all STS1 (fixed).

59. z0outmode – Mode of outgoing Z0 byte insertion

    The Z0 insertion is configurable to support interworking with old SONET equipment for STS-M interfaces (M=3, 12, 48).

    Type: Alphanumeric value set.

    Range:

    - FIXEDCC (default): for inserting the fixed value CChex
    - STSID: for inserting the STS-Id of the current frame.

## Detailed behavior description

The command retrieves the parameters as described above.

The command **RTRV-OC48** does not generate a **REPT DBCHG** message.

## Example input/output

The following example shows the successful execution of a **RTRV-OC48** command. Not all output parameters are listed (missing ones indicated by … ):

```
RTRV-OC48:LT-UNITE:1-1-#-#-1-1:123456;

   LT-UNITE 00-11-27 08:00:00
M  123456 COMPLD
```

```
   "1-1-#-#-1-1:ptype=OC48,frcdus=DISABLE,sfthr=-3,sdthr=-6, pmode=MON,
   ..... pmmsneses=15,pmrsneses=30"
;
```

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the RTRV-OC48 command.

### Check CCB against ptype and istd

See definition of error response in “RTRV-STM16: Retrieve STM16 port” (p. 3-2877).

# RTRV-OC48T: Retrieve OC48T port

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-OC48T**:*tid:aid:ctag*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Access Identifier of an OC-48 port.
   Type: AID.
   Range: SPortAID of OC48 port.
   The keyword **all** is allowed up to shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

## Output format

In response to a valid RTRV-OC48T command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command parameters

1. **aid** – Access Identifier

   Access Identifier of an OC-48 port.

   Type: AID.

   Range: SPortAID of OC48 port.

   The keyword **all** is allowed up to shelf level.

### Spec block parameters

1. **exprstrc** – Value of Expected J0

   For RTRV-OC48T this parameter refers to the incoming (ingress) direction.

   Expected regenerator section trace identifier.

   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.

   Type: Hexadecimal digits

   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

   Default: 89hex followed by 15 bytes 00hex

2. **exprstrcout** – Value of Expected J0 in outgoing direction

   Expected regenerator section trace identifier in outgoing (egress) direction.

   The parameter expstrcout specifying the expected path trace is only relevant for the section trace supervision in outgoing direction when the related trace read format strcfmtout is set to 16 (16-byte-specific-string mode).

   Type: Hexadecimal digits

   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

   Default: 89hex followed by 15 bytes 00hex

3. **fsflpbkstat** – Far Side Facility Loopback Status

   This parameter specifies the current far-side facility loopback status of the considered output *aid*.

   A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.

   Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.

   Type: Alphanumeric value set.

   Range:

   - YES
   - NO (default).

4. **istd** – Interface Standard

   Each synchronous optical interface can be set to SDH or SONET.

   Type: Alphanumeric value set.

   Range: SONET.

   Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2381).

5. **lpbk** – Loopback

   This parameter specifies the current near-side loopback status of the considered output *aid*.

   A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.

   Type: Alphanumeric value set.

   Range:

   - YES
   - NO (default).

6. **opdis** – Optical Distance

   It shows the type of application for which the optical transmitter on this port is suited. The value NA is reported for client ports.

   Type: Alphanumeric value set.

   Range:

   - VERY-SHORT-REACH
   - SHORT-REACH
   - INTERMEDIATE-REACH
   - LONG-REACH
   - VERY-LONG-REACH
   - OLS_PASSIVE
   - OLS_400G
   - OLS_800G
   - XTREME
   - NA.

7. **opwl** – Optical Wavelength

   Optical Wavelength in nanometers. It shows the type of optics that is used on this port.

   Type: Alphanumeric value set.

   Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 … 1562.640 (i.e. C-Band); 1553.731 … 1608.329 (i.e. L-Band), 1471 … 1611 (for CWDM) NA (for client ports).

   The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

8. **pmode** – Port Mode

   This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.

   Type: Alphanumeric value set.

   Range:

   - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
   - MON indicates that alarm monitoring is taking place on the port.
   - NMON means that alarm monitoring is not occurring on the port.

9. **pmrsneses** – Performance Monitoring Section/RS Near-End SES Threshold

   For RTRV-OC48T this parameter refers to the incoming (ingress) direction.

   This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET.

   Type: numeric value set.

   Range (superset of allowed ranges for SDH and SONET):1 – 64000

   Default: The default values differ for SDH and SONET and the different rates:

   - SDH (all rates): 2400
   - SONET OC48: 2392
   - SONET OC192: 8554
   - SONET OC768: 22776.

10. **pmrsneses**out – Performance Monitoring Section/RS Near-End SES Threshold in Outgoing Direction

    This parameter describes the Section/RS Near-End SES threshold value for the outgoing (egress) direction. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET.

    Type: numeric value set

    Range (superset of allowed ranges for SDH and SONET): 1 – 64000

    Default:

    The default values differ for SDH and SONET and the different rates:

    - SDH (all rates): 2400
    - SONET OC48: 2392

11. **ptype** – Port Type

    This identifies the port type of the AID.

    Type: Alphanumeric value set.

    Range: OC48T.

12. **rstimmon** – RS TIM Monitor Enable

    For RTRV-OC48T this parameter refers to the incoming (ingress) direction.

    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).

This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.

Type: Alphanumeric value set.

Range:

- ENABLE: enable TIM Monitor
- DISABLE (default): disable TIM Monitor

13. **rstimmonout** – RS TIM Monitor Enable in Outgoing direction

    Regenerator Section Trace Identifier Mismatch Monitor enable (J0) in outgoing (egress) direction. This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).

    Type: Alphanumeric value set.

    Range: ENABLE – enable TIM Monitor, DISABLE (default) – disable TIM Monitor

14. **servcond** – Service Condition

    This parameter indicates its status concerning service involvement.

    Type: Alphanumeric value set.

    Range:

    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.

15. **sltca** – Section and Line TCA Profile Pointer

    Definition of the section and line threshold crossing alarm profile pointer.

    Type: Alphanumeric string.

    Range: String with maximum of 24 characters.

    Default: DEFAULT0.

16. **sonet** – SONET ASAP

    This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH Alarm Severity Assignment Profile for SDH ports (*sdhpn*) to be compatible with current generation applications.

    Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.

    Range: String with a maximum of 24 characters.

    Default: DEFAULT.

17. **spm** – Section PM Enable

    For RTRV-OC48T this parameter refers to the incoming (ingress) direction.

    Enable or disable section performance monitoring.

    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).

18. **spmout** – Section PM Enable in Outgoing Direction

Enable or disable section performance monitoring for the outgoing (egress) direction.

Type: Alphanumeric value set.

Range: ENABLE, DISABLE (default).

19. **strc** – Value of incoming J0

    For RTRV-OC48T this parameter refers to the incoming (ingress) direction.

    This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter strc is omitted from the response.

    Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

    Range: 1 byte string, 16 byte string, 64 byte string (dependent on the strcfmt parameter).

20. **strcfmt** – Format of incoming J0

    For RTRV-OC48T this parameter refers to the incoming (ingress) direction.

    The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.

    Type: Numeric string.

    Range:

    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

21. **strcfmtout** – Format of outgoing J0

    The read format of J0 in outgoing (egress) direction, the outgoing section trace (strcout) and the expected section trace (exprstrcout).

    Type: Numeric string.

    Range:

    - 1, for specific repeating byte (SONET)
    - 2 (default), for non-specific repeating byte (ITU/ETSI mode 2)
    - 16, for 16 byte specific string (ITU/ETSI mode 1)
    - 64, for 64 byte string (SONET).

22. **strcout** – Value of outgoing J0

    This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.

If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.

Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string.

Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

Default: 01Hex

23. **strcst** – Format of incoming J0

    For RTRV-OC48T this parameter refers to the incoming (ingress) direction.

    This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.

    Type: Alphanumeric value set.

    Range: NORMAL: strc contains a valid value; UNAVAILABLE: no value for strc could be obtained by the system; AIS: no value for strc due to an SF condition.

24. **strcstout** – Status of outgoing J0

    This parameter shows the status of the value of the RS/Section Trace Identifier in outgoing (egress) direction which is available with parameter strcout.

    alphanumeric value set

    Range:

    - NORMAL, strcout contains a valid value
    - UNAVAILABLE, no value for strcout could be obtained by the system
    - AIS, no value for strcout due to an SF condition

## Detailed behavior description

The command retrieves the parameters as described above.

The **RTRV-OC48T** command does not generate a **REPT DBCHG** message.

## Example input/output

The following example shows the successful execution of a **RTRV-OC48T** command. Not all output parameters are listed (missing ones indicated by …):

```
RTRV-OC48T:LT-UNITE:1-1-#-#-1-1:123456;

   LT-UNITE 00-11-27 08:00:00
M  123456 COMPLD
   "1-1-#-#-1-1:ptype=OC48T,pmode=MON,..... pmrsneses=30,pmrsnesesout=30"
```

*;*

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-OC48T** command.

### Check CCB against *ptype* and *istd*

See definition of error response in “RTRV-STM16: Retrieve STM16 port” (p. 3-2877).

## References

GR-199-CORE (RTRV-*rr*)

# RTRV-OC192: Retrieve OC192 port

The command **RTRV-OC192** is used to retrieve all parameters related to the optical OC192 port.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-OC192**:*tid:aid:ctag*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Access Identifier of an OC192 port.
   Type: AID.
   Range: SPortAID of OC192 port.
   The keyword **all** is allowed up to shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

## Output format

In response to a valid **RTRV-OC192** command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command parameters

1. **aid** – Access Identifier

   Access Identifier of the OC192 port.

   Type: AID.

   Range: SPortAID of OC192 port.

   The keyword **all** is not allowed.

### Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)

   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

   This parameter is supported by ports of *portClass* INNI.

   This parameter is supported by ports of *portClass* ENNI.

   Type: Numeric string.

   Range: 1(default)…65535

2. **brstintvl**– Bursty Interval

   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.

   Type: numeric value set.

   Range: 2 to 10.

   Default: 7.

3. **brstthr** – Bursty Error Threshold

   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.

   Type: numeric value set.

   Range (as percentage ): 5, 10, … 50.

   Default: 30.

4. **clientNodeID** – Client Node IDentifier

   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.

   This parameter is supported by ports of *portClass* UNI.

   Type: IPv4 format: Four dot separated numeric string.

   Range: Each numeric string: 0…255

Default: 0.0.0.0

5. **`crstat`** – Constituent Rates Status list

   This parameter shows the rates of the port signals. It is the pointer processor setup if adaptive mode (*trbmd* = ADAPTIVE) is selected.

   When switching *trbmd* from FIXED to ADAPTIVE or when creating a port newly *crstat* inherits the current value of *inputsig* until the system delivers an up-to-date value from the pointer processor. If no value is available from the pointer processor the latest known value is retained.

   For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the tributary input rate signal list.

   Type: numeric value set.

   Range: NX-NX-NX-…

   N is the number of Xs. X can be 1, 3, 12, 48, 192 representing STS1, STS3C, STS12C, STS48C, STS192C.

6. **`exprstrc`** – Value of Expected J0

   Expected regenerator section trace identifier.

   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.

   Type: Hexadecimal digits

   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

   Default: 89hex followed by 15 bytes 00hex

7. **`fec`** – FEC Enable

   Forward Error Correction Enable. Enable to include the FEC information in the outgoing signal.

   Type: Alphanumeric value set.

   Range:

   DISABLE (only) for:

   - OC192 / STM64 Intermediate Reach / Short Haul 1550 nm optics
   - OC192 / STM64 intermediate reach / SH 32 colour passive WDM compatible optics
   - OC192 / STM64 Long Reach / Long Haul 1550 nm optics
   - OC192 / STM64 low cost intra office 1310 nm optics
   - OC192 / STM64 client ports (related to OTN ports)
   - OC768/STM256 basis low cost intra office 1310 nm optics.

ENABLE / DISABLE for:

- OC192 / STM64 OLS800G compatible 80 colour optics
- OC768 / STM256 Long Reach / Long Haul 1550 nm optics with strong FEC (80km)
- OC768 / STM256 OLS Xtreme compatible 64 colour optics (extended L band)

ENABLE (only) for:

- OC192 / STM64 OLS Xtreme compatible 128 colour optics 40G

Default:
DISABLE for:

- OC192 / STM64 Intermediate Reach / Short Haul 1550 nm optics
- OC192 / STM64 intermediate reach / SH 32 colour passive WDM compatible optics
- OC192 / STM64 Long Reach / Long Haul 1550 nm optics
- OC192 / STM64 low cost intra office 1310 nm optics
- OC192 / STM64 client ports (related to OTN ports)
- OC768/STM256 basis low cost intra office 1310 nm optics.

ENABLE for:

- OC192 / STM64 OLS800G compatible 80 colour optics
- OC192 / STM64 OLS Xtreme compatible 128 colour optics 40G
- OC768 / STM256 Long Reach / Long Haul 1550 nm optics with strong FEC (80km)
- OC768 / STM256 OLS Xtreme compatible 64 colour optics (extended L band)

8. **`felpm`** – Far-end Line PM Enable

   Enable or disable of the performance monitoring of the Far-end Line.
   Type: Alphanumeric value set.
   Range:

   - ENABLE
   - DISABLE (default).

9. **`frcdus`** – Force to DUS

   Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message "do not use" will be transmitted from that optical interface.
   Type: Alphanumeric value set.
   Range:

   - ENABLE: (set a forced DUS/DNU)
   - DISABLE (default): (clear a forced DUS/DNU).

10. **`fsflpbkstat`** – Far Side Facility Loopback Status

    This parameter specifies the current far-side facility loopback status of the considered output *aid*.

A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.

Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.

Type: Alphanumeric value set.

Range:

- YES
- NO (default).

11. **`inputsig`** – Tributary Input Signal Rate List

    This parameter is a list of STSn rates across the port's bandwidth.

    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then *inputsig* is settable and retrievable as in fixed mode but does not influence the port behavior.

    Type: numeric value set.

    Range: NX-NX-NX-…

    N is the number of Xs. X can be 1, 3, 12, 48, 192 representing STS1, STS3C, STS12C, STS48C or STS192C.

    Default: 1921.

12. **`istd`** – Interface Standard

    Each synchronous optical interface can be set to SDH or SONET.

    Type: Alphanumeric value set.

    Range: SONET.

    Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2381).

13. **`linkResCls`** – Link Resource Class

    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set (4 bytes), every bit defining one link class

    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF

    Default: 00 for each alphanumeric character

14. **`localLinkID`** – Local Link IDentity

    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

15. **localLPID** – Local Logical Port IDentity

    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.

    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *portClass* UNI.

    This parameter is supported by ports of *portClass* EDGE.

    Type: numeric value set.

    Range: 0 (default) to 4294967295

    The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

16. **lpbk** – Loopback

    This parameter specifies the current near-side loopback status of the considered output *aid*.

    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.

    Type: Alphanumeric value set.

    Range:

    - YES
    - NO (default).

17. **maxNNXCRate** – Maximum NN Cross Connect Rate

    The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* INNI.

This parameter is supported by ports of *portClass* ENNI.

Type: Alphanumeric value set.

Range: STS1, STS3, STS12, STS48 or STS192 (default)

18. **minNNXCRate** – Minimum NN Cross Connect Rate

    The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* INNI.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set.

    Range: STS1 (default), STS3, STS12, STS48 or STS192.

19. **msrei** – MS-REI mode

    An special extended MS REI mode is standardized for STM64/OC192 interfaces. To support the interworking with older STM64/OC192 interfaces the single byte mode (non-extended) should also be supported.

    Type: Alphanumeric value set.

    Range: SINGLE or EXTENDED (default).

20. **ndetmd** – Neighbor Detection Mode

    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* INNI.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set.

    Range:

    AUTO, MAN

    Default:

    For *portClass* = INNI: AUTO

    For *portClass* = ENNI: MAN

21. **neighborASTNNodeID** – Neighbor ASTN Node Id

    This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.

    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

*neighborASTNNodeID* is used by the ONNS application.

Type: Four dot separated numeric string.

Range: Each numeric string: 0…255.

Default: 0.0.0.0 If portClass = INNI, the default value shall have the meaning of "no neighbor discovered".

22. **neighborNodeID** – Neighbor Node Id

    This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.

    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

    *neighborNodeID* is used by the ONNS application.

    Type: Four dot separated numeric string.

    Range: Each numeric string: 0…255.

    Default: 0.0.0.0

    If *portClass* = INNI, the default value shall have the meaning of "no neighbor discovered"

23. **neighborPortID** – Neighbor Port Id

    This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.

    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

    *neighborPortID* is used by the application.

    Type: Four dash separated numeric string.

    Range: Each numeric string: 0…255.

    Default: 0-0-0-0.

    Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

24. **neighborSigPCID** – Neighbor Signaling PC IDentity

    The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Four dot separated numeric string

    Range: Each numeric string: 0…255

Default: 0.0.0.0

25. **neighborSigPCIPAddr** – Neighbor Signaling PC IP Address

    The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: IPv4 format: Four dot separated numeric string

    Range: Each numeric string: 0…255

    Default: 0.0.0.0

26. **nelpm** – Near-End Line PM Enable

    Enable or disable near-end multiplex section (near-end line) performance monitoring.

    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).

27. **networkTNAType** – Network TNA Type

    The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *portClass* UNI.

    This parameter is supported by ports of *portClass* EDGE.

    Type: Alphanumeric value set.

    Range:

    - IPV4 (default)
    - IPV6
    - NSAP

28. **networkTNAAddress** – Network TNA Address

    The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter is supported by ports of *portClass* UNI.

This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number:
  00000000000000000000000000000000000000…
  FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 00000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

29. **`och`** – optical channel enable

    Enable or disable of the optical channel. If the optical channel is disabled the further optical channel parameters don't have any impact on transmission.

    Type: Alphanumeric value set.

    Range:

    - for ports on OP10 packs, which support to enable or disable OCH: ENABLE: enable optical channel; DISABLE: disable optical channel
    - for ports on OP10 and OP40 packs, which cannot support OCH: DISABLE: disable optical channel
    - for ports on OP10 and OP40 packs, which only support OCH: ENABLE: enable optical channel
    - for client ports on packs which support OTN: DISABLE: disable, optical channel not applicable.

Default:

- for OP10 and OP40 packs, which cannot support OCH: DISABLE
- for OP10 packs, which can support OCH: ENABLE
- or OP10 and OP40 packs, which only support OCH: ENABLE
- for client ports on packs which support OTN: DISABLE.

30. **opdis** – Optical Distance

    It shows the type of application for which the optical transmitter on this port is suited. The value NA is reported for client ports.

    Type: Alphanumeric value set.

    Range:

    - VERY-SHORT-REACH
    - SHORT-REACH
    - INTERMEDIATE-REACH
    - LONG-REACH
    - VERY-LONG-REACH
    - OLS_PASSIVE
    - OLS_400G
    - OLS_800G
    - XTREME
    - NA.

31. **opwl** – Optical Wavelength

    Optical Wavelength in nanometers. It shows the type of optics that is used on this port.

    Type: Alphanumeric value set.

    Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 … 1562.640 (i.e. C-Band); 1553.731 … 1608.329 (i.e. L-Band), 1471 … 1611 (for CWDM) NA (for client ports).

    The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

32. **otnclient** – OTN Client Port

    This parameter indicates whether the port is an OTN Client Port or an optical SDH/SONET port.

    Type: Alphanumeric value set.

    Range: YES for OTN client port. NO for optical SDH/SONET port.

33. **outql** – Outgoing timing quality

    This parameter provides the outgoing quality level message on the S1 SONET line overhead byte.

    Type: Alphanumeric value set.

Range:

- PRS
- STU
- ST2
- ST3
- DUS (default).

34. **pmmsfeses** – Performance Monitoring Line/MS Far-End SES Threshold

    This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-16/OC-48: 1 – 3072000
    - STM-64/OC-192: 1 – 12288000
    - STM-256/OC-768: 1 – 49152000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM16: 460800
    - STM64: 1843200
    - STM256: 7372800
    - SONET OC48: 2459
    - SONET OC192: 9835
    - SONET OC768: 39340.

35. **pmmsneses** – Performance Monitoring Line/MS Near-End SES Threshold

    This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-16/OC-48: 1 – 3072000
    - STM-64/OC-192: 1 – 12288000
    - STM-256/OC-768: 1 – 49152000.

Default: The default values differ for SDH and SONET and the different rates:

- STM16: 460800
- STM64: 1843200
- STM256: 7372800
- SONET OC48: 2459
- SONET OC192: 9835
- SONET OC768: 39340.

36. **pmode** – Port Mode

    This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.

    Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start. The value AUTO is only supported for optical SDH/SONET ports, i.e. not supported for client ports.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

    Default:

    - AUTO for optical SDH/SONET ports
    - NMON for client ports.

37. **pmrsneses** – Performance Monitoring Section/RS Near-End SES Threshold

    This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set.

    Range (superset of allowed ranges for SDH and SONET):1 – 64000

    Default: The default values differ for SDH and SONET and the different rates:

    - SDH (all rates): 2400
    - SONET OC48: 2392
    - SONET OC192: 8554
    - SONET OC768: 22776.

38. **polynomial** – Optical Channel Scrambling Polynomial

    This parameter is used by the Wavewrapper scrambler on the optical channel. This parameter is relevant only if the optical channel is enabled (och = ENABLE).

    Type: numeric value set.

    Range: 1x7 + x + 1; 2x16 + x12 + x3 + x + 1.

    Default: 2.

39. **portClass** – Port Class

    This parameter identifies the port class of the AID.

    In which role the port is used by the ONNS application is specified by this parameter *portClass*.

    Type: Alphanumeric value set.

    Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.

    Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

40. **portControl** – Port Control (PortAdministrative Mode)

    The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.

    Type: Alphanumeric value set.

    Range: NORMAL (default), LOCKOUT

41. **propagationDelay** – Propagation Delay

    This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.

    *propagationDelay* is used by the ONNS application.

    Type: Numeric string.

    Range: 0(default) …25. The unit of this value is "milliseconds".

42. **ptype** – Port Type

    This identifies the port type of the AID.

    It is derived from the functional name and functional qualifier of a circuit pack. If the functional qualifier indicates a pack with 10GE_WANPHY interfaces the port type has the value 10GE_WANPHY, else OC192.

    Type: Alphanumeric value set.

    Range: OC192.

43. **remAdvNodeID** – Remote Advertised Node IDentity

    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition:

    The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.

    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Four dot separated numeric string

    Range: Each numeric string: 0…255

Default: 0.0.0.0

44. **remLinkID** – Remote Link IDentity

    The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: numeric value set

    Range: 0 (default) to 4294967295

45. **remRAID** – Remote Routing Area IDentity

    The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:

    The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Four dot separated numeric string

    Range: Each numeric string: 0…255

    Default: 0.0.0.0

46. **remTID** – Remote TID

    The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: TID or empty-string

    Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2397) description.

    Default: empty string: ""

47. **rstimca** – RS TIM Consequent Action Enable

    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).

    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).

    Type: Alphanumeric value set.

    Range:

    - ENABLE: enable consequent action for TIM
    - DISABLE (default): disable consequent action for TIM.

48. **rstimmon** – RS TIM Monitor Enable

    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).

    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.

    Type: Alphanumeric value set.

    Range:

    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor

49. **sdsfmode** – Signal Degrade/Signal Fail Mode

    The degraded state is detected in Burst or Poisson mode.

    Type: Alphanumeric value set.

    Range:

    - BURST
    - POISSON (default).

50. **sdthr** – Signal Degrade Threshold

    Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.

    Type: numeric value set.

    Range (as exponents of 10): –5; –6; –7; –8; –9.

    Default: –6.

51. **servcond** – Service Condition

    This parameter indicates its status concerning service involvement.

    Type: Alphanumeric value set.

    Range:

    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.

52. **sfthr** – Signal Failure Threshold

    Signal failure threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.

    Type: numeric value set.

    Range (as exponents of 10): –5; –6; –7; –8; –9.

    Default: –6.

53. **sltca** – Section and Line TCA Profile Pointer

    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.

    Type: Alphanumeric string.

    Range: String with maximum of 24 characters.

    Default: DEFAULT0.

54. **sonet** – SONET ASAP

This parameter sets a SONET ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SDH Alarm Severity Assignment Profile for SDH ports ( *sdhpn*) to be compatible with current generation applications.

Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.

Range: String with a maximum of 24 characters.

Default: DEFAULT.

55. **spm** – Section PM Enable

    Enable or disable regenerator section (section) performance monitoring.

    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).

56. **srlgList** – Shared Risk Link Group Identities List

    The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.

    If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.

    This parameter is supported by ports of *portClass* INNI.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Ten numeric strings separated by dashes.

    Range: Each numeric string: 0…65535.

    Default: 0-0-0-0-0-0-0-0-0-0.

57. **strc** – Value of incoming J0

    This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter strc is omitted from the response.

    Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

    Range: 1 byte string, 16 byte string, 64 byte string (dependent on the strcfmt parameter).

58. **strcfmt** – Format of incoming J0

The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.

Type: Numeric string.

Range:

- 1: for specific repeating byte (SONET)
- 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
- 16: for 16 byte specific string (ITU/ETSI mode 1).
- 64: for 64 byte string (SONET).

59. **strcout** – Value of outgoing J0

    This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.

    If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.

    Type: Hexadecimal digits.

    Range:

    - 1 byte string
    - 16 bytes string
    - 64 bytes string.

    Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

    Default: 01Hex

60. **strcst** – Status of incoming J0

    This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.

    Type: Alphanumeric value set.

    Range: NORMAL: strc contains a valid value; UNAVAILABLE: no value for strc could be obtained by the system; AIS: no value for strc due to an SF condition.

61. **strcwfmt** – Format of outgoing J0

    The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.

    Type: Numeric string.

    Range:

    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

62. **trbmd** – Tributary mode

    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* and *unequiposig* have no effect. See definition of output parameter *trbmd* in "RTRV-STM16: Retrieve STM16 port" (p. 3-2877) for SDH equivalent.

    Type: Alphanumeric value set.

    Range:

    - ADAPTIVE
    - FIXED.

    Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2381) command.

63. **unequiposig** – Unequipped Output Signal List

    This parameter is a list of STSn rates across the port's bandwidth. It determines the rate(s) of the *unequipped* signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need to have the identical setting. Mixed rates for tx and rx side of the port is allowed. If *trbmd* is ADAPTIVE, then *unequiposig* is settable and retrievable as in fixed mode but does not influence the port behavior.

    Type: numeric value set.

    Range: NX-NX-NX-…

    N is the number of Xs. X can be 1, 3, 12, 48 or 192 representing STS1, STS3C, STS12C, STS48C or STS192C.

    Default: 1921 = all STS1 (fixed).

## Detailed behavior description

The command retrieves the parameters as described above.

The command **RTRV-OC192** does not generate a **REPT DBCHG** message.

## Example input/output

The following example shows the successful execution of a RTRV-OC192 command. Not all output parameters are listed (missing ones indicated by … ):

```
RTRV-OC192:LT-UNITE:1-1-#-#-1-1:123456;

   LT-UNITE 00-11-27 08:00:00
M  123456 COMPLD
   "1-1-#-#-1-1:ptype=OC192,frcdus=DISABLE,sfthr=-3,sdthr=-6,emi=TRUE,
    pmode=MON,..... pmmsneses=15,pmrsneses=30"
;
```

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the RTRV-OC192 command.

### Check CCB against ptype and istd

See definition of error response in “RTRV-STM16: Retrieve STM16 port” (p. 3-2877).

## References

GR-199-CORE (RTRV-*rr*)

# RTRV-OTU2: Retrieve OTU2 port

The command **RTRV-OTU2** is used to retrieve all parameters related to the OTU2 port.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-OTU2**:*tid:aid:ctag*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **aid** – Access Identifier
   Access Identifier of an OTU2 port.
   Type: AID
   Range: OTNPortAID of OTU2 port.
   The keyword "otall" is allowed at port level, **all** up to shelf level.
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string.
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831

## Output format

In response to a valid RTRV-OTU2 command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command parameters

1. **aid** – Access Identifier
   Type: AID.
   Range: OTNPort AID.
   The AID value "otall" is not allowed in the response.

### Spec block parameters

1. **expotutti** – Expected OTU TTI
   Expected OTU trail trace identifier. The parameter indicates the Source Point Access Identifier (SAPI) of the expected OTU TTI.
   Type: Hexadecimal string (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).
   Range: 15 byte hexadecimal string
   Default: 15 bytes each with value 00.
2. **fectype** – FEC Type
   Forward error correction type.
   Type: Alphanumeric value set.
   Range: RS_FEC, V_FEC (default).
3. **ochpm** – OCH PM Enable
   Enable or disable optical channel performance monitoring.
   Type: Alphanumeric value set.
   Range: ENABLE, DISABLE (default).
4. **opwind** – Optical Window
   Optical window (L-Band, C-Band) supported by the port.
   Type: Alphanumeric value set.
   Range: BAND_L for L-Band, or BAND_C for C-Band.
5. **opwl** – Optical Wavelength
   Optical Wavelength in nanometers.
   Type: numeric value set
   Range:
   - 35 wavelengths in C-Band (1554.537 … 1568.362), i.e:
     1554.537, 1554.940, 1555.343, 1555.747, 1556.151, 1556.555, 1556.959, 1557.363, 1557.768, 1558.173, 1558.578, 1558.983, 1559.389, 1559.794, 1560.200, 1560.606, 1561.013, 1561.419, 1561.828, 1562.233, 1562.640, 1563.047, 1563.455, 1563.863, 1564.271, 1564.679, 1565.087, 1565.496, 1565.905, 1566.314, 1566.723, 1567.133, 1567.542, 1567.952, 1568.362
   - 93 wavelengths in L-Band (1568.773 … 1607.466), i.e:

1568.773, 1569.183, 1569.594, 1570.005, 1570.416, 1570.828, 1571.239, 1571.651, 1572.063, 1572.476, 1572.888, 1573.301, 1573.714, 1574.127, 1574.540, 1574.954, 1575.368, 1575.782, 1576.196, 1576.610, 1577.025, 1577.440, 1577.855, 1578.270, 1578.686, 1579.102, 1579.518, 1579.934, 1580.350, 1580.767, 1581.184, 1581.601, 1582.018, 1582.436, 1582.854, 1583.271, 1583.690, 1584.108, 1584.527, 1584.946, 1585.365, 1585.784, 1586.203, 1586.623, 1587.043, 1587.463, 1587.884, 1588.304, 1588.725, 1589.146, 1589.568, 1589.989, 1590.411, 1590.833, 1591.255, 1591.678, 1592.100, 1592.523, 1592.946, 1593.369, 1593.793, 1594.217, 1594.641, 1595.065, 1595.489, 1595.914, 1596.339, 1596.764, 1597.189, 1597.615, 1598.041, 1598.467, 1598.893, 1599.320, 1599.746, 1600.173, 1600.600, 1601.028, 1601.455, 1601.883, 1602.311, 1602.740, 1603.168, 1603.597, 1604.026, 1604.455, 1604.885, 1605.314, 1605.744, 1606.174, 1606.605, 1607.035, 1607.466

- Value 0 (default) (i.e. undefined).

6. **otnasap** – OTN ASAP

   OTN Alarm Severity Assignment Profile. This parameter retrieves the ASAP profile name of type OTN to which the designated AID points.

   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.

   Range: DEFAULT.

7. **otutimca** – OTU TIM Consequent Action Enable

   OTU Trail Trace Identifier Mismatch consequent action enable. Enabling or disabling the the TIM consequent action shall also enable or disable the TIM detection.

   Type: Alphanumeric value set.

   Range: ENABLE: enable consequent action for TIM (default), DISABLE: disable consequent action for TIM.

8. **pmode** – Port Mode

   This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.

   Type: Alphanumeric value set.

   Range:

   - AUTO (default):

     indicates that, when a signal is detected at the port, then alarm monitoring will start.

   - MON:

     indicates that alarm monitoring is taking place on the port.

   - NMON:

     means that alarm monitoring is not occurring on the port.

9. **ptype** – Port Type

   This identifies the port type of the AID.

   Type: Alphanumeric value set.

   Range: OTU2

10. **strecotutti** – Status of incoming OTU TTI

This parameter shows the status of the value of the OTU Trail Trace Identifier which is available with parameter voturectti.

Type: Alphanumeric value set.

Range:

- NORMAL: voturectti contains a valid value
- UNAVAILABLE: no value for voturectti could be obtained by the system
- AIS: no value for voturectti due to an SF condition.

11. **txenable** – Optical Output Enable

    Optical output enabling.

    Type: Alphanumeric value set.

    Range:

    - DISABLE (default): optical output disabled
    - ENABLE: optical output enabled.

12. **voturectti** – Value of incoming OTU TTI

    Value of the received OTU Trail Trace Identifier. The status of this value is contained in parameter strecotutti. If strecotutti indicates NORMAL, then voturectti contains a valid value. If strecotutti indicates UNAVAILABLE or AIS, then no incoming OTU TTI could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter voturectti is omitted from the response. The parameter indicates the Source Point Access Identifier (SAPI) of the received OTU TTI.

    Type: Hexadecimal string (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

    Range: 15 byte SAPI (Source Access Point Identifier).

13. **votutti** – Value of outgoing OTU TTI

    Value of the transmitted OTU Trail Trace Identifier. The parameter indicates the Source Point Access Identifier (SAPI) of the transmitted OTU TTI.

    Type: Hexadecimal string (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

    Range: 15 byte SAPI (Source Access Point Identifier).

    Default: 15 bytes each with value 00.

### Detailed behavior description

The command retrieves the parameters as described above. The command **RTRV-OTU2** does not generate a **REPT DBCHG** message.

### Example input/output

The following example shows the successful execution of a RTRV-OTU2 command:

```
 RTRV-OTU2:LT-UNITE:1-1-#-#-1-ot1:123456;

   LT-UNITE 06-06-30 08:00:00
M  123456 COMPLD
   "1-1-#-#-1-ot1:expotutti=4C5543454E544E45312D504F525431,fectype=V_FEC,
```

```
   ochpm=ENABLE,opwind=BAND_L,opwl=1569.183,otuasap=DEFAULT,otutimca=DISABLE,
   pmode=MON,ptype=OTU2,strecotutti=NORMAL,txenable=ENABLE,
   voturectti=4C5543454E544E45312D504F525431,
   votutti=4C5543454E544E45322D504F525433"
;
```

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the RTRV-OTU2 command.

# RTRV-OUC: Retrieve ONNS to UPSR/SNCP constructs

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

## Input format

Command syntax:

**RTRV-OUC**:*tid:wrk_aid:ctag[::ouc_dir];*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **wrk_aid** – Working Tributary Access Identifier
   This parameter specifies the working tributary of the OUC.
   Type: STS1NumAID
   Range:
   - The *1-1-#-#-all-all-all*-value is accepted in general for this parameter.
   - The *all* value is not accepted, if specified only for the slot-, port- or trib- part of this parameter.
   - The *1-1-#-#-all-all-all*-value is not accepted, if the parameter ouc_dir is present.
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.
4. **ouc_dir** – OUC Directionality
   Directionality of the OUC
   Type: Alphanumeric value set.
   Range:
   - BIDIR
   - UNIDIR-ADD
   - UNIDIR-DROP.

## Output format

In response to a valid RTRV-OUC command, the following output is returned:

```
   sid date time
M  ctag COMPLD
   "wrk_aid,prt_aid:ouc_dir,ouc_rate"
;
or in case of more than one OUC retrieved:

   sid date time
M  ctag COMPLD
   "wrk_aid,prt_aid:ouc_dir,ouc_rate"
       ...
       ...
   "wrk_aid,prt_aid:ouc_dir,ouc_rate"
;
```

The output parameters *sid, date, time* and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command parameters

1. **wrk_aid** – Working Tributary Access Identifier
   This parameter specifies the working tributary of the OUC.
   Type: STS1NumAID
   Range: n.a. (*all* values shall never occur as part of an output parameter)
2. **prt_aid** – Protection Tributary Access Identifier
   This parameter specifies the protection tributary of the OUC.
   Type: STSNumAID
   Range: n.a. (*all* values shall never occur as part of an output parameter)
3. **ouc_dir** – OUC Directionality
   Directionality of the OUC
   Type: Alphanumeric value set.
   Range:
   - BIDIR (default)
   - UNIDIR-ADD
   - UNIDIR-DROP
4. **ouc_rate** – OUC Rate

The parameter *ouc_rate* indicates the rate of the OUC, which is determined by the cross-connection rate of the associated cross-connections. For a detailed description please refer to parameter rate in RTRV-CRS.

Type: Alphanumeric value set.

Range:

- VC3
- VC4
- VC44C
- VC416C
- VC464C
- STS1
- STS3
- STS12
- STS48
- STS192

### Example input/output

Retrieval of the single bidirectional OUC with working tributary 1-1-#-#-1-1-4:

```
RTRV-OUC:UNITE-NE:1-1-#-#-1-1-4:123456::BIDIR;

   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
   "1-1-#-#-1-1-4,1-1-#-#-2-2-12:BIDIR,STS1"
;
```

Retrieval of all OUCs in an NE:

```
RTRV-OUC:UNITE-NE:1-1-#-#-all-all-all:123456;

   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
   "1-1-#-#-1-1-4,1-1-#-#-2-2-4:BIDIR,VC4"
   "1-1-#-#-1-1-7,1-1-#-#-2-4-7:UNIDIR-DROP,VC3"
   "1-1-#-#-1-1-10,1-1-#-#-2-2-10:UNIDIR-ADD,VC4"
;
```

## Error responses

### Validation rule: Invalid wildcarding

OUC command processing verifies that no wildcard is applied for *wrk_aid* on slot, port or trib level or if *ouc_dir* is present.

Error code:

```
IDNV – Input, Data Not Valid, Invalid Wildcarding for wrk_aid
```

# RTRV-OW: Retrieve orderwire and user bytes

## General

The **RTRV-OW** command can be initiated by a user to retrieve the overhead access ports and any associated optical port (OP*n*) in the NE.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-OW**:*tid*:*aid*:*ctag*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **aid** – Access Identifier
   The parameter aid (Access Identifier) specifies the overhead access port.
   Type: UserBytePortAID.
   Range: As given by the *UserBytePortAID* definition, the value "ubioall" is supported.
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

## Output format

In response to a valid **RTRV-OW** command, the following output is returned:

```
   sid date time
M  ctag COMPLD
   "aid:spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are described in the "Output parameter" section of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command parameters

1. **aid** – Access Identifier

   This parameter specifies the overhead access port for which the following spec_block parameters are returned.

   Type: UserBytePortAID.

   Range: As given by the UserBytePortAID definition, the value "ubioall" is not allowed.

### Spec block parameters

1. **intfctype** – Interface Type

   This parameter specifies which electrical interface standard of the overhead access port is used.

   Two different settings are possible:

   - electrical interface according to G.703
   - electrical interface according to V.11.

   Note: The overhead access ports with AIDs ubio1, .. ubio4 are configurable to either G703 or V11. The overhead access ports with AIDs ubio5, ubio6 are fixed to V11.

   Type: Alphanumeric value set.

   Range: G703, V11.

   Default: G703 (for the overhead access ports given by the AIDs ubio1 .. ubio4); V11 (for the overhead access ports given by the AIDs ubio5, ubio6 – fixed to V11).

2. **ohbyte** – Overhead-Byte

   This parameter specifies which of the overhead bytes is used.

   Three channels are possible:

   - E1 and F1 in the RSOH (section overhead)
   - E2 in the MSOH (line overhead).

   Type: Alphanumeric value set.

   Range: E1, F1, E2.

   Default: E1.

   Note: In output direction the empty string appears as \"\".

3. **portaid** – Port Access Identifier

   This parameter specifies the optical port (of an OP*n*) with which the overhead access port (given by the output parameter aid) is associated.

   The parameter value NOCONNECT is used to indicate that the port given by portaid is not associated to the overhead access port given by the parameter aid.

   Type: In case an association is established: SPortAID; In case an association is no established: Alphanumeric value set (i.e. the string "NOCONNECT").

Range: In case an association is established: SPortAID (No **all** value is supported); in case an association is no established: NOCONNECT.
Default: NOCONNECT.

### Detailed behavior description

The **RTRV-OW** command retrieves the overhead access ports and any associated optical port (OP*n*) in the NE.

### Example input/output

#### Example 1

Suppose the UserByte port ubio6 is associated with the port-4 of an OP2G5 in slot03 (the intfctype is fixed to V11 for ubio5 and ubio6):

```
RTRV-OW:UNITE-NE:1-1-ubio6:123456

   sid date time
M  ctag COMPLD
   "1-1-ubio6:portaid=1-1-#-#-3-4,ohbyte=E1,intfctype=V11"
;
```

#### Example 2

Suppose the

- UserByte port ubio1 (V11,E1) is associated with the port-4 of an OP2G5 in slot03
- UserByte port ubio3 (G703,E2) is associated with the port-1 of an OP10G in slot07
- UserByte port ubio6 (V11,F1) is associated with the port-4 of an OP10G in slot34
- The other UserByte ports (ubio2, ubio4, ob05) are not associated:

```
RTRV-OW:UNITE-NE:1-1-ubioall:123456

   sid date time
M  ctag COMPLD
   "1-1-ubio1:portaid=1-1-#-#-3-4,ohbyte=E1,intfctype=V11"
   "1-1-ubio2:portaid=NOCONNECT,ohbyte=E1,intfctype=G703"
   "1-1-ubio3:portaid=1-1-#-#-7-1,ohbyte=E2,intfctype=G703"
   "1-1-ubio4:portaid=NOCONNECT,ohbyte=E1,intfctype=G703"
   "1-1-ubio5:portaid=NOCONNECT,ohbyte=E1,intfctype=V11"
   "1-1-ubio6:portaid=1-1-#-#-34-4,ohbyte=F1,intfctype=V11"
;
```

# RTRV-PATH: Retrieve ONNS connection data

## Overview

The **RTRV-PATH** command requests information on an ONNS path which begins in the source node to which the message was addressed. The ONNS source node determines the status of the connection from the information stored in the Network Navigator databases.

The query must be directed to the source node. Querying an existing ONNS path by its *ConnectionID* or *ConnAlias* alone will return the status on all paths associated with the *ConnectionID*. The query response includes a status message like Connected and OK (CON&OK), the list of network element nodes that the path utilizes, and the list of constraint parameters for the connection.

ONNS supports querying all connections by sending RTRV-PATH with *connID* = ALL When all of the records of the connection data repository are retrieved by RTRV-PATH with *connID* = ALL, each connection record will be the same format as the RTRV-PATH ConnID response message format.

ONNS supports querying all connections of a connection group, i.e. all connections starting at VCGTRIBs of one single VCG, by sending RTRV-PATH with the ALL qualifier for the tributary number within the *connID*. When several records of the connection data repository are retrieved by RTRV-PATH with qualifier ALL for the tributary number in *connID*, each connection record will be the same format as the standard RTRV-PATH *ConnID* response message format. The *connAlias* will not be accepted as input to retrieve the connections of a group and will be ignored, if set.

ONNS supports querying all connections of an M:N protection group, i.e. working as well as protecting connections, by sending RTRV-PATH with the M:N protection group ID within the *connID*. In this case each connection record will be in the same format as the standard RTRV-PATH ConnID response message format.

The connection records will be sorted by their route membership. The connection records of each route will be headlined by a route indicator, the number of connections per route and an group asymmetry indicator.

Additionally querying of single working or protecting connections of an M:N protection group is supported by sending RTRV-PATH with the ID of the corresponding connection within the *connID*.

### RTRV-PATH RetrieveDetail_Route parameters

The **RTRV-PATH** command supports the RetrieveDetail_Route function. RetrieveDetail_Route is only available when a single connection ID (connID) is requested. The RetrieveDetail_Route function retrieves data from the network. RetrieveDetail_Route data is not be stored in the ONNS source node or any other node. RetrieveDetail_Route only operates on stable ONNS connections, with no other ONNS operations pending (including pending RetrieveDetail_Route operations).

RetrieveDetail_Route request is sent to the source node for the specific connection. The message data from individual nodes on the nodelist of the path that is traced is returned to the source node. Each node shall send the node ID, portID, and the timeslot (trib), for each connPoint involved in the path connection specified by pathID. The ability to trace the path though an intermediate node that has had its path cross-connection deleted is supported.

The message data from path nodes is collected, sort by nodeList order, organized by path, and sent as a second response block to the **RTRV-PATH** command. The initial RTRV-PATH response block contains the current connection data from the ONNS connection database, uses the RTRV completion code, and is terminated with a ">". The second RTRV-PATH response block has the same header line and is terminated with a ";".

The ONNS process that controls and receives the RetrieveDetail_Route signaling request responses waits for up to 15 seconds to accumulate the signaling request response messages and then send the data received via TL1 as the second and concluding response block to the **RTRV-PATH** command. The RetrieveDetail_Route response indicates any nodes that did not return path data by an node ID entry with no data, and indicates missing cross-connections as needed.

### RTRV-PATH RetrieveDetail_State parameters

The **RTRV-PATH** command supports the RetrieveDetail_State function. RetrieveDetail_State is only available when a single connection ID (connID) is requested. The RetrieveDetail_State function retrieves connection data (as retrieved by RetrieveDetail_Route) and additionally connection signal states from the network. RetrieveDetail_State data and states shall not be stored in the ONNS source node or any other node. RetrieveDetail_State only operates on stable ONNS connections, with no other ONNS operations pending (including pending RetrieveDetail_Route or RetrieveDetail_State operations). The RetrieveDetail_State request is handled in the same way as the RetrieveDetail_Route request. The only difference is, that the message data from the path nodes and the output to the request contain connection signal states additionally to the connection data as retrieved via RetrieveDetail_Route request.

### REPT PTHCHG is not generated

The **RTRV-PATH** command does not generate a **REPT PTHCHG** message.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Abortable: No.

## Input format

A user defined connection alias (an alternate name) may be optionally specified with the **RTRV-PATH** command. The alias is specified in the spec block as ConnAlias="…" (up to 83 printable ASCII characters + NULL; excluded are the following characters: colon, semicolon, double-quotes, comma). If no *connAlias* is specified, the *connID* is used as the key. If both *connAlias* and *connID* are specified then *connID* is used as the key. If neither is specified, the command is denied.

Command syntax: **RTRV-PATH**:*srcTid:[srcAid]:ctag::[servID]:[connID][:specBlock]*;

## Input parameters

### Command parameters

1. **srcTid**

   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.

   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.

   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.

2. **srcAid**

   Source node ONNS application access identifier of the ONNS controller OS command interface port.

   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn.

3. **ctag** – Correlation Tag

   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.

   The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ".").

4. **srvID** – Service Identifier

   This parameter is a logical tag for the group of connections associated with a service defined by the Service Manager system (or other management entity).

   Type: Integer.

   Range: 1 – 20000000

   Only one *srvID* is accepted. The value "ALL" is not supported.

5. **connID** – Connection ID for an existing ONNS optical path connection service

   This parameter reports only the connections originating at the specified source node. *connID* is formed from the *SrcNodeIP* and IngressPort# and an index # where 1675 LambdaUnite MSS uses bay = 1 = shelf.

   Type: Character string of length up to 39.

Range: *nodeID&Tributary AID&Index* with

- nodeID: four dot separated numeric strings: each string 0..255
- Tributary AID: five dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # with:

  Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 192).
- Index: Numeric string 0-4294967295

The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x.

Example: 29.13.196.203&1-1-13-15-1&271584

Range: *nodeID&Tributary AID range* - if port # specifies a VCG to retrieve a connection group, with:

- nodeID: four dot separated numeric strings: each string 0..255
- Tributary AID: five dash separated numeric strings representing Bay/Frame #1, Shelf #1, Slot/Pack #1...39, Port #1...9, Tributary #ALL - special value to retrieve all connection records associated with port ID:

As there is always at most one connection group associated with a VCG, the qualifier ALL specified for the Tributary # of input parameter *connID* will always deliver all connections of the affected group, i.e. all connections starting at the affected VCG.

The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x

Example: 29.13.196.203&1-5-13-7-ALL. The port AID 1-5-13-7 must denote a VCG.

Range: special value

Range: *nodeID Tributary AID&Index* - to retrieve a protecting connection of an M:N connection group, with:

- nodeID: four dot separated numeric strings: each string 0..255
- defaultTributary AID: five dash separated numeric strings with:

  Bay/Frame # (1), Shelf # (1), Slot/Pack # (#), Port # (#), Tributary # (#)
- Index: Numeric string 0-4294967295

  The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x

Range: *nodeID&groupindex* - to retrieve all connections belonging to an M:N protected connection group, with:

- nodeID: four dot separated numeric strings: each string 0..255;
- groupIndex: integer value specifying a connection group within *nodeID* 0-65535.

The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x

### Spec block parameters

1. **`DetailRoute`**

   *DetailRoute* = ON will return the portID / trib information from all nodes in each path of the *connID* specified in the second block of the response message.

   The command is rejected if *DetailRoute* = ON and *connID* = ALL.

   The command is rejected if *DetailRoute* = ON and *connID* contains a tributary ID with qualifier ALL instead of a single tributary number.

The command is rejected if *DetailState* = ON and *connID* specifies a connection group instead of a single connection.

Type: Alphanumeric value set.

Range: OFF, ON.

Default: OFF.

2. **DetailState**

   *DetailState* = ON will return the portID / trib information including corresponding incoming signal states from all nodes in each path of the connID specified in the second block of the response message.

   The command is rejected if DetailState = ON and connID = ALL.

   The command is rejected, if DetailState = ON and connID contains a tributary ID with qualifier ALL instead of a single Tributary number.

   The command is rejected if DetailState = ON and connID specifies a connection group ID instead of a single connection.

   The command is accepted, if both DetailRoute = ON and DetailState = ON, as far as all other validations are fulfilled. In this case, the action requested by DetailState = ON shall be performed.

   Type: Alphanumeric value set.

   Range: OFF, ON.

   Default: OFF.

3. **connAlias** – Connection Alias

   This parameter specifies a user defined string as an alternate name for the connection instead of *connID*.

   Type: Character string up to length 83.

   Range: The string consists of printable ASCII characters + NULL. The following characters cannot be used in the string: colon, semicolon, comma, double quotes, equal, ampersand, greater than. Additionally the string shall start with a letter.

## Output format

### Normal system response to RTRV-PATH for connID, output syntax

If the RTRV-PATH request completes successfully, then the following normal completion response is returned to the command.

Note: The *nodeListUsage1* = variable will be translated to either Exclude= or Explicit= , depending on which type of *nodeList* was received as input when the connection was set up.

```
   srcTid date time
M  ctag COMPLD
   "ConnID=connID,ConnStatus=connStatus,connControl,pdir,protectionClass,
   bandwidth,[ConnAlias=connAlias],
   MaxDelay=maxDelay,[SrvID=srvID],[nodeListUsage1=nodeList1],
   [nodeListUsage2=nodeList2],[SrlgExclude=srlgExcludeList],
   [IncludeID=linkIncludeID],[specBlock],[reserved],
   SrcNID=srcNID,srcPortID,DestNID=destNID,destPortID
```

```
   [,brDestNID=brDestNID,brDestPortID]
   [:PathID=pathID1,State=pathState1,NodeList=pNodeList1
   [:PathID=pathID2,State=pathState2,NodeList=pNodeList2]]"
;
```

NodeList1 = Node45ID & Node12ID & Node39ID & … & Node99ID to be used as set by nodeListUsage1.

pNodeList1 = srcNodeID & Node2ID & Node3ID & … & destNodeID

srlgExcludeList = SRG1 & SRG2 & SRG3 & … & SRG8

brDestNID = brDestNID, brDestPortID to be used for Y-connection.

**System response to RTRV-PATH with connID = ALL for an empty connection Data Repository.**

ONNS shall respond with a TL1 completion response of COMPLD and a message that the NCDR is empty when there are no connection records in the ONNS Network (Domain) Connection Data Repository (NCDR). If the **RTRV-PATH** ALL request completes successfully with an empty NCDR, then the following completion response is returned to the command.

```
   srcTid date time
M  ctag COMPLD
;
```

**System response behavior to RTRV-PATH for connections within an M:N protection group**

- For a working connection of an M:N protection group one single path will be associated, when this connection is currently not protected
- For a working connection of an M:N protection group two paths will be associated, when this connection is currently being protected
- For a protecting connection of an M:N protection group one single path will be associated, when this connection is currently not protecting a working connection
- For a protecting connection of an M:N protection group no path at all will be associated, when this connection is currently protecting a working connection

**System response to RTRV-PATH with connID [connAlias=connAlias] and DetailRoute=ON**

ONNS shall respond with a normal TL1 RTRV-PATH completion response of RTRV and an additional message block with the RetrieveDetail_Route information included. If the RTRV-PATH <connID> request completes successfully with a normal NCDR record as above, then the following completion response is returned to the command:

```
   srcTid date time
M  ctag COMPLD
```

```
   "ConnID=connID,PathID=pathID1[,ConnAlias=connAlias]:
   nodeID1-1,connPtID1_1-1,[protConnPtId_1-1],connInd,connPtID2_1-1,,
[detailRouteStatus]:
   nodeID1-2,connPtID1_1-2,,connInd,connPtID2_1-2,,[detailRouteStatus]:
   nodeID1-3,connPtID1_1-3,,connInd,connPtID2_1-3,,[detailRouteStatus]:
   ...
   nodeID1-n,connPtID1_1-n,,connInd,connPtID2_1-n,[protConnPtID_1-n],
[detailRouteStatus]"
  ["ConnID=connID,PathID=pathID2[,ConnAlias=connAlias]:
    nodeID2-1,connPtID1_2-1,[protConnPtID_2-1],connInd,connPtID2_2-1,,
[detailRouteStatus]:
    nodeID2-2,connPtID1_2-2,,connInd,connPtID2_2-2,,[detailRouteStatus]:
    nodeID2-3,connPtID1_2-3,,connInd,connPtID2_2-3,,[detailRouteStatus]:
    ...
    nodeID2-n,connPtID1_2-n,,connInd,connPtID2_2-n,[protConnPtID_2-n],
[detailRouteStatus]"]
;
```

Note: ConnAlias is reported only for releases in which it is supported as input parameter. See above. It depends on the protectionClass and connStatus whether one or two records are reported: UNPROT connections always have one record, N1PLUS1and YCONN connections always have two records, AUTO connections may have two records (e.g. in case restoration is active for revertive mode) or one record. Protection connections of a M:N protection group which are in use for protection shall response without the RetrieveDetail_Route information.

**System response to RTRV-PATH with connID [connAlias=connAlias] and DetailState=ON**

ONNS shall respond with a normal TL1 **RTRV-PATH** completion response of RTRV and an additional message block with the RetrieveDetail_State information included. If the **RTRV-PATH <connID>** request completes successfully with a normal NCDR record as above, then the following completion response is returned to the command.

```
   srcTid date time
M  ctag COMPLD
   "ConnID=connID,PathID=pathID1[,ConnAlias=connAlias]:
   nodeID1-1,connPtID1_1-1,[protConnPtId_1-1],connInd,connPtID2_1-1,,
   connPt1State_1-1,[connPt2State_1-1],[detailRouteStatus]:
   nodeID1-2,connPtID1_1-2,,connInd,connPtID2_1-2,,
   connPt1State_1-2,[connPt2State_1-2],[detailRouteStatus]:
   nodeID1-3,connPtID1_1-3,,connInd,connPtID2_1-3,,
   connPt1State_1-3,[connPt2State_1-3],[detailRouteStatus]:
   ...
   nodeID1-n,connPtID1_1-n,,connInd,connPtID2_1-n,[protConnPtID_1-n],
   connPt1State_1-n,[connPt2State_1-n],[detailRouteStatus]"
  ["ConnID=connID,PathID=pathID2[,ConnAlias=connAlias]:
   nodeID2-1,connPtID1_2-1,[protConnPtID_2-1],connInd,connPtID2_2-1,,
```

```
   connPt1State_2-1,[connPt2State_2-1],[detailRouteStatus]:
   nodeID2-2,connPtID1_2-2,,connInd,connPtID2_2-2,,
   connPt1State_2-2,[connPt2State_2-2],[detailRouteStatus]:
   nodeID2-3,connPtID1_2-3,,connInd,connPtID2_2-3,,
   connPt1State_2-3,[connPt2State_2-3],[detailRouteStatus]:
    ...
   nodeID2-m,connPtID1_2-m,,connInd,connPtID2_2-m,[protConnPtID_2-m],
   connPt1State_2-m,[connPt2State_2-m],[detailRouteStatus]"]
;
```

**Normal system response to RTRV-PATH with connID = ALL or with tributary# = ALL**

Connection record definition:

ConnectionIDx_dataRecord=
"<Connection_info_data>:<Path_Data_record1>[:<Path_Data_record2>]"

Connection_info_data= connID,connStatus,connControl,pdir,protectionClass,bandwidth,[connAlias],

<ConnConstraint_info>,[specBlock],{reserved},<SourceDest_info>

ConnConstraint_info= maxDelay,[srvID],[nodeListUsage1,nodeList1],[nodeListUsage2,nodeList2],[srlgExcludeList],[linkIncludeID],

SourceDest_info = srcNID,srcPortID,destNID,destPortID[,brDestNID,brDestPortID]

Path_Data_record1= pathID1,pathState1,pNodeList1:

Path_Data_record2= pathID2,pathState2,pNodeList2

If the RTRV-PATH request with connID = ALL or with tributary# = ALL completes successfully, then the following normal completion response is returned:

```
   srcTid date time
M  ctag RTRV
   "ConnectionID1_dataRecord"
   ...
   "ConnectionID4_dataRecord"
>
   srcTid date time
M  ctag RTRV
   "ConnectionID5_dataRecord"
>
   srcTid date time
M  ctag COMPLD
   "ConnectionID6_dataRecord"
   ...
   "ConnectionID11_dataRecord"
;
```

The RTRV-PATH <connID=ALL> command shall send a maximum of 8 connection records per block. On all large output message blocks but the last, the continuation RTRV completion code is used and the semicolon(;) is replaced with a (>) terminator. Then on the last record block, the COMPLD completion code is used with the final semicolon (;) data block terminator.

Note: This RTRV-PATH <connID=ALL> command can produce large amounts of data. This will require proper sizing of the receive buffer of the OS system. brDestNID = brDestNID,brDestPortID to be used for Y-connection.

Wrt. output format for the RTRV-PATH <tributary # = ALL> command the same requirements are valid as for the RTRV-PATH <connID=ALL> command.

**Normal system response to RTRV-PATH with connID = M:N groupID**

Connection record definition:

ConnectionIDx_dataRecord =
"<Connection_info_data>:<Path_Data_record1>[:<Path_Data_record2>]"

Connection_info_data = connID,connStatus,connControl,pdir,protectionClass,bandwidth, [connAlias], <ConnConstraint_info>,[specBlock],{reserved}, lt;SourceDest_info>

ConnConstraint_info = maxDelay,[srvID],[nodeListUsage1,nodeList1], [nodeListUsage2,nodeList2],[srlgExcludeList],[linkIncludeID],

SourceDest_info = srcNID,srcPortID,destNID,destPortID[,brDestNID,brDestPortID]
Path_Data_record1 = pathID1,pathState1,pNodeList1:

Path_Data_record2 = pathID2,pathState2,pNodeList2

If the RTRV-PATH request with connID = M:N groupID completes successfully, then the following normal completion response is returned:

```
   srcTid date time
M  ctag RTRV
   "Route1,NumberOfConnections,GroupAsymmetry"
   "ConnectionID1_dataRecord"
   ...
   "ConnectionID4_dataRecord"
>
   srcTid date time
M  ctag RTRV
   "Route2,NumberOfConnections,GroupAsymmetry"
   "ConnectionID5_dataRecord"
>
   srcTid date time
M  ctag COMPLD
   "ConnectionID6_dataRecord"
   ...
   "ConnectionID8_dataRecord"
```

```
   "Route3,NumberOfConnections,GroupAsymmetry"
   "ConnectionID9_dataRecord"
   ...
   "ConnectionID12_dataRecord"
;
```

The RTRV-PATH <connID=M:N groupID> command shall send a maximum of 8 connection records per TL1 block. On all large output message blocks but the last, the continuation RTRV completion code is used and the semicolon(;) is replaced with a (>) terminator. Then on the last record block, the COMPLD completion code is used with the final semicolon (;) data block terminator.

Note: This RTRV-PATH <connID=M:N groupID> command can produce large amounts of data. This will require proper sizing of the receive buffer of the OS system.

## Output parameters

### Command parameters

1. **srcTid** – Source Node Identifier
   See definition of this parameter in Input Parameters section.
2. **date**
   This parameter is set to the date when the output message is generate: YY-MM-DD where YY=00-99, MM=01-12, DD=01-31.
3. **time**
   This parameter is set to the time when the output message is generated: HH:MM:SS where HH=00-23,MM=00-59, SS=00-59.
4. **ctag** – Correlation Tag
   See the parameter description in the Input parameters section above.
5. **completionCode**
   Standard TL1 completion code result.
   Type: Value set.
   Range: COMPLD (default) for success: RTRV for data continuation.
6. **route** – M:N Route
   Indicates the M:N route in front of a group of M:N protected connections with the same node list. This parameter is only used for retrival of all connections belonging to an M:N protected group.
   Type: Alphanumeric string
   Range: WorkerRoute1, WorkerRoute2, WorkerRoute3, ProtectionRoute1
7. **numberOfConnections** – Number of Connections per Route
   *NumberOfConnections* = x indicates the number of connections per route of a M:N protection group. This parameter is only used for retrival of all connections belonging to an M:N protected group.
   Type: Integer.

Range: 1-96 (number of connections per route).

8. **groupAsymmetry** – M:N Group Asymmetry

   *GroupAsymmetry* = x indicates the connection asymmetry between the routes of a M:N protection group. This parameter is only used for retrival of all connections belonging to an M:N protected group.

   Type: Integer.

   Range: na = not applicable (value of asymmetry for the protection route); 0 – 255 indicates the difference between the number of actual worker connections within this route and the ceiling average value of worker connections per route based on the protection group.

9. **connID**

   See the parameter description in the Input parameters section above.

10. **connAlias**

    See the parameter description in the Input parameters section above.

11. **connStatus**

    ConnStatus = pst&sst[&tst]

    Connection status is the overall status of the connection *connID* which may be different than the status of an individual *pathID* in that connection.

    *connStatus* is composed out of

    - pst (PrimaryState)
    - sst (SecondaryState)
    - tst (TertiaryState, optional).

    Up to two of the allowed values are simultaneously permitted as a sst/tst parameter. The two values must be separated by an ampersand (“&”). Individual status values are 7 characters or less.

    Type: up to three &-separated value sets.

    Range *pst* values:

    - CON: Connected
    - DLT: Deleted
    - NOCON: Not Connected
    - MAINT: Maintenence Mode
    - UNKNOWN: Conn state unknown.

    Range *sst* & *tst* values:

    - OK: Conn good
    - FAILED: Conn failed
    - SETUP: Conn SetUp occurring
    - TRDOWN: Conn teardown occurring
    - NO-IN: Conn failed, signal in bad
    - RSTOR: path restore occurring
    - RSTRD: Conn restored

- RSTRFL: Conn restore failed
- DLT-FL: Delete operation Failed
- UNKNOWN: Conn state unknown
- WTORSTR: Waiting to restore path
- PREMPT: Path pre-empted
- SETUPFL: Connection SetUp Failed
- FL-NVM: Not saved in NVM
- WTORV: Waiting to revert path
- EPRTFLEDGE: Port Failed
- BAD-IN Conn failed, Bad signal in
- BRDGD Path bridged

Note: Some states listed in this list will only occur within a DLT-PATH command response or within a REPT PTHCHG or REPT PTHEVT notification message.

Range *sst* values:

- STBY: Standby (for protecting connections within an M:N protection group, when connection is not protecting a working connection)
- USED: Used (for protecting connections within an M:N protection group, when connection is currently protecting a working connection)

Range *tst* values:

- DEGRADED: Non-revertive restoration was not possible if the worker or a permanent 1+1 protected connection fails.

12. **`connControl`** -Connection Control

    This parameter indicates whether the ONNS connection is controlled by ONNS or by external control (UNI, eNNI connections).

    Range:

    - ONNS (ONNS connections, created via ENT-PATH)
    - EXT (ONNS connections, created via ENT-CONN, UNI or eNNI)

13. **`pdir`** – Path Direction Topology

    Unidirectional A-Z (1WAY) or Bidirectional (2WAY).

    For connections of *protectionClass* MBYNWRK and MBYNPRT only the path direction topology Bidirectional (2WAY) is supported.

    Type: Value set.

    Range: 1WAY, 2WAY

    Default: 1WAY.

14. **`protectionClass`**

    This parameter defines the type of restoration protection assigned to the path connection during path setup or after path modification.

Range:

- UNPROT (path from source to destination is un-protected)
- AUTONR (path from source to destination is a non-revertive auto-reroute path connection)
- N1PLUS1 (paths from source to destination is set up as a 1+1 protected connection)
- AUTORV (path from source to destination is a revertive auto-reroute path connection)
- YCONN (paths from the same source to two different destinations are set up as a bridged connection).
- MBYNWRK (working connection in an M:N connection group)
- MBYNPRT (protecting connection in an M:N connection group)
- P1PLUS1NR (paths from source to destination are set up as a 1+1 protected non-revertive connection with an additional non-revertive restoration path applied in case the worker or protection path fails.)
- P1PLUS1NRRV (paths from source to destination are set up as a 1+1 protected revertive connection with an additional non-revertive restoration path applied in case the worker or protection path fails.)

Default: None.

15. **bandwidth** – Requested bandwidth / signalRate

    Link *signalRate* is equal to or greater than the minimum cross-connect rate *minXCrate* of the *port_type*.

    Type: Value set.

    Range: STS1, STS3, STS12 STS48, STS192, STS1-pipe, STS3-pipe, STS12-pipe STS48-pipe, STS192-pipe.

    Default: None.

16. **maxDelay** – Maximum transport delay

    Maximum transport delay through all nodes in the path. Total path delay must not exceed this value.

    Range: 0, is used to select no delay limit; 1 – 32767, maximum transport delay in milliseconds.

    Default: 0.

17. **srvID** – Service Identifier

    This parameter is a logical tag for the group of connections associated with a service defined by the Service Manager system (or other management entity).

    The *srvID* parameter is an integer value range = 1 – 20,000,000. Only one *srvID* is accepted. ALL is not supported.

18. **nodeListUsage1**

For connection setup NN used/uses the list of nodes included in the *nodeList1* array block in a manner specified by the *nodeListUsage1* variable. Both, *nodeListUsage1* and *nodeList1*, fields belong together and is reported when supplied as input to the **ENT-PATH** command. An EXCLUDE list usage applies to all paths created (as in a N1PLUS1NR or N1PLUS1RV). A non-existent *nodeID* will be ignored in EXCLUDE *nodeList1* during path setup. A non-existent *nodeID* will cause setup failure in EXPLICIT *nodeList1* during path setup.

Type: Value set.

Range:

- EXPLICIT, *nodeList1* contains the intermediate NE nodes of the path in the explicit order they are to be used. (An empty list will force a direct path from source to destination.)
- EXCLUDE, nodes in the *nodeList1* must all be excluded from the path created. In the case when the *protectionClass* is either YCONN, N1PLUS1NR or N1PLUS1RV the nodes in the *nodeList1* below also apply to the second or restoration path.

19. **nodeList1**

When *nodeListUsage1* = EXPLICIT: List of intermediate nodes that specify the path in the exact node order specified in the input. Source and destination nodes are assumed to be included implicitly. The *nodeID* values are shown in the form: nid1([&nid2& …&nidx]).

When *nodeListUsage1* = EXCLUDE: List of nodes that must all be excluded from both paths. The *nodeID* values are shown in the from: nid1([&nid2& …&nidx]).

If the preceding required *nodeListUsage1* field is not supplied, this field must not be present. If user specifies empty EXCLUDE *nodeList1*, the connection should use indirect path from source node to destination node (that is, at least one intermediate node is needed). If user specifies empty EXPLICIT *nodeList1*, the connection should use a direct path from source to destination node (that is, no intermediate node is allowed).

Type: &-separated list of nodeIDs. A *nodeID* is represented as four dot separated numeric string with each numeric string between 0 – 255.

Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123

Range: nid1([&nidx ])* or empty list (where X <= 25 when *nodeListUsage1* = EXPLICIT) (where X <= 25 when *nodeListUsage1* = EXCLUSIVE)

20. **nodeListUsage2**

For connection setup NN used/uses the list of nodes included in the *nodeList2* array block in a manner specified by the *nodeListUsage2* variable. Both, *nodeListUsage2* and *nodeList2*, fields belong together and is reported when supplied as input to the **ENT-PATH** command. A non-existent *nodeID* will cause setup failure in EXPLICIT *nodeList1* during path setup.

This parameter is only be used when *protectionClass* is N1PLUS1 or YCONN. This parameter shall also be allowed when *protectionClass* is P1PLUS1NR.

Type: Value set.

Range: EXPLICIT, *nodeList2* contains the intermediate NE nodes of the path in the explicit order they are to be used. (An empty list will force a direct path from source to destination.).

21. **nodeList2**

    When *nodeListUsage2* = EXPLICIT: List of intermediate nodes that specify the path in the exact node order specified in the input. Source and destination nodes are assumed to be included implicitly. The *nodeID* values are shown in the form: nid1([[&nid2& …&nidx]]).

    If the preceding required *nodeListUsage2* field is not supplied, this field must not be present. If user specifies empty EXPLICIT *nodeList2*, the connection should use a direct path from source to destination node (i.e., no intermediate node is allowed).

    This parameter is only be used when *protectionClass* is N1PLUS1 or YCONN. This parameter shall also be allowed when *protectionClass* is P1PLUS1NR

    Type: &-separated list of *nodeIDs*. A *nodeID* is represented as four dot separated numeric string with each numeric string between 0 – 255.

    Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123

    Range: nid1([&nidX])* or empty list where X <= 8 when *nodeListUsage1* = EXPLICIT.

22. **srlgExcludeList** – SRLG Exclude List

    List of Shared Risk Link Group identifiers that are to be used to exclude links from the connection path(s) being created.

    Type: &-separated list of numeric strings | empty | 0

    Example: 33&49&64

    Range: up to 25 numeric strings, each in the range 1 – 65535. The value 0 (default) or an empty field indicates no constraint are applied.

23. **linkIncludeID** – VPN Identifier

    A connection constraint link property such as *linkIncludeID* that must be valid to include the link in the connection path(s) to be created. *linkIncludeID* is a link connection property that can be used to group and classify links. VPNID is a special case of this associative property.

    Type: Integer

    Range: 1 … 65535; 0 or an empty field indicates no VPN constraint is applied.

    Note: Since the corresponding value is not supported as Host port parameter any input different from 0 will lead to DENY of the command.

24. **srcNID** – Source nodeID

    ONNS source nodeID. Together with the following srcPortID field defines the associated Ingress connPoint that connects the source node to the edge/gateway switch or client router.

    Range: Four dot separated numeric strings. 0 – 255 for each numeric string.

25. **srcPortID** – Source PortID

    ONNS source node ingress portID. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # of the *srcNID* ingress *connPoint*. ONNS assumes a bidirectional port pair.

    Value: dash-separated list of 5 numeric strings

Example: 1-1-3-1-4

Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 192).

Range: Bay/Frame # (1), Shelf # (1), Slot/Pack ##, Port # #, Tributary ##. This range is valid for protecting connections in M:N connection groups

Range: Bay/Frame # 1 Shelf # 1 Slot/Pack # % Port # % Tributary # %. This range is valid for unprotected transferred DLT-FL connections, as such connections are not connected to specific source tributaries any more.

26. **destNID** – Destination nodeID

    ONNS destination nodeID. Together with the following *destPortID* field defines the associated Engress *connPoint* that connects the destination node to the edge/gateway switch or client router.

    Type: Four dot separated numeric strings. 0 – 255 for each numeric string.

27. **destPortID** – Destination PortID

    ONNS destination node egress portID. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # of the destNID egress *connPoint*.

    Value: dash-separated list of 5 numeric strings

    Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 192).

    Range: Bay/Frame # (1), Shelf # (1), Slot/Pack ##, Port ##, Tributary ##. This range is valid for protecting connections in M:N connection groups

    Range: Bay/Frame # 1 Shelf # 1 Slot/Pack # % Port # % Tributary # %. This range is valid for unprotected transferred DLT-FL connections, as such connections are not connected to specific destination tributaries any more.

    See the parameter description in the "ENT-PATH: Create ONNS path connection" (p. 3-1686) Input parameters section.

28. **brDestNID** – Bridged Destination NodeID

    ONNS bridged destination nodeID. Together with the following brDestPortID field defines the second associated Egress connPoint that connects the destination node to the edge/gateway switch or client router in case of protectionClass YCONN.

    Type: Four dot separated numeric strings. 0 – 255 for each numeric string.

29. **brDestPortID** – Bridged Destination PortID

    ONNS bridged destination node egress *portID* in case *protectionClass* = YCONN. The *portID* consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # of the brDestNID egress connPoint. 4.1; 5; 6

    Value: dash-separated list of 5 numeric strings

    Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).

30. **pathID1** – Path ID 1

    The PathID of the 1st path that was created.

    Type: character string of length up to 20.

    Range: nodeID-Index (nodeID: four dot separated numeric strings: each string 0 – 255) (Index: Numeric string 0-65535).

    The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x

Example: 29.13.196.203-65111

Default: None.

31. **pathState1** – Path State 1

    Path State1 = *pst*& *sst*[*&tst*]. pathState1 represents the status of the first path of the connection which may be different than the status of the overall connection in *connStatus*.

    PathState1 is composed out of *pst* (PrimaryState), *sst* (SecondaryState) and *tst* (TertiaryState, optional) Up to two of the allowed values are simultaneously permitted as a sst/tst parameter.The two values must be separated by an ampersand ("&"). Individual status values are 7 characters or less.

    Type: up to three &-separated value sets.

    Range *pst* values:

    - CON: Connected
    - NOCON: Not Connected
    - DLT: Deleted
    - MAINT: Maintenance mode.

    Range *sst* & *tst* values

    - OK: Conn good
    - FAILED-PATH: failed
    - SETUP: Conn SetUp occurring
    - TRDOWN: Conn teardown occurring
    - NO-IN: Conn failed, signal in bad
    - RSTOR: path restore occurring
    - RSTRD: Conn restored
    - RSTRFL: Conn restore failed
    - DLT-FL: Delete operation Failed
    - UNKNOWN: Conn state unknown
    - WTORSTR: Waiting to restore path
    - SETUPFL: Connection SetUp Failed
    - RVRTFL: Conn revert failed
    - PREMPTD: Preempted
    - WTORV: Waiting to revert path
    - BRDGD: Path bridged
    - EPRTFL: EDGE Port Failed
    - BAD-IN: path failed, Bad signal in
    - FLT: Fault.

    Note: Some states listed in this list will only occur within a DLT-PATH command response or in a REPT-PTHCHG / PTHEVT notification.

Range *pst* values:

- RSVD: Reserved, for paths associated to protecting connections within an M:N protection group, while not protecting a working traffic.

32. **pNodeList1** – Path Node List 1

    The path node list contains the list of nodes that the 1st path (*pathID1*) traverses in A-Z order from the source node.

    Type: &-separated list of nodeIDs. A nodeID is represented as four dot separated numeric string with each numeric string between 0 – 255.

    Range: nid1([&nidX])*

    Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123

33. **pathID2** – Path ID 2

    The PathID of the 2nd path (if existing) that was created.

    Type: character string of length up to 20.

    Range: nodeID-Index (nodeID: four dot separated numeric strings: each string 0 – 255), (Index: Numeric string 0-65535).

    The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x.

    Example: 29.13.196.203-65111

34. **pathState2** – Path State 2

    *pathState2* = pst&sst[&tst]. *pathState2* represents the status of the second path (if existing) of the connection which may be different than the status of the overall connection in *connStatus*.

    PathState2 is composed out of

    - pst (PrimaryState)
    - sst (SecondaryState)
    - tst (TertiaryState, optional).

    Up to two of the allowed values are simultaneously permitted as a sst/tst parameter.The two values must be separated by an ampersand ("&"). Individual status values are 7 characters or less.

    Type: up to three &-separated value sets

    Range *pst* values:

    - CON: Connected
    - NOCON: Not Connected
    - DLT: Deleted
    - MAINT: Maintenance mode.

    Range *sst* & *tst* values

    - OK: Conn good
    - FAILED-PATH: failed
    - SETUP: Conn SetUp occurring
    - TRDOWN: Conn teardown occurring
    - NO-IN: Conn failed, signal in bad

- RSTOR: path restore occurring
- RSTRD: Conn restored
- RSTRFL: Conn restore failed
- DLT-FL: Delete operation Failed
- UNKNOWN: Conn state unknown
- WTORSTR: Waiting to restore path
- SETUPFL: Connection SetUp Failed
- RVRTFL: Conn revert failed
- PREMPTD: Preempted
- WTORV: Waiting to revert path
- BRDGD: Path bridged
- EPRTFL: EDGE Port Failed
- BAD-IN: path failed, Bad signal in
- FLT: Fault.

Note: Some states listed in this list will only occur within a DLT-PATH command response or in a REPT-PTHCHG / PTHEVT notification.

35. **pNodeList2** – Path Node List 2

    The path node list contains the list of nodes that the 2nd path (pathID1, if existing) traverses in A-Z order from the source node.

    Type: &-separated list of nodeIDs. A *nodeID* is represented as four dot separated numeric string with each numeric string between 0 – 255.

    Range: nid1([&nidX])*

    Example: 135.13.196.203&135.13.42.23&135.213.242.133&135.13.196.123

**Spec block parameters**

1. **connMode** – Connection Mode

    The connection mode determines ONNS treatment of the failed path after an auto-reroute restoration.

    Example: *connMode* = NONREVERTIVE causes path setup to be auto-reroute non-revertive.

    Range:

    - UNPROT: converts a auto connection to a unprotected
    - N1PLUS1: Network 1+1 protected connection
    - NONREVERTIVE: Auto-reroute non-revertive
    - REVERTIVE: Auto-reroute revertive
    - YCONN: Y-connection
    - BRIDGEY: Y connection Protection

- MBYNWRK: Working connection within an M:N protection group
- MBYNPRT: Protecting connection within an M:N protection group.

2. **`rstrPriority`** – Restoration Priority

   This parameter describes the restoration priority of the connection.

   Range: 0 (default) – 7. Lower values represent higher priority.

3. **`DetailRoute`**

   *DetailRoute* = ON will return the portID / trib information from all nodes in each path of the *connID* specified in the second block of the response message.

   The command is rejected if *DetailRoute* = ON and *connID* = ALL.

   The command is rejected if *DetailRoute* = ON and *connID* contains a tributary ID with qualifier ALL instead of a single tributary number.

   The command is rejected if *DetailState* = ON and *connID* specifies a connection group instead of a single connection.

   Type: Alphanumeric value set.

   Range: OFF, ON.

   Default: OFF.

4. **`DetailState`**

   *DetailState* = ON will return the portID / trib information including corresponding incoming signal states from all nodes in each path of the connID specified in the second block of the response message.

   The command is rejected if DetailState = ON and connID = ALL.

   The command is rejected, if DetailState = ON and connID contains a tributary ID with qualifier ALL instead of a single Tributary number.

   The command is rejected if DetailState = ON and connID specifies a connection group ID instead of a single connection.

   The command is accepted, if both DetailRoute = ON and DetailState = ON, as far as all other validations are fulfilled. In this case, the action requested by DetailState = ON shall be performed.

   Type: Alphanumeric value set.

   Range: OFF, ON.

   Default: OFF.

5. **`connectionPriority`** – Connection Priority

   Connection priority allows connection setup of a higher priority connection to utilize the existing path through the network when the existing connection is pre-emptible.

   Range: 0 (default) – 7. 0 = locked, 1 – 7 = Priority, Connection may be pre-empted.

6. **`disjointness`**

   The actual level of disjointness of the calculated and established connection. The parameter is not filled when protectionClass is UNPROT.

   Type: Alphanumeric value set.

Range:

- COMPLETE: fully node and SRLG disjoint path
- FULLYSRLG: maximal node and fully SRLG disjoint path
- MAXIMAL: maximal node disjoint path.

7. **connGrpID**

   Connection Group ID for an existing ONNS connection to report the connection group the connection is member of or "UNDEFINED", if connection is not member of a group.

   For connection roups identified by A VCG EDGE port, connGrpID is formed from the *SrcNodeID* and the Ingress Port #, where 1675 LambdaUnite MSS uses bay =1= shelf.

   The connection group ID is automatically assigned to a connection, when it is setup. The connection group ID will consist of the *nodeID* and the EDGE port AID in case the EDGE port is a VCG. The connection group ID will be "UNDEFINED" otherwise. For M:N protected connection groups, *connGrpID* is formed from the *SrcNodeID* and a group index chosen by the source node to be unique within this node. The connection group ID is automatically assigned to a connection, when it is setup. The connection group ID will consist of the node ID and a group index in case the connection is member of an M:N connection group. The connection group ID will be "UNDEFINED" otherwise.

   Type: Character string of length up to 25.

   Range: UNDEFINED - special value for connections not being member of a group nodeID&Prt AID - value for connections being member of a "GbE Connection Group" nodeID&groupIndex - value for connections being member of a "M:N Connection Group"

   - nodeID: four dot separated numeric strings: each string 0..255
   - Port AID: four dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port # with: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1..39), Port # (1..8).
   - groupIndex: integer value specifying an M:N connection group 0-65535.

     The nodeID for 1675 LambdaUnite MSS starts always with 29.x.x.x

8. **protRatio** – Protection ratio

   For each working or protecting connection of an M:N protected connection group this parameter will report the concrete protection ratio as specified on creation of the group. For connections not being member of an M:N protected connection group, this parameter is not reported at all.

   Type: Alphanumeric value set

   Range. BY1 (ratio of 1 to 1 in number of protecting and working connections), 1BY2 (ratio of 1 to 2 in number of protecting and working connections), 1BY3 (ratio of 1 to 3 in number of protecting and working connections).

9. **assocConnID** – Associated Connection ID

Associated Connection ID for an existing ONNS connection of an M:N connection group to report the connection ID of the associated connection within the group, when a protection switch is active, i.e. for a working connection the ID of the associated protecting connection and for a protecting connection the ID of the associated working connection is reported. The associated connection ID will be "OPEN" for connections of an M:N connection group not involved in a protection switch. The associated *connectionID* will not be reported for connections not being member of an M:N connection group.

Type: Character string of length up to 39.

Range: nodeID&Tributary AID&Index with

- nodeID: four dot separated numeric strings: each string 0..255
- Tributary AID: five dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # with:

  Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 192).
- Index: Numeric string 0-4294967295

The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x.

Example: 29.13.196.203&1-1-13-15-1&271584

nodeID&Tributary AID range - if port # specifies a VCG to retrieve a connection group, with:

- nodeID: four dot separated numeric strings: each string 0..255
- Tributary AID: five dash separated numeric strings representing Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary # with:

  Bay/Frame #(1), Shelf #(1), Slot/Pack #(1..39), Port #(1..9), Tributary #ALL – special value to retrieve all connection records associated with the *portID*.

As there is always at most one connection group associated with a VCG, the qualifier ALL specified for the Tributary # of input parameter *connID* will always deliver all connections of the affected group, i.e. all connections starting at the affected VCG. The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x

Example: 29.13.196.203&1-5-13-7-ALL. The port AID 1-5-13-7 must denote a VCG.

nodeID Tributary AID&Index - to retrieve a protecting connection of an M:N connection group, with:

- nodeID: four dot separated numeric strings: each string 0..255
- defaultTributary AID: five dash separated numeric strings with:

  Bay/Frame #(1), Shelf #(1), Slot/Pack ##, Port ##, Tributary ##
- Index: Numeric string 0-4294967295

  The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x

  nodeID&groupindex -to retrieve all connections belonging to an M:N protected connection group, with:

  nodeID: four dot separated numeric strings: each string 0..255; groupIndex: integer value specifying a connection group within *nodeID* 0-65535.

  The *nodeID* for 1675 LambdaUnite MSS starts always with 29.x.x.x

10. **`htmr`** – Hold-Off Time

This parameter specifies the value of the hold-off timer for 1+1 protection switching.

Parameter applies to a permanent 1+1 protected connection.

Parameter does not apply to a 1+1 protected connection.

Parameter applies to 1+1 protected and permanent 1+1 protected connections.

Type: numeric string [ms].

Range for high order path protection groups: 0 .. 99 ms in 1 ms steps and 100 .. 10000 ms in 100 ms steps.

Range for low order path protection groups: 0, 25, 50, 75 ms (in steps of 25 ms) and 100 .. 10000 ms in 100 ms steps.

Default:

None.

The path protection groups at the A and Z nodes of the connection are created with default values, if the parameter is not present in the spec_block. Default Value: 0

This parameter shall relate to the *htmr* parameter provisioned via the TL1 commands **ENT-PATH** or **ED-PATH-PROT**. Configuration of path protection group parameter via **ED-PROTN-GRP** is not forbidden, but should be discouraged, since this configuration is not reflected in the ONNS view. During normal operation of an ONNS connection, the **ED-PROTN-GRP** parameters are considered but during ONNS protection conversion, the ONNS stored path protection group parameters are considered.

11. **wtr** – Wait To Restore Time

    This parameter specifies the wait-to-restore time for revertive 1+1 protection switching.

    Parameter does not apply to a 1+1 protected connection revertive.

    Parameter applies to a permanent 1+1 protected connection with revertive SNCP/UPSR protection.

    Type: numeric string [minute].

    Range: 0 – 60.

    Default:

    None.

    The path protection groups at the A and Z nodes of the connection are created with default values, if the parameter is not present in the spec_block. Default Value: 0

    This parameter shall relate to the *wtr* parameter provisioned via the TL1 commands **ENT-PATH** or **ED-PATH-PROT**. Configuration of path protection group parameter via **ED-PROTN-GRP** is not forbidden, but should be discouraged, since this configuration is not reflected in the ONNS view. During normal operation of an ONNS connection, the **ED-PROTN-GRP** parameters are considered but during ONNS protection conversion, the ONNS stored path protection group parameters are considered.

12. **switchBack** – revertive restoration path switch back

    This parameter describes how a revertive restoration path is switched back to the original path.

    Type: Alphanumeric value set.

Range:

- AUTO: path is automatically switched back after wait to revert time.
- MAN: path has to be manually switched back triggered by the TL1 command **ED-PATH-ROLL**.

Default: AUTO.

13. **detailPath Record**

    One or two detailPath records will be reported when *detailRoute* = ON.

    a. **connID** – Connection ID

    See description in the Input parameters section below.

    b. **pathID** – Path ID

    See description in the section “Output parameters” below.

    c. **connAlias** – Connection Alias

    See description in the Input parameters section below.

    d. **xcon Record**

    An xcon record will be reported for each node in the path when *DetailRoute* = ON. Records are ordered in A-Z direction from the source node:

    *nodeID*: ID of the node which reports the xcon record. Type: Four dot separated numeric strings. Range: 0 – 255 for each numeric string.

    *connPtID1* – Connection Point ID 1: ONNS connection point identifier for the ingress connection point of the cross-connection. It consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary #. Type: dash-separated list of 5 numeric strings. Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).

    Slot/Pack ##, Port ##, Tributary ##. Value # for Slot/Pack, Port and Tributary indicates default tributary AIDs used for reporting open ends in not existing xcons in the A-node or Z-node for a protecting NN connection of an M:N protected connection group.

    *connInd* – Connection Indicator: Indicator whether cross-connection is setup. Type: Alphanumeric value set. Range: -X- (cross-connection setup).

    *connPtID2* – Connection Point ID 2: ONNS connection point identifier for the egress connection point of the cross-connection. It consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary #. Type: dash-separated list of 5 numeric strings. Range: Bay/Frame # (1), Shelf # (1), Slot/Pack # (1 – 39), Port # (1 – 16), Tributary # (1 – 128).

    *protConnPtID* – Protection Connection Point ID: ONNS connection point identifier for the ingress or egress connection point of the protected OUC cross-connection. It consists of Bay/Frame #, Shelf #, Slot/Pack #, Port #, Tributary #. Type: dash-separated list of 5 numeric strings. Range: Bay/Frame #(1), Shelf #(1), Slot/Pack #(1..39), Port #(1..16), Tributary #(1..128).

    *detailRouteStatus* – Detail Route Node/XC Status: This parameter indicates the status of a node and/or its cross-connection. Range: NO_REPLY (no reply from node) (no cross-connection found).

*connPt1State* – Fault State of Incoming Signal at Connection Point 1: This parameter indicates the fault state monitored for the incoming signal at the tributary identified by Connection Point ID 1.

Type:

Alphanumeric value set.

Range:

UNKNOWN (the incoming signal could not be monitored); OK (a valid incoming signal is monitored); FAILED (no valid incoming signal is monitored, but in corr. direction an incoming signal state OK is monitored at the EDGE tributary); NO-IN (no valid incoming signal is monitored and in corr. direction an incoming signal state FAILED is monitored at the EDGE tributary).

Context wrt. OUCs:

In case an OUC is configured on top of the ONNS connection in the A-node, *connPt1State* shall denote the signal state of the EDGE tributary currently selected by the corresponding path selector. That means that in case of an OUC configured on top of an ONNS connection, it is not possible to get the signal state of both involved EDGE tributaries, but the signal is monitored behind the selector, thus yielding the signal state of the tributary currently selected.

*connPt2State* – Fault State of Incoming Signal at Connection Point 2: This parameter indicates the fault state monitored for the incoming signal at the tributary identified by Connection Point ID 2.

Type:

Alphanumeric value set.

Range:

UNKNOWN (the incoming signal could not be monitored); OK (a valid incoming signal is monitored); FAILED (no valid incoming signal is monitored, but in corr. direction an incoming signal state OK is monitored at the EDGE tributary); NO-IN (no valid incoming signal is monitored and in corr. direction an incoming signal state FAILED is monitored at the EDGE tributary).

Context wrt. OUCs:

In case an OUC is configured on top of the ONNS connection in the A-node, *connPt2State* shall denote the signal state of the EDGE tributary currently selected by the corresponding path selector. That means that in case of an OUC configured on top of an ONNS connection, it is not possible to get the signal state of both involved EDGE tributaries, but the signal is monitored behind the selector, thus yielding the signal state of the tributary currently selected.

## Example input/output

### Normal system response to RTRV-PATH with connID = ALL with no NCDR records

If the **RTRV-PATH ALL** request completes successfully with an empty NCDR then the following normal completion response is returned to the command:

```
RTRV-PATH:srcTid:srcAid:ctag::srvID:ALL;.

   srcTid date time
M  ctag COMPLD
```

```
;
```

### Input/Output example for a auto-reroute connection

The following example shows the successful completion of a **RTRV-PATH** command by the network element for a (non-revertive) auto-reroute connection:

```
RTRV-PATH:LT-ONNS-789:snn:193456::1351379:135.13.196.203&1-6-5-3-1&1;

   LT-ONNS-789 2001-01-01 08:00:00
M  193456 COMPLD
   "ConnID=135.13.196.203&1-6-5-3-1&1,ConnStatus=CON&OK,ONNS,1WAY,AUTONR,
   STS48,
   ConnAlias=AEXP-NY-BOS-ckt,
   MaxDelay=9,SrvID=1351379,Explicit=135.13.42.3&135.213.242.123&135.13.198.2,

   1-2-5-5-1&1-2-5-5-1:
   PathID=135.13.196.203-432165,State=CON&OK,
   NodeList=135.13.196.203&135.13.196.123&135.13.42.3&135.13.242.103:
   PathID=135.13.196.203-432177,State=CON&FAILED,
   NodeList=135.13.196.203&135.13.198.23&135.13.196.3&135.13.198.213&135.13.242.123"
;
```

This connection was setup using the command:

```
  ENT-PATH-N1PLUS1:LT-ONNS-9:snn:99345::13513794:2WAY:sts48:55:
     135.13.196.203: 1-6-5-3-1:135.13.196.123:1-2-5-5-1:Explicit,
     135.13.196.123&135.13.42.3:Explicit,
     135.13.198.23& 135.13.196.3&
     135.13.198.213:135&1432&222,10;
```

**RTRV-PATH output example for a connection with Path DetailRoute=ON**

The following example shows the *detailPath* record of a **RTRV-PATH** command with the parameter *DetailRoute* = ON with an OUC existing on top of the connection in the Z-node It produces this resulting second message block that follows the normal **RTRV-PATH** response (see below for a complete example):

```
RTRV-PATH:LT-ONNS-9:onn:14345::13514794:135.14.196.203&1-6-5-3-1&1:
   DetailRoute=ON;

...

   LT-ONNS-9 2002-06-04 08:00:00
M  14345 COMPLD
   "ConnID=135.14.196.203&1-6-5-3-1&1,PathID=135.14.196.203-32165,:
   135.14.196.203,1-6-5-3-1,,-X-,1-2-4-3-1,,:
   135.13.196.123,1-1-5-3-1,,-X-,1-2-2-3-1,,:
   135.13.42.63,1-1-3-1-1,,-X-,1-1-4-4-1,,:
   135.13.18.23,1-1-4-4-1,,-X-,1-2-1-3-1,,:
   135.13.242.103,1-1-2-7-1,,-X-,1-2-5-1-1,3-1-2-1-1,"
;
```

**RTRV-PATH output example for a connection with Path DetailState=ON**

The following example shows the detailPath record of a **RTRV-PATH** command with the parameter *DetailState* = ON, it produces this resulting second message block that follows the normal **RTRV-PATH** response (see below for a complete example):

```
RTRV-PATH:LT-ONNS-9:onn:14345::13514794:135.14.196.203&1-6-5-3-1&1:
   DetailState=ON;

...

   LT-ONNS-9 2002-06-04 08:00:00
M  14345 COMPLD
   "ConnID=135.14.196.203&1-6-5-3-1&1,PathID=135.14.196.203-32165,:
   135.14.196.203,1-6-5-3-1,,-X-,1-2-4-3-1,,
   GOOD,FAILED,:
   135.13.196.123,1-1-5-3-1,,-X-,1-2-2-3-1,,
   GOOD,FAILED,:
   135.13.42.63,1-1-3-1-1,,-X-,1-1-4-4-1,,
```

```
   GOOD,FAILED,:
   135.13.18.23,1-1-4-4-1,,-X-,1-2-1-3-1,,
   GOOD,GOOD,:
   135.13.242.103,1-1-2-7-1,,-X-,1-2-5-1-1,,
   GOOD,GOOD,"
;
```

This example output allows the following conclusions:

- In downstream direction, a good signal is received at the A-node EDGE tributary and stays good through the domain
- In upstream direction, a good signal is received at the Z-node EDGE tributary and stays good up to node 135.13.18.23, but is reported as FAILED by node 135.13.42.63. Thus in between these nodes a transmission failure can be assumed.

### Output Example for ONNS nodes not reporting or reporting missing cross-connections

This example shows the *detailPath* record of an **RTRV-PATH** with *DetailRoute* = ON, when intermediate nodes do not respond or can not retrieve the cross connect information (see below for a complete example):

```
RTRV-PATH:LT-ONNS-9:onn:14345::13514794:135.14.196.203&1-6-5-3-1&1:
   DetailRoute=ON;

...

   LT-ONNS-9 2002-06-04 08:00:00
M  13456 COMPLD
   "ConnID=135.14.196.203&1-6-5-3-1&1,PathID=135.14.196.203-32165,:
   135.14.196.203,1-6-5-3-1,-X-,1-2-4-3-1,:
   135.13.22.3, ,-X-, ,NO_REPLY:
   135.13.196.123,1-1-5-3-1,-X-,1-2-2-3-1,:
   135.13.44.93,1-2-2-2-1,-X-,1-1-4-2-1,:
   135.13.42.63,1-1-4-4-1,-X-,1-2-1-3-1,:
   135.13.242.103,1-1-2-7-1,-X-,1-2-5-1-1,"
;
```

### RTRV-PATH output example for an M:N protected group of connections

The example shows a successful completion of **RTRV-PATH** command for an M:N protected group of connections within a state where a protection is currently active:

```
RTRV-PATH:LT-NN-789:snn:973456::1352463:135.13.196.203&1
;

   LT-NN-789 2002-09-18 08:00:00
M  973456 COMPLD
```

```
   "WorkerRoute1,NumberOfConnections=1,GroupAsymmetry=0"
   "ConnID=135.13.196.203&1-1-13-4-1&1,ConnStatus=CON&RSTRD,ONNS,2WAY,MBYNWRK,

;
```

## Error responses

### Validation rule: *connID* Non-Existant (ICNE)

If the source node receives a command and the specified *connID* does not exist, then the following error response is returned:

Error code: `E220 - 13513794 - Input, ConnectionID Non-Existent`

### Validation rule: Invalid *srvID*

If the source node receives a command with an invalid ServiceID (srvID) parameter value, then the following error response is returned:

Error code:
`E030 - SMcon135*7.92468 - Syntax, Parameter Data Imvalid,Invalid_parameter=SrvID`

**Validation rule: Invalid command**

If an unrecognized or unsupported command is received, then the following error response is returned:

Error code:
`E235 - Input, Invalid CoMmand, Command not found or recognized`

**Validation rule: Syntax, Invalid punctuation**

If a command is received that contains incorrect punctuation, then one of the following error responses is returned:

Error code: `E240 - Syntax, InValid Punctuation`

**Validation rule: Syntax invalid or unimplemented parameter**

If a command is received that contains an empty field that requires a parameter, or if a parameter input has not an allowed value for the field, then the following error response is returned:

Error code: `E246 - Syntax, Parameter Not Implemented`

The following list identifies conditions that will cause similar error responses :

Error code:
`E030 - SPDI Error - Syntax, Parameter Data Invalid, invalid_parameter=fieldName`

Error code:
`E037 - INCS Error - Input, Neither ConnID nor ConnAlias Specified`

Error code: `E040 - SDNC Error - Syntax, Data Not Consistent`

Error code: `E221 - IANE Error - Input, ConnectionAlias Non-Existent`

**Validation rule: Invalid target identifier**

If a command is received with an invalid Target Identifier, then one of the following error responses is returned:

Error code: `E250 - Input, Invalid TArget Identifier`

Error code: `E805 - Input, Missing Target Identifier (TID)`

**Validation rule: Invalid access identifier**

If a command is received with an invalid access identifier, then the following error response is returned:

Error code: `E260 - Input, Invalid ACcess identifier`

**Validation rule: Invalid correlation tag (CTAG) or RequestID**

If a command is received with an invalid correlation tag, then one of the following error responses is returned:

Error code: `E265 - Input, Invalid Correlation Tag`

Error code: `E266 - Input, Missing Correlation Tag`

**Validation rule: Status, All Resources Busy**

If a command can not be completed due to insufficient processing resources or the system is in maintenance mode, then the following error response is returned:

Error code: `E280 - Status, All Resources Busy`

The following list identifies conditions that will cause similar error responses:

- Error code:
  `E281 - Status, Busy, NVM Write in Progress for same connection`
- Error code: `E282 - Status, Conn State Invalid for this Operation`

**Validation rule: Requested Operation Failed (SROF)**

If a command can not be completed due an internal hardware or software failure, then the following error response is returned:

Error code: `E290 - Status, Requested Operation Failed`

Example: The command
**`RTRV-PATH:LT-ONNS9:snn:123456:::123.198.42.233&1-2-32-4-1;`** can produce this output.

**Validation rule: Error Responses Specific to RTRV-PATH**

The following list identifies conditions that will cause error responses specific to **`RTRV-PATH`** commands:

Error code:
`E226 - IDNA - Input, Retrieve Detail_Route or Detail_State Not allowed for RTRV-PATH ALL`

The following list identifies conditions that will cause error responses specific to **`RTRV-PATH`** commands sent with detail_route option:

Error code:
`E227 - SRDE -Status, Retrieve Detail_Route or Detail_State Error`

**Validation rule: Retrieve path with detailed route option - No path ID associated to ONNS connection**

Error code:
`E282 - SCSI - Status, Conn State Invalid for this Operation`

Error response E282 defined for **RTRV-PATH** applied with *RetrieveDetail_Route* option shall also be valid in case of **RTRV-PATH** applied with *RetrieveDetail_State* option.

**Validation rule: Retrieve path with detailed state option - Operation Invalid for Protection Type MBYNPRT**

All error responses defined for **RTRV-PATH** applied with RetrieveDetail_Route option shall also be valid in case of **RTRV-PATH** applied with RetrieveDetail_State option.

Error code:
E283 – SOPI – Status, Operation Invalid for Protection Type MBYNPRT

For connections of protection type MBYNPRT the retrieve detailed state option does not provide any added value for the following reasons:

- If the connection is in STBY state, both ends of its associated path are not connected in the A- and Z-node and thus only FAILED signals can be monitored for the whole path throughout the domain irr. of any failures that may exist.
- If the connection is in USED state, its associated path is allocated by an MBYNWRK connection and can be monitored there.

**Validation rule: Retrieve path - Invalid connection ID for group retrieval**

If the source node Network Element receives a TL1 command containing a connID with tributary# = ALL, but the corresponding port is not a VCG, then one of the following error response is returned:

```
   srcTid 2001-06-01 08:00:00
M  ctag DENY
   IICG
   "E050:13579468:\"Input, Invalid connection ID for connection
   group/connID"
;
```

The following list identifies conditions that will cause similar error responses specific to **RTRV-PATH** commands for groups of connections (including E050 above):

- Error code:
  E050 – IICG – Input, Invalid connection ID for connection group/conn ID
- Error code:
  E051 – IIDG – Input, Invalid DetailRoute or DetailState option for Group retrieve

Example: The command

**RTRV-PATH:LT-SNNS9:snn:123456:::123.198.42.233&1-2-32-4-ALL:detailRoute=ON;**

will produce the output E051.

The following error response will be raised in case connection alias and connection ID specified in the command do not match:

Error code: `E038 - IICS - Input, Inconsistent connAlias Specified`

### Possible inconsistency during soak time

If the **RTRV-PATH** request with *detailstate* = on is started while the soak timer is running, the retrieved results may be inconsistent.

After the soak timer ends, the results are correct.

# RTRV-PM: Retrieve performance monitoring

The **RTRV-PM** command is initiated by a user to request the NE to send the current and/or historical Performance Monitoring (PM) data associated with one or more facilities. For each value in the *montype* parameter of the **RTRV-PM** input parameters section, PM counter values will be stored in the current 15-minute period, the 32 previous 15-minute periods (past 8 hours worth of data), current day, and previous day periods.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): PM1

Priority: 1

Abortable: Yes.

## Input format

Command syntax:

**RTRV-PM**-*modifier*:*tid*:*aid*:*ctag*::[*montype*], [*monlev*], [*locn*],,*tmper*, [*mondat*], [*montm*];

## Input parameters

### Command parameters

1. **modifier**

   This parameter indicates the port type or tributary on which the **RTRV-PM** command is to act on.

   Type: Alphanumeric value set.

   Range: The following values are for SONET only: STS1, STS3C, STS12C, STS48C, STS192C, OC3, OC12, OC48, OC48T, OC192, OC768, T3.

   The following values are for SDH only: VC3, VC4, VC44C, VC416C, VC464C, STM1E, STM1, STM4, STM16, STM16T, STM64, STM256, ODU1.

   The following value is for OTN only: OTU2

   Although the ODU layer is independent of SONET/SDH, the ODU1 modifier is listed here in the SDH section. This is because the ODU1 function is used for the Transparency feature, which is only supported for SDH.

2. **tid** – Target Identifier

   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).

3. **aid** – Access Identifier

   Type: AID

   Range: For STM<N>, STM<N>T, OC<N>, EC1 and OC<N>T modifiers: SPortAID.

   For T3 modifier: APortAID

   For OTU modifier: OTNPortAID

   For ODU<N> modifiers: VCGAID

   For VC3, VC4, VC44C, VC416C, VC464C, STS1, STS3C, STS12C, STS48C and STS192C modifiers only: STS1NumAID.

And for modifiers VC4 and STS1: VCGNumAID.

Range is supported up to shelf level or system level; i.e.

ALL-ALL-#-#-ALL-ALL (on port level).

ALL-ALL-#-#-ALL-ALL-ALL (on tributary level).

4. **ctag** – Correlation Tag

   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).

5. **montype** – Monitored Parameter Type

   This is the monitored parameter type for which data is requested. If the value is omitted, this parameter defaults to ALL.

   Type: Value set.

   Range: The following values are for all OC<N> and the EC1 modifiers: CVS, ESS, SESS, SEFS-S, LOSS-S, CVL, ESL, SESL, UASL, AISS-L, FC-L, CV-LFE, ES-LFE, SES-LFE, UAS-LFE, FC-LFE.

   The following values are for all OC<N>T modifiers: CVS, ESS, SESS, SEFS-S, LOSS-S.

   The following values are for all OC<N>T modifiers only: CVS-EGR, ESS-EGR, SESS-EGR, SEFS-S-EGR.

   The following values are also for OC192 and OC768 modifiers only: FECC-L.

   The following values are for STS1 (path) and are also applicable to STS3C, STS12C, STS48C and STS192C modifiers only: CVP, ESP, SESP, UASP, FC-P, CV-PFE, ES-PFE, SES-PFE, UAS-PFE, FC-PFE, PPJC-PGEN, NPJC-PGEN, PPJC-PDET, NPJC-PDET

   The following values are for all STM<N> modifiers: RS-N-ES, RS-N-SES, RS-N-BBE, RS-N-UAS, MS-N-ES, MS-N-SES, MS-N-BBE, MS-N-UAS, MS-F-ES, MS-F-SES, MS-F-BBE, MS-F-UAS.

   The following values are for all STM<N>T modifiers: RS-N-ES, RS-N-SES, RS-N-BBE, RS-N-UAS

   The following values are for all STM<N>T modifiers only: RS-N-ES-EGR, RS-N-SES-EGR, RS-N-BBE-EGR, RS-N-UAS-EGR

   The following values also are for STM64 and STM256 modifiers only: MS-N-FECC.

   The following values are for T3 modifier: CVL, ESL, ESA-L, ESB-L, SESL, LOSS-L, CVP, ESP, ESA-P, ESB-P, SESP, UASP, FC-P, SEFS-P, SAS-P, AISS-P, CV-PFE, ES-PFE, ESA-PFE, ESB-PFE, SES-PFE, UAS-PFE, FC-PFE, SAS-PFE, CVP-EGR, ESP-EGR, ESA-P-EGR, ESB-P-EGR, SESP-EGR, UASP-EGR, FC-P-EGR, SEFS-P-EGR, SAS-P-EGR, AISS-P-EGR, CV-PFE-EGR, ES-PFE-EGR, ESA-PFE-EGR, ESB-PFE-EGR, SES-PFE-EGR, UAS-PFE-EGR, FC-PFE-EGR, SAS-PFE-EGR

   The following values are for all ODU<N> modifiers only: ODU-N-ES, ODU-N-SES, ODU-N-BBE, ODU-N-UAS, ODU-F-ES, ODU-F-SES, ODU-F-BBE, ODU-F-UAS

   The following values are for VC3, VC4, VC44C, VC416C and VC464C modifiers only: VC-N-ES, VC-N-SES, VC-N-BBE, VC-N-UAS, VC-F-ES, VC-F-SES, VC-F-BBE, VC-F-UAS, PJCPOS, PJCNEG

   The following values are for OTU modifiers only: OTN-LOSS, OTN-FECC

   The following value is also allowed for all input modifiers: ALL.

   Default: ALL.

6. **monlev** – Monitored Level

   This parameter provides the level for the monitored PM parameter. The parameter is only evaluated if the value of *montype* parameter is ALL.

   Type: value set.

   Range:

   - 1-UP: Means the NE will report all non-zero data and all data which is marked as non-valid (parameter validity).
   - 0-UP: Means the NE will report zero and all positive data.

   Default: 1-UP.

7. **locn** – Location

   Location for which the PM data is monitored. The parameter value is only considered if the *montype* value is ALL; otherwise it is ignored for the calculation of the command reply (i.e has no impact on the command).

   Type: value set.

   Range:

   - NEND: Near-End PM data is requested.
   - FEND: Far-End PM data is requested.
   - ALL: All near-end and far-end data is requested. It applies only to input direction.

   Default: ALL.

8. **tmper** – Time Period

   This requests PM data for a specified time interval.

   Type: value set.

   Range:

   - 15-MIN: This requests PM data in 15-minute intervals
   - 1-DAY: This requests daily PM data.

9. **mondat** – Monitored Date

   This requests the beginning date of the interval for which the PM data is to be reported. For both values of tmper parameter, the maximum allowable range of valid dates includes the current and previous one day.

   Type: value set.

   Range:

   - MM-DD: Month-Day. A leading zero (first M or first D) is optional and may be omitted.
   - ALL: Current and previous day.

   Default: Current date

10. **montm** – Monitored Time

This parameter specifies the beginning time of day of the requested PM period that was set by *tmper* parameter. The user is able to specify a monitored time in three modes:

a. A monitored time interval (i.e., from hour-minutes to hour-minutes: HOD-MOH&&THOD-TMOH).

b. A single time interval (i.e., the hour and minutes for the appropriate 15 minute data: HOD-MOH).

c. All applicable beginning times for the given *mondat* value (i.e., all).

Where HOD-MOH represents the start of the requested PM retrieval period (hours and minutes) and THOD-TMOH represents the end of the requested PM retrieval period. The value ALL must be used if the *mondat* value provided is ALL.

Type: Character string.

Range:

- HOD-MOH: This specifies the beginning time of day of the requested PM period that was set by *tmper* parameter. This parameter may be omitted or have one of the following values: Hour Of Day- Minute Of Hour, where HOD ranges from 0 to 23 and MOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0.
- THOD-TMOH: To Hour Of Day-To Minute Of Hour, where THOD ranges from 0 to 23 and TMOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0. Parameter grouping is used when specifying THOD-TMOH. For example, 08-15&&09-00 specifies the HOD-MOH and THOD-TMOH of 08-15 and 09-00, respectively. THOD-TMOH of $$-$$indicates the current Hour Of Day-Minute Of Hour. THOD-TMOH of ##-##indicates the previous 15-min interval.
- ALL: All applicable beginning times for the given *mondat* value.

If the *tmper* value is 1-DAY, the *montm* parameter will not be used.

Default:

If THOD-TMOH is not specified, only the PM data for the retrieval period specified by HOD-MOH will be retrieved.

If HOD-MOH is omitted, the PM period for the current time will be reported.

### Output format

If the NE fully complies with the RTRV-PM request, the following normal completion response is returned:

```
    sid date time
M  ctag COMPLD
   "aid:montype,monval,[validity],[tca],[locn],,tmper,[mondat],[montm]"
   . . . . .
   . . . . .
   . . . . .
;
```

Note: The trailing comma has to be present even if the optional parameter is not supported for a dedicated release.

The output parameters *sid, date, time* and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

**Normal completion message - empty reply**

If there is no PM data stored within the NE, then the following response is returned:

```
   sid date time
M  ctag COMPLD
;
```

## Output parameters

1. **aid** – Access Identifier
   Description: Access identifier.
   Type: AID
   Range: For STM<N>, STM<N>T, OC<N>, EC1 and OC<N>T modifiers only: SPortAID.
   For T3 modifier: APortAID
   For OTU modifier: OTNPortAID
   For ODU<N> modifiers only: VCGAID
   For VC3, VC4, VC44C, VC416C, VC464C, STS1, STS3C, STS12C, STS48C and STS192C modifiers only: STS1NumAID.
   And for modifiers VC4, VC464C, STS1, STS3C and STS192C: VCGNumAID
2. **montype** – Monitored Parameter Type
   See montype in the input parameters section.
3. **monval** – Monitored Value
   This parameter specifies the measured value of the parameter specified in montype.
   Type: Integer.
   Range: 0-4294967295
   The specified range is the maximal range taking all PM parameters into consideration. Specific PM parameters may have a smaller range.
   W.r.t. value range for the specific PM parameters see
   - Section "Output parameters" in "RTRV-TCA-PROF: Retrieve TCA profile" (p. 3-2958) (if thresholding is applicable for that parameter)
   - PM parameter introduction section (if thresholding is not applicable for that parameter).
4. **validity** – validity indicator

This parameter indicates the validity of the PM data.
Type: Integer.
Range: 1: valid; (omitted): non-valid.

5. **tca** – Threshold Crossing Alert
   Type: value set.
   Range for the current interval:
   - in TCA mode TR, that the current value exceeds the provisioned threshold
   - in TCA mode TR-RTR, that a *tca* occurred since the beginning of this; interval or that the tca reset condition was not fulfilled in any previous; interval since the last tca occurred

   f the value is omitted, it indicates
   - in TCA mode TR, that the current value is below the provisioned threshold
   - in TCA mode TR-RTR, that no tca occurred since the beginning of this; interval and that the tca reset condition was fulfilled at least in one previous , interval

   For previous intervals, the tca parameter indicates the state at the end of the interval.
6. **locn** – Location
   Location for which the PM data is monitored.
   Type: value set.
   Range:
   - NEND: Near-End PM data is requested
   - FEND: Far-End PM data is requested.
7. **tmper** – Time Period
   See in the input parameters section.
8. **mondat** – Monitored Date
   This parameter specifies the beginning date of the interval for which the PM data is reported. The parameter can be omitted in case of current date.
   Type: value set.
   Range: MM-DD: Month-Day
   Default: Current date
9. **montm** – Monitored Time
   This parameter specifies the beginning time of day for the reported pm register. The parameter is optional and may be omitted for the reporting of current bins (registers).
   Type: Character string.
   Range: HOD-MOH: HOD ranges from 0 to 23; MOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0.

### Example input/output

The following example shows the successful completion of a **RTRV-PM** command by the NE for a VC3:

```
RTRV-PM-vc3:UNITE-NE:1-1-#-#-5-1-27:123456::vc-f-es,1-up,,,15-min ,,
```

```
00-00&&08-00;
   UNITE-NE 00-01-01 08:00:00
M  123456 COMPLD
   "1-1-#-#-5-1-27:vc-f-es,17,,tca,,,15-min,,00-00"
   "1-1-#-#-5-1-27:vc-f-es,10,,tca,,,15-min,,00-15"
   . . .
   "1-1-#-#-5-1-27:vc-f-es,15,,tca,,,15-min,,08-00"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-PM** command. See also subsection 'Partial Completion on RTRV Commands' w.r.t. handling of internal error (e.g. communication to XC320 fails) for a subset of replies.

# RTRV-PREDEFRAG: Perform an ONNS fragmentation analysis

## Overview

The **RTRV-PREDEFRAG** command is used to perform an analysis about the fragmentation status of a link or other entity.

This command is used by an operator in preparation for doing a defrag operation on a port or between multiple ports in a link between two nodes.

The command causes the receiving node to do an analysis of the level of fragmentation that currently exists on the specified port or link. An analysis is performed of how much usable bandwidth will be gained if defragmetation were to be done, and the time slot structure as it would be following a defragmentation operation is computed. Note that all this is done in an analysis mode. No real defragmentation is done until a subsequent "operate defrag" command is issued. The rtrv-predefrag command causes the network element to send the results of the defrag analysis in a status report back to the management system in a TL1 response.

As above stated the RTRV-PREDEFRAG is done in an analysis mode and does not guarantee the same result for Gain and *PostLDGrouping* after real defragmentation.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Abortable: No.

## Input format

Command syntax: **RTRV-PREDEFRAG:***srcTid:srcAid:ctag::scope:targetID*;

## Input parameters

### Command parameters

1. **srcTid**

   Target Identifier of the source node is the logical name of the Host NE. ONNS uses the same *tid* used by Host NE.

   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.

   Range: The *srcTid* parameter is a case insensitive ASCII character string of up to 20 characters with the allowed character set as described above.

2. **ctag** – Correlation Tag

   This parameter is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.

The *ctag* parameter is a character strings of up to 6 ASCII characters. The allowed ASCII character string is comprised of alphanumeric characters beginning with a letter, or decimal numerals (a decimal numeral is a string of decimal digits with an optional non-trailing ".").

3. **srcAid**

   Source node ONNS application access identifier of the ONNS controller OS command interface port.

   Range: Source node Access IDentifier parameter of the source node controller ONNS command interface entity has the allowed values shown here: snn.

4. **scope**

   This parameter specifies the scope of the defrag operation: intra-port or inter-port (intra link).

   Range

   - PORT: specifies the defrag is intra-fiber operation on a specific port. In this case *targetID* specifies the local port id same as the *portAID*. The corresponding neighbor node and neighbor *portAID* can be deduced from the *targetID*.
   - LINK: specifies the link defrag is inter fiber but within a link bundle. Also, the link defrag operation is performed on all the bundles between the two neighboring nodes. TargetID specifies the neighbor nodes ASTN node ID.

5. **targetID**

   The specification of the *targetID* depends on the setting of the parameter scope: PORT specifies the AID of the port on the local node that is to be defragmented;LINK specifies the ASTN node ID of the neighbor node of the link that is to be defragmented.

   Type: Four dash separated numeric string for the portAID. Four dot separated numeric string for the neighbor ASTN node ID.

   Range. Each numeric string: 0…255.

### Output format

If the RTRV-PREDEFRAG request completes successfully, the following normal completion response is returned:

```
   srcTid date time
M  ctag COMPLD
   "PreLDGrouping=NuM&NaM&....
    PostLDGrouping=NuM&NuM&...
    Gain=NSTSn&.."
;
```

The pre and post defrag time slot structure is indicated by two strings consisting of "&" separated substrings. The substrings have the form NuM or NaM where N is a number indicating the number of STS1s that make up that slot and M indicates the rate (3C, 12C

etc..). The letters "u" and "a" indicate whether the time slot is used or is available respectively. The value of M while specifying the number of available STS1s is always blank. Thus 2a means two STS1 slots are available.

The gain parameter indicates number of additional time slots that will become available once defrag is done.The highest rate time slots are indicated first, followed by the lower rates, with each signal rate substring being separated by an &. The fractional STS1s that form the remainder are not indicated. If there is nothing to be gained from the defrag operation, the gain parameter will say NONE.

**Normal system response to RTRV-PREDEFRAG for inter-port (link) defragmentation**

If the RTRV-PREDEFRAG request completes successfully, the following normal completion response is returned:

```
   srcTid date time
M  ctag COMPLD
   "BundleID=bundlID_1,Gain=NSTSn&..."
   "PortID=portID_1,
    PreLDGrouping=NuM&Na&...
    PostLDGrouping=NuM&Na&..."
   ...
   "PortID=portID_m,
    PreLDGrouping=NuM&Na&...
    PostLDGrouping=NuM&Na&..."
   ...
   "BundlID=bundleID_m,Gain=NSTSn&..."
   "PortID=portID_1,
    PreLDGrouping=NuM&Na&...
    PostLDGrouping=NuM&Na&..."
   ...
   "PortID=portID_m,
    PreLDGrouping=NuM&Na&...
    PostLDGrouping=NuM&Na&..."
;
```

The pre and post defrag time slot structure is indicated by two strings consisting of "&" separated substrings. The substrings have the form NuM or Na where N is a number indicating the number of STS1s that make up that slot and M indicates the rate (3C, 12C etc..). The letters "u" and "a" indicate whether the time slot is used or is available respectively. The available timeslots are ever shown in STS1s and no additional rate value M is needed. Thus 2a means two STS1 slots are available.

The gain parameter indicates number of additional time slots that will become available once defrag is done.The highest rate time slots are indicated first, followed by the lower rates, with each signal rate substring being separated by an &. The fractional STS1s that form the remainder are not indicated. If there is nothing to be gained from the defrag operation, the gain parameter will say NONE.

The inter-port defragmentation record will be send in data blocks that are less than 4096 characters. A data block will end with the pre and post defrag timeslot structure. On all messages but the last, a RTRV completion code is used and the semicolon (;) is replaced with a (>) terminator. Then, on the last record block, the COMPLD completion code is used with the final semicolon (;) terminator.

### Output parameters

The output parameters *srcTid*, *date*, *time*, *ctag*, *completion code* and their syntax are included in the section "Output parameters" of the "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683) command.

1. **bundleID**

   A unique numeric ID assigned to the link bundle on this node.

   Type: Integer

   Range: >0

2. **portID** – Port Identifier

   Port ID for which the NNDR data is retrieved. The portID consists of Bay/Frame #, Shelf #, Slot/Pack #, Port # .

   Type: dash-separated list of 4 numeric strings

   Range: Bay/Frame #1, Shelf #1, Slot/Pack #1,..39 Port #1..16,

3. **PreLDGrouping**

   An ordered & separated string of numbers indicating the availability or unavailability of a group of time slots of different rates. The unit of measure is STS1. Availability is indicated by "a" and unavailability (used ) by "u". Thus 1u3 indicates that one STS3c slot is used up, and 2a indicates that two STS1 slots are available. Notice that the available timeslots are always specified in terms of the number of STS1s. Hence, the "1" at the end is understood and not included to conserve space.

   Type: &-separated list of numbers.

   Example for an OC12 port:

   PreLDGrouping=1u3&2a&1u1&1u3&1u1,2a, indicates one used STS3c, two available STS1, one used STS1, one used STS3c, 1 used STS1, two available STS1.

   The size of the output string will vary depending on whether the port is OC3, OC12, OC48, OC192, OC768 and also on the distribution of the used/available time slots. For an OC192 port, the output string would indicate the STS48c, STS12c, STS3c and STS1 slots used up and the remaining unused STS1 slots.

4. **PostLDGrouping**

   An ordered string formatted the same way as the *PreLinkDefragGrouping* string, indicating the time slot structure once the defrag operation is completed.

   Type: &-separated list of numbers

   Example for the above case of the OC12 port, the PostLDGrouping=2u3&2u1&4a, indicating that two STS3c slots are used, two STS1 are used and four STS1 slots are available. Thus another STS3c can be accommodated.

5. **Gain**

A parameter indicating whether the defrag will result in an improvement or not. "NONE" indicates no improvement, any other value indicates the "delta" improvement over the existing time slot structure. The delta is computed in terms of the additional signals that can be accommodated as a result of the defrag starting with the highest signal rate possible for that port. The improvement is represented as a string composed of one or more of the following substrings: "STS3c", "STS12c", "STS48c", "STS192c". Each substring has a numeric string preceding it indicating the number of timeslots of that type that will be available once defrag is performed. The highest signal rate is stated first, then the next highest rate and so on.

Type: &-separated list of numbers concatenated with value set or the special value NONE.

Range: The value is "NONE" if no gain. Else it indicates the additional timeslot that are now available. In the above example: Gain=1STS3C. Gain will be an & separated list if there are multiple gains. E.g: 1STS12c& 3STS3c would mean that 1 STS12c and 3 STS3c connections could be accommodated on that port once the defrag is done. Note only the additional available timeslots are included in the response.

## Example input/output

### Input/output examples for RTRV-PREDEFRAG intra-port defragmentation

The following example shows a successful completion of a **RTRV-PREDEFRAG** command:

```
RTRV-PREDEFRAG:NN001:snn:ed01::PORT,1-1-2-1;

   NN001 2002-01-12 01:03:16
M  ctag COMPLD
   "PreLDGrouping=1u3&2a&1u1&1u3&1u1&2a
    PostLDGrouping=1u3&3a&1u3&2u1&1a
    Gain=1STS3C"
;
```

### Input/output examples for RTRV-PREDEFRAG inter-port defragmentation

The following example shows a successful completion of a **RTRV-PREDEFRAG** command:

```
RTRV-PREDEFRAG:NN001:snn:ed01::Link,29.13.80.192;

   NN001 2002-01-12 01:03:16
M  ctag COMPLD
   "BundleID=1,Gain=2STS3C"
   "PortID=1-1-2-1
    PreLDGrouping=1u3&2a&1u1&1u3&1u1&2a
    PostLDGrouping=1u3&3a&1u3&2u1&1a"
   "PortID=1-1-2-2
    PreLDGrouping=1u3&2a&1u1&1u3&1u1&2a
    PostLDGrouping=1u3&3a&1u3&2u1&1a"
;
```

## Error responses

### Invalid *PortID*

If the NE receives an RTRV-PREDEFRAG command with an *PortID* parameter value that is invalid the following error response is returned:

Error code: `E410 - Input, Invalid PortID`

### Invalid *ASTNNodeID*

If the NE receives an RTRV-PREDEFRAG command with an *ASTNNodeID* parameter value that is invalid the following error response is returned.

Error code: `E512 - Input, Invalid Neighbor node ID`

## Related TL1 message

# RTRV-PRMTR-DATA: Retrieve parameter data

The **RTRV-PRMTR-DATA** command retrieves information about the databases being in NVM. It identifies the databases' release numbers and provides also other information such as their states.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 2

Abortable: No

## Input format

Command syntax: **RTRV-PRMTR-DATA**:*tid*::*ctag*::*[amount]*;

## Input parameters

### Command parameters

1. **tid**- Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
3. **amount** – Amount Of Data To Return
   This parameter specifies whether the current generic or previous generic or both is returned. If a value is omitted, then the current (active) generic is returned.
   Type: Alphanumeric value set.
   Range: CURRENT (default), PREVIOUS, ALL.
   Default: CURRENT.

## Output format

The following normal completion response is returned, if the RTRV-PRMTR-DATA request completes successfully:

```
   sid date time
M  ctag COMPLD
   "nvm:spec_block"
       ...
       ...
   "nvm:spec_block"
;
```

## Output parameters

Refer to the "Output parameters" section of the "RTRV-HDR: Retrieve header" (p. 3-2397) command for a normal completion response. The output parameters listed there also apply to the **RTRV-PRMTR-DATA** command. Additional parameters that specifically apply to this command are defined in the following:

1. **nvm** – Non Volatile Memory Identifier

   This parameter specifies the region of non volatile memory data (current or previous).

   Type: Value set.

   Range:

   - NVM-A: for current NVM Data
   - NVM-B: for previous NVM-Data.

   Default: Only current NVM data is reported except for *amount* having been specified to ALL.

### Spec block parameters

This parameter provides information about the stored database. It contains the parameters *release, size, backuptime, restoretime, backupfile, restorefile, priorbackuptime, priorbackupfile, priorrestoretime, priorrestorefile, state*, *tid* and *serialnumber*.

When software is being downloaded to previous NVM, the database parameters for NVM-B do not need initialization because they still reflect information pertaining to the currently executing generic.

During installation, the following parameters are omitted (initialized to a blank field) for NVM-A:

*backuptime, restoretime, backupfile, restorefile, priorbackuptime, prioirrestoretime, priorbackupfile, priorrestorefile*.

When a backup is performed for the database in current NVM, the values of *restoretime, restorefile, priorbackuptime, priorbackupfile* is not modified.

1. **release** – Release Number

   This parameter represents the release number contained in the file. The parameter will be omitted if state is 'INITIAL'.

   Type: value set of the form x.y.z

   Range: x, y, z are integer numbers from 00 to 99 in two-digit form, that means leading zeros are not suppressed. x is not 00.

2. **size** – Size Of Allocated NVM

   This parameter indicates the allocated NVM size in bytes.

   It is not dynamically updated within the generic until data migration or software upgrade which may change the budget of NVM space used for database files.

   Type: Numeric string.

   Range: 0 to 99999999

   Default: In case the software generic on the NVM is empty, the value 0 is reported.

3. **backuptime**

   This parameter provides time and date when the last backup to a remote file store has been finished. It is omitted if the system has never been backed up.

   The NE updates *backuptime* at the OS just before file transfer starts and then update the value of current NVM's *backuptime* when the backup finishes.

   This implies the value of *backuptime* contained in backupfile at the OS will represent a slightly earlier time than the value contained in current NVM's database.

   *backuptime* is updated whether or not the file transfer was successful.

   Type: value set of the format: YY-MM-DD HH-MM-SS.

   Range: Y, M, D are numbers in two-digit format (i.e. leading zeros are not suppressed). YY represents the last two digits of the year, MM the month, DD the day of the month. H, M, S are numbers in two-digit format (i.e. leading zeros are not suppressed). HH represents the hour, MM the minutes, SS the seconds.

4. **restoretime**

   This parameter reflects the time and date when the last restore from a remote file store has been finished. It is omitted, if the system has never been restored.

   When a backup is performed for the database in current NVM, the values of *restoretime* (in current NVM, previous NVM) are not modified.

   Only database files at the current or previous NVMs shall have values for *restoretime*.

   Type: value set of the format: YY-MM-DD HH-MM-SS

   Range: Y, M, D are numbers in two-digit format (i.e. leading zeros are not suppressed). YY represents the last two digits of the year, MM the month, DD the day of the month. H, M, S are numbers in two-digit format (i.e. leading zeros are not suppressed). HH represents the hour, MM the minutes, SS the seconds.

5. **backupfile**

   This parameter indicates the remote location where the last backup is stored. Omitted if never backed up.

   The NE will update *backupfile* before the file transfer starts.

   Thus, both the source (current NVM) and the destination (*Navis*® Optical EMS or CIT) will have the same value for *backupfile*.

   Type: text string.

   Range: The parameter has one of the following formats:

   - "*CIT*,*filename*"
   - "*EMS*,*filename*"
   - *"FTTD",FTP URL"*

   The syntax contained in *filename* should be consistent with the file system. For a DOS file system, back slashes (\) should be used. For a UNIX file-system, forward slashes (/) should be used.

   Because a (\) is interpreted as the escape character, it will be represented in the output reply as a double backslash (\\).

The FTP URL must be in the format:
ftp://[<login>[:<password>]@]<host>[:<port>]/<file_name>

- <login>: default value: "anonymous"
- <password>: default for <login> "anonymous" is "" (empty). For security reasons, the <password> portion of the FTP file format must be masked prior to generating any autonomous messages.
- <host>: the <host> portion is an internet address of the form a.b.c.d with a, b, c and d in the range of 0..255.
- <port>: this is the port number of the FTP server, given when deviating from the standard port number 21.
- <file_name>: the complete path name of the file.

6. **restorefile**

   This parameter reflects the remote location where the last restore came from. Omitted if never restored.

   When a backup is performed for the database in current NVM, the values of *restorefile* (in current NVM, previous NVM, the destination) will not be modified.

   *restorefile* is updated whether or not the file transfer was successful.

   Type: text string.

   Range: *restorefile* has one of the following formats:

   - "*CIT*,*filename*"
   - "*EMS*,*filename*"
   - *"FTTD",FTP URL"*

   The syntax contained in *filename* should be consistent with the file system. For a DOS file system, back slashes (\) should be used. For a UNIX file-system, forward slashes (/) should be used.

   Because a (\) is interpreted as the escape character, it will be represented in the output as a double backslash (\\).

   The FTP URL must be in the format:
   ftp://[<login>[:<password>]@]<host>[:<port>]/<file_name>

   - <login>: default value: "anonymous"
   - <password>: default for <login> "anonymous" is "" (empty). For security reasons, the <password> portion of the FTP file format must be masked prior to generating any autonomous messages.
   - <host>: the <host> portion is an internet address of the form a.b.c.d with a, b, c and d in the range of 0..255.
   - <port>: this is the port number of the FTP server, given when deviating from the standard port number 21.
   - <file_name>: the complete path name of the file.

7. **priorbackuptime**

   This parameter gives the time and date when the next-to-last backup to a remote file store finished. It is omitted, if there is no next-to-last-backup.

When a backup is performed for the database in current NVM, the values of *priorbackuptime* (in current NVM, previous NVM, the destination) will not be modified.

Type: value set of the format: YY-MM-DD HH-MM-SS

Range: Y, M, D are numbers in two-digit format (i.e. leading zeros are not suppressed). YY represents the last two digits of the year, MM the month, DD the day of the month. H, M, S are numbers in two-digit format (i.e. leading zeros are not suppressed). HH represents the hour, MM the minutes, SS the seconds.

Default: n. a.

8. **priorrestoretime**

   This parameter specifies the time and date when the next-to-last restore from a remote file store finished. It is omitted, if there is no next-to-last restore.

   Type: value set of the format: YY-MM-DD HH-MM-SS.

   Range: Y, M, D are numbers in two-digit format (i.e. leading zeros are not suppressed). YY represents the last two digits of the year, MM the month, DD the day of the month. H, M, S are numbers in two-digit format (i.e. leading zeros are not suppressed). HH represents the hour, MM the minutes, SS the seconds.

9. **priorbackupfile**

   This parameter indicates the remote location where the next-to-last backup is stored. It is omitted, if there is no next-to-last backup.

   When a backup is performed for the database in current NVM, the values of *priorbackupfile* (in current NVM, previous NVM, the destination) will not be modified.

   Type: text string

   Range: *priorbackupfile* has one of the following formats:

   - "*CIT*,*filename*"
   - "*EMS*,*filename*"
   - *"FTTD",FTP URL"*

   The syntax contained in *filename* should be consistent with the file system. For a DOS file system, back slashes (\) should be used. For a UNIX file system, forward slashes (/) should be used.

   Because a (\) is interpreted as the escape character, it will be represented in the output reply as a double backslash (\\).

   The FTP URL must be in the format:
   ftp://[<login>[:<password>]@]<host>[:<port>]/<file_name>

   - <login>: default value: "anonymous"
   - <password>: default for <login> "anonymous" is "" (empty).For security reasons, the <password> portion of the FTP file format must be masked prior to generating any autonomous messages.
   - <host>: the <host> portion is an internet address of the form a.b.c.d with a, b, c and d in the range of 0..255.

- <port>: this is the port number of the FTP server, given when deviating from the standard port number 21.
- <file_name>: the complete path name of the file.

10. **priorrestorefile**

    This parameter reflects the remote location where the next-to-last restore came from. It is omitted, if the is no next-to-last restore.

    Type: text string

    Range: *priorrestorefile* has one of the following formats:

    - "*CIT*,*filename*"
    - "*EMS*,*filename*"
    - *"FTTD",FTP URL"*

    The syntax contained in *filename* should be consistent with the file system. For a DOS file system, back slashes (\) should be used. For a UNIX file-system, forward slashes (/) should be used.

    Because a (\) is interpreted as the escape character, it will be represented in the output reply as a double backslash (\\).

    The FTP URL must be in the format:
    ftp://[<login>[:<password>]@]<host>[:<port>]/<file_name>

    - <login>: default value: "anonymous"
    - <password>: default for <login> "anonymous" is "" (empty).For security reasons, the <password> portion of the FTP file format must be masked prior to generating any autonomous messages.
    - <host>: the <host> portion is an internet address of the form a.b.c.d with a, b, c and d in the range of 0..255.
    - <port>: this is the port number of the FTP server, given when deviating from the standard port number 21.
    - <file_name>: the complete path name of the file.

11. **state** – State of the Database

    This parameter describes the state of the database per NVM region:

    - CORRUPT (current, previous): Unavailable for invocation or execution (e.g. corrupted check sum)
    - MISMATCH (previous): Contained ES64U databases do not fit to the actual configuration
    - DOWNLOADED (previous): Applies to the previous bin of database. Database has been downloaded and is ready for activation.
    - INITIAL (current): Nothing in NVM.
    - INITIAL (previous): Nothing in previous partition of NVM.
    - INPROGRESS (current): Backup or restore in progress.
    - INPROGRESS (previous): Restore is in progress.
    - PREVIOUS (previous): A previously active database.

- PRESERVED (previous): Previously active database during trial state
- RUNNING (current): The currently active database.

The normal database states of current NVM are: RUNNING and INPROGRESS. Most of the time its state is equal to RUNNING, signifying that it contains a copy of the database that is currently in use. When a DB backup or a DB restore makes the NVM inaccessible, current NVM will have a database state of INPROGRESS.

The normal database states of previous NVM are: PREVIOUS and INPROGRESS. Most of the time its state is equal to PREVIOUS, signifying that it contains a copy of the database that was used with the previous generic. The state PRESERVED indicates a copy of the previously active database after application of a new SW generic, while the new SW generic is in trial phase. During the trial phase a switch back to the previously installed SW generic and the previously active database is possible. When a restore makes the NVM inaccessible, previous NVM will have a database state of INPROGRESS.

The state DOWNLOADED applies to the two-step DB restoration process in which a DB first is being downloaded and at a separate step being activated.

If an NVM has never contained a database, then the RTRV-PRMTR-DATA output for that NVM will consist of *state* INITIAL and size 0.

If an NVM is failed or missing, then RTRV-PRMTR-DATA will report only the state output variable for that NVM. *state* will have the value CORRUPT.

If an NVM contains a database generic, which contains ES64U databases and a) the CTL does not support the ES64U feature or b) the provisioned XC does not support the ES64U feature, then the *state* shall have the value CORRUPT.

Note: For a system with empty database (XC not provisioned) this check is not performed.

If an NVM contains a database generic, which contains ES64U databases but the contained ES64U databases do not fit to the actual ES64U configuration then the *state* shall have the value MISMATCH.

Type: Alphanumeric value set.

Range: CORRUPT, MISMATCH, DOWNLOADED, INITIAL, INPROGRESS, PREVIOUS, PRESERVED, RUNNING.

Default: INITIAL

12. **`tid`** – target identifier

    This parameter gives the TID that was stored in this NVM. The parameter will be omitted if state is INITIAL.

    This parameter is not evaluated in the NE. *serialnumber* will be used to check whether database belongs to correct NE.

    See "RTRV-HDR: Retrieve header" (p. 3-2397) for allowable tid values and details.

13. **`serialnumber`** – serial number

    This parameter gives the NE serial number from the database control information showing to which NE the database belongs to. Comparing this serial number with the actual NE serial number from the backplane EEPROM may help troubleshooting when being in maintenance mode. The parameter will be omitted if state is INITIAL.

    Type: Alphanumeric value set.

    Range: 12 times the space character or the 12 byte serial number of electronic label.

Default: 12 times the space character.

### Example input/output

In the following example for the **RTRV-PRMTR-DATA** command, current NVM contains a copy of the RUNNING database. The database was last backuped at 9:00 and the backup was to CIT:

```
RTRV-PRMTR-DATA:LT-UNITE::123456;
   LT-UNITE 00-11-01 09:45:28
M  123456 COMPLD
   "NVM-A:release=01.02.04,size=8234567,backuptime=00-11-01 09-00-00,
   backupfile=\"CIT,\\data\\00_11_01B\",priorbackuptime=00-11-01 08-00-00,
   priorbackupfile=\"CIT,\\data\\00_11_01A\",state=running,tid=LT-UNITE,
   serialnumber=01NB12345678"
;
```

### Related TL1 messages

# RTRV-PRMTR-SFTWR: Retrieve parameter software

The **RTRV-PRMTR-SFTWR** command retrieves information about the software generics being in NVM. It identifies the generics' release number and provides also other information such as its state.

RTRV-PRMTR-SFTWR can be used to determine what generic is currently executing. It can also be used to determine what generic was previously executing. If a generic was downloaded but not installed, then the output describes the downloaded generic instead of the previously executing generic.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 2

Abortable: No

## Input format

Command syntax: **RTRV-PRMTR-SFTWR**:*tid*::*ctag*::*[amount]*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
3. **amount** – Amount Of Data To Return
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

## Output format

If the NE fully complies with the **RTRV-PRMTR-SFTWR** command and the *amount* request is specified to all, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "nvm:spec_block"
       ...
       ...
   "nvm:spec_block"
;
```

## Output parameters

Refer to the "Output parameters" section of the "RTRV-HDR: Retrieve header" (p. 3-2397) command for a normal completion response. The output parameters listed there also apply to the **RTRV-PRMTR-SFTWR** command. Additional parameters that specifically apply to this command are defined in the following:

1. **nvm** – non volatile memory identifier
   This parameter specifies the version of NVM software (current or previous).
   Type: value set.
   Range: NVM-A for Current NVM-Software, NVM-B for Previous NVM-Software.
   Default: Only current NVM software is reported except for *amount* having been specified to ALL.

### Spec block parameters

This parameter provides information about the stored software. It contains the parameters *release, size, supplier, type, delivered, installed, path, state*.

1. **release** – Release Number
   The release parameter represents the software release number contained in the file.
   Type: value set of the form x.y.z
   Range: x, y, z are integer numbers from 00 to 99 in two-digit form, that means a leading zeros are not suppressed. x is not 00.
   Default: 01.00.00.
2. **buildnmbr** – Build Number
   This parameter identifies the software load contained in the file. It is an internal representation for test purpose.
   In contrast to the *release* parameter, which is the same for all software loads of a product release, the *buildnmbr* differs for all produced software loads, for example, produced for test purposes. The build number is reported for the software load in the current NVM. For the previous NVM the default value is reported.
   The *buildnmbr* typically contains the following informations to identify the specific software load:
   - internal load number (SUSI number)
   - internal build number of the load

   Type: Text string
   Range: Up to 20 characters.
   Default: UNKNOWN.
3. **size** – Program Size
   This parameter indicates the software generic size in bytes.
   Type: numeric string.
   Range: 0 to 99999999.
   Default: In case the software generic on the NVM is empty, the value 0 is reported.
4. **supplier**
   This parameter provides the supplier of generic.

Type: value set.
Range: 0 to 128 characters
Default: Alcatel-Lucent..

5. **type** – System Type
   This parameter specifies the type of system.
   Type: Value set.
   Range: WaveStar_UNITE
   Default: WaveStar_UNITE.
6. **delivered**
   This parameter specifies the time and date when the download finished.
   Type: value set of the format: YY-MM-DD HH-MM-SS.
   Range: Y, M, D are numbers in two-digit format (i.e. leading zeros are not suppressed). YY represents the last two digits of the year, MM the month, DD the day of the month. H, M, S are numbers in two-digit format (i.e. leading zeros are not suppressed). HH represents the hour, MM the minutes, SS the seconds.
   Default: 00-01-01 00-00-00.
7. **installed**
   This parameter specifies date and time when the installation started.
   Type: value set of the format: YY-MM-DD HH-MM-SS
   Range: Y, M, D are numbers in two-digit format (i.e. leading zeros are not suppressed). YY represents the last two digits of the year, MM the month, DD the day of the month. H, M, S are numbers in two-digit format (i.e. leading zeros are not suppressed). HH represents the hour, MM the minutes, SS the seconds.
   Default: 00-01-01 00-00-00.
8. **path**
   This parameter specifies the location in a remote file system from where the SW Generic has been downloaded. In the case of a factory installed SW generic the parameter shall have the value “PRE-LOADED”.
   Type: text string.
   Range: The path parameter has one of the following formats (see description for details):
   - "CIT,psel,ssel,tsel,nsap,filename"
   - "EMS,psel,ssel,tsel,nsap,filename"
   - "FTTD,psel,ssel,tsel,nsap,FTP URL"
   - "PRE-LOADED"

   The sizes for *psel, ssel, tsel, nsap* are as follows:
   - *psel* (path selector): 0-4 bytes (0-8 hex characters)
   - *ssel* (section selector): 0-4 bytes (0-8 hex characters)
   - *tsel* (transport selector): 0-16 bytes (0-32 hex characters)
   - *nsap* (network service access point): 20 bytes ( 40 hex characters).

There can only be an even number of hex characters since they are generated from bytes and each byte corresponds to 2 hex characters.

From MSB (Most Significant Byte) to LSB (Least Significant Byte), these bytes are (the number in parenthesis equals the number of bytes): IDP(3), DFI(1), ORG(3), RES(2), RD(2), AREA(2), SYS(6), SEL(1). The SEL field of the *nsap* is also called the NSEL.

The syntax contained in *filename* should be consistent with the file system. For a DOS file system, back slashes (\) should be used. For a UNIX file-system, forward slashes (/) should be used.

Because a (\) is interpreted as the escape character, it will be represented in the RTRV-PRMTR-SFTWR output as a double backslash (\\).

When the CIT is used to enter a file name for download backup, or restore, the craft is not required to enter a double backslash; the CIT software will enter the extra backslash into the TL1 CPY-MEM command.

For FT-TD *psel*, *ssel*, *tsel* and *nsap* of the GNE is reported. The FTP URL contains the CIT or EMS and the filename.

The FTP URL must be in the format:
ftp://[<login>[:<password>]@]<host>[:<port>]/<file_name>

- <login>: default value: "anonymous"
- <password>: default for <login> "anonymous" is "" (empty).For security reasons, the <password> portion of the FTP file format must be masked prior to generating any autonomous messages.
- <host>: the <host> portion is an internet address of the form a.b.c.d with a, b, c and d in the range of 0..255.
- <port>: this is the port number of the FTP server, given when deviating from the standard port number 21.
- <file_name>: the complete path name of the file.

9. **state**

   This parameter describes the state of the generic per NVM region:
   state (NVM):description

   - CORRUPT (current, previous): Unavailable for invocation or execution.(e.g. corrupted check sum)
   - DOWNLOADED (previous): Applies to the previous bin of database. Database just downloaded or ready for installation.
   - INITIAL (current): Nothing in NVM.
   - INITIAL (previous): Nothing in previous partition of NVM.
   - INPROGRESS (current): Installation is in progress..
   - INPROGRESS (previous): Previously executing generic. Available for installation
   - RUNNING (current): Currently executing generic.
   - PRESERVED (previous): Previously executing generic in trial phase
   - PREVIOUS (previous): Previously executing generic.

The normal (as contrasted with CORRUPT) states of current NVM are: RUNNING and INPROGRESS. The state is usually equal to RUNNING, signifying that it contains a copy of the generic that is currently executing. When an installation is in progress, current NVM will have a state of INPROGRESS.

The normal states of previous NVM are: PREVIOUS, DOWNLOADED and INPROGRESS. INPROGRESS means that a download is in progress. When the download terminates successfully, the state transitions to generic is installed, the NVM pointer is adjusted, and the NVM partition then identified as previous NVM will have the state set to PREVIOUS. The state PRESERVED indicates the trial phase after application of a new SW generic. During the trial phase a switch back to the previously installed SW generic and the previously active database is possible.

If an NVM has never contained a software generic, then the RTRV-PRMTR-SFTWR output for that NVM will consist of State=INITIAL.

If an NVM is corrupt, failed or missing, the RTRV-PRMTR-SFTWR output for that NVM will consist only of a single line containing State=CORRUPT.

Type: Alphanumeric value set.

Range: CORRUPT, DOWNLOADED, INITIAL, INPROGRESS, PREVIOUS, PRESERVED, RUNNING.

Default: INITIAL.

## Example input/output

In the following example for the **RTRV-PRMTR-SFTWR** command, current NVM has a copy of the executing program (normal condition), and previous NVM has a copy of the previous generic. Also, it was assumed, that the CIT is DOS based and *Navis*® Optical EMS UNIX based. This was done to illustrate the different formats for path. Notice that the current and previous NVM indicate the same number for free (and also unavailable) space since current and previous information is stored in the same physical NVM.

```
RTRV-PRMTR-SFTWR:LT-UNITE::123456::ALL;
   LT-UNITE 00-11-01 09:45:28
M  123456 COMPLD
   "NVM-A:release=01.02.04,size=11423175,supplier=Lucent,type=Unite,
   delivered=00-11-02 08-00-10,installed=00-11-02 08-00-13,path=\"CIT,01,01,
   03,39840F8000000000000000000008006A11234500,
   \\unite\\generic\\1_2_04.pgm\",state=running"
   "NVM-B:release=01.02.03,size=11343236,supplier=Lucent,type=Unite,
   delivered=00-11-01 18-30-10,installed=00-11-01 22-45-30,path=\"EMS,01,01,
   02,39840F8000000000000000000008006A11118500,/unite/generic/1_2_03.pgm\",
   state=previous"
;
```

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-PRMTR-SFTWR** command.

**Related TL1 messages**

# RTRV-PROTN-GRP: Retrieve protection group

The **RTRV-PROTN-GRP** command retrieves protection group information for all existing protection group entities. The command can be used to retrieve also sets of protection groups by using ranges. The general format can be used to retrieve protection group information for different protection group types.

Input parameters for **RTRV-PROTN-GRP** identify the type of protection group that is of interest and also a specific member (or perhaps a range of members) of that protection group. If the specified member does not belong to a protection group, then the command returns COMPLD, but contains no information about the protection group. This means that the AID is unprotected.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

## Input format

### 1+1 equipment protection group

Command syntax: **RTRV-PROTN-GRP**:*tid*:*aid*:*ctag*::*protype*;

### multiplex section/line protection group

Command syntax: **RTRV-PROTN-GRP**:*tid*:*aid*:*ctag*::*protype*;

### 2-/4-fibre MS-SPRing/BLSR protection group

Command syntax: **RTRV-PROTN-GRP**:*tid*:*[aid]*:*ctag*::*protype,[rid]*;

### Path protection group

Command syntax: **RTRV-PROTN-GRP**:*tid*:*[aid]*:*ctag*::*protype, , [ppgname][,aid1]*;

The second comma in front of *ppgname* is needed since *rid* is omitted.

The parameter *ppgname* is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of *ppgname* is not recommended.

> **Important!** The command **RTRV-PROTN-PPG** which retrieves all used path protection group names is not supported. Therefore its difficult to get an overview about all already used/defined protection group names.
>
> The operator can use the TL1 command **RTRV-PROTN-GRP** and use bay-shelf-#-#-all-all-all as value for the input parameter *aid* in order to derive all path protection groups (see *aid* – Access Identifier in "Command parameters (path protection group)" (p. 3-2746)). Then he gets the used path protection group names per protection group in the command reply.

## Input parameters

### Command parameters (1+1 Equipment protection group)

1. **`tid`** – Target Identifier

   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).

2. **`aid`** – Access Identifier

   Description: The parameter specifies the aid of 1+1 equipment protection group.

   Type: AID

   Range: 1-1-eall or SwitchAndTmgProtGrpAID or CtlProtGroupAID or EP155ProtGroupAID or EP51ProtGroupAID or LOXCProtGroupAID or TMUXProtGroupAID or ES64UProtGroupAID.

   When using aid 1-1-eall, all actual existing equipment protection groups will be returned:

   - for higher-order switch fabric and timing group (referenced by SwitchAndTmg-ProtGrpAID)
   - for system controller group (referenced by CtlProtGroupAID)
   - for electrical 155 MBit/s groups (referenced by EP155ProtGroupAID)
   - for electrical 51 MBit/s groups (referenced by EP51ProtGroupAID)
   - for low order switch fabric groups (referenced by LOXCProtGroupAID).
   - for TransMUX groups (referenced by TMUXProtGroupAID)
   - for ES64U groups (referenced by ES64UProtGroupAID)

3. **`ctag`** – Correlation Tag

   This is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.

   Type: Alphanumeric string

   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

4. **`protype`** – Protection Type

   The parameter specifies the type of the 1+1 equipment protection group for retrieving the information. The parameter evaluation is case insensitive.

   Type: Alphanumeric value set.

   Range:

   - ALL, if *aid* is 1-1-eall;
   - EQPTSWFBR, if *aid* is SwitchAndTmgProtGrpAID;
   - EQPTCTL, if *aid* is CtlProtGroupAID;
   - EQPTEP155, if *aid* is EP155ProtGroupAID;
   - EQPTEP51, if *aid* is EP51ProtGroupAID;
   - EQPTLOXC, if *aid* is LOXCProtGroupAID.
   - EQPTTMUX, if *aid* is TMUXProtGroupAID.
   - EQPTES64U, if *aid* is ES64UProtGroupAID.

### Command parameters (multiplex section/line protection group)

1. **tid** – Target Identifier

   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).

2. **aid** – Access Identifier

   This parameter specifies the *aid* of a 1+1 multiplex section/line protection group or an port *aid* being a member of the group.

   Type: AID

   Range: OnePlusOne_ProtGrpAID or oall supported or SPortAID (not ranged)

3. **ctag** – Correlation Tag

   This is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.

   Type: Alphanumeric string

   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

4. **protype** – Protection Type

   This parameter specifies the architecture (type) of the protection group. The value for the 1+1 line/MS protection group is 1+1.

   Type: Value set.

   Range: 1+1

### Command parameters (2-/4-fibre MS-SPRing/BLSR protection group)

1. **tid** – Target Identifier

   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).

2. **aid** – Access Identifier

   This parameter specifies the aid of an MS-SPRing/BLSR protection group or an port aid being a member of the group.

   Option: If *rid* is specified, then *aid* can be omitted.

   Type: AID

   Range: *bay-shelf*-tall (ranged over TwoFibre_ProtGrpAID) or bay-shelf-fall (ranged over FourFibre_ProtGrpAID) or TwoFibre_ProtGrpAID (not ranged) or FourFibre_ProtGrpAID (not ranged) or SPortAID (not ranged).

3. **ctag** – Correlation Tag

   This is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.

   Type: Alphanumeric string

   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

4. **protype** – Protection Type

   This parameter specifies the protection group type for which the information is retrieved.

   Type: Alphanumeric value set.

   Range: 2F or 4F

5. **rid** – Ring Identification

This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.

Type: text string of chars allowed for TID strings.

Range: 1 to 15 characters.

Default: NONE.

Option: If *aid* is specified, then *rid* can be omitted.

### Command parameters (path protection group)

1. **`tid`** – Target Identifier

   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).

2. **`aid`** – Access Identifier

   This parameter specifies a path protection group *aid* or an input tributary *aid* being a member of the group in combination with *ppgname*.

   This parameter specifies an input tributary *aid* when used in combination with parameter *aid1*.

   Option: If *ppgname* is specified, then *aid* can be omitted or used as an input tributary aid.

   As *ppgname* is not supported for low order path protections, the aid parameter must specify a path protection group AID for those protection groups.

   The parameter *ppgname* is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of *ppgname* is not recommended.

   If the parameter *aid* specifies a HO tributary on a port of port class EDGE and this tributary is combined with another HO tributary within an OUC, then RTRV-PROTN-GRP shall operate on all protection groups of type PATHDRI identified by these two HO tributaries, if existing.

   This option is also be applied, if wild cards are used in aid. The system discards duplicate responses if several tributaries of the same OUC are within the AID range specified by the wild cards.

   When parameter *aid* is used in combination with parameter *aid1*, then RTRV-PROTN-GRP shall operate on all protection groups of type PATHDRI having the AIDs given in parameters *aid* and *aid1* as input tributaries. In this option the use of wildcards is not allowed.

   Type: AID

   Range: STS1NumAID or VCGNumAID or GenLOTribAID or TMuxAPTNumAID.

   The usage of wild cards is not restricted. This range specifies all AIDs which can be used to identify a path protection group. Any defined wild cards (e.g. **`all`** or **`vall`** or **`usall`** in various positions) are allowed.

3. **`ctag`** – Correlation Tag

   This is included in the command by the TL1 user and is repeated by the NE in the response to allow the TL1 user to associate the command and response messages.

   Type: Alphanumeric string

Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

4. **protype** – Protection Type

   This parameter specifies the protection group type for which the information is retrieved.

   Type: Alphanumeric value set.

   Range: PATHDRI

5. **ppgname** – Path protection group Name

   The parameter specifies the path protection group name. Storage and retrieval of the ppgname is case sensitive, but actual use of the ppgname to determine the corresponding protection group is case insensitive.

   Option for high order path protection groups:

   For high order path protections, if aid is specified, then *ppgname* can be omitted. For low order path protections, the *ppgname* is omitted as not being supported at all.

   If an input value is specified for *ppgname* and none is specified for *aid*, then RTRV-PROTN-GRP operates on all protection groups of type PATHDRI that have the specified path protection group name.

   If input values are specified for *aid* and *ppgname* then RTRV-PROTN-GRP operates on all protection groups of type PATHDRI that have the specified *aid*, *ppgname* pair.

   The command will complete successfully if there is no protection group described by *aid*, *ppgname*, but no data will be returned.

   The parameter *ppgname* is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of *ppgname* is not recommended.

   Type: text string

   Range: 1 to 24 characters

6. **aid1** – Access Identifier 1

   When parameter *aid1* is applied together with parameter *aid*, these parameters specifies a pair of input tributaries for accessing emulated selector bridges in one command.

   If input values are specified for aid and *aid1* then RTRV-PROTN-GRP operates on all protection groups of type PATHDRI that have these specified tributaries as inputs. If an input value is specified for *aid1*, no value must be specified for ppgname.

   The command will complete successfully if there is no protection group described by aid and *aid1*, but no data will be returned. The parameter ppgname is kept for compatibility reasons only. Because of limitations of the path protection group name aliasing, the use of ppgname is not recommended.

   Type: AID

   Range: STS1NumAID

   The usage of wild cards is not allowed.

   The *aid1* parameter is intended to be used in ONNS context. The range is restricted to the tributary types and rates supported by ONNS.

### Output format

After receiving the **RTRV-PROTN-GRP** command, the following normal completion response is returned in case of protypes unequal to PATHDRI:

```
   sid date time
M  ctag COMPLD
   "aid:[spec_block]"
       ...
       ...
   "aid:[spec_block]"
;
```

After receiving the **RTRV-PROTN-GRP** command, the following normal completion response is returned in case of PATHDRI protection group:

```
   sid date time
M  ctag COMPLD
   "aid:[spec_block]"
   "outtribaid,CML:<CML block>"
       .
       .
   "outtribaid,CML:<CML block>"
       ...
       ...
   "aid:[spec_block]"
   "outtribaid,CML:<CML block>"
       .
       .
   "outtribaid,CML:<CML block>"
;
```

If no protection group entity exists matching the specified values of the input parameters *aid*, *rid* then the following response is returned:

```
   sid date time
M  ctag COMPLD
;
```

If no protection group entity exists matching the specified *ppgname* value, then no response is returned.

## Output parameters

### Command parameters (1+1 Equipment protection group)

1. **aid** – Access Identifier

   Description: The parameter specifies the aid of 1+1 equipment protection group.
   Type: AID
   Range: SwitchAndTmgProtGrpAID or CtlProtGroupAID or EP155ProtGroupAID or EP51ProtGroupAID or LOXCProtGroupAID or TMUXProtGroupAID or ES64UProtGroupAID.
   All actual existing equipment protection groups will be returned with a specific AID:

   - for higher-order switch fabric and timing group (referenced by SwitchAndTmg-ProtGrpAID)
   - for system controller group (referenced by CtlProtGroupAID)
   - for electrical 155 MBit/s groups (referenced by EP155ProtGroupAID)
   - for electrical 51 MBit/s groups (referenced by EP51ProtGroupAID)
   - for lower-order switch fabric groups (referenced by LOXCProtGroupAID).
   - for TransMUX groups (referenced by TMUXProtGroupAID)
   - for ES64U groups (referenced by ES64UProtGroupAID)

### Command parameters (multiplex section/line protection group)

1. **aid** – Access Identifier

   This parameter specifies the aid of a 1+1 multiplex section/line protection group.
   Type: AID
   Range: OnePlusOne_ProtGrpAID or NByOne_ProtGrpAID

### Command parameters (2-fibre MS-SPRing/BLSR protection group)

1. **aid** – Access Identifier

   This parameter specifies the AID of the 2 fibre MS-SPRing/BLSR protection group.
   Type: AID
   Range: TwoFibre_ProtGrpAID
   Default: No default

### Command parameters (4-fibre MS-SPRing/BLSR protection group)

1. **aid** – Access Identifier

   This parameter specifies the AID of the 4 fibre MS-SPRing/BLSR protection group.
   Type: AID
   Range: FourFibre_ProtGrpAID

### Command parameters (Path protection group)

1. **aid** – Access Identifier

   This parameter specifies the AID of the path protection group.
   Type: AID
   Range: STS1NumAID or VCGNumAID or GenLOTribAID or TMuxAPTNumAID.

The usage of wild cards is not restricted. This range specifies all AIDs which can be used to identify a path protection group. Any defined wild cards (e.g. **all** or **vall** or **usall** in various positions) are allowed.

2. **outtribaid** – Output Tributary Access Identifier

   This parameter specifies the output tributary AID for a constituent signal within the protection group. One value is returned for each constituent signal together with the corresponding CML (Constituent Member List) block.

   Type: AID

   Range: STS1NumAID or VCGNumAID or GenLOTribAID or TMuxAPTNumAID.

   The usage of wild cards is not restricted. This range specifies all AIDs which can be used to identify a path protection group. Any defined wild cards (e.g. **all** or **vall** or **usall** in various positions) are allowed.

**Spec block parameters (1+1 Equipment protection group)**

1. **actunit** – Active Unit State

   This parameter specifies which unit is currently selected within the protection group as active unit.

   The value WKG specifies that the worker unit is active.

   The value PROTN specifies that the protection unit is active.

   Type: Alphanumeric value set.

   Range: WKG, PROTN

   Default: For switching protection group instance: The first provisioned/auto-created circuit pack is the default active unit. For controller protection group instance: the active controller unit at the moment of creation of the CTL protection group. For any equipment protection group instance created using the **ENT-PROTN-GRP** command: The worker is the default active unit.

2. **nvmadate** – NVM Active Date

   This parameter specifies the date of the last successful update of NVM of the current active CTL in the format YY-MM-DD.

   A value of 00-00-00 is reported in case the date information is unavailable.

   Option: This parameter is reported only if *protype==EQPTCTL*, otherwise it is omitted.

   Type: Value set.

   Range: YY-MM-DD with value rangesfor YY: 00 to 99for MM: 00 to 12for DD: 00 to 31

   Default: None

3. **nvmatime** – NVM Active Time

   This parameter specifies the time of the last successful update of NVM of the current active CTL in the format HH-MM-SS.

   A value of 00-00-00 is reported in case the date information is unavailable.

   Option: This parameter is reported only if *protype==EQPTCTL*, otherwise it is omitted.

   Type: Value set.

   Range: HH-MM-SS with value rangesfor HH: 00 to 23for MM: 00 to 59or SS: 00 to 59

Default: None

4. **nvmsdate** – NVM Standby Date

   This parameter specifies the date of the last successful update of NVM of the current standby CTL in the format YY-MM-DD.

   A value of 00-00-00 is reported in case the date information is unavailable.

   Option: This parameter is reported only if *protype==EQPTCTL*, otherwise it is omitted.

   Type: Value set.

   Range: YY-MM-DD with value rangesfor YY: 00 to 99for MM: 00 to 12for DD: 00 to 31

   Default: None

5. **nvmstime** – NVM Standby Time

   This parameter specifies the time of the last successful update of NVM of the current standby CTL in the format HH-MM-SS.

   A value of 00-00-00 is reported in case the date information is unavailable.

   Option: This parameter is reported only if *protype==EQPTCTL*, otherwise it is omitted.

   Type: Value set.

   Range: HH-MM-SS with value rangesfor HH: 00 to 23for MM: 00 to 59or SS: 00 to 59

   Default: None

6. **nvmstat** – NVM Synchronization State

   This parameter specifies the current state of NVM synchronisation of the Duplex Control Protection Group.

   Option: This parameter is reported only if *protype==EQPTCTL*, otherwise it is omitted.

   Type: Alphanumeric value set.

   Range:

   - INSYNC – if NVM of both control units are fully synchronized
   - OUTOFSYNC – if either the standby control unit is not accessible or is in the process of re-synchronizing its NVM
   - REPAIRING – synchronisation has been interrupted and not yet restarted

   Default: None

7. **protn** – Protection Unit

   The parameter specifies the protection circuit pack AID being a member of the 1+1 equipment protection group.

   Type: AID

   Range: CpAID, if *protype* is not EQPTLOXC or LoxcAID, if *protype* is EQPTLOXC.

   Default:

   - 1-1-#-#-xcp-cp (if protype is EQPTSWFBR)
   - 1-1-#-#-ctlp-cp (if protype is EQPTCTL)

For all other equipment protection groups there is no default value as the slot of the protection unit will be dynamically assigned during creation of the group. For rules applying to the selection of the slot for the protection unit refer to ENT-PROTN-GRP.

8. **protnsiglvl** – Protection Fault Status

   This parameter specifies the current fault status w.r.t. the protection unit as used by the protection state machine.

   The value EF (Equipment Failed) is used if an equipment defect used as switch criteria is currently present for the protection unit.

   The value NONE is used if no such defect is currently present.

   Type: Alphanumeric value set.

   Range: EF, NONE

   Default: NONE

9. **protype** – Protection Type

   This parameter specifies the type of the protection group.

   Type: Alphanumeric value set.

   Range:

   - EQPTSWFBR, if aid is SwitchAndTmgProtGrpAID
   - EQPTCTL, if aid is CtlProtGroupAID
   - EQPTEP155, if aid is EP155ProtGroupAID
   - EQPTEP51, if aid is EP51ProtGroupAID
   - EQPTLOXC, if aid is LOXCProtGroupAID.
   - EQPTTMUX, if aid is TMUXProtGroupAID
   - EQPTES64U, if *aid* is ES64UProtGroupAID.

10. **swreq** – Switch Request State

    This parameter specifies the current switch request state of the protection state machine.

    The value EQPTFAILED (Equipment Failed) is used if an equipment failed condition is the current state.

    The value FS (Forced Switch) is used if a forced switch is the current state.

    The value MS (Manual Switch) is used if a manual switch is the current state.

    The value NR (No Request) is used if no request is the current state.

    Type: Alphanumeric value set.

    Range: EQPTFAILED, FS, MS, NR for switch fabric protection and EP155 protection; EQPTFAILED, MS, NR for controller protection.

    Default: NR

11. **wkg** – Worker Unit

    This parameter specifies the worker circuit pack AID being a member of the 1+1 equipment protection group.

    Type: AID

    Range: CpAID, if *protype* is not EQPTLOXC or LoxcAID, if *protype* is EQPTLOXC.

Default:

- 1-1-#-#-xcw-cp (if protype is EQPTSWFBR)
- 1-1-#-#-ctlw-cp (if protype is EQPTCTL)

For all other equipment protection groups there is no default value as the slot of the worker unit will be dynamically assigned during creation of the group. For rules applying to the selection of the slot for the worker unit refer to ENT-PROTN-GRP.

12. **wkgsiglvl** – Worker Fault Status

    This parameter specifies the current fault status w.r.t. worker unit as used by the protection state machine.

    The value EF (Equipment Failed) is used if an equipment defect used as switch criteria is currently present for the worker unit.

    The value NONE is used if no such defect is currently present.

    Type: Alphanumeric value set.

    Range: EF, NONE

    Default: NONE; i.e. the default is the value 'NONE'

**Spec block parameters (multiplex section/line protection group)**

1. **actunit** – Active Unit State

   This parameter specifies which port is currently selected within the protection group as active port.

   The value WKG specifies that the worker port is active.

   The value PROTN specifies that the protection port is active.

   The parameter is only supported for Protection type 1+1. – Option: If the parameter is not supported, then the parameter is omitted.

   Type: Alphanumeric value set.

   Range: WKG, PROTN

   Default: WKG

2. **actunitfe** – Far-End Incoming Requested Selection

   For 1+1 MSP

   This parameter is derived from the incoming K1 [5…8] overhead byte.

   The value WKG is used if accepted K byte value is equal to 0.

   The value PRTON is used if the accepted K byte value is equal to 1.

   The value UNAVAILABLE is used if an SF condition is active for the protection line.

   The value INV (Invalid) is used in all other cases.

   For optimized MSP

   The parameter is derived from the incoming K1 [5..8] overhead byte.

   The value NONE is used if the accepted K byte value is equal to 0.

   The value PROTN is used if the accepted K byte value is equal to 1.

   The value WKG is used if accepted K byte value is equal to 2.

   The value UNAVAILABLE is used if an SF condition is active for the secondary section.

   The value INV (InValid) is used in all other cases.

The parameter is only supported for Protection type 1+1. – Option: If the parameter is not supported, then the parameter is omitted.
Type: Alphanumeric value set.
Range: WKG, PROTN, UNAVAILABLE, NONE, INV
Default: WKG

3. **`actunitne`** – Near-End Outgoing Requested Selection
   For 1+1 MSP
   This parameter is derived from the sent K1 [5…8] overhead byte.
   The value WKG is used if sent K byte value is equal to 0.
   The value PROTN is used if the sent K byte value is equal to 1.
   For optimized MSP
   The parameter is derived from the sent K1 [5..8] overhead byte.
   The value NONE is used if the sent K byte value is equal to 0.
   The value PROTN is used if the sent K byte value is equal to 1.
   The value WKG is used if sent K byte value is equal to 2.
   The parameter is only supported for Protection type 1+1. – Option: If the parameter is not supported, then the parameter is omitted.
   Type: Alphanumeric value set.
   Range: WKG, PROTN, NONE
   Default: WKG
4. **`aps`** – Far-End Incoming APS
   This parameter is derived from the incoming K1 [1…4] overhead byte.
   It indicates the type of request as follows:
   - DNR: Do Not Revert
   - EXER: Exercise
   - INV: Invalid (unused codes)
   - UNAVAILABLE: Not Available (SF condition pending for protection line)
   - FS: Forced Switch
   - LO: Lockout of Protection
   - MS: Manual Switch
   - NR: No Request
   - RR: Reverse Request
   - SF-H: Signal Fail High
   - SF-L: Signal Fail Low
   - SD-H: Signal Degrade High
   - SD-L: Signal Degrade Low
   - WTR: Wait to restore (for MSP 1+1, MSP 1:1 / only used if protection group is revertive) / Wait to rename (for MSP 1+1 Optimized).

   Type: Alphanumeric value set.

Range: DNR, EXER, INV, NA, FS, LO , MS, NR, RR, SF-H, SF-L, SD-L, SD-H, WTR

Default: NR

5. **apsout** – Near-End Outgoing APS

   This parameter is derived from the sent K1 [1…4] overhead byte.

   It indicates the type of request as follows:

   - DNR: Do Not Revert
   - FS: Forced Switch
   - LO: Lockout of Protection
   - MS: Manual Switch
   - NR: No Request
   - RR: Reverse Request
   - SF-H: Signal Fail High
   - SF-L: Signal Fail Low
   - SD-H: Signal Degrade High
   - SD-L: Signal Degrade Low
   - WTR: Wait to restore (for MSP 1+1, MSP 1:1 / only used if protection group is revertive). Wait to rename (for MSP 1+1 Optimized).

   Type: Alphanumeric value set.

   Range: DNR, FS, LO , MS, NR, RR, SF-H, SF-L, SD-H, SF-L, WTR

   Default: NR

6. **apspn** – MSP-APS ASAP Pointer

   This parameter specifies the value for the ASAP (alarm severity assignment profile) name of type MSP-APS (Multiplex Section Protection – Automatic protection switching).

   Type: Alphanumeric string

   Range: 1-24 characters including the character "-".

   Default: DEFAULT

7. **dcclmsprotmd** – DCC Line/MS Protection Mode

   The parameter specifies, whether the line/MS dcc channel is switched as part of the line/MS protection group. The value ENABLE is used, if dcc channel is switched as part of line/MS protection group; otherwise the value DISABLED is used.

   Type: Alphanumeric value set 3;

   Range: ENABLE, DISABLE

   Default: DISABLE

8. **dccsrsprotmd** – DCC Sect/RS Protection Mode

   The parameter specifies, whether the section/RS dcc channel is switched as part of the line/MS protection group. The value ENABLE is used, if dcc channel is switched as part of line/MS protection group; otherwise the value DISABLED is used.

   Type: Alphanumeric value set

Range: ENABLE, DISABLE

Default: DISABLE

9. **pgrate** – protection group Rate

   This parameter is derived from the interface rate of the ports within the protection group. It indicates the same value as for all ports contributing to protection group.

   Type: Alphanumeric value set.

   Range: OC3, OC12, OC48, OC192, OC768, STM1, STM4, STM16, STM64, STM256

   Default: The default value is the interface rate of the worker port.

10. **protn** – Protection Unit

    This parameter specifies the protection port AID being a member of the line protection/ MS protection group.

    Type: AID

    Range: SPortAID

11. **protnsiglvl** – Protection Fault Status

    This parameter specifies the current fault status w.r.t. port as used by the protection state machine.

    The value SF (Signal Fail) is used if a defect defined as signal fail condition is currently present for the protection port.

    The value SD (Signal Degrade) is used if a defect defined as signal degraded condition is currently present for the protection port.

    The value NONE is used if no such defect is currently present.

    Type: Alphanumeric value set.

    Range: SF, SD, NONE

    Default: NONE

12. **protocol** – APS Protocol

    This parameter specifies the protocol used by the protection state machine.

    The value 1+1_UNI is used for 1+1 unidirectional switching.

    The value 1x*N*_BIDIR is used for 1:*N* bidirectional switching (*N*=1..14).

    The value 1+1_OPTM is used for 1+1 optimized, bidirectional switching.

    The value 1+1_BIDIR is used for 1+1 bidirectional switching.

    Note that “OPTIMIZED” describes rather the protection type than a protocol. Only for compatibility reasons of TL1, the parameter *protocol* is used for its selection.

    Type: Alphanumeric value set.

    Range: 1+1_UNI, 1xN_BIDIR, 1+1_OPTM, 1+1_BIDIR

    The value 1+1_OPTM implicitly specifies bidirectional operation mode.

    Default: 1+1_UNI

13. **protype** – Protection Type

    This parameter specifies the type of the protection group.

    The value for the 1+1 line/MS protection group is “1+1”.

    The value for the 1:1 line/MS protection group is “1x*N*OPT” (only R3.0 and later).

    Type: Value set.

Range: 1+1

Default: 1+1

14. **rme** – Protection Reversion

    The parameter specifies whether revertive or non-revertive mode is used as operation mode of the protection group. The value ENABLE is used if the protection group operates in revertive mode. The value DISABLE is used if the protection group operates in non-revertive mode.

    Type: Alphanumeric value set.

    Range: ENABLE, DISABLE in case of protype = 1+1

    Default: DISABLE

15. **ssi** – Secondary Section Indication

    The parameter shall indicate the “Secondary Section” (line).

    The parameter is only supported for Protection type 1+1. – Option: If the parameter is not supported, then the parameter is omitted.

    Type: AID

    Range: WKG, PROTN; WKG denotes working section 1, PROTN denotes working section 2 according ITU-T G.841 Annex B.

    Default: PROTN

16. **swreq** – Switch Request State

    This parameter specifies the current switch request state of the protection state machine.

    It shall have the following values:

    - DNR: Do Not Revert
    - FS: Forced Switch
    - LO: Lockout of Protection
    - MS: Manual Switch
    - SF: Signal Fail
    - SD: Signal Degrade
    - WTR: Wait to restore (for MSP 1+1, MSP 1:*N* / only used if protection group is revertive). Wait to rename (for MSP 1+1 Optimized)
    - FOP: Failure Of Protocol
    - NR: No Request.

      The APS code “WTR” has a different meaning depending on the protection type which is visible to the user. However, in the standards only “Wait to restore” is defined independent of the protection type.

    Type: Alphanumeric value set.

    Range: DNR, FS, LO , MS, SF, SD, WTR, FOP, NR

    Default: NR

17. **wkg** – Worker Unit

    This parameter specifies the worker port AID being a member of the 1+1 line/MS protection group.

The parameter is only supported for Protection type 1+1. – Option: If the parameter is not supported, then the parameter is omitted.

Type: AID

Range: SPortAID

18. **wkgsiglvl** – Worker Fault Status

    This parameter specifies the current fault status w.r.t. port as used by the protection state machine.

    The value SF (Signal Fail) is used if a defect defined as signal fail condition is currently present for the worker port.

    The value SD (Signal Degrade) is used if a defect defined as signal degraded condition is currently present for the worker port.

    The value NONE issued if no such defect is currently present.

    The parameter is only supported for Protection type 1+1. – Option: If the parameter is not supported, then the parameter is omitted.

    Type: Alphanumeric value set.

    Range: SF, SD, NONE.

    Default: NONE.

19. **wtr** – Wait To Restore Time / Wait to Rename Time

    The parameter specifies the “wait to restore” time used by the protection state machine operating in revertive mode. In case of MSP 1+1 optimized, the same parameter is used for the “wait to rename” time.

    Type: numeric string [minute]

    Range: 0 – 60

    Default: 5.

**Spec block parameters (2-fibre MS-SPRing/BLSR protection group)**

1. **ard** – Automatic Ring Discovery

    If this parameter is enabled, the automatic ring discovery algorithm will assign nodeID values to each node in the ring and construct the necessary ring map information. All nodes in the ring must support the Ring Discovery interworking. If disabled, the user will assign the NodeID value manually with ED-MAP-RING and supply the ring map information to each node on the ring for the BLSR protocol to operate. It is necessary to activate this user-provisioned information with SET-MAP-RING. Until all nodes on the ring have the same ring map, nodes will have most likely an outstanding NodeID mismatch alarm active.

    Type: Alphanumeric string.

    Range: ENABLE, DISABLE.

    Default: ENABLE.

2. **asmc** – Automatic Squelch Map Calculation

    If this parameter is enabled, the automatic squelch map calculation is switched on. If disabled, the function is switched off.

    Type: Alphanumeric string.

    Range: ENABLE, DISABLE (default).

3. **blsrpn** – MS-SPRing-BLSR ASAP Pointer

This parameter specifies the value for the ASAP (alarm severity assignment profile) name of type MS-SPRing-BLSR.
Type: Alphanumeric string
Range: 1-24 characters including the character "-".
Default: DEFAULT

4. **eapschst** – Incoming East APS Channel Status
   This parameter is derived from the incoming K2 [6..8] overhead byte of the east port. It indicates the status as follows:
   - IDLE: Idle
   - BRIDGED: Bridged
   - BANDS: Bridged & Switched
   - XTRFC: Extra Traffic on protection channels
   - NOTUSED: Not Used – Reserved for future use
   - RDIL: RDI-L/MS-RDI (Remote Defect Indication -Line/Multiplex Section)
   - AISL: AIS-L/MS-AIS (Alarm Indication Signal – Line/Multiplex Section)

   Type: Alphanumeric value set.
   Range: IDLE, BRIDGED, BANDS, XTRFC, NOTUSED, RDIL, AISL
   Default: IDLE
5. **eapsdnid** – Incoming East APS Destination Node Id
   This parameter is derived from the incoming K1 [5..8] overhead byte of the east port. It specifies the node ID for which the K1 byte is destined.
   The value UNAVAILABLE is used in case of an pending SF condition.
   Type: Alphanumeric value set.
   Range: 0-15 or UNAVAILABLE
   Default: 0
6. **eapsprotn** – Incoming East APS Protection Path
   This parameter is derived from the incoming K2 overhead byte of the east port. It indicates the protection path as follows:
   - 0: short path code (S)
   - 1: long path code (L)

   The value UNAVAILABLE is used in case of an pending SF condition.
   Type: Alphanumeric value set.
   Range: 0, 1, UNAVAILABLE
   Default: 0
7. **eapssnid** – Incoming East APS Source Node Id
   This parameter is derived from the incoming K2 [1..4] overhead byte of the east port. It specifies the node ID which sourced the K1 byte.
   The value UNAVAILABLE is used in case of an pending SF condition.
   Range: 0-15 or UNAVAILABLE
   Default: 0

8. **eapssw** – Incoming East APS Switch Priority

   This parameter is derived from the incoming K1 [1..4] overhead byte of the east port. It indicates the switch priority/bridge request code as follows:

   - LPS: Lockout of Protection Span
   - FSS: Forced Switch Span (4F only)
   - FSR: Forced Switch Ring
   - SFS: Signal Fail Span (4F only)
   - SFR: Signal Fail Ring
   - SDP: Signal Degrade Protection (4F only)
   - SDS: Signal Degrade Span (4F only)
   - SDR: Signal Degrade Ring
   - MSS: Manual Switch Span (4F only)
   - MSR: Manual Switch Ring
   - WTR: Wait to Restore
   - EXERS: Exerciser Span (4F only)
   - EXERR: Exerciser Ring
   - RRS: Reverse Request Span
   - RRR: Reverse Request Ring
   - NR: No Request.

   The value UNAVAILABLE is used in case of an pending SF condition.

   Range: LPS, FSS, FSR, SFS, SFR, SDP, SDS, SDR, MSS, MSR, WTR, EXERS, EXERR, RRS, RRR, NR, UNAVAILABLE.

   Default: NR.

9. **east** – East Port

   This parameter specifies the port being a member in the role of the east port for a 2-fibre MS-SPRing/BLSR protection group.

   Type: AID

   Range: SPortAID

10. **elprotnsw** – East Last protection switch Attempt

    This parameter specifies, whether the last switch request for the east side succeeded or not.

    The values have the following semantics:

    - SUCCESS: last request did succeed
    - DENY: last request was denied due a validation rule
    - FAILURE: last request could not be completed because far end node did not response with proper K-byte.

    Type: Alphanumeric value set.

    Range: SUCCESS, DENY, FAILURE

    Default: SUCCESS.

11. **eswreq** – East Switch Request State

    This parameter specifies the active switch request state of the protection state machine for the east side. If the east side is an associated side of a switching node, the value will be derived from the request currently associated with the concerned side, and accepted in the protocol as highest or coexisting priority. For all other cases, the value is 'NR'.

    It has the following values:

    - LPS: Lockout of Protection Span
    - FSR: Forced Switch of Service to Protection – Ring
    - SFR: Signal Fail – Ring
    - SDR: Signal Degrade – Ring
    - MSR: Manual Switch of Service to Protection – Ring
    - WTR: Wait to Restore
    - NR: No Request.

    Type: Alphanumeric value set.

    Range LPS, FSR, SFR, SDR, MSR, WTR, NR.

    Default: NR.

12. **pgrate** – protection group Rate

    This parameter is derived from the interface rate of the ports within the protection group. It indicates the same value as for the two ports.

    Type: Alphanumeric value set.

    Range: OC48, OC192, OC768, STM16, STM64, STM256

    Default: The default value is the interface rate of the east port.

13. **protype** – Protection Type

    This parameter specifies the type of the protection group. The value for the 2-fibre MS-SPRing/BLSR protection group is 2F.

    Type: Alphanumeric value set.

    Range: 2F.

14. **rcamode** – Ring Circuit Alarm Mode

    This parameter can be used to enable or disable ring circuit alarms for the local MS SPRING / BLSR protection group. Ring Circuit alarms are results of the ring circuit validation (Path Integrity Failure) and of the audit of the local squelch map (Local SQuelch Map Conflict). The parameter does not control the validation or audit itself, but only the associated alarming. If *rcamode* is DISABLED, any alarm associated with the local cross-connections will be suppressed and not issued.

    Type: Alphanumeric value set.

    Range: ENABLE (default), DISABLE

15. **rid** – Ring Identification

This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.

Type: text string of chars allowed for TID strings.

Range: 1 to 15 characters.

Default: NONE.

16. **`ringndst`** – Ring Node APS State

    This parameter specifies the ring node APS state.

    It shall have the following values under normal conditions: IDLE, SWITCHING, PASSTHROUGH

    It shall have in addition the following values if protection state machine is suspended: SUSPENDED-IDLE, SUSPENDED-SWITCHING, SUSPENDED-PASSTHROUGH

    Type: Alphanumeric value set.

    Range: IDLE, SWITCHING, PASSTHROUGH, SUSPENDED-IDLE, SUSPENDED-SWITCHING, SUSPENDED-PASSTHROUGH.

    Default: SUSPENDED-IDLE.

17. **`wapschst`** – Incoming West APS Channel Status

    This parameter is derived from the incoming K2 [6..8] overhead byte of the west port. It indicates the status as follows:

    - IDLE: Idle BRIDGED Bridged
    - BANDS: Bridged & Switched
    - XTRFC: Extra Traffic on protection channels
    - NOTUSED: Not Used – Reserved for future use
    - RDIL: RDI-L/MS-RDI (Remote Defect Indication – Line/Multiplex Section).
    - AISL: AIS-L/MS-AIS (Alarm Indication Signal – Line/Multiplex Section).

    Type: Alphanumeric value set.

    Range: IDLE, BRIDGED, BANDS, XTRFC, NOTUSED, RDIL, AISL.

    Default: IDLE.

18. **`wapsdnid`** – Incoming West APS Destination Node Id

    This parameter is derived from the incoming K1 [5..8] overhead byte of the west port. It specifies the node ID for which the K1 byte is destined. The value UNAVAILABLE is used in case of an pending SF condition.

    Type: Alphanumeric string.

    Range: 0-15 or UNAVAILABLE.

    Default: 0.

19. **`wapsprotn`** – Incoming West APS Protection Path

    This parameter is derived from the incoming K2 overhead byte of the west port.

It indicates the protection path as follows:

- 0: short path code (S)
- 1: long path code (L)

The value UNAVAILABLE is used in case of an pending SF condition.

Type: Alphanumeric value set.

Range: 0, 1, UNAVAILABLE.

Default: 0.

20. **wapssnid** – Incoming West APS Source Node Id

    This parameter is derived from the incoming K2 [1..4] overhead byte of the west port. It specifies the node ID which sourced the K1 byte. The value UNAVAILABLE is used in case of an pending SF condition.

    Type: Alphanumeric string.

    Range: 0-15 or UNAVAILABLE.

    Default: 0.

21. **wapssw** – Incoming West APS Switch Priority

    This parameter is derived from the incoming K1 [1..4] overhead byte of the west port. It indicates the switch priority/bridge request code as follows:

    - LPS: Lockout of Protection Span
    - FSS: Forced Switch Span (4F only)
    - FSR: Forced Switch Ring
    - SFS: Signal Fail Span (4F only)
    - SFR: Signal Fail Ring
    - SDP: Signal Degrade Protection (4F only)
    - SDS: Signal Degrade Span (4F only)
    - SDR: Signal Degrade Ring
    - MSS: Manual Switch Span (4F only)
    - MSR: Manual Switch Ring
    - WTR: Wait to Restore
    - EXERS: Exerciser Span (4F only)
    - EXERR: Exerciser Ring
    - RRS: Reverse Request Span
    - RRR: Reverse Request Ring
    - NR: No Request.

    The value UNAVAILABLE is used in case of an pending SF condition.

    Type: Alphanumeric value set.

    Range: LPS, FSS, FSR, SFS, SFR, SDP, SDS, SDR, MSS, MSR, WTR, EXERS, EXERR, RRS, RRR, NR, UNAVAILABLE.

    Default: NR.

22. **west** – West Port

This parameter specifies the port being a member in the role of the west port for a 2-fibre MS-SPRing/BLSR protection group.

Type: AID.

Range: SPortAID.

Default: None.

23. **wlprotnsw** – West Last protection switch Attempt

    This parameter specifies, whether the last switch request for the west side succeeded or not.

    The values have the following semantics:

    - SUCCESS: last request did succeed
    - DENY: last request was denied due a validation rule
    - FAILURE: last request could not be completed because far end node did not response with proper K-byte.

    Type: Alphanumeric value set.

    Range: SUCCESS, DENY, FAILURE

    Default: SUCCESS.

24. **wswreq** – West Switch Request State

    This parameter specifies the active switch request state of the protection state machine for the east side. If the east side is an associated side of a switching node, the value is derived from the request currently associated with the concerned side, and accepted in the protocol as highest or coexisting priority. For all other cases, the value is 'NR'.

    It have the following values:

    - LPS: Lockout of Protection Span
    - FSR: Forced Switch of Service to Protection – Ring
    - SFR: Signal Fail – Ring
    - SDR: Signal Degrade – Ring
    - MSR: Manual Switch of Service to Protection – Ring
    - WTR: Wait to Restore
    - NR: No Request.

    Type: Alphanumeric value set.

    Range LPS, FSR, SFR, SDR, MSR, WTR, NR.

    Default: NR.

25. **wtr** – Wait To Restore Time

    This parameter specifies the wait to restore time for ring switches used by the protection state machine operating in revertive mode. The protection operates in revertive mode if the wait-to-restore time is in the range 0-12. The protection operates in non-revertive mode if the wait-to-restore time has the value 99 representing the infinite value.

    Note: If *wtr* time is set to infinite, the switch request state is WTR until a higher request occurs.

    Type: numeric string [minute].

Range: 0 – 12 in 1 minute increments and 99.

Default: 5.

**Spec block parameters (4-fibre MS-SPRing/BLSR protection group)**

1. **ard** – Automatic Ring Discovery

   If this parameter is enabled, the automatic ring discovery algorithm will assign nodeID values to each node in the ring and construct the necessary ring map information. All nodes in the ring must support the Ring Discovery interworking. If disabled, the user will assign the NodeID value and supply the ring map information to each node on the ring for the BLSR protocol to operate. Until all nodes on the ring have the same ring map, nodes will have most likely an outstanding NodeID mismatch alarm active.

   Type: Alphanumeric string.

   Range: ENABLE, DISABLE.

   Default: ENABLE.

2. **asmc** – Automatic Squelch Map Calculation

   If this parameter is enabled, the automatic squelch map calculation is switched on. If disabled, the function is switched off.

   Type: Alphanumeric string.

   Range: ENABLE, DISABLE (default).

3. **blsrpn** – MS-SPRing-BLSR ASAP Pointer

   This parameter specifies the value for the ASAP (alarm severity assignment profile) name of type MS-SPRing-BLSR.

   Type: Alphanumeric string.

   Range: 1-24 characters including the character "-".

   Default: DEFAULT.

4. **eactunit** – East Active Unit State

   The parameter specifies whether the traffic associated with the east worker port is physically running over the east worker port (i.e. value WKG is used in that case) or over a protection port (i.e. value PROTN is used in that case). The protection port can be the east protection port in case of span switch or the west protection port in case of a loopback switch. The value of the parameter is derived from the internal handled active line state of the service port and the active line state of the protection ports. *eactunit* = WKG: active line state of east worker port is active. *eactunit* = PROTN: active line state of east worker port is standby.

   Type: Alphanumeric value set.

   Range: WKG, PROTN.

   Default: WKG.

5. **eapschst** – Incoming East APS Channel Status

   This parameter is derived from the incoming K2 [6..8] overhead byte of the east port. It indicates the status as follows:

   - IDLE: Idle
   - BRIDGED: Bridged
   - BANDS: Bridged & Switched

- XTRFC: Extra Traffic on protection channels
- NOTUSED: Not Used – Reserved for future use
- RDIL: RDI-L/MS-RDI (Remote Defect Indication -Line/MultiplexSection)
- AISL: AIS-L/MS-AIS (Alarm Indication Signal – Line/Multiplex Section)
- Extension for TOP-EX

  In case of *protnmode* = TOPEX the following additional value is supported: (ACT) command to ACT to complete the Switch.

Type: Alphanumeric value set.
Range: IDLE, BRIDGED, BANDS, XTRFC, NOTUSED, ACT, RDIL, AISL.
Default: IDLE.

6. **eapsdnid** – Incoming East APS Destination Node Id

   This parameter is derived from the incoming K1 [5..8] overhead byte of the east port. It specifies the node ID for which the K1 byte is destined.
   The value UNAVAILABLE is used in case of an pending SF condition.
   Type: Alphanumeric string.
   Range: 0-15 or UNAVAILABLE.
   Default: 0.

7. **eapsprotn** – Incoming East APS Protection Path

   This parameter is derived from the incoming K2 overhead byte of the east port.
   It indicates the protection path as follows:

   - 0: short path code (S)
   - 1: long path code (L)

   The value UNAVAILABLE is used in case of an pending SF condition.
   Type: Alphanumeric value set.
   Range: 0, 1, UNAVAILABLE.
   Default: 0.

8. **eapssnid** – Incoming East APS Source Node Id

   This parameter is derived from the incoming K2 [1..4] overhead byte of the east port. It specifies the node ID which sourced the K1 byte.
   The value UNAVAILABLE is used in case of an pending SF condition.
   Type: Alphanumeric string.
   Range: 0-15 or UNAVAILABLE.
   Default: 0.

9. **eapssw** – Incoming East APS Switch Priority

   This parameter is derived from the incoming K1 [1..4] overhead byte of the east port.
   It indicates the switch priority/bridge request code as follows:

   - LPS: Lockout of Protection Span
   - FSS: Forced Switch Span (4F only)
   - FSR: Forced Switch Ring
   - SFS: Signal Fail Span (4F only)

- SFR: Signal Fail Ring
- SDP: Signal Degrade Protection (4F only)
- SDS: Signal Degrade Span (4F only)
- SDR: Signal Degrade Ring
- MSS: Manual Switch Span (4F only)
- MSR: Manual Switch Ring
- WTR: Wait to Restore
- EXERS: Exerciser Span (4F only)
- EXERR: Exerciser Ring
- RRS: Reverse Request Span
- RRR: Reverse Request Ring
- NR: No Request.

The value UNAVAILABLE is used in case of an pending SF condition.

The bridge request LPS and SFP (Signal Fail Protection) share a common code value. Therefore they cannot be distinguished. The value 'LPS' will be used in that context.

Type: Alphanumeric value set.

Range: LPS, FSS, FSR, SFS, SFR, SDP, SDS, SDR, MSS, MSR, WTR, EXERS, EXERR, RRS, RRR, NR, UNAVAILABLE.

Default: NR.

10. **eastprotn** – East Protection Port

    This parameter shall specifies the port being a member in the role of the east protection port for a 4-fibre MS-SPRing/BLSR protection group.

    Type: AID

    Range: SPortAID

11. **eastwkg** – East Worker Port

    This parameter specifies the port being a member in the role of the east worker port for a 4-fibre MS-SPRing/BLSR protection group.

    Type: In case of an asymmetric ring: alphanumeric string; in all other cases: AID.

    Range: In case of an asymmetric ring: NOTUSED. In all other cases: SPortAID.

12. **elprotnsw** – East Last protection switch Attempt

    This parameter specifies, whether the last switch request for the east side succeeded or not.

    The values have the following semantics:

    - SUCCESS: last request did succeed
    - DENY: last request was denied due a validation rule
    - FAILURE: last request could not be completed because far end node did not response with proper K-byte.

    Type: Alphanumeric value set.

    Range: SUCCESS, DENY, FAILURE.

    Default: SUCCESS.

13. **eswreq** – East Switch Request State

    This parameter specifies the active switch request state of the protection state machine for the east side. If the east side is an associated side of a switching node, the value is derived from the request currently associated with the concerned side, and accepted in the protocol as highest or coexisting priority. For all other cases, the value is 'NR'.

    It has the following values:

    - LPS: Lockout of Protection Span
    - FSS: Forced Switch of Service to Protection – Span
    - FSR: Forced Switch of Service to Protection – Ring
    - SFS: Signal Fail – Span
    - SFR: Signal Fail – Ring
    - SDS: Signal Degrade – Span
    - SDR: Signal Degrade – Ring
    - SDP : Signal Degrade – Protection
    - MSS: Manual Switch of Service to Protection – Span
    - MSR: Manual Switch of Service to Protection – Ring
    - WTR: Wait to Restore
    - NR: No Request.

    Type: Alphanumeric value set.

    Range: LPS, FSS, FSR, SFS, SFR, SDS, SDR, SDP, MSS, MSR, WTR, NR The bridge request LPS and SFP (Signal Fail Protection) share a common code value. Therefore they cannot be distinguished. The value 'LPS' will be used in that context.

    Default: NR.

14. **pgrate** – protection group rate

    This parameter is derived from the interface rate of the ports within the protection group. It indicates the same value as for the four ports.

    Type: Alphanumeric value set.

    Range: OC48, OC192, STM16, STM64.

    If *protnmode* = TOPEX, then the range is restricted to: STM64 only

    Default: The default value is the interface rate of the east port.

15. **protnmode** – Protection Switch Mode

    The parameter specifies the protection switch mode. The value LOOPBACK is used for the classical ring application. The value SHORTENED is used for transmission delay sensitive applications.

    In case of a ring switch … LOOPBACK performs the bridge and switch function in that nodes which are most close to the failed span. SHORTENED performs the bridge function at the add node repectively the switch function at the drop node of each ring circuit.

    Type: Alphanumeric value set.

    Range: LOOPBACK, SHORTENED

    Default: LOOPBACK.

16. **protype** – Protection Type

    This parameter specifies the type of the protection group. The value for the 4-fibre MS-SPRing/BLSR protection group is 4F.

    Type: Alphanumeric value set.

    Range: 4F.

17. **rcamode** – Ring Circuit Alarm Mode

    This parameter can be used to enable or disable ring circuit alarms for the local MS SPRING / BLSR protection group. Ring Circuit alarms are results of the ring circuit validation (Path Integrity Failure) and of the audit of the local squelch map (Local SQuelch Map Conflict). The parameter does not control the validation or audit itself, but only the associated alarming. If *rcamode* is DISABLED, any alarm associated with the local cross-connections will be suppressed and not issued.

    Type: Alphanumeric value set.

    Range: ENABLE (default), DISABLE

18. **rid** – Ring Identification

    This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.

    Type: text string of chars allowed for TID strings.

    Range: 1 to 15 characters.

    Default: NONE

19. **ringndst** – Ring Node APS State

    This parameter specifies the ring node APS state.

    It shall have the following values under normal conditions: IDLE, SWITCHING, PASSTHROUGH

    It shall have in addition the following values if protection state machine is suspended: SUSPENDED-IDLE, SUSPENDED-SWITCHING, SUSPENDED-PASSTHROUGH.

    Type: Alphanumeric value set.

    Range: IDLE, SWITCHING, PASSTHROUGH, SUSPENDED-IDLE, SUSPENDED-SWITCHING, SUSPENDED-PASSTHROUGH.

    Default: SUSPENDED-IDLE.

20. **swtr** – Span Wait To Restore Time

    The parameter specifies the wait to restore time for span switches used by the protection state machine operating in revertive mode. The protection shall operate in revertive mode if the wait-to-restore time is in the range 0-12. The protection shall operate in non-revertive mode if the wait-to-restore time has the value 99 representing the infinite value.

    Note: If *wtr* time is set to infinite, the switch request state is WTR until a higher request occurs.

    Type: numeric string [minute].

    Range: 0 – 12 in 1 minute increments and 99.

Default: 5.

21. **wactunit** – West Active Unit State

    The parameter specifies whether the traffic associated with the west worker port is physically running over the west worker port (i.e. value WKG is used in that case) or over a protection port (i.e. value PROTN is used in that case). The protection port can be the west protection port in case of span switch or the east protection port in case of a loopback switch. The value of the parameter is derived from the internal handled active line state of the service port and the active line state of the protection ports. wactunit = WKG: active line state of west worker port is active wactunit = PROTN: active line state of west worker port is standby.

    Type: Alphanumeric value set.

    Range: WKG, PROTN.

    Default: WKG.

22. **wapschst** – Incoming West APS Channel Status

    This parameter is derived from the incoming K2 [6..8] overhead byte of the west port. It indicates the status as follows:

    - IDLE: Idle
    - BRIDGED: Bridged
    - BANDS: Bridged & Switched
    - XTRFC: Extra Traffic on protection channels
    - NOTUSED: Not Used – Reserved for future use
    - RDIL: RDI-L/MS-RDI (Remote Defect Indication – Line/Multiplex Section)
    - AISL: AIS-L/MS-AIS (Alarm Indication Signal – Line/Multiplex Section)
    - Extension for TOP-EX

      In case of *protnmode* = TOPEX the following additional value is supported: (ACT) command to ACT to complete the Switch.

    Type: Alphanumeric value set.

    Range: IDLE, BRIDGED, BANDS, XTRFC, NOTUSED, ACT, RDIL, AISL.

    Default: IDLE.

23. **wapsdnid** – Incoming West APS Destination Node Id

    This parameter is derived from the incoming K1 [5..8] overhead byte of the west port. It specifies the node ID for which the K1 byte is destined. The value UNAVAILABLE is used in case of an pending SF condition.

    Type: Alphanumeric string.

    Range: 0-15 or UNAVAILABLE.

    Default: 0.

24. **wapsprotn** – Incoming West APS Protection Path

    This parameter is derived from the incoming K2 overhead byte of the west port. It indicates the protection path as follows:

    - 0: short path code (S)
    - 1: long path code (L)

The value UNAVAILABLE is used in case of an pending SF condition.

Type: Alphanumeric value set.

Range: 0, 1, UNAVAILABLE.

Default: 0.

25. **wapssnid** – Incoming West APS Source Node Id

    This parameter is derived from the incoming K2 [1..4] overhead byte of the west port. It specifies the node ID which sourced the K1 byte. The value UNAVAILABLE is used in case of an pending SF condition.

    Type: Alphanumeric string.

    Range: 0-15 or UNAVAILABLE.

    Default: 0.

26. **wapssw** – Incoming West APS Switch Priority

    This parameter is derived from the incoming K1 [1..4] overhead byte of the west port. It indicates the switch priority/bridge request code as follows:

    - LPS: Lockout of Protection Span
    - FSS: Forced Switch Span
    - FSR: Forced Switch Ring
    - SFS: Signal Fail Span
    - SFR: Signal Fail Ring
    - SDP: Signal Degrade Protection
    - SDS: Signal Degrade Span
    - SDR: Signal Degrade Ring
    - MSS: Manual Switch Span
    - MSR: Manual Switch Ring
    - WTR: Wait to Restore
    - EXERS: Exerciser Span
    - EXERR: Exerciser Ring
    - RRS: Reverse Request Span
    - RRR: Reverse Request Ring
    - NR: No Request

    The value UNAVAILABLE is used in case of an pending SF condition.

    The bridge request LPS and SFP (Signal Fail Protection) share a common code value. Therefore they cannot be distinguished. The value 'LPS' will be used in that context.

    Type: Alphanumeric value set.

    Range: LPS, FSS, FSR, SFS, SFR, SDP, SDS, SDR, MSS, MSR, WTR, EXERS, EXERR, RRS, RRR, NR, UNAVAILABLE.

    Default: NR.

27. **westprotn** – West Protection Port

This parameter specifies the port being a member in the role of the west protection port for a 4-fibre MS-SPRing/BLSR protection group.

Type: AID

Range: SPortAID

28. **`westwkg`** – West Worker Port

    This parameter specifies the port being a member in the role of the west worker port for a 4-fibre MS-SPRing/BLSR protection group

    Type: In case of an asymmetric ring: alphanumeric string; in all other cases: AID

    Range: In case of an asymmetric ring: NOTUSED; in all other cases: SPortAID.

29. **`wlprotnsw`** – West Last protection switch Attempt

    This parameter specifies, whether the last switch request for the west side succeeded or not.

    The values have the following semantics:

    - SUCCESS: last request did succeed
    - DENY: last request was denied due a validation rule
    - FAILURE: last request could not be completed because far end node did not response with proper K-byte

    Type: Alphanumeric value set.

    Range: SUCCESS, DENY, FAILURE.

    Default: SUCCESS.

30. **`wswreq`** – West Switch Request State

    This parameter specifies the active switch request state of the protection state machine for the east side. If the east side is an associated side of a switching node, the value is derived from the request currently associated with the concerned side, and accepted in the protocol as highest or coexisting priority. For all other cases, the value is 'NR'.

    It have the following values:

    - LPS: Lockout of Protection Span
    - FSS: Forced Switch of Service to Protection – Span
    - FSR: Forced Switch of Service to Protection – Ring
    - SFS: Signal Fail – Span
    - SFR: Signal Fail – Ring
    - SDS: Signal Degrade – Span
    - SDR: Signal Degrade – Ring
    - SDP: Signal Degrade – Protection
    - MSS: Manual Switch of Service to Protection – Span
    - MSR: Manual Switch of Service to Protection – Ring
    - WTR: Wait to Restore
    - NR: No Request.

    Type: Alphanumeric value set.

Range LPS, FSS, FSR, SFS, SFR, SDS, SDR, SDP, MSS, MSR, WTR, NR The bridge request LPS and SFP (Signal Fail Protection) share a common code value. Therefore they cannot be distinguished. The value 'LPS' will be used in that context.

Default: NR.

31. **wtr** – Wait To Restore Time

    This parameter specifies the wait to restore time for ring switches used by the protection state machine operating in revertive mode. The protection operates in revertive mode if the wait-to-restore time is in the range 0-12. The protection operates in non-revertive mode if the wait-to-restore time has the value 99 representing the infinite value.

    Note: If wtr time is set to infinite, the switch request state is WTR until a higher request occurs.

    Type: numeric string [minute].

    Range: 0 – 12 in 1 minute increments and 99.

    Default: 5.

**Spec block parameters (path protection group)**

1. **cst** – Constituent Signal Type

   This parameter specifies the rate of the path protection group.

   Type: Alphanumeric value set.

   Range: LOVT1, STS1, STS3C, STS12C, STS48C, STS192C, LOVC12, LOVC3, VC3, VC4, VC44C, VC416C, VC464C

2. **dripathpn** – SNCP-UPSR ASAP Pointer

   This parameter specifies the value for the ASAP (alarm severity assignment profile) name of type SNCP-UPSR.

   Type: Alphanumeric string.

   Range: 1-24 characters including the character “-”.

   Default: DEFAULT.

3. **htmr** – Hold-Off Time

   This parameter specifies the hold-off time for automatic protection switching used by the protection state machine.

   Type: numeric string [ms].

   Range for high order path protection groups: 0 .. 99 ms in 1 ms steps and 100 .. 10000 ms in 100 ms steps.

   Range for low order path protection groups: 0, 25, 50, 75 ms (in steps of 25 ms) and 100 .. 10000 ms in 100 ms steps.

4. **ppgname** – Path protection group Name

   This parameter specifies the path protection group name. Storage and retrieval of the *ppgname* is case sensitive, but actual use of the *ppgname* to determine the corresponding protection group is case insensitive.

   This parameter is omitted for low order path protection groups.

   Type: text string.

   Range: 0 to 24 characters.

   Default: empty string

5. **protn** – Protection Tributary

   This parameter specifies the protection input tributary AID being a member of the path protection group.

   Type: AID.

   Range: STS1NumAID or VCGNumAID or GenLOTribAID or TMuxAPTNumAID.

   The usage of wild cards is not allowed for any part of the AID.

6. **protype** – Protection Type

   This parameter specifies the type of the protection group. The value for the path protection group is PATHDRI.

   Type: Alphanumeric value set.

   Range: PATHDRI.

   Default: PATHDRI.

7. **rme** – Protection Reversion

   This parameter specifies, whether revertive or non-revertive mode is used as operation mode of the protection group.

   The value ENABLE is used if the protection operates in revertive mode.

   The value DISABLE is used if the protection operates in non-revertive mode.

   Type: Alphanumeric value set.

   Range: ENABLE, DISABLE.

8. **snctype** – SNC Protection Type

   This parameter specifies the type of the path protection w.r.t. switch criteria used by the protection state machine.

   The value SNCI (Inherent) is used if server signal fail is used as switch criteria.

   The value SNCN (Non-Instrusive) is used if server signal fail and defects supervised by a non-intrusive path monitor are used as switch criteria

   The value NA is used if one of the tributary inputs is related to a port operating in SONET mode.

   Type: Alphanumeric value set.

   Range: SNCI, SNCN, NA.

9. **wkg** – Worker Tributary

   This parameter specifies the worker input tributary AID being a member of the path protection group.

   Type: AID.

   Range: STS1NumAID or VCGNumAID or GenLOTribAID or TMuxAPTNumAID.

   The usage of wild cards is not allowed for any part of the AID.

10. **wtr** – Wait To Restore Time

    This parameter specifies the wait to restore time used by the protection state machine operating in revertive mode.

    Type: numeric string [minute].

    Range: 0 – 60.

### CML Block parameters (path protection group)

The CML (Constituent Member List) block is only used in the context of the path protection group. One block will be returned for each constituent signal within the protection group.

1. **actunit** – Active Unit State

   This parameter specifies which input tributary is currently selected within the protection group as active input.

   The value WKG specifies that the worker tributary is active.

   The value PROTN specifies that the protection tributary is active.

   Type: Alphanumeric value set.

   Range: WKG, PROTN.

   Default: WKG.

2. **actunitaid** – Active Unit State AID

   This parameter specifies the input tributary AID of the constituent signal which is currently selected within the protection group as active input for the dedicated constituent tributary output (see parameter outtribaid).

   Type: AID.

   Range: STS1NumAID or VCGNumAID or GenLOTribAID.

   The usage of wild cards is not allowed for any part of the AID.

   Default: AID of the worker tributary.

3. **cst** – Constituent Signal Type

   This parameter specifies the rate of the constituent signal within the path protection group.

   Type: Alphanumeric value set.

   Range: LOVT1, STS1, STS3C, STS12C, STS48C, STS192C, LOVC12, LOVC3, VC3, VC4, VC44C, VC416C, VC464C.

   Default: The default value is derived from the tributary input signal rate list in case of fixed mode.

4. **protnsiglvl** – Protection Fault Status

   This parameter specifies the current fault status w.r.t. tributary as used by the protection state machine.

   The value SF (Signal Fail) is used if a defect defined as signal fail condition is currently present for the protection tributary.

   The value SD (Signal Degrade) is used if a defect defined as signal degrade condition is currently present for the protection tributary.

   The value NONE is used if no such defect is currently present.

   Type: Alphanumeric value set.

   Range: SF, SD, NONE.

   Default: NONE.

5. **swreq** – Switch Request State

   This parameter specifies the current switch request state of the protection state machines.

It have the following values:

- LO: Lockout of Protection
- FS: Forced Switch
- MS: Manual Switch
- SF: Signal Fail
- SD: Signal Degrade
- WTR: Wait to restore (only used if protection group is revertive)
- NR: No Request.

Type: Alphanumeric value set.
Range: LO ,FS, MS, SF, SD , WTR, NR.
Default: NR.

6. **wkgsiglvl** – Worker Fault Status

   This parameter specifies the current fault status w.r.t. tributary as used by the protection state machine.
   The value SF (Signal Fail) is used if a defect defined as signal fail condition is currently present for the worker tributary.
   The value SD (Signal Degrade) is used if a defect defined as signal degrade condition is currently present for the worker tributary.
   The value NONE is used if no such defect is currently present.
   Type: Alphanumeric value set.
   Range: SF, SD, NONE.
   Default: NONE.

## Detailed behavior description

The system shall allow to retrieve path protection groups at VCG tributaries using the AID format of an AU-3/STS-1 Tributary. I.e. the VCG number specified in the port field of the AID is allowed with or without the leading "v".

## Example input/output

### 1+1 Equipment Protection Group

The following example retrieves 1+1 equipment protection group information:

```
RTRV-PROTN-GRP:LT-UNITE:1-1-estgrp:123456::EQPTSWFBR;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   "1-1-estgrp:protype=EQPTSWFBR,wkg=1-1-#-#-xcw-cp,protn=1-1-#-#-xcp-cp,
   actunit=
WKG,protnsiglvl=NONE,wkgsiglvl=NONE,swreq=NR"
;
```

The following example retrieves 1+1 equipment protection group information for the Duplex Control Protection Group while both NVMs are fully synchronized:

```
RTRV-PROTN-GRP:LT-UNITE:1-1-ectlgrp:123456::EQPTCTL;
   LT-UNITE 06-10-11 11:15:00
M  123456 COMPLD
   "1-1-ectlgrp:protype=EQPTCTL,actunit=WKG,nvmadate=06-10-11,
   nvmatime=09-17-43,nvmsdate=06-10-11,nvmstime=09-17-43,nvmstat=INSYNC,
   protn=1-1-#-#-ctlp-cp,protnsiglvl=NONE,swreq=NR,wkg=1-1-#-#-ctlw-cp,
   wkgsiglvl=NONE"
;
```

The following example retrieves TransMUX equipment protection group information:

```
RTRV-PROTN-GRP:UNITE-NE:1-1-etmux01:123456::EQPTTMUX;
   UNITE-NE 07-12-21 09:00:00
M  123456 COMPLD
   "1-1-etmux01:protype=EQPTTMUX,wkg=1-1-#-#-21-cp,protn=1-1-#-#-22-cp,
   actunit=
WKG,protnsiglvl=NONE,wkgsiglvl=NONE,swreq=NR"
;
```

### Multiplex section/line protection group (1+1)

The following example retrieves 1+1 multiplex section/line protection group information:

```
RTRV-PROTN-GRP:LT-UNITE:1-1-o001:123456::1+1;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   "1-1-o01:protype=1+1,wkg=1-1-#-#-13-1,protn=1-1-#-#-14-1,wtr=5,
   apspn=DEFAULT, dcclmsprotmd=DISABLE,dccsrsprotmd=DISABLE,protocol=1+1_UNI,
   rme= DISABLE,swreq=NR,actunit=WKG,actunitfe=WKG, actunitne=WKG,aps=NR,
   apsout=NR,pgrate=OC192,wkgsiglvl=NONE,protnsiglvl=NONE"
;
```

The following example retrieves 1+1 optimized multiplex section/line protection group information:

```
RTRV-PROTN-GRP:LT-UNITE:1-1-o001:123456::1+1;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   "1-1-o001:protype=1+1,wkg=1-1-#-#-13-1,protn=1-1-#-#-14-1,wtr=5,
   apspn=DEFAULT, dcclmsprotmd=DISABLE,dccsrsprotmd=DISABLE,protocol=1+1_OPTM,
   rme= DISABLE,swreq=NR,ssi=WKG,actunit=WKG,actunitfe=NONE, actunitne=WKG,
   aps=NR,apsout=NR,pgrate=STM64,wkgsiglvl=NONE,protnsiglvl=NONE"
;
```

### 2 fibre MS-SPRing/BLSR protection group

The following example retrieves 2F MS-SPRing/BLSR protection group information:

```
RTRV-PROTN-GRP:LT-UNITE:1-1-t001:123456::2F;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   "1-1-t001:protype=2F,east=1-1-#-#-13-1,west=1-1-#-#-14-1,rid=\"denver\",
   wtr=5, blsrpn=DEFAULT,eswreq=NR,wswreq=NR,pgrate=OC192,eapschst=IDLE,
   eapsdnid=0, eapsprotn=0,eapssnid=0,eapssw=NR,elprotnsw=SUCCESS,
   ringndst=IDLE,wapschst=IDLE, wapsdnid=0,wapsprotn=0,wapssnid=0,wapssw=NR,
   wlprotnsw=SUCCESS"
;
```

### 4 fibre MS-SPRing/BLSR protection group

The following example retrieves 4F MS-SPRing/BLSR protection group information:

```
RTRV-PROTN-GRP:LT-UNITE:1-1-f001:123456::4F;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   "1-1-f001:protype=4F,eastwkg=1-1-#-#-13-1,eastprotn=1-1-#-#-15-1,
   westwkg=1-1-#-#-14-1, westwkg=1-1-#-#-16-1,rid=\"denver\",
   protnmode=LOOPBACK,swtr=5,wtr=5, blsrpn=DEFAULT,eswreq=NR,eactunit=WKG,
   wswreq=NR, wactunit=WKG,pgrate=OC192,eapschst=IDLE,eapsdnid=0, eapsprotn=0,
   eapssnid=0,eapssw=NR,elprotnsw=SUCCESS,ringndst=IDLE,wapschst=IDLE,
    wapsdnid=0,wapsprotn=0,wapssnid=0,wapssw=NR,wlprotnsw=SUCCESS"

;
```

## Path protection group

Constituent Member List – Path protection group Examples: To help understand a PATHDRI examples that will be given below, it will be helpful to summarize some facts pertaining to DRIs. The first output line for a PATHDRI gives information about the DRI as a entity.

The following output line gives information about the constituent members. Even for a fixed rate path DRI, there will be two output lines. The constituent member that is described by the second line will have a rate equal to the DRIs rate.

A path DRI has two input legs, one referred to as the working leg and the other as the protection leg. It is possible for RTRV-PROTN-GRP to indicate some constituent members have been selected from the working leg while others have been selected from

the protection leg. To determine whether or not all constituent members have been selected from the same leg, it is necessary to look at the *actunitaid* for each constituent member and determine if they are from the same leg.

Constituent Member List – Path protection group example for fixed mode :

```
RTRV-PROTN-GRP:LT-UNITE:1-1-#-#-10-1-25:123456::PATHDRI;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   "1-1-#-#-10-1-25:protype=PATHDRI,cst=STS12C,wkg=1-1-#-#-08-1-25,
   protn=1-1-#-#-06-1-1,ppgname=\"group018\",htmr=100,wtr=5,dripathpn=path2,
   rme=DISABLE,snctype=NA"
   "1-1-#-#-10-1-25,CML:cst=STS12C,swreq=NR,actunit=WKG,actuni
taid=1-1-#-#-08-1-25,wkgsiglvl=NONE,protnsiglvl=NONE"
;
```

Constituent Member List – Path protection group example for pipe mode: The examples shows an STS12 pipe with 10 constituent members.

```
RTRV-PROTN-GRP:LT-UNITE:1-1-#-#-10-1-25:123456::PATHDRI;
   LT-UNITE 05-05-31 08:00:00
M  123456 COMPLD
   "1-1-#-#-10-1-25: protype=PATHDRI,htmr=100,rme=ENABLE,
    ppgname=\"group019\",wtr=5,dripathpn=path2,cst=STS12C,wkg=1-1-#-#
-08-1-25,protn=1-1-#-#-06-1-1,snctype=NA"
   "1-1-#-#-10-1-25,CML:cst=STS1,swreq=NR,actunit=WKG,actuni
taid=1-1-#-#-08-1-25,wkgsiglvl=NONE,protnsiglvl=NONE"
   "1-1-#-#-10-1-26,CML:cst=STS1,swreq=SF,actunit=PROTN,actu
nitaid=1-1-#-#-06-1-2,wkgsiglvl=SF,protnsiglvl=NONE"
   "1-1-#-#-10-1-27,CML:cst=STS1,swreq=NR,actunit=WKG,actuni
taid=1-1-#-#-08-1-27,wkgsiglvl=NONE,protnsiglvl=NONE"
   "1-1-#-#-10-1-28,CML:cst=STS3C,swreq=SF,actunit=PROTN,actunitaid
=1-1-#-#-06-1-4,wkgsiglvl=SF,protnsiglvl=NONE"
   "1-1-#-#-10-1-31,CML:cst=STS1,swreq=SD,actunit=PROTN,actunitaid=
1-1-#-#-06-1-7,wkgsiglvl=SD,protnsiglvl=NONE"
   "1-1-#-#-10-1-32,CML:cst=STS1,swreq=NR,actunit=WKG,actuni
taid=1-1-#-#-08-1-32,wkgsiglvl=NONE,protnsiglvl=NONE"
   "1-1-#-#-10-1-33,CML:cst=STS1,swreq=NR,actunit=WKG,actuni
taid=1-1-#-#-08-1-33,wkgsiglvl=NONE,protnsiglvl=NONE"
   "1-1-#-#-10-1-34,CML:cst=STS1,swreq=NR,actunit=WKG,actuni
taid=1-1-#-#-08-1-34,wkgsiglvl=NONE,protnsiglvl=NONE"
   "1-1-#-#-10-1-35,CML:cst=STS1,swreq=NR,actunit=PROTN,actu
nitaid=1-1-#-#-06-1-11,wkgsiglvl=NONE,protnsiglvl=NONE"
   "1-1-#-#-10-1-36,CML:cst=STS1,swreq=NR,actunit=WKG,actuni
taid=1-1-#-#-08-1-36,wkgsiglvl=NONE,protnsiglvl=NONE"
;
```

Low Order Path Protection Group Example:

```
RTRV-PROTN-GRP:LT-UNITE:1-1-#-#-39-16-3-28:123456::PATHDRI;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   "1-1-#-#-39-16-3-28:protype=PATHDRI,cst=LOVT1,wkg=1-1-#-#-39-14-3-28,\
    protn=1-1-#-#-39-15-3-28, htmr=75,wtr=5,dripathpn=path2,\
    rme=DISABLE,snctype=NA"
   "1-1-#-#-39-16-3-28,CML:cst=LOVT1,swreq=NR,actunit=WKG,\
    actunitaid=1-1-#-#-39-14-3-28,wkgsiglvl=NONE,protnsiglvl=NONE"
;
```

Example for Path Protection Group Retrieval using *aid* and *aid1* for addressing via input tributaries:

In this example there exist two path protection groups on the same pair of input tributaries 1-1-#-#-8-1-25 and 1-1-#-#-6-1-25 forming an emulated selector bridge. The output tributary for one of these groups is 1-1-#-#-10-1-25 and for the other one it is 1-1-#-#-4-1-25.

Both groups will be reported after this request. Note, that the parameter values for both groups are identical.

```
RTRV-PROTN-GRP:LT-UNITE:1-1-#-#-8-1-25:123456::
               PATHDRI,,,1-1-#-#-6-1-25;
   LT-UNITE 98-01-01 08:00:00
M  123456 COMPLD
   "1-1-#-#-10-1-25:protype=PATHDRI,cst=STS12C,wkg=1-1-#-#-08-1-25,
   protn=1-1-#-#-06-1-25,ppgname=\"group018\",htmr=100,wtr=5,
   dripathpn=path2,rme=DISABLE,snctype=NA"
   "1-1-#-#-10-1-25,CML:cst=STS12C,swreq=NR,actunit=WKG,
   actunitaid=1-1-#-#-08-1-25,wkgsiglvl=NONE,protnsiglvl=NONE"
   "1-1-#-#-4-1-25:protype=PATHDRI,cst=STS12C,wkg=1-1-#-#-08-1-25,
   protn=1-1-#-#-06-1-25,ppgname=\"group018\",htmr=100,wtr=5,
   dripathpn=path2,rme=DISABLE,snctype=NA"
   "1-1-#-#-4-1-25,CML:cst=STS12C,swreq=NR,actunit=WKG,
   actunitaid=1-1-#-#-08-1-25,wkgsiglvl=NONE,protnsiglvl=NONE"
;
```

## Error responses (general)

### Validation rule: consistent *aid* and *protype*

If a range is specified for *aid* and *protype* is not consistent with that AID (for example, an AID of 1-1-fall and a protype value of 2F), then the following error response is returned.

Error code:

```
IDNV – Input, Data Not Valid, inconsistent aid and protype
```

### Error responses (2-/4-fibre MS-SPRing/BLSR protection group)

#### Validation rule: consistent *aid* and *rid*

If both an *aid* and an *rid* are specified as input parameters and they are inconsistent, then the following error response is returned

Error code: `IDNV – Input, Data Not Valid, inconsistent aid and rid`

#### Validation rule: *aid* range and *rid*

Validation rule: If a range is specified for *aid* and an *rid* is also specified as input parameters, then the following error response is returned:

Error code:
`IDNV – Input, Data Not Valid, no aid range in combination with rid`

### Error responses (path protection group)

#### Validation rule: *ppgname* and low order path protections

If a *ppgname* is given as input parameter while the *aid* references a low order tributary, then the following error response is returned:

Error code:
`IDNV – Input, Data Not Valid, ppgname not supported for this transmission rate`

#### Validation rule: *ppgname* and *aid1*

If a *aid1* is given as input parameter and additionally a value is given for parameter *ppgname*, then the following error response is returned:

Error code:
`IDNV – Input, Data Not Valid, ppgname not allowed if aid1 is given`

#### Validation rule: No wildcarding on access via *aid* and *aid1*

If *aid* and *aid1* is given as input parameters for accessing via input tributaries and wildcarding is used for any of both, then the following error response is returned:

Error code:
`IDNV – Input, Data Not Valid, No wildcarding for access via input tribs`

### Wrong system behavior

If 4F is used in the **RTRV-PROTN-GRP** command line although the used port AID belongs to a 2F protection group, or if 2F is used in the **RTRV-PROTN-GRP** command line although the used port AID belongs to a 4F protection group, the system shows a wrong behavior. Expected is an empty COMPLD report, however the command COMPLDs *and* the 2F/4F group is displayed.

# RTRV-PTF: Retrieve tributary with path termination function

The **RTRV-PTF** command retrieves the attributes of a tributary with path termination function (PTF).

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-PTF**-*modifier:tid:aid:ctag[:::spec_block];*

## Input parameters

### Command parameters

1. **modifier**

   The modifier specifies the type of the tributary. The purpose is to distinguish the standard and type of the PTF.

   Type: Alphanumeric value set.

   Range:

   - ALL
   - STS for DS3 card
   - HOSTS1 for LOXC card
   - HOVC4 for LOXC card
   - TMASTS1 for TransMUX asynchronous port
   - TMSSTS1 for TransMUX synchronous port

   The value **ALL** is used to retrieve all path terminations providing lower-order tributaries independent from the interface standard (for example, HOSTS1 and HOVC4).

   The following path terminations are not included:

   - path terminations related to DS3
   - path terminations related to TransMUX ports.

2. **tid** – Target Identifier

   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

3. **aid** – Access Identifier

   AID of a PTF tributary. The keyword **all** is allowed on slot, port and tributary level.

The so called "dynamic parameters" is not reported, if a **all** is used at the tributary level. The "dynamic parameters" are:

- *ptrc*, *ptrcst*, *rsiglb*, *trailstate*

Type: AID

Range:

- PTNumAID for modifier: STS, HOSTS1, HOVC4, ALL
- TMuxAPTNumAID for modifier: TMASTS1
- TMuxSPTNumAID for modifier: HOSTS1, TMSSTS1

as defined in AID structure with exception of value **all**.

4. **ctag** – Correlation Tag

   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

### Spec block parameters

1. **dyn** – Retrieve Dynamic Parameters

   This parameter controls whether dynamic parameters are reported with the command reply or not. It is given only when using any of the wildcard values all, usall or vall at the appropriate positions of the input AID. For input AIDs not using all, usall or vall this parameter is not allowed.

   The following output parameters of a PTF tributary are affected:

   - *ptrc*, *ptrcst*, *rsiglb*, *trailstate*

   Type: Alphanumeric value set.

   Range:

   - YES: Report dynamic parameters in the reply as well
   - NO (default): Do not report dynamic parameters in the reply.

## Output format

If the NE fully complies with the **RTRV-PTF** request, the following normal completion response is returned:

```
sid date time
M  ctag COMPLD
   "aid,aidtype::spec_block"
       ...
       ...
   "aid,aidtype::spec_block"
;
```

## Output parameters

### Command parameters

1. **aid** – Access Identifier

The access identifier specifies the PTF tributary whose attributes are reported.
Type: AID
Range:

- TNumAID for modifier: STS, HOSTS1, HOVC4, ALL
- TMuxAPTNumAID for modifier: TMASTS1
- TMuxSPTNumAID for modifier: HOSTS1, TMSSTS1

as defined in AID structure with exception of value **all**.

2. **aidtype** – Access Identifier Type
   The *aidtype* specifies the type of the tributary.
   Type: Alphanumeric value set.
   Range:
   - STS
   - HOSTS1
   - HOVC4
   - TMASTS1
   - TMSSTS1

**Spec block parameters**

1. **brstintvl**– Bursty Interval
   The parameter *brstintvl* specifies the measurement period for degraded defect if *sdsfmode* is set to BURST. If *sdsfmode* is not set to BURST, then *brstintvl* has no affect to NE behavior.
   Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS (path terminations related to physical T3 ports). But the parameters for near end performance monitoring on T3 related path terminations are kept for compatibility reasons.
   The parameter *brstintvl* is not supported for the following modifiers:
   - HOSTS1
   - HOVC4
   - TMASTS1
   - TMSSTS1

   Option: If the parameter *brstintvl* is not supported, then the parameter is omitted.
   Type: Integer.
   Range: 2, 3, … 10 [seconds]
   Default: 7 [seconds].
2. **brstthr** – Bursty Error Threshold
   The parameter *brstthr* specifies the degradation threshold for degraded defect if *sdsfmode* is set to BURST. If *sdsfmode* is not set to BURST then *brstthr* has no affect to NE behavior.

Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS (path terminations related to physical T3 ports). But the parameters for near end performance monitoring on T3 related path terminations are kept for compatibility reasons.

The parameter *brstthr* is not supported for the following modifiers:

- HOSTS1
- HOVC4
- TMASTS1
- TMSSTS1

Option: If the parameter *brstthr* is not supported, then the parameter is omitted.

Type: Integer.

Range: 5, 10, 15, … 50 [%].

Default: 30.

3. **`crslpbkstat`** – Cross-connect Loopback Status

   The parameter *crslpbkstat* reports the configuration of the cross-connection loopback of this tributary. For changing the loopback operation refer to "OPR-LPBK: Operate cross-connection loopback" (p. 3-2015).

   The parameter *crslpbkstat* is not supported for the following modifiers:

   - HOSTS1
   - HOVC4
   - TMSSTS1

   Option: If the parameter *crslpbkstat* is not supported, then the parameter is omitted.

   Type: Alphanumeric value set.

   Range: YES, for enabled loopback; NO, for disabled loopback

4. **`degthr`** – Signal Degrade Threshold

   This parameter specifies the exponent to base 10 for building the degraded threshold level. The degraded threshold level is used for building the degraded defect if *sdsfmode* is set to POISSON. If *sdsfmode* is not set to POISSON then *degthr* has no affect to NE behavior. For the definition of *sdsfmode* refer to RTRV-PTF Output parameters.

   Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS. But the parameters for near-end performance monitoring on T3 related path terminations are kept for compatibility reasons.

   The parameter *degthr* is not supported for modifiers:

   - TMSSTS1

   Option: If the parameter is not supported, then it should be omitted.

   Type: Integer.

   Range (as exponents of 10): –5; –6; –7; –8; –9.

   Default: –6.

5. **`dexcthr`** – Excessive Degrade Threshold

This parameter specifies the exponent to base 10 for building the excessive threshold level. The excessive threshold level is used for building the excessive bit error defect if *sdsfmode* is set to POISSON. If *sdsfmode* is not set to POISSON then *dexcthr* has no affect to NE behavior. For the definition of *sdsfmode* refer to RTRV-PTF Output parameters.

Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS. But the parameters for near-end performance monitoring on T3 related path terminations are kept for compatibility reasons.

The parameter *dexcthr* is not supported for modifiers:

- TMSSTS1

Option: If the parameter is not supported, then it should be omitted.

Type: Integer.

Range (as exponents of 10): –3; –4; –5.

Default: –3.

6. **exphptrc** – Expected HP trace identifier

   This parameter specifies the Expected Higher Order Path Trace Identifier (J1). The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is only useful if *ptrcrfmt* is set to 16.

   Limitation: The parameter is not supported for modifiers:

   - TMSSTS1

   Option: If the parameter is not supported, then it should be omitted.

   Type: Hexadecimal number without a preceding “H”.

   Range: length: 32 hexadecimal digits; value: specific string acc. ITU/ETSI mode 1.

   Default: 89000000000000000000000000000000

7. **feppm** – Far End Path PM Enable

   The parameter *feppm* specifies whether the performance monitoring for the far end is enabled or disabled for this tributary.

   This parameter is omitted for PTF entities which have been created due to a substructured SONET/SDH signal.

   Limitation for PTF related modifiers: Far-end performance monitoring is not available for modifier STS. But the parameters for far-end performance monitoring on T3 related path terminations are kept for compatibility reasons.

   The parameter is not supported for the following modifiers:

   - TMSSTS1

   Option: If the parameter is not supported, then it should be omitted.

   Type: Alphanumeric value set.

   Range:

   - ENABLE
   - DISABLE (default).

8. **hptimais** – HP Trace Identifier Mismatch AIS Insertion

The parameter *hptimais* shall specifies if a detected TIM will cause AIS insertion. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).

The parameter is not supported for the following modifiers:

- TMSSTS1

Option: If the parameter is not supported, then it should be omitted.

Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE.

Default: The default value depends on interface standard specified by *ptfstd* for the PTF tributary. DISABLE, if *ptfstd* = SONET

9. **hptimmon** – HP Trace Identifier Mismatch Monitor

   This parameter specifies if the mode of the TIM detection. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).

   The parameter is not supported for the following modifiers:

   - TMSSTS1

   Option: If the parameter is not supported, then it should be omitted.

   Type: Alphanumeric value set.

   Range:

   - ENABLE
   - DISABLE

   Default: DISABLE.

10. **inputsig** – Tributary Input Signal Rate List

    This parameter specifies the input LO signal structure.

    The parameter *inputsig* is only supported for the following modifiers:

    - HOVC4
    - HOSTS1
    - TMSSTS1

    Option: If the parameter *inputsig* is not supported, then the parameter is omitted.

    Type: numeric value set

    Range: NX-NX-… (N is the number of Xs. X can be 3, 12, or 11 representing VC3, VC12 or VT1.5).

    The possible values (SDH) are: 6312, 13-4212, 2112-13-2112, 4212-13, 23-2112, 13-2112-13, 2112-23, 33

    The possible values (SONET) are: 2811

    *Restricted Range with AU3/AU4 Conversion cross-connections:*

    If *modifier* = HOVC4 and the HO PTF is used for conversion cross-connections, then the range of *inputsig* is restricted to: 33.

    *Restricted Range with TransMUX:*

If *modifier* = TMSTS1, then the range of *inputsig* is restricted to: 2811.
Default:

- 6312 for SDH
- 2811 for SONET

11. **neppm** – Near End Path PM Enable

    This parameter specifies whether the performance monitoring for the near end is enabled or disabled for this tributary.

    This parameter is omitted for PTF entities which have been created due to a substructured SONET/SDH signal.

    Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS. But the possibility to enable near-end performance monitoring on T3 related path terminations is kept for compatibility reasons.

    The parameter is not supported for the following modifiers:

    - TMSSTS1

    Option: If the parameter is not supported, then it should be omitted.

    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE.

    Default: DISABLE.

12. **pmhpfeses** – PM HP Far End SES Threshold

    This parameter specifies the Higher Order Path Far End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the far end. The behavior depends on interface standard specified by *ptfstd* for the PTF tributary. If *ptfstd* is not set to SDH then *pmhpfeses* has no affect to NE behavior.

    This parameter is omitted for PTF entities which have been created due to a substructured SONET/SDH signal.

    Limitation for PTF related modifiers: Far-end performance monitoring is not available for modifier STS. But the possibility to enable far-end performance monitoring on T3 related path terminations is kept for compatibility reasons.

    The parameter is not supported for the following modifiers:

    - TMSSTS1
    - TMASTS1

    Option: If the parameter is not supported, then it should be omitted.

    Type: Integer.

    Range: 1, 2, 3, …, 63998, 63999, 64000. Includes SDH/SONET range.

    Default: 2400

13. **pmhpneses** – PM HP Near End SES Threshold

This parameter specifies the Higher Order Path Near End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the near end. The behavior depends on interface standard specified by *ptfstd* for the tributary. If *ptfstd* is not set to SDH then *pmhpneses* has no affect to NE behavior.

This parameter is omitted for PTF entities which have been created due to a substructured SONET/SDH signal.

Limitation for PTF related modifiers: Near-end performance monitoring is not available for modifier STS. But the parameters for near-end performance monitoring on T3 related path terminations are kept for compatibility reasons.

The parameter is not supported for the following modifiers:

- TMSSTS1
- TMASTS1

Option: If the parameter is not supported, then it should be omitted.

Type: Integer.

Range: 1, 2, 3, …, 63998, 63999, 64000. Includes SDH/SONET range.

Default: 2400

14. **`ptca`** – Path TCA Profile Pointer

    This parameter specifies the name of the threshold crossing alert (TCA) profile used for this tributary.

    TCA profile: The TCA profile type depends on the type and standard of the PTF, which is specified with the parameter *modifier* or *aidtype*:

    - PATH if *modifier* = TMASTS1

    The parameter is not supported for the following modifiers:

    - TMSSTS1
    - TMASTS1
    - HOVC4

    Option: If the parameter is not supported, then it should be omitted.

    Type: Alphanumeric value set.

    Range: 1 … 24 characters.

    Default: DEFAULT0

15. **`ptfstd`** – Path Termination Standard

    Standard of the tributary with Path Termination Function.

    This is currently a read-only parameter.

    Type: Alphanumeric value set.

    Range:

    - SDH (only if *modifier* = HOVC4)
    - SONET (only if *modifier* = STS, HOSTS1, TMASTS1, or TMSSTS1)

    Default:

    - SDH (if if *modifier* = HOVC4)
    - SONET (if *modifier* = STS, HOSTS1, TMASTS1, or TMSSTS1).

16. **ptpn** – Path Terminating ASA Profile Name

    This parameter points to a tributary ASAP profile name *pfname* for the designated AID.

    The parameter is not supported for the following modifiers:

    - TMSSTS1

    Option: If the parameter is not supported, then it should be omitted.

    Type: Alphanumeric value set. A hyphen ("-") is allowed in the name additionally.

    Range: 1 … 24 characters

    Default: DEFAULT

17. **ptrc** – Incoming Path Trace

    This parameter reports the accepted higher-order path trace identifier (J1). The length depends on the value of the parameter *ptrcrfmt*. The status of this value is contained in parameter *ptrcst*. If *ptrcst* indicates NORMAL, then *ptrc* contains a valid value. If *ptrcst* indicates UNAVAILABLE or AIS, then no valid incoming path trace identifier could be obtained by the system, e.g. due to not meeting the basic acceptance criteria or intra-NE communication problems, and the output parameter ptrc is omitted from the response.

    The parameter is not supported for the following modifiers:

    - TMSSTS1

    Option: If the parameter is not supported, then it should be omitted.

    Type: Hexadecimal

    Range: the range depends on the parameter ptrcrfmt specified in RTRV-PTF Output parameters

    - 2: hexadecimal digits if *ptrcrfmt*=2
    - 32: hexadecimal digits if *ptrcrfmt*=16
    - 128: hexadecimal digits if *ptrcrfmt*=64.

18. **ptrcrfmt** – Path Trace Read Format

    The parameter *ptrcrfmt* specifies the format of the path trace (J1 byte) to be received (sink).

    The parameter is not supported for the following modifiers:

    - TMSSTS1

    Option: If the parameter is not supported, then it should be omitted.

    Type: Numeric string.

    Range:

    - 2: for non-specific repeating byte
    - 16: for 16 byte specific string
    - 64: for 64 byte string.

19. **ptrcst** – Status of Incoming Path Trace

    This parameter shows the status of the value of the incoming Path Trace Identifier (J1) which is available with parameter *ptrc*.

The parameter is not supported for the following modifiers:

- TMSSTS1

Option: If the parameter is not supported, then it should be omitted.

Type: Alphanumeric value set.

Range:

- NORMAL: *ptrc* contains a valid value
- UNAVAILABLE: no valid value for *ptrc* could be obtained by the system
- AIS: no valid value for *ptrc* could be obtained due to SF condition.

20. **ptrcwfmt** – Path Trace Write Format

    The parameter *ptrcwfmt* specifies the format of the path trace (J1 byte) to be sent (source).

    The parameter is not supported for the following modifiers:

    - TMSSTS1

    Option: If the parameter is not supported, then it should be omitted.

    Type: Numeric string.

    Range:

    - 2: for non-specific repeating byte
    - 16: for 16 byte specific string
    - 64: for 64 byte string.

    Default: 2.

21. **rsiglb** – Received Signal Label

    This parameter reports the accepted trail signal label (C2). The parameter is not reported if the *trailst* parameter indicates a fail condition, i.e. has the value AIS or UNAVAILABLE.

    The parameter is not supported for the following modifiers:

    - TMSSTS1

    Option: If the parameter is not supported, then it should be omitted.

    Type: Alphanumeric value set.

    Range: 00, 01, …, FE, FF i.e. two hexadecimal digits.

22. **sdsfmode** – Signal Degrade/Signal Fail Mode

    This parameter specifies the determination mode of degraded defect for transmission.

    Limitation for PTF related to modifiers: Near-end performance monitoring is not available for modifier STS. The parameters for near-end performance monitoring on T3 related path terminations are kept for compatibility reasons.

    The parameter is not supported for the following modifiers:

    - TMSSTS1
    - TMASTS1
    - HOVC4
    - HOSTS1

    Option: If the parameter *sdsfmode* is not supported, then the parameter is omitted.

Type: Alphanumeric value set.

Range: BURST, POISSON

Default: The default value depends on interface standard specified by *ptfstd* for the tributary. POISSON, if *ptfstd* = SONET.

23. **substr** – Substructured

    The parameter *substr* indicates if the PTF is substructured.

    **Additional Description for LOXC**

    This parameter indicates if the PTF is configured for AU3/AU4 conversion cross-connections.

    The parameter *substr* is set autonomously when an AU3/AU4 conversion cross-connection is created. A PTF, which is configured for AU3/AU4 conversion cannot be used to set up HO cross-connections.

    The parameter *substr* is only supported, if *modifier* = STS.

    If the parameter *substr* is not supported, then the parameter is omitted.

    Type: Alphanumeric value set.

    Range:

    - CNV: In use for HO side of a conversion cross-connection
    - NO (default): Not used for conversion cross-connections

24. **tmonmd** – Tributary Monitoring Mode

    This parameter specifies the monitoring mode for the tributary.

    The parameter is not supported for the following modifiers:

    - TMSSTS1

    Option: If the parameter is not supported, then it should be omitted.

    Type: Alphanumeric value set.

    Range: MON, NMON (default).

25. **trailst** – Trail Status

    This parameter reports the accepted trail status value.

    The parameter is not supported for the following modifiers:

    - TMSSTS1

    Option: If the parameter is not supported, then it should be omitted.

    Type: Alphanumeric value set.

    Range:

    - AIS for Alarm Indication Signal in case of Trail Signal Fail Condition
    - UNAVAILABLE for unavailable
    - NORMAL

26. **trc** – Outgoing Path Trace

    This parameter specifies the path trace (J1) to be sent (source). For the 16 byte path trace format the following syntactical rule is applied: The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is irrelevant if the format is non-specific repeating byte (*ptrcwfmt* = 2).

The parameter is not supported for the following modifiers:

- TMSSTS1

Option: If the parameter is not supported, then it should be omitted.

Type: Hexadecimal number without a preceding “H”.

Range: the range depends on the parameter ptrcwfmt specified in RTRV-PTF Output parameters

- length: 32 hexadecimal digits, if *ptrcwfmt*=16; 128 hexadecimal digits, if *ptrcwfmt* = 64
- value: specific string acc. ITU/ETSI mode 1, if *ptrcwfmt*=16; 64 byte string if *ptrcwfmt* = 64

Default: 00. This implies also that *ptrcwfmt* is set to 2.

27. **`tslmmon`** – Trail Signal Label Mismatch Monitor

    The parameter *tslmmon* specifies the mode of the TSL mismatch detection.

    The parameter is not supported for the following modifiers:

    - TMSSTS1

    Option: If the parameter is not supported, then it should be omitted.

    Type: Alphanumeric value set.

    Range: DISABLE, ENABLE.

    Default: ENABLE.

28. **`unequiposig`** – Unequipped Output Signal List

    The parameter *unequiposig* specifies the output LO signal structure, independent whether the signal is connected or not. The parameter *unequiposig* is only supported for modifiers HOVC4. HOSTS1. and TMSSTS1.

    Option: If the parameter *unequiposig* is not supported, then the parameter is omitted.

    Type: numeric value set

    Range: NX-NX-…(N is the number of Xs. X can be 3, 12, or 11 representing VC3, VC12 or VT1.5).

    The possible values (SDH) are: 6312, 13-4212, 2112-13-2112, 4212-13, 23-2112, 13-2112-13, 2112-23, 33

    The possible values (SONET) are: 2811

    *Restricted Range with AU3/AU4 Conversion cross-connections:*

    If *modifier* = HOVC4 and the HO PTF is used for conversion cross-connections, then the range of *unequiposig* is restricted to: 33.

    *Restricted Range with TransMUX:*

    If *modifier* = TMSTS1, then the range of *inputsig* is restricted to: 2811.

    Default:

    - 6312 for SDH
    - 2811 for SONET

## Detailed behavior description

The RTRV-PTF does not generate a **REPT DBCHG** message. The command retrieves all port parameter as described in section Output parameters.

### Dependencies

*brstintvl*, *brstthr* and *sdsfmode* are not supported for modifiers HOVC4, HOSTS1,TMASTS1, and TMSSTS1 and will therefore not be reported in this case.

For all other PTFs:

- *brstintvl* and *brstthr* are only meaningful if *sdsfmode* is set to BURST.
- *degthr* and *dexcthr* are only meaningful if *sdsfmode* is set to POISSON.

Parameters which are not meaningful in the current provisioning status are reported with their default values, nevertheless.

### Behavior in the case of Conversion Cross-Connections

The **RTRV-PTF** command does not return data for the HO sides of conversion cross-connections at synchronous optical and electrical ports.

PTFs exist at the LO side of conversion cross-connections, and if the HO side is at DS3 ports, also at the HO side of conversion cross-connections.

No PTFs exist at the HO side of conversion cross-connections, when the HO side is at a synchronous optical or electrical port.

## Example input/output

```

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-PTF** command.

### Validation rule: Check CCB against *ptfstd*

Check wether the CCB fits to ptfstd of the tributary.

Error code:
`ICNV – Input, Command Not Valid, Interface Standard does not match`

E.g. DENY, if a command with modifier=VC is made on a port which is provisioned as ptfstd=SONET.

# RTRV-RC-GENERAL: Retrieve general routing controller settings

The **RTRV-RC-GENERAL** command retrieves the general settings of the network element routing controller.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-RC-GENERAL**:*tid*::*ctag*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*.

## Output format

If the **RTRV-RC-GENERAL** request is successful, the following normal completion message is returned:

```
   sid date time
M  ctag COMPLD
   "spec_block"
;
```

## Output parameters

### Spec block parameters

1. **hellointerval** – Hello Interval
   This parameter is used to indicate the time (in seconds) between two succeeding "Hello" messages to be sent to a neighbor RC.

Type: Numerical.
Range: 1 … 65535.
Default: 10.

2. **deadintv** – Dead Interval
   This parameter is used to indicate the time (in seconds) that the system waits for the reception of "Hello" PDU from a neighbor RC before the neighbor RC is considered to be dead.
   Type: Numerical.
   Range: 1 … 65535.
   Default: 30.

### Detailed behavior description

The command retrieves the routing controller general settings.

### Example input/output

The following example shows the result of **RTRV-RC-GENERAL**:

```
RTRV-RC-GENERAL:NE-UNITE::123456;
   NE-UNITE 06-11-06 11:01:00
M  123456 COMPLD
   "hellointv=10, deadintv=30"
;
```

### Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2397). The error responses listed there also apply to the **RTRV-RC-GENERAL** command.

#### Validation rule: RC must be created

If the RC is not created (through **ACT-L1ROUTING**), then the command is denied.

Error code: `IDNV – Input, Data Not Valid, RC not created`

### Related TL1 messages

# RTRV-RC-NEIGHBOR: Retrieve all neighboring routing controllers

The **RTRV-RC-NEIGHBOR** command is used to retrieve all neighboring routing controllers that have been provisioned using the **ENT-RC-NEIGHBOR** command.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-RC-NEIGHBOR**:*tid*::*ctag*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters.
   Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

## Output format

If the **RTRV-RC-NEIGHBOR** command is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "[rate]:thru[,lpaid]:spec_block"
   ...
   "[rate]:thru[,lpaid]:spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output Parameter section for the "RTRV-HDR: Retrieve header" (p. 3-2397) command.

## Output parameters

### Spec block parameters

1. **remrcid** – Remote Routing Controller Identifier
   This parameter is used to indicate the Id of the remote routing controller.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
2. **remrcscn** – Remote Routing Controller IP Address
   This parameter is used to indicate the IP address of the remote routing controller.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
3. **remrcraid** – Remote Routing Controller Routing Aread ID
   This parameter is used to indicate the routing area ID of the level 0 area of a neighboring route controller.
   Type: Four dot separated numeric strings.
   Range: Each numeric string: 0 .. 255.
   0.0.0.0 is not allowed.
4. **remrcOspfFlooding** – Remote Routing Controller OSPF Flooding
   This parameter indicates whether OSPF flooding is enabled to the remote RC or not.
   Type: Alphanumeric value set.
   Range: DISABLE or ENABLE.

## Detailed behavior description

The command shall retrieve all routing controller neighbors.

## Example input/output

The following example shows the result of a **RTRV-RC-NEIGHBOR** command:

```
RTRV-RC-NEIGHBOR:NE-UNITE::123456;
   NE-UNITE 06-11-06 11:01:00
M  123456 COMPLD
   "remrcid=1.2.3.4, remrcscn=124.24.12.56, remrcraid=1.2.3.4,
    remrcOspfFlooding=ENABLE"
   "remrcid=5.2.3.1, remrcscn=132.12.96.2, remrcraid=17.2.5.9,
    remrcOspfFlooding=DISABLE"
;
```

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-RC-NEIGHBOR** command.

### Validation rule: RC must be created

If the RC is not created (via ACT-L1ROUTING), then the command is denied.

Error code: `IDNV - Input, Data Not Valid, RC node not created`

# RTRV-RESALLOC-VCG: Retrieve resource allocation virtual concatenation group

The **RTRV-RESALLOC-VCG** command retrieves the resource allocation of an ES64U in a slot. The **RTRV-RESALLOC-VCG** command is needed to provide the user an overview about the backplane fragmentation where blocking configurations are present.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-RESALLOC-VCG***:tid:aid:ctag;*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **aid** – Access Identifier
   The AID of a circuit pack.
   Type: CpAID.
   The values **usall** for Simple_UnivSlotAID, **all** for Simple_UnivSlotAID, **all** for Simple_ShelfAID, and **all** for BayAID are excluded.
   Default: None.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

## Output format

If the NE fully complies with the **RTRV-RESALLOC-VCG** request, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "sts1equi:resalloc"
          ...
          ...
   "sts1equi:resalloc"
     <one output line for every STS-1 equivalent, together 384 lines.>
;
```

## Output parameters

### Command parameters

1. **sts1equi** – STS-1 Equivalent

   The STS-1 equivalent describes a single backplane bandwidth element from the physical backplane structure, which is represented in STS-1 granularity.

   The STS-1 equivalent reflects that the ES64U backplane bandwidth is always split in two parts of each 192 STS-1.

   Type: String.

   Range: Combined string *x*'*S*'*yyy*, where

   *x* = 1 | 2, for part 1 or part 2 of the backplane bandwidth segment;

   *yyy* = {1…192}, for the number of the STS-1 equivalents.

   "1S" or "2S" specify the first or second bandwidth segment in total circuit pack bandwidth, that means, "1S" denotes the first 192 STS-1 and "2S" the second 192 STS-1 of an ES64U.

   Default: None.

2. **resalloc** – Resource Allocation

   The resource allocation shall list the physical backplane structure in STS-1 granularity. For each backplane bandwidth element the allocated VCGTRIB instance shall be referenced. Unused backplane bandwidth elements shall be listed as well.

   It should be noted that a contiguous concatenated VCGTRIB instance has multiple STS-1 bandwidth (e.g. a single STS-3c is then listed three times for this STS-1 granularity). A VC-4 is handled like a STS-3c.

   Type: String.

   Range: Combined string <*tribaid*> | "unused".

   Default: "unused".

## Detailed behavior description

The **RTRV-RESALLOC-VCG** does not generate a **REPT DBCHG** message. The command retrieves the resource allocation as described in section" Output parameters".

### Behavior: Command not completed

In the following cases the command will not complete:

- if the switch capacity *es64ucap* for an ES64U is 0.
- if the command is applied to an ES64U protecting unit in an equipment protection.

## Example input/output

Example output for SONET *istd*, i.e. listing in STS-1 granularity for two 10G bandwidth segments 1S and 2S with each 192 STS-1 tributaries:

```
RTRV-RESALLOC-VCG:UNITE-NE:1-1-#-#-22-cp:123456;

   UNITE-NE 00-11-03 08:00:00
M  123456 COMPLD
   "1S001:1-1-#-#-22-v1-1"
```

```
   "1S002:1-1-#-#-22-v1-3"
   "1S003:unused"
   "1S004:unused"
   "1S005:1-1-#-#-22-v1-2"
   "1S006:1-1-#-#-22-v8-1"
   "1S007:1-1-#-#-22-v8-3"
   "1S008:unused"
   "1S009:1-1-#-#-22-v8-2"
   "1S010:1-1-#-#-22-v4-1"
...
   "1S192:1-1-#-#-22-v1-4"
   "2S001:1-1-#-#-22-v205-8"
   "2S002:1-1-#-#-22-v205-12"
   "2S003:1-1-#-#-22-v205-6"
   "2S004:1-1-#-#-22-v205-3"
   "2S005:1-1-#-#-22-v205-2"
   "2S006:1-1-#-#-22-v205-5"
   "2S007:1-1-#-#-22-v205-11"
   "2S008:1-1-#-#-22-v205-9"
   "2S009:1-1-#-#-22-v205-7"
   "2S010:1-1-#-#-22-v205-10"
   "2S011:1-1-#-#-22-v205-4"
   "2S012:1-1-#-#-22-v205-1"
   "2S013:unused"
...
   "2S181:1-1-#-#-22-v207-7"
   "2S182:1-1-#-#-22-v207-4"
   "2S183:1-1-#-#-22-v207-2"
   "2S184:1-1-#-#-22-v207-1"
   "2S185:1-1-#-#-22-v207-9"
   "2S186:1-1-#-#-22-v207-6"
   "2S187:1-1-#-#-22-v207-5"
   "2S188:1-1-#-#-22-v207-3"
   "2S189:1-1-#-#-22-v207-8"
   "2S190:unused"
   "2S191:unused"
   "2S192:unused"
;
```

The example output above shows one time a STS-1-4v (v1), one time a STS-1-1v (v4), STS-1-12v (v205), one time a STS-1-9v (v207) and one time a STS-1-3v (v8).

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-VCG-TRANS** command.

**Validation rule: Command only allowed for ES64U**

If the command is not applied to an ES64U pack, then the command is denied.

Error code: `IENE – Input, Entity Not Exists`

## Related TL1 messages

- “DLT-VCG – Enter virtual concatenation group” (p. 3-274)

# RTRV-RSVP: Retrieve RSVP parameters

The **RTRV-RSVP** command retrieves RSVP related parameters applicable for UNI or ENNI signaling on system level.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-RSVP**-*modifier*:*tid*::*ctag*;

## Input parameters

To retrieve RSVP parameters related to UNI signalling the TL1 command **RTRV-RSVP** is only valid with modifier UNI, that means, **RTRV-RSVP-UNI**.

### Command parameters

1. **modifier**

   The parameter modifier indicates the communication function entity for which the RSVP parameters apply.

   Type: Alphanumeric value set.

   Range: UNI or ENNI.

2. **tid** – Target Identifier

   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).

3. **ctag** – Correlation Tag

   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.

   Type: Alphanumeric string

   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*.

## Output format

If the **RTRV-RSVP** request is successful, the following normal completion message is returned:

```
   sid date time
M  ctag COMPLD
   ":spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Spec block parameters

1. **hellointerval** – Hello Interval

   This parameter is used to indicate the time between two succeeding HELLO messages to be sent to any neighbor in hello interworkings.

   Type: Numeric string.

   Range: 1 … 60

2. **maxhelloretransmit** – Maximum Hello Retransmissions

   This parameter is used to indicate the number of Hello Intervals without any HELLO_REQUEST or HELLO_ACK object received from a neighbor after which communication to this neighbor is considered as lost.

   Type: Numeric string.

   Range: 1 to 10.

   Default: 3

3. **srefreshtimer** – Srefresh Timer

   This parameter is used to indicate the maximum time between two consecutive SREFRESH requests for a UNI or network connection towards affected neighbors srefresh interworkings.

   Type: Numeric string.

   Range:

   In case of modifier=ENNI:

   10 ... 180 indicating the Srefresh Time in seconds

   In case of modifier=UNI:

   1 ... 60 indicating the Srefresh Time in seconds

   Default: 15.

## Detailed behavior description

The command shall retrieve the RSVP related parameters from the system for the node specified by the command modifier.

## Example input/output

The following example shows the result of **RTRV-RSVP** for UNI:

```
RTRV-RSVP-UNI:NE-UNITE::123456;
   NE-UNITE 06-06-30 11:01:00
M  123456 COMPLD
   ":hellointerval=5,maxhelloretransmit=3,srefreshtimer=15"
```

;

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-RSVP** command.

### Validation rule: ENNI node must be created

If the command is executed with *modifier* = ENNI while the ENNI Node is not created (by provisioning of the *sigPCIP_Address* in **ENT-ULS**), then the command is denied.

Error code: `SNVS - Status, Not in Valid State, ENNI Node not created`

### Validation rule: UNI node must be created

If the command is executed with *modifier* = UNI while the UNI Node is not created, then the command is denied.

Error code:
`SNVS - Status, Not in Valid State, UNI Node IP address not provisioned`

## Related TL1 messages

- “ED-RSVP: Modify RSVP parameters” (p. 3-850)

# RTRV-SCN-NEIGHBOR: Retrieve SCN neighbor

The **RTRV-SCN-NEIGHBOR** command retrieves entries from the routing table of the SCN stack.

Note that the information on neighbors given in the **RTRV-SCN-NEIGHBOR** command is related to the SCN, i.e. to the control plane of ONNS, whereas the neighbor information given in the RTRV-rr commands relates to the transmission plane of ONNS. In general the information given in RTRV-SCN-NEIGHBOR includes DCC and (ISIS) LAN neighbors which are assigned to the SCN.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-SCN-NEIGHBOR***:tid*::*ctag*:::;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
   Type: TID.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
   Type: CTAG.

## Output format

If the RTRV-SCN-NEIGHBOR request is successful, the following normal completion message is returned:

```
   sid date time
M  ctag COMPLD
   "[rate]:thru[,lpaid]:spec_block"
   ...
   "[rate]:thru[,lpaid]:spec_block"
;
```

## Output parameters

### Command parameters

1. **rate** – DCC Port Rate

   This parameter is only available for an SCN neighbor on DCC and provides the port rate as used in RTRV-rr.

   Type: value set.

   Range:

   - STM1
   - STM1E
   - STM4
   - STM16
   - STM64
   - STM256
   - OC3
   - OC12
   - OC48
   - OC192
   - OC768

   Default: n/a – as determined by the port type.

2. **thru** – Connected Through

   The type of connectivity between the NE and its SCN neighbor.

   Type: Value set.

   Range: DCC, LAN.

   Default: n/a – as determined by the type of connection.

3. **lpaid** – Local Port AID

   This parameter provides the SPortAID of the optical port in case thru=DCC or the LanPortAID in case thru=LAN.

   Type: AID

   Range: SPortAID in case thru=DCC or LanPortAID in case thru=LAN as defined in section AID Structure.

   Note: Since LAN1 can not be assigned to the SCN it will never appear in the output.

### Spec block parameters

1. **dcctype**

   This parameter specifies, whether MS(LINE)-DCC or RS(SECTION)-DCC is used for IP communication with the neighbor. This parameter is only available when thru=DCC.

   Type: Alphanumeric value set.

   Range: SECTION, LINE

2. **neighbor_ip** – Neighbor IP Address

This parameter is used to retrieve the IPv4 address of the LAN or DCC neighbor.

Type: Four dot separated numeric strings or empty string.

Range: Each numeric string: 0 .. 255 or empty string.

Note: The empty string is shown when the IP address can not be retrieved. In output direction the empty string is represented as \"\".

3. **neighbor_sid** – Neighbor SID

   This parameter is used to display the SID of the neighbor.

   Note: Since the SID (MAC address) is unique it might be used to detect misconfigurations of duplicate IP addresses.

   Note: This parameter is available for neighbors on LANs only, i.e. it is omitted for neighbors on DCCs.

   Type: Hexadecimal number.

   Range: 000000000000 – FFFFFFFFFFFF.

## Detailed behavior description

The command shall retrieve the *spec_block* parameters as described in the Output parameter section.

A neighbor entry shall not appear in the report for LANs and DCC channels allocated to an OSI_node_AID or the UNI_node_AID or the ENNI_node_AID.

### Behavior if no neighbors present

An empty spec block is returned, if no neighbors are present.

## Example input/output

The following example shows the result of a RTRV-SCN-NEIGHBOR command:

```
RTRV-SCN-NEIGHBOR:LT-UNITE::123456:::;
   LT-UNITE 00-11-01 08:00:00
M  123456 COMPLD
   "OC48:DCC,1-1-#-#-1-1:dcctype=LINE,neighbor_ip=192.168.200.1"
   ...
   ":LAN,lan2: neighbor_ip=192.168.200.4,neighbor_sid=00601D0D54B8"
;
```

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-SCN-NEIGHBOR** command.

# RTRV-SPANSWS: Retrieve SPAN switch state

## General

The **RTRV-SPANSWS** command requests the NE to report the current switch states of an MS-SPRing TOP+EX ring protection group related to the cross-connections either being added or dropped, ingressing or egressing ectra traffic cross-connections and addressed to a specified side of the NE.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-SPANSWS***:tid:[aid]:ctag::side,rcrole,[rid];*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **aid** – Access Identifier
   This parameter specifies the aid of an MS-SPRing/BLSR protection group or an service port aid being a member of the group.
   Option: If *rid* is specified, then *aid* can be omitted.
   Type: AID.
   Range: FourFibre_ProtGrpAID or SPortAID.
   SPortAID identifies the protection group only, it will not be evaluated if it is located on east or west side. For this purpose specify the *side* parameter.
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters
   Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.
4. **side** – side identifier of protection group
   This parameter specifies the ring side of the ring protection group.
   Type: Alphanumeric value set.
   Range: EAST, WEST

5. **rcrole** – ring cross-connection role

   This parameter specifies the cross-connection role of the ring node.

   Type: Alphanumeric value set.

   Range:

   - ADD, service cross-connections added to the ring
   - DROP, service cross-connections dropped from the ring
   - INGRESSING, ingressing extra traffic cross-connections
   - EGRESSING, egressing extra traffic cross-connections

6. **rid** – Ring Identification

   The parameter specifies the ring identification name. Storage and retrieval of the rid is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.

   Type: Text string of chars allowed for TID strings

   Range: 1 to 15 characters

   Option: If *aid* is specified, then *rid* can be omitted.

## Output format

The general format of a RTRV-SPANSWS message is as follows:

```
   tid date time
M  123456 COMPLD
   "aid:rid:side,rcrole"
   "fsts1pos:rate:protsiglvl"
   "fsts1pos:rate:protsiglvl"
       ...
       ...
   "fsts1pos:rate:protsiglvl"
;
```

## Output parameters

### Command parameters

1. **aid** – Access Identifier

   This parameter titles the listing with the AID of the reported protection group.

   Type: AID

   Range: FourFibre_ProtGrpAID

2. **rid** – Ring Identification

This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.

Type: Text string of chars allowed for TID strings.

Range: 1 to 15 characters.

Default: NONE.

3. **side** – side identifier of protection group

   This parameter titles the listing with the reported ring side of the ring protection group.

   Type: Alphanumeric value set.

   Range: EAST, WEST.

4. **rcrole** – ring cross-connection role

   This parameter titles the listing with the reported cross-connection role of the ring node.

   Type: Alphanumeric value set.

   Range:

   - ADD, service cross-connections added to the ring
   - DROP, service cross-connections dropped from the ring
   - INGRESSING, ingressing extra traffic cross-connections
   - EGRESSING, egressing extra traffic cross-connections

5. **fsts1pos** – first STS-1 tributary position

   The parameter specifies the first 'STS1NumAID' of the listed constituent signal of the protection group, i.e. the first STS-1 position of the tributary. Each row of the list of reported constituent signals shall start with this parameter. The parameter *fsts1pos* is comparable to the parameters *in_aid* and *out_aid* of the RTRV-CRS output.

   Type: AID

   Range: STS1NumAID, the part Simple_STS1NumAID of this STS1NumAID is currently limited to 1 … 192.

6. **rate** – cross-connection rate

   The parameter specifies the cross-connection rate.

   Type: Alphanumeric value set.

   Range: VC3, VC4, VC44C, VC416C, VC464C.

   All rates are shown as SDH rates here. Internal conversion may be needed, see chapter 'Detailed behavior'. Refer also to *rate* in output parameters section of "RTRV-PROTN-GRP: Retrieve protection group" (p. 3-2743).

7. **protsiglvl** – protection signal level

   The parameter specifies the current protection state of locally added or dropped service cross-connection for the TOP+EX application. The information includes the current state of either the switches or the bridges of one side of a TOP+EX protection group. It does not represent the switch request state.

   Type: Alphanumeric value set.

Range for cross-connections fulfilling the add role:

- AFFBR, affected and bridged
- AFFNOBR, affected but not bridged
- NOTAFF, not affected OR bridging not allowed in general
- UNKNOWN, unknown, ring communication in progress

Range for cross-connections fulfilling the drop role:

- AFFSW, affected and switched
- AFFNOSW, affected but not switched
- NOTAFF, not affected OR switching not allowed in general
- UNKNOWN, unknown, ring communication in progress.

Range for extra traffic cross-connections (ingressing and egressing):

- AFFRSTBL, affected and reestablished
- AFFPREMT, affected and preempted
- AFFNORST, affected, but not reestablished
- NOTAFF, not affected.

## Detailed behavior description

### Source and presentation of rate

The source of the parameter *rate* is the cross-connection rate, i.e. that value which had been provisioned before by means of the ENT-CRS-*modifier* command. The presentation of the parameter rate is always the SDH nomenclature. For the case that the cross-connection had been entered in the SONET nomenclature a conversion to SDH nomenclature is performed. Keep in mind that only service traffic cross-connections are presented.

## Example input/output

The following example shows a RTRV-SPANSWS report:

```
   LT-UNITE 99-01-10 08:12:00
M  123456 COMPLD
   "1-1-f001:\"ring01\":EAST,DROP"
   "1-1-#-#-1-1-6:VC3:AFFSW"
   "1-1-#-#-1-1-7:VC4:AFFSW"
   "1-1-#-#-1-1-10:VC44C:AFFSW"
   "1-1-#-#-1-1-22:VC416C:AFFNOSW"
   "1-1-#-#-1-1-103:VC464C:NOTAFF"
;
```

## Error responses

### Validation rule: RTRV-SPANSWS only for TOPEX

The system shall reject all RTRV-SPANSWS commands if the addressed protection group is not provisioned for MS-SPRing TOP+EX (*protnmode* /= TOPEX)

Error code:
`SNVS - Status, Not in Valid State, command supported for MS-SPRing TOPEX only`

### Validation rule: RTRV-SPANSW needs functioning XC pack

The command is denied if the XC pack is not present or in failed state.

Error code: `SPFA - Status, Protection unit FAiled` The **`RTRV-SPANSW`** command uses the protection state machine running on the XC pack.

# RTRV-STATE-EQPT (CP): Retrieve equipment state (circuit pack)

The **RTRV-STATE-EQPT** command retrieves the state information for circuit packs in the NE.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-STATE-EQPT***:tid:aid:ctag;*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **aid** – Access Identifier
   The AID of a circuit pack.
   Type: AID
   Range:
   - CpAID ::= SlotAID-cp for circuit pack in any slot
   - LoxcAID ::= UnivSlotAID-loxc for LOXC pack in universal slots.

   The keyword **xcall** is allowed for Simple_XCSlotAID
   The keyword **ctlall** is allowed for Simple_CTLSlotAID
   The keyword **all** is allowed for Simple_SlotAID
   Refer to the AID syntax description.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

## Output format

If the **RTRV-STATE-EQPT** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "aid:spec_block"
       ...
       ...
```

```
   "aid:spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command Parameter

1. **aid** – Access Identifier
   The AID of a circuit pack.
   Type: AID
   Range:
   - CpAID ::= SlotAID-cp for circuit pack in any slot
   - LoxcAID ::= UnivSlotAID-loxc for LOXC pack in universal slots.

   The keyword **usall** is allowed for Simple_UnivSlotAID
   The keyword **xcall** is allowed for Simple_XCSlotAID
   The keyword **ctlall** is allowed for Simple_CTLSlotAID
   The keyword **all** is allowed for Simple_SlotAID
   Refer to the AID syntax description.

### Spec block parameters

1. **opstate** – Operational State
   Each circuit pack has a retrievable attribute indicating whether circuit pack is operational for the system internal communication.
   Type: Alphanumeric value set.
   Range:
   - OS_ENABLED
   - OS_DISABLED (default).
   - OS_SYNCHING
2. **opstatesc** – Operational State Secondary Controller
   Each circuit pack of type ES64U/1 has a retrievable attribute indicating whether the secondary controller on this circuit pack is operational. For circuit packs of any other type this parameter is omitted.
   Type: Alphanumeric value set.
   Range:
   - OS_ENABLED
   - OS_DISABLED (default).

### Detailed behavior description

The system retrieves the state information for the CP as specified by the spec block parameters.

### Example input/output

```
RTRV-STATE-EQPT:UNITE-NE:1-1-#-#-2-cp:123456;

   UNITE-NE 00-11-03 08:00:00
M  123456 COMPLD
   "1-1-#-#-2-cp:opstate=OS_ENABLED"
;
```

Below the command and response for a circuit pack of type ES64U/1 is shown:

```
RTRV-STATE-EQPT:UNITE-NE:1-1-#-#-24-cp:123456;

   UNITE-NE 09-10-30 08:00:00
M  123456 COMPLD
   "1-1-#-#-24-cp:opstate=OS_ENABLED,opstatesc=OS_ENABLED"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-STATE-EQPT** command.

### References

GR-833-CORE

# RTRV-STATE-EQPT (slot): Retrieve equipment state (slot)

The **RTRV-STATE-EQPT** command retrieves the state information for slots in the NE.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-STATE-EQPT***:tid:aid:ctag;*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   The AID of a slot.
   Type: AID
   Range:
   - SlotAID
   - UnivSlotAID
   - XCSlotAID
   - CTLSlotAID.

   The keyword **usall** is allowed for Simple_UnivSlotAID.
   The keyword **xcall** is allowed for Simple_XCSlotAID.
   The keyword **ctlall** is allowed for Simple_CTLSlotAID.
   The keyword **all** is allowed for Simple_SlotAID.
   The keyword **all** is not allowed on bay/shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

## Output format

If the **RTRV-STATE-EQPT** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
```

```
   "aid:spec_block"
       ...
       ...
   "aid:spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### aid - Access Identifier

See definition of output parameter *aid* in "RTRV-EQPT (slot): Retrieve equipment (slot)" (p. 3-2367).

### Spec block parameters

1. **holdst** – Holder Status
   Each provisionable slot has an attribute indicating its equipage state.
   Type: Alphanumeric value set.
   Range:
   - EMPTY. The system uses the value "EMPTY" if no circuit pack is equipped in that slot.
   - VALID. The system shall use the value "Valid" if a circuit pack is equipped in that slot as provisioned.
   - UNEXPECTED. The system shall use the value "Unexpected" if a different circuit pack is equipped in that slot as provisioned or if the circuit pack is not acceptable for this slot.
   - UNKNOWN. The system shall use the value "Unknown" if a circuit pack is equipped in that slot with non-readable functional type or illegal values for the functional type.

   Default: EMPTY.

## Detailed behavior description

The system retrieves the output parameters as described above.

## Example input/output

```
RTRV-STATE-EQPT:UNITE-NE:1-1-#-#-2:123456;

   UNITE-NE 00-11-03 08:00:00
M  123456 COMPLD
   "1-1-#-#-2:holdst=VALID"
;
```

### Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2397). The error responses listed there also apply to the **ED-STATE-EQPT** command.

### Related TL1 messages

- "ED-STATE-EQPT (system): Edit equipment state" (p. 3-861)
- "ED-EQPT (slot): Edit equipment (slot)" (p. 3-367)
- "ENT-EQPT (slot): Enter equipment (slot)" (p. 3-1534)

# RTRV-STATE-EQPT (socket): Retrieve equipment state

The **RTRV-STATE-EQPT** command shall retrieve the state information for sockets in the NE.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-STATE-EQPT***:tid:aid:ctag;*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   The AID of a socket.
   Type: AID.
   Range: SocketAID. The keyword *usall* or *all* is allowed for Simple_UnivSlotAID. The keyword *scall* is allowed for Simple_SocketAID. The keyword **all** is not allowed on bay/shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

## Output format

If the **RTRV-STATE-EQPT** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_ block]"
   ... ...
   "aid[:spec_ block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command Parameter

1. **aid** – Access Identifier
   The AID of a socket.
   Type: AID.
   Range: SocketAID. The keywords *all* / *usall* / *scall* shall are not allowed on any level.

### Spec block parameters

1. **holdst** – Holder Status
   Each provisionable socket shall have an attribute indicating its equipage state.
   Type: Alphanumeric value set.
   Range:
   - EMPTY, the system shall use the value "EMPTY" if no module is equipped in that socket.
   - VALID, the system shall use the value "Valid" if a module is equipped in that socket as provisioned.
   - UNEXPECTED, the system shall use the value "Unexpected" if a different module is equipped in that socket as provisioned or if the module is not acceptable for this socket.
   - UNKNOWN, the system shall use the value "Unknown" if a module is equipped in that socket with non-readable functional type or illegal values for the functional type.

   For further details w.r.t. state transitions for holder status – see SRD_Configuration-Management.
   Default: EMPTY.

## Detailed behavior description

The system shall retrieve the output parameters as described above.

## Example input/output

This example shows a RTRV-STATE-EQPT command for a socket:

```
RTRV-STATE-EQPT:UNITE- NE:1-1-#-#-5-sc2:123456;

   UNITE- NE 00-11-03 08:00:00
M  123456 COMPLD
   "1- 1-#-#-5-sc2:holdst=VALID"
;
```

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **ED-STATE-EQPT** command.

## Related TL1 messages

# RTRV-STATE-EQPT (system): Retrieve equipment state (system)

The **RTRV-STATE-EQPT** command retrieves the state information on system (NE) level.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-STATE-EQPT***:tid:aid:ctag;*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   The aid of the system itself.
   Type: AID
   Range: system; the usage of the keyword **all** on system level is not allowed.
   Default: system
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

## Output format

If the **RTRV-STATE-EQPT** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "system:spec_block"
       ...
       ...
   "system:spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

### Output parameters

1. **aid** – Access Identifier
   The aid of the system itself.
   Type: AID
   Range: system; the usage of the keyword **all** on system level is not allowed.
   Default: system

#### Spec block parameters

1. **commitstate** – SW Commitment Status
   The system provides an indication of the SW generic commitment status.
   Type: Alphanumeric value set.
   Range:
   - PENDING = the SW generic is in trial phase, switch back to previous generic possible
   - COMMITTED = the SW generic is comitted, no switch back possible.
2. **dbstate** – Data Base Change State
   The system provides an indication of the validity of the active data base.
   Type: Alphanumeric value set.
   Range:
   - EMPTY = data base state empty.
   - NEW = data base state new
   - VALID = database state valid
   - UNKNOWN = database state is not known.

   Default: UNKNOWN.
3. **mcond** – Maintenance Condition
   This parameter denotes whether the system condition is in maintenance condition or not.
   Type: Alphanumeric value set.
   Range:
   - Y = maintenance mode
   - N = normal mode.

### Detailed behavior description

The **RTRV-STATE-EQPT** command on system level (AID = system) retrieves the current mode of the system.

The system provides the maintenance mode besides the normal operation mode in order to – handle error conditions the system can not autonomously manage – apply privileged commands.

In this maintenance mode acceptance of commands is restricted in the following way:

- commands allowed in maintenance AND normal mode:
  - get any provisionable parameter: any RTRV command
  - get any non-provisionable parameter: any RTRV command
  - set interface standard default mode: ED-EQPT (system)
  - set tributary default mode: ED-EQPT (system)
  - set maximum switch capacity: ED-EQPT (system)
  - ED-EQPT (system)
  - database download to restore empty/corrupt DBCPY-MEM
  - set time: ED-DAT
  - set date: ED-DAT
  - set IP parameter: ENT-ULS
    (note: restrictions depend on parameter base, details see command)
  - set LAN parameter: ENT-FECOM-LAN
    (note: restrictions depend on parameter base, details see command).
- commands ONLY allowed in maintenance mode:
  - set TID SET-SID
  - set SONET/SDH synchronisation default
  - leave maintenance mode (accept data base): ED-STATE-EQPT (system)

  Accepting the database will be a direct result of leaving the maintenance mode.

The system autonomously leaves maintenance mode without accepting the data base after a data base download from the management interface.

The **RTRV-STATE-EQPT** command does not generate a **REPT DBCHG** message.

### Example input/output

```
RTRV-STATE-EQPT:UNITE-NE:system:123456;

   UNITE-NE 00-11-03 08:00:00
M  123456 COMPLD
   "system:dbstate=EMPTY"
   "system:mcond=Y"
;
```

### Error responses

Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command Error responses section.

### Related TL1 messages

- "ED-STATE-EQPT (system): Edit equipment state" (p. 3-861)

- "ENT-EQPT (slot): Enter equipment (slot)" (p. 3-1534)

# RTRV-STM1E: Retrieve STM1E port

The command **RTRV-STM1E** is used to retrieve all parameters related to the electrical STM1E port.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-STM1E**:*tid:aid:ctag*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Access Identifier of an STM1E port.
   Type: AID.
   Range: SPortAID of STM1E port.
   The keyword **all** is allowed up to shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

## Output format

In response to a valid RTRV-STM1E command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command Parameter

1. **aid** – Access Identifier

   Access Identifier of STM1 port.

   Type: AID.

   Range: SPortAID of STM1E port.

### Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)

   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

   This parameter is supported by ports of *portClass* INNI.

   This parameter is supported by ports of *portClass* ENNI.

   Type: Numeric string.

   Range: 1(default)…65535

2. **brstintvl**– Bursty Interval

   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.

   Type: numeric value set.

   Range: 2 to 10.

   Default: 7.

3. **brstthr** – Bursty Error Threshold

   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.

   Type: numeric value set.

   Range (as percentage ): 5, 10, … 50.

   Default: 30.

4. **clientNodeID** – Client Node IDentifier

   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.

   This parameter is supported by ports of *portClass* UNI.

   Type: IPv4 format: Four dot separated numeric string.

   Range: Each numeric string: 0…255

   Default: 0.0.0.0

5. **crstat** – Constituent Rates Status list

   This parameter shows the rates of the port signals. For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.

   Type: numeric value set.

   Range: NX-NX-NX-…

   N is the number of Xs. X can be 3, or 4 representing VC3 or VC4.

6. **degthr** – Signal Degrade Threshold

   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.

   Type: numeric value set.

   Range (as exponents of 10): –5; –6; –7; –8; –9.

   Default: –6.

7. **dexcthr** – Excessive Degrade Threshold

   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.

   Type: numeric value set.

   Range (as exponents of 10): –5; –6; –7; –8; –9.

   Default: –6.

8. **exprstrc** – Value of Expected J0

   Expected regenerator section trace identifier.

   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.

   Type: Hexadecimal digits

   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

   Default: 89hex followed by 15 bytes 00hex

9. **femspm** – Far-end Multiplex Section PM Enable

   Enable or disable of the performance monitoring of the multiplex section.

   Type: Alphanumeric value set.

   Range:

   - ENABLE
   - DISABLE (default).

10. **frcdus** – Force to DUS

    Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message "do not use" will be transmitted from that optical interface.

    Type: Alphanumeric value set.

Range:

- ENABLE , set a forced DUS/DNU
- DISABLE (default), clear a forced DUS/DNU

11. **`fsflpbkstat`** – Far Side Facility Loopback Status

    This parameter specifies the current far-side facility loopback status of the considered output *aid*.

    A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.

    Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.

    Type: Alphanumeric value set.

    Range:

    - YES
    - NO (default).

12. **`inputsig`** – Tributary Input Signal Rate List

    This parameter is a list of VCn rates across the port's bandwidth.

    Type: numeric value set.

    Range: NX-NX-NX-…

    N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.

    Default: 14.

13. **`istd`** – Interface Standard

    Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter *istddflt*.

    Type: Alphanumeric value set.

    Range: SDH.

    Default: As specified via *istddflt* on system level, see definition in “RTRV-EQPT (system): Retrieve Equipment (system)” (p. 3-2381).

14. **`localLPID`** – Local Logical Port IDentity

    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.

    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *portClass* UNI.

    This parameter is supported by ports of *portClass* EDGE.

Type: numeric value set.

Range: 0 (default) to 4294967295

The default value shall have the meaning of "no localLPID provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

15. **lpbk** – Loopback

    This parameter specifies the current near-side loopback status of the considered output *aid*.

    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.

    Type: Alphanumeric value set.

    Range:

    - YES
    - NO (default).

16. **maxNNXCRate** – Maximum NN Cross Connect Rate

    This identifies the maximum rate at which cross-connections are allowed for ports of *portClass* INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.

    *maxNNXCRate* is introduced specifically for use by ONNS application.

    Type: Alphanumeric value set.

    Range: VC4 (default), VC3.

17. **minNNXCRate** – Minimum NN Cross Connect Rate

    This identifies the minimum rate at which cross-connections are allowed for ports of *portClass* INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.

    *minNNXCRate* is introduced specifically for use by ONNS application.

    Type: Alphanumeric value set.

    Range: VC3 (default), VC4.

18. **ndetmd** – Neighbor Detection Mode

    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* INNI.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set.

    Range:

    AUTO, MAN

    Default:

For *portClass* = INNI: AUTO

For *portClass* = ENNI: MAN

19. **neighborASTNNodeID** – Neighbor ASTN Node Id

    This parameter identifies the unique node identifier of the neighbor node of ports of portClass = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until portClass is INNI. This parameter can only be modified, if ndetmd=MAN.

    If ndetmd=MAN, this parameter shall indicate the value set by the operator. If ndetmd=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

    *neighborASTNNodeID* is used by the ONNS application.

    Type: Four dot separated numeric string.

    Range: Each numeric string: 0…255.

    Default: 0.0.0.0 If portClass = INNI, the default value shall have the meaning of "no neighbor discovered".

20. **neighborNodeID** – Neighbor Node Id

    This parameter identifies the IP address of the neighbor node of ports of portClass = INNI. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until portClass is INNI. This parameter can only be modified, if ndetmd=MAN. If ndetmd=MAN, this parameter shall indicate the value set by the operator. If ndetmd=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

    *neighborNodeID* is used by the ONNS application.

    Type: Four dot separated numeric string.

    Range: Each numeric string: 0…255.

    Default: 0.0.0.0

    If *portClass* = INNI, the default value shall have the meaning of "no neighbor discovered"

21. **neighborPortID** – Neighbor Port Id

    This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.

    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

    *neighborPortID* is used s by the ONNS application.

    Type: Four dash separated numeric string.

    Range: Each numeric string: 0…255.

    Default: 0-0-0-0.

    Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

22. **nemspm** – MS Near-End PM Enable

    Enable or disable near-end multiplex section (near-end line) performance monitoring.

    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).

23. **networkTNAType** – Network TNA Type

    The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *portClass* UNI.

    This parameter is supported by ports of *portClass* EDGE.

    Type: Alphanumeric value set.

    Range:

    - IPV4 (default)
    - IPV6
    - NSAP

24. **networkTNAAddress** – Network TNA Address

    The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *portClass* UNI.

    This parameter is supported by ports of *portClass* EDGE.

    Type:

    - networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
    - networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
    - networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number:
  00000000000000000000000000000000000000000…
  FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 00000000000000000000000000000000000000000

The default value shall have the meaning of "no TNA Address provisioned" for ports with *portClass* value supporting this parameter in case explicit setting of the default value is allowed.

25. **`outql`** – Outgoing timing quality

    This parameter provides the outgoing quality level message on the S1 SDH MS overhead byte.

    Type: Alphanumeric value set.

    Range:

    - PRC
    - SSUL
    - SSUT
    - SEC
    - DNU (default).

26. **`pmmsfeses`** – Performance Monitoring MS Far-End SES Threshold

    This parameter describes the Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) per second to declare a second as severely errored.

    Type: numeric value set.

    Range: STM1: 1 – 192000.

    Default: for STM1: 28800.

27. **`pmmsneses`** – Performance Monitoring MS Near-End SES Threshold

    This parameter describes the Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) per second to declare a second as severely errored.

    Type: numeric value set.

    Range: STM1: 1 – 192000.

Default: for STM1: 28800.

28. **pmode** – Port Mode

    This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.

    Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

29. **pmrsneses** – Performance Monitoring RS Near-End SES Threshold

    This parameter describes the RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) per second to declare a second as severely errored.

    Type: numeric value set.

    Range: 1 – 64000.

    Default: for STM1: 2400.

30. **portClass** – Port Class

    This parameter identifies the port class of the AID.

    In which role the port is used by the ONNS application is specified by this parameter *portClass*.

    Type: Alphanumeric value set.

    Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.

    Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

31. **portControl** – Port Control (PortAdministrative Mode)

    The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.

    Type: Alphanumeric value set.

    Range: NORMAL (default), LOCKOUT

32. **propagationDelay** – Propagation Delay

    This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.

    *propagationDelay* is used by the ONNS application.

    Type: Numeric string.

    Range: 0(default) …25. The unit of this value is "milliseconds".

33. **ptype** – Port Type

    This identifies the port type of the AID.

Type: Alphanumeric value set.

Range: STM1E.

34. **rsmstca** – RS/MS TCA Profile Pointer

    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.

    Type: Alphanumeric string.

    Range: String with maximum of 24 characters.

    Default: DEFAULT0.

35. **rspm** – RS PM Enable

    Enable or disable regenerator section (section) performance monitoring.

    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).

36. **rstimca** – RS TIM Consequent Action Enable

    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).

    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).

    Type: Alphanumeric value set.

    Range:

    - ENABLE (default): enable consequent action for TIM
    - DISABLE: disable consequent action for TIM.

37. **rstimmon** – RS TIM Monitor Enable

    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).

    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).

    Type: Alphanumeric value set.

    Range:

    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor

38. **sdhpn** – SDH ASAP

    This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET ASAP for the SONET ports of corresponding line rate (see definition of output parameter SONET in RTRV-OC12) to be compatible with current generation applications.

    Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.

    Range: String with a maximum of 24 characters.

    Default: DEFAULT.

39. **sdsfmode** – Signal Degrade/Signal Fail Mode

    The degraded state is detected in Burst or Poisson mode.

    Type: Alphanumeric value set.

Range:

- BURST (default)
- POISSON.

40. **servcond** – Service Condition

    This parameter indicates its status concerning service involvement.

    Type: Alphanumeric value set.

    Range:

    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.

41. **srlgList** – Shared Risk Link Group Identities List

    The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.

    If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.

    This parameter is supported by ports of *portClass* INNI.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Ten numeric strings separated by dashes.

    Range: Each numeric string: 0…65535.

    Default: 0-0-0-0-0-0-0-0-0-0.

42. **strc** – Value of incoming J0

    This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter strc is omitted from the response.

    Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

    Range: 1 byte string, 16 byte string, 64 byte string (dependent on the strcfmt parameter).

43. **strcfmt** – Format of incoming J0

    The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc).

    Type: Numeric string.

    Default: 2

44. **strcout** – Value of outgoing J0

    This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.

    Type: Hexadecimal digits.

    Range:

    - 1 byte string
    - 16 bytes string
    - 64 bytes string.

    Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

    Default: 01Hex

45. **strcst** – Status of incoming J0

    This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.

    Type: Alphanumeric value set.

    Range: NORMAL: strc contains a valid value; UNAVAILABLE: no value for strc could be obtained by the system; AIS: no value for strc due to an SF condition.

46. **strcwfmt** – Format of outgoing J0

    The write format of J0, the outgoing section trace (strcout).

    Type: Numeric string.

    Default: 2

47. **tcamd** – TCA mode

    This parameter shows the modus of the PM thresholding.

    Two thresholding methods are applicable:

    - TR-only (lso known as the implicit reset method)
    - TR-RTR (lso known as the explicit reset method).

    Type: Alphanumeric value set.

    Range: TR or TRRTR (default).

48. **trbmd** – Tributary mode

    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* has no effect.

    Type: Alphanumeric value set.

    Range: ADAPTIVE, FIXED.

    Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in “RTRV-EQPT (system): Retrieve Equipment (system)” (p. 3-2381) command.

49. **unequiposig** – Unequipped Output Signal List

    This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the “unequipped” signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for tx and rx side of the port are allowed.

Type: numeric value set.
Range: NX-NX-NX-…
N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.
Default: 14.

### Detailed behavior description

The command retrieves the parameters as described above.

The command **RTRV-STM1E** does not generate a **REPT DBCHG** message.

### Example input/output

The following example shows the successful execution of a **RTRV-STM1E** command. Not all output parameters are listed (missing ones indicated by … ):

```
RTRV-STM1E:LT-UNITE:1-1-#-#-1-1:123456;

   LT-UNITE 00-11-24 08:00:00
M  123456 COMPLD
   "1-1-#-#-1-1:ptype=STM1E,frcdus=DISABLE,dexcthr=-3,degthr=-6, pmode=MON,
   ...,pmmsneses=15,pmrsneses=30"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the RTRV-STM1E command.

#### Check CCB against ptype and istd

See definition of error response in “RTRV-STM16: Retrieve STM16 port” (p. 3-2877).

# RTRV-STM1: Retrieve STM1 port

The command **RTRV-STM1** is used to retrieve all parameters related to the optical STM1 port.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-STM1**:*tid:aid:ctag*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Access Identifier of an STM1 port.
   Type: AID.
   Range: SPortAID of STM1 port.
   The keyword **all** is allowed up to shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

## Output format

In response to a valid **RTRV-STM1** command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command Parameter

1. **aid** – Access Identifier

   Access Identifier of STM1 port.

   Type: AID.

   Range: SPortAID of STM1 port.

### Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)

   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

   This parameter is supported by ports of *portClass* INNI.

   This parameter is supported by ports of *portClass* ENNI.

   Type: Numeric string.

   Range: 1(default)…65535

2. **brstintvl**– Bursty Interval

   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.

   Type: numeric value set.

   Range: 2 to 10.

   Default: 7.

3. **brstthr** – Bursty Error Threshold

   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.

   Type: numeric value set.

   Range (as percentage ): 5, 10, … 50.

   Default: 30.

4. **clientNodeID** – Client Node IDentifier

   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.

   This parameter is supported by ports of *portClass* UNI.

   Type: IPv4 format: Four dot separated numeric string.

   Range: Each numeric string: 0…255

   Default: 0.0.0.0

5. **crstat** – Constituent Rates Status list

   This parameter shows the rates of the port signals. For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter inputsig showing the Tributary Input Rate Signal List.

   Type: numeric value set.

   Range: NX-NX-NX-… N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.

6. **degthr** – Signal Degrade Threshold

   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.

   Type: numeric value set.

   Range (as exponents of 10): –5; –6; –7; –8; –9.

   Default: –6.

7. **dexcthr** – Excessive Degrade Threshold

   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.

   Type: numeric value set.

   Range (as exponents of 10): –5; –6; –7; –8; –9.

   Default: –6.

8. **exprstrc** – Value of Expected J0

   Expected regenerator section trace identifier.

   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.

   Type: Hexadecimal digits

   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

   Default: 89hex followed by 15 bytes 00hex

9. **femspm** – Far-end Multiplex Section PM Enable

   Enable or disable of the performance monitoring of the multiplex section.

   Type: Alphanumeric value set.

   Range:

   - ENABLE
   - DISABLE (default).

10. **frcdus** – Force to DUS

    Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message "do not use" will be transmitted from that optical interface.

    Type: Alphanumeric value set.

Range:

- ENABLE , set a forced DUS/DNU
- DISABLE (default), clear a forced DUS/DNU

11. **`fsflpbkstat`** – Far Side Facility Loopback Status

    This parameter specifies the current far-side facility loopback status of the considered output *aid*.

    A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.

    Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.

    Type: Alphanumeric value set.

    Range:

    - YES
    - NO (default).

12. **`inputsig`** – Tributary Input Signal Rate List

    This parameter is a list of VCn rates across the port's bandwidth.

    Type: numeric value set.

    Range: NX-NX-NX-…

    N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.

    Default: 14.

13. **`istd`** – Interface Standard

    Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter *istddflt*.

    Type: Alphanumeric value set.

    Range: SDH.

    Default: As specified via *istddflt* on system level, see definition in “RTRV-EQPT (system): Retrieve Equipment (system)” (p. 3-2381).

14. **`linkResCls`** – Link Resource Class

    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set (4 bytes), every bit defining one link class

    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF

    Default: 00 for each alphanumeric character

15. **`localLinkID`** – Local Link IDentity

The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

16. **`localLPID`** – Local Logical Port IDentity

    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.

    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *portClass* UNI.

    This parameter is supported by ports of *portClass* EDGE.

    Type: numeric value set.

    Range: 0 (default) to 4294967295

    The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

17. **`lpbk`** – Loopback

    This parameter specifies the current near-side loopback status of the considered output *aid*.

    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.

    Type: Alphanumeric value set.

    Range:

    - YES
    - NO (default).

18. **`maxNNXCRate`** – Maximum NN Cross Connect Rate

    The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* INNI.

This parameter is supported by ports of *portClass* ENNI.

Type: Alphanumeric value set.

Range: VC3 or VC4 (default)

19. **`minNNXCRate`** – Minimum NN Cross Connect Rate

    The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* INNI.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set.

    Range: VC3 (default) or VC4.

20. **`ndetmd`** – Neighbor Detection Mode

    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* INNI.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set.

    Range:

    AUTO, MAN

    Default:

    For *portClass* = INNI: AUTO

    For *portClass* = ENNI: MAN

21. **`neighborASTNNodeID`** – Neighbor ASTN Node Id

    This parameter identifies the unique node identifier of the neighbor node of ports of portClass = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until portClass is INNI. This parameter can only be modified, if ndetmd=MAN.

    If ndetmd=MAN, this parameter shall indicate the value set by the operator. If ndetmd=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

    *neighborASTNNodeID* is used by the ONNS application.

    Type: Four dot separated numeric string.

    Range: Each numeric string: 0…255.

Default: 0.0.0.0 If portClass = INNI, the default value shall have the meaning of "no neighbor discovered".

22. **neighborNodeID** – Neighbor Node Id

    This parameter identifies the IP address of the neighbor node of ports of portClass = INNI. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until portClass is INNI. This parameter can only be modified, if ndetmd=MAN. If ndetmd=MAN, this parameter shall indicate the value set by the operator. If ndetmd=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

    *neighborNodeID* is used by the ONNS application.

    Type: Four dot separated numeric string.

    Range: Each numeric string: 0…255.

    Default: 0.0.0.0

    If *portClass* = INNI, the default value shall have the meaning of "no neighbor discovered"

23. **neighborPortID** – Neighbor Port Id

    This parameter identifies the identity of the adjacent port at the neighbor NE for ports of portClass = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.

    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

    *neighborPortID* is used by the ONNS application.

    Type: Four dash separated numeric string

    Range: Each numeric string: 0…255

    Default: 0-0-0-0

24. **neighborSigPCID** – Neighbor Signaling PC IDentity

    The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Four dot separated numeric string

    Range: Each numeric string: 0…255

    Default: 0.0.0.0

25. **neighborSigPCIPAddr** – Neighbor Signaling PC IP Address

    The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* ENNI.

Type: IPv4 format: Four dot separated numeric string

Range: Each numeric string: 0…255

Default: 0.0.0.0

26. **`nemspm`** – MS Near-End PM Enable

    Enable or disable near-end multiplex section (near-end line) performance monitoring.

    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).

27. **`networkTNAType`** – Network TNA Type

    The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *portClass* UNI.

    This parameter is supported by ports of *portClass* EDGE.

    Type: Alphanumeric value set.

    Range:

    - IPV4 (default)
    - IPV6
    - NSAP

28. **`networkTNAAddress`** – Network TNA Address

    The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *portClass* UNI.

    This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number: 00000000000000000000000000000000000000000… FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 00000000000000000000000000000000000000000000

The default value shall have the meaning of "no TNA Address provisioned" for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

29. **`opdis`** – Optical Distance

    It shows the type of application for which the optical transmitter on this port is suited. The value NA is reported for client ports.

    Type: Alphanumeric value set.

    Range:

    - INTRA-OFFICE
    - SHORT-HAUL
    - LONG-HAUL
    - VERY-LONG-HAUL
    - OLS_PASSIVE
    - OLS_400G
    - OLS_800G
    - XTREME
    - NA

30. **`opwl`** – Optical Wavelength

Optical Wavelength in nanometers. It shows the type of optics that is used on this port.

Type: Alphanumeric value set.

Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 … 1562.640 (i.e. C-Band); 1553.731 … 1608.329 (i.e. L-Band), 1471 … 1611 (for CWDM), NA (for client ports). T

he value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

31. **`outql`** – Outgoing timing quality

    This parameter provides the outgoing quality level message on the S1 SDH MS overhead byte.

    Type: Alphanumeric value set.

    Range:

    - PRC
    - SSUL
    - SSUT
    - SEC
    - DNU (default).

32. **`pmmsfeses`** – Performance Monitoring Line/MS Far-End SES Threshold

    This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-1/OC-3: 1 – 192000.

    Default: The default values differ for SDH and SONET:

    - STM1: 28800
    - OC3: 154.

33. **`pmmsneses`** – Performance Monitoring Line/MS Near-End SES Threshold

    This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-1/OC-3: 1 – 192000.

Default: The default values differ for SDH and SONET and the different rates:

- STM1: 28800
- OC3: 154.

34. **pmode** – Port Mode

    This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.

    Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

35. **pmrsneses** – Performance Monitoring Section/RS Near-End SES Threshold

    This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set.

    Range (superset of allowed ranges for SDH and SONET):1 – 64000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM1: 2400
    - OC3: 155.

36. **portClass** – Port Class

    This parameter identifies the port class of the AID.

    In which role the port is used by the ONNS application is specified by this parameter *portClass*.

    Type: Alphanumeric value set.

    Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.

    Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

37. **portControl** – Port Control (PortAdministrative Mode)

    The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.

    Type: Alphanumeric value set.

    Range: NORMAL (default), LOCKOUT

38. **propagationDelay** – Propagation Delay

This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.

*propagationDelay* is used by the ONNS application.

Type: Numeric string.

Range: 0(default) …25. The unit of this value is "milliseconds".

39. **ptype** – Port Type

    This identifies the port type of the AID.

    Type: Alphanumeric value set.

    Range: STM1.

40. **remAdvNodeID** – Remote Advertised Node IDentity

    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition:

    The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.

    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Four dot separated numeric string

    Range: Each numeric string: 0…255

    Default: 0.0.0.0

41. **remLinkID** – Remote Link IDentity

    The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: numeric value set

    Range: 0 (default) to 4294967295

42. **remRAID** – Remote Routing Area IDentity

    The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:

    The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0…255

Default: 0.0.0.0

43. **`remTID`** – Remote TID

    The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: TID or empty-string

    Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2397) description.

    Default: empty string: ""

44. **`rsmstca`** – RS/MS TCA Profile Pointer

    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.

    Type: Alphanumeric string.

    Range: String with maximum of 24 characters.

    Default: DEFAULT0.

45. **`rspm`** – RS PM Enable

    Enable or disable regenerator section (section) performance monitoring.

    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).

46. **`rstimca`** – RS TIM Consequent Action Enable

    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).

    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimca* is autonomously set by the neighbor detection mechanism.

    Type: Alphanumeric value set.

    Range:

    - ENABLE (default): enable consequent action for TIM
    - DISABLE: disable consequent action for TIM.

47. **`rstimmon`** – RS TIM Monitor Enable

    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).

This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.

Type: Alphanumeric value set.

Range:

- ENABLE: enable TIM Monitor
- DISABLE (default): disable TIM Monitor

48. **sdhpn** – SDH ASAP

    This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET ASAP for the SONET ports of corresponding line rate (see definition of output parameter SONET in RTRV-OC12) to be compatible with current generation applications.

    Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.

    Range: String with a maximum of 24 characters.

    Default: DEFAULT.

49. **sdsfmode** – Signal Degrade/Signal Fail Mode

    The degraded state is detected in Burst or Poisson mode.

    Type: Alphanumeric value set.

    Range:

    - BURST (default)
    - POISSON.

50. **servcond** – Service Condition

    This parameter indicates its status concerning service involvement.

    Type: Alphanumeric value set.

    Range:

    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.

51. **srlgList** – Shared Risk Link Group Identities List

    The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.

    If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.

    This parameter is supported by ports of *portClass* INNI.

    This parameter is supported by ports of *portClass* ENNI.

Type: Ten numeric strings separated by dashes.

Range: Each numeric string: 0…65535.

Default: 0-0-0-0-0-0-0-0-0-0.

52. **strc** – Value of incoming J0

    This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter strc is omitted from the response.

    Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

    Range: 1 byte string, 16 byte string, 64 byte string (dependent on the strcfmt parameter).

53. **strcfmt** – Format of incoming J0

    The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.

    Type: Numeric string.

    Range:

    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

54. **strcout** – Value of outgoing J0

    This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.

    If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.

    Type: Hexadecimal digits.

    Range:

    - 1 byte string
    - 16 bytes string
    - 64 bytes string.

    Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

    Default: 01Hex

55. **strcst** – Status of incoming J0

This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.

Type: Alphanumeric value set.

Range: NORMAL: strc contains a valid value; UNAVAILABLE: no value for strc could be obtained by the system; AIS: no value for strc due to an SF condition.

56. **strcwfmt** – Format of outgoing J0

    The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.

    Type: Numeric string.

    Range:

    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

57. **tcamd** – TCA mode

    This parameter shows the modus of the PM thresholding.

    Two thresholding methods are applicable:

    - TR-only (lso known as the implicit reset method)
    - TR-RTR (lso known as the explicit reset method).

    Type: Alphanumeric value set.

    Range: TR or TRRTR (default).

58. **trbmd** – Tributary mode

    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* has no effect.

    Type: Alphanumeric value set.

    Range: ADAPTIVE, FIXED.

    Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in “RTRV-EQPT (system): Retrieve Equipment (system)” (p. 3-2381) command.

59. **unequiposig** – Unequipped Output Signal List

    This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the “unequipped” signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for tx and rx side of the port are allowed.

    Type: numeric value set.

    Range: NX-NX-NX-…

    N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.

    Default: 14.

### Detailed behavior description

The command retrieves the parameters as described above.

The command **RTRV-STM1** does not generate a **REPT DBCHG** message.

### Example input/output

The following example shows the successful execution of a **RTRV-STM1** command. Not all output parameters are listed (missing ones indicated by … ):

```
RTRV-STM1:LT-UNITE:1-1-#-#-1-1:123456;

   LT-UNITE 00-11-24 08:00:00
M  123456 COMPLD
   "1-1-#-#-1-1:ptype=STM1,frcdus=DISABLE,dexcthr=-3,degthr=-6, pmode=MON,...,
   pmmsneses=15,pmrsneses=30"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the RTRV-STM1 command.

#### Check CCB against ptype and istd

See definition of error response in “RTRV-STM16: Retrieve STM16 port” (p. 3-2877).

# RTRV-STM4: Retrieve STM4 port

The command **RTRV-STM4** is used to retrieve all parameters related to the optical STM4 port.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-STM4**:*tid:aid:ctag*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Access Identifier of an STM4 port.
   Type: AID.
   Range: SPortAID of STM4 port.
   The keyword **all** is allowed up to shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

## Output format

In response to a valid **RTRV-STM4** command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command Parameter

1. **aid** – Access Identifier

   Access Identifier of STM-4 port.

   Type: AID.

   Range: SPortAID of STM-4 port.

### Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)

   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

   This parameter is supported by ports of *portClass* INNI.

   This parameter is supported by ports of *portClass* ENNI.

   Type: Numeric string.

   Range: 1(default)…65535

2. **brstintvl**– Bursty Interval

   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.

   Type: numeric value set.

   Range: 2 to 10.

   Default: 7.

3. **brstthr** – Bursty Error Threshold

   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.

   Type: numeric value set.

   Range (as percentage ): 5, 10, … 50.

   Default: 30.

4. **clientNodeID** – Client Node IDentifier

   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.

   This parameter is supported by ports of *portClass* UNI.

   Type: IPv4 format: Four dot separated numeric string.

   Range: Each numeric string: 0…255

   Default: 0.0.0.0

5. **crstat** – Constituent Rates Status list

   This parameter shows the rates of the port signals. For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.

   Type: numeric value set.

   Range: NX-NX-NX-…

   N is the number of Xs. X can be 3, or 4 representing VC3 or VC4.

6. **degthr** – Signal Degrade Threshold

   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.

   Type: numeric value set.

   Range (as exponents of 10): –5; –6; –7; –8; –9.

   Default: –6.

7. **dexcthr** – Excessive Degrade Threshold

   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.

   Type: numeric value set.

   Range (as exponents of 10): –5; –6; –7; –8; –9.

   Default: –6.

8. **exprstrc** – Value of Expected J0

   Expected regenerator section trace identifier.

   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.

   Type: Hexadecimal digits

   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

   Default: 89hex followed by 15 bytes 00hex

9. **femspm** – Far-end Multiplex Section PM Enable

   Enable or disable of the performance monitoring of the multiplex section.

   Type: Alphanumeric value set.

   Range:

   - ENABLE
   - DISABLE (default).

10. **frcdus** – Force to DUS

    Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message "do not use" will be transmitted from that optical interface.

    Type: Alphanumeric value set.

Range:

- ENABLE , set a forced DUS/DNU
- DISABLE (default), clear a forced DUS/DNU

11. **`fsflpbkstat`** – Far Side Facility Loopback Status

    This parameter specifies the current far-side facility loopback status of the considered output *aid*.

    A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.

    Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.

    Type: Alphanumeric value set.

    Range:

    - YES
    - NO (default).

12. **`inputsig`** – Tributary Input Signal Rate List

    This parameter is a list of VCn rates across the port's bandwidth.

    Type: numeric value set.

    Range: NX-NX-NX-…

    N is the number of Xs. X can be 3, 4 or 4C representing VC3, VC4 or VC4-4C.

    Default: 44.

13. **`istd`** – Interface Standard

    Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter *istddflt*.

    Type: Alphanumeric value set.

    Range: SDH.

    Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2381).

14. **`linkResCls`** – Link Resource Class

    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set (4 bytes), every bit defining one link class

    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF

    Default: 00 for each alphanumeric character

15. **`localLinkID`** – Local Link IDentity

The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

16. **`localLPID`** – Local Logical Port IDentity

    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.

    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *portClass* UNI.

    This parameter is supported by ports of *portClass* EDGE.

    Type: numeric value set.

    Range: 0 (default) to 4294967295

    The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

17. **`lpbk`** – Loopback

    This parameter specifies the current near-side loopback status of the considered output *aid*.

    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.

    Type: Alphanumeric value set.

    Range:

    - YES
    - NO (default).

18. **`maxNNXCRate`** – Maximum NN Cross Connect Rate

    The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* INNI.

This parameter is supported by ports of *portClass* ENNI.

Type: Alphanumeric value set.

Range: VC3, VC4 or VC44C (default)

19. **minNNXCRate** – Minimum NN Cross Connect Rate

    The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* INNI.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set.

    Range: VC3 (default), VC4 or VC44C

20. **ndetmd** – Neighbor Detection Mode

    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* INNI.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set.

    Range:

    AUTO, MAN

    Default:

    For *portClass* = INNI: AUTO

    For *portClass* = ENNI: MAN

21. **neighborASTNNodeID** – Neighbor ASTN Node Id

    This Parameter identifies the unique node identifier of the neighbor node of ports of portClass = INNI to be used for ONNS application. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until portClass is INNI. This parameter can only be modified, if ndetmd=MAN.

    If ndetmd=MAN, this parameter shall indicate the value set by the operator. If ndetmd=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

    *neighborASTNNodeID* is used by the ONNS application.

    Type: Four dot separated numeric string.

    Range: Each numeric string: 0…255.

Default: 0.0.0.0 If portClass = INNI, the default value shall have the meaning of "no neighbor discovered".

22. **neighborNodeID** – Neighbor Node Id

    This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until portClass is INNI. This parameter can only be modified, if ndetmd=MAN. If ndetmd=MAN, this parameter shall indicate the value set by the operator. If ndetmd=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

    *neighborNodeID* is used by the ONNS application.

    Type: Four dot separated numeric string.

    Range: Each numeric string: 0…255.

    Default: 0.0.0.0

    If *portClass* = INNI, the default value shall have the meaning of "no neighbor discovered"

23. **neighborPortID** – Neighbor Port Id

    This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.

    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

    *neighborPortID* is used by the ONNS application.

    Type: Four dash separated numeric string.

    Range: Each numeric string: 0…255.

    Default: 0-0-0-0.

    Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

24. **neighborSigPCID** – Neighbor Signaling PC IDentity

    The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Four dot separated numeric string

    Range: Each numeric string: 0…255

    Default: 0.0.0.0

25. **neighborSigPCIPAddr** – Neighbor Signaling PC IP Address

The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* ENNI.

Type: IPv4 format: Four dot separated numeric string

Range: Each numeric string: 0…255

Default: 0.0.0.0

26. **nemspm** – MS Near-End PM Enable

    Enable or disable near-end multiplex section (near-end line) performance monitoring.

    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).

27. **networkTNAType** – Network TNA Type

    The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *portClass* UNI.

    This parameter is supported by ports of *portClass* EDGE.

    Type: Alphanumeric value set.

    Range:

    - IPV4 (default)
    - IPV6
    - NSAP

28. **networkTNAAddress** – Network TNA Address

    The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter is supported by ports of *portClass* UNI.

This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number:
  00000000000000000000000000000000000000000…
  FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 00000000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

29. **`opdis`** – Optical Distance

    It shows the type of application for which the optical transmitter on this port is suited.

    The value NA is reported for client ports.

    Type: Alphanumeric value set.

    Range:

    - INTRA-OFFICE
    - SHORT-HAUL
    - LONG-HAUL
    - VERY-LONG-HAUL
    - OLS_PASSIVE
    - OLS_400G
    - OLS_800G

- XTREME
- NA.

30. **opwl** – Optical Wavelength

    Optical Wavelength in nanometers. It shows the type of optics that is used on this port.

    Type: Alphanumeric value set.

    Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 … 1562.640 (i.e. C-Band); 1553.731 … 1608.329 (i.e. L-Band), 471 … 1611 (for CWDM), NA (for client ports).

    The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

31. **outql** – Outgoing timing quality

    This parameter provides the outgoing quality level message on the S1 SDH MS overhead byte.

    Type: Alphanumeric value set.

    Range:

    - PRC
    - SSUL
    - SSUT
    - SEC
    - DNU (default).

32. **pmmsfeses** – Performance Monitoring Line/MS Far-End SES Threshold

    This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-4/OC-12: 1 – 768000.

    Default: The default values differ for SDH and SONET:

    - STM4: 115200
    - OC12: 615.

33. **pmmsneses** – Performance Monitoring Line/MS Near-End SES Threshold

    This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set.

Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

- STM-4/OC-12: 1 – 768000.

Default: The default values differ for SDH and SONET and the different rates:

- STM4: 115200
- OC3: 615.

34. **pmode** – Port Mode

    This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.

    Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

35. **pmrsneses** – Performance Monitoring Section/RS Near-End SES Threshold

    This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set.

    Range (superset of allowed ranges for SDH and SONET):1 – 64000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM4: 2400
    - OC12: 616.

36. **portClass** – Port Class

    This parameter identifies the port class of the AID.

    In which role the port is used by the ONNS application is specified by this parameter *portClass*.

    Type: Alphanumeric value set.

    Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.

    If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

37. **portControl** – Port Control (PortAdministrative Mode)

    The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.

    Type: Alphanumeric value set.

Range: NORMAL (default), LOCKOUT

38. **`propagationDelay`** – Propagation Delay

    This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.

    *propagationDelay* is used by the ONNS application.

    Type: Numeric string.

    Range: 0(default) …25. The unit of this value is "milliseconds".

39. **`ptype`** – Port Type

    This identifies the port type of the AID.

    Type: Alphanumeric value set.

    Range: STM4.

40. **`remAdvNodeID`** – Remote Advertised Node IDentity

    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition:

    The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.

    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Four dot separated numeric string

    Range: Each numeric string: 0…255

    Default: 0.0.0.0

41. **`remLinkID`** – Remote Link IDentity

    The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: numeric value set

    Range: 0 (default) to 4294967295

42. **`remRAID`** – Remote Routing Area IDentity

    The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:

The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* ENNI.

Type: Four dot separated numeric string

Range: Each numeric string: 0…255

Default: 0.0.0.0

43. **`remTID`** – Remote TID

    The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: TID or empty-string

    Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2397) description.

    Default: empty string: ""

44. **`rsmstca`** – RS/MS TCA Profile Pointer

    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.

    Type: Alphanumeric string.

    Range: String with maximum of 24 characters.

    Default: DEFAULT0.

45. **`rspm`** – RS PM Enable

    Enable or disable regenerator section (section) performance monitoring.

    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).

46. **`rstimca`** – RS TIM Consequent Action Enable

    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).

    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimca* is autonomously set by the neighbor detection mechanism.

    Type: Alphanumeric value set.

    Range:

    - ENABLE (default): enable consequent action for TIM
    - DISABLE: disable consequent action for TIM.

47. **rstimmon** – RS TIM Monitor Enable

    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).

    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.

    Type: Alphanumeric value set.

    Range:

    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor

48. **sdhpn** – SDH ASAP

    This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET ASAP for the SONET ports of corresponding line rate (see definition of output parameter SONET in RTRV-OC12) to be compatible with current generation applications.

    Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.

    Range: String with a maximum of 24 characters.

    Default: DEFAULT.

49. **sdsfmode** – Signal Degrade/Signal Fail Mode

    The degraded state is detected in Burst or Poisson mode.

    Type: Alphanumeric value set.

    Range:

    - BURST (default)
    - POISSON.

50. **servcond** – Service Condition

    This parameter indicates its status concerning service involvement.

    Type: Alphanumeric value set.

    Range:

    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.

51. **srlgList** – Shared Risk Link Group Identities List

    The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.

    If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.

This parameter is supported by ports of *portClass* INNI.

This parameter is supported by ports of *portClass* ENNI.

Type: Ten numeric strings separated by dashes.

Range: Each numeric string: 0…65535.

Default: 0-0-0-0-0-0-0-0-0-0.

52. **strc** – Value of incoming J0

    This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter strc is omitted from the response.

    Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

    Range: 1 byte string, 16 byte string, 64 byte string (dependent on the strcfmt parameter).

53. **strcfmt** – Format of incoming J0

    The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.

    Type: Numeric string.

    Range:

    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

54. **strcout** – Value of outgoing J0

    This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.

    If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.

    Type: Hexadecimal digits.

    Range:

    - 1 byte string
    - 16 bytes string
    - 64 bytes string.

    Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

Default: 01Hex

55. **strcst** – Status of incoming J0

    This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.

    Type: Alphanumeric value set.

    Range: NORMAL: strc contains a valid value; UNAVAILABLE: no value for strc could be obtained by the system; AIS: no value for strc due to an SF condition.

56. **strcwfmt** – Format of outgoing J0

    The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.

    Type: Numeric string.

    Range:

    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

57. **tcamd** – TCA mode

    This parameter shows the modus of the PM thresholding.

    Two thresholding methods are applicable:

    - TR-only (lso known as the implicit reset method)
    - TR-RTR (lso known as the explicit reset method).

    Type: Alphanumeric value set.

    Range: TR or TRRTR (default).

58. **trbmd** – Tributary mode

    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* has no effect.

    Type: Alphanumeric value set.

    Range: ADAPTIVE, FIXED.

    Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in “RTRV-EQPT (system): Retrieve Equipment (system)” (p. 3-2381) command.

59. **unequiposig** – Unequipped Output Signal List

    This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the “unequipped” signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for tx and rx side of the port are allowed.

    Type: numeric value set.

    Range: NX-NX-NX-…

    N is the number of Xs. X can be 3 or 4 representing VC3 or VC4.

    Default: 14.

### Detailed behavior description

The command retrieves the parameters as described above.

The command **RTRV-STM4** does not generate a **REPT DBCHG** message.

### Example input/output

The following example shows the successful execution of a **RTRV-STM4** command. Not all output parameters are listed (missing ones indicated by … ):

```
RTRV-STM4:LT-UNITE:1-1-#-#-1-1:123456;

   LT-UNITE 00-11-24 08:00:00
M  123456 COMPLD
   "1-1-#-#-1-1:ptype=STM4,frcdus=DISABLE,dexcthr=-3,degthr=-6, pmode=MON,...,
   pmmsneses=15,pmrsneses=30"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the RTRV-STM4 command.

#### Check CCB against ptype and istd

See definition of error response in “RTRV-STM16: Retrieve STM16 port” (p. 3-2877).

# RTRV-STM16: Retrieve STM16 port

The command **RTRV-STM16** is used to retrieve all parameters related to the optical STM16 port.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-STM16**:*tid:aid:ctag*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Description: Access Identifier of an STM16 port.
   Type: AID.
   Range: SPortAID of STM16 port.
   The keyword **all** is allowed up to shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

## Output format

In response to a valid **RTRV-STM16** command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command Parameter

1. **aid** – Access Identifier

   Access Identifier of STM16 port.

   Type: AID.

   Range: SPortAID of STM16 port.

   The keyword **all** is not allowed.

### Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)

   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

   This parameter is supported by ports of *portClass* INNI.

   This parameter is supported by ports of *portClass* ENNI.

   Type: Numeric string.

   Range: 1(default)…65535

2. **brstintvl**– Bursty Interval

   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.

   Type: numeric value set.

   Range: 2 to 10.

   Default: 7.

3. **brstthr** – Bursty Error Threshold

   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.

   Type: numeric value set.

   Range (as percentage ): 5, 10, … 50.

   Default: 30.

4. **clientNodeID** – Client Node IDentifier

   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.

   This parameter is supported by ports of *portClass* UNI.

   Type: IPv4 format: Four dot separated numeric string.

   Range: Each numeric string: 0…255

Default: 0.0.0.0

5. **crstat** – Constituent Rates Status list

   This parameter shows the rates of the port signals. For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.

   Type: numeric value set.

   Range: NX-NX-NX-…

   N is the number of Xs. X can be 3, or 4 representing VC3 or VC4.

6. **degthr** – Signal Degrade Threshold

   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.

   Type: numeric value set.

   Range (as exponents of 10): –5; –6; –7; –8; –9.

   Default: –6.

7. **dexcthr** – Excessive Degrade Threshold

   Retrieving of the excessive degrade/signal failure threshold in exponent of 10. This parameter is available when *sdsfmode* = POISSON

   Type: numeric value set.

   Range (as exponent of 10): –3; –4; –5.

   Default: –3.

8. **exprstrc** – Value of Expected J0

   Expected regenerator section trace identifier.

   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.

   Type: Hexadecimal digits

   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

   Default: 89hex followed by 15 bytes 00hex

9. **femspm** – Far-end Multiplex Section PM Enable

   Enable or disable of the performance monitoring of the multiplex section.

   Type: Alphanumeric value set.

   Range:

   - ENABLE
   - DISABLE (default).

10. **frcdus** – Force to DUS

    Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message "do not use" will be transmitted from that optical interface.

    Type: Alphanumeric value set.

Range:

- ENABLE , set a forced DUS/DNU
- DISABLE (default), clear a forced DUS/DNU

11. **`fsflpbkstat`** – Far Side Facility Loopback Status

    This parameter specifies the current far-side facility loopback status of the considered output *aid*.

    A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.

    Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.

    Type: Alphanumeric value set.

    Range:

    - YES
    - NO (default).

12. **`inputsig`** – Tributary Input Signal Rate List

    This parameter is a list of VCn rates across the port's bandwidth.

    Type: numeric value set.

    Range: NX-NX-NX-…

    N is the number of Xs. X can be 3, 4, 4C or 16C representing VC3, VC4, VC4-4C or VC4-16C.

    Default: The initial value of X is 4.

    Example:

    An STM-16 signal might be represented by 93-14-14C-243 which implies 9 VC3s, 1 VC4, 1 VC4-4C, 24 VC3s. The representation is not unique, for example it could also be 33-63-14-14C-243. Worst case of string length for STM16: 47 characters.

13. **`istd`** – Interface Standard

    Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter *istddflt*.

    Type: Alphanumeric value set.

    Range: SDH.

    Default: As specified via *istddflt* on system level, see definition in “RTRV-EQPT (system): Retrieve Equipment (system)” (p. 3-2381).

14. **`linkResCls`** – Link Resource Class

    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set (4 bytes), every bit defining one link class

Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF

Default: 00 for each alphanumeric character

15. **`localLinkID`** – Local Link IDentity

    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: numeric value set

    Range: 0 (default) to 4294967295

16. **`localLPID`** – Local Logical Port IDentity

    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.

    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *portClass* UNI.

    This parameter is supported by ports of *portClass* EDGE.

    Type: numeric value set.

    Range: 0 (default) to 4294967295

    The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

17. **`lpbk`** – Loopback

    This parameter specifies the current near-side loopback status of the considered output *aid*.

    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.

    Type: Alphanumeric value set.

    Range:

    - YES
    - NO (default).

18. **`maxNNXCRate`** – Maximum NN Cross Connect Rate

The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* INNI.

This parameter is supported by ports of *portClass* ENNI.

Type: Alphanumeric value set.

Range: VC3, VC4, VC44C or VC416C (default)

19. **minNNXCRate** – Minimum NN Cross Connect Rate

    The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* INNI.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set.

    Range: VC3 (default), VC4, VC44C or VC416C

20. **ndetmd** – Neighbor Detection Mode

    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* INNI.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set.

    Range:

    AUTO, MAN

    Default:

    For *portClass* = INNI: AUTO

    For *portClass* = ENNI: MAN

21. **neighborASTNNodeID** – Neighbor ASTN Node Id

    This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.

    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

*neighborASTNNodeID* is used by the ONNS application.

Type: Four dot separated numeric string.

Range: Each numeric string: 0…255.

Default: 0.0.0.0 If portClass = INNI, the default value shall have the meaning of "no neighbor discovered".

22. **neighborNodeID** – Neighbor Node Id

    This parameter identifies the IP address of the neighbor node of ports of portClass = INNI. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until portClass is INNI. This parameter can only be modified, if ndetmd=MAN. If ndetmd=MAN, this parameter shall indicate the value set by the operator. If ndetmd=AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

    *neighborNodeID* is used by the ONNS application.

    Type: Four dot separated numeric string.

    Range: Each numeric string: 0…255.

    Default: 0.0.0.0

    If *portClass* = INNI, the default value shall have the meaning of "no neighbor discovered"

23. **neighborPortID** – Neighbor Port Id

    This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if ndetmd=MAN.

    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

    *neighborPortID* is used by the ONNS application.

    Type: Four dash separated numeric string.

    Range: Each numeric string: 0…255.

    Default: 0-0-0-0.

    Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

24. **neighborSigPCID** – Neighbor Signaling PC IDentity

    The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Four dot separated numeric string

    Range: Each numeric string: 0…255

Default: 0.0.0.0

25. **neighborSigPCIPAddr** – Neighbor Signaling PC IP Address

    The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: IPv4 format: Four dot separated numeric string

    Range: Each numeric string: 0…255

    Default: 0.0.0.0

26. **nemspm** – MS Near-End PM Enable

    Enable or disable near-end multiplex section (near-end line) performance monitoring.

    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).

27. **networkTNAType** – Network TNA Type

    The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *portClass* UNI.

    This parameter is supported by ports of *portClass* EDGE.

    Type: Alphanumeric value set.

    Range:

    - IPV4 (default)
    - IPV6
    - NSAP

28. **networkTNAAddress** – Network TNA Address

    The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter is supported by ports of *portClass* UNI.

This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number:
  00000000000000000000000000000000000000…
  FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 00000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

29. **`opdis`** – Optical Distance

    It shows the type of application for which the optical transmitter on this port is suited.

    The value NA is reported for client ports.

    Type: Alphanumeric value set.

    Range:

    - INTRA-OFFICE
    - SHORT-HAUL
    - LONG-HAUL
    - VERY-LONG-HAUL
    - OLS_PASSIVE
    - OLS_400G
    - OLS_800G

- XTREME
- NA.

30. **opwl** – Optical Wavelength

    Optical Wavelength in nanometers. It shows the type of optics that is used on this port.

    Type: Alphanumeric value set.

    Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 … 1562.640 (i.e. C-Band); 1553.731 … 1608.329 (i.e. L-Band), 1471 … 1611 (for CWDM), NA (for client ports).

    The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

31. **outql** – Outgoing timing quality

    This parameter provides the outgoing quality level message on the S1 SDH MS overhead byte.

    Type: Alphanumeric value set.

    Range:

    - PRC
    - SSUL
    - SSUT
    - SEC
    - DNU (default).

32. **pmmsfeses** – Performance Monitoring Line/MS Far-End SES Threshold

    This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-16/OC-48: 1 – 3072000
    - STM-64/OC-192: 1 – 12288000
    - STM-256/OC-768: 1 – 49152000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM16: 460800
    - STM64: 1843200
    - STM256: 7372800
    - SONET OC48: 2459
    - SONET OC192: 9835
    - SONET OC768: 39340.

33. **pmmsneses** – Performance Monitoring Line/MS Near-End SES Threshold

    This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-16/OC-48: 1 – 3072000
    - STM-64/OC-192: 1 – 12288000
    - STM-256/OC-768: 1 – 49152000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM16: 460800
    - STM64: 1843200
    - STM256: 7372800
    - SONET OC48: 2459
    - SONET OC192: 9835
    - SONET OC768: 39340.

34. **pmode** – Port Mode

    This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.

    Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

35. **pmrsneses** – Performance Monitoring Section/RS Near-End SES Threshold

    This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET.

    Type: numeric value set.

    Range (superset of allowed ranges for SDH and SONET):1 – 64000

    Default: The default values differ for SDH and SONET and the different rates:

    - SDH (all rates): 2400
    - SONET OC48: 2392
    - SONET OC192: 8554
    - SONET OC768: 22776.

36. **portClass** – Port Class

    This parameter identifies the port class of the AID.

    In which role the port is used by the ONNS application is specified by this parameter *portClass*.

    Type: Alphanumeric value set.

    Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.

    Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

37. **portControl** – Port Control (PortAdministrative Mode)

    The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.

    Type: Alphanumeric value set.

    Range: NORMAL (default), LOCKOUT

38. **propagationDelay** – Propagation Delay

    This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.

    *propagationDelay* is used by the ONNS application.

    Type: Numeric string.

    Range: 0(default) …25. The unit of this value is "milliseconds".

39. **ptype** – Port Type

    This identifies the port type of the AID.

    Type: Alphanumeric value set.

    Range: STM16.

40. **remAdvNodeID** – Remote Advertised Node IDentity

    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition:

    The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.

    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Four dot separated numeric string

    Range: Each numeric string: 0…255

    Default: 0.0.0.0

41. **remLinkID** – Remote Link IDentity

The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

42. **`remRAID`** – Remote Routing Area IDentity

    The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:

    The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Four dot separated numeric string

    Range: Each numeric string: 0…255

    Default: 0.0.0.0

43. **`remTID`** – Remote TID

    The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: TID or empty-string

    Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2397) description.

    Default: empty string: ""

44. **`rsmstca`** – RS/MS TCA Profile Pointer

    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.

    Type: Alphanumeric string.

    Range: String with maximum of 24 characters.

    Default: DEFAULT0.

45. **`rspm`** – RS PM Enable

    Enable or disable regenerator section (section) performance monitoring.

    Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

46. **rstimca** – RS TIM Consequent Action Enable

    Regenerator Section Trace Identifier Mismatch consequent action enable (J0).

    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimca* is autonomously set by the neighbor detection mechanism.

    Type: Alphanumeric value set.

    Range:

    - ENABLE (default): enable consequent action for TIM
    - DISABLE: disable consequent action for TIM.

47. **rstimmon** – RS TIM Monitor Enable

    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).

    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.

    Type: Alphanumeric value set.

    Range:

    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor

48. **sdhpn** – SDH ASAP

    This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET Alarm Severity Assignment Profile for the SONET ports (see definition of output parameter SONET in "RTRV-OC48: Retrieve OC48 port" (p. 3-2624)) to be compatible with current generation applications.

    Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.

    Range: String with a maximum of 24 characters.

    Default: DEFAULT.

49. **sdsfmode** – Signal Degrade/Signal Fail Mode

    The degraded state is detected in Burst or Poisson mode.

    Type: Alphanumeric value set.

    Range:

    - BURST (default)
    - POISSON.

50. **servcond** – Service Condition

    This parameter indicates its status concerning service involvement.

    Type: Alphanumeric value set.

Range:

- INSERVICE (default): Provisioning values for service are accepted
- OUTOFSERVICE: Provisioning values for service are not accepted.

51. **srlgList** – Shared Risk Link Group Identities List

    The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.

    If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.

    This parameter is supported by ports of *portClass* INNI.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Ten numeric strings separated by dashes.

    Range: Each numeric string: 0…65535.

    Default: 0-0-0-0-0-0-0-0-0-0.

52. **strc** – Value of incoming J0

    This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter strc is omitted from the response.

    Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

    Range: 1 byte string, 16 byte string, 64 byte string (dependent on the strcfmt parameter).

53. **strcfmt** – Format of incoming J0

    The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.

    Type: Numeric string.

    Range:

    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

54. **strcout** – Value of outgoing J0

This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.

If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.

Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string.

Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

Default: 01Hex

55. **strcst** – Status of incoming J0

    This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.

    Type: Alphanumeric value set.

    Range: NORMAL: strc contains a valid value; UNAVAILABLE: no value for strc could be obtained by the system; AIS: no value for strc due to an SF condition.

56. **strcwfmt** – Format of outgoing J0

    The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.

    Type: Numeric string.

    Range:

    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

57. **tcamd** – TCA mode

    This parameter shows the modus of the PM thresholding.

    Two thresholding methods are applicable:

    - TR-only (lso known as the implicit reset method)
    - TR-RTR (lso known as the explicit reset method).

    Type: Alphanumeric value set.

    Range: TR or TRRTR (default).

58. **trbmd** – Tributary mode

    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* has no effect.

Type: Alphanumeric value set.

Range: ADAPTIVE, FIXED.

Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2381) command.

59. **unequiposig** – Unequipped Output Signal List

    This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the "unequipped" signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for tx and rx side of the port are allowed.

    Type: numeric value set.

    Range: NX-NX-NX-…

    N is the number of Xs. X can be 3, 4, 4C or 16C representing VC3, VC4, VC4-4C or VC4-16C.

    Default: 164 = all VC4.

### Detailed behavior description

The command retrieves the parameters as described above.

The command **RTRV-STM16** does not generate a **REPT DBCHG** message.

### Example input/output

The following example shows the successful execution of a **RTRV-STM16** command. Not all output parameters are listed (missing ones indicated by … ):

```
 RTRV-STM16:LT-UNITE:1-1-#-#-1-1:123456;

   LT-UNITE 00-11-24 08:00:00
M  123456 COMPLD
   "1-1-#-#-1-1:ptype=STM16,frcdus=DISABLE,dexcthr=-3,degthr=-6,pmode=MON,...,
   pmmsneses=15,pmrsneses=30"
;
```

### Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2397). The error responses listed there also apply to the RTRV-STM16 command.

#### Validation rule: Check CCB against *ptype* and *istd*

Check wether the CCB fits to *ptype* and *istd*.

Error code:

ICNV – Input, Command Not Valid, Interface Standard does not match

E.g. DENY, if a command with rr=STM16 is made on a OP2G5 port which is provisioned as *istd* = SONET and *ptype* = OC48.

# RTRV-STM16T: Retrieve STM16T port

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-STM16T**:*tid:aid:ctag*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Description: Access Identifier of an STM16T port.
   Type: AID.
   Range: SPortAID of STM16T port.
   The keyword **all** is allowed up to shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

## Output format

In response to a valid RTRV-STM16 command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command Parameter

1. **aid** – Access Identifier

   Access Identifier of STM16 port.

   Type: AID.

   Range: SPortAID of STM16 port.

   The keyword **all** is not allowed.

### Spec block parameters

1. **exprstrc** – Value of Expected J0

   For RTRV-STM16T this parametr refers to the incoming (inress) direction

   Expected regenerator section trace identifier.

   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.

   Type: Hexadecimal digits

   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

   Default: 89hex followed by 15 bytes 00hex

2. **exprstrcout** – Value of Expected J0 in outgoing direction

   Expected regenerator section trace identifier in outgoing (egress) direction.

   The parameter expstrcout specifying the expected path trace is only relevant for the section trace supervision in outgoing direction when the related trace read format strcfmtout is set to 16 (16-byte-specific-string mode).

   Type: Hexadecimal digits

   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

   Default: 89hex followed by 15 bytes 00hex

3. **fsflpbkstat** – Far Side Facility Loopback Status

   This parameter specifies the current far-side facility loopback status of the considered output *aid*.

   A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.

   Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.

   Type: Alphanumeric value set.

   Range:

   - YES
   - NO (default).

4. **istd** – Interface Standard

   Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter istddflt.

   Type: Alphanumeric value set.

   Range: SDH.

   Default: As specified via *istddflt* on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2381).

5. **lpbk** – Loopback

   This parameter specifies the current near-side loopback status of the considered output *aid*.

   A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.

   Type: Alphanumeric value set.

   Range:

   - YES
   - NO (default).

6. **opdis** – Optical Distance

   It shows the type of application for which the optical transmitter on this port is suited. The value NA is reported for client ports.

   Type: Alphanumeric value set.

   Range:

   - INTRA-OFFICE
   - SHORT-HAUL
   - LONG-HAUL
   - VERY-LONG-HAUL
   - OLS_PASSIVE
   - OLS_400G
   - OLS_800G
   - XTREME.

7. **opwl** – Optical Wavelength

   Optical Wavelength in nanometers. It shows the type of optics that is used on this port.

   Type: Alphanumeric value set.

   Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 … 1562.640 (i.e. C-Band); 1553.731 … 1608.329 (i.e. L-Band), 1471 … 1611 (for CWDM), NA (for client ports).

   The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

8. **pmode** – Port Mode

This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.

Type: Alphanumeric value set.

Range:

- AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.
- MON indicates that alarm monitoring is taking place on the port.
- NMON means that alarm monitoring is not occurring on the port.

9. **pmrsneses** – Performance Monitoring Section/RS Near-End SES Threshold

   This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET.

   Type: numeric value set.

   Range (superset of allowed ranges for SDH and SONET):1 – 64000

   Default: The default values differ for SDH and SONET and the different rates:

   - SDH (all rates): 2400
   - SONET OC48: 2392
   - SONET OC192: 8554
   - SONET OC768: 22776.

10. **pmrsnesesout** – Performance Monitoring Section/RS Near-End SES Threshold in outgoing direction

    This parameter describes the Section/RS Near-End SES threshold value for the outgoing (egress) direction. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET.

    Type: numeric value set

    Range (superset of allowed ranges for SDH and SONET): 1 – 64000

    Default:

    The default values differ for SDH and SONET and the different rates:

    - SDH (all rates): 2400
    - SONET OC48: 2392

11. **ptype** – Port Type

    This identifies the port type of the AID.

    Type: Alphanumeric value set.

    Range: STM16T.

12. **rsmstca** – RS/MS TCA Profile Pointer

    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.

    Type: Alphanumeric string.

    Range: String with maximum of 24 characters.

Default: DEFAULT0.

13. **rspm** – RS PM Enable

    For RTRV-STM16T this parameter refers to the incoming (ingress) direction.

    Enable or disable regenerator section (section) performance monitoring.

    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).

14. **rspmout** – RS PM Enable in Outgoing Direction

    Enable or disable regenerator section (section) performance monitoring for the outgoing (egress) direction.

    Type: Alphanumeric value set.

    Range: ENABLE, DISABLE (default).

15. **rstimmon** – RS TIM Monitor Enable

    For RTRV-STM16T this parameter refers to the incoming (Ingress) direction.

    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).

    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.

    Type: Alphanumeric value set.

    Range:

    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor

16. **rstimmonout** – RS TIM Monitor Enable in Outgoing direction

    Regenerator Section Trace Identifier Mismatch Monitor enable (J0) in outgoing (egress) direction. This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode).

    Type: Alphanumeric value set.

    Range: ENABLE – enable TIM Monitor, DISABLE (default) – disable TIM Monitor

17. **sdhpn** – SDH ASAP

    This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET Alarm Severity Assignment Profile for the SONET ports (see definition of output parameter SONET in "RTRV-OC48: Retrieve OC48 port" (p. 3-2624)) to be compatible with current generation applications.

    Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.

    Range: String with a maximum of 24 characters.

    Default: DEFAULT.

18. **servcond** – Service Condition

    This parameter indicates its status concerning service involvement.

    Type: Alphanumeric value set.

Range:

- INSERVICE (default): Provisioning values for service are accepted
- OUTOFSERVICE: Provisioning values for service are not accepted.

19. **strc** – Value of incoming J0

    For RTRV-STM16T this parameter refers to the incoming (Ingress) direction.

    This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port.

    The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter strc is omitted from the response.

    Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

    Range: 1 byte string, 16 byte string, 64 byte string (dependent on the strcfmt parameter).

20. **strcfmt** – Format of incoming J0

    For RTRV-STM16T this parameter refers to the incoming (Ingress) direction.

    The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.

    Type: Numeric string.

    Range:

    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

21. **strcfmtout** – Format of outgoing J0

    The read format of J0 in outgoing (egress) direction, the outgoing section trace (strcout) and the expected section trace (exprstrcout).

    Type: Numeric string.

    Range:

    - 1, for specific repeating byte (SONET)
    - 2 (default), for non-specific repeating byte (ITU/ETSI mode 2)
    - 16, for 16 byte specific string (ITU/ETSI mode 1)
    - 64, for 64 byte string (SONET).

22. **strcout** – Value of outgoing J0

    For RTRV-STM16T this parameter refers to the outgoing (egress) direction.

    This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.

If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.

Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string.

Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

Default: 01Hex

23. **strcst** – Status of incoming J0

    For RTRV-STM16T this parameter refers to the incoming (ingress) direction.

    This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.

    Type: Alphanumeric value set.

    Range: NORMAL: strc contains a valid value; UNAVAILABLE: no value for strc could be obtained by the system; AIS: no value for strc due to an SF condition.

24. **strcstout** – Status of outgoing J0

    This parameter shows the status of the value of the RS/Section Trace Identifier in outgoing (egress) direction which is available with parameter *strcout*.

    alphanumeric value set

    Range:

    - NORMAL, *strcout* contains a valid value
    - UNAVAILABLE, no value for *strcout* could be obtained by the system
    - AIS, no value for *strcout* due to an SF condition

25. **tcamd** – TCA mode

    This parameter shows the modus of the PM thresholding.

    Two thresholding methods are applicable:

    - TR-only (lso known as the implicit reset method)
    - TR-RTR (lso known as the explicit reset method).

    Type: Alphanumeric value set.

    Range: TR or TRRTR (default).

### Detailed behavior description

The command retrieves the parameters as described above.

The **RTRV-STM16T** command does not generate a **REPT DBCHG** message.

## Example input/output

The following example shows the successful execution of a **RTRV-STM16T** command. Not all output parameters are listed (missing ones indicated by …):

```
 RTRV-STM16T:LT-UNITE:1-1-#-#-1-1:123456;

   LT-UNITE 00-11-24 08:00:00
M  123456 COMPLD
   "1-1-#-#-1-1:ptype=STM16T,pmode=MON,...,pmrsneses=30,pmrsfeses=30"
;
```

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-STM16T** command.

### Validation rule: Check CCB against *ptype* and *istd*

Check wether the CCB fits to *ptype* and *istd*.

Error code:
`ICNV – Input, Command Not Valid, Interface Standard does not match`

E.g. DENY, if a command with rr=STM16T is made on a OPT2G5 port which is provisioned as *istd* = SONET and *ptype* = OC48T.

# RTRV-STM64: Retrieve STM64 port

The command **RTRV-STM64** is used to retrieve all parameters related to the optical STM64 port or the STM64 client .

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-STM64**:*tid:aid:ctag*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   Access Identifier of an STM64 port.
   Type: AID.
   Range: SPortAID of ST-64 port.
   The keyword **all** is allowed up to shelf level.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

## Output format

In response to a valid **RTRV-STM64** command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command Parameter

1. **aid** – Access Identifier

   Type: AID

   Range: STM-64 port AID

### Spec block parameters

1. **adminCost**- Administrative Cost (Link Cost)

   The *adminCost* identifies the provisioned administrative link cost setting for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

   This parameter is supported by ports of *portClass* INNI.

   This parameter is supported by ports of *portClass* ENNI.

   Type: Numeric string.

   Range: 1(default)…65535

2. **brstintvl**– Bursty Interval

   Measurement period for determining bursty errors. This parameter applies when *sdsfmode* = BURST.

   Type: numeric value set.

   Range: 2 to 10.

   Default: 7.

3. **brstthr** – Bursty Error Threshold

   Degradation threshold in a range from 5% to 50% with a resolution of 5% steps. This parameter applies when *sdsfmode* = BURST.

   Type: numeric value set.

   Range (as percentage ): 5, 10, … 50.

   Default: 30.

4. **clientNodeID** – Client Node IDentifier

   The *clientNodeID* identifies the IP address of a client node attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

   For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other port classes in future.

   This parameter is supported by ports of *portClass* UNI.

   Type: IPv4 format: Four dot separated numeric string.

   Range: Each numeric string: 0…255

   Default: 0.0.0.0

5. **crstat** – Constituent Rates Status list

This parameter shows the rates of the port signals. For fixed mode (*trbmd* = FIXED) this parameter is derived from the parameter *inputsig* showing the Tributary Input Rate Signal List.

Type: numeric value set.

Range: NX-NX-NX-…

N is the number of Xs. X can be 3, 4, 4C, 16C or C64 representing VC3, VC4, VC4-4C, VC4-16C or VC-64C.

6. **degthr** – Signal Degrade Threshold

   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.

   Type: numeric value set.

   Range (as exponents of 10): –5; –6; –7; –8; –9.

   Default: –6.

7. **dexcthr** – Excessive Degrade Threshold

   Signal degrade threshold in a range from 10exp-5 to 10exp-9. This parameter applies when *sdsfmode* = POISSON.

   Type: numeric value set.

   Range (as exponents of 10): –5; –6; –7; –8; –9.

   Default: –6.

8. **exprstrc** – Value of Expected J0

   Expected regenerator section trace identifier.

   The parameter *expstrc* specifying the expected path trace is only relevant for the section trace supervision when the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and *ndetmd* is set to AUTO, the parameter *exprstrc* is autonomously set by the neighbor detection mechanism.

   Type: Hexadecimal digits

   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

   Default: 89hex followed by 15 bytes 00hex

9. **fec** – FEC Enable

   Forward Error Correction Enable. Enable to include the FEC information in the outgoing signal.

   Type: Alphanumeric value set.

   Range:

   DISABLE (only) for:

   - OC192 / STM64 Intermediate Reach / Short Haul 1550 nm optics
   - OC192 / STM64 intermediate reach / SH passive WDM compatible optics
   - OC192 / STM64 Long Reach / Long Haul 1550 nm optics
   - OC192 / STM64 low cost intra office 1310 nm optics

- OC192 / STM64 client ports (related to OTN ports)
- OC768 / STM256 basis low cost intra office 1310 nm optics.

ENABLE / DISABLE for:

- OC192 / STM64 OLS800G compatible 80 colour optics
- OC768 / STM256 Long Reach / Long Haul 1550 nm optics (80km)
- OC768 / STM256 OLS Xtreme compatible 64 colour optics (extended L band)

ENABLE (only) for:

- OC192 / STM64 OLS Xtreme compatible 128 colour optics 40G.

Default:
DISABLE for:

- OC192 / STM64 Intermediate Reach / Short Haul 1550 nm optics
- OC192 / STM64 intermediate reach / SH 32 colour passive WDM compatible optics
- OC192 / STM64 Long Reach / Long Haul 1550 nm optics
- OC192 / STM64 low cost intra office 1310 nm optics
- OC192 / STM64 client ports (related to OTN ports)
- OC768 / STM256 basis low cost intra office 1310 nm optics.

ENABLE for:

- OC192 / STM64 OLS800G compatible 80 colour optics
- OC192 / STM64 OLS Xtreme compatible 128 colour optics 40G
- OC768 / STM256 Long Reach / Long Haul 1550 nm optics (80km)
- OC768 / STM256 OLS Xtreme compatible 64 colour optics (extended L band)

10. **`femspm`** – Far-end Multiplex Section PM Enable

    Enable or disable of the performance monitoring of the multiplex section.
    Type: Alphanumeric value set.
    Range:

    - ENABLE
    - DISABLE (default).

11. **`frcdus`** – Force to DUS

    Force DUS/DNU for sync messaging on optical interfaces. When provisioned for ENABLE, the message "do not use" will be transmitted from that optical interface.
    Type: Alphanumeric value set.
    Range:

    - ENABLE: (set a forced DUS/DNU)
    - DISABLE (default): (clear a forced DUS/DNU).

12. **`fsflpbkstat`** – Far Side Facility Loopback Status

    This parameter specifies the current far-side facility loopback status of the considered output *aid*.

A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback existing for the aid.

Note: not both loopbacks (*lpbk* and *fsflpbkstat*) can be set to YES at the same time.

Type: Alphanumeric value set.

Range:

- YES
- NO (default).

13. **`inputsig`** – Tributary Input Signal Rate List

    This parameter is a list of VCn rates across the port's bandwidth.

    Type: numeric value set.

    Range: NX-NX-NX-…

    N is the number of Xs. X can be 3, 4, 4C, 16C or C64 representing VC3, VC4, VC4-4C, VC4-16C or VC4-64C.

    Default: 644.

14. **`istd`** – Interface Standard

    Each synchronous optical interface can be set to SDH or SONET. The default value depends on the setting of the parameter istddflt.

    Type: Alphanumeric value set.

    Range: SDH.

    Default: As specified via *istddflt* on system level, see definition in “RTRV-EQPT (system): Retrieve Equipment (system)” (p. 3-2381).

15. **`linkResCls`** – Link Resource Class

    The *linkResourceClass* provides a classification for routing purposes of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it. The value of this attribute represents a 32-bit mask.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set (4 bytes), every bit defining one link class

    Range: fixed 4 alphanumeric characters with hexadecimal values 00..FF

    Default: 00 for each alphanumeric character

16. **`localLinkID`** – Local Link IDentity

    The *localLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    This identification is from the local NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

17. **`localLPID`** – Local Logical Port IDentity

    The *localLPID* provides a unique logical identification of a single port with a *portClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.

    Depending on the *portClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkLPID”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *portClass* UNI.

    This parameter is supported by ports of *portClass* EDGE.

    Type: numeric value set.

    Range: 0 (default) to 4294967295

    The default value shall have the meaning of “no localLPID provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

18. **`lpbk`** – Loopback

    This parameter specifies the current near-side loopback status of the considered output *aid*.

    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.

    Type: Alphanumeric value set.

    Range:

    - YES
    - NO (default).

19. **`maxNNXCRate`** – Maximum NN Cross Connect Rate

    The *maxNNXCRate* identifies the maximum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* INNI.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set.

    Range: VC3, VC4, VC44C, VC416C or VC464C (default)

20. **minNNXCRate** – Minimum NN Cross Connect Rate

    The *minNNXCRate* identifies the minimum rate at which cross-connections are allowed for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* INNI.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set.

    Range: VC3 (default), VC4, VC44C, VC416C or VC464C

21. **msrei** – MS-REI mode

    An special extended MS REI mode is standardized for STM64/OC192 interfaces. To support the interworking with older STM64/OC192 interfaces the single byte mode (non-extended) should also be supported.

    Type: Alphanumeric value set.

    Range: SINGLE or EXTENDED (default)

22. **ndetmd** – Neighbor Detection Mode

    The *ndetmd* identifies the mode for neighbor detection for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* INNI.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Alphanumeric value set.

    Range:

    AUTO, MAN

    Default:

    For *portClass* = INNI: AUTO

    For *portClass* = ENNI: MAN

23. **neighborASTNNodeID** – Neighbor ASTN Node Id

    This parameter identifies the unique node identifier of the neighbor node of ports of *portClass* = INNI to be used for ONNS application. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until portClass is INNI. This parameter can only be modified, if *ndetmd* = MAN.

    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

    *neighborASTNNodeID* is used by the ONNS application.

    Type: Four dot separated numeric string.

    Range: Each numeric string: 0…255.

Default: 0.0.0.0 If *portClass* = INNI, the default value shall have the meaning of "no neighbor discovered".

24. **neighborNodeID** – Neighbor Node Id

    This parameter identifies the IP address of the neighbor node of ports of *portClass* = INNI. For all ports with other values of portClass, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until portClass is INNI. This parameter can only be modified, if *ndetmd* = MAN. If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

    *neighborNodeID* is used by the ONNS application.

    Type: Four dot separated numeric string.

    Range: Each numeric string: 0…255.

    Default: 0.0.0.0

    If *portClass* = INNI, the default value shall have the meaning of "no neighbor discovered"

25. **neighborPortID** – Neighbor Port Id

    This parameter identifies the identity of the adjacent port at the neighbor NE for ports of *portClass* = INNI. For all ports with other values of *portClass*, this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI. This parameter can only be modified, if *ndetmd* = MAN.

    If *ndetmd* = MAN, this parameter shall indicate the value set by the operator. If *ndetmd* = AUTO, this parameter shall indicate the value detected via automatic neighbor detection.

    *neighborPortID* is used by the ONNS application.

    Type: Four dash separated numeric string.

    Range: Each numeric string: 0…255.

    Default: 0-0-0-0.

    Interpretation: For UNITE ports the contents of this parameter is interpreted as SPort AID, a value of a-b-c-d is interpreted as the SPortAID a-b-#-#-c-d.

26. **neighborSigPCID** – Neighbor Signaling PC IDentity

    The *neighborSigPCID* provides a logical identification of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Four dot separated numeric string

    Range: Each numeric string: 0…255

    Default: 0.0.0.0

27. **neighborSigPCIPAddr** – Neighbor Signaling PC IP Address

The *neighborSigPCIPAddr* identifies the IP address of the neighbor node connected via the corresponding port for signaling purposes, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* ENNI.

Type: IPv4 format: Four dot separated numeric string

Range: Each numeric string: 0…255

Default: 0.0.0.0

28. **nemspm** – MS Near-End PM Enable

    Enable or disable near-end multiplex section (near-end line) performance monitoring.

    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).

29. **networkTNAType** – Network TNA Type

    The *networkTNAType* identifies the type of the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkTNAType”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *portClass* UNI.

    This parameter is supported by ports of *portClass* EDGE.

    Type: Alphanumeric value set.

    Range:

    - IPV4 (default)
    - IPV6
    - NSAP

30. **networkTNAAddress** – Network TNA Address

    The *networkTNAAddress* identifies the Network TNA Address attached to a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

    The content depends on the given *NetworkTNAType*. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This attribute replaces attribute “uniNetworkTNAAddress”, as starting with R9 this attribute is not exclusively valid any more for port class UNI only and thus a more generic name seems reasonable.

This parameter is supported by ports of *portClass* UNI.

This parameter is supported by ports of *portClass* EDGE.

Type:

- networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)
- networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)
- networkTNAType= NSAP: hexadecimal number (represents 20 Bytes)

Range:

- IPV4: Each numeric string: 0…255
- IPV6: Each hexadecimal number: 0000…FFFF
- NSAP: Hexadecimal number:
  00000000000000000000000000000000000000…
  FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

Examples:

- IPV4: 129.12.3.178
- IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
- NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF

Default:

- IPV4: 0.0.0.0
- IPV6: 0-0-0-0-0-0-0-0
- NSAP: 00000000000000000000000000000000000000

The default value shall have the meaning of “no TNA Address provisioned” for ports with *portClass* value supporting this parameter, in case explicit setting of the default value is allowed.

31. **`och`** – optical channel enable

    Enable or disable of the optical channel. If the optical channel is disabled the further optical channel parameters don't have any impact on transmission.

    Type: Alphanumeric value set.

    Range:

    - for ports on OP10 packs, which support to enable or disable OCH: ENABLE: enable optical channel; DISABLE: disable optical channel
    - for ports on OP10 and OP40 packs, which cannot support OCH: DISABLE: disable optical channel
    - for ports on OP10 and OP40 packs, which only support OCH: ENABLE: enable optical channel
    - for client ports on packs which support OTN: DISABLE disable, optical channel not applicable.

Default:

- for OP10 and OP40 packs, which cannot support OCH: DISABLE
- for OP10 packs, which cannot support OCH: ENABLE
- for OP10 and OP40 packs, which only support OCH: ENABLE
- for client ports on packs which support OTN: DISABLE.

32. **opdis** – Optical Distance

    It shows the type of application for which the optical transmitter on this port is suited. The value NA is reported for client ports.

    Type: Alphanumeric value set.

    Range:

    - INTRA-OFFICE
    - SHORT-HAUL
    - LONG-HAUL
    - VERY-LONG-HAUL
    - OLS_PASSIVE
    - OLS_400G
    - OLS_800G
    - XTREME.

33. **opwl** – Optical Wavelength

    Optical Wavelength in nanometers. It shows the type of optics that is used on this port.

    Type: Alphanumeric value set.

    Range (wavelength in [nm]): 0 (i.e. undefined), 1310; 1550; 1530.334 … 1562.640 (i.e. C-Band); 1553.731 … 1608.329 (i.e. L-Band), 1471 … 1611 (for CWDM), NA (for client ports).

    The value undefined is used e.g. in the context of optical modules if the retrieval of the inventory data is not yet supported.

34. **otnclient** – OTN Client Port

    This parameter indicates whether the port is an OTN Client Port or an optical SDH/SONET port..

    Type: Alphanumeric value set.

    Range: YES for OTN client port; NO for optical SDH/SONET port.

35. **outql** – Outgoing timing quality

    This parameter provides the outgoing quality level message on the S1 SDH MS overhead byte.

    Type: Alphanumeric value set.

    Range:

    - PRC
    - SSUL

- SSUT
- SEC
- DNU (default).

36. **pmmsfeses** – Performance Monitoring Line/MS Far-End SES Threshold

    This parameter describes the Line/Multiplex-Section Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-16/OC-48: 1 – 3072000
    - STM-64/OC-192: 1 – 12288000
    - STM-256/OC-768: 1 – 49152000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM16: 460800
    - STM64: 1843200
    - STM256: 7372800
    - SONET OC48: 2459
    - SONET OC192: 9835
    - SONET OC768: 39340.

37. **pmmsneses** – Performance Monitoring Line/MS Near-End SES Threshold

    This parameter describes the Line/Multiplex-Section Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set.

    Range (the range depends on the line rate but is identical for the corresponding SDH and SONET rates):

    - STM-16/OC-48: 1 – 3072000
    - STM-64/OC-192: 1 – 12288000
    - STM-256/OC-768: 1 – 49152000.

    Default: The default values differ for SDH and SONET and the different rates:

    - STM16: 460800
    - STM64: 1843200
    - STM256: 7372800
    - SONET OC48: 2459

- SONET OC192: 9835
- SONET OC768: 39340.

38. **pmode** – Port Mode

    This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.

    Type: Alphanumeric value set.

    Range:

    - AUTO (default) indicates that, when a signal is detected at the port, then alarm monitoring will start.

      The value AUTO is only supported for optical SDH/SONET ports, i.e. not supported for client ports.
    - MON indicates that alarm monitoring is taking place on the port.
    - NMON means that alarm monitoring is not occurring on the port.

    Default: AUTO for optical SDH/SONET ports; NMON for client ports.

39. **pmrsneses** – Performance Monitoring Section/RS Near-End SES Threshold

    This parameter describes the Section/RS Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set.

    Range (superset of allowed ranges for SDH and SONET):1 – 64000

    Default: The default values differ for SDH and SONET and the different rates:

    - SDH (all rates): 2400
    - SONET OC48: 2392
    - SONET OC192: 8554
    - SONET OC768: 22776.

40. **polynomial** – Optical Channel Scrambling Polynomial

    This parameter is used by the Wavewrapper scrambler on the optical channel. This parameter is relevant only if the optical channel is enabled (*och* = ENABLE).

    Type: numeric value set.

    Range: 1x7 + x + 1; 2x16 + x12 + x3 + x + 1.

    Default: 2.

41. **portClass** – Port Class

    This parameter identifies the port class of the AID.

    In which role the port is used by the ONNS application is specified by this parameter *portClass*.

    Type: Alphanumeric value set.

    Range: TRADITIONAL, INNI, EDGE, UNI, ENNI.

Default: If Cross Connect Setup (*xcsetup*) is set to SWISS, then the value of the system parameter Port Class Default (*portclassdefault*) is used as default value. Otherwise, the default value is TRADITIONAL.

42. **`portControl`** – Port Control (PortAdministrative Mode)

    The *portControl* identifies the administrative mode for a port with a *portClass* value used by the ONNS application. For ports of *portClass* TRADITIONAL this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is different from TRADITIONAL.

    Type: Alphanumeric value set.

    Range: NORMAL (default), LOCKOUT

43. **`propagationDelay`** – Propagation Delay

    This parameter identifies the provisioned propagation delay value for ports of *portClass* = INNI. For all ports with other values of *portClass* this parameter is not relevant, i.e. parameter can be retrieved and changed, but will internally not be evaluated until *portClass* is INNI.

    *propagationDelay* is used by the ONNS application.

    Type: Numeric string.

    Range: 0(default) …25. The unit of this value is "milliseconds".

44. **`ptype`** – Port Type

    Definition: This identifies the port type of the AID.

    It is derived from the functional name and functional qualifier of a circuit pack. If the functional qualifier indicates a pack with 10GE_WANPHY interfaces the port type has the value 10GE_WANPHY, else STM64.

    Type: Alphanumeric value set.

    Range: STM64.

45. **`remAdvNodeID`** – Remote Advertised Node IDentity

    The *remoteAdvNodeID* provides a logical identification of the remote level 1 routing entity the corresponding port is connected to under the following condition:

    The port has a *portClass* value used by the ONNS application and supporting this specific parameter The character of this remote routing entity depends on the level 1 routing model configured for the corresponding neighbor node.

    For all ports with *portClass* values not supporting this parameter and in case a level 1 routing model not supporting this parameter is configured, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until both these conditions are fulfilled.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Four dot separated numeric string

    Range: Each numeric string: 0…255

    Default: 0.0.0.0

46. **`remLinkID`** – Remote Link IDentity

    The *remoteLinkID* provides a logical identification of the link the corresponding port is assigned to, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

This identification is from the remote NEs point-of-view. For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

This parameter is supported by ports of *portClass* ENNI.

Type: numeric value set

Range: 0 (default) to 4294967295

47. **remRAID** – Remote Routing Area IDentity

    The *remoteRAID* provides a logical identification of the remote routing area the corresponding port is connected to under the following condition:

    The port has a *portClass* value used by the ONNS application and supporting this specific parameter For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: Four dot separated numeric string

    Range: Each numeric string: 0…255

    Default: 0.0.0.0

48. **remTID** – Remote TID

    The *remoteTID* provides the TID of the node connected via the corresponding port, if the port has a *portClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

    This parameter is supported by ports of *portClass* ENNI.

    Type: TID or empty-string

    Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2397) description.

    Default: empty string: ""

49. **rsmstca** – RS/MS TCA Profile Pointer

    Definition of the active regenerator section/section and multiplex section/line threshold crossing alarm profile pointer.

    Type: Alphanumeric string.

    Range: String with maximum of 24 characters.

    Default: DEFAULT0.

50. **rspm** – RS PM Enable

    Enable or disable regenerator section (section) performance monitoring.

    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).

51. **rstimca** – RS TIM Consequent Action Enable

Regenerator Section Trace Identifier Mismatch consequent action enable (J0).

This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimca* is autonomously set by the neighbor detection mechanism.

Type: Alphanumeric value set.

Range:

- ENABLE (default): enable consequent action for TIM
- DISABLE: disable consequent action for TIM.

52. **rstimmon** – RS TIM Monitor Enable

    Regenerator Section Trace Identifier Mismatch Monitor enable (J0).

    This parameter is relevant only if the related trace read format *strcfmt* is set to 16 (16-byte-specific-string mode). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *rstimmon* is autonomously set by the neighbor detection mechanism.

    Type: Alphanumeric value set.

    Range:

    - ENABLE: enable TIM Monitor
    - DISABLE (default): disable TIM Monitor

53. **sdhpn** – SDH ASAP

    This parameter retrieves the ASAP profile name of type PORT to which the designated AID points. The value of this parameter is identical to the SONET Alarm Severity Assignment Profile for the SONET ports (see definition of output parameter SONET in "RTRV-OC192: Retrieve OC192 port" (p. 3-2650)) to be compatible with current generation applications.

    Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.

    Range: String with a maximum of 24 characters.

    Default: DEFAULT.

54. **sdsfmode** – Signal Degrade/Signal Fail Mode

    The degraded state is detected in Burst or Poisson mode.

    Type: Alphanumeric value set.

    Range:

    - BURST (default)
    - POISSON.

55. **servcond** – Service Condition

    This parameter indicates its status concerning service involvement.

    Type: Alphanumeric value set.

    Range:

    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.

56. **srlgList** – Shared Risk Link Group Identities List

The *srlgList* identifies the provisioned shared risk group identities for a port with a *portClass* value used by the ONNS application and supporting this specific parameter.

For all ports with *portClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *portClass* is set to a value supporting it.

The max. number of identities that can be provisioned per port may be release dependent. The order of the identities is not significant, e.g. 3-7-1 is considered the same as 7-1-3.

If less than the max. number of identities are provisioned, the remaining ones are set to the default value 0, e.g. 3-2-1 given yields 3-2-1-0-0-0-0-0-0-0, if the max. number that can be given is 10.

This parameter is supported by ports of *portClass* INNI.

This parameter is supported by ports of *portClass* ENNI.

Type: Ten numeric strings separated by dashes.

Range: Each numeric string: 0…65535.

Default: 0-0-0-0-0-0-0-0-0-0.

57. **strc** – Value of incoming J0

    This parameter shows the value of the Section Trace Identifier on the incoming section overhead J0 byte of a port. The length of the string depends on the value of the parameter *strcfmt*. The status of this value is contained in parameter *strcst*. If *strcst* indicates NORMAL, then strc contains a valid value. If *strcst* indicates UNAVAILABLE or AIS, then no incoming section trace identifier could be obtained by the system, e.g. due to a signal-fail condition, and the output parameter strc is omitted from the response.

    Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

    Range: 1 byte string, 16 byte string, 64 byte string (dependent on the strcfmt parameter).

58. **strcfmt** – Format of incoming J0

    The read format of J0, the incoming section trace (strc) and the expected section trace (exprstrc). If the parameter *portClass* is set to INNI and ndetmd is set to AUTO, the parameter *strcfmt* is autonomously set by the neighbor detection mechanism.

    Type: Numeric string.

    Range:

    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

59. **strcout** – Value of outgoing J0

    This identifies the section trace message to be transmitted. The length is set with the *strcwfmt* parameter.

If ITU/ETSI mode 2 is selected (strcwfmt = 2) the outgoing J0 is fixed to 01hex. Therefore the setting of this parameter has no impact. If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcout* according to the actually outgoing J0.

Type: Hexadecimal digits.

Range:

- 1 byte string
- 16 bytes string
- 64 bytes string.

Dependent on the strcwfmt parameter. Each byte is expressed as two hexadecimal digits (example value: 6D). Value constraint for 16 byte format: The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

Default: 01Hex

60. **strcst** – Status of incoming J0

    This parameter shows the status of the value of the incoming RS/Section Trace Identifier which is available with parameter *strc*.

    Type: Alphanumeric value set.

    Range: NORMAL: strc contains a valid value; UNAVAILABLE: no value for strc could be obtained by the system; AIS: no value for strc due to an SF condition.

61. **strcwfmt** – Format of outgoing J0

    The write format of J0, the outgoing section trace (strcout). If the parameter *portClass* is set to INNI, the system shall autonomously set the parameter *strcwfmt* according to the actually outgoing J0.

    Type: Numeric string.

    Range:

    - 1: for specific repeating byte (SONET)
    - 2 (default): for non-specific repeating byte (ITU/ETSI mode 2)
    - 16: for 16 byte specific string (ITU/ETSI mode 1).
    - 64: for 64 byte string (SONET).

62. **tcamd** – TCA mode

    This parameter shows the modus of the PM thresholding.

    Two thresholding methods are applicable:

    - TR-only (lso known as the implicit reset method)
    - TR-RTR (lso known as the explicit reset method).

    Type: Alphanumeric value set.

    Range: TR or TRRTR (default).

63. **trbmd** – Tributary mode

    If *trbmd* is FIXED, then *inputsig* constrains the cross-connection rates that can be entered for the port. If *trbmd* is ADAPTIVE, then input *inputsig* has no effect.

    Type: Alphanumeric value set.

    Range: ADAPTIVE, FIXED.

Default: The initial value is defined as the *trbmddflt* parameter on system level, see definition in "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2381) command.

64. **unequiposig** – Unequipped Output Signal List

    This parameter is a list of VCn rates across the port's bandwidth. It determines the rate(s) of the *unequipped* signal that will be transmitted if there is no cross-connection. *unequiposig* and *inputsig* do not need the identical setting. Mixed rates for *tx* and *rx* side of the port are allowed.

    Type: numeric value set.

    Range: NX-NX-NX-…

    N is the number of Xs. X can be 3, 4, 4C, 16C or C64 representing VC3, VC4, VC4-4C, VC4-16C or VC4-64C.

    Default: 644 = all VC4.

## Detailed behavior description

The command retrieves the parameters as described above.

The command **RTRV-STM64** does not generate a **REPT DBCHG** message.

## Example input/output

The following example shows the successful execution of a **RTRV-STM64** command. Not all output parameters are listed (missing ones indicated by … ):

```
RTRV-STM64:LT-UNITE:1-1-#-#-1-1:123456;

   LT-UNITE 00-11-24 08:00:00
M  123456 COMPLD
   "1-1-#-#-1-1:ptype=STM64,frcdus=DISABLE,dexcthr=-3,degthr=-6, pmode=MON,
   ...,pmmsneses=15,pmrsneses=30"
;
```

## Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2397). The error responses listed there also apply to the RTRV-STM64 command.

### Check CCB against ptype and istd

See definition of error response in "RTRV-STM16: Retrieve STM16 port" (p. 3-2877).

# RTRV-STS1: Retrieve STS1 tributary

## General

The command **RTRV-STS1** is used to retrieve all parameters related to the STS1 tributary.

Note: If a tributary AID (Access IDentifier) is specifed in the RTRV-STS1 request for a slot provisioned with a GE1 pack (e.g. 1-1-#-#-1-1-1 is used), then an empty reply is returned instead of: `IENE - Input, Entity Not Exists`.

For GE1 the "RTRV-VCGTRIB: Retrieve virtual concatenation group tributary " (p. 3-3082) command must be used.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-STS1**:*tid:aid:ctag*;

## Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   AID of an SDH tributary. The keyword **all** is allowed on slot, port and tributary level. The so called "dynamic parameters" is reported, if a **all** is used at the tributary level.
   The "dynamic parameters" are:
   - *ptrc*, *ptrcst*, *siglb*, *trailstate*.

   Type: AID
   Range: STS1NumAID.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

   **Important!** To retrieve the dynamic parameters (*ptrc*, *ptrcst*, *siglb*, *trailstate* ) of all tributaries use the "RTRV-ALL: Retrieve all (tributary)" (p. 3-2216) command and set the parameter *dyn* to YES.

### Output format

In response to a valid RTRV-STS1 command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

### Output parameters

#### Command parameters

1. **aid** – Access Identifier

   AID of the SONET tributary. The keyword **all** is not allowed on any level.

   Type: AID

   Range: STS1NumAID

#### Spec block parameters

1. **brstintvl**– Bursty Interval

   If the STS-1 tributary is related to a EC1 port, then the parameter *sdsfmode* is fixed to POISSON. As a consequence, the parameter *brstintvl* will never be used by the system in this case.

   Measurement period for determining bursty errors The setting of this parameter is used when *sdsfmode* = BURST.

   Type: numeric value set.

   Range: 2 to 10.

   Default: 7.

2. **brstthr** – Bursty Error Threshold

   If the STS-1 tributary is related to a EC1 port, then the parameter *sdsfmode* is fixed to POISSON. As a consequence, the parameter *brstthr* will never be used by the system in this case.

   The values are set in percent for the degradation threshold. The setting of this parameter is used when *sdsfmode* = BURST.

   Type: numeric value set.

   Range (as percentage ): 5, 10, 15, 20, 25, 30, … 50.

   Default: 30.

3. **crslpbkrate** – Cross-connect loopback Rate

   It is independent from the current interface standard and therefore both SDH and SONET values are allowed.

The parameter *crslpbkrate* is not reported if the parameter *crlspbkstat* indicates that no loopback is set.

Type: Alphanumeric value set.

Range:

- VC3
- VC4
- VC44C
- VC416C
- VC464C
- STS1
- STS3
- STS12
- STS48
- STS192

4. **crslpbkstat** – Cross-connect loopback status

   State of cross- connect loopback.

   Type: Alphanumeric value set.

   Range:

   - YES = Cross-connect loopback is provisioned
   - NO (default) = No cross-connect loopback is provisioned.

5. **degthr** – Signal Degrade Threshold

   The setting of this parameter are used when *sdsfmode* = POISSON

   Type: numeric value set.

   Range (as exponents of 10): –5; –6 (default); –7; –8; –9

6. **dexcthr** – Excessive Degrade Threshold

   The setting of this parameter are used when *sdsfmode* = POISSON. The values are set as exponent of 10.

   Type: numeric value set.

   Range (as exponent of 10) –3 (default); –4; –5.

7. **exphptrc** – Expected Path Trace (J1)

   The parameter *exphptrc* specifying the expected path trace is only relevant for the path trace supervision when the path trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).

   Type: Hexadecimal digits

   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

   Default: 89hex followed by 15 bytes 00hex.

8. **feppm** – Far-End Path PM Enable

   It indicates whether this performance monitoring feature is enabled or disabled.

Type: Alphanumeric value set.
Range:

- ENABLE
- DISABLE (default).

9. **loca** – Ring A-node TID
   This parameter specifies the TID of the node at which the service is added to the BLSR ring. This parameter is required for the input of tributaries to be used by ONNS on ports of *portClass* = EDGE being members in BLSR/MS-SPRing protection groups. The *loca* parameter value is an empty string for all other tributaries.
   *loca* is introduced specifically for use related to ONNS application.
   Type: TID or empty-string.
   Range: Please refer to the TID definition in "RTRV-HDR: Retrieve header" (p. 3-2397) description.
   Default: empty string: "". This is displayed as \"\" in output direction.
10. **locz** – Ring Z-node TID
    This parameter specifies the TID of the node at which the service is dropped from the BLSR ring. This parameter is required for the output of tributaries to be used by ONNS on ports of *portClass* = EDG E being members in BLSR/MS-SPRing protection groups. The *locz* parameter value is an empty string for all other tributaries.
    *locz* is introduced specifically for use related to ONNS application.
    Type: TID or empty-string.
    Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2397) description.
    Default: empty string: "". This is displayed as \"\" in output direction.
11. **hptimmon** – Path Trace Monitoring Enable (J1)
    Description: High order path trace (J1) identifier mismatch (TIM) monitor enable.
    This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
12. **neppm** – Near-End Path PM Enable
    It indicates whether this performance monitoring feature is enabled or disabled.
    Type: Alphanumeric value set.
    Range:
    - ENABLE
    - DISABLE (default).
13. **pjepm** – Pointer Justification Event PM Enable
    It indicates whether this performance monitoring feature is enabled or disabled.
    Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

14. **pmhpfeses** – Performance Monitoring Path Far-End SES Threshold

    This parameter describes the Path Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. When the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set.

    Range (superset of ranges for SDH and SONET): 1-64000.

    Default: 2400.

15. **pmhpneses** – Performance Monitoring Path Near-End SES Threshold

    This parameter describes the Path Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. When the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set.

    Range (superset of ranges for SDH and SONET): 1-64000.

    Default: 2400.

16. **pse** – PDI-P Switching Enable

    The PDI-P Switching Enable parameter indicates if the PDI-P contributes to the automatic path protection switch criteria.

    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).

17. **ptca** – Path TCA Profile Pointer

    Type: Alphanumeric string.

    Range: string with up to 24 characters.

    Default: DEFAULT0.

18. **ptrc** – Path Trace (J1)

    This parameter shows the value of the path trace identifier on the incoming path overhead J1 byte of a non-terminated tributary. The length depends on the value of the parameter *ptrcrfmt*. The status of this value is contained in parameter *ptrcst*. If *ptrcst* indicates NORMAL, then ptrc contains a valid value. If *ptrcst* indicates UNAVAILABLE or AIS, then no valid incoming path trace identifier could be obtained by the system, e.g. due to a signal-fail condition or intra-NE communication problems, and the output parameter ptrc is omitted from the response. For concatenated tributaries the system shall not return this parameter (see detailed behavior below).

    Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

Range:

- 1 byte for non-specific repeating byte
- 16 byte: These 16 byte shall consist of 15 byte information and the CRC7 byte
- 64 bytes: This is a pure byte stream without any restrictions.

19. **ptrcrfmt** – Path Trace Read Format (J1)

    The read format of J1, the incoming path trace (ptrc).

    Type: numeric string.

    Range:

    - 2: for non-specific repeating byte
    - 16: for 16 byte specific string.
    - 64: for 64 byte string.

      Default: 2.

20. **ptrcst** – Status of Incoming Path Trace (J1)

    This parameter shows the status of the value of the incoming path trace identifier which is available with parameter ptrc. For concatenated tributaries the system shall not return this parameter (see detailed behavior below).

    Type: Alphanumeric value set.

    Range:

    - NORMAL: ptrc contains a valid value
    - UNAVAILABLE: no valid value for ptrc could be obtained by the system
    - AIS: no valid value for ptrc due to an SF condition.

21. **sdsfmode** – Signal Degrade/Signal Fail Mode

    The degraded state is detected in BURST or POISSON mode.

    Type: Alphanumeric value set.

    Range:

    - BURST
    - POISSON (default).

    If the tributary is related to a EC1 port, then the range is limited to: POISSON

22. **siglb** – Signal Label

    This parameter shows the value of the signal label on the incoming path overhead C2 byte of a non-terminated VC tributary.

    The parameter is not reported if the *trailstate* parameter indicates a fail condition, i.e. has the value AIS or UNAVAILABLE. For concatenated tributaries the system shall not return this parameter (see detailed behavior below).

    Type: Alphanumeric value set.

    Range: 00, 01, …, FE, FF; i.e. two hexadecimal digits.

23. **substr** – Substructured

    This parameter indicates if the tributary is substructured.

    *Substructure for LO cross-connections:*

A HO tributary, which is sub structured for LO cross-connections, has a HO path termination associated which provides LO tributaries to be used for LO cross-connections.

The parameter *substr* is set autonomously when LO cross-connections are created or deleted with ENT-CRS or DLT-CRS commands (see also the lower-order cross-connection creation/deletion behavior description for the commands ENT-CRS and DLT-CRS).

A sub structured HO tributary cannot be used to set up HO cross-connections. The parameter *substr* is set autonomously when the LO substructure is created or deleted using the **ED-SUBS** command.

*Substructure for conversion cross-connections:*

A HO tributary, which is sub structured for the LO side of a conversion cross-connection, has a HO path termination associated which provides LO tributaries to be used for conversion cross-connections.

The parameter *substr* is set autonomously when an AU3/AU4 conversion cross-connection is created.

A HO tributary, which is sub structured for conversion cross-connections, cannot be used to set up HO cross-connections.

Type: Alphanumeric value set.

Range:

- YES: Automatically sub structured for LO cross-connections
- MANSUB: Manually sub structured for LO cross-connections
- CNVSUB: Automatically sub structured for the LO side of conversion cross-connections
- NO (default): Not sub structured, not used for conversion cross-connections

If the STS-1 tributary is related to a EC1 port, then no LO cross-connections are allowed. As a consequence, the parameter *substr* can only have the values CNV and NO in this case.

24. **tmonmd** – Tributary Monitoring Mode

    This parameter indicates the mode of the tributary.

    Type: Alphanumeric value set.

    Range:

    - MON = alarm monitoring is taking place on the port.
    - NMON (default) = alarm monitoring is not occurring on the port.

25. **trailstate** – Trail State (C2)

    It is possible to read the accepted trail value status (C2) of every VC which is terminated/monitored in the system. For concatenated tributaries the system shall not return this parameter (see detailed behavior below).

    Type: Alphanumeric value set.

Range:

- NORMAL: for accepted TSL which has valid payload type
- AIS: for SSF, VC-AIS, dTIM or dUNEQ
- UNAVAILABLE: for TSL which does not meet the acceptance criteria or no reporting is possible.

Default: UNAVAILABLE.

26. **tribsonetpn** – Tributary Alarm Severity Assignment Profile

    This parameter points to a tributary ASAP profile name of type PATH for the designated AID.

    Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.

    Range: String with a maximum of 24 characters.

    Default: DEFAULT.

## Detailed behavior description

### Applicability for STS3c and concatenated signals

The command **RTRV-STS1** is also applicable to STS3c tributaries. Even though an STS3c signal is not a concatenated STS1 signal in a strict sense, from a pointer processor viewpoint it can be considered to be comprised of three STS1 signals which have the properties of a concatenated signal. Thus it is not necessary to have a separate RTRV command for STS3c. Similarly, RTRV-STS1 is also applicable to other "concatenated" signals.

### Retrieval of concatenated tributaries

The rules as defined for RTRV-VC3 apply as well.

### Behavior for non-existing entities

If the specified VC3/VC4 tributaries do not exist, the command shall return an empty response. E.g. if an attempt is made, to retrieve VC3/VC4 tributaries on a GbE circuit pack.

## Example input/output

```
RTRV-STS1:LT-UNITE:1-1-#-#-3-1-1:123456;

   LT-UNITE 00-11-27 08:00:00
M  123456 COMPLD
   "1-1-#-#-3-1-1:crslpbkstat=NO,tmonmd=NMON,tribsonetpn=Default,
ptca=Default0,feppm=DISABLE,pmhpneses=30,pmhpfeses=30,degthr=-6,...,
   ptrcrfmt=1,dexcthr=-3,ptrc=00,ptrcst=NORMAL,sdsfmode=POISSON"
;
```

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the RTRV-STS1 command.

### Check CCB against *istd* of related port

See definition of error response in “RTRV-VC3: Retrieve VC3 tributary” (p. 3-3043).

## Related TL1 messages

“ED-STS1: Edit STS1 tributary” (p. 3-1175)

## References

GR-199-CORE (RTRV-*rr*)

# RTRV-SYNCN: Retrieve synchronization

The command displays the provisioning and operational information of the synchronization attributes as set by the **SET-SYNCN** command and after initial system start-up. It also displays the status of the external timing reference input and output ports.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): M1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-SYNCN**:*tid*:*[aid]*:*ctag*;

## Input parameters

### Command parameters

1. **tid** – target identifier
   See definition of *tid – target identifier* in "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **aid** – access identifier
   This parameter is used to identify the timing related settings. The AID separates the parameter in system timing related parameter, output timing related parameters, parameters related to assigned timing references and parameters for external timing input and external timing output. The *all* AID retrieves all retrievable parameters for synchronization. If the AID is omitted, the outputs for the whole synchronization area are given.
   Type: AID
   Range:
   - SystemAID
   - Timing_Output_AID
   - External_timing_ref_AID
   - Line_timing_ref_AID
   - External_Timing_input_port_AID
   - External_Timing_output_port_AID
   - **all**.

   Default: **all**.
3. **ctag** – correlation tag
   See definition of *ctag – correlation tag* in "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output format

After receiving the **RTRV-SYNCN** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "aid:spec_block"
       ...
       ...
   "aid:spec_block"
;
```

## Output parameters

### Command parameters

1. **aid** – access identifier
   This parameter specifies the timing related settings.
   Type: AID
   Range:
   - SystemAID
   - Timing_Output_AID
   - External_timing_ref_AID
   - Line_timing_ref_AID
   - External_Timing_input_port_AID
   - External_Timing_output_port_AID

   Default: Not applicable.

### Spec block parameters

1. System Timing
   a. **active_ref** – active timing reference status
      This parameter displays the active timing reference, which the system clock is currently using for locked mode of system timing.
      The value NONE is reported in the following cases:
      - no timing reference is assigned (or all references are failed or locked-out)
      - the system is in free-running mode

      Type: text string
      Range: External_timing_ref_AID, Line_timing_ref_AID; NONE
      Default: NONE.

   b. **clkmod** – clock mode
      This parameter specifies the provisioned operational mode of the system timing. In the clockmod = FREE-RUNNING mode the system clock process uses the internal oscillator as reference. In the clockmod = LOCKED mode the system clock process uses the input signal from the system.

Type: Alphanumeric value set.

Range: FREE-RUNNING, LOCKED.

Default: FREE-RUNNING.

c. **clkmod_stat** – system clock mode status

This parameter specifies the state of the system clock. The range is depending on the system synchronization characteristic.

NORMAL: This operational mode indicates either the NE derives timing from the internal oscillator when clockmod = FREE-RUNNING, or the system timing is locked to a timing reference signal when clockmod = LOCKED and the reference is derived from one of the timing input signals. Refer to *clkmod* parameter.

AUTONOMOUS-HOLDOVER: This state indicates that all references are failed and no higher priority request is present.

FORCED-HOLDOVER: This operational mode is caused by a Clock Backup Request.

FAST-START: This operational mode indicates for fast pull-in of the clock when recovering from holdover (for SONET only).

The values AUTONOMOUS-HOLDOVER, FORCED-HOLDOVER and FAST-START are only possible when clockmod = LOCKED.

Type: Alphanumeric value set.

Range:

SONET: NORMAL, AUTONOMOUS-HOLDOVER, FORCED-HOLDOVER, FAST-START.

SDH: NORMAL, AUTONOMOUS-HOLDOVER, FORCED-HOLDOVER.

Default: NORMAL

d. **refsw_stat** – reference switch status

The System Timing Reference Switch Request State is a state of the system timing.

The value FORCED means, the system enters the Forced Switch state upon the initiation and successful completion of the Forced Switch command. While in the Forced Switch state the system may not switch the active timing reference, neither automatically nor by means of the Forced Switch or Manual Switch command.

The value MANUAL means, the system enters the Manual Switch state upon the initiation and successful completion of the Manual Switch command. While in the Manual Switch state the system may switch the active timing reference automatically if required for protection switching.

The parameter NO-REQUEST indicates, this is the routine-operation quiet state in which no external command activities are occurring. The system enters this state upon initial start-up, and following a clear command, or the clearing of an automatic switch.

Type: Alphanumeric value set.

Range: MANUAL, FORCED, NO-REQUEST

Default: NO-REQUEST.

e. **stratum_level** – stratum level status

This parameter provides information about the level of the system clock. The parameter is depending from the system synchronization characteristic.

Type: Alphanumeric value set.
Range:
SONET: 3
SDH: SEC
Default:
SONET: 3
SDH: SEC.

f. **syncmsg** – system synchronization status messaging mode

This parameter is used to ENABLE or DISABLE the SSM protocol.
The parameter provisions the automatic reference selection process to use the incoming QLs in QL-enabled mode or to ignore them in QL-disabled mode. In case of DISABLE, for SDH all output SSMs are set to DNU, for SONET all output SSMs are set to STU.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE.
Default: ENABLE.

g. **sysql_stat** – system quality level status

This parameter indicates the overall system timing quality level status. If the system configured as SONET then the SONET related values are indicated and if the system configured as SDH the SDH related values are indicated.
Type: Alphanumeric value set.
Range:
SONET: PRS, STU, ST2, ST3, DUS
SDH: PRC, SSUL, SSUT, SEC, DNU.
Default:
SONET: DUS
SDH: DNU.

h. **timing** – ASAP name

This parameter specifies the name of the ASAP (Alarm Severity Assignment Profile) that is assigned to timing.
Type: Alphanumeric value set.
Range: PFNAME (alphanumeric string with 1… 24 characters). A hyphen ("-") is allowed in the name additionally.
Default: Default

i. **wtr** – wait to restore

This parameter specifies the provisioned wait to restore timer used for all timing ports for revertive switching. This is the amount of time it takes to switch from lower priority to higher priority references. The value range depends from the system synchronization characteristic.
Type: Alphanumeric value set.
Range:
SONET: 0SEC, 20SEC, 0…60MIN (1 minute steps), 99 (infinite).

SDH: 0SEC, 0…60MIN (1 minute steps); the values “0SEC” and “0MIN” can be used for SONET and SDH to provision a zero wait to restore time.

Default:

SONET: 20SEC

SDH: 5MIN

j. **wu_stat** – warm up status

This parameter is an attribute of the timing pack hardware design.

At initial start up of the system and at replacing of the active or standby timing function the system is in warm-up state. DNU/DUS is transmitted during this state on all ports. The clock would be expected to warm up for a temporary period of time before transition to NORMAL.

Type: Alphanumeric value set.

Range: NORMAL, WARMING-UP.

Default: NORMAL.

2. Output Timing (instance only valid for SDH)

a. **active_oref_stat** – active output timing reference status

This parameter displays the current selected timing reference of the timing link switch for the external output.

The value NONE is reported in the following cases:

- the external output timing is not locked to system timing (i.e. extout_prov ≠ SETG) AND none of the six line_timing instances (line1 to line6) is enabled OR all are failed OR locked out

- the external output timing is locked to system timing (i.e. extout_prov = SETG)

Type: text string.

Range: Line_timing_ref_AID, NONE.

Default: NONE.

b. **orefswr_stat** – output timing reference switch request status

This parameter indicates the output timing reference switch request state.

The value MANUAL means, a manual switch is active to the external timing output. The value FORCED means, a forced switch is active to the external timing output. The value NO-REQUEST means, no external command activities are occurring at the external timing output.

Type: Alphanumeric value set.

Range: MANUAL, FORCED, NO-REQUEST

Default: NO-REQUEST.

3. Assigned Timing Reference

a. **extout_pri** – timing output reference priority

This parameter specifies the priority assignment of the timing link switch of the external output timing. This parameter is only for SDH and for line timing references.

The greater the number the lower the priority. The number "1" indicates the highest priority. The priority "0" means not assigned for external output.

Type: Numeric value set.

Range: 0 (means DISABLED), 1, 2, 3, 4, 5, 6.

Default: 0 (means DISABLED).

b. **inql** – assigned timing reference quality value

This parameter displays the input synchronization message for each port of the timing link switch provisioning of the system timing and of the output timing. In the output timing context the values for SDH are valid only. In case of invalid SSM, the value DNU or DUS is displayed. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.

Range: SONET: PRS, STU, ST2, ST3, DUS

SDH: PRC, SSUT, SSUL, SEC, DNU.

Default: Not applicable.

c. **inql_stat** – input quality status

This parameter indicates the synchronization messaging quality level status for the specified timing reference.

The parameter describes the validity of the incoming quality level and take the following values: VALID, when the QL is a valid SSM and stable, INVALID, when the QL is not a valid SSM, or unstable, NOT-SUPPORTED, when SSM reception is not supported on that interface due to HW capabilities or the chosen format of the input signal (such as 2MHz), NOT-APPLICABLE, when no port is assigned to the current timing reference or the assigned timing reference experiences a reference fail.

Type: Alphanumeric value set.

Range: VALID, INVALID, NOT-SUPPORTED, NOT-APPLICABLE.

Default: NOT-APPLICABLE.

d. **ql_prov** – quality provisioned

This parameter defines the quality for the specified timing reference to a fixed SSM value. It is the provisioned quality level sync message value that will be received on timing references.

This parameter is related to all assigned timing references (both external timing references and line timing references) and overrides what is received for the respective timing reference. The AUTO value implies sync message support. The AUTO value is rejected if SSM is not supported for the assigned timing reference (i.e. for DS1 SF). The value range depends from the system synchronization characteristic. Per default is:

AUTO – for STM-N/OC-N line, 2Mbit/s framed or DS1 ESF with SSM,

SSUT – for 2MHz, 2Mbit/s unframed or framed without SSM

STU – for DS1 SF or DS1 ESF without SSM

Type: Alphanumeric value set.

Range:

SONET: AUTO, PRS, STU, ST2, ST3

SDH: AUTO, PRC, SSUL, SSUT, SEC.

Default:

SONET: AUTO (External_timing_ref_AID, Line_timing_ref_AID)

SDH: AUTO (Line_timing_ref_AID) SSUT (External_timing_ref_AID).

e. **ref_lock** – timing reference lockout status

This parameter displays the timing reference lockout state to the specified timing reference. It is the input status for each port of the timing link switch provisioning of the system timing.

The value LOCKOUT means, the assigned reference has been locked out by the user, and cannot be used as a timing reference signal until the lockout is cleared.

Type: Alphanumeric value set.

Range: LOCKOUT, NO-LOCKOUT.

Default: NO-LOCKOUT.

f. **ref_stat** – assigned timing reference signal status

The Assigned Timing Reference Signal Status is a status of each timing reference.

The status NORMAL means, the timing reference is available and operating normally without faults. The status FAILED means, the timing reference is failed. The status WAIT-TO-RESTORE means, the wait to restore timer is active before transition to NORMAL. The status NOT-CONNECTED means, there is no timing reference signal connected to the timing port.

Type: Alphanumeric value set.

Range: NORMAL, FAILED, WAIT-TO-RESTORE, NOT-CONNECTED.

Default: NOT-CONNECTED.

g. **sclkref_lockstat** – station clock output timing reference lockout state

This parameter indicates the assigned station clock output timing reference lockout state. This parameter is only for SDH and for line timing references.

Type: Alphanumeric value set.

Range: LOCKOUT, NO-LOCKOUT.

Default: NO-LOCKOUT.

h. **syncref_pri** – system timing reference priority

This parameter defines the priority for assigned timing references.

When multiple input references have been given the same priority value, it implies non-revertive switching between the associated references. Otherwise, it implies revertive switching to the reference with the highest assigned priority. When the QL-control is disabled, the selection process is controlled by signal status and port priority. The greater the number, the lower the priority. Priority "0" means not assigned.

Type: Numeric value set.

Range: 0 (means DISABLE), 1, 2, 3, 4, 5, 6, 7, 8.

Default: 0 (means DISABLE).

i. **timing** – ASAP name

See definition in "RTRV-SYNCN: Retrieve synchronization" (p. 3-2931) section system timing of this parameter.

j. **tpmode** – timing port mode monitoring

This parameter specifies the monitoring status of the timing port. If the timing port is in the MONITORED mode and the reference is in FAILED status alarms are active for this port. The value NOT-MONITORED means that alarm monitoring is not occurring on the port.

Type: Alphanumeric value set.

Range: MONITORED, NOT-MONITORED.

Default: NOT-MONITORED.

k. **`tpql_in`** – incoming SSM value of the timing port

This parameter indicates the QL value for the timing port. The value range depends on the system synchronization characteristic.

The parameter describes the incoming SSM and takes the following values:

PRS – Stratum-1 Traceable STU – Synchronized Traceability Unknown

ST2 – Stratum-2

ST3 – Stratum-3

DUS/DNU – Don't Use for Synchronization

PRC – Primary Reference Clock

SSUT – Synchronization Supply Unit Transit node

SSUL – Synchronization Supply Unit Local node

SEC – SDH Equipment Clock

SSMn – other SSM values with invalid state (for SDH)

UNSTABLE – value is unstable

NONE – SSM value not supported by hardware

Type: Alphanumeric value set.

Range:

SONET: PRS (0001), STU (0000), ST2 (0111), ST3 (1010), DUS (1111), NONE

SDH: PRC (0010), SSUT (0100), SSUL (1000), SEC (1011), DNU (1111), SSM0 (0000), SSM1 (0001), SSM3 (0011), SSM5 (0101), SSM6 (0110), SSM7 (0111), SSM9 (1001), SSM10 (1010), SSM12 (1100), SSM13 (1101), SSM14 (1110), UNSTABLE, NONE.

Default: Not applicable.

l. **`tref_aid`** – timing reference assigned port AID

This parameter specifies the port AID of the assigned timing reference AID.

The parameter is rejected, if the timing reference already assigned to a timing port, or if the reference does not support SSM and timing port is provisioned AUTO, or if the unit which delivers the reference is not present or pre-provisioned. It is not possible to assign more then one reference from a unit. It is not possible to un-assign units from which a reference is assigned to a timing port. It is also not possible to assign a reference from a protection port in a protection group. The value NOT-CONNECTED means no reference is assigned to current timing port.

Type: AID.

Range: External_Timing_input_port_AID, SPortAID, NOT-CONNECTED.

Default: NOT-CONNECTED.

4. External Timing Input

   a. **ext_if** – external input signal format

      This parameter specifies the format of the external timing input.

      The value range depends on the system synchronization characteristic. The external timing input format can be set at both external timing inputs individually. The reference is rejected, if the reference does not support SSM and the timing port is provisioned AUTO.

      Type: Alphanumeric value set.

      Range:

      SONET: SF, ESF

      SDH: 2MHz, 2Mbit-unframed, 2Mbit-framed.

      Default:

      SONET: ESF

      SDH: 2MHz.

   b. **ext_isa** – external input sa bit location

      This parameter defines the external input Sa bit location. It is only valid for the external timing input format “2Mbit/s” framed; i.e. for ports with format unequal to “2Mbit/s framed” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

      The location of the Sa bit is can be set at both external timing inputs individually. One of the Sa4 to Sa8 bits of the 2Mbit/s sub-multiframe is allocated for Synchronization Status Messages (SSM).

      Type: Alphanumeric value set.

      Range: SA4, SA5, SA6, SA7, SA8.

      Default: SA4.

   c. **ext_issm** – external input ssm support

      This parameter specifies if the SSM mode is supported or not on the external timing input port.

      The parameter is adjustable individually to both external timing input ports.

      Type: Alphanumeric value set.

      Range: SUPPORTED, NOT-SUPPORTED.

      Default: SONET: SUPPORTED, SDH: NOT-SUPPORTED.

5. External Timing Output

   a. **ext_equ** – cable equalization

      This parameter specifies the timing output cable equalization to adjust the specified timing reference output signal power. This parameter is valid only for DS1 (SONET).

      This parameter is rejected for all input interfaces except DS1. The values are represented by percentage (3.0dB=100%; 2.4dB=80%; 1.8dB=60%; 1.2dB=40%; 0.6dB=20%).

      Type: Numeric value set.

      Range: 20, 40, 60, 80, 100.

Default: 20.

b. **ext_of** – external output signal format

This parameter specifies the external output signal format. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: SF, ESF

SDH: 2MHz, 2Mbit-unframed, 2Mbit-framed.

Default:

SONET: ESF

SDH: 2MHz.

c. **ext_osa** – external output sa bit location

This parameter defines the external output Sa bit location. This parameter is only valid for external timing output format “2Mbit/s framed”; i.e. for ports with format unequal to “2Mbit/s framed” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

Type: Alphanumeric value set.

Range: SA4, SA5, SA6, SA7, SA8.

Default: SA4.

d. **ext_out_sig_stat** – external output signal status

This parameter indicates the external output signal status.

The value NORMAL indicates when the output timing signal is enabled and providing a correctly synchronized output timing signal. The value DISABLED indicates when the output timing signal has been disabled by means of user provisioning. The value UNACCEPTABLE indicates when the output timing signal is enabled but the timing output does not provide a suitable timing reference signal. This is caused by failed reference into the timing output process or references rejected based on threshold AIS criteria.

Type: Alphanumeric value set.

Range: NORMAL, DISABLED, UNACCEPTABLE.

Default: DISABLED.

e. **extout_en** – external timing output enabling/disabling

This parameter specifies whether the external timing output is enabled or disabled.

Type: Alphanumeric value set.

Range: ENABLE, DISABLE.

Default: DISABLE.

f. **extout_prov** – external timing output selection

This parameter specifies the operation mode of the external output timing.

The value SETG means the system clock. The value TLS means the output. For SONET both values are fixed to the respective external timing output. The value range depends on the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: LINE1 [ fix for output 1 ], LINE2 [ fix for output 2 ]
SDH: SETG, TLS.
Default: SONET: LINE1 [ fix for output 1 ], LINE2 [ fix for output 2 ]
SDH: SETG.

g. **extout_ssm** – external timing output AIS mode

This parameter specifies which value will be send when the signal level is below the quality acceptance level or when *frcdus* is enabled. The parameter is valid depending from the system synchronization characteristic, for SDH 2Mbit/s framed and for SONET DS1 ESF; i.e. for ports with format unequal to “2Mbit/s framed” or “DS1 ESF” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

The value AISMODE means AIS is inserted in the external timing output signal. The value QLMODE means DUS is inserted in the external timing output signal.

Type: Alphanumeric value set.
Range: AISMODE, QLMODE.
Default: QLMODE.

h. **frcdus** – forced DNU/DUS

This parameter specifies the synchronization messaging forced DNU/DUS enable or disable for the timing output port. DUS applies to SONET and DNU applies to SDH. This is only valid for '2Mbit/s framed' and 'DS1 ESF'; i.e. for ports with format unequal to “2Mbit/s framed” or “DS1 ESF” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

Type: Alphanumeric value set.
Range: ENABLE, DISABLE.
Default: DISABLE.

i. **loopdelay** – timing regenerator loop delay

This parameter indicates the delay in the SASE/BITS loop operation. The values are represented by seconds in steps of 1 seconds per loop.

Type: Numeric value set.
Range: 0…60 (1 seconds steps).
Default: 10.

j. **ql_out** – quality of the external timing output port

This parameter indicates the quality value on the signal for the timing output port.

Type: Alphanumeric value set.
Range:
SONET: PRS, STU, ST2, ST3, DUS
SDH: PRC, SSUL, SSUT, SEC, DNU.
Default: Not applicable.

k. **qlout_tais** – acceptance quality level for output threshold AIS

This parameter is the provisioned quality acceptance level for external timing output. When the incoming message is below this level, AIS or DUS (depending from the *extout_ssm* value) will be inserted into the external timing output. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.
Range:
SONET: PRS, STU, ST2, ST3
SDH: PRC, SSUT, SSUL, SEC.
Default:
SONET: ST3
SDH: SEC.

l. **`regen_loop`** – timing regenerator loop
This parameter specifies the avoiding of loops over the SASE/BITS clocks. When this parameter is set to ENABLED, the synchronization message DUS will be inserted in the traffic output port associated with the traffic input port used as source for the station clock. The parameter is selectable for both external timing outputs individually.
Type: Alphanumeric value set.
Range:
SONET: DISABLE, ENABLE
SDH: DISABLE, EXTREF1, EXTREF2, BOTH.
Default:
SONET: ENABLE
SDH: DISABLE.

m. **`timing`** – ASAP name
See definition in "RTRV-SYNCN: Retrieve synchronization" (p. 3-2931) section system timing of this parameter.

### Detailed behavior description

The **`RTRV-SYNCN`** command retrieves the output parameters values for the specified input AID as described in "RTRV-SYNCN: Retrieve synchronization" (p. 3-2931) output parameters section.

### Example input/output

The following is an example of the **`RTRV-SYNCN`** command:

```
RTRV-SYNCN:LT-UNITE:extrefall:123456;

   LT-UNITE 00-11-13 12:00:00
M  123456 COMPLD
   "EXTREF1:tref_aid=EXTTMG0,syncref_pri=2,ref_stat=NORMAL,
ref_lock=NO-LOCKOUT,inql=SSUT,inql_stat=NOT-SUPPORTED"
   "EXTREF2:tref_aid=EXTTMG1,syncref_pri=3,ref_stat=NORMAL,
ref_lock=NO-LOCKOUT,inql=SSUT,inql_stat=NOT-SUPPORTED"
;
```

# RTRV-T3: Retrieve DS3 port

The command **RTRV-T3** is used to retrieve all parameters related to the electrical DS3 port.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

## Input format

Command syntax:

**RTRV-T3**:*tid:aid:ctag;*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **aid** – Access Identifier
   Access Identifier of a DS3 port.
   Type: AID
   Range: APortAID of DS3 port. The keyword **all** is allowed up to shelf level.
3. **ctag** – Correlation Tag
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output format

In response to a valid **RTRV-T3** command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the Output parameter section for the **RTRV-HDR** command.

## Output parameters

### Command parameters

1. **aid** – access identifier

   Type: AID

   Range: APortAID of DS3 port

### Spec block parameters

1. **cbitmis** – C-bit Signal Format Mismatch

   DS3 C-bit Signal Format Mismatch parameter indicates a mismatch between the C-bit parity formatand the format of the incoming DS3 signal (ingress direction).

   The DS3 C-bit Signal Format Mismatch parameter shall have the value:

   - NORMAL, if the Signal Format (fmt) is set to C-BIT and a DS3 signal in C-bit parity channelized DS3 format is received
   - MISMATCH, if the Signal Format (fmt) is set to C-BIT and a DS3 signal in M23 channelized DS3 format is received
   - NA, if the Signal Format (fmt) is set to C-BIT and one of the alarms DS3LOS, DS3LOF, DS3AIS, DS3IDLE is present, or if the Signal Format (fmt) is set to another value than C-BIT, or if the value cannot be determined because pmode is set to AUTO or NMON or the circuit pack is not present or other system internal reasons.

   Type: Alphanumeric value set.

   Range: NORMAL, MISMATCH, NA.

2. **ds3pn** – DS3 ASAP

   DS3 Alarm Severity Assignment Profile. This parameter retrieves the ASAP profile name of type DS3 to which the designated AID points.

   Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.

   Range: String with a maximum of 24 characters.

   Default: DEFAULT.

3. **eif** – Electrical Interface Type

   The parameter eif indicates the type of input the port has been provisioned to receive.

   Type: Alphanumeric value set.

   Range: DS3

4. **feac** – Far-End Alarm and Control

   The parameter *feac* indicates the status of the FEAC channel of the incoming C-bit parity formatted DS3 signal. The parameter is only applicable, if *fmt* is set to C-BIT. The parameter shall have the value "NA" if the parameter is not applicable (*fmt* = M23 or UNFRAMED-CC), or the value for the parameter is not available because it cannot be determined.

   Type: Alphanumeric string.

   Range: String with 6 characters.

5. **fmt** – Signal Format

   This parameter shows the format for the DS3 signal

Type: Alphanumeric value set. A hyphen ("-") is allowed in the alphanumeric values additionally.

Range:

- C-BIT (default): C-bit parity channelized DS3 format
- M23: M23 channelized DS3 format
- UNFRAMED-CC: UNFRAMED and CLEAR-CHANNEL format

6. **`fsflpbkstat`** – Far Side Facility Loopback Status

   This parameter specifies the current far-side facility loopback status of the considered output aid. A far-side loopback means that the signal on the outgoing port is looped to the incoming port – this would thus correspond to loop via an external fibre cable, connecting the out-port with the in-port. If YES then the port is (far-side) loop-backed – if NO then there is no (far-side) loopback exististing for the aid.

   Note: not both loopbacks (lpbk and fsflpbkstat) can be set to YES at the same time

   Type: Alphanumeric value set.

   Range: YES, NO (default)

7. **`infepm`** – Incoming DS3 Far End Path PM Enable

   This parameter enables/disables the incoming DS3 far end path performance monitoring.

   Type: Alphanumeric value set.

   Range: ENABLE, DISABLE (default).

8. **`inlnpm`** – Incoming DS3 Line PM Enable

   This parameter enables/disables the incoming DS3 line performance monitoring.

   Type: Alphanumeric value set.

   Range: ENABLE, DISABLE (default).

9. **`inpm`** – Incoming DS3 Near End Path PM Enable

   This parameter enables/disables the incoming DS3 near end path performance monitoring.

   Type: Alphanumeric value set.

   Range: ENABLE, DISABLE (default).

10. **`lbo`** – Line Build Out

    This parameter defines the cable length applicable for the DS3 port.

    Type: Alphanumeric value set.

    Range:

    - SHORT (default): 0 … 68.5 m (0 … 225 ft)
    - LONG: 68.5 … 137 m (225 … 450 ft).

11. **`lpbk`** – Loopback

    This parameter specifies the current near-side loopback status of the considered output *aid*.

    A near-side loopback means that the signal on the incoming port is looped to the outgoing port. If YES then the port is (near-side) loop-backed – if NO then there is no (near-side) loopback existing for the port.

Type: Alphanumeric value set.

Range:

- YES
- NO (default).

12. **outmntc** – Outgoing Maintenance Signal

    This parameter determines whether an AIS, a DS3AIS or IDLE signal is transmitted in response to an unconnected input.

    Type: Alphanumeric value set.

    Range: AIS (default), DS3AIS, IDLE

13. **outfepm** – Outgoing DS3 Far End Path PM Enable

    This parameter enables/disables the outgoing DS3 far end path performance monitoring.

    Type: Alphanumeric value set.

    Range: ENABLE, DISABLE (default).

14. **outpm** – Outgoing DS3 Near End Path PM Enable

    This parameter enables/disables the outgoing DS3 near end path performance monitoring.

    Type: Alphanumeric value set.

    Range: ENABLE, DISABLE (default).

15. **pmode** – Port Mode

    This parameter sets the mode of the port. In the case of AUTO the *pmode* state transitions to MON if the loss-of-signal alarm of this port is cleared.

    Type: Alphanumeric value set.

    Range: AUTO (default): indicates that, when a signal is detected at the port, then alarm monitoring will start. MON: indicates that alarm monitoring is taking place on the port. NMON: means that alarm monitoring is not occurring on the port.

16. **pmsesl** – PM Threshold for SES – Line

    PM Threshold (errors in a second) for declaring SES – Line

    Type: numeric value set.

    Range: 1 … 8000

    Default: 44

17. **pmsesp** – PM Threshold for SES – Path Incoming

    PM Threshold (errors in a second) for declaring SES – Path in incoming direction.

    Type: numeric value set.

    Range: 1 … 8000

    Default: 44

18. **pmsespfe** – PM Threshold for Far-End SES – Path Incoming

    PM Threshold (errors in a second) for declaring Far-End SES – Path in incoming direction.

    Type: numeric value set.

    Range: 1 … 8000

    Default: 44

19. **pmsespfeout** – PM Threshold (errors in a second) for declaring Far-End SES – Path in outgoing direction.
    Type: numeric value set.
    Range: 1 … 8000
    Default: 44
20. **pmsespout** – PM Threshold for SES – Path Outgoing
    PM Threshold (errors in a second) for declaring SES – Path in outgoing direction.
    Type: numeric value set.
    Range: 1 … 8000
    Default: 44
21. **ptype** – Port Type
    This üparameter identifies the port type of the AID.
    Type: Alphanumeric value set.
    Range: T3
22. **sdthr** – Signal Degrade Threshold
    Signal degrade threshold in a range from 10exp-3 to 10exp-9.
    Type: numeric value set.
    Range: (as exponents of 10): -3, -4, -5 -6 (default), -7, -8, -9
23. **servcond** – Service Condition
    This parameter indicates its status concerning service involvement.
    Type: Alphanumeric value set.
    Range:
    - INSERVICE (default): Provisioning values for service are accepted
    - OUTOFSERVICE: Provisioning values for service are not accepted.
24. **tca** – DS3 PM TCA
    The parameter tca assigns an DS3 PM TCA profile name to the designated AID.
    Type: Alphanumeric value set. A hyphen ("-") is allowed in the name additionally.
    Range: String with a maximum of 24 characters, DEFAULT, DEFAULT0 (default).
25. **vmr** – Violation Monitoring Mode
    This parameter indicates the status of the DS3 P-bit parity violation monitoring and removal.
    Type: Alphanumeric value set. A hyphen ("-") is allowed in the alphanumeric values additionally.
    Range: VMR, VM, NO-VM (default)

### Detailed behavior description

The command shall retrieve the parameters as described above. The **RTRV-T3** command do not generate a **REPT DBCHG** message.

### Example input/output

The following example shows the successful execution of a **RTRV-T3** command. Not all output parameters are listed (missing ones indicated by …).

```
RTRV-T3:LT-UNITE:1-1-#-#-21-1:123456;

   LT-UNITE 00-11-27 08:00:00
M  123456 COMPLD
   "1-1-#-#-21-1:cbitmis=NORMAL,eif=DS3,ptype=T3,fmt=C-BIT,.... sigmis=NORMAL,
   vmr=NO-VM"
;
```

### Error responses

See definition in "RTRV-HDR: Retrieve header" (p. 3-2397) command error responses section for general validation rules. The error responses listed there also apply to the **RTRV-T3** command.

#### Validation rule: Check CCB against *ptype* and *eif*

Check wether the CCB fits to *ptype* and *eif*.

Error code:
`ICNV – Input, Command Not Valid, Interface Type does not match`

# RTRV-TACC: Retrieve test access

## General

The **RTRV-TACC** command is used to retrieve the test access-related information on one or all of the test tributaries in the NE. For identification of test access sessions only the primary test access tributary is used.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): T1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-TACC**-*modifier:tid:aid:ctag;*

## Input parameters

### Command parameters

1. **modifier**

   This parameter indicates the cross-connection rate on which the retrieve test access command is to act.

   A distinction of the modifier usage has to be made between the retrieval (RTRV-TACC-modifier) and the other test access related commands (CONN-TACC-modifier, DISC-TACC-modifier, CHG-ACCMD-modifier):

   - The establishment (CONN-TACC-modifier), removal (DISC-TACC-modifier) or modification (CHG-ACCMD-modifier) of test access sessions is independent of the provisioned port interface-standard. I.e., either the SDH-rates (VC3, VC4 etc.) or the corresponding SONET-rates (STS1, STS3 etc.) can be used as modifier and no command validation between port interface-standard and modifier will be performed.
   - For the RTRV-TACC-modifier command the following holds: Again, no command validation between port interface-standard and modifier will be performed. The output parameter *rate*, however, is filled with the *rate* which was used with the CONN-TACC-modifier command.

   Type: Alphanumeric value set.

   Range:

   - ALL
   - SDH modifier: VC3, VC4, VC44C, VC416C, VC464C
   - SONET modifier: LOVT1, STS1, STS3, STS12, STS48, STS192.

2. **tid** – Target Identifier

See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).

3. **aid** – Access Identifier
   AID of a SONET or SDH tributary. The keyword **all** is allowed on slot, port and tributary level.
   Type: AID.
   Range: STS1NumAID, PTNumAID, or GenLOTribAID.
   The usage of **all** or **usall** or **vall** values at all defined positions within the AID is allowed.
4. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

## Output format

In response to a valid **RTRV-TACC** command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "tatrib1:rate[:spec_block]"
       ...
       ...
   "tatrib1:rate[:spec_block]"
;
```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

The NE returns the following normal completion response for a successful **RTRV-TACC** command if no test access activity is found on the specified tributaries in the system:

```
   sid date time
M  ctag COMPLD
;
```

This output format is only valid if 'all' is used in the *aid*. Otherwise the validation rule leads to an error message.

## Output parameters

### Command parameters

1. **tatrib1** – primary Test Access Tributary
   AID of the primary test access tributary. The keyword **all** is not allowed on any level.
   Type: AID
   Range: STS1NumAID, PTNumAID, or GenLOTribAID.

The usage of **all** or **usall** or **vall** values at any position of the aid is not allowed.

2. **rate** – Test Access rate

   This parameter specifies the rate of the signal that is being tested.

   Type: Alphanumeric value set.

   Range: VC3, VC4, VC44C, VC416C, VC464C, LOVT1, STS1, STS3, STS12, STS48, STS192.

**Spec block parameters**

1. **eomode** – output mode of the E-tributary

   This parameter is only present if the test session is created on a two-way cross-connection. The parameter is omitted for test sessions on one-way cross-connections or on idle E-tributaries.

   Type: Alphanumeric value set.

   Range:

   - NORM: this is the normal output i.e. the signal from the F-tributary or from a test access tributary is passed through to the E-tributary
   - AIS: an AIS signal is sent out at the E-tributary.

   Default:

   - NORM, this tributary is still the output of the original cross-connection or
   - NORM, this tributary is the output of a connection from a test access tributary.
   - AIS, in all other cases.

2. **etrib** – AID of the E-tributary

   AID of the E-tributary for the test session.

   Type: AID

   Range: GenTribAID or GenLOTribAID.

   The usage of **all** or **usall** or **vall**-values at any position of the aid is not allowed.

3. **fomode** – output mode of the F-tributary

   This parameter is only present if the test session is created on a one-way or two-way cross-connection. The parameter is omitted for test sessions on idle E-tributaries.

   Type: Alphanumeric value set.

   Range:

   - NORM: this is the normal output i.e. the signal from the E-tributary or from a test access tributary is passed through to the F-tributary.
   - AIS: an AIS signal is sent out at the F-tributary.

   Default:

   - NORM, this tributary is still the output of the original cross-connection or this tributary is the output of a connection from a test access tributary.
   - AIS, in all other cases.

4. **ftrib** – AID of the F-tributary

   AID of the F-tributary for the test session. If there is no cross-connection at the E-tributary, this parameter is omitted.

Type: AID.

Range: GenTribAID or GenLOTribAID.

The usage of **all** or **usall** or **vall**-values at any position of the aid is not allowed.

5. **tatrib2** – secondary Test Access Tributary

   AID of the secondary Test Access Tributary. In the case of test access modes with single test tributary the parameter is omitted.

   Type: AID.

   Range: STS1NumAID, PTNumAID, or GenLOTribAID.

   The usage of **all** or **usall** or **vall** values at any position of the aid is not allowed.

6. **tstmde** – Test Access Mode

   Type: Alphanumeric value set.

   Range: Allowed values:

   - MONE – Monitor E-end mode of test access. This test access mode monitors the E end of an idle tributary or a leg of a cross-connection.
   - MONF- Monitor F-end mode of test access. This test access mode monitors the F-end of a two-way cross-connection.
   - MONEF – Monitor E-end and F-end mode of test access. This test access mode monitors (E end and F end) both directions of a two-way cross-connection.
   - SPLTE – Split access E-end mode of test access. This test access mode splits the connection between the E end and F end of a one-way cross-connection or a leg of two-way cross-connection. Can also be used in an idle tributary.
   - SPLTF – Split access F-end mode of test access. This test access mode splits the E-end and F-end connection of a two-way cross-connection to allow testing at the F-end.
   - SPLTEF – Split E-end and F-end mode of test access. This test access mode splits both directions of a two-way cross-connection to allow testing at both the E end and F end.

### Example input/output

```
RTRV-TACC-STS1:LT-UNITE:1-1-#-#-3-1-1:123456;

   LT-UNITE 02-10-01 08:00:00
M  123456 COMPLD
   "1-1-#-#-3-1-1:STS1:TSTMDE=MONEF,TATRIB2=1-1-#-#-4-1-1,ETRIB=1-1-#-#-6-1-1,
   EOMODE=NORM,FTRIB=1-1-#-#-7-1-1,FOMODE=NORM"
;
```

For Lower-order test access sessions:

```
RTRV-TACC-LOVT1:LT-UNITE:1-1-#-#-3-1-1-28:123456;

   LT-UNITE 02-10-01 08:00:00
M  123456 COMPLD
   "1-1-#-#-3-1-1-28:LOVT1:TSTMDE=MONEF,\
```

```
    TATRIB2=1-1-#-#-4-1-1-28,ETRIB=1-1-#-#-6-1-1-28,\
    EOMODE=NORM,FTRIB=1-1-#-#-7-1-1-28,FOMODE=NORM"
;
```

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-TACC** command.

### Validation rule: Tributary is not assigned as a primary test tributary

If the aid is not assigned as a primary test tributary and 'all' is not used in the aid, the following error message is returned:

Error code:

```
SNVS - Status, Not in Valid State, Tributary not assigned as a
test tributary
```

# RTRV-TCA-ASGNMT: Retrieve TCA assignment

The **RTRV-TCA-ASGNMT** command allows the user to retrieve a list of AIDs that have been assigned to the specified profile type and name.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): PM1

Priority: 1

Abortable: Yes.

## Input format

Command syntax:

**RTRV-TCA-ASGNMT**:*tid::ctag::pftype,pfname;*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **ctag** – Correlation Tag
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
3. **pftype** – Profile Type
   This indicates the type of PM TCA profile for the selected facility.
   Type: value set.
   Range: SECTION-LINE, RS-MS, HOVC, PATH, ENET, ODU, LOVC, LOPATH, DS3, DS1.
4. **pfname** – Profile Name
   This indicates the name of the PM TCA profile which was already established by the command **ENT-TCA-PROF**. If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested. If a valid profile name is inserted in this field, the output will display the parameters within the profile with their values. A *pfname* value will always uniquely identify an existing profile for a specified *pftype* value. NULL means, that the Profile Name is omitted.
   Type: Alphanumeric string.
   Range: This is an alphanumeric character string with a maximum of 24 characters.
   Default: If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested.

## Output format

If the NE fully complies with the RTRV-TCA-ASGNMT request, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "pftype,pfname:aid"
   .     .     .
   .     .     .
;
```

### Output parameters

The output parameters *sid, date, time* and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

1. **aid** – Access Identifier
   Type: AID
   Range: SPortAID, STSNumAID, EPortAID, VCGAID, VCGNumAID, PTNumAID, GenLOTribAID, TMuxAPortAID, TMuxAPTNumAID, DS1NumAID.
2. **pftype** – Profile Type
   This indicates the type of PM TCA profile for the selected facility.
   Type: value set.
   Range: SECTION-LINE, RS-MS, HOVC, PATH, ENET, ODU, LOVC, LOPATH, DS3, DS1.
3. **pfname** – Profile Name
   This indicates the name of the PM TCA profile which was already established by the command **ENT-TCA-PROF**. If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested. If a valid profile name is inserted in this field, the output will display the parameters within the profile with their values. A *pfname* value will always uniquely identify an existing profile for a specified *pftype* value. NULL means, that the Profile Name is omitted.
   Type: Alphanumeric string.
   Range: This is an alphanumeric character string with a maximum of 24 characters.
   Default: If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested.

### Example input/output

The following example shows the successful completion of a RTRV-TCA-ASGNMT command by the NE:

```
  RTRV-TCA-ASGNMT:UNITE-NE::123456::section-line,ATT;
   UNITE-NE 00-01-01 08:00:00
M  123456 COMPLD
   "section-line,ATT:1-1-#-#-22-1"
   "section-line,ATT:1-1-#-#-23-1"
   "section-line,ATT:1-1-#-#-24-1"
;
```

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-TCA-ASGNMT** command. See also subsection 'Partial Completion on RTRV Commands' w.r.t. handling of internal error (e.g. communication to XC320 fails) for a subset of replies.

### Validation rule: profile name does not exist

If the profile name specified does not exist.

Error code: `IDNV – Input, Data Not Valid, TCA profile does not exist`

# RTRV-TCA-PROF: Retrieve TCA profile

## General

The **RTRV-TCA-PROF** command allows the user to retrieve either a list of profile names that have been created for a specific profile type or the contents of a profile whose type and name are given in this command. The system supports two default sets of profiles called “DEFAULT” and “DEFAULT0”.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): PM1

Priority: 1

Abortable: Yes.

## Input format

Command syntax:

**RTRV-TCA-PROF**:*tid::ctag::pftype;*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2397).
2. **ctag** – Correlation Tag
   See definition in “RTRV-HDR: Retrieve header” (p. 3-2397).
3. **pftype** – Profile Type
   This indicates the type of PM TCA profile for the selected facility.
   Type: value set.
   Range: SECTION-LINE, RS-MS, HOVC, PATH, ENET, ODU, LOVC, LOPATH, DS3, DS1.
4. **pfname** – Profile Name
   This indicates the name of the PM TCA profile which was already established by the command **ENT-TCA-PROF**. If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested. If a valid profile name is inserted in this field, the output will display the parameters within the profile with their values. A *pfname* value will always uniquely identify an existing profile for a specified *pftype* value. NULL means, that the Profile Name is omitted.
   Type: Alphanumeric string.
   Range: This is an alphanumeric character string with a maximum of 24 characters.
   Default: If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested.

## Output format

If the system receives this command and the profile name is NULL, the following response is returned:

```
   sid date time
M  ctag COMPLD
   "pftype:pfname"
   "pftype:pfname"
   "pftype:pfname"
   .     .     .     .     .     .
   .     .     .     .     .     .
;
```

If the system receives this command with a valid profile name, the following response is returned:

```
   sid date time
M  ctag COMPLD
   "pftype,pfname:spec_block"
;
```

The output parameters *sid, date, time* and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command parameters - general profile

1. **pftype** – Profile Type

   This indicates the type of PM TCA profile for the selected facility.

   Type: value set.

   Range: SECTION-LINE, RS-MS, HOVC, PATH, ENET, ODU, LOVC, LOPATH, DS3, DS1.

2. **pfname** – Profile Name

   This indicates the name of the PM TCA profile which was already established by the command **ENT-TCA-PROF**. If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested. If a valid profile name is inserted in this field, the output will display the parameters within the profile with their values. A *pfname* value will always uniquely identify an existing profile for a specified *pftype* value. NULL means, that the Profile Name is omitted.

   Type: Alphanumeric string.

   Range: This is an alphanumeric character string with a maximum of 24 characters.

   Default: If this field is NULL, the output will only consist of a list of all profile names for the specific profile type that was requested.

**Command parameters - profile parameters of type SECTION-LINE**

1. **qhcvsoc3**
   15-minute threshold for CV-S bin for OC-3.
   Type: Integer.
   Range: 0-57599100
   Default: 140.
2. **daycvsoc3**
   Day threshold for CV-S bin of OC-3.
   Type: Integer.
   Range: 0-4294967295
   Default: 1344.
3. **qhcvsoc12**
   15-minute threshold for CV-S bin for OC-12.
   Type: Integer.
   Range: 0-57599100
   Default: 560.
4. **daycvsoc12**
   Day threshold for CV-S bin for OC-12.
   Type: Integer.
   Range: 0-4294967295
   Default: 5376.
5. **qhcvsoc48**
   15-minute threshold for CV-S bin for OC-48.
   Type: Integer.
   Range: 0-57599100
   Default: 2240.
6. **daycvsoc48**
   Day threshold for CV-S bin for OC-48.
   Type: Integer.
   Range: 0-4294967295
   Default: 21504.
7. **qhcvsoc192**
   15-minute threshold for CV-S bin for OC-192.
   Type: Integer.
   Range: 0-57599100
   Default: 8960.
8. **daycvsoc192**
   Day threshold for CV-S bin for OC-192.
   Type: Integer.
   Range: 0-4294967295
   Default: 86016.

9. **qhcvsoc768**
   15-minute threshold for CV-S bin for OC-768.
   Type: Integer.
   Range: 0-57599100
   Default: 35840.
10. **daycvsoc768**
    Day threshold for CV-S bin for OC-768.
    Type: Integer.
    Range: 0-4294967295
    Default: 344064.
11. **qhcvsec1**
    15-minute threshold for CV-S bin for EC-1.
    Type: Integer.
    Range: 0-57599100
    Default: 47
12. **daycvsec1**
    Day threshold for CV-S bin of EC-1
    Type: Integer.
    Range: 0-4294967295
    Default: 448
13. **qhess**
    15-minute threshold for ES-S bin.
    Type: Integer.
    Range: 0-900
    Default: 25.
14. **dayess**
    Day threshold for ES-S bin.
    Type: Integer.
    Range: 0-86400
    Default: 250.
15. **qhsess**
    15-minute threshold for SES-S bin.
    Type: Integer.
    Range: 0-810
    Default: 10.
16. **daysess**
    Day threshold for ES-S bin.
    Type: Integer.
    Range: 0-77760
    Default: 40.
17. **qhsefss**

15-minute threshold for SEFS-S bin.
Type: Integer.
Range: 0-900
Default: 5.

18. **daysefss**
    Day threshold for SEFS-S bin.
    Type: Integer.
    Range: 0-86400
    Default: 10.
19. **qhcvloc3**
    15-minute threshold for CV-L and CV-LFE bin for OC-3.
    Type: Integer.
    Range: 0-172799100
    Default: 140.
20. **daycvloc3**
    Day threshold for CV-L bin and CV-LFE for OC-3.
    Type: Integer.
    Range: 0-4294967295
    Default: 1344.
21. **qhcvloc12**
    15-minute threshold for CV-L and CV-LFE bin for OC-12.
    Type: Integer.
    Range: 0-691199100
    Default: 560.
22. **daycvloc12**
    Day threshold for CV-L bin and CV-LFE for OC-12.
    Type: Integer.
    Range: 0-4294967295
    Default: 5376.
23. **qhcvloc48**
    15-minute threshold for CV-L and CV-LFE bin for OC-48.
    Type: Integer.
    Range: 0-2764799100
    Default: 2240.
24. **daycvloc48**
    Day threshold for CV-L and CV-LFE bin for OC-48.
    Type: Integer.
    Range: 0-4294967295
    Default: 21504.
25. **qhcvloc192**
    15-minute threshold for CV-L and CV-LFE bin for OC-192.

Type: Integer.
Range: 0-4294967295
Default: 8960.

26. **daycvloc192**
    Day threshold for CV-L and CV-LFE bin for OC-192.
    Type: Integer.
    Range: 0-4294967295
    Default: 86016.
27. **qhcvloc768**
    15-minute threshold for CV-L and CV-LFE bin for OC-768.
    Type: Integer.
    Range: 0-4294967295
    Default: 35840.
28. **daycvloc768**
    Day threshold for CV-L and CV-LFE bin for OC-768.
    Type: Integer.
    Range: 0-4294967295
    Default: 344064.
29. **qhcvlec1**
    15-minute threshold for CV-L and CV-LFE bin for EC-1
    Type: Integer.
    Range: 0-57599100
    Default: 47
30. **daycvlec1**
    Day threshold for CV-L bin and CV-LFE for EC-1.
    Type: Integer.
    Range: 0-4294967295
    Default: 448
31. **qhesl**
    15-minute threshold for ES-L and ES-LFE bin.
    Type: Integer.
    Range: 0-900
    Default: 25.
32. **dayesl**
    Day threshold for ES-L and ES-LFE bin.
    Type: Integer.
    Range: 0-86400
    Default: 250.
33. **qhfeccloc192**
    15-minute threshold for FECC-L bin for OC-192.
    Type: Integer.

Range: 0 – 4294967295
Default: 5184.

34. **dayfeccloc192**
    Day threshold for FECC-L bin for OC-192.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 497644.
35. **qhfeccloc768**
    15-minute threshold for FECC-L bin for OC-768.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 20736.
36. **dayfeccloc768**
    Day threshold for FECC-L bin for OC-768.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 1990656.
37. **qhsesl**
    15-minute threshold for SES-L and SES-LFE bin.
    Type: Integer.
    Range: 0-810
    Default: 10.
38. **daysesl**
    Day threshold for SES-L and SES-LFE bin.
    Type: Integer.
    Range: 0-77760
    Default: 40.
39. **qhuasl**
    15-minute threshold for UAS-L and UAS-LFE bin.
    Type: Integer.
    Range: 0-900
    Default: 10.
40. **dayuasl**
    Day threshold for UAS-L and UAS-LFE bin.
    Type: Integer.
    Range: 0-86400
    Default: 10.

**Command parameters - profile parameters of type RS-MS**

1. **qhrsnbbe**
    15-minute threshold for RS_N_BBE bin.
    Type: Integer.

Range: 0-7199100
Default: 9000.

2. **dayrsnbbe**
   Day threshold for RS_N_BBE bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.
3. **qhrsnes**
   15-minute threshold for RS_N_ES bin.
   Type: Integer.
   Range: 0-900
   Default: 180.
4. **dayrsnes**
   Day threshold for RS_N_ES bin.
   Type: Integer.
   Range: 0-86400
   Default: 1500.
5. **qhrsnses**
   15-minute threshold for RS_N_SES bin.
   Type: Integer.
   Range: 0-810
   Default: 15.
6. **dayrsnses**
   Day threshold for RS_N_SES bin.
   Type: Integer.
   Range: 0-77760
   Default: 20.
7. **qhrsnuas**
   15-minute threshold for RS_N_UAS bin.
   Type: Integer.
   Range: 0-900
   Default: 15.
8. **dayrsnuas**
   Day threshold for RS_N_UAS bin.
   Type: Integer.
   Range: 0-86400
   Default: 20.
9. **qhmsbbestm1**
   15-min threshold for MS_N_BBE and MS_F_BBE for stm1 bin.
   Type: Integer.
   Range: 0-172799100

Default: 228000.

10. **daymsbbestm1**
    Day threshold for MS_N_BBE and MS_F_BBE for stm1 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 432000.
11. **qhmsbbestm4**
    15-min threshold for MS_N_BBE and MS_F_BBE for stm4 bin.
    Type: Integer.
    Range: 0-691199100
    Default: 912000.
12. **daymsbbestm4**
    Day threshold for MS_N_BBE and MS_F_BBE for stm4 bin.
    Type: Integer.
    Range: 00-4294967295
    Default: 1728000.
13. **qhmsbbestm16**
    15-min threshold for MS_N_BBE and MS_F_BBE for stm16 bin.
    Type: Integer.
    Range: 0-2764799100
    Default: 3648000.
14. **daymsbbestm16**
    Day threshold for MS_N_BBE and MS_F_BBE for stm16 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 6912000.
15. **qhmsbbestm64**
    15-min threshold for MS_N_BBE and MS_F_BBE for stm64 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 14592000.
16. **daymsbbestm64**
    Day threshold for MS_N_BBE and MS_F_BBE for stm64 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 27648000.
17. **qhmsbbestm256**
    15-min threshold for MS_N_BBE and MS_F_BBE for stm256 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 58368000.

18. **daymsbbestm256**
    Day threshold for MS_N_BBE and MS_F_BBE for stm256 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 110592000.
19. **qhmses**
    15-minute threshold for MS_N_ES and MS_F_ES bin.
    Type: Integer.
    Range: 0-900
    Default: 50.
20. **daymses**
    Day threshold for MS_N_ES and MS_F_ES bin.
    Type: Integer.
    Range: 0-86400
    Default: 150.
21. **qhmsnfeccstm64**
    15-minute threshold for MS-N-FECC bin forSTM-64.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 5184.
22. **daymsnfeccstm64**
    Day threshold for MS-N-FECC bin forSTM-64.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 49764.
23. **qhmsnfeccstm256**
    15-minute threshold for MS-N-FECC bin forSTM-256.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 20736.
24. **daymsnfeccstm256**
    Day threshold for MS-N-FECC bin forSTM-256.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 1990656.
25. **qhmsses**
    15-minute threshold for MS_N_SES and MS_F_SES bin.
    Type: Integer.
    Range: 0-810
    Default: 10.
26. **daymsses**

Day threshold for MS_N_SES and MS_F_SES bin.
Type: Integer.
Range: 0-77760
Default: 15.

27. **qhmsuas**
    15-min threshold for MS_N_UAS and MS_F_UAS for stm64 bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
28. **daymsuas**
    Day threshold for MS_N_UAS and MS_F_UAS for stm64 bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.

**Command parameters - reset profile parameters of type RS-MS**

1. **qhrtrrsnbbe**
   15-minute reset threshold for RS_N_BBE bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
2. **dayrtrrsnbbe**
   Day reset threshold for RS_N_BBE bin.
   Type: Integer.
   Range: 0-691113600
   Default: 4800.
3. **qhrtrrsnes**
   15-minute reset threshold for RS_N_ES bin.
   Type: Integer.
   Range: 0-900
   Default: 20.
4. **dayrtrrsnes**
   Day reset threshold for RS_N_ES bin.
   Type: Integer.
   Range: 0-86400
   Default: 150.
5. **qhrtrrsnses**
   15-minute reset threshold for RS_N_SES bin.
   Type: Integer.
   Range: 0-810
   Default: 0.
6. **dayrtrrsnses**

Day reset threshold for RS_N_SES bin.
Type: Integer.
Range: 0-77760
Default: 0.

7. **qhrtrrsnuas**
   15-minute reset threshold for RS_N_UAS bin.
   Type: Integer.
   Range: 0-900
   Default: 0.
8. **dayrtrrsnuas**
   Day reset threshold for RS_N_UAS bin.
   Type: Integer.
   Range: 0-86400
   Default: 0.
9. **qhrtrmsbbestm1**
   15-min reset threshold for MS_N_BBE and MS_F_BBE for stm1 bin.
   Type: Integer.
   Range: 0-172799100
   Default: 2400.
10. **dayrtrmsbbestm1**
    Day reset threshold for MS_N_BBE and MS_F_BBE for stm1 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 43200.
11. **qhrtrmsbbestm4**
    15-min reset threshold for MS_N_BBE and MS_F_BBE for stm4 bin.
    Type: Integer.
    Range: 0-691199100
    Default: 9600.
12. **dayrtrmsbbestm4**
    Day reset threshold for MS_N_BBE and MS_F_BBE for stm4 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 172800.
13. **qhrtrmsbbestm16**
    15-min reset threshold for MS_N_BBE and MS_F_BBE for stm16 bin.
    Type: Integer.
    Range: 0-2764799100
    Default: 38400.
14. **dayrtrmsbbestm16**
    Day reset threshold for MS_N_BBE and MS_F_BBE for stm16 bin.

Type: Integer.
Range: 0-4294967295
Default: 691200.

15. **qhrtrmsbbestm64**
    15-min reset threshold for MS_N_BBE and MS_F_BBE for stm64 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 153600.
16. **dayrtrmsbbestm64**
    Day reset threshold for MS_N_BBE and MS_F_BBE for stm64 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 2764800.
17. **qhrtrmsbbestm256**
    15-min threshold for MS_N_BBE and MS_F_BBE for stm256 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 614400.
18. **dayrtrmsbbestm256**
    Day reset threshold for MS_N_BBE and MS_F_BBE for stm256 bin.
    Type: Integer.
    Range: 0-4294967295
    Default: 11059200.
19. **qhrtrmses**
    15-minute reset threshold for MS_N_ES and MS_F_ES bin.
    Type: Integer.
    Range: 0-900
    Default: 5.
20. **dayrtrmses**
    Day reset threshold for MS_N_ES and MS_F_ES bin.
    Type: Integer.
    Range: 0-86400
    Default: 15.
21. **qhrtrmsnfeccstm64**
    15-minute reset threshold for MS-N-FECC bin forSTM-64.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 0.
22. **dayrtrmsnfeccstm64**
    Day reset threshold for MS-N-FECC bin forSTM-64.
    Type: Integer.

Range: 0 – 4294967295
Default: 0.

23. **qhrtrmsnfeccstm256**
    15-minute reset threshold for MS-N-FECC bin forSTM-256.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 0.
24. **dayrtrmsnfeccstm256**
    Day reset threshold for MS-N-FECC bin forSTM-256.
    Type: Integer.
    Range: 0 – 4294967295
    Default: 0.
25. **qhrtrmsses**
    15-minute reset threshold for MS_N_SES and MS_F_SES bin.
    Type: Integer.
    Range: 0-810
    Default: 0.
26. **dayrtrmsses**
    Day reset threshold for MS_N_SES and MS_F_SES bin.
    Type: Integer.
    Range: 0-77760
    Default: 0.
27. **qhrtrmsuas**
    15-min reset threshold for MS_N_UAS and MS_F_UAS.
    Type: Integer.
    Range: 0-900
    Default: 0.
28. **dayrtrmsuas**
    Day reset threshold for MS_N_UAS and MS_F_UAS.
    Type: Integer.
    Range: 0-86400
    Default: 0.

**Command parameters - profile parameters of type ODU**

1. **qhodupbbeodu1**
    15-minute threshold for ODU_N_BBE bin and ODU_F_BBE for ODU1P.
    Type: Integer.
    Range: 0-18377100
    Default: 32000.
2. **dayodupbbeodu1**
    Day threshold for ODU_N_BBE bin and ODU_F_BBE for ODU1P.
    Type: Integer.

Range: 0-1764201600
Default: 61000.

3. **qhodupes**
   15-minute threshold for ODU_N_ES and ODU_F_ES bin for ODU1P.
   Type: Integer.
   Range: 0-900
   Default: 50.
4. **dayodupes**
   Day threshold for ODU_N_ES and ODU_F_ES bin for ODU1P.
   Type: Integer.
   Range: 0-86400
   Default: 150.
5. **qhodupses**
   15-minute threshold for ODU_N_SES and ODU_F_SES bin for ODU1P.
   Type: Integer.
   Range: 0-810
   Default: 10.
6. **dayodupses**
   Day threshold for ODU_N_SES and ODU_F_SES bin for ODU1P.
   Type: Integer.
   Range: 0-77760
   Default: 15.
7. **qhodupuas**
   15-minute threshold for ODU_N_UAS and ODU_F_UAS bin for ODU1P.
   Type: Integer.
   Range: 0-900
   Default: 15.
8. **dayodupuas**
   Day threshold for ODU_N_UAS and ODU_F_UAS bin for ODU1P.
   Type: Integer.
   Range: 0-86400
   Default: 20.

**Command parameters - reset profile parameters of type ODU**

1. **qhrtrodupbbeodu1**
   15-minute threshold for ODU_N_BBE bin and ODU_F_BBE for ODU1P.
   Type: Integer.
   Range: 0-18377100
   Default: 200.
2. **dayrtrodupbbeodu1**
   Day threshold for ODU_N_BBE bin and ODU_F_BBE for ODU1P.
   Type: Integer.

Range: 0-1764201600
Default: 4800.

3. **qhrtrodupes**
   15-minute threshold for ODU_N_ES and ODU_F_ES bin for ODU1P.
   Type: Integer.
   Range: 0-900
   Default: 5.
4. **dayrtrodupes**
   Day threshold for ODU_N_ES and ODU_F_ES bin for ODU1P.
   Type: Integer.
   Range: 0-86400
   Default: 15.
5. **qhrtrodupses**
   15-minute threshold for ODU_N_SES and ODU_F_SES bin for ODU1P.
   Type: Integer.
   Range: 0-810
   Default: 0.
6. **dayrtrodupses**
   Day threshold for ODU_N_SES and ODU_F_SES bin for ODU1P.
   Type: Integer.
   Range: 0-77760
   Default: 0.
7. **qhrtrodupuas**
   15-minute threshold for ODU_N_UAS and ODU_F_UAS bin for ODU1P.
   Type: Integer.
   Range: 0-900
   Default: 0.
8. **dayrtrodupuas**
   Day threshold for ODU_N_UAS and ODU_F_UAS bin for ODU1P.
   Type: Integer.
   Range: 0-86400
   Default: 0.

**Command parameters - profile parameters of type HO-VC**

1. **qhvcbbevc3**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC3 bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
2. **dayvcbbevc3**
   Day threshold for VC_N_BBE and VC_F_BBE for VC3 bin.
   Type: Integer.

Range: 0-691113600
Default: 48000.

3. **qhvcbbevc4**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC4 bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
4. **dayvcbbevc4**
   Day threshold for VC_N_BBE and VC_F_BBE for VC4 bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.
5. **qhvcbbevc44c**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC44C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
6. **dayvcbbevc44c**
   Day threshold for VC_N_BBE and VC_F_BBE for VC44C bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.
7. **qhvcbbevc416c**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC416C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
8. **dayvcbbevc416c**
   Day threshold for VC_N_BBE and VC_F_BBE for VC416C bin.
   Type: Integer.
   Range: 0-691113600
   Default: 48000.
9. **qhvcbbevc464c**
   15-minute threshold for VC_N_BBE and VC_F_BBE for VC464C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 36000.
10. **dayvcbbevc464c**
    Day threshold for VC_N_BBE and VC_F_BBE for VC464C bin.
    Type: Integer.
    Range: 0-691113600

Default: 48000.

11. **qhvcesvc3**
    15-minute threshold for VC_N_ES and VC_F_ES VC3 bin.
    Type: Integer.
    Range: 0-900
    Default: 150.
12. **dayvcesvc3**
    Day threshold for VC_N_ES and VC_F_ES VC3 bin.
    Type: Integer.
    Range: 0-86400
    Default: 600.
13. **qhvcesvc4**
    15-minute threshold for VC_N_ES and VC_F_ES for VC4 bin.
    Type: Integer.
    Range: 0-900
    Default: 180.
14. **dayvcesvc4**
    Day threshold for VC_N_ES and VC_F_ES for VC4 bin.
    Type: Integer.
    Range: 0-86400
    Default: 1500.
15. **qhvcesvc44c**
    15-minute threshold for VC_N_ES and VC_F_ES for VC4-4C bin.
    Type: Integer.
    Range: 0-900
    Default: 180.
16. **dayvcesvc44c**
    Day threshold for VC_N_ES and VC_F_ES for VC4-4C bin.
    Type: Integer.
    Range: 0-86400
    Default: 1500.
17. **qhvcesvc416c**
    15-minute threshold for VC_N_ES and VC_F_ES for VC4-16C bin.
    Type: Integer.
    Range: 0-900
    Default: 180.
18. **dayvcesvc416c**
    Day threshold for VC_N_ES and VC_F_ES for VC4-16C bin.
    Type: Integer.
    Range: 0-86400
    Default: 1500.

19. **qhvcesvc464c**
    15-minute threshold for VC_N_ES and VC_F_ES for VC4-64C bin.
    Type: Integer.
    Range: 0-900
    Default: 180.
20. **dayvcesvc464c**
    Day threshold for VC_N_ES and VC_F_ES for VC4-64C bin.
    Type: Integer.
    Range: 0-86400
    Default: 1500.
21. **qhvcsesvc3**
    15-minute threshold for VC_N_SES and VC_F_SES for VC3 bin.
    Type: Integer.
    Range: 0-810
    Default: 15.
22. **dayvcsesvc3**
    Day threshold for VC_N_SES and VC_F_SES for VC3 bin.
    Type: Integer.
    Range: 0-77760
    Default: 20.
23. **qhvcsesvc4**
    15-minute threshold for VC_N_SES and VC_F_SES for VC4 bin.
    Type: Integer.
    Range: 0-810
    Default: 15.
24. **dayvcsesvc4**
    Day threshold for VC_N_SES and VC_F_SES for VC4 bin.
    Type: Integer.
    Range: 0-77760
    Default: 20.
25. qhvcsesvc44c
    15-minute threshold for VC_N_SES and VC_F_SES for VC44C bin.
    Type: Integer.
    Range: 0-810
    Default: 15.
26. dayvcsesvc44c
    Day threshold for VC_N_SES and VC_F_SES for VC44C bin.
    Range: 0-77760
    Default: 20.
27. **qhvcsesvc416c**
    15-minute threshold for VC_N_SES and VC_F_SES for VC416C bin.

Type: Integer.
Range: 0-810
Default: 15.

28. **dayvcsesvc416c**
    Day threshold for VC_N_SES and VC_F_SES for VC416C bin.
    Type: Integer.
    Range: 0-77760
    Default: 20.
29. **qhvcsesvc464c**
    15-minute threshold for VC_N_SES and VC_F_SES for VC464C bin.
    Type: Integer.
    Range: 0-810
    Default: 15.
30. **dayvcsesvc464c**
    Day threshold for VC_N_SES and VC_F_SES for VC464C bin.
    Type: Integer.
    Range: 0-77760
    Default: 20.
31. **qhvcuasvc3**
    15-minute threshold for VC_N_UAS and VC_F_UAS for VC3 bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
32. **dayvcuasvc3**
    Day threshold for VC_N_UAS and VC_F_UAS for VC3 bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.
33. **qhvcuasvc4**
    15-minute threshold for VC_N_UAS and VC_F_UAS for VC4 bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
34. **dayvcuasvc4**
    Day threshold for VC_N_UAS and VC_F_UAS for VC4 bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.
35. **qhvcuasvc44c**
    15-minute threshold for VC_N_UAS and VC_F_UAS for VC44C bin.
    Type: Integer.

Range: 0-900
Default: 15.

36. **dayvcuasvc44c**
    Day threshold for VC_N_UAS and VC_F_UAS for VC44C bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.
37. **qhvcuasvc416c**
    15-minute threshold for VC_N_UAS and VC_F_UAS for VC416C bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
38. **dayvcuasvc416c**
    Day threshold for VC_N_UAS and VC_F_UAS for VC416C bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.
39. **qhvcuasvc464c**
    15-minute threshold for VC_N_UAS and VC_F_UAS for VC464C bin.
    Type: Integer.
    Range: 0-900
    Default: 15.
40. **dayvcuasvc464c**
    Day threshold for VC_N_UAS and VC_F_UAS for VC464C bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.
41. **qhpjcpos**
    15-minute threshold for positive PJC bin.
    Type: Integer.
    Range: 0-1800000
    Default: 30.
42. **daypjcpos**
    Day threshold for positive PJC bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.
43. **qhpjcneg**
    15-minute threshold for negative PJC bin.
    Type: Integer.
    Range: 0-1800000

Default: 30.

44. **daypjcneg**
    Day threshold for negative PJC bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.

**Command parameters - reset profile parameters of type HO-VC**

1. **qhrtrvcbbevc3**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC3 bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
2. **dayrtrvcbbevc3**
   Day reset threshold for VC_N_BBE and VC_F_BBE for VC3 bin.
   Type: Integer.
   Range: 0-691113600
   Default: 4800.
3. **qhrtrvcbbevc4**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC4 bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
4. **dayrtrvcbbevc4**
   Day reset threshold for VC_N_BBE and VC_F_BBE for VC4 bin.
   Type: Integer.
   Range: 0-691113600
   Default: 4800.
5. **qhrtrvcbbevc44c**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC44C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
6. **dayrtrvcbbevc44c**
   Day reset threshold for VC_N_BBE and VC_F_BBE for VC44C bin.
   Type: Integer.
   Range: 0-691113600
   Default: 4800.
7. **qhrtrvcbbevc416c**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC416C bin.
   Type: Integer.
   Range: 0-7199100

Default: 200.

8. **dayrtrvcbbevc416c**
   Day reset threshold for VC_N_BBE and VC_F_BBE for VC416C bin.
   Type: Integer.
   Range: 0-691113600
   Default: 4800.
9. **qhrtrvcbbevc464c**
   15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC464C bin.
   Type: Integer.
   Range: 0-7199100
   Default: 200.
10. **dayrtrvcbbevc464c**
    Day reset threshold for VC_N_BBE and VC_F_BBE for VC464C bin.
    Type: Integer.
    Range: 0-691113600
    Default: 4800.
11. **qhrtrvcesvc3**
    15-minute reset threshold for VC_N_ES and VC_F_ES VC3 bin.
    Type: Integer.
    Range: 0-900
    Default: 10.
12. **dayrtrvcesvc3**
    Day reset threshold for VC_N_ES and VC_F_ES VC3 bin.
    Type: Integer.
    Range: 0-86400
    Default: 60.
13. **qhrtrvcesvc4**
    15-minute reset threshold for VC_N_ES and VC_F_ES for VC4 bin.
    Type: Integer.
    Range: 0-900
    Default: 20.
14. **dayrtrvcesvc4**
    Day reset threshold for VC_N_ES and VC_F_ES for VC4 bin.
    Type: Integer.
    Range: 0-86400
    Default: 150.
15. **qhrtrvcesvc44c**
    15-minute reset threshold for VC_N_ES and VC_F_ES for VC4-4C bin.
    Type: Integer.
    Range: 0-900
    Default: 20.

16. **dayrtrvcesvc44c**
    Day reset threshold for VC_N_ES and VC_F_ES for VC4-4C bin.
    Type: Integer.
    Range: 0-86400
    Default: 150.
17. **qhrtrvcesvc416c**
    15-minute reset threshold for VC_N_ES and VC_F_ES for VC4-16C bin.
    Type: Integer.
    Range: 0-900
    Default: 20.
18. **dayrtrvcesvc416c**
    Day reset threshold for VC_N_ES and VC_F_ES for VC4-16C bin.
    Type: Integer.
    Range: 0-86400
    Default: 150.
19. **qhrtrvcesvc464c**
    15-minute reset threshold for VC_N_ES and VC_F_ES for VC4-64C bin.
    Type: Integer.
    Range: 0-900
    Default: 20.
20. **dayrtrvcesvc464c**
    Day reset threshold for VC_N_ES and VC_F_ES for VC4-64C bin.
    Type: Integer.
    Range: 0-86400
    Default: 150.
21. **qhrtrvcsesvc3**
    15-minute reset threshold for VC_N_SES and VC_F_SES for VC3 bin.
    Type: Integer.
    Range: 0-810
    Default: 0.
22. **dayrtrvcsesvc3**
    Day reset threshold for VC_N_SES and VC_F_SES for VC3 bin.
    Type: Integer.
    Range: 0-77760
    Default: 0.
23. **qhrtrvcsesvc4**
    15-minute reset threshold for VC_N_SES and VC_F_SES for VC4 bin.
    Type: Integer.
    Range: 0-810
    Default: 0.
24. **dayrtrvcsesvc4**

Day reset threshold for VC_N_SES and VC_F_SES for VC4 bin.
Type: Integer.
Range: 0-77760
Default: 0.

25. **qhrtrvcsesvc44c**
    15-minute reset threshold for VC_N_SES and VC_F_SES for VC44C bin.
    Type: Integer.
    Range: 0-810
    Default: 0.
26. **dayrtrvcsesvc44c**
    Day reset threshold for VC_N_SES and VC_F_SES for VC44C bin.
    Type: Integer.
    Range: 0-77760
    Default: 0.
27. **qhrtrvcsesvc416c**
    15-minute reset threshold for VC_N_SES and VC_F_SES for VC416C bin.
    Type: Integer.
    Range: 0-810
    Default: 0.
28. **dayrtrvcsesvc416c**
    Day reset threshold for VC_N_SES and VC_F_SES for VC416C bin.
    Type: Integer.
    Range: 0-77760
    Default: 0.
29. **qhrtrvcsesvc464c**
    15-minute reset threshold for VC_N_SES and VC_F_SES for VC464C bin.
    Type: Integer.
    Range: 0-810
    Default: 0.
30. **dayrtrvcsesvc464c**
    Day reset threshold for VC_N_SES and VC_F_SES for VC464C bin.
    Type: Integer.
    Range: 0-77760
    Default: 0.
31. **qhrtrvcuasvc3**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC3 bin.
    Type: Integer.
    Range: 0-900
    Default: 0.
32. **dayrtrvcuasvc3**
    Day reset threshold for VC_N_UAS and VC_F_UAS for VC3 bin.

Type: Integer.
Range: 0-86400
Default: 0.

33. **qhrtrvcuasvc4**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC4 bin.
    Type: Integer.
    Range: 0-900
    Default: 0.
34. **dayrtrvcuasvc4**
    Day reset threshold for VC_N_UAS and VC_F_UAS for VC4 bin.
    Type: Integer.
    Range: 0-86400
    Default: 0.
35. **qhrtrvcuasvc44c**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC44C bin.
    Type: Integer.
    Range: 0-900
    Default: 0.
36. **dayrtrvcuasvc44c**
    Day reset threshold for VC_N_UAS and VC_F_UAS for VC44C bin.
    Type: Integer.
    Range: 0-86400
    Default: 0.
37. **qhrtrvcuasvc416c**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC416C bin.
    Type: Integer.
    Range: 0-900
    Default: 0.
38. **dayrtrvcuasvc416c**
    Day reset threshold for VC_N_UAS and VC_F_UAS for VC416C bin.
    Type: Integer.
    Range: 0-86400
    Default: 0.
39. **qhrtrvcuasvc464c**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC464C bin.
    Type: Integer.
    Range: 0-900
    Default: 0.
40. **dayrtrvcuasvc464c**
    Day reset threshold for VC_N_UAS and VC_F_UAS for VC464C bin.
    Type: Integer.

Range: 0-86400
Default: 0.

41. **qhrtrpjcpos**
    15-minute reset threshold for positive PJC bin.
    Type: Integer.
    Range: 0-1800000
    Default: 0.
42. **dayrtrpjcpos**
    Day reset threshold for positive PJC bin.
    Type: Integer.
    0-172800000
    Default: 0.
43. **qhrtrpjcneg**
    15-minute reset threshold for negative PJC bin.
    Type: Integer.
    Range: 0-1800000
    Default: 0.
44. **dayrtrpjcneg**
    Day reset threshold for negative PJC bin.
    Type: Integer.
    Range: 0-172800000
    Default: 0.

**Command parameters - profile parameters of type PATH**

1. **qhcvpsts1**
    15-minute threshold for CV-P and CV-PFE bin for STS1.
    Type: Integer.
    Range: 0-57599100
    Default: 15.
2. **daycvpsts1**
    Day threshold for CV-P and CV-PFE bin for STS1.
    Type: Integer.
    Range: 0-4294967295
    Default: 125.
3. **qhcvpsts3c**
    15-minute threshold for CV-P and CV-PFE bin for STS3C.
    Type: Integer.
    Range: 0-57599100
    Default: 25.
4. **daycvpsts3c**
    Day threshold for CV-P and CV-PFE bin for STS3C.
    Type: Integer.

Range: 4294967295
Default: 250.

5. **qhcvpsts12c**
   15-minute threshold for CV-P and CV-PFE bin for STS12C.
   Type: Integer.
   Range: 0-57599100
   Default: 75.
6. **daycvpsts12c**
   Day threshold for threshold for CV-P and CV-PFE bin for STS12C.
   Type: Integer.
   Range: 4294967295
   Default: 750.
7. **qhcvpsts48c**
   15-minute threshold for CV-P and CV-PFE bin for STS48C.
   Type: Integer.
   Range: 0-57599100
   Default: 300.
8. **daycvpsts48c**
   Day threshold for CV-P and CV-PFE bin for STS48C.
   Type: Integer.
   Range: 4294967295
   Default: 3000.
9. **qhcvpsts192c**
   Day threshold for CV-P and CV-PFE bin for STS192C.
   Type: Integer.
   Range: 0-57599100
   Default: 1200.
10. **daycvpsts192c**
    Day threshold for CV-P and CV-PFE bin for STS192C.
    Type: Integer.
    Range: 0-4294967295
    Default: 12000.
11. **qhespsts1**
    15-minute threshold for ES-P and ES-PFE bin for STS1.
    Type: Integer.
    Range: 0-900
    Default: 12.
12. **dayespsts1**
    Day threshold for ES-P and ES-PFE bin for STS1.
    Type: Integer.
    Range: 0-86400

Default: 100.

13. **qhespsts3c**
    15-minute threshold for ES-P and ES-PFE bin for STS3C.
    Type: Integer.
    Range: 0-900
    Default: 20.
14. **dayespsts3c**
    Day threshold for ES-P and ES-PFE bin for STS3C.
    Type: Integer.
    Range: 0-86400
    Default: 200.
15. **qhespsts12c**
    15-minute threshold for ES-P and ES-PFE bin for STS12C.
    Type: Integer.
    Range: 0-900
    Default: 60.
16. **dayespsts12c**
    Day threshold for ES-P and ES-PFE bin for STS12C.
    Type: Integer.
    Range: 0-86400
    Default: 600.
17. **qhespsts48c**
    15-minute threshold for ES-P and ES-PFE bin for STS48C.
    Type: Integer.
    Range: 0-900
    Default: 240.
18. **dayespsts48c**
    Day threshold for ES-P and ES-PFE bin for STS48C.
    Type: Integer.
    Range: 0-86400
    Default: 2400.
19. **qhespsts192c**
    Day threshold for ES-P and ES-PFE bin for STS192C.
    Type: Integer.
    Range: 0-900
    Default: 240.
20. **dayespsts192c**
    Day threshold for ES-P and ES-PFE bin for STS192C.
    Type: Integer.
    Range: 0-86400
    Default: 9600.

21. **qhsesp**
    15-minute threshold for SES-P and SES-PFE bin.
    Type: Integer.
    Range: 0-810
    Default: 3.
22. **daysesp**
    Day threshold for SES-P and SES-PFE bin.
    Type: Integer.
    Range: 0-77760
    Default: 7.
23. **qhuasp**
    15-minute threshold for UAS-P and UAS-PFE bin.
    Type: Integer.
    Range: 0-900
    Default: 10.
24. **dayuasp**
    Day threshold for UAS-P and UAS-PFE bin.
    Type: Integer.
    Range: 0-86400
    Default: 10.
25. **qhppjcgen**
    15-minute threshold for PPJC-PGen bin.
    Type: Integer.
    Range: 0-1800000
    Default: 30.
26. **dayppjcgen**
    Day threshold for PPJC-PGen bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.
27. **qhnpjcgen**
    15-minute threshold for NPJC-PGen bin.
    Type: Integer.
    Range: 0-1800000
    Default: 30.
28. **daynpjcgen**
    Day threshold for NPJC-PGen bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.
29. **qhppjcdet**

15-minute threshold for PPJC-PDet bin.
Type: Integer.
Range: 0-1800000
Default: 30.

30. **dayppjcdet**
    Day threshold for PPJC-PDet bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.
31. **qhnpjcdet**
    15-minute threshold for NPJC-PDet bin.
    Type: Integer.
    Range: 0-1800000
    Default: 30.
32. **daynpjcdet**
    Day threshold for NPJC-PDet bin.
    Type: Integer.
    Range: 0-172800000
    Default: 2880.

**Command parameters - profile parameters of type ENET**

1. **qhpdege**
   15-minute threshold for PDE bin for GE.
   Type: Integer.
   Range: 0-183000000
   Default: 187500.
2. **daypdege**
   Day threshold for PDE bin for GE.
   Type: Integer.
   Range: 0-4294967295
   Default: 9000000.
3. **qhpdevcg**
   15-minute threshold for PDE bin for VCG.
   Type: Integer.
   Range: 0-183000000
   Default: 10.
4. **daypdevcg**
   Day threshold for PDE bin for VCG.
   Type: Integer.
   Range: 0-4294967295
   Default: 50.
5. **qhedfe1ge**

15min EDFE for 1GbE Ethernet port
Type: Integer.
Range: 0-1371951220
Default: 1875000

6. **dayedfe1ge**
   24 h EDFE for 1GbE Ethernet port
   Type: Integer.
   Range: 0-4294967295
   Default: 9000000
7. **qhedfc1ge**
   15min EDFC for 1GbE Ethernet port
   Type: Integer.
   Range: 0-1371951220
   Default: 20.
8. **dayedfc1ge**
   24 h EDFC for 1GbE Ethernet port
   Type: Integer.
   Range: 0-4294967295
   Default: 50.
9. **qhedfe10ge**
   15min EDFE for 10GbE Ethernet port
   Type: Integer.
   Range: 0-2147483647
   Default: 18750000.
10. **dayedfe10ge**
    24 h EDFE for 10GbE Ethernet port
    Type: Integer.
    Range: 0-4294967295
    Default: 90000000
11. **qhedfc10ge**
    15min EDFC for 10GbE Ethernet port
    Type: Integer.
    Range: 0-2147483647
    Default: 100.
12. **dayedfc10ge**
    24 h EDFC for 10GbE Ethernet port
    Type: Integer.
    Range: 0-4294967295
    Default: 500.
13. **qhedfe1gevcg**
    15min EDFE for 1GbE VCG port

Type: Integer.
Range: 0-1371951220
Default: 10.

14. **dayedfe1gevcg**
    24 h EDFE for 1GbE VCG port
    Type: Integer.
    Range: 0-4294967295
    Default: 50.
15. **qhedfc1gevcg**
    15min EDFC for 1GbE VCG port
    Type: Integer.
    Range: 0-1371951220
    Default: 10.
16. **dayedfc1gevcg**
    24 h EDFC for 1GbE VCG port
    Type: Integer.
    Range: 0-4294967295
    Default: 50.
17. **qhedfe10gevcg**
    15min EDFE for 10GbE VCG port
    Type: Integer.
    Range: 0-2147483647
    Default: 100.
18. **dayedfe10gevcg**
    24 h EDFE for 10GbE VCG port
    Type: Integer.
    Range: 0-4294967295
    Default: 500.
19. **qhedfc10gevcg**
    15min EDFC for 10GbE VCG port
    Type: Integer.
    Range: 0-2147483647
    Default: 100.
20. **2.2.1.5.1.10.20**
    24 h EDFC for 10GbE VCG port
    Type: Integer.
    Range: 0-4294967295
    Default: 500.

**Command parameters - reset profile parameters of type ENET**

1. **qhrtrpdege**
   15-minute reset threshold for PDE bin for GE.

Type: Integer.
Range: 0-183000000
Default: 937500.

2. **dayrtrpdege**
   Day reset threshold for PDE bin for GE.
   Type: Integer.
   Range: 0-4294967295
   Default: 4500000.
3. **qhrtrpdevcg**
   15-minute reset threshold for PDE bin for VCG.
   Type: Integer.
   Range: 0-183000000
   Default: 2.
4. **dayrtrpdevcg**
   Day reset threshold for PDE bin for VCG.
   Type: Integer.
   Range: 0-4294967295
   Default: 5.
5. **qhrtredfe1ge**
   15min reset threshold for EDFE of 1GbE Ethernet port.
   Type: Integer.
   Range: 0-1371951220
   Default: 937500.
6. **dayrtredfe1ge**
   24h reset threshold for EDFE of 1GbE Ethernet port
   Type: Integer.
   Range: 0-4294967295
   Default: 4500000.
7. **qhrtredfc1ge**
   15min reset threshold for EDFC of 1GbE Ethernet port.
   Type: Integer.
   Range: 0-1371951220
   Default: 2.
8. **dayrtredfc1ge**
   24h reset threshold for EDFC of 1GbE Ethernet port
   Type: Integer.
   Range: 0-4294967295
   Default: 5.
9. **qhrtredfe10ge**
   15min reset threshold for EDFE of 10GbE Ethernet port
   Type: Integer.

0-2147483647
Default: 9375000

10. **dayrtredfe10ge**
    24h reset threshold for EDFE of 10GbE Ethernet port
    Type: Integer.
    Range: 0-4294967295
    Default: 45000000.
11. **qhrtredfc10ge**
    15min reset threshold for EDFC of 10GbE Ethernet port.
    Type: Integer.
    0-2147483647
    Default: 20.
12. **dayrtredfc10ge**
    24h reset threshold for EDFC of 10GbE Ethernet port.
    Type: Integer.
    Range: 0-4294967295
    Default: 50.
13. **qhrtredfe1gevcg**
    15min reset threshold for EDFE of 1GbE VCG por
    Type: Integer.
    Range: 0-1371951220
    Default: 2.
14. **dayrtredfe1gevcg**
    24h reset threshold for EDFE of 1GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 5.
15. **qhrtredfc1gevcg**
    15min reset threshold for EDFC of 1GbE VCG port
    Type: Integer.
    Range: 0-1371951220
    Default: 2.
16. **dayrtredfc1gevcg**
    24h reset threshold for EDFC of 1GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 5.
17. **qhrtredfe10gevcg**
    15min reset threshold for EDFE of 10GbE VCG port
    Type: Integer.
    Range: 0-2147483647

Default: 20.

18. **dayrtredfe10gevcg**
    24h reset threshold for EDFE of 10GbE VCG port.
    Type: Integer.
    Range: 0-4294967295
    Default: 50.
19. **qhrtredfc10gevcg**
    15min reset threshold for EDFC of 10GbE VCG port.
    Type: Integer.
    Range: 0-2147483647
    Default: 20.
20. **dayrtredfc10gevcg**
    24h reset threshold for EDFC of 10GbE VCG port
    Type: Integer.
    Range: 0-4294967295
    Default: 50.

**Command parameters - profile parameters of type LOVC**

1. **qhvcbbevc12**
    15-minute threshold for VC_N_BBE and VC_F_BBE for VC12 bin.
    Type: Integer.
    Range: 0-1799100
    Default: 9000.
2. **dayvcbbevc12**
    Day threshold for VC_N_BBE and VC_F_BBE for VC12 bin.
    Type: Integer.
    Range: 0-172713600
    Default: 12000.
3. **qhvcbbelovc3**
    15minute threshold for VC_N_BBE and VC_F_BBE for lower-order VC3 bin.
    Type: Integer.
    Range: 0-7199100
    Default: 36000.
4. **dayvcbbelovc3**
    Day threshold for VC_N_BBE and VC_F_BBE for lower-order VC3 bin.
    Type: Integer.
    Range: 0-691113600
    Default: 48000.
5. **qhvcesvc12**
    15-minute threshold for VVC_N_ES and VC_F_ES for VC12 bin.
    Type: Integer.
    Range: 0-900

Default: 120.

6. **dayvcesvc12**
   Day threshold for VC_N_ES and VC_F_ES for VC12 bin.
   Type: Integer.
   Range: 0-86400
   Default: 350.
7. **qhvceslovc3**
   15-minute threshold for VC_N_ES and VC_F_ES for lower-order VC3 bin.
   Type: Integer.
   Range: 0-900
   Default: 150.
8. **dayvceslovc3**
   Day threshold for VC_N_ES and VC_F_ES for lower-order VC3 bin.
   Type: Integer.
   Range: 0-86400
   Default: 600.
9. **qhvcsesvc12**
   15-minute threshold for VC_N_SES and VC_F_SES for VC12 bin.
   Type: Integer.
   Range: 0-810
   Default: 15.
10. **dayvcsesvc12**
    Day threshold for VC_N_SES and VC_F_SES for VC12 bin.
    Type: Integer.
    Range: 0-77760
    Default: 20.
11. **qhvcseslovc3**
    15-minute threshold for VC_N_SES and VC_F_SES for lower-order VC3 bin.
    Type: Integer.
    Range: 0-810
    Default: 15.
12. **dayvcseslovc3**
    Day threshold for VC_N_SES and VC_F_SES for lower-order VC3 bin.
    Type: Integer.
    Range: 0-77760
    Default: 20.
13. **qhvcuasvc12**
    15-minute threshold for VC_N_UAS and VC_F_UAS for VC12 bin.
    Type: Integer.
    Range: 0-900
    Default: 15.

14. **dayvcuasvc12**
    Day threshold for VC_N_UAS and VC_F_UAS for VC12 bin..
    Type: Integer.
    Range: 0-86400
    Default: 20.
15. **qhvcuaslovc3**
    15-minute threshold for VC_N_UAS and VC_F_UAS for lower-order VC3 bin..
    Type: Integer.
    Range: 0-900
    Default: 15.
16. **dayvcuaslovc3**
    Day threshold for VC_N_UAS and C_F_UAS for lower-order VC3 bin.
    Type: Integer.
    Range: 0-86400
    Default: 20.

**Command parameters - reset profile parameters of type LOVC**

1. **qhrtrvcbbevc12**
    15-minute reset threshold for VC_N_BBE and VC_F_BBE for VC12 bin.
    Type: Integer.
    Range: 0-1799100
    Default: 50.
2. **dayrtrvcbbevc12**
    Day reset threshold for VC_N_BBE and VC_F_BBE for VC12 bin.
    Type: Integer.
    Range: 0-172713600
    Default: 1200.
3. **qhrtrvcbbelovc3**
    15-minute reset threshold for VC_N_BBE and VC_F_BBE for lower-order VC3 bin.
    Type: Integer.
    Range: 0-7199100
    Default: 200.
4. **dayrtrvcbbelovc3**
    Day reset threshold for VC_N_BBE and VC_F_BBE for lower-order VC3 bin.
    Type: Integer.
    Range: 0-691113600
    Default: 4800.
5. **qhrtrvcesvc12**
    15-minute reset threshold for VC_N_ES and VC_F_ES for VC12 bin.
    Type: Integer.
    Range: 0-900
    Default: 5.

6. **dayrtrvcesvc12**
   Day reset threshold for VC_N_ES and VC_F_ES for VC12 bin.
   Type: Integer.
   Range: 0-86400
   Default: 35.
7. **qhrtrvceslovc3**
   15-minute reset threshold for VC_N_ES and VC_F_ES for lower-order VC3 bin.
   Type: Integer.
   Range: 0-900
   Default: 10.
8. **dayrtrvceslovc3**
   Day reset threshold for VC_N_ES and VC_F_ES for lower-order VC3 bin.
   Type: Integer.
   Range: 0-86400
   Default: 60.
9. **qhrtrvcsesvc12**
   15-minute reset threshold for VC_N_SES and VC_F_SES for VC12 bin.
   Type: Integer.
   Range: 0-810
   Default: 0.
10. **dayrtrvcsesvc12**
    Day reset threshold for VC_N_SES and VC_F_SES for VC12 bin.
    Type: Integer.
    Range: 0-77760
    Default: 0.
11. **qhrtrvcseslovc3**
    15-minute reset threshold for VC_N_SES and VC_F_SES for lower-order VC3 bin.
    Type: Integer.
    Range: 0-810
    Default: 0.
12. **dayrtrvcseslovc3**
    Day reset threshold for VC_N_SES and VC_F_SES for lower-order VC3 bin.
    Type: Integer.
    Range: 0-77760
    Default: 0.
13. **qhrtrvcuasvc12**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for VC12 bin.
    Type: Integer.
    Range: 0-900
    Default: 0.
14. **dayrtrvcuasvc12**

Day reset threshold for VC_N_UAS and VC_F_UAS for VC12 bin.
Type: Integer.
Range: 0-86400
Default: 0.

15. **qhrtrvcuaslovc3**
    15-minute reset threshold for VC_N_UAS and VC_F_UAS for lower-order VC3 bin.
    Type: Integer.
    Range: 0-900
    Default: 0.
16. **dayrtrvcuaslovc3**
    Day reset threshold for VC_N_UAS and VC_F_UAS for lower-order VC3 bin.
    Type: Integer.
    Range: 0-86400
    Default: 0.

**Command parameters - profile parameters of type LOPATH**

1. **qhcvvt1**
   15-minute threshold for CV-P and CV-PFE bin for VT1.
   Type: Integer.
   Range: 0-14399100
   Default: 75.
2. **daycvvt1**
   Day threshold for CV-P and CV-PFE bin for VT1.
   Type: Integer.
   Range: 0-1382313600
   Default: 750.
3. **qhesvt1**
   15-minute threshold for ES-P and ES-PFE bin for VT1.
   Type: Integer.
   Range: 0-900
   Default: 40.
4. **dayesvt1**
   Day threshold for ES-P and ES-PFE bin for VT1.
   Type: Integer.
   Range: 0-86400
   Default: 900.
5. **qhsesvt1**
   15-minute threshold for SES-P and SES-PFE bin for VT1.
   Type: Integer.
   Range: 0-810
   Default: 40.
6. **daysesvt1**

Day threshold for SES-P and SES-PFE bin for VT1.
Type: Integer.
Range: 0-77760
Default: 900.

7. **qhuasvt1**
   15-minute threshold for UAS-P and UAS-PFE bin for VT1.
   Type: Integer.
   Range: 0-900
   Default: 40.
8. **dayuasvt1**
   Day threshold for UAS-P and UAS-PFE bin for VT1.
   Type: Integer.
   Range: 0-86400
   Default: 900.

**Command parameters - profile parameters of type DS3**

1. **qhcvl**
   15-minute threshold for CV-L bin of DS3 Line.
   Type: Integer.
   Range: 0-7200000
   Default: 387.
2. **daycvl**
   Day threshold for CV-L bin of DS3 Line.
   Type: Integer.
   Range: 0- 691200000
   Default: 3865.
3. **qhesl**
   15-minute threshold for Es-L bin of DS3 Line.
   Type: Integer.
   Range: 0-900
   Default: 25.
4. **dayesl**
   Day threshold for ES-L bin of DS3 Line.
   Type: Integer.
   Range: 0-86400
   Default: 250.
5. **qhesal**
   15-minute threshold for ESA-L bin of DS3 Line.
   Type: Integer.
   Range: 0-900
   Default: 25.
6. **dayesal**

Day threshold for ESB-L bin of DS3 Line.
Type: Integer.
Range: 0-86400
Default: 250.

7. **qhesbl**
   15-minute threshold for ESB-L bin of DS3 Line.
   Type: Integer.
   Range: 0-900
   Default: 25.
8. **dayesbl**
   Day threshold for ESB-L bin of DS3 Line.
   Type: Integer.
   Range: 0-86400
   Default: 250.
9. **qhsesl**
   15-minute threshold for SES-L bin of DS3 Line.
   Type: Integer.
   Range: 0-810
   Default: 4.
10. **daysesl**
    Day threshold for SES-L bin of DS3 Line.
    Type: Integer.
    Range: 0-77760
    Default: 40.
11. **qhcvp**
    15-minute threshold for CV-P and CV-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-7200000
    Default: 382.
12. **daycvp**
    Day threshold for CV-P and CV-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-691200000
    Default: 3820.
13. **qhesp**
    15-minute threshold for ES-P and ES-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-900
    Default: 25.

14. **dayesp**
    Day threshold for ES-P and ES-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 250.
15. **qhesap**
    15-minute threshold for ESA-P and ESA-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-900
    Default: 25.
16. **dayesap**
    Day threshold for ESA-P and ESA-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 250.
17. **qhesbp**
    15-minute threshold for ESB-P and ESB-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-900
    Default: 25.
18. **dayesbp**
    Day threshold for ESB-P and ESB-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 250.
19. **qhsesp**
    15-minute threshold for SES-P and SES-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-810
    Default: 4.
20. **daysesp**
    Day threshold for SES-P and SES-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-77760
    Default: 40.
21. **qhuasp**
    15-minute threshold for UAS-P and UAS-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.

Range: 0-900
Default: 10.

22. **dayuasp**
    Day threshold for UAS-P and UAS-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 10.
23. **qhsasp**
    15-minute threshold for SAS-P and SAS-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-900
    Default: 2.
24. **daysasp**
    Day threshold for SAS-P and SAS-PFE bin of DS3 Path ingress and egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 8.

**Command parameters - profile parameters of type DS1**

1. **qhcvsfp**
    15-minute threshold for CV-P bin of DS1 Path with SF format in egress direction.
    Type: Integer.
    Range: 0-16383
    Default: 72.
2. **daycvsfp**
    Day threshold for CV-P bin of DS1 Path with SF format in egress direction.
    Type: Integer.
    Range: 0- 1048575
    Default: 691.
3. **qhcvesfp**
    15-minute threshold for CV-P bin of DS1 Path with ESF format in egress direction.
    Type: Integer.
    Range: 0-16383
    Default: 13296.
4. **daycvesfp**
    Day threshold for CV-P bin of DS1 Path with ESF format in egress direction.
    Type: Integer.
    Range: 0-1048575
    Default: 132960.
5. **qhesp**
    15-minute threshold for ES-P bin of DS1 Path egress direction.

Type: Integer.
Range: 0-900
Default: 65.

6. **dayesp**
   Day threshold for ES-P bin of DS1 Path egress direction.
   Type: Integer.
   Range: 0-86400
   Default: 648.
7. **qhsesp**
   15-minute threshold for SES-P bin of DS1 Path egress direction.
   Type: Integer.
   Range: 0-810
   Default: 10.
8. **daysesp**
   Day threshold for SES-P bin of DS1 Path egress direction.
   Type: Integer.
   Range: 0-86400
   Default: 250.
9. **qhuasp**
   15-minute threshold for UAS-P bin of DS1 Path egress direction.
   Type: Integer.
   Range: 0-900
   Default: 10.
10. **dayuasp**
    Day threshold for UAS-P bin of DS1 Path egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 10.
11. **qhsasp**
    15-minute threshold for SAS-P bin of DS1 Path egress direction.
    Type: Integer.
    Range: 0-900
    Default: 2.
12. **daysasp**
    Day threshold for SAS-P bin of DS1 Path egress direction.
    Type: Integer.
    Range: 0-86400
    Default: 17.

### Detailed behavior description

The command shall retrieve the list of profile names of the specified profile type, if only the profile type is specified in the command. If profile type and profile name is specified, and a profile with the specified name exists, then the parameters of the profile is retrieved. If the profile does not exist, the system shall not return a response to the command.

### Example input/output

The following example shows the successful completion of a RTRV-TCA-PROF command by the NE:

```
RTRV-TCA-PROF:UNITE-NE::123456::section-line;
   UNITE-NE 00-01-01 08:00:00
M  123456 COMPLD
   "SECTION-LINE:DEFAULT"
   "SECTION-LINE:DEFAULT0"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-TCA-PROF** command.

### Related TL1 messages

- “DLT-TCA-PROF: Delete TCA profile” (p. 3-256)
- “ED-TCA-PROF: Edit TCA profile” (p. 3-1212)
- “ENT-TCA-PROF: Enter TCA Profile” (p. 3-1877)

# RTRV-TMAT3: Retrieve asynchronous adjunct port of the TransMUX card

## General

The command **RTRV-TMAT3** allows the user to retrieve all parameters related to the TransMUX asynchronous adjunct port.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

## Input format

Command syntax:

**RTRV-TMAT3**:*tid:aid:ctag;*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **aid** – Access Identifier
   Type: AID.
   Range: TMuxAPortAID.
   The keyword **all** is allowed up to shelf level.
   Default: None.
3. **ctag** – Correlation Tag
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output format

In response to a valid **RTRV-TMAT3** command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command parameters

1. **aid** – Access Identifier

   Access Identifier.

   Type: AID.

   Range: TMuxAPortAID. The keyword **all** is not allowed.

   Default: None.

### Spec block parameters

1. **cbitmis** – C-bit Signal Format Mismatch

   DS3 C-bit Signal Format Mismatch parameter indicates a mismatch between the provisioned C-bit signal format and the C-bit format of the DS3 signal.

   For the TransMUX Card: – outgoing DS3 signal (egress direction).

   The DS3 C-bit Signal Format Mismatch parameter will show a MISMATCH value if the DS3 port were provisioned for C-bit parity format, but it actually receives a different type of DS3 format. Otherwise, it will show the value NORMAL.

   The DS3 C-bit Signal Format Mismatch parameter shall have the value:

   - NORMAL, if the Signal Format (fmt) is set to C-BIT and a DS3 signal in C-bit parity channelized DS3 format is received
   - MISMATCH, if the Signal Format (fmt) is set to C-BIT and a DS3 signal in M23 channelized DS3 format is received
   - NA, if the Signal Format (fmt) is set to C-BIT and one of the alarms DS3LOS, DS3LOF, DS3AIS, DS3IDLE is present, or if the Signal Format (fmt) is set to another value than C-BIT, or if the value cannot be determined because pmode is set to NMON or the circuit pack is not present or other system internal reasons.

   Type: Alphanumeric value set.

   Range: NORMAL; MISMATCH; NA.

   Default: None.

2. **ds3pn** – DS3 ASAP

   DS3 Alarm Severity Assignment Profile. This parameter retrieves the ASAP profile name of type DS3 to which the designated AID points.

   Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.

   Range: String with a maximum of 24 characters.

   Default: DEFAULT.

3. **feac** – Far-End Alarm and Control

The parameter *feac* indicates the status of the FEAC channel of the incoming C-bit parity formatted DS3 signal. The parameter is only applicable, if *fmt* is set to C-BIT. The parameter shall have the value "NA" if the parameter is not applicable (*fmt* = M23 or UNFRAMED-CC), or the value for the parameter is not available because it cannot be determined.

For the TransMUX card, the FEAC channel of the outgoing DS3 signal (egress direction) is considered.

Type: Alphanumeric string.

Range: String with 6 characters.

Default: None.

4. **fmt** – Signal Format

   This parameter shows the format for the DS3 signal

   Type: Alphanumeric value set. A hyphen ("-") is allowed in the alphanumeric values additionally.

   Range:

   - C-BIT: C-bit parity channelized DS3 format
   - M23: M23 channelized DS3 format. M23 format contains seven DS2 signals, which contain DS1 signals.

   Default: C-BIT.

5. **outfepm** – Outgoing DS3 Far End Path PM Enable

   This parameter enables/disables the outgoing DS3 far end path performance monitoring.

   Type: Alphanumeric value set.

   Range: ENABLE, DISABLE.

   Default: DISABLE.

6. **outpm** – Outgoing DS3 Near End Path PM Enable

   This parameter enables/disables the outgoing DS3 near end path performance monitoring.

   Type: Alphanumeric value set.

   Range: ENABLE, DISABLE.

   Default: DISABLE.

7. **pmode** – Port Mode

   This parameter sets the mode of the port. In the case of AUTO the pmode state transitions to MON if the loss-of-signal alarm of this port is cleared.

   Type: Alphanumeric value set.

   Range:

   - MON indicates that alarm monitoring is taking place on the port.
   - NMON means that alarm monitoring is not occurring on the port.

   Default: NMON.

8. **ptype** – Port Type

   This identifies the port type of the AID.

   Type: Alphanumeric value set.

Range: TMAT3
Default: TMAT3

9. **servcond** – Service Condition
   This parameter indicates its status concerning service involvement.
   Type: Alphanumeric value set.
   Range:
   - INSERVICE: Provisioning values for service are accepted
   - OUTOFSERVICE: Provisioning values for service are not accepted.

   Default: INSERVICE.
10. **tca** – DS3 PM TCA
    This parameter assigns a DS3 PM TCA profile name to the designated AID.
    Type: Alphanumeric string. A hyphen ("-") is allowed in the name additionally.
    Range: String with a maximum of 24 characters.
    - DEFAULT
    - DEFAULT0

    Default: DEFAULT.

### Detailed behavior description

The command retrieves the parameters as described above. The **RTRV-TMAT3** command does not generate a **REPT DBCHG** message.

### Example input/output

The following example shows the successful completion of a **RTRV-TMAT3** command. Not all output parameters are listed (missing ones indicated by …):

```
RTRV-TMAT3:UNITE-NE:1-1-#-#-21-tma1:123456;

   LT-UNITE 00-11-27 08:00:00
M  123456 COMPLD
   "1-1-#-#-21-tma1:cbitmis=NORMAL,ptype=TMAT3,fmt=C-BIT,....,tca=DEFAULT"
;
```

### Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2397). The error responses listed there also apply to the **RTRV-TMAT3** command.

# RTRV-TMST3: Retrieve synchronous adjunct port of the TransMUX card

## General

The command **RTRV-TMAT3** allows the user to retrieve all parameters related to the TransMUX synchronous adjunct port.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

## Input format

Command syntax:

**RTRV-TMST3**:*tid:aid:ctag;*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **aid** – Access Identifier of a TransMUX virtual synchronous adjunct port.
   Type: AID
   Range: TMuxSPortAID
   The keyword **all** is allowed up to shelf level.
   Default: None
3. **ctag** – Correlation Tag
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output format

In response to a valid RTRV-TMST3 command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;

# RTRV-TMUXPM: Retrieve performance monitoring data of TransMUX pack

The **RTRV-TMUXPM** command is initiated by a user to request the network element to send the current and/or historical Performance Monitoring (PM) data associated with performance monitoring points located on a TransMUX pack. For each value in the *montype* parameter of the **RTRV-TMUXPM** input parameters section, PM counter values will be stored in the current 15-minute period, the 32 previous 15-minute periods (past 8 hours worth of data), current day, and previous day periods.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): PM1

Priority: 1

Abortable: Yes.

## Input format

Command syntax:
**RTRV-TMUXPM**-*modifier*:*tid*:*aid*:*ctag*::*[montype]*,*[monlev]*,*[locn]*,,*tmper*,*[mondat]*, *[montm]*;

## Input parameters

### Command parameters

1. **modifier**
   This parameter defines the type of performance monitoring point.
   Type: Alphanumeric value set.
   Range: The following value is for SONET only: TMAT3, TMASTS1, DS1.
   Default: None.
2. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
3. **aid** – Access Identifier
   Type: AID
   Range:
   For TMAT3 modifier: TMuxAPortAID
   For TMASTS1 modifier: TMuxAPTNumAID
   For DS1 modifier: DS1NumAID
   Wildcard values in parts of both AIDs are usable as follows:
   - *all*, *usall* in Simple_UnivSlotAID,
   - *all* in Simple_TMuxAPortAID,

- *all* in Simple_TMuxAPTNumAID,
- *all* in Simple_DS1NumAID.

Default: None.

4. **ctag** – Correlation Tag

   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).

5. **montype** – Monitored Parameter Type

   This is the monitored parameter type for which data is requested. If the value is omitted, this parameter defaults to ALL.

   Type: value set.

   Range:

   - The following values are for TMASTS1 modifier: CVP, ESP, SESP, UASP, FC-P, CV-PFE, ES-PFE, SES-PFE, UAS-PFE, FC-PFE
   - The following values are for TMAT3 modifier: CVP-EGR, ESP-EGR, ESA-P-EGR, ESB-P-EGR, SESP-EGR, UASP-EGR, FC-P-EGR, SEFS-P-EGR, SAS-P-EGR, AISS-P-EGR, CV-PFE-EGR, ES-PFE-EGR, ESA-PFE-EGR, ESB-PFE-EGR, SES-PFE-EGR, UAS-PFE-EGR, FC-PFE-EGR, SAS-PFE-EGR
   - The following values are for DS1 modifier: CVP-EGR, ESP-EGR, SESP-EGR, UASP-EGR, SAS-P-EGR, AISS-P-EGR

   The following value is also allowed for all input modifiers: ALL.

   Default: ALL.

6. **monlev** – Monitored Level

   This parameter provides the level for the monitored PM parameter. The parameter is only evaluated if the value of *montype* parameter is ALL.

   Type: value set.

   Range:

   - 1-UP: Means the NE will report all non-zero data and all data which is marked as non-valid (parameter validity).
   - 0-UP: Means the NE will report zero and all positive data.

   Default: 1-UP.

7. **locn** – Location

   Location for which the PM data is monitored. The parameter value is only considered if the *montype* value is ALL; otherwise it is ignored for the calculation of the command reply (i.e has no impact on the command).

   Type: value set.

   Range:

   - NEND: Near-End PM data is requested.
   - FEND: Far-End PM data is requested.
   - ALL: All near-end and far-end data is requested. It applies only to input direction.

   Default: ALL.

8. **tmper** – Time Period

This requests PM data for a specified time interval.

Type: value set.

Range:

- 15-MIN: This requests PM data in 15-minute intervals
- 1-DAY: This requests daily PM data.

Default: None.

9. **mondat** – Monitored Date

   This requests the beginning date of the interval for which the PM data is to be reported. For both values of tmper parameter, the maximum allowable range of valid dates includes the current and previous one day.

   Type: value set.

   Range:

   - MM-DD: Month-Day. A leading zero (first M or first D) is optional and may be omitted.
   - ALL: Current and previous day.

   Default: Current date

10. **montm** – Monitored Time

    This parameter specifies the beginning time of day of the requested PM period that was set by *tmper* parameter. The user is able to specify a monitored time in three modes:

    a. A monitored time interval (i.e., from hour-minutes to hour-minutes: HOD-MOH&&THOD-TMOH).

    b. A single time interval (i.e., the hour and minutes for the appropriate 15 minute data: HOD-MOH).

    c. All applicable beginning times for the given *mondat* value (i.e., all).

    Where HOD-MOH represents the start of the requested PM retrieval period (hours and minutes) and THOD-TMOH represents the end of the requested PM retrieval period. The value ALL must be used if the *mondat* value provided is ALL.

    Type: Character string.

Range:

- HOD-MOH: This specifies the beginning time of day of the requested PM period that was set by *tmper* parameter. This parameter may be omitted or have one of the following values: Hour Of Day- Minute Of Hour, where HOD ranges from 0 to 23 and MOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0.
- THOD-TMOH: To Hour Of Day-To Minute Of Hour, where THOD ranges from 0 to 23 and TMOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0. Parameter grouping is used when specifying THOD-TMOH. For example, 08-15&&09-00 specifies the HOD-MOH and THOD-TMOH of 08-15 and 09-00, respectively. THOD-TMOH of $$-$$ indicates the current Hour Of Day-Minute Of Hour. THOD-TMOH of ##- ## indicates the previous 15-min interval.
- ALL: All applicable beginning times for the given *mondat* value.

If the *tmper* value is 1-DAY, the *montm* parameter will not be used.

Default:

If THOD-TMOH is not specified, only the PM data for the retrieval period specified by HOD-MOH will be retrieved.

If HOD-MOH is omitted, the PM period for the current time will be reported.

## Output format

### Normal completion message

If the network element fully complies with the **RTRV-TMUXPM** request, the following normal completion response is returned:

```
    sid date time
M  ctag COMPLD
   "aid:montype,monval,[validity],[tca],[locn],,tmper,[mondat],[montm]"
   . . . . .
   . . . . .
   . . . . .
;
```

Note: The trailing comma has to be present even if the optional parameter is not supported for a dedicated release.

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2397).

### Normal completion message - empty reply

If there is no PM data stored within the NE, then the following response is returned:

```
   sid date time
M  ctag COMPLD
```

*;*

## Output parameters

### Command parameters

1. **aid** – Access Identifier
   Type: AID
   Range:
   TMuxAPortAID, TMuxAPTNumAID, or DS1NumAID
   Wildcard values, for example *all*, *usall*, are not used in any parts of the AIDs.
   Default: None.
2. **montype** – Monitored Parameter Type
   This is the monitored parameter type for which data is requested. If the value is omitted, this parameter defaults to ALL.
   Type: value set.
   Range:
   - The following values are for TMASTS1 modifier: CVP, ESP, SESP, UASP, FC-P, CV-PFE, ES-PFE, SES-PFE, UAS-PFE, FC-PFE
   - The following values are for TMAT3 modifier: CVP-EGR, ESP-EGR, ESA-P-EGR, ESB-P-EGR, SESP-EGR, UASP-EGR, FC-P-EGR, SEFS-P-EGR, SAS-P-EGR, AISS-P-EGR, CV-PFE-EGR, ES-PFE-EGR, ESA-PFE-EGR, ESB-PFE-EGR, SES-PFE-EGR, UAS-PFE-EGR, FC-PFE-EGR, SAS-PFE-EGR
   - The following values are for DS1 modifier: CVP-EGR, ESP-EGR, SESP-EGR, UASP-EGR, SAS-P-EGR, AISS-P-EGR

   The following value is also allowed for all input modifiers: ALL.
   Default: ALL.
3. **monval** – Monitored Value
   This parameter contains the measured value of the parameter specified in montype.
   Type: Integer.
   Range: 0-4294967295
   The specified range is the maximal range taking all PM parameters into consideration. Specific PM parameters may have a smaller range.
   W.r.t. value range for the specific PM parameters see
   - "Output parameters" section in "RTRV-TCA-PROF: Retrieve TCA profile" (p. 3-2958) (if thresholding is applicable for that parameter)
   - PM parameter introduction section (if thresholding is not applicable for that parameter).
4. **validity** – validity indicator
   This parameter indicates the validity of the PM data.
   Type: Integer.
   Range: 1: valid; (omitted): non-valid.

If the value is omitted, it indicates that the validity is "non valid".

5. **tca** – Threshold Crossing Alert

   Type: value set.

   Range:

   For the current interval: *tca* indicates, that the current value exceeds the provisioned threshold. If the value is omitted, it indicates that the current value is below the provisioned threshold.

   For previous intervals, the *tca* parameter indicates the state at the end of the interval.

   Default: None.

6. **locn** – Location

   Location for which the PM data is monitored.

   Type: value set.

   Range:

   - NEND: Near-End PM data is requested
   - FEND: Far-End PM data is requested.

7. **tmper** – Time Period

   This requests PM data for a specified time interval.

   Type: value set.

   Range:

   - 15-MIN: This requests PM data in 15-minute intervals
   - 1-DAY: This requests daily PM data.

   Default: None.

8. **mondat** – Monitored Date

   This parameter specifies the beginning date of the interval for which the PM data is reported. The parameter can be omitted in case of current date.

   Type: value set.

   Range: MM-DD: Month-Day

   Default: Current date

9. **montm** – Monitored Time

   This parameter specifies the beginning time of day for the reported pm register. The parameter is optional and may be omitted for the reporting of current bins (registers).

   Type: Character string.

   Range: HOD-MOH: HOD ranges from 0 to 23; MOH is 0, 15, 30 and 45. A leading zero is optional. For example, 00 means 0.

## Detailed behavior description

### Fault tolerant and filtered retrievals

This command shall only return those parameters, which are specified by the input parameters. This command shall omit parts of the response (maybe to return an empty response) if related performance monitoring has not been enabled (independent whether

this occurs due to a specific or wildcard query). This command shall oomitparts of the response due to a wildcard query (maybe to return an empty response) if the related entity does not exist.

### Examples

If a command is executed for a specific existing TransMUX asynchronous port entity to retrieve all parameters but the entity has only near-end (thus no far-end) performance monitoring enabled, then a response will be returned containing only the near-end values.

### Restrictions on current bin interval

Current bins can only be retrieved for one slot. The AID values “all” and “usall” cannot be used on slot level to retrieve current bins.

Current bins can only be retrieved if the TransMUX pack is plugged-in. If the retrieval of current bins is not possible because of one of the reasons listed above, then the system does not return a response on the **RTRV-TMUXPM** command.

## Example input/output

The following example shows the successful completion of a **RTRV-TMUXPM** command by the network element for a TMAT3 port:

```
RTRV-TMUXPM-TMAT3:UNITE-NE:1-1-#-#-39-tma16:123456::\
cvp-egr,1-up,,,15-min ,,00-00&&08-00;

   UNITE-NE 00-01-01 08:00:00
M  123456 COMPLD
   "1-1-#-#-39-tma16: cvp-egr,17,,tca,,,15-min,,00-00"
   "1-1-#-#-39-tma16: cvp-egr,10,,tca,,,15-min,,00-15"
   . . .
   "1-1-#-#-39-tma16: cvp-egr,15,,tca,,,15-min,,08-00"
;
```

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-TMUXPM** command.

# RTRV-ULS: Retrieve upper layer stack

The **RTRV-ULS** command is used to retrieve global parameters of the TCP/IP stack.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-ULS**:tid*::ctag;*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for input parameter syntax and description of this parameter.

## Output format

If the RTRV-ULS request is successful, the following normal completion message is returned:

```
   sid date time
M  ctag COMPLD
   "spec_block"
   .    .    .
   .    .    .
   .    .    .
   "spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

1. **ip_ad_astn** – IP Address of ASTN

This parameter is used to set or retrieve the router ID for the SCN and the ONNS node.

Note: As a consequence, if ip_ad_astn is not configured the whole SWISS application can not be enabled. See also parameter xcsetup in RTRV/ED-EQPT (system).

Type: Four dot separated numeric strings OR empty string.

The empty string value is used as indication for an undefined IP address.

Range: Each numeric string: 0 .. 255.

Default: empty string.

2. **ip_ad_uni** – IP address for UNI

   This parameter is used to retrieve the UNI node IP address.

   Type: Four dot separated numeric strings OR empty string The empty string value is used as indication for an undefined IP address.

   Range:

   - For first numeric string: 0 .. 223
   - For second to fourth numeric string: 0 .. 255.

   The values 0.0.0.0 and 1.1.1.1 are not allowed.

   Default: empty string.

3. **sigPCIP_Address** – IP address for Signaling Controller (E-NNI node)

   This parameter is used to retrieve the signaling controller (E-NNI node) IP address.

   Type: Four dot separated numeric strings OR empty string The empty string value is used as indication for an undefined IP address.

   Range:

   - For first numeric string: 0 .. 223
   - For second to fourth numeric string: 0 .. 255.

   The values 0.0.0.0, 1.1.1.1, and 127.0.0.1 are not allowed.

   Default: empty string.

4. **sigPCID** – ID of the Signaling Controller (E-NNI node)

   This parameter is used to retrieve the signaling controller (E-NNI node) ID.

   Type: Four dot separated numeric strings OR empty string The empty string value is used as indication for an undefined IP address.

   Range: Four times numeric string: 0 .. 255

   Default: empty string.

5. **ip_drad** – IP Default Router Address

   This parameter is used to set or retrieve the IP default router address (IPv4) to which the host points to, needed for the T-TD functionality.

   Type: Four dot separated numeric strings OR empty string. The empty string value is used as indication for an invalid/undefined IP address.

   Range: Each numeric string: 0 .. 255.

   Default: empty string.

6. **ip_drlan** – IP Default Router LAN port AID

   This parameter specifies with which LAN port the default router is associated.

Type: AID.
Range: LanPortAID. The value lanall is not allowed.
Default: 1-1-lan1.

7. **lv_port** – T-TD Length Value Port
   This parameter is used to set or retrieve the port number over which the T-TD function is accessible using the Length Value encoding method.
   Type: Numeric string.
   Range: Each numeric string: 0 .. 65535, except the value 3083.
   Default: 3081.
8. **raw_port** – T-TD Raw Mode Port
   This parameter is used to set or retrieve the port AID of number over which the T-TD function is accessible using raw-mode encoding.
   Type: Numeric string.
   Range: Each numeric string: 0 .. 65535, except the value 3083.
   Default: 3082.

### Detailed behavior description

The command retrieves system parameters as described in the Output parameter section.

### Example input/output

The following example shows the result of a RTRV-ULS command:

```
RTRV-ULS:LT-UNITE::123456;
   LT-UNITE 06-06-30 08:00:00
M  123456 COMPLD
   "ip_ad_astn=127.93.94.10"
   "ip_ad_uni=221.131.82.1"
   "ip_drad=198.84.65.20"
   "ip_drlan=1-1-lan1"
   "lv_port=3081"
   "raw_port=3082"
;
```

The following example shows the result of a RTRV-ULS command:

```
RTRV-ULS:LT-UNITE::123456;
   LT-UNITE 06-06-30 08:00:00
M  123456 COMPLD
   "ip_ad_astn=127.93.94.10"
   "ip_ad_uni=221.131.82.1"
   "ip_drad=198.84.65.20"
   "ip_drlan=1-1-lan1"
   "lv_port=3081"
   "raw_port=3082"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-NE** command.

### Related TL1 Messages

“ENT-ULS: Enter upper layer stack” (p. 3-1926)

# RTRV-ULSDCC-L3: Retrieve layer 3 related parameters

The command **RTRV-ULSDCC-L3** is used to retrieve the layer 3 parameters of the OSI nodes or the SCN node. Up to 8 independent OSI nodes can exist in an NE: Node-1 has an NSAP and is created by default. Node 2-8 have each a Network Entity Title (NET). NSAP = NET + SEL . Node 2-8 can be created and deleted, see commands **ENT-ULSDCC-L3**, **DLT-ULSDCC-L3**. The SCN node is created when an ASTN IP address is defined (see **ENT-ULS**), for this node the command retrieves only the NSAP parameter used by I-ISIS. For OSI nodes the parameters of the NSAP field, IS level, IS domain, RA prefix and RA destination node are retrieved.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-ULSDCC-L3***:tid::ctag[::osinode];*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for input parameter syntax and description of this parameter.
3. **osinode**
   A 1675 LambdaUnite MSS NE can have up to 8 instances of the OSI stack and one SCN node. Node-1 is default. Node 2-8 can be created and configured, see command **ENT-ULSDCC-L3**. The SCN node is created when an ASTN IP address is defined, see ENT-ULS.
   Type AID.
   Range: OSI_node_AID | SCN_node_AID.
   Default: If this field is omitted then the command shall provide output for all nodes which are created.

## Output format

If the **RTRV-ULSDCC-L3** is successful, the following normal completion response is returned:

```
sid date time
```

```
M  ctag COMPLD
   "osinode:spec_block"
       ...
   "osinode:spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command parameters

1. **osinode**

   See definition of input parameter *osinode* in **RTRV-ULSDCC-L3**. The value *osinodeall* is not allowed as output parameter.

### Spec block parameters

1. **autoencap** – Auto Encapsulation

   The parameter *autoencap* is used to enable or disable the Auto Encapsulation function. The parameter is only supported for osinode1. The parameter shall be omitted for all other osinodes.

   Type: Alphanumeric value set.

   Range: ENABLE, DISABLE.

   Default: DISABLE.

2. **l3afi** – NSAP/NET Authority and Format Identifier

   This parameter sets or retrieves the format for the rest of the address.

   Type: Hexadecimal number.

   Range: 10 – 99

   Default: 39. This value identifies the iso_dcc format.

3. **l3idi** – NSAP/NET initial Domain Identifier

   This parameter consists of two values:

   - a 3 semi-octet (3-digit hexadecimal) IDI part to specify the country code indicating the registration authority responsible for the allocation and assignment of the NSAP address.
   - a 1 semi-octet (1-digit hexadecimal) IDI pad part. The parameter is used for set and retrieve values.

   Type: Hexadecimal number.

   Range: 0000 – FFFF

   Default:

   SONET: IDI = 840; IDI pad = F

   SDH: IDI = 000; IDI pad = 0.

4. **l3dfi** – NSAP/NET DSP Format Identifier

This parameter (2-digit hex) NSAP is used to set or retrieve the format for the rest of the address.

Type: Hexadecimal number.

Range: 00 – FF.

Default: 80. This value represents the SONET DSP format.

5. **l3org** – NSAP/NET Organization Identifier

   This parameter of NSAP is used to set or retrieve the NSP (allocated Company Code).

   Type: Hexadecimal number.

   Range: 000000 – FFFFFF.

   Default: 000000.

6. **l3res** – NSAP/NET Reserved

   This NSAP part currently has not been assigned a specific purpose.

   Type: Hexadecimal number.

   Range: 0000 – FFFF.

   Default: 0000.

7. **l3rd** – NSAP/NET Routing Domain

   This parameter of NSAP is used to set or retrieve a unique routing domain within an administrative domain. A standard for use has not been defined until now.

   Type: Hexadecimal number.

   Range: 0000 – FFFF.

   Default: 0000.

8. **l3area** – NSAP/NET Area Identifier

   This parameter of NSAP is used to set or retrieve the area. So NEs can be identified in the same area.

   Type: Hexadecimal number.

   Range: 0000 – FFFF.

   Default: 0000.

9. **l3sys** – NSAP/NET System Identifier

   This system parameter of the NSAP is set by the Equipment Manufacturer. The value is fix and globally unique among all NEs. For values of NSAP/NET system parameter see chapter Default below.

   Type: Hexadecimal number.

   Range: 000000000000 – FFFFFFFFFFFF

   Default:

   - Node-1: IEEE-MAC address of LAN1
   - Node-2: IEEE-MAC address of LAN1 +1
   - Node-3: IEEE-MAC address of LAN1 +2
   - Node-4: IEEE-MAC address of LAN1 +3
   - Node-5: IEEE-MAC address of LAN1 +4
   - Node-6: IEEE-MAC address of LAN1 +5
   - Node-7: IEEE-MAC address of LAN1 +6

- Node-8: IEEE-MAC address of LAN1 +7
- scnnode: IEEE-MAC address of LAN1 +8 (default)

10. **l3sel** – NSAP Selector

    This parameter serves to differentiate multiple access points (NSAPs) for the same NE (node-1). The values cannot be set manually. The NET addresses of node 2-8 have *l3sel*=00.

    Type: Hexadecimal number.

    Range: 00 – FF. Values:

    - 1D: For TP4 PDUs, whenTP4 runs over CLNP, Also used for SDH supporting NEs
    - 00: For NET, used for exchanging PDUs in the ES-IS and IS-IS routing exchange protocols
    - 04: For NSAP of CLNP PDUs, encapsulated IP packets
    - AF: For TARP PDUs, when TARP is run over CLNP.

    Default: 1D, see NET addresses of node 2-8 are reported as NSAP with *l3sel*=00.

11. **l3isisnl** – Layer 3 IS Level

    This parameter indicates the network router type: ES-IS (level1, value L1), IS-IS (level2, value L2) and partition repair capability (value3).

    Note: This parameter is not reported when output parameter *osinode* = scnnode.

    Type: Alphanumeric string.

    Range:

    - L1: this means level1, IS-IS, only allowed when parameter l3radesnode=0
    - L12: this means level2, IS-IS which contains also level1, ES-IS
    - L12PRC : this means partition repair capable (PRC) and contains also level1 and level2.

    Default: L1.

12. **l3domain** – Layer3 IS Domain

    Per node in a NE, a domain group must be specified. This will be done with this parameter which can be set and retrieved. All nodes in the NE with the same domain-number are interconnected and can communicate without the need for inter-domain routing via RA-PREFIX.

    Note: This parameter is not reported when output parameter *osinode* = scnnode.

    Type: Alphanumeric string.

    Range:

    - 1 for osinode1
    - 1 – 2 for osinode2 to osinode8.

    Default: 1.

13. **l3raprefix** – Layer3 Reachable Address Prefix

This value specifies an area address or a part of an area address representing an area address group. This parameter is needed when nodes in different routing domains (see *l3domain*) must communicate. The node must forward then CLNP PDUs to the RA-Destination-Node if the destination NSAPs of CLNP PDUs match with the PA-Prefix.

Note: This parameter is not reported when output parameter *osinode* = scnnode.

Type: Hexadecimal number.

Range:

- NONE,
- a string of 1 to 13 bytes: first byte (most significant): 10 – 99; rest: 0000 – FFFF.

The value represents an area address or a part of an area address beginning with AFI.

Default: empty string.

14. **l3radesnode** – Layer3 Reachable Address Destination Node

    This parameter is in combination with parameter l3raprefix necessary. The value represents the destination node in the same NE. An internal connection over a domain-boundary is established between this node and the RA-Destination-Node, with IS-IS disabled over that connection.

    Note: This parameter is not reported when output parameter *osinode* = scnnode.

    Type: AID and digit value.

    Range:

    - 0, osinode{2-8} for osinode1
    - 0, osinode1 for osinode2 to osinode 8.

    Value 0 indicates that functionality of RA-Prefix is disabled.

    Default: 0.

15. **nsapcount** – Number of OSI Nodes in level 1 Area

    This parameter indicates the number of OSI nodes (NSAPs) for the level 1 area in which the OSI node specified by the osinode parameter is located. When the number of OSI nodes in the level 1 area is more than the maximum supported number (250), the value of this parameter is shown as "250+",which indicates a state of NSAP count overflowed. The parameter is omitted for the SCN node.

    Type: Value set.

    Range: 1 – 250 if the number of nodes is less or equal to 250. 250+ if the number of nodes exceeds 250.

    Default: 1

16. **nsapthlev** – Number of OSI Nodes Threshold Level

    This parameter indicates the NSAP count threshold level for monitoring the number of OSI nodes (NSAPs) for the level 1 area in which the OSI node specified by the *osinode* parameter is located. A threshold value of zero (0) indicates that NSAP threshold alarming is disabled. The parameter is omitted for the SCN node.

    Type: Numeric string.

    Range: 0 no alarming; 1 – 250 threshold alarming

    Default: 0

### Detailed behavior description

The command retrieves system parameter as described in the Output parameter section.

### Example input/output

The following example shows the result of RTRV-ULSDCC-L3:

```
RTRV-ULSDCC-L3:NE-UNITE::123456::osinode1;
   NE-UNITE 00-12-24 11:01:59
M  123456 COMPLD
   "osinode1:L3AFI=39,L3IDI=840F,L3DFI=80,
   L3ORG=100100,L3res=0000,L3RD=0000,L3AREA=0000,
   L3SYS=08006A112345,L3SEL=1D,L3ISISNL=L12PRC,
   L3DOMAIN=1,L3RADESNODE=0,NSAPCOUNT=2,NSAPTHLEV=0"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the RTRV-ULSDCC-L3 command.

### Related TL1 messages

- “ENT-ULSDCC-L3: Create a further OSI node” (p. 3-1933)
- “ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack” (p. 3-1308)
- “DLT-ULSDCC-L3: Delete a node ID other than node-1” (p. 3-262)

# RTRV-ULSDCC-L4: Retrieve OSI layer 4 related parameters

The command **RTRV-ULSDCC-L4** is used to retrieve layer 4 parameters of the OSI stacks. Layer 4 include some TARP parameter which can be modified and the TARP Manual Adjacencies parameter which can be provided, modified or deleted.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-ULSDCC-L4***:tid::ctag[::osinode];*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for input parameter syntax and description of this parameter.
2. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for input parameter syntax and description of this parameter.
3. **osinode**
   A 1675 LambdaUnite MSS NE can have up to 8 instances of the OSI stack and one SCN node. Node-1 is default. Node 2-8 can be created and configured, see command **ENT-ULSDCC-L3**. The SCN node is created when an ASTN IP address is defined, see ENT-ULS.
   Type AID.
   Range: OSI_node_AID | SCN_node_AID.
   Default: If this field is omitted then the command shall provide output for all nodes which are created.

## Output format

If the RTRV-ULSDCC-L4 is successful, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "osinode:spec_block"
       ...
   "osinode:spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2397).

### Manual adjacencies

If more than one manual adjacency is defined for one osinode, they appears on separate output lines.

**Example:**

```
   sid date time
M  ctag COMPLD
   "osinode1:<other spec_block parameters>"
   "osinode1:l4ajnsap=39840F800000000000000000000123456789ABC00"
   "osinode1:l4ajnsap=39840F800000000000000000000023456789ABCD00"
;
```

### Output parameters

#### Command parameters

1. **osinode**

   A 1675 LambdaUnite MSS NE can have up to 8 instances of the OSI stack and one SCN node. Node-1 is default. Node 2-8 can be created and configured, see command **ENT-ULSDCC-L3**. The SCN node is created when an ASTN IP address is defined, see ENT-ULS.

   Type AID.

   Range: OSI_node_AID | SCN_node_AID.

   Default: If this field is omitted then the command shall provide output for all nodes which are created.

#### Spec block parameters

1. **l4etdc** – TARP Data Cache

   This parameter is only valid for node-1. It is used to enable or disable TARP data cache.

   Type: Alphanumeric value set.

   Range: ENABLE (default), DISABLE.

2. **l4etof** – TARP origination

   This parameter only valid for node-1. It is used to enable or disable TARP Origination function and is valid for all interfaces of a node.

   Type: Alphanumeric value set.

   Range: ENABLE, DISABLE.

   Default: ENABLE (for osinode1), DISABLE (for osinode2-8, fixed).

3. **l4etpf** – TARP propagation

This parameter is used to enable or disable TARP Propagation function for a node.
Type: Alphanumeric value set.
Range:

- ENABLE (default)
- DISABLE.

4. **l4etrf** – TARP responder
   This parameter is only valid for node-1. It is used to enable or disable TARP responder function
   Type: Alphanumeric value set.
   Range:
   - ENABLE
   - DISABLE.

   Default: For node-1: ENABLE DISABLE (fixed for nodes 2-8).
5. **l4ajnsap** – TARP Manual Adjacency List
   This parameter specifies the NSAP address portion of an entry in the TARP Manual Adjacent NE list. Up to two addresses are possible for each node in a 1675 LambdaUnite MSS NE.
   Type: Hexadecimal number or alphanumeric value set.
   Range: NONE, 20 octet (40-digit hex) long address.
   The NSAP address / NET is composed of the following components:
   - l4ajafi 10 – 99
   - l4ajidi 0000 – FFFF
   - l4dfi 00 – FF
   - l4alorg 000000 – FFFFFF
   - l4ajres 0000 – FFFF
   - l4jrd 0000 – FFFF
   - l4jarea 0000 – FFFF
   - l4ajsys 000000000000 – FFFFFFFFFFFF
   - SEL 00 The last byte indicates the selector and is not to set.

   Note: For more details see description of ENT-ULSDCC-L3.
   Default: NONE (no TARP manual adjacencies).

## Detailed behavior description

The command retrieves system parameter as described in the Output parameter section.

## Example input/output

The following example shows the result of RTRV-ULSDCC-L4:

```
RTRV-ULSDCC-L4:NE-UNITE::456789::osinode1;
```

```
   NE-UNITE 01-17-01 18:11:01
M  456789 COMPLD
   "OSINODE1:l4etof=DISABLE,l4etpf=ENABLE,l4etrf=ENABLE,
   l4etdc=ENABLE,
   l4ajnsap=39840F800000000000000000000123456789ABC00"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the RTRV-ULSDCC-L4 command.

### Related TL1 messages

- “ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks ” (p. 3-1943)
- “DLT-ULSDCC-L4: Delete TARP manual adjacent NSAP address in layer 4 of the specified OSI stack” (p. 3-266)

# RTRV-USER: Retrieve user

The **RTRV-USER** command retrieves a user's own security information.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S2

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-USER**:*tid*::*ctag*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output format

After receiving the **RTRV-USER** command, the following normal completion response is returned:

```
^^^sid^date^time
M^^ctag^COMPLD
^^^"uid::spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command parameters

1. **uid** – User ID
   User ID whose security parameters are to be retrieved.
   This is the unique user login identifier for which the ACT-USER login command is intended. Grouping and/or ranging of uid values for the **ACT-USER** command are not allowed. Valid uid values for the **ACT-USER** command are case-sensitive alphanumeric strings which have been previously provisioned as valid login IDs in the NE.

Type: Alphanumeric string (case-sensitive)

Range: 5 – 10 characters. The uid ALL is not allowed in any combination of upper or lower cases.

### Spec block parameters

1. **`page`** – Password Aging Interval

   This parameter specifies the period in days after which the user has to change the password of their account. If the value is set to 0 then the password aging function is disabled.

   Type: Integer.

   Range: 0, 7-999 [days]

   Default: 90

2. **`screen`** – Message Screening

   This parameter specifies what output messages are associated with the *uid*. This parameter is omitted if the user has none of these values. Any combination of these values may be specified using ampersand (&)

   Type: Alphanumeric string An '&' is also allowed for concatenation of values.

   Range:

   - DBCHG

     Data Base Change notifications – changes in creation of entities, in user provisionable parameters, in deletion of entities will be reported (data base changes). The user will receive **`REPT DBCHG`** messages.

   - STCHG

     State Change notifications – report changes in user non-provisionable parameters (state changes). The user will receive **`REPT DBCHG`** messages.

   - PSCHG

     Protection switch notifications – report protection switch changes. User will receive REPT EVT and REPT SW messages.

   - ALARMS

     Alarm notifications. The user will receive REPT ALM ENV, REPT ALM, and REPT EVT messages.

   - ONNS

     ONNS Notifications. Database and state changes associated with entities managed by ONNS application and only issued when *xcsetup* = NN. The related ONNS TL1 notifications are REPT PTHCHG, REPT PTHEVT, REPT NNCHG, REPT NNEVT.

   - OWN

     Responses to own commands. The user will receive no other notifications.

     Note: OWN will never be shown in conjunction with DBCHG, STCHG, PSCHG or ALARMS.

   - NA

     Not applicable. This value is reserved for users with uidclass=MEMADMIN. The notification behavior is controlled in this case by the user class.

Default: OWN

If more than one value is set the values will be concatenated by '&'.

Example: DBCHG&STCHG&ALARMS

3. **tmout** – Inactivity Timeout Period

   If there are no messages between the user and the NE over the Timeout Period, the session is logged off. A value of 0 disables the timeout function.

   Type: Integer.

   Range: 0 – 999 [minutes]

   Default: 30

4. **uidclass** – UID Class

   This is the user class of a *uid*.

   Type: Alphanumeric value set.

   Range:

   - OTHER – This is the default class. For users in this class, command privileges and notifications are controlled only by their UPCs and their notification Registration List.
   - MEMADMIN – User class for memory administration users. All users of this class share the same atag counter for autonomous messages and are allowed to execute the command **RTRV-AO**.

   Default: OTHER

5. **upc** – User Privilege Code List

   This parameter specifies the user privilege code UCFC/UCAL pair assigned to a user. Multiple UCFC/UCALs can be specified using single ampersands ('&'). If a user tries to operate a command with a privilege code higher than assigned to the user for the category of the command the command will be denied.

   Type: Alphanumeric string; for concatenation “&” is also allowed.

   Range: P*i*, M*i*, T*i*, S*i*, PM*i*, D*i*, C*i*, where *i* is an integer ranging from 0 to 5, with *i* = 0 implying that there is no authorization for the functional category. S0 is not allowed.

   Default: P1&M1&T1&S1&PM1&C0 except for super users: P5&M5&T5&S5&PM5&C5.

   Note: The system does not support commands for the D (DEBUG) category. Setting this privilege code does not have any effect on the system behavior and it will not be visible in output direction. It is only for compatibility.

   See also “List of user privilege codes” (p. 15-1).

## Example input/output

The following example shows the successful completion of **RTRV-USER** command by the NE:

```
RTRV-USER:LT-UNITE-123::123456;
   LT-UNITE-123 05-05-31 08:00:00
M  123456 COMPLD
   "nbguser1::upc=P3&M3,screen=DBCHG&STCHG&ALARMS,page=999,uidclass=OTHER,
```

```
   tmout=3"
;
```

# RTRV-USER-SECU: Retrieve user security

The **RTRV-USER-SECU** command can be initiated by a user to retrieve user security information of one or all the users in the NE.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S4

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-USER-SECU**:*tid*:[*uid*]:*ctag*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **uid** – User ID
   If this parameter is omitted, all *uid*s will be retrieved.
   See definition of "ACT-USER: Activate user" (p. 3-24).
3. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output format

If the NE has logins to report, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "uid::spec_block"
   .
   .
   "uid::spec_block"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command parameters

1. **uid** – User ID

This is the unique user login identifier for which the ACT-USER login command is intended. Grouping and/or ranging of uid values for the **ACT-USER** command are not allowed. Valid uid values for the **ACT-USER** command are case-sensitive alphanumeric strings which have been previously provisioned as valid login IDs in the NE.

Type: Alphanumeric string (case-sensitive)

Range: 5 – 10 characters. The uid ALL is not allowed in any combination of upper or lower cases.

### Spec block parameters

1. **alw_login** – Allow Login

   This parameter displays the enable/disable state of a User ID.

   A User ID can be automatically disabled by the system when the time specified by parameter *usrage* (see "RTRV-NE-SECU: Retrieve NE security" (p. 3-2536)) expires or via the **ED-USER-SECU** command. A User ID can be enabled via the **ED-USER-SECU** command.

   If a User ID is disabled, logins with that User ID are denied.

   Type: Alphanumeric value set.

   Range:

   - YES: User ID is enabled
   - NO: User ID is disabled

   Default: YES

2. **initobs** – Initialization Observability

   This parameter allows the system to accept commands before it has completed initialization. Do not enable this parameter in networks using a Telcordia operations system.

   Type: Alphanumeric value set.

   Range: DISABLE – The feature is disabled.

   Default: DISABLE

   Note: 1675 LambdaUnite MSS does not support Initialization Observability feature. This parameter is only for compatibility. The DISABLE value will be returned as fixed value.

3. **page** – Password Aging Interval

   This parameter specifies the period in days after which the user has to change the password of their account. If the value is set to 0 then the password aging function is disabled.

   Type: Integer.

   Range: 0, 7-999 [days]

   Default: 90

4. **screen** – Message Screening

   This parameter specifies what output messages are associated with the *uid*. This parameter is omitted if the user has none of these values. Any combination of these values may be specified using ampersand (&)

   Type: Alphanumeric string An '&' is also allowed for concatenation of values.

Range:

- DBCHG

  Data Base Change notifications: changes in creation of entities, in user provisionable parameters, in deletion of entities will be reported (data base changes).

  File Transfer In-progress notifications: The user will receive **REPT DBCHG** and REPT EVT FXFR messages.

- STCHG

  State Change notifications – report changes in user non-provisionable parameters (state changes). The user will receive **REPT DBCHG** messages.

- PSCHG

  Protection switch notifications – report protection switch changes. User will receive REPT EVT and REPT SW messages.

- ALARMS

  Alarm notifications. The user will receive REPT ALM ENV, REPT ALM, and REPT EVT messages.

- ONNS

  ONNS Notifications. Database and state changes associated with entities managed by ONNS application and only issued when *xcsetup* = NN. The related ONNS TL1 notifications are REPT PTHCHG, REPT PTHEVT, REPT NNCHG, REPT NNEVT.

- SECURITY: Security event notifications

- OWN

  Responses to own commands. The user will receive no other notifications.

  Note: OWN will never be shown in conjunction with DBCHG, STCHG, PSCHG or ALARMS.

- NA

  Not applicable. For users with uidclass=MEMADMIN only this value is allowed. The notification behavior is controlled in this case by the user class. If the value NA is applied for users of other user classes, then the value has the same effect as DBCHG.

Default: OWN

If more than one value is set the values will be concatenated by '&'.

Example: DBCHG&STCHG&ALARMS

5. **tmout** – Inactivity Timeout Period

   If there are no messages between the user and the NE over the Timeout Period, the session is logged off. A value of 0 disables the timeout function.

   Type: Integer.

   Range: 0 – 999 [minutes]

   Default: 30

6. **ucpl** – User Community Priority Level

This parameter specifies with which priority the commands of a user will be operated by the NE. Input commands from users with higher priority are executed before commands from users with lower priority.

Type: Integer.

Range: 1

Default: 1

Note: 1675 LambdaUnite MSS does not support User Community Priority Level's. Only the default value 1 will be reported. The value is not setable.

7. **uidclass** – UID Class

   This is the user class of a *uid*.

   Type: Alphanumeric value set.

   Range:

   - OTHER – This is the default class. For users in this class, command privileges and notifications are controlled only by their UPCs and their notification Registration List.
   - MEMADMIN – User class for memory administration users. All users of this class share the same atag counter for autonomous messages and are allowed to execute the command **RTRV-AO**.

   Default: OTHER

8. **upc** – User Privilege Code List

   This parameter specifies the user privilege code UCFC/UCAL pair assigned to a user. Multiple UCFC/UCALs can be specified using single ampersands ('&'). If a user tries to operate a command with a privilege code higher than assigned to the user for the category of the command the command will be denied.

   Type: Alphanumeric string; for concatenation “&” is also allowed.

   Range: P*i*, M*i*, T*i*, S*i*, PM*i*, D*i*, C*i*, where *i* is an integer ranging from 0 to 5, with *i* = 0 implying that there is no authorization for the functional category. S0 is not allowed.

   Default: P1&M1&T1&S1&PM1&C0 except for super users: P5&M5&T5&S5&PM5&C5.

   Note: The system does not support commands for the D (DEBUG) category. Setting this privilege code does not have any effect on the system behavior and it will not be visible in output direction. It is only for compatibility.

   See also “List of user privilege codes” (p. 15-1).

## Example input/output

Example for specified user:

The following example shows the successful completion of **RTRV-USER-SECU** command by the NE. The example below retrieves the security information associated with the user specified in the *uid* field:

```
RTRV-USER-SECU:LT-UNITE-123:nbguser1:123456;
   LT-UNITE-123 05-05-31 08:00:00
M  123456 COMPLD
```

```
   "nbguser1::upc=P3&M3,screen=DBCHG&STCHG&ALARMS,page=90,tmout=30,
   alw_login=YES,uidclass=OTHER"
;
```

Example for all users:

The following example shows the successful completion of **RTRV-USER-SECU** command by the NE. The example below retrieves the security information associated with all the users from the NE:

```
RTRV-USER-SECU:LT-UNITE-123::123456;
   LT-UNITE-123 05-05-31 08:00:00
M  123456 COMPLD
   "LUC01::upc=S5,screen=DBCHG&STCHG&PSCHG&ALARMS,page=90,tmout=30,
   alw_login=YES,uidclass=OTHER"
   "LUC02::upc=S5,screen=DBCHG&STCHG&PSCHG&ALARMS,page=47,tmout=11,
   alw_login=YES,uidclass=OTHER"
   "hugo::upc=P3&M3,screen=DBCHG&STCHG&ALARMS,page=999,tmout=3,alw_login=YES,
   uidclass=OTHER"
   "egon::upc=P3&M3&T3&PM3,screen=PSCHG,page=7,tmout=999,alw_login=NO,
   uidclass=OTHER"
   "ronald::upc=T2,screen=DBCHG&STCHG&PSCHG&ALARMS,page=0,tmout=0,
   alw_login=YES,uidclass=OTHER"
   "fritz::upc=C5,screen=OWN,page=0,tmout=0,alw_login=YES,uidclass=OTHER"
   "cathrin::upc=T2,screen=OWN,page=90,tmout=30,alw_login=YES,uidclass=OTHER"
;
```

## Error responses

### Validation rule: invalid uid

If the NE receives an RTRV-USER-SECU command with an invalid (unknown) Only the own *uid* value.

Error code: `IDNV - Input, Data Not Valid, invalid UID`

# RTRV-VC3: Retrieve VC3 tributary

## General

The command **RTRV-VC3** is used to retrieve all parameters related to a VC3 tributary.

Note: If a tributary AID (Access IDentifier) is specifed in the RTRV-VC3 request for a slot provisioned with a GE1 pack (e.g. 1-1-#-#-1-1-1 is used), then an empty reply is returned instead of: `IENE - Input, Entity Not Exists`.

For GE1 the "RTRV-VCGTRIB: Retrieve virtual concatenation group tributary " (p. 3-3082) command must be used.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-VC3**:*tid:aid:ctag*;

## Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.
2. **aid** – Access Identifier
   AID of a SDH tributary. The keyword **all** is allowed on slot, port and tributary level. The so called "dynamic parameters" is reported, if a **all** is used at the tributary level. The "dynamic parameters" are:
   - *ptrc*, *ptrcst*, *siglb*, *trailstate*.
     Type: AID
     Range: STS1NumAID.
3. **ctag** – Correlation Tag
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and description of this parameter.

   **Important!** To retrieve the dynamic parameters (*ptrc*, *ptrcst*, *siglb*, *trailstate* ) of all tributaries use the ("RTRV-ALL: Retrieve all (tributary)" (p. 3-2216)) command and set the parameter *dyn* to YES.

## Output format

In response to a valid RTRV-VC3 command, the following output report is returned:

```
   sid date time
M  ctag COMPLD
   "aid[:spec_block]"
       ...
       ...
   "aid[:spec_block]"
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command parameters

1. **aid** – Access Identifier

   Description: AID of the SDH tributary. The keyword **all** is not allowed on any level.

   Type: AID

   Range: STS1NumAID

### Spec block parameters

1. **brstintvl**– Bursty Interval

   Measurement period for determining bursty errors The setting of this parameter is used when *sdsfmode* = BURST.

   Type: numeric value set.

   Range: 2 to 10.

   Default: 7.

2. **brstthr** – Bursty Error Threshold

   The values are set in percent for the degradation threshold. The setting of this parameter is used when *sdsfmode* = BURST.

   Type: numeric value set.

   Range (as percentage ): 5, 10, 15, 20, 25, 30, … 50.

   Default: 30.

3. **crslpbkrate** – Cross-connect loopback Rate

   It is independent from the current interface standard and therefore both SDH and SONET values are allowed.

   The parameter *crslpbkrate* is not reported if the parameter *crlspbkstat* indicates that no loopback is set.

   Type: Alphanumeric value set.

   Range:

   - VC3
   - VC4

- VC44C
- VC416C
- VC464C
- STS1
- STS3
- STS12
- STS48
- STS192

4. **crslpbkstat** – Cross-connect loopback status

   State of cross- connect loopback.

   Type: Alphanumeric value set.

   Range:

   - YES = Cross-connect loopback is provisioned
   - NO (default) = No cross-connect loopback is provisioned.

5. **degthr** – Signal Degrade Threshold

   The setting of this parameter are used when *sdsfmode* = POISSON

   Type: numeric value set.

   Range (as exponents of 10): –5; –6 (default); –7; –8; –9

6. **dexcthr** – Excessive Degrade Threshold

   The setting of this parameter are used when *sdsfmode* = POISSON. The values are set as exponent of 10.

   Type: numeric value set.

   Range (as exponent of 10) –3 (default); –4; –5.

7. **exphptrc** – Expected Path Trace (J1)

   The parameter *exphptrc* specifying the expected path trace is only relevant for the path trace supervision when the path trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).

   Type: Hexadecimal digits

   Range: 16 byte string. Each byte is expressed as two hexadecimal digits (example value: 6D). The first byte value is in the range from 80 to FF. The other byte values are in the range from 00 to 7F.

   Default: 89hex followed by 15 bytes 00hex.

8. **feppm** – Far-End Path PM Enable

   It indicates whether this performance monitoring feature is enabled or disabled.

   Type: Alphanumeric value set.

   Range:

   - ENABLE
   - DISABLE (default).

9. **hptimmon** – Path Trace Monitoring Enable (J1)

   Description: High order path trace (J1) identifier mismatch (TIM) monitor enable.

This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).

Type: Alphanumeric value set.

Range:

- ENABLE
- DISABLE (default).

10. **loca** – Ring A-node TID

    This parameter specifies the TID of the node at which the service is added to the BLSR ring. This parameter is required for the input of tributaries to be used by ONNS on ports of *portClass* = EDGE being members in BLSR/MS-SPRing protection groups. The *loca* parameter value is an empty string for all other tributaries.

    *loca* is introduced specifically for use related to ONNS application.

    Type: TID or empty-string.

    Range: Please refer to the TID definition in "RTRV-HDR: Retrieve header" (p. 3-2397) description.

    Default: empty string: "". This is displayed as \"\" in output direction.

11. **locz** – Ring Z-node TID

    This parameter specifies the TID of the node at which the service is dropped from the BLSR ring. This parameter is required for the output of tributaries to be used by ONNS on ports of *portClass* = EDG E being members in BLSR/MS-SPRing protection groups. The *locz* parameter value is an empty string for all other tributaries.

    *locz* is introduced specifically for use related to ONNS application.

    Type: TID or empty-string.

    Range: Please refer to the TID definition in the "RTRV-HDR: Retrieve header" (p. 3-2397) description.

    Default: empty string: "". This is displayed as \"\" in output direction.

12. **neppm** – Near-End Path PM Enable

    It indicates whether this performance monitoring feature is enabled or disabled.

    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).

13. **pjepm** – Pointer Justification Event PM Enable

    It indicates whether this performance monitoring feature is enabled or disabled.

    Type: Alphanumeric value set.

    Range:

    - ENABLE
    - DISABLE (default).

14. **pmhpfeses** – Performance Monitoring Path Far-End SES Threshold

This parameter describes the Path Far-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. When the interface standard is changed the current default value is not adapted automatically.

Type: numeric value set.

Range (superset of ranges for SDH and SONET): 1-64000.

Default: 2400.

15. **pmhpneses** – Performance Monitoring Path Near-End SES Threshold

    This parameter describes the Path Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. When the interface standard is changed the current default value is not adapted automatically.

    Type: numeric value set.

    Range (superset of ranges for SDH and SONET): 1-64000.

    Default: 2400.

16. **ptca** – Path TCA Profile Pointer

    Type: Alphanumeric string.

    Range: string with up to 24 characters.

    Default: DEFAULT0.

17. **ptrc** – Path Trace (J1)

    This parameter shows the value of the path trace identifier on the incoming path overhead J1 byte of a non-terminated tributary. The length depends on the value of the parameter *ptrcrfmt*. The status of this value is contained in parameter *ptrcst*. If *ptrcst* indicates NORMAL, then ptrc contains a valid value. If *ptrcst* indicates UNAVAILABLE or AIS, then no valid incoming path trace identifier could be obtained by the system, e.g. due to a signal-fail condition or intra-NE communication problems, and the output parameter ptrc is omitted from the response. For concatenated tributaries the system shall not return this parameter (see detailed behavior below).

    Type: Hexadecimal (each byte is expressed as two hexadecimal digits. An example of a byte is 6D).

    Range:

    - 1 byte for non-specific repeating byte
    - 16 byte: These 16 byte shall consist of 15 byte information and the CRC7 byte
    - 64 bytes: This is a pure byte stream without any restrictions.

18. **ptrcrfmt** – Path Trace Read Format (J1)

    The read format of J1, the incoming path trace (ptrc).

    Type: numeric string.

    Range:

    - 2: for non-specific repeating byte
    - 16: for 16 byte specific string.
    - 64: for 64 byte string.

Default: 2.

19. **ptrcst** – Status of Incoming Path Trace (J1)

    This parameter shows the status of the value of the incoming path trace identifier which is available with parameter ptrc. For concatenated tributaries the system shall not return this parameter (see detailed behavior below).

    Type: Alphanumeric value set.

    Range:

    - NORMAL: ptrc contains a valid value
    - UNAVAILABLE: no valid value for ptrc could be obtained by the system
    - AIS: no valid value for ptrc due to an SF condition.

20. **sdsfmode** – Signal Degrade/Signal Fail Mode

    The degraded state is detected in BURST or POISSON mode.

    Type: Alphanumeric value set.

    Range:

    - BURST (default)
    - POISSON

21. **siglb** – Signal Label

    This parameter shows the value of the signal label on the incoming path overhead C2 byte of a non-terminated VC tributary. The parameter is not reported if the *trailstate* parameter indicates a fail condition, i.e. has the value AIS or UNAVAILABLE. For concatenated tributaries the system shall not return this parameter (see detailed behavior below) .

    Type: Alphanumeric value set.

    Range: 00, 01, …, FE, FF; i.e. two hexadecimal digits.

22. **substr** – Substructured

    This parameter indicates if the tributary is substructured.

    *Substructure for LO cross-connections:*

    A HO tributary, which is sub structured for LO cross-connections, has a HO path termination associated which provides LO tributaries to be used for LO cross-connections.

    The parameter *substr* is set autonomously when LO cross-connections are created or deleted with ENT-CRS or DLT-CRS commands (see also the lower-order cross-connection creation/deletion behavior description for the commands ENT-CRS and DLT-CRS).

    A sub structured HO tributary cannot be used to set up HO cross-connections. The parameter *substr* is set autonomously when the LO substructure is created or deleted using the **ED-SUBS** command.

    *Substructure for conversion cross-connections:*

    A HO tributary, which is sub structured for the LO side of a conversion cross-connection, has a HO path termination associated which provides LO tributaries to be used for conversion cross-connections.

    The parameter *substr* is set autonomously when an AU3/AU4 conversion cross-connection is created.

A HO tributary, which is sub structured for conversion cross-connections, cannot be used to set up HO cross-connections.

Type: Alphanumeric value set.

Range:

- YES: Automatically sub structured for LO cross-connections
- MANSUB: Manually sub structured for LO cross-connections
- CNVSUB: Automatically sub structured for the LO side of conversion cross-connections
- NO (default): Not sub structured, not used for conversion cross-connections

23. **tcamd** – TCA mode

    This parameter shows the modus of the PM thresholding.

    Two thresholding methods are applicable:

    - TR-only (also known as the implicit reset method)
    - TR-RTR (also known as the explicit reset method).

      Type: Alphanumeric value set.

      Range: TR, TRRTR (default).

24. **tmonmd** – Tributary Monitoring Mode

    This parameter indicates the mode of the tributary.

    Type: Alphanumeric value set.

    Range:

    - MON = alarm monitoring is taking place on the port.
    - NMON (default) = alarm monitoring is not occurring on the port.

25. **trailstate** – Trail State (C2)

    It is possible to read the accepted trail value status (C2) of every VC which is terminated/monitored in the system. For concatenated tributaries the system shall not return this parameter (see detailed behavior below).

    Type: Alphanumeric value set.

    Range:

    - NORMAL: for accepted TSL which has valid payload type
    - AIS: for SSF, VC-AIS, dTIM or dUNEQ
    - UNAVAILABLE: for TSL which does not meet the acceptance criteria or no reporting is possible.

    Default: UNAVAILABLE.

26. **tribsdhpn** – Tributary Alarm Severity Assignment Profile

    This parameter points to a tributary ASAP profile name of type PATH for the designated AID.

    Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.

    Range: string with a maximum of 24 characters.

    Default: DEFAULT.

## Detailed behavior description

### Applicability for VC4 and concatenated signals

The command **RTRV-VC3** is also applicable to VC4 tributaries. Even though a VC4 signal is not a concatenated VC3 signal in a strict sense, from a pointer processor viewpoint it can be considered to be comprised of three VC3 signals which have the properties of a concatenated signal. Thus it is not necessary to have a separate RTRV command for VC4.

### Retrieval of concatenated tributaries

It is allowed to retrieve data from concatenated tributaries and the system responds by returning all parameters which are not derived from traffic. The details can be found in the parameter description.

Concatenated tributaries are such tributaries, that are not the leftmost ones in concatenated signals, e.g. if an OC 48 port is provisioned for a fixed traffic of AU4-16c, STS-1 #1 represents the VC4-16c defined and all other STS-1s #2 to #48 do currently not represent valid substructures and thus are concatenated tributaries. The retrievable values e.g. for the STS-1s #2 to #48 are irrelevant for transmission.

Parameters derived from traffic are data like trace identifiers and signal labels which are collected from the actual input signal and thus do not exist for concatenated tributaries.

### Behavior for non-existing entities

If the specified VC3/VC4 tributaries do not exist, the command shall return an empty response. E.g. if an attempt is made, to retrieve VC3/VC4 tributaries on a GbE circuit pack.

## Example input/output

```
RTRV-VC3:LT-UNITE:1-1-#-#-3-1-1:123456;

   LT-UNITE 00-11-27 08:00:00
M  123456 COMPLD
   "1-1-#-#-3-1-1:crslpbkstat=NO,tmonmd=NMON,tribsdhpn=Default,
ptca=Default0,neppm=DISABLE,pmhpneses=30,pmhpfeses=30,degthr=-6,...,
   ptrcrfmt=1,dexcthr=-3,ptrc=00,ptrcst=NORMAL,sdsfmode=POISSON"
;
```

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the RTRV-VC3 command.

## Check CCB against istd for related port

### Validation rule: Check CCB against *istd*

Check wether the CCB fits to *istd* of the related port.

Error code:
`ICNV – Input, Command Not Valid, Interface Standard does not match`.

E.g. DENY, if a command with rr=VC3 is made on a port which is provisioned as *istd* = SONET.

GR-199-CORE (RTRV-*rr*)

# RTRV-VCG: Retrieve virtual concatenation group

The **RTRV-VCG** command retrieves the attributes of a virtual concatenation group.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-VCG***[-modifier]:tid:aid:ctag[:::spec_block];*

## Input parameters

### Command parameters

1. **modifier**
   The modifier specifies the type of the virtual concatenation group of the unit. Implicit, it indicates the transmission rate for which VCG related data is retrieved. The parameter modifier must be given if a virtual concatenation group on a GE10PL1 or ES64U pack is addressed. Otherwise this parameter has to be omitted.
   Type: Alphanumeric value set.
   Range: 1GEPL representing a 1 GE port on the GE10PL1 pack; 10GEPL representing a 10 GE port on the GE10PL1 pack, ES64U representing a VCG port at an ES64U subsystem.
2. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
3. **aid** – Access Identifier
   This parameter specifies the virtual concatenation group (VCG) to be operated on.
   Type: AID.
   Range: VCGAID as defined in AID structure. The values
   - *vall* for Simple_VCGAID and
   - *usall* for Simple_UnivSlotAID
   - *all* for Simple_UnivSlotAID
   - *all* for Simple_ShelfAID and
   - *all* for BayAID

   are accepted.
4. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string

Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows “0” as valid *ctag*, which is an extension to GR-831.

### Spec block parameter

1. **dyn** – Retrieve Dynamic Parameters

   This parameter controls whether dynamic parameters are reported with the command reply or not. It is given only when using any of the wildcard values *usall* or *vall* at the appropriate positions of the input AID. For input AIDs not using *usall* or *vall* this parameter is not allowed. This implies that with such input AIDs the dynamic parameters are always returned.

   The following output parameters of a vcgport port are affected: *mfiv*, *macaddr*, *stmd*, *stpop*, *stpid, stprole*, *vss*, *vvidlsd*.

   Note that not only those parameters have to be returned which are supported by the related Ethernet pack. Not all Ethernet packs support all listed parameters. For details refer to the detailed specification of those output parameters.

   For *modifier* ES64U, the parameter *dyn* is not supported because none of these parameters will be returned.

   Type: Alphanumeric value set.

   Range:

   - YES: Report dynamic parameters in the reply as well
   - NO (default): Do not report dynamic parameters in the reply.

## Output format

If the NE fully complies with the **RTRV-VCG** request, the following normal completion response is returned:

```
sid date time
M  ctag COMPLD
   "aid::spec_block"
      <1 or more of the line above>
   "tribaid:mfiv,MFIV"
    <no such line, if the virtual concatenation mode is disabled, else
     no such line, if no dynamic data are retrieved, else
     no such line, if modifier = ES64U, else
     one or more lines, one for each tribaid belonging to aid>
       ...
       ...
   "aid::spec_block"
      <1 or more of the line above>
   "tribaid:mfiv,MFIV"
    <no such line, if the virtual concatenation mode is disabled, else
     no such line, if no dynamic data are retrieved, else
     no such line, if modifier = ES64U, else
     one or more lines, one for each tribaid belonging to aid>
;
```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Output parameters

### Command parameters

1. **`aid`** – Access Identifier

   This parameter specifies the VCG to be operated on.
   Type: AID.
   Range: VCGAID as defined in AID structure. The values

   - *vall* for Simple_VCGAID and
   - *usall* for Simple_UnivSlotAID
   - *all* for Simple_UnivSlotAID
   - *all* for Simple_ShelfAID and
   - *all* for BayAID

   are excluded.

2. **`tribaid`** – Tributary Access Identifier

   The tributary access identifier specifies a tributary belonging to the virtual concatenation group (VCG) given by the aid above.
   This parameter is not supported if the input parameter *modifier* = ES64U.
   This specification is necessary due to hardware restrictions of the Gauss device. If the parameter *tribaid* is not supported, then the parameter shall be omitted.
   Type: AID.
   Range: VCGNumAID as defined in AID structure. The values

   - *all* for Simple_VCGNumAID,
   - *vall* for Simple_VCGAID,
   - *usall* for Simple_UnivSlotAID
   - *all* for Simple_UnivSlotAID
   - *all* for Simple_ShelfAID and
   - *all* for BayAID

   are excluded.

3. **`mfiv`** – Multiframe Indicator Value

   This parameter reports the differential delay between the tributary addressed by *tribaid* (see above) and the fastest tributary of the VCG. The fastest tributary has the value zero. For each retrieve of a VCG there is a report of *mfiv* for all tributaries belonging to the VCG.
   This parameter is not supported if the input parameter *modifier* = ES64U.
   This specification is necessary due to hardware restrictions of the Gauss device. If the parameter *mfiv* is not supported, then the parameter shall be omitted.
   Type: Alphanumeric value set.

Range:

- 0, 125, 250, 375, …, 511750, 511875 [microseconds]
- NA
- UNAVAILABLE

In fact the reported range for delay is 0 … 255875 microseconds. Other values can only be reported as raw values without a delay calculation between the tributaries. UNAVAILABLE is reported when the accepted MFI contents do not meet the basic acceptance criteria (multiframe alignment not completed), or intra-NE communication with the reporting entity is disrupted. NA (Not Applicable) is reported under defect conditions detected by the Sn[i] termination function or the VC-n is not part of an S-n-Xv group.

**Spec block parameters**

1. **`clientNodeID`** – Client Node IDentifier

   The *clientNodeID* identifies the IP address of a client node attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.

   For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.

   This attribute replaces attribute “uniClientNodeID”, as a more generic name seems reasonable for a possible extension of this attribute to other eport classes in future.

   This parameter is supported by ports of *eportClass* UNI.

   For *modifier* = ES64U, the parameter is visible with default values for retrieval, but it cannot be modified.

   Type: IPv4 format: Four dot separated numeric string

   Range: Each numeric string: 0…255

   Default: 0.0.0.0

2. **`cnprole`** – Customer/Network Port Role

   This parameter specifies whether the addressed port is used as a customer WAN port or a network WAN port.

   This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U.

   If the parameter *cnprole* is not supported, then the parameter is omitted.

   Type: Alphanumeric value set.

   Range: CUSTOMER, for a customer WAN port. NETWORK, for a network WAN port.

   Default: NETWORK.

3. **`dftpri`** – Default User Priority

   This parameter specifies the default user priority acc. the IEEE 802.1Q tagging scheme.

   This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL.

   This parameter is not supported if the input parameter *modifier* = ES64U.

If the parameter *dftpri* is not supported, then the parameter is omitted.

Type: Alphanumeric value set.

Range:

- HIGH
- LOW (default).

4. **dftvlan** – Default VLAN Identifier

   The parameter *dftvlan* specifies the value of the VLAN identifier which is applied to ingressing frames (tagging) . This only applies to frames carrying no VLAN identifier, yet. This parameter is also used to provision the customer tag (CID) to be used in transparent tagging mode.

   This parameter is not supported if the input parameter *modifier* = 1GEPL, or *modifier* = 10GEPL.

   This parameter is not supported if the input parameter *modifier* = ES64U.

   If the parameter *dftvlan* is not supported, then the parameter is omitted.

   Type: Alphanumeric value set.

   Range: 1, 2, 3, … 4092, 4093; UNAVAILABLE (default)

5. **enetpn** – Ethernet Alarm Severity Assignment Profile Name

   This parameter points to an ASAP profile name of type ENET for the designated AID.

   Ethernet port and VCG port have the same ASAP profile named ENET.

   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.

   Range: 1 … 24 characters length.

   Default: DEFAULT.

6. **enettca** – Ethernet TCA Profile Name

   This parameter specifies the name of the threshold crossing alert (TCA) profile used for the VCG.

   This parameter is not supported if the input parameter *modifier* = ES64U.

   If the parameter *enettca* is not supported, then the parameter is omitted.

   Type: Alphanumeric string.

   Range: 1 … 24 characters length.

   Default: DEFAULT0.

7. **eportClass** – Ethernet Port Class

   This identifies the Ethernet port class of the AID. *eportClass* is used to specify Ethernet ports for use by NN application.

   For *modifier* = ES64U, the parameter is visible with default values for retrieval, but it cannot be modified.

   Type: Alphanumeric value set.

   Range: Depends on the *modifier*:

   - if *modifier* is missing or is 1GEPL, then the value range is: TRADITIONAL, EDGE, UNI
   - if *modifier* is 10GEPL, then the value range is: TRADITIONAL, EDGE
   - if *modifier* is ES64U, then the value range is: TRADITIONAL

Default: Depends on system parameters Cross Connect Setup (*xcsetup*) and Port Class Default (*portclassdefault*):

- if *xcsetup* is TRADITIONAL, then the default value is TRADITIONAL
- if *xcsetup* is SWISS, then the value of *portclassdefault* is used as default value.
- if *modifier* is ES64U, then the default value is TRADITIONAL.

8. **`eportControl`** – Ethernet Port Control (Ethernet Port Administrative Mode)

   This identifies the administrative mode of Ethernet ports of *eportlass* = EDGE ot UNI. For Ethernet ports of other Ethernet port class this parameter is not relevant. *eportControl* is introduced specifically for use by NN application.

   For *modifier* = ES64U, the parameter is visible with default values for retrieval, but it cannot be modified.

   Type: Alphanumeric value set.

   Range: NORMAL (default), MAINT, LOCKOUT .

9. **`htmr`** – Hold-Off Time

   The parameter *htmr* specifies the hold off time for the LCAS protection. If a tributary is configured to take part on transmission for the VCG and it goes to state faulty then this tributary is taken out of transmission by LCAS after the hold off time. This time is configured on group level, i.e. all tributaries have the same value for hold-off time. This parameter only affects NE behavior if *lcasmd* = ENABLE.

   For *modifier* = ES64U, the parameter is visible with default values for retrieval, but it cannot be modified.

   Type: numeric value set.

   Range: 0 (default), 100, 200, …, 9900, 10000 [milliseconds].

10. **`inputsig`** – Tributary Input Signal Rate List

    This parameter reports the tributary structure of the VCG port in input direction. This will implicitly give the maximum capacity of the VCG port, too. The tributary structure depends on interface standard specified for this VCG by istd . For definition of *istd* refer to "RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3052) Output parameters.

    If the input parameter *modifier* = 1GEPL or *modifier* = 10GEPL, then the possible tributary structures depends on interface standard specified for this VCG by istd and on the virtual concatenation mode *vcat*. For definitions of *istd* and *vcat* refer to RTRV-VCG Output Parameters.

    Type: numeric string of the form NX

    - N specifies the count of container type X
    - X specifies the container type (or envelope).

    Range:

    - Values: N = 7, X = 4; Modifier=omitted; Interface Standard=SDH; Virtual Concatenation=not applicable; Represented Signal Structure: 7 times VC4
    - Values: N = 7, X = 4; Modifier=1GEPL; Interface Standard=SDH; Virtual Concatenation=ENABLE; Represented Signal Structure: 7 times VC4

- Values: N = 64, X = 4; Modifier=10GEPL; Interface Standard=SDH; Virtual Concatenation=ENABLE; Represented Signal Structure: 64 times VC4
- Values: N = 1, X = c64; Modifier=10GEPL; Interface Standard=SDH; Virtual Concatenation=DISABLE; Represented Signal Structure: 1 times VC4-64C
- Values: N = 21, X = 1; Modifier=omitted; Interface Standard=SONET; Virtual Concatenation=not applicable; Represented Signal Structure: 21 times STS-1
- Values: N = 21, X = 1; Modifier=1GEPL; Interface Standard=SONET; Virtual Concatenation=ENABLE; Represented Signal Structure: 21 times STS-1
- Values: N = 7, X = 3; Modifier=1GEPL; Interface Standard=SONET; Virtual Concatenation=ENABLE; Represented Signal Structure: 7 times STS-3C
- Values: N = 192, X = 1; Modifier=10GEPL; Interface Standard=SONET; Virtual Concatenation=ENABLE; Represented Signal Structure: 921 times STS-1
- Values: N = 64, X = 3; Modifier=10GEPL; Interface Standard=SONET; Virtual Concatenation=ENABLE; Represented Signal Structure: 64 times STS-3C
- Values: N = 1, X = 192; Modifier=10GEPL; Interface Standard=SONET; Virtual Concatenation=DISABLE; Represented Signal Structure: 1 times STS-192C

For *modifier* = ES64U, the value combination of "N" and "X" is done according to the following rules:

- *istd* = SONET
- X = 1 for STS-1
- N $\in$ {1, 2, …, 192}

For *modifier* = ES64U, the parameter *inputsig* is visible for retrieval, but it cannot be modified once the VCG is established.

Default:

- modifier = omitted, Interface Standard=SDH, Default Value = 74
- modifier = 1GEPL, Interface Standard=SDH, Default Value = 74
- modifier = 10GEPL, Interface Standard=SDH, Default Value = 644
- modifier = omitted, Interface Standard=SONET, Default Value = 211
- modifier = 1GEPL, Interface Standard=SONET, Default Value = 211
- modifier = 10GEPL, Interface Standard=SONET, Default Value = 1921
- modifier = ES64U, Interface Standard=SONET, Default Value not applicable

Default in case of System Default *portClass* EDGE: In case of the *portclassdefault* EDGE, i.e. VCGs are created with *eportClass* EDGE, the default values for *unequiposig* is as in table above with the following exception: For *modifier* = GE10PL and *Interface Standard* = SONET, the default value is 643.

For *modifier* = ES64U, this parameter will always be defined by the **ENT-VCG** command.

11. **istd** – Interface Standard

    This parameter specifies the interface standard of this VCG. This value is applied for both input and output direction.

For *modifier* 1GEPL, 10GEPL, or ES64U the parameter is visible with default values for retrieval, but it cannot be modified.

Type: Alphanumeric value set.

Range:

- SDH
- SONET.

Default:

- *modifier*: 1GEPL, 10GEPL, or ES64U: The value is derived from the circuit pack parameter *istd*
- no *modifier*: As derived from parameter *istddflt* specified at "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2381).

Restriction: The parameter *istd* is only allowed if *modifier* is omitted.

12. **`lcasmd`** – LCAS Mode

    This parameter specifies the operation mode of the Link Capacity Adjustment Scheme for this VCG. This value is bidirectional.

    For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.

    Type: Alphanumeric value set.

    Range:

    - DISABLE
    - ENABLE

    Default:

    - *modifier* = ES64U: DISABLE
    - other or no *modifier*: ENABLE

13. **`localLPID`** – Local Logical Port IDentity

    The *localLPID* provides a unique logical identification of a single port with an *eportClass* value used by the ONNS application and supporting this specific parameter.

    This identification is from the local NEs point-of-view.

    Depending on the *eportClass* value of the port the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like e.g. *networkTNAAddress*.

    For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.

    This attribute replaces attribute "uniNetworkLPID", as this attribute will not be exclusively valid any more for *eportClass* UNI only and thus a more generic name seems reasonable.

    This parameter is supported by ports of *eportClass* UNI.

    The parameter *localLPID* is used by ONNS for switching network connections on SONET/SDH layer.

    This parameter is supported by ports of *eportClass* UNI.

    This parameter is supported by ports of *eportClass* EDGE.

For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.

Type: numeric value set.

Range: 0 to 4294967295.

Default: 0.

14. **`localLPIDVCAT`** – Local Logical Port Identity on VCAT layer

    The *localLPIDVCAT* provides a unique logical identification of a single VCG port with an *eportClass* value used by the ONNS application and supporting this specific parameter. This identification is from the local NEs point-of-view.

    Depending on the *eportClass* value of the port, the uniqueness may be defined as relative to the whole node or relative to the value of any other ONNS related port parameter like, for example, *networkTNAAddressVCAT*.

    For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, that means it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.

    The parameter *localLPIDVCAT* is used by ONNS for switching network connections on VCAT layer.

    This parameter is supported by ports of *eportClass* UNI.

    This parameter is supported by ports of *eportClass* EDGE.

    For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.

    Type: numeric value set.

    Range: 0 to 4294967295.

    Default: 0.

15. **`macaddr`** – Port MAC Address

    This parameter specifies the MAC address of the WAN port.

    This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U.

    If the parameter is not supported, is shall be omitted.

    Type: Alphanumeric value set.

    Range: 000000000000 to FFFFFFFFFFFF or UNAVAILABLE if the value can not be retrieved.

16. **`networkTNAType`** – Network TNA Type

    The *networkTNAType* identifies the type of the Network TNA Address attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, that means, it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkTNAType”, as this attribute will not be exclusively valid any more for *eportClass* UNI only and thus a more generic name seems reasonable.

    The parameter *networkTNAType* is used by ONNS for switching network connections on SONET/SDH layer.

    This parameter is supported by ports of *eportClass* UNI.

    This parameter is supported by ports of *eportClass* EDGE.

For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.

Type: Alphanumeric value set.

Range: IPV4, IPV6, or NSAP.

Default: IPV4.

17. **networkTNATypeVCAT** – Network TNA Type on VCAT level

    The *networkTNATypeVCAT* identifies the type of the Network TNA Address on VCAT level attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.

    For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, that means, it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.

    The parameter *networkTNATypeVCAT* is used by ONNS for switching network connections on VCAT layer.

    This parameter is supported by ports of eportClass UNI.

    This parameter is supported by ports of eportClass EDGE.

    For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.

    Type: Alphanumeric value set.

    Range: IPV4, IPV6, or NSAP.

    Default: IPV4.

18. **networkTNAAddress** – Network TNA Address

    The *networkTNAAddress* identifies the Network TNA Address attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.

    The content depends on the given NetworkTNAType. For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, i.e. it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.

    This attribute replaces attribute “uniNetworkTNAAddress”, as this attribute will not be exclusively valid any more for *eportClass* UNI only and thus a more generic name seems reasonable.

    The parameter *networkTNAAddress* is used by ONNS for switching network connections on SONET/SDH layer.

    This parameter is supported by ports of *eportClass* UNI.

    This parameter is supported by ports of *eportClass* EDGE.

    For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.

    Type:

    networkTNAType= IPV4: Four dot separated numeric string (represents 4 Bytes)

    networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 Bytes)

    networkTNAType= NSAP: Hexadecimal number (represents 20 Bytes)

    Range:

    IPV4: Each numeric string: 0…255

    IPV6: Each hexadecimal number: 0000…FFFF

    NSAP: Hexadecimal number:

00000000000000000000000000000000000000000 …
FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF
Examples:
IPV4: 129.12.3.178
IPV6: AE12-0-0-12-EDFB-89AB-2254-8A2E
NSAP: FFAABBCCDD213141515A6A7EB2D433221100AAFF
Default:
IPV4: 0.0.0.0
IPV6: 0-0-0-0-0-0-0-0
NSAP: 00000000000000000000000000000000000000000

19. **networkTNAAddressVCAT** – Network TNA Address on VCAT level

    The *networkTNAAddressVCAT* identifies the Network TNA Address attached to a port with an *eportClass* value used by the ONNS application and supporting this specific parameter.

    The content depends on the given *NetworkTNATypeVCAT*. For all ports with *eportClass* values not supporting this parameter, the parameter is not relevant, that means, it can be retrieved and changed, but will internally not be evaluated until *eportClass* is set to a value supporting it.

    The parameter *networkTNAAddressVCAT* is used by ONNS for switching network connections on VCAT layer.

    This parameter is supported by ports of *eportClass* UNI.

    This parameter is supported by ports of *eportClass* EDGE.

    For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.

    Type:

    networkTNAType= IPV4: Four dot separated numeric string (represents 4 bytes)

    networkTNAType= IPV6: Eight dash separated hexadecimal number (represents 16 bytes)

    networkTNAType= NSAP: Hexadecimal number (represents 20 bytes)

    Range:

    IPV4: Each numeric string: 0…255

    IPV6: Each hexadecimal number: 0000…FFFF

    NSAP: Hexadecimal number:

    00000000000000000000000000000000000000000 …

    FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF

    Default:

    IPV4: 0.0.0.0

    IPV6: 0-0-0-0-0-0-0-0

    NSAP: 00000000000000000000000000000000000000000

20. **plcrthr** – Threshold for Partial Loss of Capacity (Receive)

    The parameter *plcrthr* specifies the acceptable limit of valid VCG members in receive direction (refer to the *outmbs* parameter of all related VCGTRIB entities) for which the PLCR alarm will not yet be raised. The PLCR alarm will be raised if the actual number of those VCG members is between [1 … (value of the *plcrthr* parameter – 1)] (if *plcrthr* ≥ 2). The PLCR alarm shall never be raised if *plcrthr* is set to 1.

The PLCR alarm will be cleared if the actual number of those VCG members is equal to or more than the value of the *plcrthr* parameter (or if the number of those VCG members is 0 – in this case the TLCR alarm will be raised instead). This parameter is not supported if the input parameter *modifier* is omitted. If the parameter *plcrthr* is not supported, then the parameter is omitted.

For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.

Type: numeric value set.

Range: 1, 2, 3, …, 192

Default:

| Modifier | Input signal structure | Default value |
|---|---|---|
| 1GEPL | 74 | 7 |
| 1GEPL | 211 | 21 |
| 10GEPL | 644, 1c64 | 64 |
| 10GEPL | 1921, 1192 | 192 |
| ES64U | n × 1 | n |

21. **`plctthr`** – Threshold for Partial Loss of Capacity (Transmit)

    The parameter *plctthr* specifies the acceptable limit of valid VCG members in transmit direction (refer to the *inmbs* parameter of all related VCGTRIB entities) for which the PLCT alarm will not yet be raised. The PLCT alarm will be raised if the actual number of those VCG members is between [1 … (value of the *plctthr* parameter – 1)] (if *plctthr* ≥ 2). The PLCR alarm shall never be raised if *plctthr* is set to 1.

    The PLCT alarm will be cleared if the actual number of those VCG members is equal to or more than the value of the *plctthr* parameter (or if the number of those VCG members is 0 – in this case the TLCT alarm will be raised instead). This parameter is not supported if the input parameter *modifier* is omitted. If the parameter *plctthr* is not supported, then the parameter is omitted.

    For *modifier* = ES64U, the parameter is visible for retrieval, but it cannot be modified.

    Type: numeric value set.

    Range: 1, 2, 3, …, 192

    Default:

| Modifier | Input signal structure | Default value |
|---|---|---|
| 1GEPL | 74 | 7 |
| 1GEPL | 211 | 21 |
| 10GEPL | 644, 1c64 | 64 |
| 10GEPL | 1921, 1192 | 192 |
| ES64U | n × 1 | n |

22. **`stdis`** – Spanning Tree Protocol Disable

This parameter allows to enable or disable the Spanning Tree Protocol for the given port. If the input parameter modifier is omitted, then this parameter is supported but applicable only if the port is a network port (cnprole = NETWORK). For customer ports (cnprole = CUSTOMER) this parameter has no effect. However, changes are stored in the database.

This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U. If the parameter *stdis* is not supported, then the parameter is omitted.

Type: Alphanumeric value set.

Range: DISABLE – STP is disabled, that means, the port is not used to build the spanning tree. ENABLE – STP is enabled, that means, the port is used to build the spanning tree.

Default: ENABLE.

As VCGs are by default network ports the default value is to enable STP.

23. **`stmd`** – Spanning Tree Protocol Mode

    This parameter returns whether the normal STP according to IEEE802.1D or the rapid spanning tree protocol rSTP according to IEEE802.1w is used on the given port.

    This parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER), this parameter has no effect. However, changes are stored in the database.

    If the input parameter *modifier* = 1GE, then this parameter is applicable meaningful only if the port is a network port (*cnprole* = NETWORK). For customer ports (cnprole = CUSTOMER) this parameter has no effect. However, changes are stored in the database.

    This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U. If the parameter *stmd* is not supported, then the parameter is omitted.

    Type: Alphanumeric value set.

    Range:

    - 802.1D, for the normal ST
    - 802.1W, for rSTP
    - UNAVAILABLE if the value cannot be retrieved.

    Default: There is no default value.

24. **`stpcost`** – Spanning Tree Path Cost

    The parameter *stpcost* specifies the STP-related cost of the path egressing the given port.

    If the input parameter *modifier* is omitted, then this parameter is supported but applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.

    This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U.

    If the parameter *stpcost* is not supported, then the parameter is omitted.

    Type: Integer.

    Range: 1 to 200000000.

    Default: 20000.

The default value depends on the provisioned VCG size. As currently only a fix size of 7 VC4s or 21 STS1s corresponding to approximately 1 Gbit is supported, the default value is as shown above.

25. **stpid** – Spanning Tree Port Identifier

    The port identifier is a 16 bit parameter consisting of the port priority (high-order bits) and the port number (low-order bits). The port number is assigned by the system to a port and is not provisionable.

    This parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.

    This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U. If the parameter *stpid* is not supported, then the parameter is omitted.

    Type: Alphanumeric value set.

    Range: 0 to 65535 and UNAVAILABLE if the value can not be retrieved.

26. **stpop** – Spanning Tree Protocol Operational

    This parameter indicates whether the Spanning Tree Protocol is operational or not.

    This parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.

    This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U. If the parameter *stpop* is not supported, then the parameter is omitted.

    Type: Alphanumeric value set.

    Range: YES, operational; NO, not operational, UNAVAILABLE if the value can not be retrieved.

27. **stpp** – Spanning Tree Port Priority

    The parameter *stpp* specifies the priority of the given port for the Spanning Tree Protocol.

    This parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.

    This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U. If the parameter *stpp* is not supported, then the parameter is omitted.

    Type: Integer.

    Range: 0 to 255.

    Default: 128.

28. **stprole** – Spanning Tree Protocol Role

    The parameter *stprole* shall report the role of the given port in rSTP.

    This parameter is applicable only if the port is a network port (*cnprole* = NETWORK) and operates in rSTP mode (*stmd* = 802.1W). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.

    This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U. If the parameter *stprole* is not supported, then the parameter is omitted.

    Type: Alphanumeric value set.

Range:

- ROOT, root
- DESG, designated
- ALT, alternative
- BACKUP, backup
- UNAVAILABLE if the value can not be retrieved.

29. **tcamd** – TCA Mode

    This parameter shows the modus of the PM thresholding.

    Two thresholding methods are applicable: TR-only, (also known as the implicit reset method). TR-RTR, (also known as the explicit reset method).

    This parameter is not supported if the input parameter *modifier* = ES64U. If the parameter *tcamd* is not supported, then the parameter is omitted.

    Type: Alphanumeric value set.

    Range: TR, TRRTR.

    Default: TRRTR in SDH mode; TR in SONET mode.

30. **unequiposig** – Unequipped Tributary Output Signal Rate List

    The parameter *unequiposig* specifies the tributary structure and the capacity of the VCG port in output direction. As long as there is no cross-connection applied the specified tributaries are occupied by an unequipped signal. The parameter will implicitly give the maximum capacity of the VCG port, too.

    If the input parameter *modifier* is omitted, then the tributary structure depends on interface standard specified for this VCG by *istd* . For the definition of *istd* refer to the "Output parameters" section of "RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3052).

    If the input parameter *modifier* = 1GEPL or *modifier* = 10GEPL, then the range of possible tributary structures depends on interface standard specified for this VCG by *istd* and on the virtual concatenation mode *vcat*. For definitions of *istd* and *vcat* refer to the "Output parameters" section of "RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3052). The signal will be immediately terminated on the unit. So no unequipped signal is visible to the outside world.

    If the input parameter: *modifier* = ES64U, then the parameter *unequiposig* is set automatically according to the value of the *inputsig* parameter.

    For *modifier* = ES64U, the parameter *unequiposig* is only retrievable and cannot be changed because it follows always the value of the *inputsig* parameter.

    Type: numeric string of the form *NX*

    - *N* specifies the count of container type *X*
    - *X* specifies the container type (or envelope).

    Range:

| Values | Modifier | Interface standard | Virtual concatenation mode | Represented signal structure |
|---|---|---|---|---|
| *N* = 7, *X* = 4 | omitted | SDH | not applicable | 7 × VC4 |

| Values | Modifier | Interface standard | Virtual concatenation mode | Represented signal structure |
|---|---|---|---|---|
| *N* = 7, *X* = 4 | 1GEPL | SDH | ENABLE | 7 × VC4 |
| *N* = 64, *X* = 4 | 10GEPL | SDH | ENABLE | 64 × VC4 |
| *N* = 1, *X* = c64 | 10GEPL | SDH | DISABLE | 1 × VC4-64C |
| *N* = 21, *X* = 1 | omitted | SONET | not applicable | 21 × STS-1 |
| *N* = 21, *X* = 1 | 1GEPL | SONET | ENABLE | 21 × STS-1 |
| *N* = 7, *X* = 3 | 1GEPL | SONET | ENABLE | 7 × STS-3C |
| *N* = 192, *X* = 1 | 10GEPL | SONET | ENABLE | 192 × STS-1 |
| *N* = 64, *X* = 3 | 10GEPL | SONET | ENABLE | 64 × STS-3C |
| *N* = 1, *X* = 192 | 10GEPL | SONET | DISABLE | 1 × STS-192C |

For *modifier* = ES64U, the same value set is applicable as for the parameter *inputsig*.
Default:

| Modifier | Interface Standard | Default Value |
|---|---|---|
| omitted | SDH | 74 |
| 1GEPL | SDH | 74 |
| 10GEPL | SDH | 644 |
| omitted | SONET | 211 |
| 1GEPL | SONET | 211 |
| 10GEPL | SONET | 1921 |
| ES64U | SONET | not applicable |

Default in case of System Default *portClass* EDGE: In case of the *portclassdefault* EDGE, that means, VCGs are created with *eportClass* EDGE, the default values for *unequiposig* is as in table above with the following exception:
For *modifier* = GE10PL and *Interface Standard* = SONET, the default value is 643.

31. **`vcat`** – Virtual Concatenation

    The parameter *vcat* specifies whether the Ethernet signal is mapped to a number of virtually concatenated tributaries (value = ENABLE) or into a contiguously concatenated tributaries (value = DISABLE). In the latter case, LCAS related parameters become insignificant (values set to default, values cannot be changed). This parameter is not supported if the input parameter *modifier* is omitted. If the parameter *vcat* is not supported, then the parameter is omitted.
    Type: Alphanumeric value set.
    Range:

    - For *modifier* = ES64U: ENABLE.
    - Otherwise: ENABLE, DISABLE.

For *modifier* = ES64U, the parameter *vcat* is visible for retrieval, but cannot be modified once the VCG is established.

Default: Enable.

32. **vmode** – VCG Monitoring Mode

    the parameter *vmode* specifies the monitoring mode for VCG. Alarms for this port will be reported if in mode MON otherwise not. There is no automatic mode.

    Type: Alphanumeric value set.

    Range:

    - MON, for monitored
    - NMON (default), for not monitored.

33. **vpm** – VCG Performance Monitoring

    The parameter *vpm* specifies whether the performance monitoring is enabled or disabled for this port.

    This parameter is not supported if the input parameter *modifier* = . If the parameter *vpm* is not supported, then the parameter is omitted.

    Type: Alphanumeric value set.

    Range:

    - DISABLE (default)
    - ENABLE.

34. **vrtswid** – Virtual Switch Identifier

    This parameter identifies the instance of the virtual switch.

    This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U. If the parameter *vrtswid* is not supported, then the parameter is omitted.

    Type: Integer.

    Range: 1 – Currently this is the only allowed value

35. **vss** – Spanning Tree Status

    This parameter returns the status of the spanning tree protocol for the given port.

    This parameter is applicable only if the port is a network port (*cnprole* = NETWORK ). For customer ports (*cnprole* = CUSTOMER), this parameter has no effect. However, changes are stored in the database.

    If the input parameter *modifier* = 1GE, then this parameter is applicable only if the port is a network port (*cnprole* = NETWORK). For customer ports (*cnprole* = CUSTOMER) this parameter has no effect. However, changes are stored in the database.

    This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U.

    If the parameter *vss* is not supported, then the parameter is omitted.

    Type: Alphanumeric value set.

    Range:

    - FWG, Forwarding
    - LRG, Learning

- LIS, Listening (IEEE8102.D/STP only)
- BLK, Blocking (IEEE8102.D/STP only)
- DISF, Disabled due to a failure (IEEE8102.D/STP only)
- DISA, Disabled via provisioning
- BRK, Broken (IEEE8102.w/rSTP only)
- DCD, Discarding (IEEE8102.w/rSTP only)
- UNAVAILABLE if the value can not be retrieved.

36. **vvidls** – Valid VLAN Identifier List (static)

    This parameter specifies a list of all static VLAN identifiers allowed for this port. The list is ampersand grouped (& and &&). The list is packed by the NE and the management systems as good as possible by using '&' and '&&' . The vlan identifier of an incoming frame must be a member of this static VLAN Id list or the dynamic VLAN Id list *vvidlsd*. Frames tagged by a vlan identifier not member of these lists will be discarded. The port VLAN identifier (refer to parameter dftvlan of RTRV-EPORT Output Parameters) is not part of this list. This parameter is also used in transparent tagging mode to specify the list of valid customer tags (CIDs) for network ports (*cnprole* = NETWORK).

    This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U. If the parameter *vvidls* is not supported, then the parameter is omitted.

    Type: Alphanumeric string and the character '&'.

    Range:

    - Value of each single member (valid VLAN identifier) in the list 1, 2, …, 4092, 4093
    - In case the list has no members (empty list) –1.

    Default: –1.

37. **vvidlsd** – Valid VLAN Identifier List (dynamic)

    This parameter gives the list of all dynamic VLAN identifiers allowed for this port as gathered autonomously via GVRP. The list is ampersand grouped (& and &&). The vlan identifier of an incoming frame must be a member of this dynamic VLAN Id list or the static VLAN Id list vvidls. Frames tagged by a vlan identifier not member of these lists will be discarded. This parameter is also used in transparent tagging mode to report the list of valid customer tags (CIDs) for network ports (*cnprole* = NETWORK) collected by GVRP.

    This parameter is not supported if the input parameter *modifier* = 1GEPL, 10GEPL, or ES64U.

    Ths parameter is reported only if

    - the virtual switch entity exists (i.e. the VLAN tagging mode *vlantagmd* of the slot the addressed EPort belongs to is set to 802.1TAG) AND
    - GVRP is enabled on the virtual switch (*gvrpmode* = ENABLED)
    - the port is a NETWORK port (*cnprole* = NETWORK).

    Type: Alphanumeric string and the character “&”.

Range:

- Value of each single member (valid VLAN identifier) in the list 1, 2, …, 4092, 4093
- In case the list has no members (empty list) –1.

If the value can not be retrieved: UNAVAILABLE

Default: There is no default value.

38. **`wtr`** – Wait To Restore Time

    The parameter *wtr* specifies the wait to restore time for the LCAS protection. If a tributary is configured to take part on transmission for the VCG and it recovers from a faulty state then this tributary is taken in again to transmission by LCAS after the wait-to-restore time. This time is configured on group level, i.e. all tributaries have the same value for the wait-to-restore time. This parameter only affects NE behavior if *lcasmd* = ENABLED.

    For *modifier* = ES64U, the parameter is visible with default values for retrieval, but cannot be modified.

    Type: Alphanumeric value set.

    Range: 0, 1, 2, …, 59, 60 [minutes].

    Default: 0.

### Detailed behavior description

The **`RTRV-VCG`** does not generate a **`REPT DBCHG`** message. The command retrieves all VCG parameters as described in section Output parameters.

The values of the following parameters are directly requested form the hardware:

- mfiv
- macaddr
- stmd
- stpop
- stpid
- stprole
- vss
- vvidlsd.

### Example input/output

Example of a VCG retrieval on a GE1 pack working in switched mode:

```
RTRV-VCG:UNITE-NE:1-1-#-#-2-v3:123456;

   UNITE-NE 08-03-28 09:05:00
M 123456 COMPLD
   "1-1-#-#-02-v3:cnprole=NETWORK,dftpri=LOW,dftvlan=UNAVAILABLE,
   enetpn=DEFAULT,enettca=DEFAULT0,eportClass=TRADITIONAL,eportControl=NORMAL,
   htmr=0,inputsig=74,istd=SDH,lcasmd=ENABLE,macaddr=112233445566,
```

```
   stdis=ENABLE,stmd=802.1W,stpcost=20000,stpid=262,stpp=128,stpop=YES,
   stprole=DESG,tcamd=TRRTR,unequiposig=74,vmode=NMON,vpm=DISABLE,vrtswid=1,
   vss=FWG,vvidls=-1,vvidlsd=1&24,wtr=0,networkTNAType=IPV4,

;
```

Example of a VCG retrieval related to an UNI port on a GE10PL1 pack:

```
RTRV-VCG-1GE:UNITE-NE:1-1-#-#-39-v1:123456;

   UNITE-NE 08-03-28 09:05:00
M 123456 COMPLD
   "1-1-#-#-39-v1:enetpn=DEFAULT,enettca=DEFAULT0,eportClass=UNI,\
    eportControl=NORMAL,htmr=0,inputsig=211,istd=SONET,lcasmd=ENABLE,\
    plcrthr=21,plctthr=21,tcamd=TR,unequiposig=211,vcat=ENABLE,vmode=NMON,\
    vpm=DISABLE,wtr=0,networkTNAType=IPV4,networkTNAAddress=0.0.0.0,\
    localLPID=0,clientNodeID=12.1.31.11,networkTNATypeVCAT=IPV4,\
    networkTNAAddressVCAT=111.121.23.6,localLPIDVCAT=12"
   "1-1-#-#-39-v1-1:2000,MFIV"
   .
   . for all 21 VCG Tributaries belonging to the VCG
   .
   "1-1-#-#-39-v1-21:8000,MFIV"
;
```

Example of a VCG retrieval related to a 1 GE interface on a GE10PL1 pack (virtual concatenation mode enabled):

```
RTRV-VCG-1GE:UNITE-NE:1-1-#-#-39-v1:123456;

   UNITE-NE 08-03-28 09:05:00
M 123456 COMPLD
   "1-1-#-#-39-v1:enetpn=DEFAULT,enettca=DEFAULT0,eportClass=TRADITIONAL,\
    eportControl=NORMAL,htmr=0,inputsig=211,istd=SONET,lcasmd=ENABLE,\
    plcrthr=21,plctthr=21,tcamd=TR,unequiposig=211,vcat=ENABLE,vmode=NMON,
    vpm=DISABLE,wtr=0,networkTNAType=IPV4,networkTNAAddress=0.0.0.0,\
    clientNodeID=0.0.0.0,networkTNATypeVCAT=IPV4,localLPID=0,\
    networkTNAAddressVCAT=0.0.0.0,localLPIDVCAT=0"
   "1-1-#-#-39-v1-1:2000,MFIV"
   .
   . for all 21 VCG Tributaries belonging to the VCG
   .
   "1-1-#-#-39-v1-21:8000,MFIV"
;
```

Example of a VCG retrieval related to a 10 GE interface on a GE10PL1 pack (virtual concatenation mode disabled):

```
RTRV-VCG-10GEPL:LT-UNITE:1-1-#-#-39-v9:123456;

   LT-UNITE 01-03-20 09:05:00
M 123456 COMPLD
   "1-1-#-#-39-v9:enetpn=DEFAULT,enettca=DEFAULT0,eportClass=TRADITIONAL,\
    eportControl=NORMAL,htmr=0,inputsig=1c64,istd=SDH,lcasmd=ENABLE,\
```

```
    plcrthr=64,plctthr=64,tcamd=TRRTR,unequiposig=1c64,vcat=DISABLE,\
    vmode=NMON,vpm=DISABLE,wtr=0"
;
```

Example of a VCG retrieval related to an ES64U pack:

```
RTRV-VCG-ES64U:UNITE-NE:1-1-#-#-35-v1:123456;

   UNITE-NE 08-03-28 09:05:00
M 123456 COMPLD
   "1-1-#-#-35-v1: enetpn=DEFAULT,eportClass=TRADITIONAL,\
    eportControl=NORMAL,htmr=0,inputsig=211,istd=SONET,lcasmd=DISABLE,\
    plcrthr=21,plctthr=21,unequiposig=211,clientNodeID=0.0.0.0,\
    vcat=ENABLE,vmode=NMON,wtr=0,networkTNAType=IPV4,\
    networkTNAAddress=0.0.0.0,localLPID=0,networkTNATypeVCAT=IPV4,\
    networkTNAAddressVCAT=0.0.0.0,localLPIDVCAT=0"
;
```

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-VCG** command.

**Validation rule: Command only allowed for VCG on GE*n* or ES64U circuit packs**

If the command is not applied to a VCG on a GE*n* or ES64U pack, then the command is denied.

Error code: `IENE – Input, Entity Not Exists`

**Validation rule: *modifier* mandatory for the GE10PL1 and ES64U circuit pack**

The system shall verify that the modifier parameter is provided by the command if the related slot has been successfully provisioned with a GE10PL1 or ES64U circuit pack.

Error code:
`IDNC – Input, Data Not Consistent, modifier is required for this circuit pack type`

**Validation rule: *modifier* consistent with given port-rate**

The system shall verify that a given modifier parameter is consistent with the rate of the port (given by the input aid parameter). Refer to the Range definition of the input parameter modifier of the **RTRV-VCG** command for applicable combinations.

Error code:
`IDNC – Input, Data Not Consistent, modifier is inconsistent with existing port rate`

**Related TL1 messages**

- "DLT-VCG – Enter virtual concatenation group" (p. 3-274)
- "ED-VCG: Edit virtual concatenation group" (p. 3-1349)
- "ENT-VCG – Enter virtual concatenation group" (p. 3-1965)

# RTRV-VCG-TRANS: Retrieve virtual concatenation group transparent

The **RTRV-VCG-TRANS** command retrieves the attributes of a virtual concatenation group, used for fully transparent applications.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes.

## Input format

Command syntax: **RTRV-VCG-TRANS***:tid:aid:ctag[:::spec_block];*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **aid** – Access Identifier
   This parameter specifies the virtual concatenation group (VCG) to be operated on.
   Type: AID.
   Range: VCGAID as defined in AID structure. The values
   - *vall* for Simple_VCGAID and
   - *usall* for Simple_UnivSlotAID

   are accepted.
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

### Spec block parameter

1. **dyn** – Retrieve Dynamic Parameters
   This parameter controls whether dynamic parameters are reported with the command reply or not. It is given only when using any of the wildcard values usall or vall at the appropriate positions of the input AID. For input AIDs not using usall or vall this parameter is not considered. This implies that with such input AIDs the dynamic parameters are always returned.
   The following output parameters of a vcgport port are affected: *mfiv*, *rplt*.

Type: Alphanumeric value set.
Range:

- YES: Report dynamic parameters in the reply as well
- NO (default): Do not report dynamic parameters in the reply.

## Output format

If the NE fully complies with the RTRV-VCG request, the following normal completion response is returned:

```
sid date time
M  ctag COMPLD
   "aid::spec_block"
      <1 or more of the line above>
   "tribaid:mfiv,MFIV"
    <no such line, if the virtual concatenation mode is disabled, else
     no such line, if no dynamic data are retrieved, else
     one or more lines, one for each tribaid belonging to aid>
       ...
       ...
   "aid::spec_block"
      <1 or more of the line above>
   "tribaid:mfiv,MFIV"
    <no such line, if the virtual concatenation mode is disabled, else
     no such line, if no dynamic data are retrieved, else
     one or more lines, one for each tribaid belonging to aid>
;
```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2397).

## Output parameters

### Command parameters

1. **aid** – Access Identifier
   This parameter specifies the VCG to be operated on.
   Type: AID.
   Range: VCGAID as defined in AID structure with the exception of the value *vall*.
2. **tribaid** – Tributary Access Identifier
   The tributary access identifier specifies a tributary belonging to the virtual concatenation group (VCG) given by the aid above.
   Type: AID.
   Range: VCGNumAID as defined in AID structure with the exception of the value *all*.
3. **mfiv** – Multiframe Indicator Value

This parameter reports the differential delay between the tributary addressed by *tribaid* (see above) and the fastest tributary of the VCG. The fastest tributary has the value zero. For each retrieve of a VCG there is a report of *mfiv* for all tributaries belonging to the VCG.

Type: Alphanumeric value set.

Range:

- 0, 125, 250, 375, …, 511750, 511875 [microseconds]
- NA
- UNAVAILABLE

In fact the reported range for delay is 0 … 255875 microseconds. Other values can only be reported as raw values without a delay calculation between the tributaries. UNAVAILABLE is reported when the accepted MFI contents do not meet the basic acceptance criteria (multiframe alignment not completed), or intra-NE communication with the reporting entity is disrupted. NA (Not Applicable) is reported under defect conditions detected by the Sn[i] termination function or the VC-n is not part of an S-n-Xv group.

**Spec block parameters**

1. **camd** – Consequent Action Mode

   This parameter specifies the mode of the consequent action to be executed in egress direction (to the synchronous port) on detected signal fail conditions (dPLM, AI_TSF or detected generic AIS) on the ODU layer

   Type: Alphanumeric value set.

   Range: GENERICAIS (default), MSAIS, LASEROFF

2. **enetpn** – Ethernet Alarm Severity Assignment Profile Name

   This parameter points to an ASAP profile name of type ENET for the designated AID. Some VCG related alarms have to be referenced via the ASAP profile named ENET.

   Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.

   Range: 1 … 24 characters length.

   Default: DEFAULT.

3. **fevpm** – Far End VCG Performance Monitoring

   The parameter fevpm specifies whether the far end performance monitoring is enabled or disabled for this port. For the fully transparent application performance monitoring is actually done on the ODUkP layer. This parameter enables/disable therefore far end PM on the ODUkP layer.

   Type: Alphanumeric value set.

   Range: DISABLE (default), ENABLE

4. **inputsig** – Tributary Input Signal Rate List

   This parameter reports the tributary structure of the VCG port in input direction. This will implicitly give the maximum capacity of the VCG port, too. The tributary structure is independent from the interface standard istd specified for this VCG.

Type: numeric string of the form NX

- N specifies the count of container type X
- X specifies the container type (or envelope).

Range:

- N=17,
- X = 4 for VC-4 / STS3.

Default: 174.

5. **istd** – Interface Standard

   This parameter specifies the interface standard of this VCG. This value is applied for both input and output direction.

   Type: Alphanumeric value set.

   Range:

   - SDH
   - SONET.

   Default: As derived from parameter *istddflt* specified at "RTRV-EQPT (system): Retrieve Equipment (system)" (p. 3-2381).

6. **nevpm** – Near End VCG (ODUkP) Performance Monitoring

   This parameter specifies whether the near end performance monitoring is enabled or disabled for this port. For the fully transparent application performance monitoring is actually done on the ODUkP layer and on the VCG level. This parameter enables/disable therefore near end PM on the ODUkP layer.

   Type: Alphanumeric value set.

   Range: DISABLE (default), ENABLE

7. **pmvcgfeses** – Performance Monitoring VCG (ODUkP) Far-End SES Threshold

   This parameter describes the ODUkP Far-End SES threshold value. It indicates the number of errored blocks per second to declare a second as severely errored. The default value is defined in G.8201 for OTN. If the interface standard is changed the current default value is not changed.

   Type: numeric value set.

   Range (the range depends on the ODUkP rate): ODU1P: 1 – 20420

   Default: ODU1P: 3064

   G.8201 defines block based PM on the ODUkP layer.

8. **pmvcgneses** – Performance Monitoring VCG (ODUkP) Near-End SES Threshold

   This parameter describes the VCG (actually ODUkP) Near-End SES threshold value. It indicates the number of errored blocks (SDH) or code violations (SONET) per second to declare a second as severely errored. The default value depends on the interface standard and may differ between SDH and SONET. If the interface standard is changed the current default value is not adapted automatically.

   Type: numeric value set.

   Range (the range depends on the ODUkP rate): ODU1P: 1 – 20420

   Default: ODU1P: 3064

   G.8201 defines block based PM on the ODUkP layer.

9. **rplt** – Reported Payload Type

   The parameter rplt shall report the received payload type for the constant bit rate mapping on the ODU layer.

   Type: Alphanumeric value set.

   Range:

   - 00, 01, …, FE, FF i.e. two hexadecimal digits
   - UNAVAILABLE

10. **tcamd** – TCA mode

    This parameter shows the modus of the PM thresholding.

    Two thresholding methods are applicable: TR-only, (also known as the implicit reset method). TR-RTR, (also known as the explicit reset method).

    Type: Alphanumeric value set.

    Range: TR, TRRTR.

    Default: TRRTR in SDH mode; TR in SONET mode.

11. **transpn** – Transparent Alarm Severity Assignment Profile Name

    This parameter points to a ASAP profile name of type TRANSPARENCY for the designated AID.

    Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.

    Range: 1 … 24 characters length

    Default: DEFAULT.

12. **transtca** – Transparent TCA Profile Name

    The parameter transtca specifies the name of the threshold crossing alert (TCA) profile used for the VCG..

    Type: Alphanumeric string.

    Range: 1 … 24 characters length

    Default: DEFAULT0

13. **unequiposig** – Unequipped Tributary Output Signal Rate List

    This parameter specifies the tributary structure and the capacity of the VCG port in output direction. As long as there is no cross-connection applied the specified tributaries are occupied by an unequipped signal. The parameter will implicitly give the maximum capacity of the VCG port, too. The tributary structure is independent of the interface standard specified for this VCG.

    The signal will be immediately terminated on the unit. So no unequipped signal is visible to the outside world.

    Type: numeric string of the form NX.

    - N specifies the count of container type X
    - X specifies the container type (or envelope)

    Range:

    - N = 17
    - X = 4 for VC-4 / STS-3C

Default: 174

14. **vmode** – VCG Monitoring Mode

    This parameter wtr specifies the monitoring mode for VCG. Alarms for this port will be reported if in mode MON otherwise not. There is no automatic mode.

    Type: Alphanumeric value set.

    Range: MON: for monitored; NMON (default): for not monitored.

### Detailed behavior description

The RTRV-VCG-TRANS does not generate a **REPT DBCHG** message. The command retrieves all VCG parameters as described in section Output parameters.

The values of the following parameters are directly requested form the hardware:

- *mfiv*
- *rplt*

Thus the value "UNAVAILABLE" is reported, if the CP HW is not available in the system.

### Example input/output

Example 1:

```
RTRV-VCG-TRANS:LT-UNITE:1-1-#-#-2-v3:123456;

   LT-UNITE 01-03-20 09:05:00

   transpn=DEFAULT,transtca=DEFAULT0,unequiposig=174,vmode=NMON"
;
```

## Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2397). The error responses listed there also apply to the **RTRV-VCG-TRANS** command.

### Validation rule: Command only allowed for VCG on Transparent Packs

If the command is not applied to a VCG on a transparent pack, then the command is denied.

Error code: `IENE - Input, Entity Not Exists`

## Related TL1 messages

"ED-VCG-TRANS: Edit virtual concatenation group for fully transparent application" (p. 3-1399)

# RTRV-VCGTRIB: Retrieve virtual concatenation group tributary

The **RTRV-VCGTRIB** command retrieves the attributes of a VCG tributary used for 1 and 10 GbE and ES64U or fully transparent applications.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-VCGTRIB**-*modifier:tid:aid:ctag*[*:::spec_block*];

## Input parameters

### Command parameters

1. **modifier**

   This parameter specifies the type of the tributary. The purpose is to distinguish between SDH/SONET tributaries and between the application of the VCG the tributary belongs to. Current applications are 1 and 10 GbE and ES64Uand fully transparency.

   Type: Alphanumeric value set.

   Range:

   - ALL
   - STS
   - VC.
   - STST
   - VCT.

   To distinguish the fully transparent application from a GE application, a letter "T" is appended. There is no distinction between VCGTRIB entities of the GE1 pack from the GE10PL1 or ES64U pack needed. In particular, the transmission rate in case the parameter *modifier* = STS needs to be derived from the parameters inputsig and unequiposig of the related VCG entity.

2. **tid** – Target Identifier

   See definition in “RTRV-HDR: Retrieve header” (p. 3-2397).

3. **aid** – Access Identifier

   This parameter specifies VCG tributary to be operated on.

   Type: AID.

   Range: VCGNumAID as defined in AID structure. The values

   - *all* for Simple_VCGNumAID
   - *vall* for Simple_VCGAID

- *usall* for Simple_UnivSlotAID
- *all* for Simple_UnivSlotAID
- *all* for Simple_ShelfAID and
- *all* for BayAID

is accepted.

4. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows “0” as valid *ctag*, which is an extension to GR-831.

**Spec block parameter**

dyn – Retrieve Dynamic Parameters

This parameter controls whether dynamic parameters are reported with the command reply or not. It is given only when using any of the wildcard values all, usall or vall at the appropriate positions of the input AID. For input AIDs not using all, usall or vall this parameter is not allowed.

The following output parameters of a vcgtrib are affected:

- aseqno
- tseqno
- ptrc
- ptrcst
- rsiglb
- trailst.

Type: Alphanumeric value set.

Range: YES: Report dynamic parameters in the reply as well; NO (default): Do not report dynamic parameters in the reply.

## Output format

If the NE fully complies with the RTRV-VCGTRIB request, the following normal completion response is returned:

```
sid date time
M  ctag COMPLD
   "aid::spec_block set1"
    <1 or more of the line above,
     or no lines, depending on dynamic data retrieval mode>
   "aid,aidtype::spec_block set2"
    <1 or more of the line above>
```

```
        ...
        ...
   "aid::spec_block set1"
    <1 or more of the line above,
     or no lines, depending on dynamic data retrieval mode>
   "aid,aidtype::spec_block set2"
    <1 or more of the line above>
;
```

The output parameters *sid*, *date*, *time* and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2397).

## Output parameters

### Command parameters

1. **aid** – Access Identifier
   This parameter specifies the VCG tributary whose attributes are reported.
   Type: AID.
   Range: VCGNumAID as defined in AID structure with exception of value all.
2. **aidtype** – Access Identifier Type
   This parameter specifies the type of the tributary.
   Type: Alphanumeric value set.
   Range: STS or VC or STST or VCT.

To distinguish the fully transparent application from a GE application, a letter "T" is appended. There is no distinction between VCGTRIB entities of the GE1 pack from the GE10PL1 or ES64U pack needed. In particular, the transmission rate in case the parameter *modifier* = STS needs to be derived from the parameters inputsig and unequiposig of the related VCG entity.

### Spec block parameters Set 1

1. **aseqno** – Accepted Sequence Number
   This parameter reports the accepted sequence number of the tributary. In case of a disrupted intra-NE communication with the reporting entity “not available” is reported.
   In case that the received sequence no. does not meet the basic acceptance criteria or under defect conditions a value is reported, which is outside of the designated range (see parameter *tseqno* for the designated range).
   If the tributary to be reported is no configured member of the VCG “not applicable” is reported.
   Type: Alphanumeric value set.

Range:

- 0, 1, 2, …, 254, 255
- NA, for not applicable
- UNAVAILABLE, for not available/unavailable.

  Although the normal accepted sequence no. is limited to the designated range (see parameter *tseqno* for the designated range), the NE is not prevented to report a higher number (accompanied by a proper alarm).

2. **`tseqno`** – Transmitted Sequence Number

   This parameter reports the transmitted sequence number of the tributary. In case of a disrupted intra-NE communication with the reporting unit 'not available' is reported. If the tributary to be reported is no configured member of the VCG 'not applicable' is reported.

   Type: Alphanumeric value set.

   Range:

   - For modifier STS: 0, 1, 2, …, 190, 191
   - For modifier VC: 0, 1, 2, …, 62, 63
   - For modifier STST or VCT: 0, 1, 2, …, 15, 16
   - For modifier STS or VC: NA for not applicable
   - For all modifiers: UNAVAILABLE for not available/unavailable.

   The following table explains the possible value ranges for the various pack types:

| Pack type | *modifier* | *tseqno* range | Remarks |
|---|---|---|---|
| GE1 | STS | 0, [1, …, 20] | depends also on configured and actual membership |
| | VC | 0, [1, …, 6] | |
| GE10PL1 | STS | 0, [1, …, 20] | if VCGTRIB entities belong to 1 GE interface |
| | VC | 0, [1, …, 6] | depends also on configured and actual membership |
| | STS | 0, [1, …, 191] | if VCGTRIB entities belong to 10 GE interface |
| | VC | 0, [1, …, 63] | depends also on configured and actual membership |
| OPT2G5 | STST | 0, 1, …, 16 | always all 17 are needed and no LCAS is supported |
| | VCT | | |
| <all> | <all> | NA | if not applicable |
| | | UNAVAILABLE | if not available/unavailable |

Values for the parameters are derived from the VCGTRIB number as follows:

| *modifier* | Tributary rate | *tseqno* calculation |
|---|---|---|
| STS | STS-1 | VCGTRIB No. - 1 |

| *modifier* | Tributary rate | *tseqno* calculation |
|---|---|---|
| STS | STS-3c | (VCGTRIB No. - 1) / 3 for VCGTRIB in {1, 4, …, 190}<br>otherwise NA |
| VC | VC-4 | (VCGTRIB No. - 1) / 3 for VCGTRIB in {1, 4, …, 190}<br>otherwise NA |
| STST | STS-3c | VCGTRIB No. - 1 |
| VCT | VC-4 | |

### Spec block parameters Set 2

Mode STS | VC

Some of the spec block parameters set 2 depend on the *modifier* (for RTRV) or *aidtype* (for ED, ED Not. and ENT Not.). Those parameters are only applicable for the given mode, i.e in the other mode they is neither reported nor modifiable.

1. **`brstintvl`**- Bursty Interval

   This parameter specifies the measurement period for degraded defect if *sdsfmode* is set to BURST. If *sdsfmode* is not set to BURST then *brstintvl* has no affect to NE behavior. The parameter *brstintvl* is only valid for modifiers different from STST and VCT, .e. is omitted in the command response for STST and VCT.

   Type: Integer.

   Range: 2, 3, …, 10 [seconds].

   Default: 7 [seconds].

2. **`brstthr`** – Bursty Error Threshold

   This parameter specifies the degradation threshold for degraded defect if *sdsfmode* is set to BURST. If *sdsfmode* is not set to BURST then *brstthr* has no affect to NE behavior. The parameter brstthr is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.

   Type: Integer.

   Range: 5, 10, 15, … 50 [%].

   Default: 30 [%].

3. **`crslpbkstat`** – Cross-connect Loopback Status

   This parameter reports the configuration of the cross-connection loopback of this tributary. For changing the loopback operation refer to “OPR-LPBK: Operate cross-connection loopback” (p. 3-2015).

   Type: Alphanumeric value set.

   Range: YES, for enabled loopback; NO, for disabled loopback.

4. **`degthr`** – Signal Degrade Threshold

This parameter specifies the exponent to base 10 for building the degraded threshold level. The degraded threshold level is used for building the degraded defect if sdsfmode is set to POISSON. If *sdsfmode* is not set to POISSON then *degthr* has no affect to NE behavior. For the definition of *sdsfmode* refer to the Output parameters section. The parameter degthr is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.

Type: Integer.

Range: -5, -6, -7, -8, -9 i.e. range is 10exp-9 to 10exp-5.

Default: -6

5. **dexcthr** – Excessive Degrade Threshold

   This parameter specifies the exponent to base 10 for building the excessive threshold level. The excessive threshold level is used for building the excessive bit error defect if *sdsfmode* is set to POISSON. If *sdsfmode* is not set to POISSON then *dexcthr* has no affect to NE behavior. For the definition of *sdsfmode* refer to the Output parameters section. The parameter *dexcthr* is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.

   Type: Integer.

   Range: -3, -4, -5 i.e. range is 10exp-5 to 10exp-3.

   Default: -3.

6. **exphptrc** – Expected HP trace identifier

   This parameter specifies the Expected Higher Order Path Trace Identifier (J1). The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is only useful if ptrcrfmt is set to 16.

   For VCG tributaries located on ES64U packs this parameter is visible with default values for retrieval, but cannot be modified.

   Type: Hexadecimal number without a preceding “H”.

   Range: length, 32 hexadecimal digits; value, specific string acc. ITU/ETSI mode 1.

   Default: 89000000000000000000000000000000.

7. **feppm** – Far End Path PM Enable

   This parameter specifies whether the performance monitoring for the far end is enabled or disabled for this tributary. The parameter *feppm* is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.

   For VCG tributaries located on ES64U packs this parameter cannot be modified but will be reported with default values since performance monitoring on VCGTRIB level is not supported.

   Type: Alphanumeric value set.

   Range: DISABLE (default), ENABLE.

8. **hptimais** – HP Trace Identifier Mismatch AIS Insertion

   This parameter specifies if a detected TIM will cause AIS insertion. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).

   Type: Alphanumeric value set.

Range: DISABLE , ENABLE.

Default: The default value depends on interface standard specified by istd for the VCG owning this tributary. For definition of *istd* refer to "RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3052) Output parameters. DISABLE, if *istd* = SONET; ENABLE, if *istd* = SDH.

9. **hptimmon** – HP Trace Identifier Mismatch Monitor

   This parameter specifies if the mode of the TIM detection. This parameter is relevant only if the related trace read format *ptrcrfmt* is set to 16 (16-byte-specific-string mode).

   Type: Alphanumeric value set.

   Range: DISABLE (default), ENABLE.

10. **inmbs** – Input Membership

    This parameter specifies if the tributary shall take part to the transmission of its owning VCG in input direction. Input direction in this case means from the LCAS source on the GE1 pack to the cross-connect pack XC*n*. The addressing scheme of the tributaries by using VCGNumAIDs is ensuring that only legal AIDs are used. So no consideration about the "illegal" tributaries (for example, 1-1-#-#-1-1-3 for VC-4) is necessary. The parameter *inmbs* is only valid for modifiers different from STST and VCT, that means, is omitted in the command response for STST and VCT.

    The system shall not evaluate the parameter *inmbs* if the parameter *vcat* of the related VCG is set to DISABLE. The parameter is retrievable.

    Type: Alphanumeric value set.

    Range: DISABLE , ENABLE.

    Default:

    - for modifiers STST or VCT: ENABLE
    - for all other modifiers: DISABLE.

    The VCG for GE*n* and ES64U has as default the size 0, that means, it has no member. So the default for the parameter above for VCGTRIB needs to be DISABLE so that the user decide explicitly if one tributary take part to the transmission.

11. **inmbst** – Input Member Status

    This parameter reports the status of the tributary related to its VCG membership in input direction. The parameter *inmbst* is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.

    Type: Alphanumeric value set.

    Range:

    - for modifiers STST or VCT always ACTIVE is reported
    - for all other modifiers:
    - NA, for not applicable, i.e. if the trib. is no member of the VCG or if virtual concatenation is disabled
    - ADD, the tributary is in the LCAS state "Wait-for-Add", "Add" or "Wait-for-ACK"
    - ACTIVE, the tributary is member of the VCG and working

- FAILED, the tributary is member of the VCG but taken off by LCAS (incoming failed condition for the sink tributary)
- UNAVAILABLE, for not available, i.e. the trib. is member of the VCG but the current data is not retrievable for any reason.

  The state FAILED can only be reported if *lcasmd* is set to ENABLE for the VCG owning this tributary. For parameter *lcasmd* refer to the Output parameters section of "RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3052).

  For VCG tributaries located on ES64U packs only "NA" will be reported.

12. **neppm** – Near End Path PM Enable

    This parameter specifies whether the performance monitoring for the near end is enabled or disabled for this tributary. The parameter neppm is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.

    For VCG tributaries located on ES64U packs this parameter cannot be modified but will be reported with default values since performance monitoring on VCGTRIB level is not supported.

    Type: Alphanumeric value set.

    Range:

    - DISABLE (default)
    - ENABLE.

13. **outmbs** – Output Membership

    This parameter specifies if the tributary shall take part to the transmission of its owning VCG in input direction. Output direction in this case means from the cross-connect pack XCn to the LCAS sink on the GE1 pack. The parameter *outmbs* is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.

    The system shall not evaluate the parameter outmbs if the parameter vcat of the related VCG is set to DISABLE. The parameter is retrievable.

    Type: Alphanumeric value set.

    Range:

    - DISABLE
    - ENABLE.

    Default: for modifiers STST or VCT: ENABLE. for all other modifiers:DISABLE. The VCG for GE*n* and ES64U has as default the size 0, i.e. it has no member. So the default for the parameter above for VCGTRIB needs to be DISABLE so that the user decide explicitly if one tributary take part to the transmission.

14. **outmbst** – Output Member Status

    This parameter reports the status of the tributary related to its VCG membership in output direction. The parameter *outmbst* is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.

    Type: Alphanumeric value set.

Range:

- for modifiers STST or VCT always ACTIVE is reported, for all other modifiers:
- NA, for not applicable, i.e. if the trib. is no member of the VCG or if virtual concatenation is disabled
- ADD, the tributary is in the LCAS state "Wait-for-Add" or "Wait-for-Data"
- ACTIVE, the tributary is member of the VCG and working
- FAILED, the tributary is member of the VCG but not working due to a failure condition. Includes period during "Hold-Off".
- WTR, failure condition has cleared, tributary is in wait to restore condition.
- UNAVAILABLE, for not available, i.e. the trib. is member status is not retrievable for any reason.

  The state WTR can only be reported if lcasmd is set to ENABLE for the VCG owning this tributary. For parameter lcasmd refer to RTRV-VCG Output Parameters. For a detailed explanation of the ADD state in the LCAS protection scheme, please refer to SRD_DATA_Virtual_Concatenation.

  For VCG tributaries located on ES64U packs only "NA" will be reported.

15. **pmhpfeses** – PM HP Far End SES Threshold

    This parameter specifies the Higher Order Path Far End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the far end. The behavior depends on interface standard specified by *istd* for the VCG owning this tributary. For definition of *istd* refer to the output parameters section of "RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3052). If *istd* is not set to SDH then *pmhpfeses* has no affect to NE behavior. The parameter *pmhpfeses* is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.

    For VCG tributaries located on ES64U packs this parameter can be modified although it has currently no effect as performance monitoring on VCGTRIB level is not supported..

    Type: Integer.

    Range: 1, 2, 3, …, 63998, 63999, 64000, includes SDH/SONET range.

    Default: 2400.

16. **pmhpneses** – PM HP Near End SES Threshold

    This parameter specifies the Higher Order Path Near End Severely Errored Seconds Performance Monitoring Threshold for errored frames. If errored frames are crossing this threshold this will result in an SES count for the near end.

    The behavior depends on interface standard specified by *istd* for the VCG owning this tributary. For definition of *istd* refer to the output parameters section of "RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3052). If *istd* is not set to SDH then *pmhpneses* has no affect to NE behavior.

    The parameter pmhpneses is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.

For VCG tributaries located on ES64U packs this parameter can be modified although it has currently no effect as performance monitoring on VCGTRIB level is not supported..

Type: Integer.

Range: 1, 2, 3, …, 63998, 63999, 64000, includes SDH/SONET range.

Default: 2400.

17. **ptca** – Path TCA Profile Pointer

    This parameter specifies the name of the threshold crossing alert (TCA) profile used for this tributary.

    The parameter *ptca* is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.

    For VCG tributaries located on ES64U packs this parameter can be modified although it has currently no effect as performance monitoring on VCGTRIB level is not supported..

    Type: Alphanumeric string.

    Range: 1 … 24 characters.

    Default: DEFAULT0.

18. **ptpn** – Path Terminating ASA Profile Name

    This parameter points to a tributary ASAP profile name pfname for the designated AID.

    Type: Alphanumeric string. A hyphen (“-”) is allowed in the name additionally.

    Range: 1 … 24 characters.

    Default: DEFAULT.

19. **ptrc** – Incoming Path Trace

    This parameter reports the accepted higher-order path trace identifier (J1). The length depends on the value of the parameter *ptrcrfmt*. The status of this value is contained in parameter *ptrcst*. If *ptrcst* indicates NORMAL, then *ptrc* contains a valid value. If *ptrcst* indicates UNAVAILABLE or AIS, then no valid incoming path trace identifier could be obtained by the system, e.g. due to not meeting the basic acceptance criteria or intra-NE communication problems, and the output parameter *ptrc* is omitted from the response.

    Type: Hexadecimal.

    Range: the range depends on the parameter ptrcrfmt specified in RTRV-VCGTRIB Output Parameters

    - 2 hexadecimal digits, if ptrcrfmt=2
    - 32 hexadecimal digits, if ptrcrfmt=16
    - 128 hexadecimal digits, if ptrcrfmt=64.

20. **ptrcrfmt** – Path Trace Read Format

    This parameter specifies the format of the path trace (J1 byte) to be received (sink). For VCG tributaries located on ES64U packs this parameter is visible with default values for retrieval, but cannot be modified.

    Type: numeric string.

Range:

- 2, for non-specific repeating byte
- 16, for 16 byte specific string
- 64, for 64 byte string.

Default:

For VCG tributaries located on GE1 packs: 2

For VCG tributaries located on GE10PL1 or ES64U packs: 16 if istd = SDH, 64 if istd = SONET.

21. **ptrcst** – Status of Incoming Path Trace

    This parameter shows the status of the value of the incoming Path Trace Identifier (J1) which is available with parameter *ptrc*. For VCG tributaries located on ES64U packs this parameter is always reported with UNAVAILABLE.

    Type: Alphanumeric value set.

    Range:

    - NORMAL, *ptrc* contains a valid value
    - UNAVAILABLE, no valid value for *ptrc* could be obtained by the system
    - AIS , no valid value for ptrc could be obtained due to SF condition.

22. **ptrcwfmt** – Path Trace Write Format

    This parameter specifies the format of the path trace (J1 byte) to be sent (source). For VCG tributaries located on ES64U packs this parameter is visible with default values for retrieval, but cannot be modified.

    Type: numeric string.

    Range:

    - 2, for non-specific repeating byte
    - 16, for 16 byte specific string
    - 64, for 64 byte string.

    Default:

    For VCG tributaries located on GE1 packs: 2

    For VCG tributaries located on GE10PL1 or ES64U packs: 16 if istd = SDH, 64 if istd = SONET.

23. **rsiglb** – Received Signal Label

    This parameter reports the accepted trail signal label (C2). The parameter is not reported if the *trailst* parameter indicates a fail condition, i.e. has the value AIS or UNAVAILABLE.

    Type: Alphanumeric value set.

    Range: 00, 01, …, FE, FF, i.e. two hexadecimal digits.

24. **sdsfmode** – Signal Degrade/Signal Fail Mode

    This parameter specifies the determination mode of degraded defect for transmission. The parameter sdsfmode is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.

    Type: Alphanumeric value set.

Range: BURST or POISSON.

Default: For VCG tributaries located on a GE10PL1 pack, the default is: BURST. For VCG tributaries located on other packs, the default value depends on interface standard specified by istd for the VCG owning this tributary. For definition of istd refer to RTRV-VCG Output Parameters. POISSON, if *istd* = SONET; BURST, if *istd* = SDH.

25. **tcamd** – TCA mode

    This parameter is only available for SDH modeand the modifier must be VC. The parameter shows the modus of the PM thresholding. Two thresholding methods are applicable for SDH: TR-only (also known as the implicit reset method), TR-RTR (also known as the explicit reset method). For SONET the parameter *tcamd* does not exist. SONET ports only support "TR-only" mode. Thus the mode must be internally set to "TR-only".

    Type: Alphanumeric value set.

    Range: TR, TRRTR.

    Default: SDH mode: TRRTR. SONET mode: TR (internal). For SONET the parameter tcamd does not exist. SONET ports only support "TR-only" mode. Thus the mode must be internally set to "TR-only".

    The parameter *tcamd* is only valid for modifiers different from STST and VCT, i.e. is omitted in the command response for STST and VCT.

    For VCG tributaries located on ES64U packs this parameter can be modified although it has currently no effect as performance monitoring on VCGTRIB level is not supported.

26. **tmonmd** – Tributary Monitoring Mode

    This parameter specifies the monitoring mode for the tributary. For VCG tributaries located on ES64U packs this parameter can be modified although it has currently no effect.

    Type: Alphanumeric value set.

    Range: MON or NMON (default).

27. **trailst** – Trail Status

    This parameter reports the accepted trail status value.

    Type: Alphanumeric string.

    Range:

    - AIS, for Alarm Indication Signal in case of Trail Signal Fail Condition
    - UNAVAILABLE, for unavailable
    - NORMAL.

28. **trc** – Outgoing Path Trace

    This parameter specifies the path trace (J1) to be sent (source). For the 16 byte path trace format the following syntactical rule is applied: The first byte value is in the range from 80 to FF (MSB always set to 1). The other byte values are in the range from 00 to 7F (MSB always set to 0). This parameter is irrelevant if the format is non-specific repeating byte (*ptrcwfmt* = 2).

    For VCG tributaries located on ES64U packs, this parameter shall be visible with default values for retrieval, but cannot be modified.

Type: Hexadecimal number without a preceding “H”.
Range: the range depends on the parameter ptrcwfmt specified in **RTRV-VCGTRIB**
Output parameters length

- 32, hexadecimal digits, if *ptrcwfmt* = 16
- 128, hexadecimal digits, if *ptrcwfmt* = 64
- value: specific string acc. ITU/ETSI mode 1, if *ptrcwfmt* = 16; 64 byte string, if *ptrcwfmt* = 16.

Default: Depending on the default value of *ptrcwfmt*:

- 00hex, if *ptrcwfmt* = 2.
- 89hex followed by 15 bytes 00hex, if *ptrcwfmt* = 16.
- 64 bytes 00hex, if *ptrcwfmt* = 64.

29. **tslmmon** – Trail Signal Label Mismatch Monitor
    This parameter specifies the mode of the TSL mismatch detection.
    For VCG tributaries located on ES64U packs, this parameter is visible with default values for retrieval, but cannot be modified.
    Type: Alphanumeric value set.
    Range:
    - DISABLE
    - ENABLE (default).

## Detailed behavior description

The **RTRV-VCGTRIB** does not generate a **REPT DBCHG** message. The command retrieves all port parameter as described in section Output parameters.

### Dependencies

*brstintvl* and *brstthr* are only meaningful if *sdfsmode* is set to BURST. *degthr* and *dexcthr* are only meaningful if *sdfsmode* is set to POISSON.

Parameters which are not meaningful at the moment are reported with their default values, nevertheless.

;
```

## Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-VCGTRIB** command.

### Validation rule: Check *modifier* against circuit pack type

If the command is applied

- with modifier = VC or STS to a VCG tributary on a transparent pack or
- with modifier = VCT or STST to a VCG Tributary on a GE*n* or ES64U pack, then the command is denied.

Error code: `IENE - Input, Entity Not Exists`

### Validation rule: Check CCB against *istd* of related VCG

Check wether the CCB fits to *istd* of the related VCG.

Error code:
`ICNV - Input, Command Not Valid, Interface Standard does not match`.

E.g. DENY, if a command with *modifier* = VC or *modifier* = VCT is made on a port which is provisioned as *istd* = SONET.

# RTRV-VRTSW: Retrieve virtual switch

The **RTRV-VRTSW** command retrieves the attributes of a virtual switch of a GE1 pack.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): P1

Priority: 1

Abortable: Yes

## Input format

Command syntax: **RTRV-VRTSW**:*tid*:*aid*:*ctag*[:::*spec_block*];

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   Refer to the "RTRV-HDR: Retrieve header" (p. 3-2397) command for the input parameter syntax and the description of this parameter.
2. **aid** – Access Identifier
   The access identifier specifies the slot containing a GE1 pack.
   Type: AID.
   Range: UnivSlotAID as defined in AID structure.
   The values
   - all and
   - usall for Simple_UnivSlotAID

   is accepted.
3. **ctag** – Correlation Tag
   See definition of *ctag* in "RTRV-HDR: Retrieve header" (p. 3-2397).

### Spec block parameters

1. **dyn** – Retrieve Dynamic Parameters
   This parameter controls whether dynamic parameters are reported with the command reply or not. It is given only when using any of the wildcard values all or usall at the appropriate positions of the input AID. For input AIDs not using *all* or *usall* this parameter is not allowed. This implies that with such input AIDs the dynamic parameters are always returned.
   The following output parameters of a virtual switch are affected:
   - *macaddr*
   - *rootpriority*
   - *rootmacaddr*

- *rootcost*
- *rootport*.

Type: Alphanumeric value set.
Range: YES, report dynamic parameters in the reply as well. NO (default), do not report dynamic parameters in the reply.

## Output format

After receiving the **RTRV-VRTSW** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
   "aid:vrtswid:spec_block"
   <this entire block is repeated for another vrtswid>
   <this entire structure is repeated for another slot>
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are described in the "Output parameter" section of "RTRV-HDR: Retrieve header" (p. 3-2397).

The output is in the form of a nested list. The primary list is based on the slot AID. For each slot AID, there is a nested list for each instance of a virtual switch giving the spec_block parameters.

## Output parameters

### Command parameters

1. **aid** – Access Identifier
   This parameter specifies the slot containing a GE1 pack to be operated on.
   Type: AID.
   Range: UnivSlotAID as defined in AID structure with the exception of the value all and usall.
2. **vrtswid** – Virtual Switch Identifier
   This parameter identifiers the instance of the virtual switch.
   - A Virtual Switch ID is unique within a single circuit pack. When creating a new Virtual Switch, the system automatically assigns a unique ID to it.
   - There will be one virtual switch per physical switch, implicitly all LAN ports and all WAN ports on the physical switch are part of the single virtual switch. The ID of this virtual switch is fixed to 1. A future release may support multiple virtual switches per physical switch.

   Type: Integer.
   Range: 1 – Currently this is the only allowed value.
   Default: 1.

### Spec block parameters

1. **eplst** – EPORT AID list

   This parameter specifies a list of EPORT instances connected to the virtual switch instance as specified by *vrtswid*.

   In R3 there is only one virtual switch instance to which all ports are mapped. Therefore this list is fix.

   Type: AID list.

   Range: A list of EPortAIDs as specified in the AID definition section with the exception of the values all and usall in the respective components of the AID, separated by an ampersand ('&')

   Example: If all four EPORTs of a GE1 are mapped to one virtual switch: 1-#-#-1-1-1&1-#-#-1-1-2&1-#-#-1-1-3&1-#-#-1-1-4

2. **ethertype** – VLAN tag protocol ID

   This parameter specifies the VLAN tag protocol ID necessary for interworking purposes. This parameter is used to control whether the virtual switch operates in IEEE802.1Q tagging mode (i.e. set to 0x8100) or in transparent tagging mode (i.e. set to value different to 0x8100).

   Type: Hexadecimal value.

   Range: 0x0600 … 0xFFFF.

   The following values have a specific meaning:

   - 0x8100: virtual switch operates in IEEE802.1Q tagging mode
   - any other value: virtual switch operates in transparent tagging mode.

   Default: 0x8100.

3. **gvrpmode** – GVRP mode

   The parameter *gvrpmode* allows to control the dynamic VLAN registration mode.

   Type: Alphanumeric value set.

   Range: ENABLED, GVRP is enabled. DISABLED (default), GVRP is disabled.

4. **macaddr** – Bridge ID address

   The parameter *macaddr* specifies the bridge address field of the bridge identifier.

   Type: Alphanumeric value set.

   Range: 000000000000 to FFFFFFFFFFFF (hexadecimal value) and UNAVAILABLE, if the value can not be retrieved.

5. **rootcost** – Cost of Path to root bridge

   This parameter specifies the cost of the path to the root bridge as determined by the *Spanning Tree Protocol*.

   Type: Alphanumeric value set.

   Range: 0 to 4 294 967 295 and UNAVAILABLE if the value can not be retrieved.

6. **rootmacaddr** – Root bridge ID address

   This parameter specifies the bridge identifier of the root bridge as determined by the *Spanning Tree Protocol*.

   Type: Alphanumeric value set.

Range: 000000000000 to FFFFFFFFFFFF (hexadecimal value) and UNAVAILABLE if the value can not be retrieved.

7. **rootport** – Root port identifier

   This parameter specifies the identifier of the root port, which offers the lowest cost path from the virtual switch to the root bridge.

   Type: AID or alphanumeric string.

   Range: *EPortAID* or *VCGAID* as specified in the AID definition section with the exception of the values *all*, *usall* and *vall* in the respective components of the AID; UNAVAILABLE.

   The value UNAVAILABLE is returned when the addressed virtual switch is currently the spanning tree root bridge. This is also the case if STP is disabled for all ports belonging to the virtual switch. The Value UNAVAILABLE is returned if the value can not be retrieved from the HW.

8. **rootpriority** – Root bridge priority

   The parameter *rootpriority* specifies the priority of the root bridge as determined by the Spanning Tree Protocol.

   The virtual switch defined with the lowest value for its bridge priority compared to other virtual switches in the network will be elected as the root bridge.

   Type: AID or alphanumeric string.

   Range: 0 to 65535 and UNAVAILABLE if the value can not be retrieved.

   Default: 32678.

9. **rstpmd** – Rapid Spanning Tree Protocol Mode

   This parameter allows to enable or disable the Rapid Spanning Tree Protocol for the given virtual switch.

   Type: Alphanumeric value set.

   Range:

   - DISABLE (rSTP is disabled, that means, the virtual switch only supports normal STP (IEEE802.1D))
   - ENABLE (rSTP is enabled, that means, the virtual switch also supports rSTP (IEEE802.1w))

   Default: ENABLE (if Rapid Spanning Tree Functionality is available)

10. **stbrpriority** – Spanning tree bridge priority

    This parameter specifies the priority of the bridge to be used by the Spanning Tree Protocol.

    Type: Integer.

    Range: 0 to 65535.

    The stepping as recommended by the standard (steps of 4096 starting at 0) should be implemented by the management system. The NE will accept any value in the range described above. This has the consequence, that also the range restriction "0 to 61440" is not done by the NE.

    Default: 32768.

11. **stfdtm** – Spanning Tree forward delay timer

The parameter *stfdtm* specifies the rSTP-related bridge forward delay timer. This parameter is relevant for both rSTP and STP.

Type: Integer.

Range: 1 … 255.

Default: 15.

12. **sthellotm** – Spanning Tree hello timer

    The parameter *sthellotm* specifies the rSTP-related bridge hello timer. This parameter is relevant for both rSTP and STP.

    Type: Integer.

    Range: 1 … 225.

    Default: 2.

13. **stmaxage** – Spanning Tree maximum age timer

    The parameter *stmaxage* specifies the rSTP-related maximum PDU transmission delay timer. This parameter is relevant for both rSTP and STP.

    Type: Integer.

    Range: 1 … 255.

    Default: 20.

14. **vcglst** – VCG AID list

    The parameter *vcglst* specifies a list of VCG instances connected to the virtual switch instance as specified by *vrtswid*.

    In R3 there is only one virtual switch instance to which all eports are mapped. Therefore this list is fix.

    Type: AID list.

    Range: A list of VCGAIDs as specified in the AID definition section with the exception of the values all, usall and vall in the respective components of the AID, separated by an ampersand ('&').

    Example: If all four VCGs of a GE1 are mapped to one virtual switch: 1-#-#-1-1-v1&1-#-#-1-1-v2&1-#-#-1-1-v3&1-#-#-1-1-v4.

## Detailed behavior description

### Omit dynamic parameters if not accessible

If the system cannot access dynamic data related to the addressed slot, e.g. due to a missing or defect pack or a system-internal communication outage, the following parameters shall response the value "UNAVAILABLE"::

- *macaddr*
- *rootpriority*
- *rootmacaddr*
- *rootcost*
- *rootport*.

### Example input/output

```
RTRV-VRTSW:LT-UNITE:1-1-#-#-1:123456;
   LT-UNITE 02-05-15 13:31:30
M  123456 COMPLD
   "1-1-#-#-1:1:eplst=1-1-#-#-1-1&1-1-#-#-1-2&1-1-#-#-1-3&1-1-#-#-1-4,
   gvrpmode=ENABLE,macaddr=010203040506,rootcost=1234567890,
   rootmacaddr=112233445566,rootport=1-1-#-#-1-v2,rootpriority=32678,
   stbrpriority=32768,stfdtm=15,sthellotm=2,stmaxage=20,ethertype=0x8100,
   vcglst=1-1-#-#-1-v1&1-1-#-#-1-v2&1-1-#-#-1-v3&1-1-#-#-1-v4"
;
```

### Error responses

Refer to the section “Error responses” of “RTRV-HDR: Retrieve header” (p. 3-2397). The error responses listed there also apply to the **RTRV-EPORT** command.

# Security event notification

## Output format

The security event notification uses the general format of a **REPT EVT** notification.

**Syntax:**

**REPT EVT** *modifier aid:condtype,condeff,ocrdat,ocrtm:conddescr;*

## Output parameters

### Command parameters

1. **modifier** – Modifier
   The parameter specifies the value 'COM' as an event that applies to the whole NE.
   Type: Alphanumeric value set.
   Range: COM
2. **aid** – Access Identifier
   Type: AID
   Range: SystemAID
3. **condtype** – Condition Type
   This parameter specifies/identifies the type of security event being reported.
   Type: Alphanumeric value set.
   Range:
   - SEC-USERLOGIN: Successful user login
4. **condeff** – Condition Effect
   The parameter shall indicate the effect of the reported security event on the NE.
   Type: Alphanumeric value set.
   Range:
   - SC: Standing condition
   - CL: Clear
5. **ocrdat** – Occurrence Date
   The parameter shall indicate the date of the security event being reported.
   Type: value set of format YY-MM-DD
   Range: Y, M, D are digits. Leading zeros are not suppressed. YY represents the year, MM the month, DD the day.
   Default: None.
6. **ocrtm** – Occurrence Time
   The parameter shall indicate the time of the security event being reported.
   Type: value set of format HH-MM-SS
   Range: H, M, S are digits. Leading zeros are not suppressed. HH represents hours, MM minutes, SS seconds.

Default: None.

7. **conddescr** – Condition Description

   The parameter shall provide additional information w.r.t. the security event.

   Type: inner string

   Range:

   The following strings are applicable for the one remaining *condtype* SEC-USERLOGIN.

   Also see the relation between *condeff* and *conddescr*:

   *condeff – conddescr*

   SC – \"login – <uid>\"

   CL – \"logout – <uid>\"

   CL – \"forced logout – <uid> \"

   CL – \"inactivity timeout – \"

   CL – \"logout, disconnected – <uid> \"

   The security event notification is related to the user session which is indicated by the user ID (*uid*).

## Example outputs

```
   UPGRADE_2 07-07-31 17:13:06
A  002 REPT EVT COM
   "system:SEC-USERLOGIN,CL,07-31,17-13-06:\"login - LUC01\""
   UPGRADE_2 07-07-31 17:25:49
A  003 REPT EVT COM
   "system:SEC-USERLOGIN,CL,07-31,17-25-49:\"logout - LUC01\""
```

# SET-ATTR-CONT: Set attribute control

The **SET-ATTR-CONT** command can be initiated by users to set the description associated with an MDO port (Miscellaneous Discrete Output / external discrete control).

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 1

Abortable: No.

## Input format

Command syntax: **SET-ATTR-CONT**:*tid*:*aid*:*ctag*::*contmsg*[,,*asgcond*];

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **aid** – Access Identifier
   This is the address of the MDO port entities on which the command operates. If misc_outall is specified the configuration of all MDO's will be retrieved.
   Type: AID
   Range: Miscellaneous_out_discreteAID
   Default: misc_outall (if the *aid* is omitted).
3. **ctag** – Correlation Tag
   See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).
4. **contmsg** – Control Message
   This is the name associated to a MDO port (environmental control).
   Type: text string
   Range: A string of up to 26 characters, any character except " and \, upper and lower cases considered. An empty string is allowed. The value would be "".
5. **asgncond** – Assigned Condition Type
   This parameter identifies the probable cause (type of alarm indication) which is assigned to an MDO port (external control). If one or more alarm(s) of this probable cause appears then the MDO port (external control) will be switched on.
   Type: Alphanumeric value set. Additionally a "-" will be allowed (not the first character).
   Range: All defined probable causes and UNDEF: if no probable cause is assigned.
   Default: UNDEF.
   If the value is omitted, then the actual value is not changed.

### Output format

The following example shows the successful completion of the **SET-ATTR-CONT** command by the NE:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

### Detailed behavior description

The name of a MDO via the aid specified will be updated according the value of *contmsg*. The update will be reported via a SET-ATTR-CONT – REPT DBCHG message. Refer to the definition of the SET-ATTR-CONT notification.

### Example input/output

The following example shows the successful completion of the **SET-ATTR-CONT** command by the NE:

```
SET-ATTR-CONT:LT-UNITE-123:MISC_OUT3:123456::"fan 3",,FANF;

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
;
```

The following example shows the successful completion of the **SET-ATTR-CONT** command by the NE if the *asgncond* parameter will be unchanged:

```
SET-ATTR-CONT:LT-UNITE-123:MISC_OUT3:123456::"fan 3";

   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
;
```

### Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2397). The error responses listed there also apply to the **SET-ATTR-CONT** command.

# SET-ATTR-CONT notification

## Output format

The **SET-ATTR-CONT** notification uses the general format of a **REPT DBCHG** (Report Database Change) notification.

The **SET-ATTR-CONT** notification has the following specific syntax:

**SET-ATTR-CONT**:*aid::contmsg,,asgncond*

## Output parameters

### Command parameters

1. **aid** – Access Identifier
   This is the address of the MDO port entity for which the configuration is retrieved or on which an operation is performed.
   Type: AID.
   Range: Miscellaneous_out_discreteAID. misc_outall must not be reported or used.
2. **contmsg** – Control Message
   This is the name associated to a MDO port (environmental control). It is a description which can be retrieved by the management system.
   Type: inner string.
   Range: string up to 26 characters, any character except " and \, upper and lower cases considered. A empty string is allowed. The value would be \"\".
   Default: MDO port #n. n is the number of the port 1 … 8.
3. **asgncond** – Assigned Condition Type
   This parameter identifies the probable cause (type of alarm indication) which is assigned to an MDO port (external control). If one or more alarm(s) of this probable cause appears then the MDO port (external control) will be switched on.
   Type: Alphanumeric value set. Additionally a “-” will be allowed (not the first character).
   Range: All defined probable causes and UNDEF: if no probable cause is assigned.
   Default: UNDEF.

## Example output

The example shows a normal SET-ATTR-CONT notification:

```
   LT-UNITE-123 00-01-01 08:00:50
A 815 REPT DBCHG
   "TIME=08-00-12,DATE=00-01-01:SET-ATTR-CONT:MISC_OUT3::\"fan 3\",,FANF"
;
```

# SET-ATTR-ENV: Set attribute environment

The **SET-ATTR-ENV** command can be used to set the alarm message, name and assigned ASAP of an miscellaneous discrete input (MDI/environmental point).

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 1

Abortable: No

## Input format

Command syntax: **SET-ALM-ENV**:*tid*:*aid*:*ctag*::,,*almmsg,envname*:*spec_block*;

## Input parameters

### Command parameters

- **tid** – Target Identifier
  See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).
- **aid** – Access Identifier
  This is the address of the MDI port entities for which an alarm condition or the configuration is being reported. If misc_inall is specified the information for all entities will be retrieved.
  Type: AID.
  Range: Miscellaneous_in_discreteAID.
  Default: misc_inall (if the aid is omitted).
- **ctag** – Correlation Tag
  See definition of "RTRV-HDR: Retrieve header" (p. 3-2397).
- **almmsg** – Alarm Message
  This is the condition description which is associated with the MDI port (environmental point). This description will be sent with the alarm generated from the MDI port.
  Type: inner string.
  Range: a string up to 32 characters, any character except " and \, upper and lower cases are considered.
  Default: Miscellaneous Discrete #<N> with N = 1 … 8 for the different MDI ports.
- **envname** – Environmental Point Name
  This is the name associated to a MDI port (environmental point). It is a description which can be retrieved by the management system. It is not to be mixed up with the envmsg parameter. The envname is just a name of the MDI port and not reported via the condition description of an alarm.
  Type: inner string

Range: a string up to 26 characters, any character except " and \, upper and lower cases considered.

Default: MDI port #n; n is the number of the port 1 … 8.

### Spec block parameters

- **envinv** – Environmental Alarm Inversion

  This parameter indicates for the MDI (environmental point) whether an alarm is generated if the port is on or if the port is off.

  Type: Alphanumeric value set.

  Range:

  – YES: The alarm will be inverted

  – NO: The alarm will be not inverted.

- **pfname** – Profile Name

  This is the name of the ASAP that is assigned to the MDI port (environmental point). The ASAP must be of the type ENV.

  Type: alphanumeric character string. A hyphen (“-”) is allowed in the name additionally.

  Range: string up to 24 characters.

  Default: DEFAULT.

## Output format

The following example shows the successful completion of the **SET-ATTR-ENV** command by the NE:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section “Output parameters” of “RTRV-HDR: Retrieve header” (p. 3-2397).

## Detailed behavior description

The **SET-ATTR-ENV** command updates the configuration of the almmsg, envname, pfname of the via aid specified MDI port. The changes will be reported via a REPT DBCHG message. See definition of SET-ATTR-ENV notification.

## Example input/output

The following example shows the successful completion of the **SET-ATTR-ENV** command by the NE:

```
SET-ATTR-ENV:LT-UNITE-123:MISC_IN7:123456::,,"open door","door":pfname=ENV_NM,
   envinv=YES;
```

```
   LT-UNITE-123 00-01-01 08:00:00
M  123456 COMPLD
;
```

## Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2397). The error responses listed there also apply to the **RTRV-ATTR-ENV** command.

### Validation rule: *pfname* does not exist

An ASAP with the name pfname does not exist for an ASAP type ENV.

Error code: `IDNV – Input Data Not Valid, ASAP profile does not exist`

# SET-ATTR-ENV notification

## Output format

The **SET-ATTR-ENV** notification uses the general format of a **REPT DBCHG** (Report Database Change) notification.

The **SET-ATTR-ENV** notification has the following specific syntax:

**SET-ATTR-ENV**:*aid,,almmsg,envname:spec_block*;

## Output parameters

### Command parameters

- **aid** – Access Identifier

  This is the address of the MDI port entities for which an alarm condition or the configuration is being reported. If misc_inall is specified the information for all entities will be retrieved.

  Type: AID.

  Range: Miscellaneous_in_discreteAID.

  Default: misc_inall (if the aid is omitted).

- **almmsg** – Alarm Message

  This is the condition description which is associated with the MDI port (environmental point). This description will be sent with the alarm generated from the MDI port.

  Type: inner string.

  Range: a string up to 32 characters, any character except " and \, upper and lower cases are considered.

  Default: Miscellaneous Discrete #<N> with N = 1 … 8 for the different MDI ports.

- **envname** – Environmental Point Name

  This is the name associated to a MDI port (environmental point). It is a description which can be retrieved by the management system. It is not to be mixed up with the envmsg parameter. The envname is just a name of the MDI port and not reported via the condition description of an alarm.

  Type: inner string

  Range: a string up to 26 characters, any character except " and \, upper and lower cases considered.

  Default: MDI port #n; n is the number of the port 1 … 8.

### Spec block parameters

- **envinv** – Environmental Alarm Inversion

  This parameter indicates for the MDI (environmental point) whether an alarm is generated if the port is on or if the port is off.

  Type: Alphanumeric value set.

Range:

– YES: The alarm will be inverted

– NO: The alarm will be not inverted.

- **pfname** – Profile Name

  This is the name of the ASAP that is assigned to the MDI port (environmental point). The ASAP must be of the type ENV.

  Type: alphanumeric character string. A hyphen (“-”) is allowed in the name additionally.

  Range: string up to 24 characters.

  Default: DEFAULT.

## Example output

The example shows a normal notification after an SET-ATTR-ENV Command:

```
   LT-UNITE-123 00-01-01 08:00:50
A 815 REPT DBCHG
   "TIME=08-00-12,DATE=00-01-01:SET-ATTR-ENV:MISC_IN7::,,\"open door\",
   \"door\":pfname=ENV_NM,envinv=YES"
;
```

# SET-MAP-RING: Set map ring

The **SET-MAP-RING** command writes the transitional, manually provisioned ring map to NVM for use by the MS-SPRing/BLSR protection group.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 1

Abortable: No

## Input format

Command syntax: **SET-MAP-RING**:*tid*:[*aid*]:*ctag*::[*rid*]*;*

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **aid** – Access Identifier
   This parameter specifies the aid of an MS-SPRing/BLSR protection group or an port aid being a member of the group.
   Option: If *rid* is specified, then *aid* can be omitted.
   Type: AID.
   Range: TwoFibre_ProtGrpAID (not ranged) or FourFibre_ProtGrpAID (not ranged) or SPortAID (not ranged)
3. **ctag** – Correlation Tag
   See definition in input parameters section "RTRV-HDR: Retrieve header" (p. 3-2397).
4. **rid** – Ring Identification
   This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.
   Type: text string of chars allowed for TID strings.
   Range: 1 to 15 characters.
   Default: NONE.
   Option: If *aid* is specified, then *rid* can be omitted.

## Output format

After receiving the **SET-MAP-RING** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

### Output parameters

1. **sid** – Source Identifier

   This is the currently active name of the network element to which the command is addressed. The tid is a case insensitive character string.

   Type: identifier, in addition the special character underscore "_" and the password characters are allowed.

   Range: 1 to 20 characters.

2. **date** – Date

   Date when output message is generated. This has the format YY-MM-DD (year-month-day)

   Type: value set.

   Range: for YY 00 to 99, for MM 01 to 12, for DD 01 to 31

   TL1 messages use YY-MM-DD for the format of a date, meaning that the year only has two digits. This is consistent with Telcordia requirements. Internally, however, the system does use a 4-digit year. When the year appears in a response, the internal 4-digit year is truncated to two digits. When the year appears as an input parameter, for example in the **ED-DAT** command, years in the range 90-99 will represent 1990-1999, and years in the range 00-37 will represent 2000-2037.

   Default:00-01-01

3. **time** – Time

   Time when output message is generated. This has the format HH:MM:SS (hours:minutes:seconds).

   Type: Value set.

   Range: for HH 00 to 23, for MM 00 to 59, for SS 00 to 59.

   Default: 00:00:00

4. **M** – Message

   M indicates that the output message is generated in response to a manual command.

   Type: Value set.

   Range: M

5. **ctag** – Correlation Tag

   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.

   Type: Alphanumeric string

   Range: Non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

6. **IP** – In Progress

IP is sent in response to all commands with the exception of commands that result in error code output.

Type: Value set.

Range: IP

7. **RL** – Repeat Later

   The requested command cannot be executed due to unavailable system resources. The command may be entered again later.

   Type: Value set.

   Range: RL

8. **COMPLD** – Completion Code

   It indicates that the command has been completed.

   COMPLD for successful command execution: For a command that is decomposed into a set of atomic commands a COMPLD completion code means that the command was successful for all atomic commands (e.g. AID ranges, group alias).

   COMPLD for no changes: If a parameter has a current value, and a provisioning command attempts to reprovision the parameter with a value that is the same as its current value, the command will return a COMPLD completion code.

   Type: Value set.

   Range: COMPLD.

## Detailed behavior description

The **SET-MAP-RING** command is used to move the transitional manually provisioned ring map to NVM foe use by the BLSR port protection group. This command will be denied if automatic ring discovery is enabled.

The **SET-MAP-RING** command is also denied if the list does not contain the local node , if the list does not contain at least 2 nodes, or if duplicate nid values appear in the list. The **SET-MAP-RING** command generates a REPT DBCHG message.

## Example input/output

The following is an example of a SET-MAP-RING command:

```
SET-MAP-RING:NENAME-1::123456::rid1;
   NENAME-1 98-01-01 08:00:00
M  123456 COMPLD
;
```

## Error responses

### Validation rule: Automatic ring discovery to be disabled

If the automatic ring discovery is enabled, the following error response is returned:

Error code: `SNVS - Status, Not Valid State`

### Validation rule: consistent aid and rid

If both an aid and an rid are specified as input parameters and they are inconsistent, then the following error response is returned

Error code: `IDNV – Input, Data Not Valid, inconsistent aid and rid`

GR-199-CORE

# SET-MAP-RING notification

## Output format

Command syntax: **SET-MAP-RING**:*aid[:rid];*

## Output parameters

### Command parameters

1. **aid** – Access Identifier

   This parameter specifies the aid of an MS-SPRing/BLSR protection group or an port aid being a member of the group.

   Option: If *rid* is specified, then *aid* can be omitted.

   Type: AID.

   Range: TwoFibre_ProtGrpAID (not ranged) or FourFibre_ProtGrpAID (not ranged) or SPortAID (not ranged)

2. **rid** – Ring Identification

   This parameter specifies the ring identification name. Storage and retrieval of the *rid* is case sensitive, but actual use of the rid to determine the corresponding protection group is case insensitive. The parameter is used as an alias to identify exactly one MS-SPRing/BLSR protection group of any type. Therefore the value is unique for all protection groups of type 2F or 4F within the NE.

   Type: text string of chars allowed for TID strings.

   Range: 1 to 15 characters.

   Default: NONE.

   Option: The rid is only included in the SET-MAP-RING notification if the rid has been specified in the **SET-MAP-RING** command.

## Example input/output

The following example reports the creation of a ring map in LT-UNITE's NVM:

```
LT-UNITE 00-11-03 15:00:00
A  000 REPT DBCHG
   "TIME=15-00-00,DATE=00-11-03:SET-MAP-RING:1-1-t001:rid1"
;
```

# SET-OW: Set orderwire and user bytes

## General

The **SET-OW** command associates the overhead byte (E1 or E2 or F1) on an optical port to an overhead access port or removes this association. Furthermore the port-interface (either G.703 or V.11) of the overhead access port can be specified.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 1

Abortable: No.

## Input format

Command syntax: **SET-OW**:*tid*:*aid*:*ctag*:::*spec_block*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **aid** – Access Identifier
   The parameter *aid* specifies the overhead access port to be used for association (or removing the association).
   Type: UserBytePortAID.
   Range: As given by the UserBytePortAID definition, the value "ubioall" is not allowed.
3. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters. Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.

### Spec block parameters

1. **intfctype** – Interface Type
   This parameter specifies which electrical interface standard of the overhead access port is used.
   Two different settings are possible:
   - electrical interface according to G.703
   - electrical interface according to V.11.

Note: The overhead access ports with AIDs ubio1, … ubio4 are configurable to either G703 or V11. The overhead access ports with AIDs ubio5, ubio6 are fixed to V11.

Type: Alphanumeric value set.

Range: G703, V11.

Default: G703 (for the overhead access ports given by the AIDs ubio1 … ubio4); V11 (for the overhead access ports given by the AIDs ubio5, ubio6 – fixed to V11).

2. **ohbyte** – Overhead-Byte

   This parameter specifies which of the overhead bytes is used.

   Three channels are possible:

   - E1 and F1 in the RSOH (section overhead)
   - E2 in the MSOH (line overhead).

   Type: Alphanumeric value set.

   Range: E1, F1, E2.

   Default: E1.

   Note: In output direction the empty string appears as \"\".

3. **portaid** – Port Access Identifier

   This parameter specifies the optical/electrical port (of an OP*n*/EP*n*) of the userbyte to which the overhead access port (given by the command parameter aid) is associated, respectively dis-associated.

   Type: In case an association is established: SPortAID; in case an association will be removed: Alphanumeric value set (i.e. the string "NOCONNECT").

   Range: In case an association is established: SPortAID (No **all** value is supported); in case an association will be removed: NOCONNECT.

   Default: NOCONNECT.

### Output format

If the **SET-OW** command completes successfully, then the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are described in the “Output parameter” section of “RTRV-HDR: Retrieve header” (p. 3-2397).

### Detailed behavior description

The attributes *portaid*, *ohbyte* and *intfctype* of the entity Userbyte port is updated by this command.

This update is reported by a SET-OW notification.

**Example:**

SET-OW:UNITE-NE:ubio3:123456:::portaid=1-1-#-#-5-1,ohbyte=E2,intfctype=V11;

REPT DBCHG

SET-OW:ubio3::port_aid=1-1-#-#-5-1,ohbyte=E2,intfctype=V11;

**Circuit pack type related restrictions**

The Orderwire and User Byte access is only functioning on the following circuit pack types: OP155, EP155, OPLB, all OP10xx packs.

**Update affected entities**

Apart from the Userbyte port entity no further entities are affected by the **SET-OW** command.

## Example input/output

### Example 1

Suppose the Userbyte port given by AID ubio1, to be configured to V11, is associated to the E1-Byte channel of the optical port of an OP10G in slot 10:

```
SET-OW:UNITE-NE:1-1-ubio1:123456:::portaid=1-1-#-#-10-1-1,ohbyte=E1,
   intfctype=V11;

   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

### Example 2

Suppose the association as made in Example-1 is removed (i.e. dis-associated):

```
SET-OW:UNITE-NE:1-1-ubio1:123456:::portaid=NOCONNECT,
ohbyte=E1,intfctype=V11;

   UNITE-NE 00-11-14 12:00:00
M  123456 COMPLD
;
```

## Error responses

### Validation rule: Interface type compliant with port

Command processing verifies that setting the interface type to G.703 is only possible for the UserByte-Ports *ubio1*, … *ubio4* (but not for ubio5 and ubio6).

Error code:
`IDNV – Input, Data Not Valid, Interface type not settable for specified UserByte-Port`

**Validation rule: No association present (when associating)**

Command processing verifies that when setting up an association no association is already present.

This means, that only a one to one relation is allowed between the specified:

- Userbyte of a SDH/SONET optical/electrical port and
- UserByte port.

Error code:
`SNVS – Status, Not in Valid State, association already exists`

**Validation rule: Association present (when dis-associating)**

Command processing verifies that an association exists when trying to remove it.

Error code:
`IENE – Input, Entity Not Exists, Specified association does not exist`

**Validation rule: *ohbyte* and *intfctype* values correct (when dis-associating)**

Command processing shall verify in case of removing the association that the entered value for the parameters ohbyte and intfctype are identical with the current ones.

Error code:
`IDNV – Input, Data Not Valid, discrepancy between entered values and current value of spec-block parameters`

**Validation rule: Port exists (when associating)**

When setting up an association, the command processing verifies that the specified SDH/SONET optical/electrical port exists.

Error code:
`IENE – Input, Entity Not Exists, Specified port does not exist`

**Validation rule: No Userbyte access at EC1 ports on EP51 pack**

When setting up an association, the command processing verifies that the specified port is not a EC1 port on an EP51 pack.

Error code:
`IDNV – Input, Data Not Valid, No Userbyte access at the specified port`

# SET-OW notification

## General

The **SET-OW** notification uses the general format of a **REPT DBCHG** (Report Database Change) notification.

Command syntax: **SET-OW***:aid::spec-block;*

## Output parameters

### Command parameters

1. **aid** – Access Identifier

   This parameter specifies the overhead access port for which the following spec_block parameters are returned.

   Type: UserBytePortAID.

   Range: As given by the UserBytePortAID definition, the value "ubioall" is not allowed.

### Spec block parameters

1. **intfctype** – Interface Type

   This parameter specifies which electrical interface standard of the overhead access port is used.

   Two different settings are possible:

   - electrical interface according to G.703
   - electrical interface according to V.11.

   Note: The overhead access ports with AIDs ubio1, … ubio4 are configurable to either G703 or V11. The overhead access ports with AIDs ubio5, ubio6 are fixed to V11.

   Type: Alphanumeric value set.

   Range: G703, V11.

   Default: G703 (for the overhead access ports given by the AIDs ubio1 … ubio4); V11 (for the overhead access ports given by the AIDs ubio5, ubio6 – fixed to V11).

2. **ohbyte** – Overhead-Byte

   This parameter specifies which of the overhead bytes is used.

   Three channels are possible:

   - E1 and F1 in the RSOH (section overhead)
   - E2 in the MSOH (line overhead).

   Type: Alphanumeric value set.

   Range: E1, F1, E2.

   Default: E1.

   Note: In output direction the empty string appears as \"\".

3. **portaid** – Port Access Identifier

This parameter specifies the optical/electrical port (of an OP*n*/EP*n*) of the userbyte to which the overhead access port (given by the command parameter aid) is associated, respectively dis-associated.

Type: In case an association is established: SPortAID; in case an association will be removed: Alphanumeric value set (i.e. the string "NOCONNECT").

Range: In case an association is established: SPortAID (No **`all`** value is supported); in case an association will be removed: NOCONNECT.

Default: NOCONNECT.

### Behavior description

Refer to the *Detailed behavior description* of "SET-OW: Set orderwire and user bytes" (p. 3-3120).

# SET-SID: Set SID

The **SET-SID** command is used to change the target/source identification of the NE. The command is denied if the system is not in maintenance condition.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): S4

Priority: 1

Abortable: no

## Input format

Command syntax: **SET-SID***:tid::ctag::newsid*;

## Input parameters

### Command parameters

1. **tid** – Target Identifier
   See definition in "RTRV-HDR: Retrieve header" (p. 3-2397).
2. **ctag** – Correlation Tag
   This is included in the command by the TL1 user and is repeated by the network element in the response to allow the TL1 user to associate the command and response messages.
   Type: Alphanumeric string
   Range: non-zero decimal number or identifier of up to 6 characters.
   Note: Current implementation also allows "0" as valid *ctag*, which is an extension to GR-831.
3. **newsid** – New Target/Source Identification
   This is the new name of the NE. Future commands must use this name instead of the current name.
   Type: identifier, in addition the special character underscore "_" and the password characters are allowed, except the characters plus sign ("+"), number sign ("#") and percent sign ("%").
   Range: 1 to 20 characters.
   Default: None

## Output format

If the NE fully complies with the SET-SID request, the normal completion response is returned as shown below:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

## Detailed behavior description

This command provides a new name to the NE.

The update is reported by means of an SET-SID notification.

The **SET-SID** command is denied if the system is not in maintenance condition. Maintenance condition applies only to NE.

The new SID will come into effect only after reset of the CTL. This reset takes place autonomously when the maintenance condition is left. Commands after the reset must use the new SID instead of the current name.

The response as well as corresponding **REPT DBCHG** notification use the old SID in the *sid* parameter.

The **SET-SID** command generates a **REPT DBCHG** message.

### Updated affected entities

There is no further entities affected.

If the NE is a node in a BLSR ring/MS-SPRing and the TID is changed, then this may impact cross-connection entities of ring neighbors. Since these updates are reported by NEs not addressed in the command request, these events are treated like autonomous events. For further details see corresponding section in the transmission chapter – entity cross-connection.

## Example input/output

The following shows an example of the **SET-SID** command where the target/source identification of the NE was changed to HARRY:

```
SET-SID:LT-UNITE::123456::HARRY;

   LT-UNITE 00-11-15 08:00:00
M  123456 COMPLD
;
```

## Error responses

Refer to the section "Error responses" of "RTRV-HDR: Retrieve header" (p. 3-2397). The error responses listed there also apply to the **SET-SID** command.

### Validation rule: Check of Maintenance Condition

If a SET-SID command is entered when the administrative state of the system is not in maintenance condition, the following error response is returned.

Error code:

```
SNVS - Status, Not in Valid State, not in Maintenance Condition
```

### Validation rule: Uniqueness of TID within Ringmaps

If the new sid conflicts with an existing TID in at least one of the valid ringmaps, the following error response is returned.

Error code:

```
IDNV - Input, Data Not Valid, sid is already used by another
BLSR/MS-SPRing Node
```

GR-833-CORE, "Surveillance Messages"

# SET-SID notification

## Output format

The **SET-SID** notification uses the general format of a **REPT DBCHG** (Report Database Change) notification.

Syntax: **SET-SID**::*newsid*

## Output parameters

### Command parameters

1. **newsid** – New Target/Source Identification
   See definition of input parameter *tid* in "RTRV-HDR: Retrieve header" (p. 3-2397).

## Example output

```
SET-SID:LT-UNITE::805::HARRY;

   LT-UNITE  00-11-17  10:11:00
M  805  COMPLD;

   LT-UNITE  00-11-17  10:12:03
A  610  REPT  DBCHG
   Time=13-49-30,DATE=00-11-17:SET-SID::HARRY"
;
```

# SET-SYNCN: Set synchronization

The **SET-SYNCN** command is used to provision system timing clock mode, assign timing references, and external input and output timing port attributes. The command is used not only to assign system timing attributes but also to modify or remove them.

## Properties

Login privilege: User Privilege Code (UCFC/UCAL): M3

Priority: 1

Abortable: No.

## Input format

Command syntax: **SET-SYNCN**:*tid*:*aid*:*ctag*:::*spec_block*;

## Input parameters

### Command parameters

1. **tid** – target identifier

   See definition of *tid – target identifier* in "RTRV-HDR: Retrieve header" (p. 3-2397).

2. **aid** – access identifier

   This parameter specifies the timing related settings. The AID separates the parameter in system timing related parameter, parameters related to assigned timing references and parameters for port provisioning. The values all or *someprefix* all are not allowed in this context.

   Type: AID

   Range: SystemAID, External_timing_ref_AID, Line_timing_ref_AID, External_Timing_input_port_AID, External_Timing_output_port_AID

   Default: Not applicable.

3. **ctag** – correlation tag

   See definition of *ctag – correlation tag* in "RTRV-HDR: Retrieve header" (p. 3-2397).

### Spec block parameters

1. System Timing

   a. **clkmod** – clock mode

      This parameter specifies the provisioned operational mode of the system timing. In the clockmod = FREE-RUNNING mode the system clock process uses the internal oscillator as reference. In the clockmod = LOCKED mode the system clock process uses the input signal from the system.

      Type: Alphanumeric value set.

      Range: FREE-RUNNING, LOCKED.

      Default: FREE-RUNNING.

   b. **syncmsg** – system synchronization status messaging mode

This parameter is used to ENABLE or DISABLE the SSM protocol.

The parameter provisions the automatic reference selection process to use the incoming QLs in QL-enabled mode or to ignore them in QL-disabled mode. In case of DISABLE, for SDH all output SSMs are set to DNU, for SONET all output SSMs are set to STU.

Type: Alphanumeric value set.

Range: ENABLE, DISABLE.

Default: ENABLE.

c. **`timing`** – ASAP name

This parameter specifies the name of the ASAP (Alarm Severity Assignment Profile) that is assigned to timing.

Type: Alphanumeric value set.

Range: PFNAME (alphanumeric string with 1… 24 characters). A hyphen ("-") is allowed in the name additionally.

Default: Default

d. **`wtr`** – wait to restore

This parameter specifies the provisioned wait to restore timer used for all timing ports for revertive switching. This is the amount of time it takes to switch from lower priority to higher priority references. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: 0SEC, 20SEC, 0…60MIN (1 minute steps), 99 (infinite).

SDH: 0SEC, 0…60MIN (1 minute steps); the values "0SEC" and "0MIN" can be used for SONET and SDH to provision a zero wait to restore time.

Default:

SONET: 20SEC

SDH: 5MIN

2. Assigned Timing Reference

a. **`extout_pri`** – timing output reference priority

This parameter specifies the priority assignment of the timing link switch of the external output timing. This parameter is only for SDH and for line timing references.

The greater the number the lower the priority. The number "1" indicates the highest priority. The priority "0" means not assigned for external output.

Type: Numeric value set.

Range: 0 (means DISABLED), 1, 2, 3, 4, 5, 6.

Default: 0 (means DISABLED).

b. **`ql_prov`** – quality provisioned

This parameter defines the quality for the specified timing reference to a fixed SSM value. It is the provisioned quality level sync message value that will be received on timing references.

This parameter is related to all assigned timing references (both external timing references and line timing references) and overrides what is received for the respective timing reference. The AUTO value implies sync message support. The AUTO value is rejected if SSM is not supported for the assigned timing reference (i.e. for DS1 SF). The value range depends from the system synchronization characteristic. Per default is:

AUTO – for STM-N/OC-N line, 2Mbit/s framed or DS1 ESF with SSM,

SSUT – for 2MHz, 2Mbit/s unframed or framed without SSM

STU – for DS1 SF or DS1 ESF without SSM

Type: Alphanumeric value set.

Range:

SONET: AUTO, PRS, STU, ST2, ST3

SDH: AUTO, PRC, SSUL, SSUT, SEC.

Default:

SONET: AUTO (External_timing_ref_AID, Line_timing_ref_AID)

SDH: AUTO (Line_timing_ref_AID) SSUT (External_timing_ref_AID).

c. **syncref_pri** – system timing reference priority

This parameter defines the priority for assigned timing references.

When multiple input references have been given the same priority value, it implies non-revertive switching between the associated references. Otherwise, it implies revertive switching to the reference with the highest assigned priority. When the QL-control is disabled, the selection process is controlled by signal status and port priority. The greater the number, the lower the priority. Priority "0" means not assigned.

Type: Numeric value set.

Range: 0 (means DISABLE), 1, 2, 3, 4, 5, 6, 7, 8.

Default: 0 (means DISABLE).

d. **timing** – ASAP name

This parameter specifies the name of the ASAP (Alarm Severity Assignment Profile) that is assigned to timing.

Type: Alphanumeric value set.

Range: PFNAME (alphanumeric string with 1… 24 characters). A hyphen (“-”) is allowed in the name additionally.

Default: Default

e. **tpmode** – timing port mode monitoring

This parameter specifies the monitoring status of the timing port. If the timing port is in the MONITORED mode and the reference is in FAILED status alarms are active for this port. The value NOT-MONITORED means that alarm monitoring is not occurring on the port.

Type: Alphanumeric value set.

Range: MONITORED, NOT-MONITORED.

Default: NOT-MONITORED.

f. **tref_aid** – timing reference assigned port AID

This parameter specifies the port AID of the assigned timing reference AID.

The parameter is rejected, if the timing reference already assigned to a timing port, or if the reference does not support SSM and timing port is provisioned AUTO, or if the unit which delivers the reference is not present or pre-provisioned. It is not possible to assign more then one reference from a unit. It is not possible to un-assign units from which a reference is assigned to a timing port. It is also not possible to assign a reference from a protection port in a protection group. The value NOT-CONNECTED means no reference is assigned to current timing port.

Type: AID.

Range: External_Timing_input_port_AID, SPortAID, NOT-CONNECTED.

Default: NOT-CONNECTED.

3. External Timing Input

   a. **ext_if** – external input signal format

   This parameter specifies the format of the external timing input.

   The value range depends on the system synchronization characteristic. The external timing input format can be set at both external timing inputs individually. The reference is rejected, if the reference does not support SSM and the timing port is provisioned AUTO.

   Type: Alphanumeric value set.

   Range:

   SONET: SF, ESF

   SDH: 2MHz, 2Mbit-unframed, 2Mbit-framed.

   Default:

   SONET: ESF

   SDH: 2MHz.

   b. **ext_isa** – external input sa bit location

   This parameter defines the external input Sa bit location. It is only valid for the external timing input format “2Mbit/s” framed; i.e. for ports with format unequal to “2Mbit/s framed” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

   The location of the Sa bit is can be set at both external timing inputs individually. One of the Sa4 to Sa8 bits of the 2Mbit/s sub-multiframe is allocated for Synchronization Status Messages (SSM).

   Type: Alphanumeric value set.

   Range: SA4, SA5, SA6, SA7, SA8.

   Default: SA4.

4. External Timing Output

   a. **ext_equ** – cable equalization

   This parameter specifies the timing output cable equalization to adjust the specified timing reference output signal power. This parameter is valid only for DS1 (SONET).

   This parameter is rejected for all input interfaces except DS1. The values are represented by percentage (3.0dB=100%; 2.4dB=80%; 1.8dB=60%; 1.2dB=40%; 0.6dB=20%).

Type: Numeric value set.
Range: 20, 40, 60, 80, 100.
Default: 20.

b. **ext_of** – external output signal format

This parameter specifies the external output signal format. The value range depends from the system synchronization characteristic.
Type: Alphanumeric value set.
Range:
SONET: SF, ESF
SDH: 2MHz, 2Mbit-unframed, 2Mbit-framed.
Default:
SONET: ESF
SDH: 2MHz.

c. **ext_osa** – external output sa bit location

This parameter defines the external output Sa bit location. This parameter is only valid for external timing output format “2Mbit/s framed”; i.e. for ports with format unequal to “2Mbit/s framed” the parameter value is retrievable, but it has no impact on the ports transmission behavior.
Type: Alphanumeric value set.
Range: SA4, SA5, SA6, SA7, SA8.
Default: SA4.

d. **extout_en** – external timing output enabling/disabling

This parameter specifies whether the external timing output is enabled or disabled.
Type: Alphanumeric value set.
Range: ENABLE, DISABLE.
Default: DISABLE.

e. **extout_prov** – external timing output selection

This parameter specifies the operation mode of the external output timing.
The value SETG means the system clock. The value TLS means the output. For SONET both values are fixed to the respective external timing output. The value range depends on the system synchronization characteristic.
Type: Alphanumeric value set.
Range:
SONET: LINE1 [ fix for output 1 ], LINE2 [ fix for output 2 ]
SDH: SETG, TLS.
Default: SONET: LINE1 [ fix for output 1 ], LINE2 [ fix for output 2 ]
SDH: SETG.

f. **extout_ssm** – external timing output AIS mode

This parameter specifies which value will be send when the signal level is below the quality acceptance level or when *frcdus* is enabled. The parameter is valid depending from the system synchronization characteristic, for SDH 2Mbit/s framed and for SONET DS1 ESF; i.e. for ports with format unequal to “2Mbit/s framed” or “DS1 ESF” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

The value AISMODE means AIS is inserted in the external timing output signal. The value QLMODE means DUS is inserted in the external timing output signal.

Type: Alphanumeric value set.

Range: AISMODE, QLMODE.

Default: QLMODE.

g. **`frcdus`** – forced DNU/DUS

This parameter specifies the synchronization messaging forced DNU/DUS enable or disable for the timing output port. DUS applies to SONET and DNU applies to SDH. This is only valid for '2Mbit/s framed' and 'DS1 ESF'; i.e. for ports with format unequal to “2Mbit/s framed” or “DS1 ESF” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

Type: Alphanumeric value set.

Range: ENABLE, DISABLE.

Default: DISABLE.

h. **`loopdelay`** – timing regenerator loop delay

This parameter indicates the delay in the SASE/BITS loop operation. The values are represented by seconds in steps of 1 seconds per loop.

Type: Numeric value set.

Range: 0…60 (1 seconds steps).

Default: 10.

i. **`qlout_tais`** – acceptance quality level for output threshold AIS

This parameter is the provisioned quality acceptance level for external timing output. When the incoming message is below this level, AIS or DUS (depending from the *extout_ssm* value) will be inserted into the external timing output. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: PRS, STU, ST2, ST3

SDH: PRC, SSUT, SSUL, SEC.

Default:

SONET: ST3

SDH: SEC.

j. **`regen_loop`** – timing regenerator loop

This parameter specifies the avoiding of loops over the SASE/BITS clocks.

When this parameter is set to ENABLED, the synchronization message DUS will be inserted in the traffic output port associated with the traffic input port used as source for the station clock. The parameter is selectable for both external timing outputs individually.

Type: Alphanumeric value set.
Range:
SONET: DISABLE, ENABLE
SDH: DISABLE, EXTREF1, EXTREF2, BOTH.
Default:
SONET: ENABLE
SDH: DISABLE.

k. **`timing`** – ASAP name

This parameter specifies the name of the ASAP (Alarm Severity Assignment Profile) that is assigned to timing.
Type: Alphanumeric value set.
Range: PFNAME (alphanumeric string with 1… 24 characters). A hyphen ("-") is allowed in the name additionally.
Default: Default

### Output format

After receiving the **`SET-SYNCN`** command, the following normal completion response is returned:

```
   sid date time
M  ctag COMPLD
;
```

The output parameters *sid*, *date*, *time*, and *ctag* included in the normal completion response are specified in the section "Output parameters" of "RTRV-HDR: Retrieve header" (p. 3-2397).

### Detailed behavior description

After successful receiving the **`SET-SYNCN`** command a **`REPT DBCHG`** database change notification is returned. This notification consists the same parameter as per delivered by the command. Notifications are sent whenever a user-provisionable parameter has been changed.

When the system receives a SET-SYNCN command with changing of the clock mode, a REPT EVT report event notification is returned.

If the system receives a SET-SYNCN command with changing of the active timing reference, a REPT EVT report event notification is returned.

It is not possible to assign a reference from a protection port in a protection group.

If the system synchronization characteristic is SONET and the SSM is invalid the value DUS is displayed for QL values.

It is possible to provision a QL acceptance level to the external timing output. If the system quality below this acceptance QL level and QL control is enabled and the external timing output is enabled then an AIS signal or DUS, depending on settings of parameter *extout_ssm*, is substituted in the output.

If the system timing QL mode is DISABLED for SDH all output SSMs are set to DNU, for SONET all output SSMs are set to STU.

If the system synchronization characteristic is SDH and the external timing input format is either 2MHz or 2Mbit/s unframed or 2Mbit/s framed without SSM then the assigned timing reference status are default SSUT. If the system synchronization characteristic is SONET and the external timing input format is either SF or ESF without SSM then the assigned timing reference status are default STU. The value AUTO is rejected if SSM is not supported for the assigned timing reference.

It is possible to provision the automatic reference selection process to use the incoming QLs in QL-enabled mode. The input with the highest quality level is selected. If there is more then one input with the same highest quality level, then the input with the highest port priority is selected. In QL-disabled mode the reference selection is working by priority provisioning. It is possible to assign the same priority to multiple inputs. In this case, it implies non revertive switching between the associated references.

A MS-SPRing/BLSR span or MSP pair is handled as one transport port, so also counts as one reference signal. If one of the sections of the pair do not support SSM, the reported QL status is NOT-SUPPORTED.

If the timing port is in the NOT-MONITORED mode then no Timing Link Fail alarm will be active when reference is in FAILED status or no Timing Link Unequipped alarm will be active when the reference is in NOT-CONNECTED state.

If the external input signal format ext_if is changed to an unframed mode without also specifying the external input ssm support ext_issm then the external input ssm support ext_issm is set to NOT-SUPPORTED autonomously if not already having this value. The change is reported via a SET-SYNCN notification.

### Example input/output

The following is an example of the **SET-SYNCN** command for System Timing:

```
SET-SYNCN:LT-UNITE:system:123456:::clkmod=LOCKED,wtr=1MIN;

   LT-UNITE 00-11-14 12:00:00
M  123456 COMPLD
;
```

The following is an example of the **SET-SYNCN** command for Assigned Timing Reference:

```
SET-SYNCN:LT-UNITE:extref1:123456:::tref_aid=EXTTMG0,
```

```
ql_prov=SSUL;

   LT-UNITE 00-11-14 12:00:00
M  123456 COMPLD
;
```

The following is an example of the **SET-SYNCN** command for External Timing Input:

```
SET-SYNCN:LT-UNITE:exttmg1:123456:::ext_if=2MHZ;

   LT-UNITE 00-11-14 12:00:00
M  123456 COMPLD
;
```

The following is an example of the **SET-SYNCN** command for External Timing Output:

```
SET-SYNCN:LT-UNITE:exttmg0_out:123456:::ext_of=2MHZ,extout_en=ENABLE;

   LT-UNITE 00-11-14 12:00:00
M  123456 COMPLD
;
```

## Error responses

### Validation rule: Timing reference already assigned

If a timing reference already assigned to a timing port or circuit pack the system responds with:

Error code:

```
SDNC – Status, Data Not Consistent, reference already assigned
```

### Validation rule: One timing port for a circuit pack

If a second port of a circuit pack is assigned to a timing reference the system responds with:

Error code:

```
SDNC – Status, Data Not Consistent, other port already assigned
```

### Validation rule: No timing port on protection pack of an MS protected timing port

If another port of a circuit pack where the protection port of an MS protection group is located whose associated worker port for this span has already a timing reference being assigned the system shall respond with:

Error code:

```
SDNC – Status, Data Not Consistent, other port already assigned
```

"MS protection group" denotes an MSP/APS or a 4 fibre MS SPRING/BLSR group.

**Validation rule: Timing reference other than working port 1 of MSP 1:N protection**

The system reject an **SET-SYNCN** command, if a timing reference is assigned to a port of a 1:N MSP group and this port is not associated with working channel number 1.

Error code:
`IDNC - Input, Data Not Consistent, Timing reference other than MSP Working channel number 1`

"MS protection group" denotes an MSP/APS or a 4 fibre MS SPRING/BLSR group.

**Validation rule: No out-of-service state for timing port**

If an 'out of service' port (i.e. the port attribute *servcond* has the value 'OUTOFSERVICE') is assigned to a timing reference the system responds with:

Error code:
`SDNC – Status, Data Not Consistent, port is out-of-service`

A port must be in the out-of-service before any port loop can be switched. Therefore it is sufficient to request for a timing reference assignment, that a port is not in the out-of-service state in order to prevent timing loops caused by port loops; i.e. a port that is not in out-of-service state will not have a switched port loop.

**Validation rule: Timing reference from a protection port in a protection group only allowed in asymmetric spans of a ring**

If a timing reference is assigned from a protection port in a protection group which is not part of an asymmetric span, the system shall respond with:

Error code:
`SDNC – Status, Data Not Consistent, reference in protection group`

The characteristic of an asymmetric ring is that one or more spans have only protection lines, no working lines (asymmetric spans). In these asymmetric spans it must be possible to use the protection ports for timing.

**Validation rule: Port is already assigned to another timing reference**

Ports can be assigned only one. If a port already assigned to a timing reference the system responds with:

Error code:
`SDNC – Status, Data Not Consistent, port already assigned`

**Validation rule: Command rejection if quality evaluation disabled**

If the quality mode disabled the setting to forced DUS/DNU or the setting the quality output threshold AIS is rejected and the system responds with:

Error code:
`SDNC – Status, Data Not Consistent, quality evaluation disabled`

**Validation rule: No transparent port as line timing reference**

The system shall not allow to use a Transparent Port, i.e. ports with a rate of STM16T or OC48T, as line timing reference.

Error code:

```
IDNV – Input, Data Not Valid, Transparent Ports not allowed as
line timing reference
```

**Validation rule: No DS3 Port as line timing reference**

The system shall not allow to use a DS3 Port, i.e. a port with a rate of T3, as line timing reference.

Error code:

```
IDNV – Input, Data Not Valid, DS3 Ports not allowed as line
timing reference
```

**Validation rule: No EC1 Port as line timing reference**

The system shall not allow to use a EC1 Port as line timing reference.

Error code:

```
IDNV – Input, Data Not Valid, EC1 Ports not allowed as line
timing reference
```

**Validation rule: SSM not supported**

SSM support is rejected for invalid input or output format types and the system responds with:

Error code:

```
IDNV – Input, Data Not Valid, SSM not supported for this format
```

**Validation rule: SSM not supported for unframed formats**

Setting an invalid combination of external input frame format (ext_if) and external input SSM support (ext_issm) by changing one or both parameters are rejected and the system shall respond with:

Error code:

```
IDNV – Input, Data Not Valid, SSM not supported for this format
```

**Validation rule: Format not supported for forced DNU/DUS**

DNU/DUS provisioning is rejected for invalid output format types and the system responds with:

Error code:

```
IDNV – Input, Data Not Valid, forced DUS not supported for this
format
```

**Validation rule: Input / Output format not supported for Sa bit settings**

Sa bit location setting is rejected for invalid input or output format types and the system responds with:

Error code:
`IDNV – Input, Data Not Valid, Sa bit location not supported`

**Validation rule: SSM not supported if timing port provisioned AUTO**

If a timing port provisioned AUTO and the reference which is being assigned does not support SSM, the assignment request is rejected and the system responds with:

Error code:
`IDNV – Input, Data Not Valid, SSM not supported for provisioned QL`

**Validation rule: Output type not supported for AIS mode**

If the AIS mode provisioned to a not supported output type then the system responds with:

Error code: `IDNV – Input, Data Not Valid, AIS mode not valid`

**Validation rule: Cable equalization not supported**

If the cable equalization provisioned to a not supported output type or if the system synchronization characteristic is SDH then the system responds with:

Error code:
`IDNV – Input, Data Not Valid, cable equalization not supported`

**Validation rule: Timing clock mode inconsistent**

If the NE receives a command with FREE-RUNNING provisioning while the clock mode switch request state is forced holdover, the following error response is returned:

Error code:
`SNVS – Status, Not in Valid State, timing clock mode inconsistent`

**Validation rule: Regenerator loops with SETG as timing output**

If the output timing source selection is set to SETG and the timing regenerator loop is provisioned, then the system responds with:

Error code:
`IDNV – Input, Data Not Valid, no regen loop with SETG as timing output`

# SET-SYNCN notification

## Output format

The **SET-SYNCN** notification uses the general format of a **REPT DBCHG** (Report Database Change) notification.

The **SET-SYNCN** notification has the following specific syntax:

**SET-SYNCN**:*aid*::*spec_block*

## Output parameters

### Command parameters

1. **aid** – access identifier

   The AID is used to specify the timing related settings. The AID separates the parameter in system timing related parameter, parameters related to assigned timing references and parameters for port provisioning. The values all or someprefix all are not allowed in this context.

   Type: AID

   Range:

   - SystemAID
   - External_timing_ref_AID
   - Line_timing_ref_AID
   - External_Timing_input_port_AID
   - External_Timing_output_port_AID

### Spec block parameters

1. System Timing

   a. **clkmod** – clock mode

   This parameter specifies the provisioned operational mode of the system timing. In the *clockmod* = FREE-RUNNING mode the system clock process uses the internal oscillator as reference. In the *clockmod* = LOCKED mode the system clock process uses the input signal from the system.

   Type: Alphanumeric value set.

   Range: FREE-RUNNING, LOCKED.

   Default: FREE-RUNNING.

   b. **syncmsg** – system synchronization status messaging mode

   This parameter is used to ENABLE or DISABLE the SSM protocol.

   The parameter provisions the automatic reference selection process to use the incoming QLs in QL-enabled mode or to ignore them in QL-disabled mode. In case of DISABLE, for SDH all output SSMs are set to DNU, for SONET all output SSMs are set to STU.

   Type: Alphanumeric value set.

Range: ENABLE, DISABLE.

Default: ENABLE.

c. **timing** – ASAP name

This parameter specifies the name of the ASAP (Alarm Severity Assignment Profile) that is assigned to timing.

Type: Alphanumeric value set.

Range: PFNAME (alphanumeric string with 1… 24 characters). A hyphen ("-") is allowed in the name additionally.

Default: Default

d. **wtr** – wait to restore

This parameter specifies the provisioned wait to restore timer used for all timing ports for revertive switching. This is the amount of time it takes to switch from lower priority to higher priority references. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: 0SEC, 20SEC, 0…60MIN (1 minute steps), 99 (infinite).

SDH: 0SEC, 0…60MIN (1 minute steps); the values "0SEC" and "0MIN" can be used for SONET and SDH to provision a zero wait to restore time.

Default:

SONET: 20SEC

SDH: 5MIN

2. Assigned Timing Reference

a. **extout_pri** – timing output reference priority

This parameter specifies the priority assignment of the timing link switch of the external output timing. This parameter is only for SDH and for line timing references.

The greater the number the lower the priority. The number "1" indicates the highest priority. The priority "0" means not assigned for external output.

Type: Numeric value set.

Range: 0 (means DISABLED), 1, 2, 3, 4, 5, 6.

Default: 0 (means DISABLED).

b. **ql_prov** – quality provisioned

This parameter defines the quality for the specified timing reference to a fixed SSM value. It is the provisioned quality level sync message value that will be received on timing references.

This parameter is related to all assigned timing references (both external timing references and line timing references) and overrides what is received for the respective timing reference. The AUTO value implies sync message support. The AUTO value is rejected if SSM is not supported for the assigned timing reference (i.e. for DS1 SF). The value range depends from the system synchronization characteristic. Per default is:

AUTO – for STM-N/OC-N line, 2Mbit/s framed or DS1 ESF with SSM,

SSUT – for 2MHz, 2Mbit/s unframed or framed without SSM

STU – for DS1 SF or DS1 ESF without SSM

Type: Alphanumeric value set.

Range:

SONET: AUTO, PRS, STU, ST2, ST3

SDH: AUTO, PRC, SSUL, SSUT, SEC.

Default:

SONET: AUTO (External_timing_ref_AID, Line_timing_ref_AID)

SDH: AUTO (Line_timing_ref_AID) SSUT (External_timing_ref_AID).

c. **`syncref_pri`** – system timing reference priority

This parameter defines the priority for assigned timing references.

When multiple input references have been given the same priority value, it implies non-revertive switching between the associated references. Otherwise, it implies revertive switching to the reference with the highest assigned priority. When the QL-control is disabled, the selection process is controlled by signal status and port priority. The greater the number, the lower the priority. Priority "0" means not assigned.

Type: Numeric value set.

Range: 0 (means DISABLE), 1, 2, 3, 4, 5, 6, 7, 8.

Default: 0 (means DISABLE).

d. **`timing`** – ASAP name

This parameter specifies the name of the ASAP (Alarm Severity Assignment Profile) that is assigned to timing.

Type: Alphanumeric value set.

Range: PFNAME (alphanumeric string with 1… 24 characters). A hyphen (“-”) is allowed in the name additionally.

Default: Default

e. **`tpmode`** – timing port mode monitoring

This parameter specifies the monitoring status of the timing port. If the timing port is in the MONITORED mode and the reference is in FAILED status alarms are active for this port. The value NOT-MONITORED means that alarm monitoring is not occurring on the port.

Type: Alphanumeric value set.

Range: MONITORED, NOT-MONITORED.

Default: NOT-MONITORED.

f. **`tref_aid`** – timing reference assigned port AID

This parameter specifies the port AID of the assigned timing reference AID.

The parameter is rejected, if the timing reference already assigned to a timing port, or if the reference does not support SSM and timing port is provisioned AUTO, or if the unit which delivers the reference is not present or pre-provisioned. It is not possible to assign more then one reference from a unit. It is not possible to un-assign units from which a reference is assigned to a timing port. It is also not possible to assign a reference from a protection port in a protection group. The value NOT-CONNECTED means no reference is assigned to current timing port.

Type: AID.

Range: External_Timing_input_port_AID, SPortAID, NOT-CONNECTED.

Default: NOT-CONNECTED.

3. External Timing Input

   a. **ext_if** – external input signal format

      This parameter specifies the format of the external timing input.

      The value range depends on the system synchronization characteristic. The external timing input format can be set at both external timing inputs individually. The reference is rejected, if the reference does not support SSM and the timing port is provisioned AUTO.

      Type: Alphanumeric value set.

      Range:

      SONET: SF, ESF

      SDH: 2MHz, 2Mbit-unframed, 2Mbit-framed.

      Default:

      SONET: ESF

      SDH: 2MHz.

   b. **ext_isa** – external input sa bit location

      This parameter defines the external input Sa bit location. It is only valid for the external timing input format “2Mbit/s” framed; i.e. for ports with format unequal to “2Mbit/s framed” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

      The location of the Sa bit is can be set at both external timing inputs individually. One of the Sa4 to Sa8 bits of the 2Mbit/s sub-multiframe is allocated for Synchronization Status Messages (SSM).

      Type: Alphanumeric value set.

      Range: SA4, SA5, SA6, SA7, SA8.

      Default: SA4.

4. External Timing Output

   a. **ext_equ** – cable equalization

      This parameter specifies the timing output cable equalization to adjust the specified timing reference output signal power. This parameter is valid only for DS1 (SONET).

      This parameter is rejected for all input interfaces except DS1. The values are represented by percentage (3.0dB=100%; 2.4dB=80%; 1.8dB=60%; 1.2dB=40%; 0.6dB=20%).

      Type: Numeric value set.

      Range: 20, 40, 60, 80, 100.

      Default: 20.

   b. **ext_of** – external output signal format

      This parameter specifies the external output signal format. The value range depends from the system synchronization characteristic.

      Type: Alphanumeric value set.

Range:
SONET: SF, ESF
SDH: 2MHz, 2Mbit-unframed, 2Mbit-framed.
Default:
SONET: ESF
SDH: 2MHz.

c. **ext_osa** – external output sa bit location

This parameter defines the external output Sa bit location. This parameter is only valid for external timing output format "2Mbit/s framed"; i.e. for ports with format unequal to "2Mbit/s framed" the parameter value is retrievable, but it has no impact on the ports transmission behavior.

Type: Alphanumeric value set.

Range: SA4, SA5, SA6, SA7, SA8.

Default: SA4.

d. **extout_en** – external timing output enabling/disabling

This parameter specifies whether the external timing output is enabled or disabled.

Type: Alphanumeric value set.

Range: ENABLE, DISABLE.

Default: DISABLE.

e. **extout_prov** – external timing output selection

This parameter specifies the operation mode of the external output timing.

The value SETG means the system clock. The value TLS means the output. For SONET both values are fixed to the respective external timing output. The value range depends on the system synchronization characteristic.

Type: Alphanumeric value set.

Range:
SONET: LINE1 [ fix for output 1 ], LINE2 [ fix for output 2 ]
SDH: SETG, TLS.

Default: SONET: LINE1 [ fix for output 1 ], LINE2 [ fix for output 2 ]
SDH: SETG.

f. **extout_ssm** – external timing output AIS mode

This parameter specifies which value will be send when the signal level is below the quality acceptance level or when *frcdus* is enabled. The parameter is valid depending from the system synchronization characteristic, for SDH 2Mbit/s framed and for SONET DS1 ESF; i.e. for ports with format unequal to "2Mbit/s framed" or "DS1 ESF" the parameter value is retrievable, but it has no impact on the ports transmission behavior.

The value AISMODE means AIS is inserted in the external timing output signal. The value QLMODE means DUS is inserted in the external timing output signal.

Type: Alphanumeric value set.

Range: AISMODE, QLMODE.

Default: QLMODE.

g. **frcdus** – forced DNU/DUS

This parameter specifies the synchronization messaging forced DNU/DUS enable or disable for the timing output port. DUS applies to SONET and DNU applies to SDH. This is only valid for '2Mbit/s framed' and 'DS1 ESF'; i.e. for ports with format unequal to “2Mbit/s framed” or “DS1 ESF” the parameter value is retrievable, but it has no impact on the ports transmission behavior.

Type: Alphanumeric value set.

Range: ENABLE, DISABLE.

Default: DISABLE.

h. **`loopdelay`** – timing regenerator loop delay

This parameter indicates the delay in the SASE/BITS loop operation. The values are represented by seconds in steps of 1 seconds per loop.

Type: Numeric value set.

Range: 0…60 (1 seconds steps).

Default: 10.

i. **`qlout_tais`** – acceptance quality level for output threshold AIS

This parameter is the provisioned quality acceptance level for external timing output. When the incoming message is below this level, AIS or DUS (depending from the *extout_ssm* value) will be inserted into the external timing output. The value range depends from the system synchronization characteristic.

Type: Alphanumeric value set.

Range:

SONET: PRS, STU, ST2, ST3

SDH: PRC, SSUT, SSUL, SEC.

Default:

SONET: ST3

SDH: SEC.

j. **`regen_loop`** – timing regenerator loop

This parameter specifies the avoiding of loops over the SASE/BITS clocks.

When this parameter is set to ENABLED, the synchronization message DUS will be inserted in the traffic output port associated with the traffic input port used as source for the station clock. The parameter is selectable for both external timing outputs individually.

Type: Alphanumeric value set.

Range:

SONET: DISABLE, ENABLE

SDH: DISABLE, EXTREF1, EXTREF2, BOTH.

Default:

SONET: ENABLE

SDH: DISABLE.

k. **`timing`** – ASAP name

This parameter specifies the name of the ASAP (Alarm Severity Assignment Profile) that is assigned to timing.

Type: Alphanumeric value set.

Range: PFNAME (alphanumeric string with 1… 24 characters). A hyphen (“-”) is allowed in the name additionally.
Default: Default

## Example output

The following is an example of the SET-SYNCN notification for System Timing:

```
   LT-UNITE 00-11-16 12:00:00
A  000 REPT DBCHG
   "TIME=12-00-00,DATE=00-11-16:SET-SYNCN:SYSTEM::wtr=2MIN"
;
```

The following is an example of the SET-SYNCN notification for Assigned Timing Reference:

```
   LT-UNITE 00-11-16 12:00:00
A  000 REPT DBCHG
   "TIME=12-00-00,DATE=00-11-16:SET-SYNCN:LINE2::ql_prov=PRC"
;
```

The following is an example of the SET-SYNCN notification for External Timing Input:

```
   LT-UNITE 00-11-16 12:00:00
A  000 REPT DBCHG
   "TIME=12-00-00,DATE=00-11-16:SET-SYNCN:EXTTMG0::ext_isa=SA5,
ext_if=2MBIT-FRAMED"
;
```

The following is an example of the SET-SYNCN notification for External Timing Output:

```
   LT-UNITE 00-11-16 12:00:00
A  000 REPT DBCHG
   "TIME=12-00-00,DATE=00-11-16:SET-SYNCN:EXTTMG1_OUT::ql_out=SEC,
extout_ssm=AISMODE"
;
```

# TCA notification

## Output format

The **`Threshold Crossing Alert`** notification uses the general format of a **`REPT EVT`** notification.

Command syntax: **`REPT EVT`** *modifier*
*aid:condtype,condeff,ocrdat,ocrtm,,,,thlev,tmper:conddescr*

## Output parameter

1. **`modifier`**
   This parameter indicates the port type or tributary on which the **`INIT-REG`** command is to act on.
   Type: Alphanumeric value set.
   Range:
   The following values are for SONET only:
   - STS1, STS3C, STS12C, STS48C, STS192C, OC3, OC12, OC48, OC48T, OC192, OC768, T3, EC1, LOVT1.

   The following values are for TransMUX only:
   - TMAT3, TMASTS1, DS1

   The following values are for SDH only:
   - VC3, VC4, VC44C, VC416C, VC464C, STM1E, STM1, STM4, STM16, STM16T, STM64, STM256, ODU1, LOVC3, LOVC12

   The following value is for Ethernet only:ENET, 1GEPL, 10GEPL.
2. **`aid`** – Access Identifier
   Type: AID
   Range:
   - For STM<N>, STM<N>T, OC<N>, EC1 and OC<N>T ports: SPortAID
   - For Ethernet ports: EPortAID VCGAID
   - For DS3 ports: APortAID, TMuxAPortAID
   - For DS1 NIM: DS1NumAID
   - For ODU terminations: VCGAID
   - For STS/VC tribs: STS1NumAID, TMuxAPTNumAID
   - For VCG tribs: VCGNumAID
   - For LOXC related LO tribs: GenLOTribAID.
3. **`condeff`** – Condition Effect
   This parameter indicates the effect of the reported event on the NE. It is used to distinguish between persistent and transient alarms/events.

Two state transitions can be distinguished for a persistent alarm/event:

- raise transition: state change from not present to present
- clear transition: state change from present to not present.

A transient alarm/event has no 'presence' state; i.e. just the occurrence of that event/alarm is reported. ABN condition are always persistent and not transient.

Type: Alphanumeric value set.

Range:

- CL: Standing condition cleared for a persistent alarm/event.
- SC: Standing condition raised for a persistent alarm/event
- TC: Transient condition occurred for a transient alarms/events.

4. **conddescr** – Description Of The Condition

   The general format is: category, entity, description, additional text. If there is no additional text, then the trailing comma may be omitted.

   Type: inner string

   Range:

   - For STM<N>, STM<N>T, OC<N>T, OC<N> and EC1: Quality of service, {rr} port, TCA where rr is equal to the port rate
   - For ODU<N>: Quality of service, {rr} path, TCA where rr is equal to the ODU rate (e. g., ODU1)
   - For not terminated VC12, VC3, VC4, VC44C, VC416C, VC464C, VT1, STS1, STS3C, STS12C, STS48C and STS192C: Quality of service, {rr} CS, TCA where rr is equal to the signal rate
   - For terminated VC4 and STS1signals: Quality of service, {rr} path, TCA where rr is equal to the Constituent Signal (CS) rate
   - For GE port: Quality of service, {ge_rate}GE, TCA where ge_rate is the signal rate of the GE port
   - For VCG port: Quality of service, VCG, TCA.
   - For DS3 port: Quality of service, T3 port, TCA
   - For TMAT3 port: Quality of service, T3 port, TCA
   - For TMASTS1 path termination: Quality of service, {*rr*} path, TCA, where *rr* is equal to STS1 rate
   - For not terminated DS1 tributary: Quality of service, DS1 path, TCA

5. **condtype** – Condition Type

   This parameter identifies the type of event indication being reported.

   Type: inner string with the Format: T-<montype>

   Range:

   - Range for SDH signals

     The following values are for all *STM<N> signals*: T-RS-N-ES, T-RS-N-SES, T-RS-N-BBE, T-RS-N-UAS, T-MS-N-ES, T-MS-N-SES, T-MS-N-BBE, T-MS-N-UAS, T-MS-F-ES, T-MS-F-SES, T-MS-F-BBE, T-MS-F-UAS

The following values are for all *STM<N>T signals*: T-RS-N-ES, T-RS-N-SES, T-RS-N-BBE, T-RS-N-UAS, T-RS-N-ES-EGR, T-RS-N-SES-EGR, T-RS-N-BBE-EGR, T-RS-N-UAS-EGR

The following values also are for *STM64 and STM256 signals*: T-MS-N-FECC

The following values are for *VC3, VC4, VC44C, VC416C and VC464C tributaries*: T-VC-N-ES, T-VC-N-SES, T-VC-N-BBE, T-VC-N-UAS, T-VC-F-ES, T-VC-F-SES, cVC-F-BBE, T-VC-F-UAS, T-PJCPOS, T-PJCNEG

The following values are for *VC12 tributaries*: T-VC-N-ES, T-VC-N-SES, T-VC-N-BBE, T-VC-N-UAS, T-VC-F-ES, T-VC-F-SES, T-VC-F-BBE, T-VC-F-UAS

- Range for SONET signals

  The following values are for all *OC<N> and EC1 signals*: T-CVS, T-ESS, T-SESS, T-SEFS-S, T-CVL, T-ESL, T-SESL, T-UASL, T-CV-LFE, T-ES-LFE, T-SES-LFE, T-UAS-LFE

  The following values are for all *OC<N>T signals*: T-CVS, T-ESS, T-SESS, T-SEFS-S, T-CVS-EGR, T-ESS-EGR, T-SESS-EGR, T-SEFS-S-EGR

  The following values are also for *OC192 and OC768 signals*: T-FECC-L

  The following values are for STS1, STS3C, STS12C, STS48C and STS192C tributaries: T-CVP, T-ESP, T-SESP, T-UASP,T-CV-PFE, T-ES-PFE, T-SES-PFE, T-UAS-PFE, PPJC-PDet, NPJC-PDet, NPJC-PDet, NPJC-PGen

  The following values are for *TMASTS1 tributaries*: T-CVP, T-ESP, T-SESP, T-UASP, T-CV-PFE, T-ES-PFE, T-SES-PFE, T-UAS-PFE

  The following values are for *VT1 tributaries*: T-CVP, T-ESP, T-SESP, T-UASP,T-CV-PFE, T-ES-PFE, T-SES-PFE, T-UAS-PFE

- Range for DS3/DS1 signals

  The following values are for *DS3 signals with T3 modifier*:

  T-CVL, T-ESL, T-ESA-L, T-ESB-L, T-SESL, T-CVP, T-ESP, T-ESA-P, T-ESB-P, T-SESP, T-UASP, T-SAS-P, T-CV-PFE, T-ES-PFE, T-ESA-PFE, T-ESB-PFE, T-SES-PFE, T-UAS-PFE, T-SAS-PFE, T-CVP-EGR, T-ESP-EGR, T-ESA-P-EGR, T-ESB-P-EGR, T-SESP-EGR, T-UASP-EGR, T-SAS-P-EGR, T-CV-PFE-EGR, T-ES-PFE-EGR, T-ESA-PFE-EGR, T-ESB-PFE-EGR, T-SES-PFE-EGR, T-UAS-PFE-EGR, T-SAS-PFE-EGR

  The following values are for *DS3 signals with TMAT3 modifier*:

  T-CVP-EGR, T-ESP-EGR, T-ESA-P-EGR, T-ESB-P-EGR, T-SESP-EGR, T-UASP-EGR, T-SAS-P-EGR, T-CV-PFE-EGR, T-ES-PFE-EGR, T-ESA-PFE-EGR, T-ESB-PFE-EGR, T-SES-PFE-EGR, T-UAS-PFE-EGR, T-SAS-PFE-EGR

  The following values are for *DS1 signals*:

  T-CVP-EGR, T-ESP-EGR, T-SESP-EGR, T-UASP-EGR, T-SAS-P-EGR

- Range for other signals

  The following values are for all *ODU<N> signals*:

  T-ODU-N-ES, T-ODU-N-SES, T-ODU-N-BBE, T-ODU-N-UAS, T-ODU-F-ES, T-ODU-F-SES, T-ODU-F-BBE, T-ODU-F-UAS

  For *ENET signals*:

  T-PDE, T-EDFE, T-EDFC

6. **ocrdat** – Occurrence Date

   This parameter indicates the raising / clearing date of the alarm.

   Type: value set of the format MM-DD.

   Range: MM represents the month, DD represents the day, leading zeros are not suppressed.

7. **ocrtm** – Occurrence Time

   This parameter indicates the raising / clearing time of the alarm. The accuracy should be +/- 1 second.

   Type: value set of the format HH-MM-SS.

   Range: HH represents the hours, MM represents the minutes, SS represents the seconds, leading zeros are not suppressed.

8. **thlev** – Threshold Level

   This parameter is only used for Threshold Crossing Alerts (TCAs). It reports the threshold level value which is set by ED-TCA-PROF.

   The two applicable thresholding methods (tcamd) must be distinguished. For TR-only mode:

   - the raise TCA threshold value is reported.

   For TR-RTR mode:

   - the raise TCA threshold value is reported for the raise event
   - the reset TCA threshold value is reported for the clear event.

   Type: Integer.

   Range: >1 (1 … 4294967295). Leading zeros will be suppressed.

9. **tmper** – Time Period

   This parameter reports the monitored time interval. This parameter is only used for Threshold Crossing Alerts (TCAs).

   Type: value set.

   Range: 15-MIN, 1-DAY.

### Example input/output

TCA alarm for an STS-1 SES of slot 14 for port 3 STS-12 (24h register):

```
   UNITE-NE 00-01-01 08:00:50
A  009 REPT EVT STS1
   "1-1-#-#-14-3-2:T-SESP,TC,01-10,08-00-49,,,,250,1-DAY:\"Quality of service,
    STS1 CS, TCA\""
;
```

# 4 TL1 messages - administration and security

## Overview

### Purpose

This section lists the TL1 interface definition for the domain “administration and security”.

### Contents

| | |
|---|---|
| **Session** | 4-2 |
| List of commands | 4-3 |
| **NE security administration** | 4-4 |

# Autonomous notifications

### Change acceptable type list for CTL

During system startup it shall be detected which CTL type is plugged in.

Appropriate to this CTL the acceptable type list of the second controller slot shall be changed

- If the first controller is a CTL, the second controller can be CTL or CTL/2
- If the first controller is a CTL/2, the second controller must be CTL/2.

The term *first* and *second* is related on installation time. No database change notification will be send out during system initialization.

### Change of the data base change status

The data base change state (see *dbstate* parameter in "RTRV-STATE-EQPT (system): Retrieve equipment state (system)" (p. 3-2826)) can change autonomously. This change is reported by means of an ED-STATE-EQPT notification.

### System start-up with default DB

The system autonomously create the entity *system* when starting up with the default database. No notification is sent.

# Bay

## Overview

### Purpose

This section lists the bay level configuration messages.

### Contents

| | |
|---|---|
| RTRV-EQPT: Retrieve equipment (bay) | 5-7 |
| Autonomous notifications | 5-8 |

# RTRV-EQPT: Retrieve equipment (bay)

For description of this parameter refer to "RTRV-EQPT (bay): Retrieve equipment (bay)" (p. 3-2354).

# Autonomous notifications

### System start-up with default DB

The system autonomously creates the entity *bay* when starting up with the default database. No notification is sent.

# Shelf

## Overview

### Purpose

This section lists the shelf level configuration messages.

### Contents

| | |
|---|---|
| List of commands | 5-10 |
| Autonomous notifications | 5-11 |

# List of commands

- "RTRV-EQPT (shelf): Retrieve equipment (shelf)" (p. 3-2364)
- "ED-EQPT (shelf): Edit equipment (shelf)" (p. 3-362)
- "ED-EQPT (shelf) notification" (p. 3-365)

# Autonomous notifications

### System start-up with default DB

The system autonomously creates the entity *shelf* when starting up with the default database. No notification is sent.

# Slot

## Overview

### Purpose

This section lists the slot level configuration messages.

### Contents

- "INIT-EQPT (slot): Initialize equipment (slot)" (p. 3-2003)

# Autonomous notifications

## Circuit pack plug in

### Autoprovisioning

If a circuit pack is plugged into an allowed slot, which is not provisioned to any circuit pack, this slot is auto-provisioned to this plugged-in pack. This change is reported by means of an ED-EQPT notification for this slot for the *nvmname, nvmqual* parameters and an ED-STATE-EQPT notification for the *holdst* parameter.

### Unexpected, not acceptable, not recognizable CP handling

If an unexpected or not acceptable circuit pack or a circuit pack which inventory data can not be read is plugged into the slot only the holder status is changed and this is notified by an ED-STATE-EQPT notification.

For all these cases alarms will be sent out in addition.

### Report of inventory data

In addition to the notifications above the system reports an ED-EQPT (slot) notification for the parameters *name, qual, app, ssn, clei, eci, sln*.

In case the inventory data can not be read the fields shall be reported as empty ("").

If circuit packs will be plugged in containing plugged in modules or fixed mounted modules implicit the socket entities will be updated and created according description of auto provisioning of modules.

### Create CTL protection group- when plugging a second CTL

When plugging in a second CTL the system shall create one instance of 1+1 equipment protection group of type EQPTCTL

This shall be reported by means of ENT-PROTNGRP notification for 1+1 equipment protection group. The initial protection state shall be reported by means of a protection switch notification for the 1+1 equipment protection group.

### Further Autonomous Notifications

For details on further autonomous notifications when autoprovisioning a slot refer to the detailed behavior of "ENT-EQPT (slot): Enter equipment (slot)" (p. 3-1534) describing the side effects during pre-provisioning.

## Circuit pack plug out

If a circuit pack is plugged out the holder state for this board will change. This change is reported by means of an ED-STATE-EQPT notification for the *holdst* parameter.

In addition to the notification above the system reports an ED-EQPT (slot) notification for the parameters *name, qual, app, ssn, clei, eci, sln*.

If a circuit pack is plugged out which contains sockets with plugged in modules, then implicitly the socket entities shall be updated as required for the case of plug out of modules.

### Change of functional type for neighbor slots

If a multislot circuit pack with *nvmname*=<XXX> is provisioned to slot n the parameters *nvmname*, *nvmqual* of each slots m to n-1 (n>m) change to <XXX>, EXTD and the parameter *actlname* is set to empty (i.e. the output contains one row with *actlname*="", see also Example Input/output section of ED-EQPT(slot) notification). This change is reported by means of ED-EQPT notification for slot m to n-1 for *nvmname*, *nvmqual*, *actlname* parameters.

If a circuit pack is provisioned and as side effect it is no longer possible to use one of the neighbor slot for a multislot CP, the parameter *actname* for this slot is changed and all multislot CPs are removed. This change is reported by means of an ED-EQPT notification.

If a multislot circuit pack of slot n is deprovisioned the parameters *nvmname*, *nvmqual* of each slots m to n-1 (n>m) change to UNDEFINED, UNDEF and the parameters *actlname* changes to list of acceptable CPs. This change is reported by means of ED-EQPT notifications for slot m to n-1 for *nvmname*, *nvmqual*, *actlname* parameters.

If a circuit pack is deprovisioned and as side effect it becomes now possible to use one of the neighbor slot for a multislot CP, the parameter *actname* for this slot is changed and all multislot CPs are added. This change is reported by means of an ED-EQPT notification.

### System start-up with default DB

The system shall autonomously create all entities addressable by SlotAID when starting up with the default database. No notification is sent.

# Socket

## Overview

### Purpose

Circuit packs can contain sockets where modules can be plugged in. For unite in the current version Pluggable Interfaces mainly optical modules will be plugged in. A module with a pluggable interface will be only related to one port (e.g. a STM64 port). The relation is done in that way that a socket number n is related to a port number n of the same slot (e.g.port 1-1-#-#-1-sc3 is related to socket 1-1-#-#-1-3) The port functionality (and the related e.g. tributaries) is not available as long no module is provisioned by a provisioning command or by plugging in. This means the related entities will be only available if a module is provisioned. A socket behaves similar like a slot. That means there can be inventory data of the module read out, it can be (pre- or auto-) provisioned and also the acceptable type list for the socket is available. Also the rules how and when a module can be provisioned or de provisioned are similar.

- "ED-STATE-EQPT (socket) notification" (p. 3-859)

# Autonomous notifications

## Module plug in

### Auto provisioning

If a module will be plugged into a not provisioned socket the socket will be auto provisioned to the plugged in module if the plugged in module type matches the acceptable type list of the socked. This shall be reported by means of the ED-EQPT (socket) notification. In addition also all entities will be created and updated as described in the detailed behaviour of the ENT-EQPT (socket) command. The update of the holder status of the socket will be reported by means of the ED-STATE-EQPT (socket) notification.

### Unexpected, not acceptable, not recognizeable module handling

If an unexpected or not acceptable module or a module from which inventory data can not be read is plugged into the socket only the holder status is changed and this is notified by an ED-STATE-EQPT(socket) notification. For all these cases alarms will be sent out in addition , either Optical Module Type Mismatch or Optical Module EPROM Access Fail.

### Report of inventory data

In addition to the notifications above the system shall report an ED-EQPT (socket) notification for the affected parameters.

Affected parameters for Optical Modules with SFP or XFP EEPROM format:

- *app,clei*, *ccode*, *compatibilitybyte, connectortype, datecde*, *interchangemarker, name*, *physicalid, prodid*, *qual*, *transceivercode, uniquenumber, vendorname*, *vendoroui*, *vendorpartno*, *vendorrevlvl*, *vendorsln, wesserialno, wesvendorid*.

Affected parameters for Optical Modules with Small EEPROM format:

- *app*, *clei*, *eci*, *name*, *qual*, *sln*, *ssn*.

In case the inventory data can not be read the fields shall be reported as empty ("").

### Auto provisioning of CPs with plugged in modules

If a circuit pack is auto provisioned which contains already plugged in modules or fixed installed modules or an already provisioned circuit pack will be plugged in where the modules are not provisioned but already plugged in or fixed mounted then is the behaviour the same as the module will be auto provisioned by plugging in a module into a socket of the circuit pack. It can be seen as two independent actions, which will be performed one after the other: (auto) provisioning of the circuit pack with following auto provisioning of modules.

### Module plug out

If a module is plugged out the holder state for this socket will change. This change shall be reported by means of an ED-STATE-EQPT (socket) notification for the holdst parameter.

In addition to the notification above the system reports an ED-EQPT (socket) notification for the affected parameters with the defined default value (empty string "").

Affected parameters for Optical Modules with SFP EEPROM format:

- *app,clei*, *ccode*, *compatibilitybyte, connectortype, datecde*, *interchangemarker, name*, *physicalid, prodid*, *qual*, *transceivercode, uniquenumber, vendorname*, *vendoroui*, *vendorpartno*, *vendorrevlvl*, *vendorsln, wesserialno, wesvendorid*.

Affected parameters for Optical Modules with Small or XFP EEPROM format:

- *app*, *clei*, *eci*, *name*, *qual*, *sln*, *ssn*.

The parameter set in the ED-EQPT (socket) Notification depends on the EEPROM format of the Optical Module which is plugged out.

#### Circuit pack plug out with plugged in modules

If a circuit pack will be plugged out with plugged in modules or with fixed mounted modules the system behaves like two independent actions, which will be performed one after the other: plug out of the plugged in or fixed mounted modules and plug out of the circuit pack. Regarding modules notifications will be sent as described for module plug out.

### Circuit pack pre-provisioning

If a circuit pack, which supports sockets, is pre-provisioned using the ENT-EQPT command for a slot, then the creation of the socket entities shall be reported via ENT-EQPT notifications for sockets with empty spec block. Example:

```
   LT-UNITE^06-03-15 11:14:13
A  004 REPT DBCHG
   "TIME=11-14-13,DATE=06-03-15:ENT-EQPT:1-1-#-#-39-sc1::"
;
```

# Circuit pack

## Overview

### Purpose

This section lists the circuit pack level configuration messages.

### Contents

| | |
|---|---|
| List of commands | 5-21 |
| Autonomous notifications | 5-22 |

# List of commands

- "RTRV-EQPT (CP): Retrieve equipment (circuit pack)" (p. 3-2356)
- "ENT-EQPT (CP) notification" (p. 3-1530)
- "ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-345)
- "ED-EQPT (CP) notification" (p. 3-358)
- "DLT-EQPT (CP) notification" (p. 3-191)
- "RTRV-STATE-EQPT (CP): Retrieve equipment state (circuit pack)" (p. 3-2817)
- "ED-STATE-EQPT (CP) notification" (p. 3-855)

# Autonomous notifications

### System start-up with default DB

The system autonomously creates the following entities when starting up with the default database:

- backplane (backpl)
- user panel (upl)
- fan unit (fan)
- two TIs (tia and tib)
- CI-CTL (cictl)
- two PIs (pia and pib)
- CTL (ctlw-cp).

No notifications is sent.

### Change of the operational state

A change of the operational state is autonomously reported by means of an ED-STATE-EQPT notification for this circuit pack.

# Port

## Overview

### Purpose

The term “port” is defined as physical interface of the EP51, EP155 and OPn packs including the 10-Gigabit Ethernet WANPHY interface variant. The ports of the OPn packs can work in SDH or SONET mode. Therefore SDH and SONET related commands are defined for physically identical ports. The ports of the EP155 packs can only work in SDH mode. Therefore only SDH related commands are defined.

TL1 commands related to gigabit Ethernet LAN ports (GE1 packs) are described in the “Virtual switch” (p. 7-16) section.

# Tributary

## Overview

### Purpose

The following chapter lists the commands for VC-3/STS-1 tributaries and path termination functions. The tributaries are related to the synchronous optical/electrical interfaces (e.g. on OPn or EP155). The tributaries with path termination function are related to asynchronous ports (e.g. DS3 port on EP51).

SONET and SDH tributaries are supported to keep the compatibility to current generation equipment as far as possible and to be compatible with the Telcordia manager.

- "RTRV-PTF: Retrieve tributary with path termination function" (p. 3-2783)
- "ENT-PTF notification" (p. 3-1765)
- "ED-PTF: Edit tributary with Path Termination Function (PTF)" (p. 3-824)
- "ED-PTF notification" (p. 3-837)
- "DLT-PTF notification" (p. 3-243)

# Autonomous notification

### Impact of ONNS cross-connection creation

On creation of an ONNS cross-connection (*xconcls*=NN), which involves tributaries on EDGE ports (*portClass*=EDGE) which are part of a BLSR/MS-SPRING protection group the non-empty *loca*, *locz* information of the tributaries are copied into the corresponding attributes of the cross-connection and the *loca*, *locz* parameters in the tributaries are reset to its default values.

The reset of the *loca*, *locz* parameters in the tributaries are reported by means of an ED-STS (*istd* of related port SONET) or ED-VC3 (*istd* of related port SDH) notification.

# 6 TL1 messages - fault management

## Overview

### Purpose

This section lists the TL1 interface definition for the domain *fault management*.

# Alarms, events, ASAPs

### Alarms/events

The system reports failures via alarms and events. An alarm/event can be persistent or transient. If it is persistent then a declaration (when the alarm will be raised) and a clear (when the alarm will be cleared) message will be sent by the NE. If it is transient only a declaration message will be sent.

Each one has a probable cause assigned. This is an identifier for the alarm/event. It will be reported via the *condtype* parameter in several commands/messages.

Alarms (conditions) with the severity Critical, Major, or Minor – will be reported via REPT ALM and can be retrieved via RTRV-ALM. Events/Alarms (conditions) with severity Warning/Not-Alarmed – will be reported via REPT EVT and can be retrieved via RTRV-COND. Alarms of environmental points will be not reported and retrieved via this command. Refer to MDI/MDO description. The different reporting messages and retrieve commands are because of TL1 requirements.

### Service affecting / non service affecting

An alarm can be service affecting (sa) or non service affecting (nsa). This indicates if transmission on a path may be affected (sa) or not (nsa). It is only a well educated guess based on the limited view of a single NE.

### Alarm severity

Each alarm/event will be reported with a severity. The severity specifies the urgency of the alarm/event. The severity which will be sent for a specific probable cause can be configured via ASAPs.

The NE supports the following severities:

- CR – Critical (ITU / Telcordia)
- MJ – Major (ITU / Telcordia)
- MN – Minor (ITU / Telcordia)
- NA – Warning (ITU) / Not-Alarmed (Telcordia)
- NR – Non-Alarmed (ITU) / Not-Reported (Telcordia).

### ASAPs

Alarm Severity Assignment Profiles (ASAP) assign for each probable cause and if applicable service affecting and non service affecting independent a severity. Each ASAP parameter of an ASAP refers to a probable cause and if applicable for service affecting or not. There are different types of ASAPs which defines the severities for different sets of probable causes. An entity which can raise an alarm/event will be assigned an ASAP

which defines for the specific alarms/events of the entity the severity. For each ASAP type a default ASAP exists in the NE, which cannot be deleted. ASAPs can be created via ENT-ASAP-PROF, edited via ED-ASAP-PROF, deleted via DLT-ASAP-PROF and retrieved via RTRV-ASAP-PROF.

### SONET / SDH Mode

The NE does not distinguish between SONET and SDH. For both the same alarms will be reported and only one set of severities is supported. Alarms use probable causes where applicable from the Telcordia ("SONET world") standard. For alarm description is system specific and not adapted to Telcordia standards.

For severities the notation is used like described in the TL1 standards of Telcordia. For explanation the meaning in the SONET and SDH world is added.

# MDI / MDO

**MDI**

*Miscellaneous Discrete Inputs* (MDI / environmental point) are used to have some external input which can raise alarms like from a fire detector. The name and alarm description of an MDI can be configured. The general discussion for alarms/events is also true for MDIs. Only the alarms will be reported via REPT-ALM-ENV and can be retrieved via RTRV-ALM-ENV. The configuration of MDIs can be edited via SET-ATTR-ENV and retrieved via RTRV-ATTR-ENV.

**MDO**

*Miscellaneous Discrete Outputs* (MDO / external control) are outputs which can operate equipment outside of the NE like a lamp. Each MDO has a name which can be configured. MDOs can be configured via SET-ATTR-CONT and can be retrieved via RTRV-ATTR-CONT.

MDOs can be operated in two modes: automatically and via management commands. For the automatic mode an MDO gets assigned a probable cause. If at least one alarm of this probable cause is active then the MDO will be operated. For operation with the management commands no probable cause must be assigned to the MDO. The MDO can be operated via OPR-EXT-COND and RLS-EXT-COND. The control state of an MDO can be retrieved with the RTRV-EXT-CONT command.

# Alarm assignment profiles

# Alarm, event, ASAP tables

## Overview

### Purpose

This section describes which alarms and events in the system can occur.

For each possible alarm following will be described:

#### condtype

The *condtype*, it represents the probable cause.

#### sa/nsa

States if it is service affecting (sa) or/and non service affecting (nsa).

#### conddescr

The *conddescr* related to the alarm. It is of the format:

1. \"<category>, <entity>, <description>, <additional text>\"
2. \"<category>, <entity>, <description>, <additional text>-cleared\".

If there is no additional text, then the trailing comma may be omitted.

The *conddescr* has two forms for persistent alarms:

1. It is used when the alarm is raised.
2. The string: "-cleared" is appended. It is used when the alarm will be cleared. Transient alarms use only the first form.

The description in the tables below defines the text for each part of the *condescr*. The leading and ending ' \" ' are omitted.

#### ASAP Parameter

The ASAP parameter which are used in the RTRV-ASAP-PROF, ED-ASAP-PROF, ENT-ASAP-PROF commands for the specific ASAP type.

The name of service affected related ASAP parameters starts with the prefix "sa_", for non service affected one with "nsa_". The prefix can be omitted if the one probable cause reports only for service affected or non service affected.

#### default severity

The default alarm severity which is assigned to the ASAP parameter.

#### Description

A description for explanation.

### modifier/aidtype

The to the alarm related *modifier* and *aidtype.*

### AID

The AIDs which can be reported related to the alarms. All wildcard aids like **`all`** must not be used.

### Alarm duration

It describes if the alarm is a persistent one or a transient one.

There are separate ASAP parameter for sa and nsa alarms. There applicable each parameter will be described separately together with their default values.

The Alarms will be described per ASAP type.

Please refer also to other fragments of the TL1 documentation where REPT EVT messages related to this fragment will be defined.

Remark to TCA: The alarm level of threshold crossing alarms (TCA) shall always be “not alarmed”, and it is not user provisionable. The system shall not allow the user to change any attribute of TCA alarm through ASA profile. All the attributes, such as TCA reporting enable/disable, that will affect TCA reporting shall be handled by the TCA profile.

# ASAP Type DCN

**Properties of all alarms**

modifier/aidtype: COM

AID: SystemAID

Alarm duration: persistent.

**condtype: PARARREP**

sa/nsa: nsa

conddescr: Communication-DCN, DCN, Partitioned Area Repair

ASAP parameter: *pararrep*

Default severity: MN.

**condtype: PROVINVAL**

**Important!** *Please note that this condtype is not supported by the current release.*

sa/nsa: nsa

conddescr: Communication-DCN, DCN, DCN Provisioning Not Valid

ASAP parameter: *provinval*

Default severity: MJ.

**condtype: ADDROV**

sa/nsa: nsa

conddescr: Communication-DCN, DCN, Address List Overflow

ASAP parameter: *addrov*

Default severity: MJ.

**condtype: ASTNNBRNAV**

sa/nsa: nsa

conddescr: Communication-SCN, SCN, ASTN Neighbor Not Available

ASAP parameter: *astnnbrnav*

Default severity: MJ.

modifier/aidtype: COM

AID: SystemAID

The alarm information also includes the IP address of the affected ASTN neighbor, which has to be mapped into the *conddescr*.

**condtype: NSAPHIGH**

sa/nsa: nsa

conddescr: Communication-DCN, DCN, NSAP counter exceeds threshold

ASAP parameter: *nsaphigh*

Default severity: MN.

**condtype: BUFROVLD**

sa/nsa: nsa

conddescr: Communication-DCN, DCN, NSAP counter over maximum

ASAP parameter: *bufrovld*

Default severity: MJ.

# ASAP Type DS1

**Properties of all alarms**

modifier/aidtype: DS1

AID: DS1NumAID

Alarm duration: persistent.

**condtype: DS1LOF-EGR**

sa/nsa: sa

conddescr: Communication-Transport, DS1 path, DS1 LOF egress

ASAP parameter: *sa_ds1lofe* (service affecting).

default severity: NR

**condtype: DS1AIS-EGR**

sa/nsa: sa

conddescr: Communication-Transport, DS1 path, DS1 AIS egress

ASAP parameter: *sa_ds1aise* (service affecting).

default severity: NR

**condtype: DS1RAI-EGR**

sa/nsa: sa

conddescr: Communication-Transport, DS1 path, DS1 RAI egress

ASAP parameter: *sa_ds1raie* (service affecting).

default severity: NR

# ASAP Type DS3

**Properties of all alarms**

Alarm duration: persistent

**condtype: DS3LOS**

sa/nsa: sa

conddescr: Communication-Transport, T3 port, DS3 Loss of Signal

ASAP parameter: *sa_ds3los* (service affecting).

default severity: MJ

modifier/aidtype: T3

AID: APortAID

**condtype: DS3LineDEG**

sa/nsa: sa

conddescr: Communication-Transport, T3 port, Degraded DS3 Line signal

ASAP parameter: *sa_ds3deg* (service affecting).

default severity: MJ

modifier/aidtype: T3

AID: APortAID

**condtype: DS3LOF**

sa/nsa: sa

# ASAP Type ENV

### Properties of all alarms

modifier/aidtype: ENV

AID: Miscellaneous_in_DiscreteAID

Alarm duration: persistent.

### Reference ASAP Type ENV

Refer to the *envmsg* parameter in the output parameters section of the "RTRV-ATTR-ENV: Retrieve attribute environment" (p. 3-2244) command for string values as part of *conddescr*.

### condtype: MISC_1

sa/nsa: none

conddescr: {envmsg}

ASAP parameter: envron_1

Default severity: NR

Alarm of MDI (Miscellaneous Discrete Input / environmental point). The description can be assigned.

### condtype: MISC_2

sa/nsa: none

conddescr: {envmsg}

ASAP parameter: envron_2

Default severity: NA

Alarm of MDI (Miscellaneous Discrete Input / environmental point). The description can be assigned.

### condtype: MISC_3

sa/nsa: none

conddescr: {envmsg}

ASAP parameter: envron_3

Default severity: NR

Alarm of MDI (Miscellaneous Discrete Input / environmental point). The description can be assigned.

**condtype: MISC_4**

sa/nsa: none

conddescr: {envmsg}

ASAP parameter: envron_4

Default severity: NR

Alarm of MDI (Miscellaneous Discrete Input / environmental point). The description can be assigned.

**condtype: MISC_5**

sa/nsa: none

conddescr: {envmsg}

ASAP parameter: envron_5

Default severity: NR

Alarm of MDI (Miscellaneous Discrete Input / environmental point). The description can be assigned.

**condtype: MISC_6**

sa/nsa: none

conddescr: {envmsg}

ASAP parameter: envron_6

Default severity: NR

Alarm of MDI (Miscellaneous Discrete Input / environmental point). The description can be assigned.

**condtype: MISC_7**

sa/nsa: none

conddescr: {envmsg}

ASAP parameter: envron_7

Default severity: NR

Alarm of MDI (Miscellaneous Discrete Input / environmental point). The description can be assigned.

**condtype: MISC_8**

sa/nsa: none

conddescr: {envmsg}

ASAP parameter: environ_8

Default severity: NR

Alarm of MDI (Miscellaneous Discrete Input / environmental point). The description can be assigned.

# ASAP Type EQUIP-PROT

**Properties of all alarms**

modifier/aidtype: EQPT

Alarm duration: persistent

**condtype: EQPT**

sa/nsa: sa / nsa

conddescr: Equipment, {cpname}/{cpqual}, Circuit Pack Clock Failure

ASAP parameter: sa_eqpt;

Default severity: CR

ASAP parameter: nsa_eqpt;

Default severity: MN

AID: CpAID.

**condtype: CPTEMP**

sa/nsa: sa / nsa

conddescr: Equipment, {cpname}/{cpqual}, Unit Temperature too High

ASAP parameter: sa_cptemp;

Default severity: MJ

ASAP parameter: nsa_cptemp;

Default severity: MN

AID: CpAID.

**condtype: PRCDRERR**

sa/nsa: sa / nsa

conddescr: Equipment, slot, Circuit Pack Type Mismatch

Default severity: CR.

# Entity – ASAP relation

## Introduction

This section describes which entity is related to which ASAP.

## Entities

For description of the entities see in the fragments of the TL1 message description which defines and describes the entities. (Example: The slot entity is described in the configuration fragment.)

The entity of an alarm can be retrieved from the entity in the *condescr* in the ASAP descriptions above so it is not explicitly listed here.

If an entity has a relation to at least one ASAP does it mean that this entity will raise alarms for this entity.

## Entity – ASAP relation

For each ASAP type must exist one ASAP pointer for the entity. Each ASAP pointer is related to only one ASAP type. That means that for some entities more than one ASAP pointer exist.

| Fragment | Entity | ASAP Type | Entity containing ASAP pointer |
|---|---|---|---|
| Administration & Security | Session | none | none |
| Administration & Security | NE Security Administration | none | none |

# 7 TL1 messages - transmission and cross-connect handling

## Overview

### Purpose

This section lists the TL1 interface definition for the

- high-order and low-order transmission domain
- user byte access functionality
- Gigabit Ethernet virtual switch configuration
- Gigabit Ethernet port (GEn) configuration
- virtual concatenation (group and tributary) configuration for GEn applications
- virtual concatenation (group and tributary) configuration for ES64U applications
- high-order and low-order remote test access function.

# Cross-connection

## Overview

### Purpose

The cross-connection (CRS) commands cover all type of

- creating (ENT-CRS),
- removing (DLT-CRS),
- modifying (ED-CRS) and
- retrieving (RTRV-CRS) cross-connections.

Furthermore the commands ENT-ROLL directly affect existing cross-connections by rolling the input of an existing cross-connection towards another input while keeping the output unchanged.

### Cross-connections and tributaries

Physically cross-connections are transport channels between tributaries within an NE. These cross-connections are logically modeled by the entity cross-connection and include provisionable parameters which describe the behavior of these channels.

Tributaries are path-level units of bandwidth within ports. With the introduction of the LOXC feature, there has been a second level of tributary added: Low-order tributaries are contained in high-order tributaries within ports.

These tributaries may belong

- either as high-order tributaries to SDH/SONET ports (for example, located on OP*n*), which are to be addressed via the STS1NumAIDs,
- or as high-order tributaries to Virtual Concatenation Group ports (for example, located on GE*n*) which are to be addressed via the VCGNumAIDs,
- or as high-order path terminations to asynchronous ports (for example, located on EP51) which are to be addressed via the STS1NumAIDs,
- or as high-order path terminations to adjunct ports (for example, located on TransMUX pack) which are to be addressed via TMuxAPTNumAIDs
- or as low-order tributaries to high-order tributaries of SDH/SONET ports (for example, located on OP*n*) which are to be addressed via the LONumAIDs
- or as low-order tributaries to high-order path terminations of adjunct ports (for example, located on TransMUX pack) which are to be addressed via theTMuxSLONumAIDs.

In the following, the general AID GenTribAID is used to reference all connectable high-order tributaries and path terminations.

In the following, the general AID GenLOTribAID is used to reference all connectable low-order tributaries.

### High-order tributary-rate provisioning versus cross-connection-rate

For fixed-rate provisioned ports the high-order cross-connection-rate (either the SDH-rate or its equivalent SONET-rate) must match with the high-order tributary-rate.

As an example a tributary provisioned to vc44c can be cross-connected only at a rate of vc44c (or STS12, which is equivalent) - requests with other rates will be rejected. This restriction concerning the consistency of tributary-rate and cross-connection-rate does NOT hold in the case the port is provisioned as adaptive (which is only possible in case of a SONET-port).

### Low-order tributary-rate provisioning versus cross-connection-rate

For SONET low-order tributaries, only one type is allowed (VT1.5) which causes to match its rate with the referring cross-connection rate.

For SDH low-order tributaries, two types are allowed (LO-VC3 and VC12). VC12 tributaries are created by default. However, if a cross-connection request allows to adapt the signal structure to the requested rate then this request will be granted.

As an example, a high-order VC4 tributary has been substructured to 63 times VC12 signals (e.g. because a first VC12 cross-connection has been previously established for the first timeslot out of the 63). A cross-connection request to cross-connect the last third of the VC4 as a low-order cross-connection at a LO-VC3 will be granted since an adaptation is possible (no VC12 cross-connection present yet). Thus, the NE does an automatic correction of the substructure (in this case it changes to 42 times VC12 plus 1 times LO-VC3), before the cross-connect request will be successfully executed.

Please note that the following features are not part of the current 1675 LambdaUnite MSS release and are thus not specified here:

- provisioning of adjunct path-protected cross-connection (no adjunct related parameter)
- changing working and protection leg for path-protected cross-connections (no TL1 command OPR-WKGLEG)
- no adaptive-mode is allowed for both *in_aids* of a path-protected cross-connection.

### AU3/AU4 Conversion Cross-Connections

AU3/AU4 conversion cross-connections allow the conversion of a HO STS1 (SONET) or VC3 (SDH) to a LO SDH VC3, and the mapping into a HO VC4.

From cross-connection provisioning point of view, an AU3/AU4 conversion cross-connection is a cross-connection between a HO STS1 or VC3 tributary and a LO VC3 tributary.

A conversion cross-connection has a HO or AU3 side and a LO or TU3 side.

In the requirements the terms “HO side” and “LO side” are used, to show the similarity of a conversion cross-connection with a HO cross-connection at one side and a LO cross-connection at the other side.

# Autonomous notification

## TID Change

### *loca*, *locz* auto notification for service traffic

If a source TID (*loca*) or destination TID (*locz*) is changed due to a TID change of one NE within a BLSR ring/MS-SPRing, the update is reported by means of corresponding ED-CRS notifications.

### No auto notification for *loca* and *locz* change for extra traffic

For extra traffic the *loca/z* info are generated automatically, for this reason they will change after an initialization or a recovery. Too many intermediate, void changes would be detected and notified.

### No notification for *sqfa* and *sqfz* change

If a source TID (*loca*) or destination TID (*locz*) is changed due to a TID change of one NE within a MS-SPRing with the *protnmode* = TOPEX, the related parameters *sqfa* and *sqfz* will change to AINVALID respectively to MINVALID for an intermediate time, depending on internal processing speed and fault conditions of the ring. Finally they will again change to other values. Due to this transient behaviour it is only suitable to make it retrievable on demand.

### No auto notification for loca and locz change caused by Automatic Squelch Map Calculation

If Automatic Squelch Map Calculation is used in a BLSR/MS-SPRING, then changes of *loca*/*locz* and the related status information *locastate*/*loczstate* caused by the Automatic Squelch Map Calculation shall not be notified. *loca*/*locz* and the related status information *locastate*/*loczstate* are generated automatically. For this reason they will change after an initialisation or a recovery. Too many intermediate, void changes would be detected and notified.

## ONNS triggered changes

The ONNS TL1 command ENT-PATH shall lead to ENT-CRS notifications in the NEs along the route of the new path. In case of a 1+1 protected ONNS path there are also ENT-PROTN-GRP notifications in the source and destination NE of the ONNS path.

The ONNS TL1 command DLT-PATH shall lead to DLT-CRS notifications in the NEs along the route of the deleted path. In case of a 1+1 protected path there are also DLT-PROTN-GRP notifications in the source and destination NE of the ONNS path.

The ONNS TL1 command ED-PATH-ROLL

- shall lead to ENT-CRS and ENT-PROTN-GRP notifications in the two NEs where the bridge/merge function is performed
- shall lead to ENT-CRS notifications in the NEs along the new route of the path

- shall lead to DLT-CRS notifications in the NEs along the old route of the path
- shall lead to DLT-CRS and DLT-PROTN-GRP notifications in the two NEs where the bridge/selector is removed. The ONNS TL1 command ED-PATH-PROT
- shall lead to ENT-CRS notifications along the route of the new protecting path and ENT-PROTN-GRP notifications in the A and Z node when a modification from unprotected to 1+1 protected is performed
- shall lead to DLT-CRS notifications along the route of the new protecting path and DLT-PROTN-GRP notifications in the A and Z node when a modification from 1+1 protected to unprotected is performed
- shall not lead to additional host notifications when a modification from unprotected to auto-reroute or vice versa is performed.

The (non-revertive) restoration of an ONNS path shall lead to ENT-CRS notifications in the NEs along the restored route of the path, and to DLT-CRS notifications in the NEs along the route of the failed path.

The revertive restoration of an ONNS path shall lead to ENT-CRS notifications in the NEs along the restored route of the path, and to ENT-PROTN-GRP notifications in the A and Z node of the path. When the restoration reverts, it shall lead to DLT-CRS notifications in the NEs along the restored route of the path, and to DLT-PROTN-GRP notifications in the A and Z node of the path.

The ONNS TL1 command **OPR-DEFRAG** shall lead to

- **ENT-CRS** and **ENT-PROTN-GRP** notifications for each connection which is moved
- **DLT-CRS** and **DLT-PROTN-GRP** notifications for each connection which is moved

in the two NEs between which the link is defragmented.

# Tributary

## Overview

# UserByte port

## Overview

### Purpose

Physically the UserByte-Port is a physical transmission interface, consisting of both an input and an output, which can be used to carry traffic through channels given by the E1- or F1-Byte (located in the RSOH) or the E2-Byte (located in the MSOH). Logically an UserByte-Port is an entity within an NE which models the function of the physical UserByte-Port.

Six UserByte-Ports are available (with AIDs denoted ubio1 .. ubio6) each of which can be associated to an optical port of an OPn either to the E1- or E2- or F1-Byte. The association is always bidirectional. Four of these six UserByte-Ports (AIDs: ubio1 .. ubio4) are provisionable to either the G703- or V11-interface, while the others (AIDs: ubio5,ubio6) are fixed to V11-interface.

The association as well as this mode setting can be done via the SET-OW-command. Furthermore the SET-OW command allows to release the association (dis-association). With the RTRV-OW command the information related to an UserByte-Port can be retrieved from the NE.

Note: Throughout this section the term order-wire (OW) is retained in the command names for "historical" reasons although the name user-byte would be more appropriate, because these ports can not only be used for order-wire purposes.

# Autonomous notification

### Start-up with default database

The event *Start-up with default DB* causes the 6 instances of type UserByte port to be created.

# Virtual switch

## Overview

### Purpose

Starting with the entity Virtual Switch the TL1 commands for all entities of the GE1 functionality will be described in the following chapters.

These are in detail:

- Virtual switch (VRTSW)
- Ethernet port (EPORT)
- Virtual concatenation group (VCG)
- Virtual concatenation tributary (VCGTRIB).

Each GE1 circuit pack consists of the following entities as shown in the following figure. The number of EPORT and VCG instances connected to the virtual switch is fixed. The number of VCGTRIBs per VCG depends on whether operating in SDH or SONET mode. In SDH mode there are 7 VCGTRIBs of type VC4 whereas in SONET mode there are 21 VCGTRIBs of type STS1s.

Commands for the entity *Virtual switch* allow to retrieve and modify its parameters. These commands are applicable to the GE1 circuit pack which supports one virtual switch instance.

The virtual switch as part of the physical switch on the GE1 pack is created by software. It serves to group and separate traffic within the physical switch via VLAN tagging.

The virtual switch is not applicable on the GE10PL1 pack.

The virtual switch is not applicable on the ES64U1 pack.

- "DLT-VRTSW notification" (p. 3-280)

# Ethernet port

## Overview

### Purpose

Starting with the entity Ethernet port the TL1 commands for all entities of the GE1 functionality will be described in the following chapters. These are in detail:

- Ethernet port (EPORT)
- Virtual concatenation group (VCG)
- Virtual concatenation group tributary (VCGTRIB).

### GE1 circuit pack

Commands for the entity Ethernet port cover the parameters for

- physical link layer (layer 1) and
- data link layer (layer 2)

of the LAN side of Gigabit Ethernet. These commands are applicable to the GE1 circuit pack which has 4 LAN ports.

Those ethernet ports are mainly intended to connect several parts of a LAN via standard transmission technique like SDH or SONET.

There is no interworking with the Data Communications Network application (which uses Ethernet-LAN ports, too) used to control the NEs. The latter one is specified in another section.

### GE10PL1 pack

#### Modelling of the transmission path

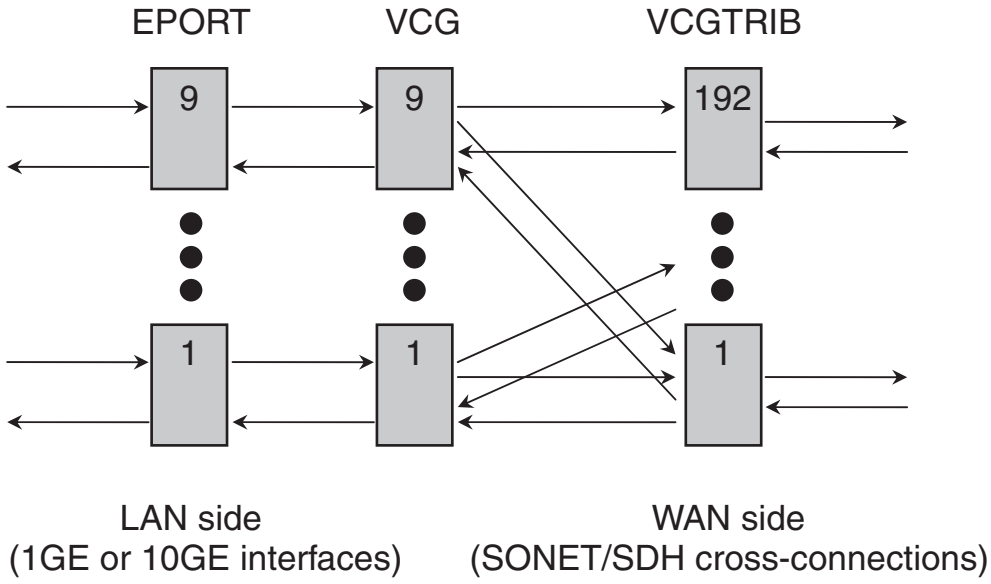
On the GE10PL1 pack, transmission functionality will be described by the following entities:

- Ethernet Port (EPORT)
- Virtual Concatenation Group (VCG)
- Virtual Concatenation Tributary (VCGTRIB).

#### Transmission entities on the GE10PL1/1A8

The GE10PL1/1A8 circuit pack consists of:

- 9 EPORTs (8 as 1 GE interface, 1 as 10GE interface)
- 9 VCGs (1 per EPORT)
- 192 VCGTRIBs (shared among the VCGs).



### Existence of EPORT entities

EPORT entities exist only if the referring pluggable module has been successfully pre- or auto-provisioned. The first 8 ports are reserved for 1GE interface types while the 9th port is reserved for 10GE interface types. There will be only one transmission rate being accepted at the same time (either 8 times 1GE ports or 1 times 10GE port). Each entity represents functionality always bidirectionally.

### Existence of VCG entities

VCG entities exist only if the referring pluggable module has been successfully pre- or auto-provisioned and are therefore created in conjunction to the referring EPORT entity. The same constraints are applicable here. Each entity represents functionality always bidirectionally.

### Existence of VCGTRIB entities

VCGTRIB entities exist only if the referring pluggable module has been successfully pre- or auto-provisioned and are therefore created in conjunction to the referring VCG entity.

The number and address of the entities depend on the VCG type as follows:

| VCG No. X exists | Existing VCGTRIB Numbers |
|---|---|
| No | None |
| Yes, for X=1…8 | Yes, with 1…21 |
| Yes, for X=9 | Yes, with 1…192 |

### Significance of VCGTRIB entities (general)

Out of the created VCGTRIB entities for a specific VCG, not all of them may be significant (configurations have no effect). This depends on the configured transmission rate and on the membership configuration.

The following table illustrates those dependencies:

| Signal structure | VCG membership | VCGTRIB significance |
|---|---|---|
| 211 (21 times STS1) or<br>1921 (192 times STS1) | Enable | Significant |
| | Disable | Insignificant |
| 73 (7 times STS3C) or<br>74 (7 times VC4) or<br>644 (64 times CV4) | Enable | Significant (each third VCGTRIB only) [if (VCGTRIB No. 1) modulo 3 == 0)]<br>Insignificant otherwise |
| | Disable | Insignificant |

### Significance of 10GE VCGTRIB entities (contiguous concatenation mode)

For the 10GE VCG, it is possible to configure a signal mapping into a contiguous concatenated signal instead of a mapping into a number of virtual concatenated signals. The mapping is controlled by the VCG parameter *vcat*. In this case, the first VCGTRIB entity remains significant while the other 191 entities will become insignificant (if not yet insignificant before). Note that the parameters of the VCG and VCGTRIB entities which are not applicable in the contiguous concatenation mapping mode will be set to default and cannot be altered as long this mode is present.

### Meaning of the terms “Existing” and “Significance”

If an entity does not exist then any operation for this instance will be rejected. If an entity is insignificant then all allowed operation may be executed. Configured values will be stored in the database and can be retrieved. However, the settings have no impact to the transmission flow in the hardware.

## Contents

| | |
|---|---|
| List of commands | 7-22 |
| Autonomous notifications | 7-23 |

# List of commands

- "RTRV-EPORT: Retrieve Ethernet port" (p. 3-2340)
- "ENT-EPORT notification" (p. 3-1523)
- "ED-EPORT: Edit Ethernet port" (p. 3-325)
- "ED-EPORT notification" (p. 3-338)
- "DLT-EPORT notification" (p. 3-172)

# Autonomous notifications

### GE1 circuit pack is auto-provisioned

If a GE1 circuit pack is auto-provisioned a GE1PORT instance will be created with the given default parameter values for all GE1 ports of the circuit pack.

This change is reported via the ENT-EPORT notification.

### Optical Module for a GE10PL1/1A8 Circuit Pack is Auto-provisioned

If an optical module is successfully auto-provisioned as a socket of the GE10PL1/1A8 circuit pack then a related EPORT instance will be created with the specified default parameter values. In case that the socket with the Simple_SocketAID = sc9 has been created, the EPORT shall reflect an instance with a parameter value modifier = 10GEPL, otherwise with a parameter value modifier = 1GEPL. All applicable parameters listed in the ENT-EPORT notification shall be reported in a referring single ENT-EPORT notification.

# Virtual concatenation group

## Overview

### Purpose

The Virtual Concatenation Group is an entity which exists for Gigabit Ethernet and Fully Transparent applications. For both applications the parameter set is slightly different, making a distinction of the related commands via a modifier for the Fully Transparent application necessary (e.g no LCAS is supported for the fully transparent application).

#### Overview of GE1 Application

Commands for the entity virtual concatenation group (VCG) cover the parameters for both

- the Ethernet side (WAN ports) and
- the EoS (Ethernet over SDH/SONET).

These commands are applicable to the GE1 circuit pack which has 4 WAN ports.

Note: The virtual concatenation group (VCG) and its tributaries (VCGTRIB) have some direction dependent parameters. Following the semantic for optical ports the direction indicators input and output are used.

#### Input direction

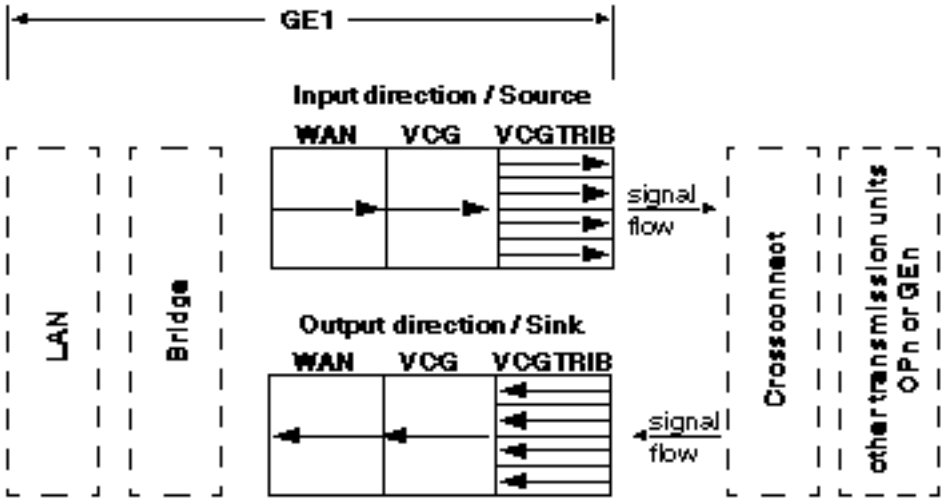
*WAN → VCG → VCGTRIB → Cross-connect*

As those tributaries have termination function, this is also often called source.

#### Output direction

*Cross-connect → VCGTRIB → VCG → WAN*

As those tributaries have termination function, this is also often called sink.



### Overview of OPT*n* Application

Commands for the entity virtual concatenation group (VCG) cover the parameters for both

- the ODU layer and
- the Virtual Concatenation functionality.

These commands are applicable to the OPT2G5 circuit pack which has 3 client ports (one-to-one relationship to the VCG ports).

Note: The virtual concatenation group (VCG) and its tributaries (VCGTRIB) have some direction dependent parameters. Following the semantic for optical ports the direction indicators input and output are used. Also the equivalent terms ingress and egress are applicable.

### Input direction

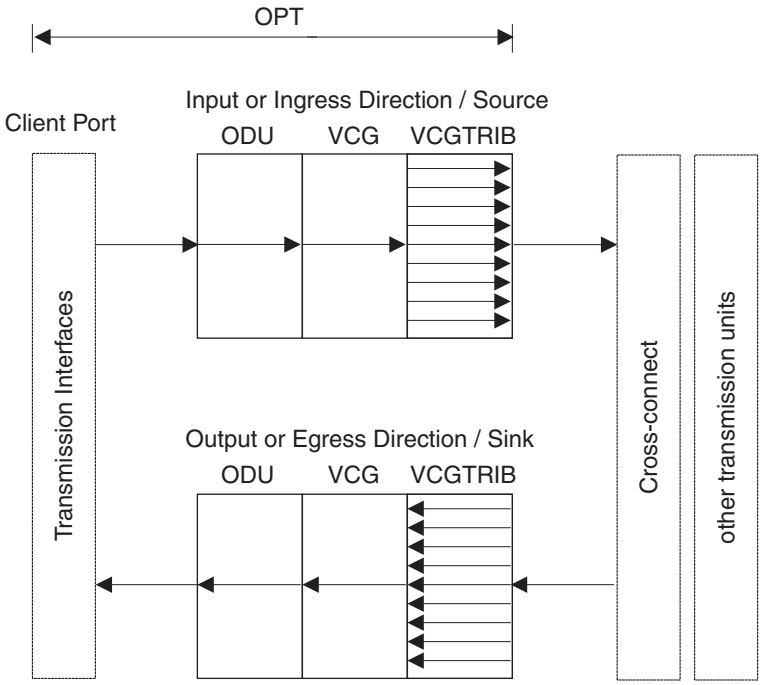
*Client Port → VCG (including ODU) → VCGTRIB → Cross-connect*

As those tributaries have termination functions, this is also often called source.

### Output direction

*Cross-connect → VCGTRIB → VCG (including ODU) → Client Port*

As those tributaries have termination functions, this is also often called sink.



### Overview of ES64U application

The ES64U has no LAN ports on the pack.

The virtual switch is other than for the GE1 application not managed via TL1 for the ES64U application. For the ES64U application it is managed via a direct CLI/SNMP interface to the data part of the ES64U.

The WAN port setting is other than for the GE1 application not managed via TL1 for the ES64U application. For the ES64U application it is managed via a direct CLI/SNMP interface to the data part of the ES64U.

Commands for the entity virtual concatenation group (VCG) cover the parameters for EoS (Ethernet over SDH/SONET).

These commands are applicable to the ES64U circuit pack which has up to 252 VCG ports.

Note: The virtual concatenation group (VCG) and its tributaries (VCGTRIB) have some direction dependent parameters. Following the semantic for optical ports the direction indicators input and output are used.

### Input direction

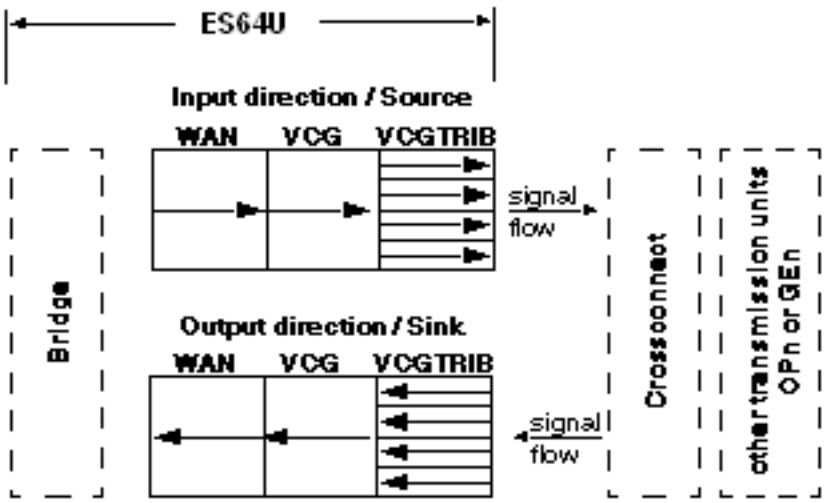
*WAN → VCG → VCGTRIB → Cross-connect*

As those tributaries have termination function, this is also often called source.

### Output direction

*Cross-connect → VCGTRIB → VCG → WAN*

As those tributaries have termination function, this is also often called sink.



From the Ethernet bridge point of view the definition of input and output direction is quite confusing as it is contrary to expectation. However, the definition was made such that it fits to the usual nomenclature being used for optical ports from the cross-connect point of view. The terms input and output direction are e.g. used for parameters inputsig, istd, and unequiposig which are available on standard OC*n*/STM*n* ports also.

For an overview about the resource allocation for an ES64U in a slot, the command **RTRV-RESALLOC-VCG** can be used. This command is needed to provide the user an overview about the backplane fragmentation and where the VCGs are located.

### GE1 circuit pack is auto-provisioned

If a GE1 circuit pack is auto-provisioned a VCG instance will be created with the given default parameter values for all VCGs of the circuit pack.

This change is reported via the **ENT-VCG** notification.

### OPT*n* Circuit Pack is Auto-provisioned

If an OPT*n* circuit pack is auto-provisioned a VCG instance will be created with the given default parameter values for all Virtual Concatenation Groups of the circuit pack. This change shall be reported via the **ENT-VCG-TRANS** notification.

# Virtual concatenation group tributary

## Overview

### Purpose

For an overview of the GE1 related entities EPORT, VCG, and VCGTRIB see "ENT-EQPT (slot): Enter equipment (slot)" (p. 3-1534).

For an overview of the OPT*n* related entities EPORT, VCG, and VCGTRIB (and client port), see "Overview of OPT*n* Application" (p. 7-25).

For an overview of the GE10PL1 related entities EPORT, VCG, and VCGTRIB, see "GE10PL1 pack" (p. 7-19).

For an overview of the ES64U related entities VCG and VCGTRIB, see "Overview of ES64U application" (p. 7-26).

Commands for the entity virtual concatenation group tributary cover the parameters for

- standard termination as for other tributaries
- tributary related parameters of virtual concatenation.

Each virtual concatenation tributary can be configured independently.

# Autonomous notifications

### GE1 circuit pack is auto-provisioned

If a GE1 circuit pack is auto-provisioned 7 VC4 or 21 STS1 VCGTRIB instances will be created (dependent on the attribute *istddflt*) with the given default parameter values for all VCGs of the circuit pack.

This change is reported via the **ENT-VCGTRIB** notification.

### OPT*n* circuit pack is auto-provisioned

If an OPT*n* circuit pack is auto-provisioned 17 VC4 or STS3c VCGTRIB instances will be created (dependent on the attribute **istddflt**) with the given default parameter values for all Virtual Concatenation Groups of the circuit pack.

This change shall be reported via the **ENT-VCGTRIB** notification.

### Optical module for a GE10PL1/1A8 circuit pack is auto-provisioned

If an optical module is successfully auto-provisioned as a 1 GE socket of the GE10PL1/1A8 circuit pack then 21 VCGTRIB instances will be created with the specified default parameter values.

If an optical module is successfully auto-provisioned as a 10 GE socket of the GE10PL1/1A8 circuit pack then 192 VCGTRIB instances will be created with the specified default parameter values.

All applicable parameters listed in the **ENT-VCGTRIB** notification shall be reported in a referring single **ENT-VCGTRIB** notification.

### VCG on a ES64U circuit pack is provisioned

If a VCG is successfully provisioned on a ES64U circuit pack, then the VCGTRIB instances belonging to it will be created with the specified default parameter values. The VCGTRIB number range is from 1 up to the number of tributaries given by the parameter *inputsig* given with the **ENT-VCG** command. All applicable parameters listed in the **ENT-VCGTRIB** notification shall be reported in a referring single **ENT-VCGTRIB** notification.

### VCG on a ES64U circuit pack is deprovisioned

If a VCG is successfully deprovisioned on a ES64U circuit pack, then the VCGTRIB instances belonging to it will be deleted. All applicable parameters listed in the **ENT-VCGTRIB** notification shall be reported in a referring single **ENT-VCGTRIB** notification.

### Group notifications for VCG tributaries

For efficiency reasons the notifications for VCG tributaries shall be sent out as a single notification (so-called group notification) using a range over the aid which depends on the used mapping of the associated vcg port, i.e. the Simple_VCGNumAID field in the VCGNumAID is set to

- 1&&-<N> for sequential range
- 1&-4 .. &-<N> for non-sequential range

with N is maximal legal VCG tributary number.

Example:

The AID field in a group notification for VCG tributaries related to VCG port 1 for a GE1 pack in slot 1 looks like:

1-1-#-#-1-v1-1&&-21 (for STS-1/VC-3 mapping)

1-1-#-#-1-v1-1&-4&-7&-10&-13&-16&-19 (for STS-3c/VC-4 mapping)

For efficiency reasons the notifications for tributaries shall be sent out as a single notification (so-called group notification) using a range over the aid which depends on the port rate of the associated port, i.e. the Simple_STS1NumAID field in the STS1NumAID is set to

- 1&&-<N>

with N is maximal legal STS-1/AU-3 number.

Example:

The AID field in a group notification for tributaries related to port 1 for a OP10 pack in slot 1 looks like:

1-1-#-#-1-1-1&&-192

#### Behavior

The **ENT-VCG** shall generate a **REPT DBCHG** message for the creation of the VCG together with a **REPT DBCHG** message for the creation of the VCG tributaries (**ENT-VCGTRIB** notification).

The command shall establish a virtual concatenation group together with the virtual concatenation group tributaries belonging to it according to the parameters given with this command. The virtual concatenation group tributary number range is from 1 up to the number of tributaries given by the parameter *inputsig*. The modification shall be reported by means of an **ENT-VCG** notification and grouped notifications for VCG tributaries.

### Group notification for VCG tributaries

For efficiency reasons the notifications for VCG tributaries shall be sent out as a single notification (so-called group notification) using a range over the aid which depends on the used mapping of the associated VCG port, i.e. the *Simple_VCGNumAID* field in the *VCGNumAID* is set to:

- 1&&-<*N*> for sequential range
- 1&-4 … &-<*N*> for non-sequential range

where <*N*> is the maximal legal VCG tributary number.

Example:

The AID field in a group notification for a VCG tributaries related to VCG port 1 for a GE1 pack in slot 1 looks like:

1-1-#-#-1-v1-1&&-21 (for STS-1/VC-3 mapping)

1-1-#-#-1-v1-1&-4&-7&-10&-13&-16&-19 (for STS-3c/VC-4 mapping)

## Incoming VCG tributary is dropped or added

If an incoming (sink direction) VCG tributary is dropped or added due to manual operation or a failure event, the parameter *outmbst* shall be set to the corresponding value considering the current LCAS mode. This change shall be reported via the ED-VCGTRIB notification with the parameter *outmbst*.

For the modifiers VCT or STST tributaries will be added or dropped only via manual operation.

## Outgoing VCG tributary is dropped or added

If an outgoing (source direction) VCG tributary is dropped or added due to manual operation or a failure event, the parameter *inmbst* shall be set to the corresponding value considering the current LCAS mode. This change shall be reported via the ED-VCGTRIB notification with the parameter *inmbst*.

For the modifiers VCT or STST tributaries will be added or dropped only via manual operation.

# Lower-order tributaries

## Overview

### Purpose

Higher-order tributaries on I/O packs (e.g. OPn, EP155) can be substructured as follows:

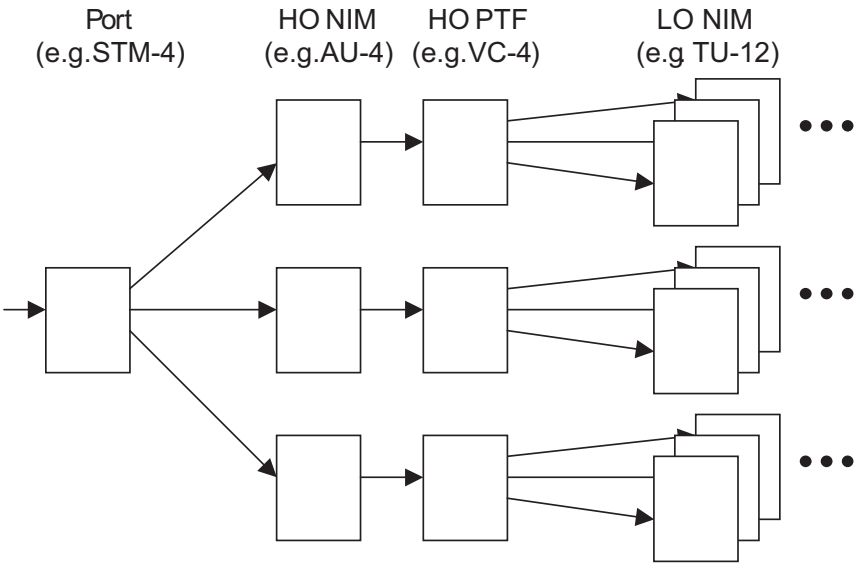
- HO path termination function (PTF, see SRD_TL1_Configuration)
- LO non-intrusive monitoring function (see below).

Following substructures are supported:

- SDH: VC4 PTF entity and 3 VC3 or 63 VC12 LONIM entities - or a mix of it,
- SONET: STS1 PTF entity and 28 VT1.5 LONIM entities.

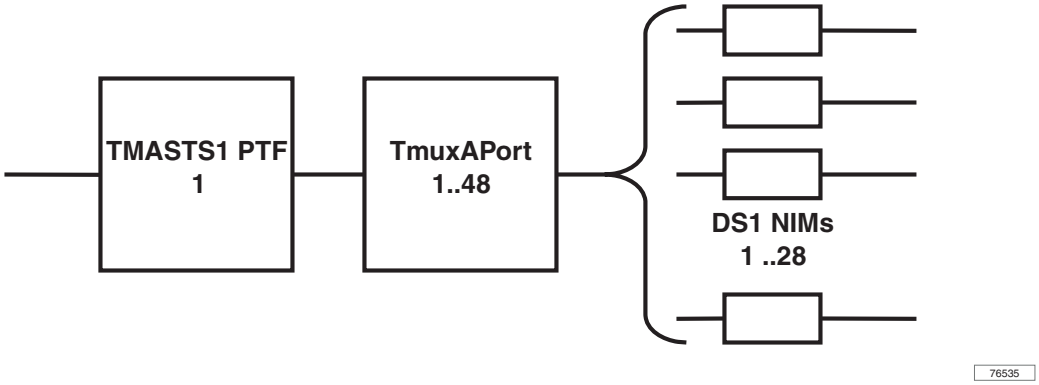
### Example

The following figure shows an example:



### HO and LO entities on the asynchronous side of the TransMUX pack

The entities at the asynchronous side of the TransMUX pack are static, i.e. are created when the TransMUX capacity is set away from 0 and persist until the TransMUX capacity is set to 0 again.



### HO and LO entities on the synchronous side of the TransMUX pack

The static entities at the synchronous side of the TransMUX pack are created when the TransMUX capacity is set away from 0 and persist until the TransMUX capacity is set to 0 again. The dynamically created entities are created with the first LO cross-connection at the STS1 PTF and removed when the last LO cross-connection at the PTF is deleted

# Remote Test Access

## Overview

### Purpose

Test access consists of a set of non-intrusive operations (“monitoring” modes) and intrusive operations (“split modes”) that aid users in turning up facilities and in fault sectionalization of existing service circuits.

Basic user capabilities in test access include:

- assigning available tributary(ies) as “test access tributary(ies)”, whose line interface(s) will be connected by the user to the external testing system. These test access tributaries are assigned and released as part of establishing or disconnecting test access sessions.
- establishing test access cross-connections from tributaries to be tested to the test access tributary(ies) that either monitor or “split” connections for testing purposes.
- retrieving information about test access connections present on the system.
- releasing test access connections and test tributaries, upon which the system automatically restores any pre-existing cross-connections that were affected.

The architecture and nomenclature depicted below help to explain how test access is defined and used.

The E-Tributary and F-Tributary are the tributaries unter test. The E and F tributaries are the ends of a one-way or two-way cross-connection, with the dashed lines indicating the signal traveling through the system. The signal path from the E-end to the F-end is referred to as the "A" direction; the opposite direction as the "B" direction. If there is only a one-way cross-connection, the signal travels in the A direction. If an idle (un-cross-connected) tributary is the focus of test access, it is always the E-end.

**Adapted Definition of one-way and two-way - HO cross-connections**;

In the context of Remote Test Access a Higher-Order (HO) connection topology is considered one-way if the Reported Leg Pair of the cross-connection between the involved tributaries indicates 1WAY (repleg = 1WAY). In the context of Remote Test Access a Higher-Order (HO) connection topology is considered two-way if the Reported Leg Pair of the cross-connection between the involved tributaries indicates 2WAY (repleg = 2WAY).

**Adapted Definition of one-way - LO cross-connections**;

In the context of Remote Test Access a Lower-Order (LO) connection topology is considered one-way if there is a cross-connection from tributary #1 to tributary #2 AND there is no cross-connection in opposite direction between tributaries #1 and #2 This is applicable regardless whether the connection from #1 to #2 is unprotected, bridged or path-protected. Also note, that there might be other cross-connections from any other tributary with tributary #1 as output tributary.

**Adapted Definition of two-way - LO cross-connections**;

In the context of Remote Test Access a Lower-Order (LO) connection topology is considered two-way if there is a cross-connection from tributary #1 to tributary #2 AND there is also a cross-connection in opposite direction from tributary #2 to tributary #1 This is applicable regardless whether the connections between tributaries #1 and #2 are unprotected, bridged or path-protected or any combination of both.

The following table shows the known test access modes:

Two groups of test access modes are defined:

- single test access tributary modes
- dual test access tributary modes.

| Mode | Description | Group |
|---|---|---|
| MONE | Monitor E-end mode of test access. This test access mode monitors the E end of an idle tributary or a leg of a cross-connection. | Single |
| MONF | Monitor F-end mode of test access. This test access mode monitors the F-end of a two-way cross-connection. | Single |
| MONEF | Monitor E-end and F-end mode of test access. This test access mode monitors (E end and F end) both directions of a 2WAY cross-connection. | Dual |
| SPLTE | Split access E-end mode of test access. This test access mode splits the connection between the E end and F end of a 1WAY cross-connection or a leg of 2WAY cross-connection. Can also be used in an idle tributary. | Single |
| SPLTF | Split access F-end mode of test access. This test access mode splits the E-end and F-end connection of a two-way cross-connection to allow testing at the F-end. | Single |
| SPLTEF | Split E-end and F-end mode of test access. This test access mode splits both directions of a 2WAY cross-connection to allow testing at both the E end and F end. | Dual |

# Protection group

## Overview

### Purpose

The protection group commands cover all types of protections within the system. The following protection group types can be distinguished:

- 1+1 equipment protection group
- 1+1 multiplex section/line protection group
- 2-fibre MS-SPRing/BLSR protection group
- 4-fibre MS-SPRing/BLSR protection group
- Path protection group.

Dedicated subsections corresponding to these protection group types will cover the specific behavior. If such a separation is not made, the description is valid for all protection group types. In addition common properties are also described in a dedicated General section.

Three operation modes can be distinguished for a 4-fibre MS-SPRing/BLSR protection group:

1. 2-sided node: An east side (protection and worker) and a west side (protection and worker) is provisioned for that group. Therefore, four ports are members within that protection group.
2. 1-sided node: Only one side is provisioned for the protection group. That can be either the east or the west side. Therefore, two ports are members within that protection group. This mode is used in context of an open 4-fiber ring w.r.t. end node in that chain.
3. Asymmetric node: Both protection ports are members of the protection group and only one or zero worker ports are assigned externally.

All attributes/parameters specifying east/or west side properties are optional and will be omitted if the corresponding side is not provisioned in case of a 1-sided node.

Note: 1-sided node (open ring) is not supported in R1. As indication if and when this feature is supported use the following criteria (supported if criteria is met): Ports can be added/removed to/from one side of the protection group (conversion from 1-side node to 2-side node and the other way round). Be aware to differentiate that scenario from switching from an asymmetric node to a non-asymmetric and the other way round. The combination of a 1-sided and asymmetric node is not allowed.

# Introduction to protection groups

## General information

The following section presents on overview of all attributes of the different protection types and their use within the different commands. The information is derived from the corresponding sections describing the commands and notifications.

Note: The following tables are specifying the set of operations, notifications, and attributes for protection groups. They do not consider any release information. Check in the corresponding sections in which release the functionality is supported.

## 1+1 equipment protection group

Entity table for switching and controller equipment protection group (EQPTSWFBR and EQPTCTL)

| Attribute | Opr | Not | Class | Note |
|---|---|---|---|---|
| aid – Switch And Timing Protection Group AID<br>or<br>Controller Protection Group AID | RTRV | ENT DLT PROTNSW | input | (1) |
| protype – Protection Type | RTRV | ENT DLT PROTNSW | input | |
| wkg – Worker Unit | RTRV | ENT PROTNSW | input | (2) |
| protn – Protection Unit | RTRV | ENT PROTNSW | input | (2) |
| actunit – Active Unit State | RTRV | PROTNSW | state | (3) |
| swreq – Switch Request State | RTRV | PROTNSW | state | (3) |
| protnsiglvl – Protection Fault Status | RTRV | | state | |
| wkgsiglvl – Worker Fault Status | RTRV | | state | |

Note 1: protection switch events reported via **REPT EVT** message will use protection group aid for identification purpose.

Note 2: protection switch events reported via **REPT SW** message will use worker/protection unit aid for identification purpose.

Note 3: updated either via protection switch commands (**OPR-PROTNSW**, **RLS-PROTNSW**) or autonomous switch events.

Entity table for EP155 Equipment Protection Group (EQPTEP155)

| Attribute | Opr | Not | Class | Note |
|---|---|---|---|---|
| aid – EP155 equipment protection group AID | RTRV, ENT, DLT | ENT, DLT, PROTNSW | input | (1) |

| Attribute | Opr | Not | Class | Note |
|---|---|---|---|---|
| protype – Protection Type | RTRV, ENT, DLT | ENT, DLT, PROTNSW | input | |
| wkg – Worker Unit | RTRV, ENT | ENT, PROTNSW | input | (2) |
| protn – Protection Unit | RTRV, ENT | ENT, PROTNSW | input | (2) |
| actunit – Active Unit State | RTRV | PROTNSW | state | (3) |
| swreq – Switch Request State | RTRV | PROTNSW | state | (3) |
| protnsiglvl – Protection Fault Status | RTRV | | state | |
| wkgsiglvl – Worker Fault Status | RTRV | | state | |

Note 1: protection switch events reported via **REPT EVT** message will use protection group aid for identification purpose.

Note 2: protection switch events reported via **REPT SW** message will use worker/protection unit aid for identification purpose.

Note 3: updated either via protection switch commands (**OPR-PROTNSW**, **RLS-PROTNSW**) or autonomous switch events.

Entity table for EP51 Equipment Protection Group (EQPTEP51)

| Attribute | Opr | Not | Class | Note |
|---|---|---|---|---|
| aid – EP51 Equipment Protection Group AID | RTRV, ENT, DLT | ENT, DLT, PROTNSW | input | (1) |
| protype – Protection Type | RTRV, ENT, DLT | ENT, DLT, PROTNSW | input | |
| wkg – Worker Unit | RTRV, ENT | ENT, PROTNSW | input | (2) |
| protn – Protection Unit | RTRV, ENT | ENT, PROTNSW | input | (2) |
| actunit – Active Unit State | RTRV | PROTNSW | state | (3) |
| swreq – Switch Request State | RTRV | PROTNSW | state | (3) |
| protnsiglvl – Protection Fault Status | RTRV | | state | |
| wkgsiglvl – Worker Fault Status | RTRV | | state | |

Note 1: protection switch events reported via **REPT EVT** message will use protection group aid for identification purpose.

Note 2: protection switch events reported via **REPT SW** message will use worker/protection unit aid for identification purpose.

Note 3: updated either via protection switch commands (**OPR-PROTNSW**, **RLS-PROTNSW**) or autonomous switch events.

Entity table for LOXC Equipment Protection Group (EQPTLOXC)

| Attribute | Opr | Not | Class | Note |
|---|---|---|---|---|
| aid – LOXC Equipment Protection Group AID | RTRV, ENT, DLT | ENT, DLT, PROTNSW | input | (1) |
| protype – Protection Type | RTRV, ENT, DLT | ENT, DLT, PROTNSW | input | |
| wkg – Worker Unit | RTRV, ENT | ENT, PROTNSW | input | (2) |
| protn – Protection Unit | RTRV, ENT | ENT, PROTNSW | input | (2) |
| actunit – Active Unit State | RTRV | PROTNSW | state | (3) |
| swreq – Switch Request State | RTRV | PROTNSW | state | (3) |
| protnsiglvl – Protection Fault Status | RTRV | | state | |
| wkgsiglvl – Worker Fault Status | RTRV | | state | |

Note 1: protection switch events reported via **REPT EVT** message will use protection group aid for identification purpose.

Note 2: protection switch events reported via **REPT SW** message will use worker/protection unit aid for identification purpose.

Note 3: updated either via protection switch commands (**OPR-PROTNSW**, **RLS-PROTNSW**) or autonomous switch events.

### TransMUX equipment protection group

Entity table for TransMUX equipment protection group (EQPTTMUX)

| Attribute | Opr | Not | Class | Note |
|---|---|---|---|---|
| aid - TransMUX Equipment Protection Group AID | RTRV | ENT | input | (1) |
| | ENT | DLT | | |
| | DLT | PROTNSW | | |
| protype - Protection Type | RTRV | ENT | input | |
| | ENT | DLT | | |
| | DLT | PROTNSW | | |
| wkg - Worker Unit | RTRV | ENT | input | (2) |
| | ENT | PROTNSW | | |
| protn - Protection Unit | RTRV | ENT | input | (2) |
| | ENT | PROTNSW | | |
| actunit - Active Unit State | RTRV | PROTNSW | state | (3) |
| swreq - Switch Request State | RTRV | PROTNSW | state | (3) |
| protnsiglvl - Protection Fault Status | RTRV | | state | |

| Attribute | Opr | Not | Class | Note |
|---|---|---|---|---|
| wkgsiglvl - Worker Fault Status | RTRV | | state | |

Note 1: Protection switch events reported via **REPT EVT** message will use protection group aid for identification purpose.

Note 2: Protection switch events reported via **REPT SW** message will use worker/protection unit aid for identification purpose.

Note 3: Updated either via protection switch commands (**OPR-PROTNSW**, **RLS-PROTNSW**) or autonomous switch events.

### ES64U equipment protection group

Entity table for ES64U equipment protection group (EQPTES64U)

| Attribute | Opr | Not | Class | Note |
|---|---|---|---|---|
| aid - ES64U Equipment Protection Group AID | RTRV | ENT | input | (1) |
| | ENT | DLT | | |
| | DLT | PROTNSW | | |
| protype - Protection Type | RTRV | ENT | input | |
| | ENT | DLT | | |
| | DLT | PROTNSW | | |
| wkg - Worker Unit | RTRV | ENT | input | (2) |
| | ENT | PROTNSW | | |
| protn - Protection Unit | RTRV | ENT | input | (2) |
| | ENT | PROTNSW | | |
| actunit - Active Unit State | RTRV | PROTNSW | state | (3) |
| swreq - Switch Request State | RTRV | PROTNSW | state | (3) |
| protnsiglvl - Protection Fault Status | RTRV | | state | |
| wkgsiglvl - Worker Fault Status | RTRV | | state | |

Note 1: Protection switch events reported via **REPT EVT** message will use protection group aid for identification purpose.

Note 2: Protection switch events reported via **REPT SW** message will use worker/protection unit aid for identification purpose.

Note 3: Updated either via protection switch commands (**OPR-PROTNSW**, **RLS-PROTNSW**) or autonomous switch events.

### Multiplex section/line protection group

Entity table for 1+1 multiplex section/line protection group.

| Attribute | Opr | Not | Class | Note |
|---|---|---|---|---|
| aid – protection group AID | RTRV ENT ED DLT | ENT ED DLT | input user | (1) |
| protype – Protection Type | RTRV ENT DLT | ENT DLT PROTNSW | input | |
| wkg – Worker Port | RTRV ENT ED DLT | ENT PROTNSW | input user | (2) |
| protn – Protection Port | RTRV ENT ED | ENT PROTNSW | input user | (2) |
| apspn – MSP-APS ASAP Pointer | RTRV ED | ENT ED | user | |
| rme – Protection Reversion | RTRV ENT | ENT | user | |
| wtr – Wait To Restore Time | RTRV ED | ENT ED | user | |
| protocol – APS Protocol | RTRV ENT | ENT | user | |
| dcclmsprotmd – DCC Line/MS Protection Mode | RTRV ED | ENT ED | user | |
| dccsrsprotmd – DCC Sect/RS Protection Mode | RTRV ED | ENT ED | user | |
| pgrate – protection group Rate | RTRV | PROTNSW | user | |
| actunit – Active Unit State | RTRV | PROTNSW | state | (3) |
| swreq – Switch Request State | RTRV | PROTNSW | state | (3) |
| protnsiglvl – Protection Fault Status | RTRV | | state | |
| wkgsiglvl – Worker Fault Status | RTRV | | state | |
| actunitfe – Far-End Incoming Requested Selection | RTRV | | state | |
| actunitne – Near-End Outgoing Requested Selection | RTRV | | state | |
| aps – Far-End Incoming APS | RTRV | | state | |
| apsout – Near-End Outgoing APS | RTRV | | state | |

Note 1: AID field “transmission protection group ID” of protection group can be specified as part of **ENT-PROTN-GRP** command.

Note 2: Member port can be used as alias for identification of protection group entity.

Note 3: Updated either via protection switch commands (**OPR-PROTNSW**, **RLS-PROTNSW**) or autonomous switch events.

### 2-fibre BLSR/MS-SPRing protection group

Entity table for 2-fibre BLSR/MS-SPRing protection group.

| Attribute | Opr | Not | Class | Note |
|---|---|---|---|---|
| aid – protection group AID | RTRV ENT ED DLT | ENT ED DLT | input user | (1) |
| protype – Protection Type | RTRV ENT ED DLT | ENT ED DLT PROTNSW | input | |
| rid – Ring Identification | RTRV ENT ED DLT | ENT ED | input user | (4) |
| east – East Port | RTRV ENT ED DLT | ENT PROTNSW | input user | (2) |
| west – West Port | RTRV ENT ED DLT | ENT PROTNSW | input user | (2) |
| blsrpn – MSSPRING-BLSR ASAP Pointer | RTRV ED | ENT ED | user | |
| wtr – Wait To Restore Time | RTRV ED | ENT ED | user | |
| pgrate – protection group Rate | RTRV | PROTNSW | user | |
| eswreq – East Switch Request State | RTRV | PROTNSW | state | (3) |
| wswreq – West Switch Request State | RTRV | PROTNSW | state | (3) |
| ringndst – Ring Node APS State | RTRV | | state | |
| eapschst – Incoming East APS Channel Status | RTRV | | state | |
| wapschst – Incoming West APS Channel Status | RTRV | | state | |
| eapsdnid – Incoming East APS Destination Node Id | RTRV | | state | |
| wapsdnid – Incoming West APS Destination Node Id | RTRV | | state | |
| eapsprotn – Incoming East APS Protection Path | RTRV | | state | |
| wapsprotn – Incoming West APS Protection Path | RTRV | | state | |
| eapssnid – Incoming East APS Source Node Id | RTRV | | state | |
| wapssnid – Incoming West APS Source Node Id | RTRV | | state | |
| eapssw – Incoming East APS Switch Priority | RTRV | | state | |
| wapssw – Incoming West APS Switch Priority | RTRV | | state | |
| elprotnsw – East Last protection switch Attempt | RTRV | | state | |
| wlprotnsw – West Last protection switch Attempt | RTRV | | state | |

Note 1: AID field “transmission protection group ID” of protection group can be specified as part of **ENT-PROTN-GRP** command.

Note 2: Member port can be used as alias for identification of protection group entity.

Note 3: Updated either via protection switch commands (**OPR-PROTNSW**, **RLS-PROTNSW**) or autonomous switch events.

Note 4: Parameter is called *newrid* in the context of **ED-PROTN-GRP** command.

## 4-fibre BLSR/MS-SPRing protection group

Entity table for 4-fibre BLSR/MS-SPRing protection group.

| Attribute | Opr | Not | Class | Note |
|---|---|---|---|---|
| aid – protection group AID | RTRV ENT ED DLT | ENT ED DLT | input user | (1) |
| protype – Protection Type | RTRV ENT ED DLT | ENT ED DLT PROTNSW | input | |
| rid – Ring Identification | RTRV ENT ED DLT | ENT ED | input user | (4) |
| eastwkg – East Worker Port | RTRV ENT ED | ENT ED PROTNSW | input user | (2)(5) |
| westwkg – West Worker Port | RTRV ENT ED | ENT ED PROTNSW | input user | (2)(5) |
| eastprotn – East Protection Port | RTRV ENT ED | ENT ED PROTNSW | input user | (2)(5) |
| westprotn – East Protection Port | RTRV ENT ED | ENT ED PROTNSW | input user | (2)(5) |
| blsrpn – MSSPRING-BLSR ASAP Pointer | RTRV ED | ENT ED | user | |
| wtr – Wait To Restore Time | RTRV ED | ENT ED | user | |
| swtr – Span Wait To Restore Time | RTRV ED | ENT ED | user | |
| protnmode – protection switch Mode | RTRV ENT ED | ENT ED | user | |
| pgrate – protection group Rate | RTRV | PROTNSW | user | |
| eswreq – East Switch Request State | RTRV | PROTNSW | state | (3) |
| wswreq – West Switch Request State | RTRV | PROTNSW | state | (3) |
| eactunit – East Active Unit State | RTRV | PROTNSW | state | (3) |
| wactunit – West Active Unit State | RTRV | PROTNSW | state | (3) |
| ringndst – Ring Node APS State | RTRV | | state | |
| eapschst – Incoming East APS Channel Status | RTRV | | state | |
| wapschst – Incoming West APS Channel Status | RTRV | | state | |
| eapsdnid – Incoming East APS Destination Node Id | RTRV | | state | |
| wapsdnid – Incoming West APS Destination Node Id | RTRV | | state | |
| eapsprotn – Incoming East APS Protection Path | RTRV | | state | |
| wapsprotn – Incoming West APS Protection Path | RTRV | | state | |
| eapssnid – Incoming East APS Source Node Id | RTRV | | state | |
| wapssnid – Incoming West APS Source Node Id | RTRV | | state | |
| eapssw – Incoming East APS Switch Priority | RTRV | | state | |
| wapssw – Incoming West APS Switch Priority | RTRV | | state | |
| elprotnsw – East Last protection switch Attempt | RTRV | | state | |

| Attribute | Opr | Not | Class | Note |
|---|---|---|---|---|
| wlprotnsw – West Last protection switch Attempt | RTRV | | state | |

Note 1: AID field “transmission protection group ID” of protection group can be specified as part of **ENT-PROTN-GRP** command.

Note 2: Member port can be used as alias for identification of protection group entity.

Note 3: Updated either via protection switch commands (**OPR-PROTNSW**, **RLS-PROTNSW**) or autonomous switch events.

Note 4: Parameter is called *newrid* in the context of **ED-PROTN-GRP** command.

Note 5: Port can be used as user parameter in **ED-PROTN-GRP** in case of adding/removing one side to/from the protection group (conversion from 1-side node to 2-side node and the other way round). It can also be used to convert a 2-side node to an asymmetric node and the other way round.

### Path protection group

Entity table for path protection group

| Attribute | Opr | Not | Class | Note |
|---|---|---|---|---|
| aid – protection group AID | RTRV ED DLT | ENT ED DLT | input | |
| protype – Protection Type | RTRV ED DLT | ENT ED DLT | input | |
| ppgname – Path protection group Name | RTRV ENT ED | ENT ED | input user | (1)(2)(5) |
| wkg – Worker Tributary | RTRV ENT | ENT<br>ED | user | (1) |
| protn – Protection Tributary | RTRV ENT | ENT<br>ED | user | (1) |
| dripathpn – SNCP-UPSR ASAP Pointer | RTRV ED | ENT ED | user | |
| rme – Protection Reversion | RTRV ENT ED | ENT ED | user | (1) |
| wtr – Wait To Restore Time | RTRV ENT ED | ENT ED | user | (1) |
| htmr – Hold-Off Time | RTRV ENT ED | ENT ED | user | (1) |
| snctype – SNC Protection Type | RTRV ENT ED | ENT ED | user | (1) |
| outtribaid – Output Tributary AID | RTRV ENT | PROTNSW | user | (1) (4) |
| cst – Constituent Signal Type | RTRV | PROTNSW | user | (1) (4) |
| actunit – Active Unit State | RTRV | PROTNSW | state | (3) (4) |
| swreq – Switch Request State | RTRV | PROTNSW | state | (3) (4) |
| actunitaid – Active Unit State AID | RTRV | | state | (3) (4) |
| protnsiglvl – Protection Fault Status | RTRV | | state | (4) |

| Attribute | Opr | Not | Class | Note |
|---|---|---|---|---|
| wkgsiglvl – Worker Fault Status | RTRV | | state | (4) |

Note 1: Initial value has to be specified as part of **ENT-CRS**/**ENT-ROLL** command.

Note 2: Parameter is called *newppgname* in the context of **ED-PROTN-GRP** command.

Note 3: Updated either via protection switch commands (**OPR-PROTNSW**, **RLS-PROTNSW**) or autonomous switch events.

Note 4: Parameter may change dynamically if path-protection uses tributaries of ports in the adaptive mode.

Note 5: Parameter not supported for low order path protection groups.

# List of commands

- "RTRV-PROTN-GRP: Retrieve protection group" (p. 3-2743)
- "RTRV-SPANSWS: Retrieve SPAN switch state" (p. 3-2812)
- "ENT-PROTN-GRP: Enter protection group" (p. 3-1730)
- "ENT-PROTN-GRP notification" (p. 3-1754)
- "ED-PROTN-GRP: Edit protection group" (p. 3-798)
- "ED-PROTN-GRP notification" (p. 3-816)
- "DLT-PROTN-GRP: Delete protection group" (p. 3-230)
- "DLT-PROTN-GRP notification" (p. 3-240)
- "OPR-PROTNSW: Operate protection switch" (p. 3-2045)

- "REPT SW: Report switch" (p. 3-2176)

# Autonomous notifications

## 1+1 equipment protection group

If the second switch circuit pack is auto created, the 1+1 switch equipment protection group entity shall be created. This entity creation shall be reported by means of **ENT-PROTN-GRP** notification.

### Auto creation of the second switch circuit pack

If the second switch circuit pack is auto created, the 1+1 switch equipment protection group entity is created. This shall be reported by means of **ENT-PROTN-GRP** notification for 1+1 equipment protection group. The initial protection state shall be reported by means of a protection switch notification for the 1+1 equipment protection group.

### Protection switch

A protection switch notification (that is, protection state change) is triggered by means equipment fail condition change as specified for the corresponding protection state machine.

### Deletion of the second switch circuit pack

If the second switch circuit pack is deleted, the 1+1 switch equipment protection group entity shall be deleted. This entity deletion shall be reported by means of DLT-PROTN-GRP notification.

### Deletion of the second controller circuit pack

If the second switch circuit pack is deleted, the 1+1 switch equipment protection group entity shall be deleted. This entity deletion is reported by means of DLT-PROTN-GRP notification for the 1+1 protection group.

## Multiplex section/Line protection group

### Protection switch and related events

A protection switch notification (i.e. protection state change) is triggered by means of

- fault condition change
- wait to restore timer expiry
- switch command received via APS message as specified for the corresponding protection state machine.

A protection switch notification shall be triggered upon a change of the Secondary Section Identifier (spec block parameter 'ssi'). This applies to MSP 1+1 optimized only. This requirement gives additionally to other requirements a further trigger for the autonomous notification for a MSP protection group. It does not require necessarily a separate notification beside other notifications of the same MSP protection group at the same time.

### 2-/4-fibre MS-SPRing/BLSR protection group

#### Protection switch

A protection switch notification (that is, protection state change) is triggered by means of

- fault condition change
- wait to restore timer expiry
- switch command received via APS message

as specified for the corresponding protection state machine.

### Path protection group

#### Protection switch

A protection switch notification (that is, protection state change) is triggered by means of

- fault condition change
- wait to restore timer expiry

as specified for the corresponding protection state machine.

Note that a path protection switch notification may be suppressed if the WTR timer expiry notification follows immediately.

# Protection log

## Overview

### Purpose

Each NE stores protection switch events in a protection log. The NE administrates the log autonomously. Therefore only a retrieve operation is defined for log the entity.

### Contents

| | |
|---|---|
| List of commands | 8-17 |
| Autonomous notifications | 8-18 |

# List of commands

- "RTRV-LOG-PROTNSW: Retrieve log protection switch" (p. 3-2448)

# Autonomous notifications

### System start-up with default DB

The system will start up with an empty protection log as part of the default DB.

### System start-up after DB transformation

The system will start up with an empty protection log after a database transformation has taken place in context of an SW upgrade.

# Ring map

## Overview

### Purpose

Each NE within a 2-/4fibre MS-SPRing/BLSR ring will maintain a ring map entity for each MS-SPRing/BLSR protection group entity. The ring map either will be discovered automatically by the NEs (default) or manually be entered by the user (see also parameter ard in “ENT-PROTN-GRP: Enter protection group” (p. 3-1730)).

The ring map consists of:

- the nodes within the ring
- the links connecting the nodes.

If the automatic ring discovery is disabled and the ring map is entered manually, the links connecting the nodes may not be retrievable. The ring map can be edited manually with ED-MAP-RING and is then stored in volatile memory. With SET-MAP-RING, the new ring map is written to NVM and activated.

# PM parameters

## PM parameter overview

This section gives an overview of all PM parameters and the associated TCA profiles. Overview tables are given for the entities supporting of PM parameters:

- SONET ports/tributaries
- SDH ports/tributaries
- Ethernet ports
- DS3 ports (including the virtual TransMUX ports)
- OTN ports.
- DS1 tributaries

Note: In Ethernet, DS3, and Transparency application, the tributaries are acting as path terminations.

Each table consists of the following rows:

- PM parameter short name (as defined in the *montype* parameter)
- PM parameter long name
- associated TCA profile type (as defined in the *pftype* parameter).

Note: If thresholding is not applicable for a PM parameter, the value 'None' is specified as associated profile type.

## SONET PM parameter table

| Short name | Long name | Profile type |
|---|---|---|
| CVS | Code Violation Section | SECTION-LINE |
| ESS | Errored Second Section | SECTION-LINE |
| SESS | Severely Errored Second Section | SECTION-LINE |
| SEFS-S | Severely Errored Framing Second Section | SECTION-LINE |

| SES-PFE | Severely Errored Second Path Far End | None |
| UAS-PFE | Unavailable Second Path Far End | DS3 |
| FC-PFE | Failure Count Path Far End | None |
| SAS-PFE | SEF/AIS Seconds Path Far End | DS3 |

## OTN PM parameter table

| Short Name | Long Name | Profile Type |
|---|---|---|
| OTN-LOSS | OTN LOS Seconds | None |
| OTN-FECC | OTN MS OTN FEC Corrected Errors | None |

### DS1 PM parameter table

| Short Name | Long Name | Profile Type |
|---|---|---|
| CVP | Code Violation Path | DS1 |
| ESP | Errored Second Path | DS1 |
| SESP | Severely Errored Second Path | DS1 |
| UASP | Unavailable Second Path | DS1 |
| SAS-P | SEF/AIS Seconds Path | DS1 |
| AISS-P | AIS Second Path | None |

### Details for PM parameters with no thresholding

Below those PM parameters are described which do not support thresholding. All other parameters which support thresholding are described in the Output Parameters section of RTRV-TCA-PROF.

#### SONET PM parameters

1. qhaissl

   Description: 15-minute AISS-L bin for SONET Line.

   The 15-minute AISS-L bin shall be supported for OC-n Line. The 15-minute AISS-L bin shall be supported for EC-1 Line.

   Type: integer

   Range: 0-900

2. dayaissl

   Description: Day AISS-L bin for SONET Line.

   The Day AISS-L bin shall be supported for OC-n Line. The Day AISS-L bin shall be supported for EC-1 Line.

   Type: integer

   Range: 0-86400

3. qhlosss

   Description: 15-minute LOSS-S bin for ONET Section.

   The 15-minute LOSS-S bin shell be supported for OC-n Section. The 15-minute LOSS-S bin shell be supported for EC-1 Section.

   Type: integer

   Range: 0-900

4. daylosss

Description: Day LOSS-S bin for SONET Section.

The Day LOSS-S bin shall be supported for OC-n Section. The Day LOSS-S bin shall be supported for EC-1 Section.

Type: integer

Range: 0-86400

5. qhfcl

   Description: 15-minute FC-L and FC-LFE bin for OC-n lines.

   The 15-minute FC-L and FC-LFE bin shall be supported for OC-n Line. The 15-minute FC-L and FC-LFE bin shall be supported for EC-1 Line.

   Type: integer

   Range: 0-900

6. dayfcl

   Description: Day FC-L and FC-LFE bin for SONET Line.

   The Day FC-L and FC-LFE bin shall be supported for OC-n lines. The Day FC-L and FC-LFE bin shall be supported for EC-1 lines.

   Type: integer

   Range: 0-86400

7. qhfcp

   Description: 15-minute FC-P and FC-PFE bin for STS1 and STS1-xC (x=3, 12, 48, 192) tributaries

   Type: integer

   Range: 0-900

8. dayfcp

   Description: Day FC-P and FC-PFE bin for STS1 and STS1-xC (x=3, 12, 48, 192) tributaries

   Type: integer

   Range: 0-86400

**Ethernet PM parameters**

1. qhcbr

   Description: 15-minute CBR for a Ethernet port

   Type: integer

   Range: 0-110000

2. daycbr

   Description: Day CBR for a Ethernet port.

   Type: integer

   Range: 0-10560000

3. qhcbs

   Description: 15-minute CBS for a Ethernet port

   Type: integer

   Range: 0-110000

4. daycbs

Description: Day CBS for a Ethernet port.
Type: integer
Range: 0-10560000

5. qheinb1ge
   Description: 15 minute EINB for a 1 GbE LAN and WAN port
   Type: integer
   Range: 0-112500000000
6. dayeinb1ge
   Description: Day EINB for a 1 GbE LAN and WAN port
   Type: integer
   Range: 0-10800000000000
7. qheonb1ge
   Description: 15 minute EONB for a 1 GbE LAN and WAN port.
   Type: integer
   Range: 0-112500000000
8. dayeonb1ge
   Description: Day EONB for a 1 GbE LAN and WAN port.
   Type: integer
   Range: 0-10800000000000
9. qheinf1ge
   Description: 15 minute EINF for a 1 GbE LAN and WAN port
   Type: integer
   Range: 0-1371951220
10. dayeinf1ge
    Description: Day EINF for a 1 GbE LAN and WAN port
    Type: integer
    Range: 0-131707317073
11. qheonf1ge
    Description: 15 minute EONF for a 1 GbE LAN and WAN port
    Type: integer
    Range: 0-1371951220
12. dayeonf1ge
    Description: Day EONF for a 1 GbE LAN and WAN port
    Type: integer
    Range: 0-131707317073
13. qheinb10ge
    Description: 15 minute EINB for a 10 GbE LAN and WAN port
    Type: integer
    Range: 0-1125000000000
14. dayeinb10ge

Description: Day EINB for a 10 GbE LAN and WAN port
Type: integer
Range: 0-108000000000000

15. qheonb10ge
    Description: 15 minute EONB for a 10 GbE LAN and WAN port
    Type: integer
    Range: 0-1125000000000
16. dayeonb10ge
    Description: Day EONB for a 10 GbE LAN and WAN port
    Type: integer
    Range: 0-108000000000000
17. qheinf10ge
    Description: 15 minute EINF for a 10 GbE LAN and WAN port
    Type: integer
    Range: 0-13719512195
18. dayeinf10ge
    Description: Day EINF for a 10 GbE LAN and WAN port
    Type: integer
    Range: 0-1317073170732 Default
19. qheonf10ge
    Description: 15 minute EONF for a 10 GbE LAN and WAN port
    Type: integer
    Range: 0-13719512195
20. dayeonf10ge
    Description: Day EONF for a 10 GbE LAN and WAN port
    Type: integer
    Range: 0-1317073170732

**DS3 PM Parameters**

1. qhaissp
   Description: 15-minute AISS-P bin for DS3
   Type: integer
   Range: 0-900
2. dayaissp
   Description: Day AISS-P bin for DS3.
   Type: integer
   Range: 0-86400
3. qhfcp
   Description: 15-minute FC-P and FC-PFE bin for DS3
   Type: integer
   Range: 0-900

4. dayfcp
   Description: Day FC-P and FC-PFE bin for DS3
   Type: integer
   Range: 0-86400
5. qhsefsp
   Description: 15-minute SEFS-P bin for DS3.
   Type: integer
   Range: 0-900
6. daysefsp
   Description: Day SEFS-P bin for DS3
   Type: integer
   Range: 0-86400
7. qhlossl
   Description: 15-minute LOSS-L bin for DS3.
   Type: integer
   Range: 0-900
8. daylossl
   Description: Day LOSS-L bin for DS3.
   Type: integer
   Range: 0-86400

**DS1 PM Parameters**

1. qhaissp
   Description: 15-minute AISS-P bin for DS1.
   Type: Integer.
   Range: 0 – 900.
   Default: None.
2. dayaissp
   Description: Day AISS-P bin for DS1.
   Type: Integer.
   Range: 0 – 86400.
   Default: None.
3. qhfcp
   Description: 15-minute FC-P bin for DS1.
   Type: Integer.
   Range: 0 – 900.
   Default: None.
4. dayfcp
   Description: Day FC-P bin for DS1.
   Type: Integer.
   Range: 0 – 86400.
   Default: None.

### OTN PM Parameters

1. qhotnloss
   Description: 15-minute LOSS bin for OTN
   Type: integer
   Range: 0-900
2. dayotnloss
   Description: Day LOSS bin for OTN
   Type: integer
   Range: 0-86400
3. qhotnfecc
   Description: 15-minute FECC bin for OTN
   Type: integer
   Range: 0-4294967295
4. dayotnfecc
   Description: Day FECC bin for OTN
   Type: integer
   Range: 0-4294967295

# List of commands

- "RTRV-PM: Retrieve performance monitoring" (p. 3-2716)

| TCA Profile | 9-15 |
| List of commands | 9-17 |
| System Start-up with Default DB | 9-18 |

TCA Profile

# TCA Profile

## General

The threshold settings for the different PM parameters supporting thresholding is provisionable by means of TCA profiles. The profiles of a certain type contains all pm parameters related to a certain entity supporting enabling/disabling of performance monitoring. Therefore the following profiles types are defined:

- SECTION-LINE - used/referenced by SONET port entities
- RS-MS - used/referenced by SDH port entities
- PATH - used/referenced by SONET and TransMUX STS1 tributary (TMASTS1) entities
- HO-VC - used/referenced by SDH tributary entities
- ENET - used/referenced by Ethernet port entities
- ODU - used/referenced by ODU/VCG entities
- DS3 - used/referenced by DS3 and TransMUX (TMAT3) port entities
- DS1 - used/referenced by DS1 tributary entities
- LO-PATH - used/referenced by SONET lower order tributary entities related to the LOXC
- LO-VC - used/referenced by SDH lower order tributary entities related to the LOXC

All threshold data of one certain profile type is sometimes also called a profile image. This term may be used in other TCA profiles commands as parameter name. It is then used as an alias for all PM thresholds parameters of the corresponding profile type.

TCA suppression can be provisioned by means of setting the corresponding profile parameter to zero.

The system supports two default sets of profiles for each type of TCA profile. One set of default profiles shall contain zero threshold value for each parameter in the profile. Another set of default profiles contains real non-zero threshold value for each parameter in the profile. The name of the zero threshold value default profile shall be “Default0” and the name of the non-zero threshold value default profile shall be “Default”.

The number of TCA profiles are limited to a specific number per profile type. This number also includes the system default profiles.

The maximum numbers are for:

- PATH SDH and PATH SONET together (higher order) 80
- RSMS SDH and section/line SONET together 30
- for ENET and ODU together 10
- DS3 10

- LOXC PATH SDH and SONET together 20.
- TMUX DS1 path 10

The user is able to change the threshold values of the non-zero default profile, but will not be allowed to change its name. The user is not allowed to change the name or the threshold values of the zero default profile.

All the profile pointers are pointed to zero threshold value default profiles when the ports are provisioned. That is, thresholding is not performed as a default. All the profile pointers are pointed to non-zero threshold value default profiles when thresholding is to be performed.

Threshold parameters names are defined using the following pattern:

<bintype>[rtr]<montype>[<port/trib rate|port type|monitoring point> with:

- bintype = day (for 24h) or qh (for 15 Min)
- [rtr] = rtr is inserted if the clear threshold is mentioned
- montype = montype as defined in **RTRV-PM** or **RTRV-TMUXPM** command
- portrate = ec1, oc3, oc12, oc48, oc192, oc768, stm1, stm4, stm16, stm64, stm256, odu1, ds3
- trib rate = sts1, sts3c, sts12c, sts48c, sts192c or vc3, vc4, vc44c, vc416c, vc464c, hosts1, vt1, hovc4, lovc3, vc12, ds1
- porttype = ge, 1ge, 10ge, vcg
- monitoring point = l, p.

# List of commands

- "RTRV-TCA-PROF: Retrieve TCA profile" (p. 3-2958)
- "RTRV-TCA-ASGNMT: Retrieve TCA assignment" (p. 3-2955)
- "ENT-TCA-PROF: Enter TCA Profile" (p. 3-1877)
- "ENT-TCA-PROF notification" (p. 3-1880)
- "ED-TCA-PROF: Edit TCA profile" (p. 3-1212)
- "ED-TCA-PROF notification" (p. 3-1258)
- "DLT-TCA-PROF: Delete TCA profile" (p. 3-256)
- "DLT-TCA-PROF notification" (p. 3-259)

# System Start-up with Default DB

## General

The system shall create during start-up with default DB two TCA profiles per supported profile type with profile name "DEFAULT" and "DEFAULT0". The values for profile "DEFAULT" shall be as specified in corresponding default requirements for each profile parameter. The values for profile "DEFAULT0" shall be '0' for each profile parameter.

# 10 TL1 messages - synchronization

## Overview

### Purpose

This section contains the TL1 commands related to the synchronization management. The synchronization commands covers types of assigning, modifying or removing and retrieving system timing attributes. Furthermore they are initiating switch requests and releasing requests.

It contains following commands and levels.

- RTRV-SYNCN
  - System Timing
  - Output Timing
  - Assigned Timing Reference
  - External Timing Input
  - External Timing Output
- SET-SYNCN
  - System Timing
  - Assigned Timing Reference
  - External Timing Input
  - External Timing Output
- OPR-SYNCNSW
- RLS-SYNCNSW.

For the system, the choice between SONET and SDH is determined by the system synchronization characteristic. The system synchronization characteristic may only be adjustable in the MCOND state. If the system synchronization characteristic is SONET, all SONET related parameter and settings are valid. All SSM messages, based on the SDH market are handled as being invalid. If the system synchronization characteristic is SDH, all SDH related parameter and settings are valid. All SSM messages, based on the SONET market are handled as being invalid.

The values of a number of parameters will be distinguished from the system synchronization characteristic. The parameter *synccrtc* in RTRV-EQPT and ED-EQPT determines whether the system synchronization characteristic, and therewith the NE, is in SDH or in SONET mode.

## Contents

# Synchronization protection switch notification

## Output format

Syntax: The **REPT EVT** notification has following specific syntax:

**REPT EVT** *modifier aid:condtype,condeff,ocrdat,ocrtm:conddescr*

## Output parameters

### System timing

1. Clock Mode Protection Type
   a. modifier – message modifier
      This parameter indicates on which entity the report event belongs.
      Type: Alphanumeric value set.
      Range: SYST (means System Timing).
   b. aid – access identifier
      This parameter indicates on which AID the report event belongs.
      Type: Alphanumeric value set.
      Range: SYSTEM
   c. condtype – condition type
      This parameter specifies the type of event being reported.
      Type: alphanumeric value set.
      Range: See Table 10-1, “Range of condtype (clock mode protection type)” (p. 10-5).
      Default: none
   d. conddescr – description of the condition
      This parameter is a textual description of the condition.
      Type: inner string.
      Range: See Table 10-2, “Range of conddescr (clock mode protection type)” (p. 10-5).
2. Timing Reference Protection Type
   a. modifier – message modifier
      See definition above.
   b. aid – access identifier
      This parameter indicates on which AID the report event belongs. The values all or *someprefix* all are not allowed in this context.
      Type: Alphanumeric value set.
      Range:
      – External_timing_ref_AID
      – Line_timing_ref_AID
      – NONE.
      The value NONE shall be reported when the last timing reference is failed.

c. condtype – condition type

This parameter specifies the type of event being reported.

Type: alphanumeric value set.

Range: See Table 10-3, "Range of condtype (timing reference protection type)" (p. 10-5).

d. conddescr – description of the condition

This parameter is a textual description of the condition.

Type: inner string.

Range: See Table 10-4, "Range of conddescr (timing reference protection type)" (p. 10-6).

**Table 10-1 Range of condtype (clock mode protection type)**

| Selection State | Attribute | Condtype |
|---|---|---|
| free running | clkmod = FREE-RUNNING<br>clkmod_stat = NORMAL | FRNGSYNC |
| forced holdover | clkmod = LOCKED<br>clkmod_stat = FORCED-HOLDOVER | HLDOVRSYNC |
| autonomous holdover | clkmod = LOCKED<br>clkmod_stat = AUTONOMOUS-HOLDOVER | HLDOVRSYNC |
| locked | clkmod = LOCKED<br>clkmod_stat = NORMAL | SYNCCLK |

**Table 10-2 Range of conddescr (clock mode protection type)**

| Selection State | Conddescr |
|---|---|
| free running | Protection switch, clock mode, Freerunning |
| forced holdover | Protection switch, clock mode, Forced Holdover |
| autonomous holdover | Protection switch, clock mode, Holdover |
| locked | Protection switch, clock mode, Locked |

**Table 10-3 Range of condtype (timing reference protection type)**

| Selection State / Lockout State | Attribute | Condtype |
|---|---|---|
| manual | refsw_stat = MANUAL | PS |
| forced | refsw_stat = FORCED | PS |
| no request | refsw_stat = NO-REQUEST | PS |
| lockout | ref_lock = LOCKOUT | INHSWPR |
| no lockout | ref_lock = NO-LOCKOUT | INHSWPR |

**Table 10-4 Range of conddescr (timing reference protection type)**

| Selection State / Lockout State | Conddescr |
|---|---|
| manual | Protection switch,sync reference, manual switch |
| forced | Protection switch,sync reference, forced switch |
| no request | Protection switch,sync reference, no Request |
| lockout | Protection switch,sync reference, lockout |
| no lockout | Protection switch,sync reference, no lockout |

### Output timing (only for SDH)

1. Output Timing Reference Protection Type
   a. modifier – message modifier
      This parameter indicates on which entity the report event belongs.
      Type: Alphanumeric value set.
      Range: OUTT (means Output Timing).
   b. aid – access identifier
      This parameter indicates on which AID the report event belongs. The values all or *someprefix* all are not allowed in this context.
      Type: Alphanumeric value set.
      Range:
      – Line_timing_ref_AID
      – NONE.
      The value NONE shall be reported when the last timing reference is failed.
   c. condtype – condition type
      This parameter specifies the type of event being reported.
      Type: alphanumeric value set.
      Range: See Table 10-5, “Range of condtype (Output timing reference protection type)” (p. 10-6).
   d. conddescr – description of the condition
      This parameter is a textual description of the condition.
      Type: inner string
      Range: See Table 10-6, “Range of conddescr (Output timing reference protection type)” (p. 10-7).

**Table 10-5 Range of condtype (Output timing reference protection type)**

| Selection State / Lockout State | Attribute | Condtype |
|---|---|---|
| manual | orefswr_stat = MANUAL | PS |
| forced | orefswr_stat = FORCED | PS |

**Table 10-5 Range of condtype (Output timing reference protection type) (continued)**

| Selection State / Lockout State | Attribute | Condtype |
|---|---|---|
| no request | orefswr_stat = NO-REQUEST | PS |
| lockout | sclkref_lockstat = LOCKOUT | INHSWPR |
| no lockout | sclkref_lockstat = NO-LOCKOUT | INHSWPR |

**Table 10-6 Range of conddescr (Output timing reference protection type)**

| Selection State / Lockout State | Conddescr |
|---|---|
| manual | Protection switch, output reference, Manual switch |
| forced | Protection switch, output reference, Forced switch |
| no request | Protection switch, output reference, No Request |
| lockout | Protection switch, output reference, Lockout |
| no lockout | Protection switch, output reference, No Lockout |

## Example output

The following is an example of a protection switch notification for clock mode protection type:

```
   LT-UNITE 00-11-09 12:00:00
A  000 REPT EVT SYST
   "SYSTEM:HLDOVRSYNC,TC,11-09,12-00-00,,,:\"Protection switch,clock
      mode,
   Forced Holdover\""
;
```

The following is an example of a protection switch notification for timing reference protection type:

```
   LT-UNITE 00-11-09 12:00:00
A  000 REPT EVT SYST
   "EXTREF1:PS,TC,11-09,12-00-00,,,:\"Protection switch,sync reference,
   Manual switch\""
;
```

The following is an example of a protection switch notification for timing reference protection type when the last reference has failed:

```
   LT-UNITE 07-01-26 14:41:00
A  000 REPT EVT SYST
   "NONE:PS,TC,07-01-26,14-40-30,,,:\"Protection switch,sync reference,
   No Request\""
```

```
;
```

The following is an example of a protection switch notification for output timing reference protection type:

```
   LT-UNITE 00-11-09 12:00:00
A  000 REPT EVT OUTT
   "LINE2:INHSWPR,SC,11-09,12-00-00,,,:\"Protection switch,output
      reference,
   Lockout\""
;
```

The following is an example of a protection switch notification for output timing reference protection type when the last timing reference has failed:

```
   LT-UNITE 07-01-26 14:42:00
A  000 REPT EVT OUTT
   "NONE:PS,TC,07-01-26,14-41-30,,,:\"Protection switch,output
      reference,
   No Request\""
;
```

# Autonomous notifications

### System initialization with default values

After first system initialization for all parameters the described default values are valid and no timing reference is assigned. No database change notification will be returned during database auto creation.

### System initialization after system synchronization characteristic change

It is possible to change the system synchronization characteristic later on. For this case, the system will behave as a new created node. All assigned timing references are un-assigned before and after changing in the MCOND state the system will start-up with the default values. No database change notification will be returned after changing the system synchronization characteristic and reset to default values.

### Autonomous clock switch

If the provisioned clockmod = LOCKED and a failure of all timing references active, the system switches in autonomous-holdover state and return a report event and a report alarm notification to the management system. If at least one fault-free timing reference is available, the system switches back to the locked state autonomously. The following parameter are affected by the autonomous clock mode switch: clkmod_stat = [AUTONOMOUS-HOLDOVER, NORMAL].

### Autonomous reference switch for system timing

The autonomous reference switching is initiated by the failure of a reference. The autonomous reference switching results also after a SSM change of the active reference or of any of the standby references. The choice for the next active timing reference primarily depends on provisioned QL values if QL mode is enabled and subsequent on provisioned priorities for each reference. In consequence of identical QL values and priorities the system supports non-revertive switching. The autonomous reference switch returns a protection switch notification for System Timing. The following parameter are affected by the autonomous timing reference switch: active_ref = [External_timing_ref_AID, Line_timing_ref_AID, NONE].

### Autonomous reference switch for output timing (only for SDH)

The autonomous reference switching is initiated by the failure of a reference. The autonomous reference switching might also switch after a SSM change. The choice for the next active timing reference is primarily depending on provisioned QL values if QL mode is enabled and subsequent on provisioned priorities for each reference. In consequence of similar QL values and priorities the system supports non-revertive

switching. The autonomous reference switch returns a protection switch notification for Output Timing. The following parameter are affected by the autonomous timing reference switch: active_oref_stat = Line_timing_ref_AID, NONE.

### Synchronization instances

The following instances are created during system initialization:

- one system timing entity
- one output timing entity (only for SDH)
- two timing reference entities for external timing input
- six timing reference entities for line timing for

SDH only:

- one external timing output port entity

for SONET only:

- two external timing output port entities.

# 11 TL1 messages - software & database management

## Overview

### Purpose

This section contains the TL1 interface definition for the domain *software and database management*.

### Background information:

In the Non Volatile Memory (NVM) of the NE, there are two regions: current and previous. Each region contains a software generic (code and static data) and a database.

The properties of the databases and the software generics can be retrieved by RTRV-PRMTR-DATA and RTRV-PRMTR-SFTWR.

The restore option of CPY-MEM is used to copy a database from a remote file store into previous NVM and then to install it as the working database. The backup option of CPY-MEM is used to copy the database that is in current NVM to a remote file store.

The download option of CPY-MEM is used to download new generics to previous NVM. Installation via APPLY causes the contents of previous NVM to be installed. Following installation, a "pointer" is changed so that what is identified as current NVM contains the currently executing generic and previous NVM contains the previous generic.

- "ENT-FECOM notification" (p. 3-1564)
- "DLT-FECOM notification" (p. 3-194)

# Transparent DCC cross-connection

## Overview

### Purpose

Transparent DCC cross-connections allows to cross-connect DCC channels (either DCC-R or DCC-M) of an OPn/EPn on the XCn without adding/dropping them to/from the OHI bus to/from the CTL/DCF. As such there is no processing on the DCF for those channels a transparent DCC cross-connection allows to transparently pass-through certain DCC channel without any processing by the system. The transparent DCC cross-connections are complete independent from the transmission cross C-connection. The transparent DCC cross-connections are always bidirectional. The system supports up to 25 bidirectional transparent DCC cross-connections.

- "DLT-ULSDCC-L4 notification" (p. 3-268)

# TCP/IP parameters

## Overview

### Purpose

This section lists TL1 commands applicable to the TCP/IP stack.

### Contents

| | |
|---|---|
| List of commands | 12-18 |

# List of commands

- "RTRV-ULS: Retrieve upper layer stack" (p. 3-3020)
- "ENT-ULS: Enter upper layer stack" (p. 3-1926)
- "ENT-ULS notification" (p. 3-1931)

# IP Map

## Overview

### Purpose

This section describes commands dealing with the IP map:

- the IP map provides T-TD access to the NE via one of the LANs that is assigned to node 1. Only managers registered in the IP map are allowed to access the NE via TCP/IP unless the wildcard (255.255.255.255) is entered into the list. In this case the access restriction is disabled.
- historically, the application context identifier for TL1 over OSI connections has been used to tailor the characteristics of the TL1 session (e.g. which events are reported using TL1 notifications) to the calling manager.
- ADM40G bases the characteristics of a TL1 session on the user name passed in the ACT-USER command rather than the application context identifier.
- still, for backwards compatibility, the feature of having the application context identifier being determined by the address of the calling manager is required on the T-TD.

# ONNS system parameters

## Overview

### Purpose

This section lists information about the TL1 commands related to the ONNS system parameters.

### Contents

| | |
|---|---|
| List of commands | 13-3 |

# List of commands

- "RTRV-NNCNFG: Retrieve ONNS configuration data" (p. 3-2539)
- "ED-NNCNFG: Modify ONNS system configuration" (p. 3-448)
- "RTRV-NNEVT-TCA" (p. 3-2568)
- "REPT-NNCHG notification" (p. 3-2126)
- "REPT-NNEVT notification" (p. 3-2133)

# ONNS data repositories

## Overview

### Purpose

This section lists information about the TL1 commands related to the ONNS data repositories.

### Contents

| | |
|---|---|
| List of commands | 13-5 |

# List of commands

- "RTRV-NNDR: Retrieve ONNS neighbor nodal data repository" (p. 3-2545)
- "RTRV-NTDR: Retrieve ONNS network topology data repository" (p. 3-2574)
- "RTRV-NADR: Retrieve ONNS network (domain) address data repository" (p. 3-2523)

# Path

## Overview

### Purpose

This section contains information about the TL1 commands related to the Path.

### Contents

| | |
|---|---|
| List of commands | 13-7 |
| Connection and path state definitions | 13-8 |

# List of commands

- “RTRV-PATH: Retrieve ONNS connection data” (p. 3-2683)
- “ENT-PATH: Create ONNS path connection” (p. 3-1686)
- “ED-PATH: Add or modify alias of ONNS connection” (p. 3-736)
- “ED-PATH-PROT: Modify ONNS connection parameters or protection type” (p. 3-749)
- “ED-PATH-ROLL: Modify ONNS connection route” (p. 3-776)
- “DLT-PATH: Delete ONNS path connection” (p. 3-219)
- “REPT-PTHCHG notification” (p. 3-2138)
- “REPT-PTHEVT notification” (p. 3-2163)

# Connection and path state definitions

## Overview

The Connection connStatus and the pathState variables are related, and the connStatus can be derived from the pathState. The two tables below show the possible states.

The column State Type characterizes the codes further:

- ES: connection/path is in a stable and active End State
- FR: Final Report state (indicates that the connection/path is no longer active)
- TS: Transient State
- RQ connection/path on Restoration Queue.

## connStatus Codes

| TL1 *connStatus* code | Description | State Type |
|---|---|---|
| CON&OK | Normal Connection Status | ES |
| CON&FAILED | Connection failure | ES |
| CON&NO-IN | No Input, source or destination (Initial setup) | ES |
| CON&FAILED&RSTRFL | Restoration attempt failed / connection going to the Restoration Queue | TS |
| CON&TRDOWN | Connection Delete (In Progress) | TS |
| DLT | Connection Deleted | FR |
| CON&DLT-FL | Conn Delete Failed, path not deleted | ES |
| CON&OK&RSTRD | Auto-Reroute Revertive Connection Status (after initial restoration) | ES |
| NOCON&SETUP | Initial connection setup in progress | TS |
| NOCOM&PREMPTD | Connection has been disconnected from original path | TS |
| CON&OK&WTORV | AUTORV Path ready, waiting for WTR (wait-to-revert) timer to revert to original path | TS |
| NOCON&WTORSTR | Preempted path removed & Connection has been added to the Restoration Queue. | ES / RQ |
| CON&FAILED&WTORSTR | Auto Connection failed & has been added to the Restoration Queue. | ES / RQ |
| CON&SETUP | Initial connection setup completed, waiting for check of signal | TS |
| NOCON&SETUPFL | Initial connection setup failed | FR |
| NOCON | Connection has been disconnected from original path by maintenance operation | TS |
| CON&STBY | Protecting connection not being allocated for protecting a working one | ES |

| TL1 *connStatus* code | Description | State Type |
|---|---|---|
| CON&USED | Protecting connection not being allocated for protecting a working one | ES |
| CON&UNKNOWN | Connection Status is not known after a recovery until the fault status is retrieved from the z-node | TS |
| CON&OK&DEGRADED | Path failure of a permanent 1+1 TS connection can't be restored by a new path | TS |

## PathState Codes

| TL1 *pathState* code | Description | State Type |
|---|---|---|
| CON&OK | Normal Path Status | ES |
| CON&FAILED | Path failure | ES |
| CON&TRDOWN | Path Delete in progress | TS |
| DLT | Path Delete complete | FR |
| CON&NO-IN | No Input, source or destination, during initial setup | ES/TS |
| CON&OK&RSTRD | Auto-Reroute Revertive Restoration | ES |
| NOCON&SETUP | Initial connection setup in progress | TS |
| CON&DLT-FL | Path delete failed | ES |
| NOCON&PREMPTD | Path has been disconnected from original EDGE port and will be re-used on another restored connection | TS |
| CON&OK&WTORV | AUTORV Path ready, waiting for WTR (wait-to-revert) timer to revert to original path | TS |
| NOCON | Pre-calculated restore path available for use | ES |
| CON&SETUP | Initial connection setup completed, waiting for signal confirmation from the egress node | TS |
| CON&FAILED&WTORSTR | Restoration attempt failed and will be restored when a new path is available | ES |
| NOCON&SETUPFL | Initial connection setup failed | ES |
| RSVD&OK | Normal Path Status while associatedto a protecting connection | ES |
| RSVD&FAILED | Path Failure while associated to a protecting connection | ES |
| RSVD&DLT-FL | Path delete failed for a path associated to a protecting connection | ES |
| RSVD&SETUPFAIL | Initial connection setup failed for protecting connection | ES |
| RSVD&TRDOWN | Path Delete in progress for path associated to protecting connection | TS |

| TL1 *pathState* code | Description | State Type |
|---|---|---|
| RSVD&SETUP | Initial connection setup completed, for path associated to protecting connection, waiting for signal confirmation from the egress node | TS |
| CON&UNKNOWN | Path State is not known after a recovery until the fault status is retrieved from the z-node. | TS |
| RSVD&UNKNOWN | Path State for a path associated to a protecting connection is not known after a recovery until the fault status is retrieved from the z-node. | TS |

# Network optimization

## Overview

### Purpose

This section contains information about the TL1 commands related to the network optimization.

### Contents

| | |
|---|---|
| List of commands | 13-12 |

# List of commands

- “RTRV-PREDEFRAG: Perform an ONNS fragmentation analysis” (p. 3-2723)
- “OPR-DEFRAG: Perform defragmentation ” (p. 3-2008)

# Maintenance

## Overview

### Purpose

This section contains information about the TL1 commands related to the maintenance.

### Contents

| | |
|---|---|
| List of commands | 13-14 |

# List of commands

- "RTRV-AUDLOG: Retrieve audit result log for ONNS connection data" (p. 3-2249)
- "AUD: Perform audit data" (p. 3-46)
- "ED-SYNCDATA: Synchronization of ONNS data" (p. 3-1196)

# UNI commands

## Overview

### Purpose

This section contains information about the TL1 commands related to the UNI feature.

### Contents

| | |
|---|---|
| List of commands | 13-16 |

# List of commands

- "DLT-CONN: Delete network connection" (p. 3-141)
- "ENT-CONN: Establish network connections with TNA address parameters" (p. 3-1447)
- "REPT-CONNCHG notification" (p. 3-2092)
- "RTRV-CONN: Retrieve data relevant for network connections" (p. 3-2278)
- "RTRV-NADR: Retrieve ONNS network (domain) address data repository" (p. 3-2523)
- "RTRV-NNDR: Retrieve ONNS neighbor nodal data repository" (p. 3-2545)
- "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683)

# ENNI commands

## Overview

### Purpose

This section contains information about the TL1 commands related to the ENNI feature.

### Contents

| | |
|---|---|
| List of commands | 13-18 |

# List of commands

- "ACT-L1ROUTING" (p. 3-15)
- "CANC-L1ROUTING" (p. 3-54)
- "DLT-CONN: Delete network connection" (p. 3-141)
- "ENT-CONN: Establish network connections with TNA address parameters" (p. 3-1447)
- "REPT-CONNCHG notification" (p. 3-2092)
- "REPT L1ROUTING notification" (p. 3-2122)
- "REPT-PTHCHG notification" (p. 3-2138)
- "RTRV-CONN: Retrieve data relevant for network connections" (p. 3-2278)
- "RTRV-ELDR: Retrieve ONNS external link data repository" (p. 3-2322)
- "RTRV-L1ADR: Retrieve level 1 Address Data Repository" (p. 3-2419)
- "RTRV-L1TDR: Retrieve level 1 topology data repository" (p. 3-2426)
- "RTRV-NADR: Retrieve ONNS network (domain) address data repository" (p. 3-2523)
- "RTRV-NNDR: Retrieve ONNS neighbor nodal data repository" (p. 3-2545)
- "RTRV-NTDR: Retrieve ONNS network topology data repository" (p. 3-2574)
- "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683)

# 14 Error codes

## List of error codes

| Error code | Meaning (validation rule) | Related to command |
|---|---|---|
| **DNC - Input, Data Not Consistent, No BLSR/MS-SPRing inter-working with low-order traffic** | LO Substructure creation not allowed on BLSR/MS-SPRing ports | "ED-SUBS: Create or delete the lower-order substructure at a higher-order tributary." (p. 3-1189) |
| **DNC - Input, Data Not Consistent, revertive mode not supported for MSP Protection Type 1+1 and a port with the indicated rate** | No MSP/APS 1+1 revertive protection for bitrate STM-256/OC-768 | "ENT-PROTN-GRP: Enter protection group" (p. 3-1730) |
| **DNV - Input, Data Not Valid, DCC on DS3 Ports not allowed** | No DCC on DS3 ports | "ENT-CRS-FECOM: Enter transparent DCC cross-connection" (p. 3-1503); "ENT-FECOM: Enter DCC channel related parameters" (p. 3-1552) |
| **DNV - Input, Data Not Valid, DCC on EC1 Ports not allowed** | No DCC on EC1 ports | "ENT-CRS-FECOM: Enter transparent DCC cross-connection" (p. 3-1503); "ENT-FECOM: Enter DCC channel related parameters" (p. 3-1552) |
| **E001 - srvID - InSufficient Network Resources for connection setup** | Insufficient network resources | "ENT-PATH: Create ONNS path connection" (p. 3-1686); "ED-PATH-PROT: Modify ONNS connection parameters or protection type" (p. 3-749); "ED-PATH-ROLL: Modify ONNS connection route" (p. 3-776) |
| **E002 - SICE - Status, Inter-Processor Communication Error caused cmd failure** | Access to the database is not possible I | "RTRV-NADR: Retrieve ONNS network (domain) address data repository" (p. 3-2523) |
| **E002 - SICE Error - Status, Inter-Processor Communication Error caused cmd failure** | Invalid componentID parameter II | "RTRV-NTDR: Retrieve ONNS network topology data repository" (p. 3-2574) |

| Error code | Meaning (validation rule) | Related to command |
|---|---|---|
| **E003 - SNTT - Status, Network Topology database Timed out** | Access to the database is not possible II | "RTRV-NADR: Retrieve ONNS network (domain) address data repository" (p. 3-2523) |
| **E004 - srvID - InSufficient Network Resources for Alternate Path** | Insufficient network resources for alternate route | "ED-PATH-PROT: Modify ONNS connection parameters or protection type" (p. 3-749) |
| **E004 - srvID - InSufficient Network Resources for Alternate Path** | Insufficient Network Resources for Alternate Route | "ENT-PATH: Create ONNS path connection" (p. 3-1686) |
| **E020 - Maximum Transport Delay Exceeded (by calculated path)** | Maximum delay errors on calculated path | "ED-PATH-PROT: Modify ONNS connection parameters or protection type" (p. 3-749); "ED-PATH-ROLL: Modify ONNS connection route" (p. 3-776) |
| **E020 - srvID - Maximum Transport Delay Exceeded,errorData** | Maximum Delay Exceeded by calculated path | "ENT-PATH: Create ONNS path connection" (p. 3-1686) |
| **E030 - SMcon135*7.92468 - Syntax, Parameter Data Imvalid,Invalid_ parameter=SrvID** | Invalid srvID | "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683) |
| **E030 - SPDI - Syntax, Parameter Data Invalid, invalid_parameter= fieldName** | ED-PATH request denied - Parameter invalid | "ED-PATH-ROLL: Modify ONNS connection route" (p. 3-776) |
| **E030 - srvID - Syntax, Parameter Data Invalid,invalid_parameter= fieldName** | ENT-PATH syntax, parameter data invalid | "ENT-PATH: Create ONNS path connection" (p. 3-1686) |
| **E030 - Syntax, Parameter Data Invalid, invalid_parameter** | ED-PATH-PROT request denied - Parameter invalid | "ED-PATH-PROT: Modify ONNS connection parameters or protection type" (p. 3-749) |
| **E040 - SDNC - Syntax, Data Not Consistent** | Error Responses specific for OPR-PATH | "OPR-PATH: Operate path" (p. 3-2038) |
| **E040 - srvID - Syntax, Data Not Consistent** | ENT-PATH syntax, data not consistent | "ENT-PATH: Create ONNS path connection" (p. 3-1686) |
| **E050 - IICG - Input, Invalid connection ID for connection group/conn ID** | Retrieve path - Invalid connection ID for group retrieval | "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683) |
| **E050 - IICG - Input, Invalid connection ID for connection group/connID** | Grouped connection deletion on VCG EDGE affects EXT Connection | "DLT-PATH: Delete ONNS path connection" (p. 3-219) |
| **E081 - IIEP - Input, Invalid ingress / Egress Port,errorData** | NN PortID parameter value is not valid | "ENT-PATH: Create ONNS path connection" (p. 3-1686) |
| **E082 - Status, NNI connPoint / port Unavailable ID=<ASTN node ID> &<ConnPtID>** | Port related problems | "ED-PATH-PROT: Modify ONNS connection parameters or protection type" (p. 3-749) |
| **E150 - SPPF - Status, Parameter Provisioning Failed** | ENT-PATH partially failed due to failed Parameter Provisioning | "ENT-PATH: Create ONNS path connection" (p. 3-1686) |

| Error code | Meaning (validation rule) | Related to command |
|---|---|---|
| **E160 - srvID - XConn Connect Failure, Port does not exist or is TRADITIONAL** | Cross-connect connect failure | "ENT-PATH: Create ONNS path connection" (p. 3-1686) |
| **E220 - 135.13.7.9-48 - Input, ConnectionID Non-Existent** | Path ConnectionID does not exist | "DLT-PATH: Delete ONNS path connection" (p. 3-219) |
| **E220 - 13513794 - Input, ConnectionID Non-Existent** | connID Non-Existant (ICNE) | "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683) |
| **E222 - IIDM srvID - Input, Invalid deletion of connection of protection** | Connection is member of an M:N protected connection group | "DLT-PATH: Delete ONNS path connection" (p. 3-219) |
| **E223 - SPCU 135.7.9.2-35 - Status, Protection Connection in Use, removal of the M:N worker connection aborted** | Protection connection of an M:N protection group in use | "DLT-PATH: Delete ONNS path connection" (p. 3-219) |
| **E224 - IIDC srvID - Input, Invalid Deletion of a Connection of a switched connection group** | Connection is member of a switched VCG connection group | "DLT-PATH: Delete ONNS path connection" (p. 3-219) |
| **E226 - IDNA - Input, Retrieve Detail_** | Error Responses Specific to RTRV-PATH | "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683) |
| **Route or Detail_State Not allowed for RTRV-PATH ALL** | | |
| **E235 - Input, Invalid CoMmand, Command not found or recognized** | Invalid command | "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683) |
| **E240 - Syntax, InValid Punctuation** | Syntax, Invalid punctuation | "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683) |
| **E246 - Syntax, Parameter Not Implemented** | Syntax invalid or unimplemented parameter | "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683) |
| **E250 - Input, Invalid TArget Identifier** | Invalid target identifier | "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683) |
| **E260 - Input, Invalid ACcess identifier** | Invalid access identifier | "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683) |
| **E265 - Input, Invalid Correlation Tag** | Invalid correlation tag (CTAG) or RequestID | "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683) |
| **E280 - Status, All Resources Busy** | Status, All Resources Busy | "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683) |
| **E282 - SCSI - Status, Conn State Invalid for this Operation** | Retrieve path with detailed route option - No path ID associated to ONNS connection | "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683) |
| **E282 - SCSI Error - Status, Conn State Invalid for this Operation** | Switch Back behavior modification | "ED-PATH-PROT: Modify ONNS connection parameters or protection type" (p. 3-749) |
| **E283 - SOPI - Status, Operation Invalid for Protection Type MBYNPRT** | Retrieve path with detailed state option - Operation Invalid for Protection Type MBYNPRT | "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683) |
| **E290 - Status, Requested Operation Failed** | Requested Operation Failed (SROF) | "RTRV-PATH: Retrieve ONNS connection data" (p. 3-2683) |

| Error code | Meaning (validation rule) | Related to command |
|---|---|---|
| **E335 - SCOF Error - Status, Connection Operation Failed** | ED-PATH-PROT Parameter Provisioned failed | "ED-PATH-PROT: Modify ONNS connection parameters or protection type" (p. 3-749) |
| **E360 - SPMF - Status, Path Modify Failed due to invalid protection type change** | Protection modification for External Connections | "ED-PATH-PROT: Modify ONNS connection parameters or protection type" (p. 3-749) |
| **E511 - IINO - Input, Invalid NOde_ ID** | Invalid componentID parameter I | "RTRV-NADR: Retrieve ONNS network (domain) address data repository" (p. 3-2523) |
| **E511 - IINO - Input, Invalid NOde_ ID** | Invalid componentID parameter II | "RTRV-NTDR: Retrieve ONNS network topology data repository" (p. 3-2574) |
| **E512 - IINI Error - Input, Invalid Neighbor node ID** | Invalid componentID parameter | "RTRV-NNEVT-TCA" (p. 3-2568) |
| **E512 - Input, Invalid Neighbor node ID** | Invalid PortID or componentID parameter | "RTRV-NNDR: Retrieve ONNS neighbor nodal data repository" (p. 3-2545) |
| **E520 - IIDD - Input, Invalid Degree of Disjointness** | ENT-PATH syntax, invalid degree of disjointness value | "ENT-PATH: Create ONNS path connection" (p. 3-1686) |
| **E520 - IIDD - Input, Invalid Degree of Disjointness for protection type N1PLUS1 or YCONN** | ED-PATH-PROT syntax, invalid degree of disjointness value | "ED-PATH-PROT: Modify ONNS connection parameters or protection type" (p. 3-749) |
| **E660 - LDOS - Local Data Out of Sync** | ED-SYNCDATA-PATH not possible because of local data inconsistencies | "ED-SYNCDATA: Synchronization of ONNS data" (p. 3-1196) |
| **E700 - ICID - Invalid Connection IDentification** | OPR-MAINT-ONNS with reqType = REMLEG or REMLEG_RESV not allowed because of specified connection is not valid | "OPR-MAINT-ONNS: Maintenance actions for the ONNS application" (p. 3-2034) |
| **E701 - DLID - Duplicate Leg IDentification** | OPR-MAINT-ONNS with reqType = REMLEG or REMLEG_RESV not allowed because of both pathID and connPtID specified | "OPR-MAINT-ONNS: Maintenance actions for the ONNS application" (p. 3-2034) |
| **E702 - ULID - Unsupported Leg IDentification** | OPR-MAINT-ONNS with reqType = REMLEG or REMLEG_RESV not allowed because of invalid leg identification via pathID or connPtID | "OPR-MAINT-ONNS: Maintenance actions for the ONNS application" (p. 3-2034) |
| **EATN - Equipage, not valid for Access Type, incorrect equipage** | Incorrect Equipage (EATN) | "RTRV-HDR: Retrieve header" (p. 3-2397) |
| **EATN - Equipage, Not Valid for Access Type, retrieved file TID mismatch** | TID Mismatch in retrieved File (EATN) | "RTRV-HDR: Retrieve header" (p. 3-2397) |
| **EATN - Status, incorrect equipage, unrecognized CP for this slot** | Check whether CP is acceptable | "ENT-EQPT (slot): Enter equipment (slot)" (p. 3-1534) |
| **ENEQ - Equipage, Not EQuipped** | Missing Equipage (ENEQ) | "RTRV-HDR: Retrieve header" (p. 3-2397) |

| Error code | Meaning (validation rule) | Related to command |
|---|---|---|
| **ENEQ - Equipage, Not EQuipped osinode** | Check for parameter osinode | "ENT-FECOM: Enter DCC channel related parameters" (p. 3-1552) |
| **ENEQ - Equipage, Not EQuipped, ES64U destination slot empty** | No forced switch to empty slot (ES64U Protection Group) | "OPR-PROTNSW: Operate protection switch" (p. 3-2045) |
| **ENEQ - Equipage, Not Equipped, insufficient file space** | Insufficient file space | "COPY-RFILE: Copy remote file" (p. 3-108); "CPY-MEM: Copy memory" (p. 3-116) |
| **ENEQ - Equipage, Not EQuipped, insufficient file space** | Insufficient File Space (ENEQ) | "RTRV-HDR: Retrieve header" (p. 3-2397) |
| **ENEQ - Equipage, Not EQuipped, LOXC destination slot empty** | No forced switch to empty LOXC slot (LOXC Protection Group) | "OPR-PROTNSW: Operate protection switch" (p. 3-2045) |
| **ENEQ - Equipage, Not EQuipped, osinode** | parameter osinode | "ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1567) |
| **ENEQ - Equipage, Not EQuipped, TMUX destination slot empty** | No forced switch to empty slot (TransMUX; Protection Group) | "OPR-PROTNSW: Operate protection switch" (p. 3-2045) |
| **ENEQ - Equipage, Not EQuipped, XC destination slot empty** | No forced switch to empty XC slot (Switching Protection Group) | "OPR-PROTNSW: Operate protection switch" (p. 3-2045) |
| **ENRE - Equipage, Not Recognized Equipage, unrecognized CP for this slot** | Check exchangeability rules for electrical packs | "ED-EQPT (slot): Edit equipment (slot)" (p. 3-367) |
| **ENRE - Equipage, Not Recognized Equipage, unrecognized CP for this slot** | Check exchangeability rules for LOXC packs | "ED-EQPT (slot): Edit equipment (slot)" (p. 3-367) |
| **ENRE - Equipage, Not Recognized Equipage, unrecognized CP for this slot** | Check exchangeability rules for optical packs | "ED-EQPT (slot): Edit equipment (slot)" (p. 3-367) |
| **ENRE - Equipage, Not Recognized Equipage, unrecognized CP for this slot** | Check exchangeability rules for XC packs | "ED-EQPT (slot): Edit equipment (slot)" (p. 3-367) |
| **ENRE - Equipage, Not Recognized Equipage, unrecognized CP for this slot** | Check whether CP is acceptable | "ED-EQPT (slot): Edit equipment (slot)" (p. 3-367) |
| **ENRE - Equipage, Not Recognized Equipage, unrecognized module for this socket** | Exchangeability III: Invalid module plugged in | "ED-EQPT (socket): Edit equipment" (p. 3-376) |
| **ENRE - Equipage, Not Recognized Equipage, unrecognized module for this socket** | Module must be part of acceptable module list | "ENT-EQPT (socket): Enter equipment (socket)" (p. 3-1544) |
| **ENSG - Equipage, Not Software Generic, generic not available** | Generic not available | "APPLY: Apply software generic or activate a downloaded database" (p. 3-35); "CPY-MEM: Copy memory" (p. 3-116) |
| **ENSG - Equipage, Not Software Generic, generic not available** | Generic not available (ENSG) | "RTRV-HDR: Retrieve header" (p. 3-2397) |

| Error code | Meaning (validation rule) | Related to command |
|---|---|---|
| **ICNV - Input Command Not Valid, Interface Standard does not match** | modifier consistent with given port's interface standard | "OPR-LPBK: Operate facility loopback" (p. 3-2025); "RLS-LPBK: Release loopback (facility)" (p. 3-2187) |
| **ICNV - Input, Command Not Valid** | Input failure (ICNV) | "RTRV-HDR: Retrieve header" (p. 3-2397) |
| **ICNV - Input, Command Not Valid** | Login on established session | "ACT-USER: Activate user" (p. 3-24) |
| **ICNV - Input, Command Not Valid, directory/URL must be specified** | Directory/URL not specified | "COPY-RFILE: Copy remote file" (p. 3-108) |
| **ICNV - Input, Command Not Valid, directory/URL must be specified** | Directory/URL not specified for backup | "COPY-RFILE: Copy remote file" (p. 3-108) |
| **ICNV - Input, Command Not Valid, directory/URL must be specified** | Directory/URL not specified for database download | "COPY-RFILE: Copy remote file" (p. 3-108) |
| **ICNV - Input, Command Not Valid, directory/URL must be specified** | Directory/URL not specified for restoration | "COPY-RFILE: Copy remote file" (p. 3-108) |
| **ICNV - Input, Command Not Valid, extra AID** | Too much AID parameters (ICNV) | "RTRV-HDR: Retrieve header" (p. 3-2397) |
| **ICNV - Input, Command Not Valid, file must be specified** | Directory/URL not specified | "CPY-MEM: Copy memory" (p. 3-116) |
| **ICNV - Input, Command Not Valid, FTTD must be specified** | FT-TD device not specified | "COPY-RFILE: Copy remote file" (p. 3-108) |
| **ICNV - Input, Command Not Valid, inmbst not NA** | Correct state of tributary for being added (Source) | "ED-VCGTRIB: Edit virtual concatenation group tributary" (p. 3-1410) |
| **ICNV - Input, Command Not Valid, Interface Standard does not match** | Check CCB against istd | "ED-SUBS: Create or delete the lower-order substructure at a higher-order tributary." (p. 3-1189); "RTRV-VC3: Retrieve VC3 tributary" (p. 3-3043) |
| **ICNV - Input, Command Not Valid, Interface Standard does not match** | Check CCB against istd of related port | "ED-STS1: Edit STS1 tributary" (p. 3-1175); "ED-VC3: Edit VC3 tributary" (p. 3-1334) |
| **ICNV - Input, Command Not Valid, Interface Standard does not match** | Check CCB against istd of related VCG | "RTRV-VCGTRIB: Retrieve virtual concatenation group tributary " (p. 3-3082) |
| **ICNV - Input, Command Not Valid, Interface Standard does not match** | Check CCB against ptfstd | "RTRV-PTF: Retrieve tributary with path termination function" (p. 3-2783) |
| **ICNV - Input, Command Not Valid, Interface Standard does not match** | Check CCB against ptfstd of the tributary | "ED-PTF: Edit tributary with Path Termination Function (PTF)" (p. 3-824) |

| **IDNC - Input, Data Not Consistent, 'ALL' qualifier for port aid not allowed** | 'ALL' qualifier used for wrong parameters | "ED-OC12: Edit OC12 port" (p. 3-521); "ED-OC192: Edit OC192 port" (p. 3-660); "ED-OC3: Edit OC3 port" (p. 3-458); "ED-OC48: Edit OC48 port" (p. 3-583); "ED-STM1: Edit STM1 port" (p. 3-910); "ED-STM16: Edit STM16 port" (p. 3-1032); "ED-STM1E: Edit STM1E port" (p. 3-865); "ED-STM4: Edit STM4 port" (p. 3-971); "ED-STM64: Edit STM64 port" (p. 3-1108); "ED-VCG: Edit virtual concatenation group" (p. 3-1349) |
| **IDNC - Input, Data Not Consistent, Assigned Node not allowed for Auto Encapsulation** | Only osinode1 supports Auto Encapsulation | "ENT-MANROUTE-MCN: Enter manual IP route for management communication" (p. 3-1600) |
| **IDNC - Input, Data Not Consistent, Connections between BLSR/MS-SPRing working and protection tributaries are not allowed** | No connections between BLSR/MS-SPRing working and protection tribs | "CNVT-CCT: Convert cross-connection topology" (p. 3-73); "ENT-CRS: Enter cross-connection" (p. 3-1455) |
| **IDNC - Input, Data Not Consistent, conversion cross-connection not supported by that pack** | Pack restrictions for conversion cross-connection sources | "ENT-CRS: Enter cross-connection" (p. 3-1455) |
| **IDNC - Input, Data Not Consistent, Corresponding loca/locz information is missing** | Corresponding loca/loca2/locz information is missing | "ENT-CRS: Enter cross-connection" (p. 3-1455) |
| **IDNC - Input, Data Not Consistent, default profile** | deleting the system default profile | "DLT-TCA-PROF: Delete TCA profile" (p. 3-256) |
| **IDNC - Input, Data Not Consistent, Default VLAN ID is already assigned for this System** | Default VLAN ID is already assigned for this system | "ED-VCG: Edit virtual concatenation group" (p. 3-1349) |
| **IDNC - Input, Data Not Consistent, Flow Control settings do not match to existing autonegotiation mode** | GE10PL1 Pack specific validation rule: No auto flow control settings if autonegotiation disabled | "ED-EPORT: Edit Ethernet port" (p. 3-325) |
| **IDNC - Input, Data Not Consistent, Flow Control settings do not match to existing autonegotiation mode** | GE10PL1 Pack specific validation rule: No fix flow control settings if autonegotiation enabled | "ED-EPORT: Edit Ethernet port" (p. 3-325) |
| **IDNC - Input, Data Not Consistent, Inconsistent loca/locz information** | Consistent loca/loca2/locz for all low-order cross-connections using the same HO PTF at an MS-SPRing port | "ENT-CRS: Enter cross-connection" (p. 3-1455) |
| **IDNC - Input, Data Not Consistent, Inconsistent loca/locz information** | Consistent loca/locz for all conversion cross-connections using the same HO PTF at an MS-SPRing port | "ENT-CRS: Enter cross-connection" (p. 3-1455) |

| Error code | Meaning (validation rule) | Related to command |
|---|---|---|
| **IDNC - Input, Data Not Consistent, IP address of level 1 Routing Controller already in use** | SCN IP address already in use | "ACT-L1ROUTING" (p. 3-15) |
| **IDNC - Input, Data Not Consistent, It is not allowed to specify loca/locz for EXTRA TRAFFIC** | loca/locz information only retrievable for EXTRA TRAFFIC | "ED-CRS: Edit cross-connection" (p. 3-289) |
| **IDNC - Input, Data Not Consistent, It is not allowed to specify loca/locz for EXTRA TRAFFIC** | newloca not provisionable for Extra Traffic | "CNVT-CCT: Convert cross-connection topology" (p. 3-73) |
| **IDNC - Input, Data Not Consistent, level 1 Routing Controller already in place** | level 1 Routing controller in place | "ACT-L1ROUTING" (p. 3-15) |
| **IDNC - Input, Data Not Consistent, LO tributary not supported by that pack** | Pack restrictions for LO substructure creation | "ED-SUBS: Create or delete the lower-order substructure at a higher-order tributary." (p. 3-1189) |
| **IDNC - Input, Data Not Consistent, LO tributary not supported by that pack** | Pack restrictions for LO tributaries under test | "CONN-TACC: Connect test access" (p. 3-95) |
| **IDNC - Input, Data Not Consistent, LO tributary not supported by that pack** | Pack restrictions for LOXC cross-connection sources | "ENT-CRS: Enter cross-connection" (p. 3-1455) |
| **IDNC - Input, Data Not Consistent, modifier is inconsistent with existing port rate** | modifier consistent with given port-rate | "ED-EPORT: Edit Ethernet port" (p. 3-325); "ED-VCG: Edit virtual concatenation group" (p. 3-1349); "RTRV-EPORT: Retrieve Ethernet port" (p. 3-2340); "RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3052) |
| **IDNC - Input, Data Not Consistent, modifier is inconsistent with the related circuit pack type** | modifier consistent with the related circuit pack type | "ED-EPORT: Edit Ethernet port" (p. 3-325); "OPR-LPBK: Operate facility loopback" (p. 3-2025); "RLS-LPBK: Release loopback (facility)" (p. 3-2187); "RTRV-EPORT: Retrieve Ethernet port" (p. 3-2340) |
| **IDNC - Input, Data Not Consistent, modifier is required for this circuit pack type** | modifier mandatory for the GE10PL1 and ES64U circuit pack | "ED-VCG: Edit virtual concatenation group" (p. 3-1349); "RTRV-VCG: Retrieve virtual concatenation group" (p. 3-3052) |
| **IDNC - Input, Data Not Consistent, MSP 1+1 optimized not supported for SONET mode** | No MSP 1+1 optimized protection for SONET | "ENT-PROTN-GRP: Enter protection group" (p. 3-1730) |
| **IDNC - Input, Data Not Consistent, new name for default profile** | rename default profile name | "ED-TCA-PROF: Edit TCA profile" (p. 3-1212) |

| Error code | Meaning (validation rule) | Related to command |
|---|---|---|
| **IDNC - Input, Data Not Consistent, new name for default profile** | Rename of default ASAP | "ED-ASAP-PROF: Edit alarm severity assignment profile" (p. 3-281) |
| **IDNC - Input, Data Not Consistent, No low-order path protection with input tributaries from 2 fiber MS-SPRing/BLSR protection** | No low-order path protection input tributaries from the protection bandwith of 2-fiber MS-SPRing/BLSR protection | "CNVT-CCT: Convert cross-connection topology" (p. 3-73) |
| **IDNC - Input, Data Not Consistent, No low-order path protection with input tributaries from 4-fiber BLSR/MS-SPRing ports** | No low-order connection with 4 fiber BLSR/MS-SPRing ports | "CNVT-CCT: Convert cross-connection topology" (p. 3-73) |
| **IDNC - Input, Data Not Consistent, No low-order path protection with input tributaries from BLSR/MS-SPRing ports** | No low-order path protection with input tributaries from BLSR/MS-SPRing ports | "ENT-CRS: Enter cross-connection" (p. 3-1455) |
| **IDNC - Input, Data Not Consistent, No low-order path protection with input tributaries from protection bandwidth of 2-fiber MS-SPRing/BLSR protection** | No low-order path protection with input tributaries from the protection bandwidth of 2-fiber MS-SPRing/BLSR protection | "ENT-CRS: Enter cross-connection" (p. 3-1455) |
| **IDNC - Input, Data Not Consistent, no OPT2G5-trib as input-trib in pathprotected crossconnection** | No OPT2G5 related trib as in_aid (for path-protected cross-connection | "CNVT-CCT: Convert cross-connection topology" (p. 3-73) |
| **IDNC - Input, Data Not Consistent, no OPT2G5-trib as input-trib in path-protected cross-connection** | No OPT2G5 related trib as in_aid (for path-protected cross-connection) | "ENT-CRS: Enter cross-connection" (p. 3-1455) |
| **IDNC - Input, Data Not Consistent, No trib of MS-SPRing/ BLSR port allowed for conversion cross-connection** | No tributary of an MS-SPRing/BLSR port for conversion cross-connection | "ENT-CRS: Enter cross-connection" (p. 3-1455) |
| **IDNC - Input, Data Not Consistent, NSA severity is higher than SA severity** | Inconsistent severity level | "ED-ASAP-PROF: Edit alarm severity assignment profile" (p. 3-281) |
| **IDNC - Input, Data Not Consistent, only one of dccstat, scn_dccstat, uni_dccstat, or enni_ dccstat allowed** | Single occurence of dccstat, scn_dccstat, uni_dccstat, or enni_dccstat parameter | "ENT-FECOM: Enter DCC channel related parameters" (p. 3-1552) |
| **IDNC - Input, Data Not Consistent, path-protected conversion cross-connections not allowed** | No path-protected conversion cross-connection | "ENT-CRS: Enter cross-connection" (p. 3-1455) |
| **IDNC - Input, Data Not Consistent, port_aid1 and port_aid2 not different** | Different port AIDs | "ENT-CRS-FECOM: Enter transparent DCC cross-connection" (p. 3-1503) |

| Error code | Meaning (validation rule) | Related to command |
|---|---|---|
| **IDNC - Input, Data Not Consistent, primary/secondary test access tributary not supported by that pack** | Pack restrictions for primary and secondary HO test access tributary | "CONN-TACC: Connect test access" (p. 3-95) |
| **IDNC - Input, Data Not Consistent, primary/secondary test access tributary not supported by that pack** | Pack restrictions for primary and secondary LO test access tributary | "CONN-TACC: Connect test access" (p. 3-95) |
| **IDNC - Input, Data Not Consistent, raw_port and lv_port must be unequal** | check that raw_port and lv_port are unequal | "ENT-ULS: Enter upper layer stack" (p. 3-1926) |
| **IDNC - Input, Data Not Consistent, RC PC SCN address must be different from SC PC SCN address** | SCN IP address already in use 2 | "ACT-L1ROUTING" (p. 3-15) |
| **IDNC - Input, Data Not Consistent, SCN not enabled** | Check of SCN availability | "ACT-L1ROUTING" (p. 3-15) |
| **IDNC - Input, Data Not Consistent, sigPCIP address and RC IP address must not be equal** | SC IP Address and RC IP address must be different | "ENT-ULS: Enter upper layer stack" (p. 3-1926) |
| **IDNC - Input, Data Not Consistent, sigPCIP_Address and sigPCID must be supplied together** | sigPCIP_Address and sigPCID must be supplied together. | "ENT-ULS: Enter upper layer stack" (p. 3-1926) |
| **IDNC - Input, Data Not Consistent, Specified Tributary cannot be used for LOXC connections** | Restrictions for LOXC cross-connection sources | "CNVT-CCT: Convert cross-connection topology" (p. 3-73) |
| **IDNC - Input, Data Not Consistent, Specified Tributary does not support the indicated rate** | HO tributary rate consistency | "ED-SUBS: Create or delete the lower-order substructure at a higher-order tributary." (p. 3-1189) |
| **IDNC - Input, Data Not Consistent, Specified Tributary does not support the indicated rate** | Rate consistency for VCG Tributaries | "ENT-CRS: Enter cross-connection" (p. 3-1455) |
| **IDNC - Input, Data Not Consistent, Specified Tributary does not support the indicated rate** | Restrictions for LO SONET test access rates | "CONN-TACC: Connect test access" (p. 3-95) |
| **IDNC - Input, Data Not Consistent, Specified Tributary does not support the indicated rate** | Restrictions for LOXC cross-connection rates | "ENT-CRS: Enter cross-connection" (p. 3-1455) |
| **IDNC - Input, Data Not Consistent, Specified Tributary does not support the indicated rate** | Tributary provisioning and rate consistency | "CONN-TACC: Connect test access" (p. 3-95) |

| Error code | Meaning (validation rule) | Related to command |
|---|---|---|
| **IDNC - Input, Data Not Consistent, Specified Tributary does not support the indicated rate** | Tributary rates for conversion cross-connections | "ENT-CRS: Enter cross-connection" (p. 3-1455) |
| **IDNC - Input, Data Not Consistent, strcout length must match the given outgoing J0 trace mode** | transmitted path trace length | "ED-EC1: Edit EC1 port" (p. 3-313) |
| **IDNC - Input, Data Not Consistent, This MSP protection type not supported for a port with the indicated rate** | No MSP/APS 1+1 for bitrate STM-256/OC-768 | "ENT-PROTN-GRP: Enter protection group" (p. 3-1730) |
| **IDNC - Input, Data Not Consistent, Timing reference other than MSP Working channel number 1** | Timing reference other than working port 1 of MSP 1:N protection | "SET-SYNCN: Set synchronization" (p. 3-3131) |
| **IDNC - Input, Data Not Consistent, trc length must match the given path trace mode** | transmitted path trace length | "ED-PTF: Edit tributary with Path Termination Function (PTF)" (p. 3-824) |
| **IDNC - Input, Data Not Consistent, Tributaries must not be on ports of portClass INNI** | (ONNS specific): LO Tributaries must not belong to ports of portClass INNI | "CNVT-CCT: Convert cross-connection topology" (p. 3-73); "ENT-CRS: Enter cross-connection" (p. 3-1455) |
| **IDNC - Input, Data Not Consistent, Tributary boundary is inconsistent with the indicated rate** | LO-AID boundary and rate consistency | "OPR-LPBK: Operate cross-connection loopback" (p. 3-2015) |
| **IDNC - Input, Data Not Consistent, UNI IP address, sigPCIP address, and ASTN IP address must not be equal** | UNI IP address, SC IP Address and SCN IP address must be different. | "ENT-ULS: Enter upper layer stack" (p. 3-1926) |
| **IDNC - Input, Data Not Consistent, value change not allowed for profile Default0** | value change of default profile Default0 | "ED-TCA-PROF: Edit TCA profile" (p. 3-1212) |
| **IDNC - Input, Data Not Consistent, VCG-trib as input-trib in path-protected cross-connection** | Tributaries must not be VCG tributaries | "ENT-OUC: Enter ONNS to UPSR/SNCP constructs" (p. 3-1676) |
| **IDNC - Input, Data, Not Consistent** | Can't assign same IP address to several LANs | "ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1567) |
| **IDNC - Input, Data, Not Consistent** | Can't enable ip_lanstat and/or osi_lanstat when lanstat is disabled | "ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1567) |
| **IDNC - Input, Data, Not Consistent** | Can't enable lanstat when ip_lanstat and osi_lanstat are DISABLED | "ENT-FECOM-LAN: Enter LAN related parameters" (p. 3-1567) |
| **IDNC - Input, Data, Not Consistent, 2f-BSLR rate exceeds half of the port rate** | Rate must not exceed half of the port rate (2f-BSLR only) | "ENT-CRS: Enter cross-connection" (p. 3-1455) |

| Error code | Meaning (validation rule) | Related to command |
|---|---|---|
| **IDNC - Input, Data, Not Consistent, a new trc must also be supplied for a path trace mode change** | supply of transmitted path trace | "ED-VCGTRIB: Edit virtual concatenation group tributary" (p. 3-1410) |
| **IDNC - Input, Data, Not Consistent, Bridging rate is not compliant with existing leg** | Both legs must have same rate | "ENT-CRS: Enter cross-connection" (p. 3-1455) |
| **IDNC - Input, Data, Not Consistent, default profile** | pfname is default | "DLT-ASAP-PROF: Delete alarm severity assignment profile" (p. 3-136) |
| **IDNC - Input, Data, Not Consistent, MSP 1+1 Optimized is always non-revertive** | MSP type 1+1_optimized is never revertive | "ENT-PROTN-GRP: Enter protection group" (p. 3-1730) |
| **IDNC - Input, Data, Not Consistent, MSP Protection Type 1x1 is always revertive** | MSP type 1:1 is never non-revertive | "ENT-PROTN-GRP: Enter protection group" (p. 3-1730) |
| **IDNC - Input, Data, Not Consistent, no allowed topology conversion** | Topology conversion command must be consistent | "CNVT-CCT: Convert cross-connection topology" (p. 3-73) |
| **IDNC - Input, Data, Not Consistent, No MSP protection supported for SONET mode** | No MSP 1:1 protection for SONET | "ENT-PROTN-GRP: Enter protection group" (p. 3-1730) |
| **IDNC - Input, Data, Not Consistent, not own uid** | not the own uid specified | "CANC-USER: Cancel user" (p. 3-60) |
| **IDNC - Input, Data, Not Consistent, Optimized exists only with 1+1 Protection Type** | only MSP 1+1 can be optimized | "ENT-PROTN-GRP: Enter protection group" (p. 3-1730) |
| **IDNC - Input, Data, Not Consistent, revertive mode not supported for MSP Protection Type 1+1 and a port with the indicated rate** | No MSP/APS 1+1 protection for bitrate STM-256/OC-768 | "ENT-PROTN-GRP: Enter protection group" (p. 3-1730) |
| **IDNC - Input, Data, Not Consistent, SNC Type not compliant with existing path-protected cross-connection** | SNC type compliance | "CNVT-CCT: Convert cross-connection topology" (p. 3-73) |
| **IDNC - Input, Data, Not Consistent, SNC Type not compliant with existing path-protected cross-connection** | SNC Type Compliance | "ENT-CRS: Enter cross-connection" (p. 3-1455) |
| **IDNC - Input, Data, Not Consistent, Specified new Tributary does not support the indicated rate** | New tributary rate validity | "CNVT-CCT: Convert cross-connection topology" (p. 3-73) |
| **IDNC - Input, Data, Not Consistent, Specified Tributary does not support the indicated rate** | Tributary provisioning and rate consistency | "ENT-CRS: Enter cross-connection" (p. 3-1455) |

| Error code | Meaning (validation rule) | Related to command |

| **SROF - Status, Requested Operation Failed** | no more than two TARP manual adjacencies per node | "ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks " (p. 3-1943) |
| **SROF - Status, Requested Operation Failed** | Non-Hardware system difficulties | "APPLY: Apply software generic or activate a downloaded database" (p. 3-35) |
| **SROF - Status, Requested Operation Failed** | Operation Failed (SROF) | "RTRV-HDR: Retrieve header" (p. 3-2397) |
| **SROF - Status, Requested Operation Failed** | Provisioning of TARP manual adjacencies only if TARP enabled | "ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks " (p. 3-1943) |
| **SROF - Status, Requested Operation Failed, external communications failure** | Communication Failure (SROF) | "RTRV-HDR: Retrieve header" (p. 3-2397) |
| **SROF - Status, Requested Operation Failed, external communications failure** | External communication failure | "CPY-MEM: Copy memory" (p. 3-116) |
| **SROF - Status, Requested Operation Failed, invalid ES64U switch capacity without XC** | No ES64U capacity setting without XC | "ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-345) |

| Error code | Meaning (validation rule) | Related to command |
|---|---|---|
| **SROF - Status, Requested Operation Failed, not all ES64U databases preserved** | Not all databases of ES64U preserved for trial phase | "APPLY: Apply software generic or activate a downloaded database" (p. 3-35) |
| **SROF - Status, Requested Operation Failed, processing failure** | Processing Failed (SROF) | "RTRV-HDR: Retrieve header" (p. 3-2397) |
| **SROF - Status, Requested Operation Failed, unsuccessful file retransmission** | Backup failed after unsuccessful retransmission of files | "CPY-MEM: Copy memory" (p. 3-116) |
| **SROF - Status, Requested Operation Failed,, invalid LOXC switch capacity without XC** | No LO switch capacity setting without XC | "ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-345) |
| **SROF - Status, Requested Operation Failed,, invalid TransMUX switch capacity without XC** | No TransMUX; capacity setting without XC | "ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-345) |
| **SRQN - Status, invalid request, uid not logged in** | user with uid not logged in | "CANC-USER-SECU: Cancel user security" (p. 3-62) |
| **SSRD - Status, Switch Request Denied, clock mode inconsistent** | Clock backup switch request when clock mode is free running | "OPR-SYNCNSW: Operate synchronization switch " (p. 3-2065) |
| **SSRE - Status, System Resources Exceeded (sent by T-TD, TL1_TTD)** | Maximum number of user sessions via T-TD on Gateway NE | "ACT-USER: Activate user" (p. 3-24) |
| **SSRE - Status, System Resources Exceeded (sent by T-TD, TL1_TTD)** | maximum number of user sessions via T-TD on Gateway NE per TCP connection | "ACT-USER: Activate user" (p. 3-24) |
| **SSRE - Status, System Resources Exceeded (sent by T-TD, TL1_TTD)** | Maximum number of user sessions via T-TD on Gateway NE with CTL/4 | "ACT-USER: Activate user" (p. 3-24) |
| **SSRE - Status, System Resources Exceeded, no free DDC-M channel available for ES64U** | Check whether DCC Channel available for ES64U circuit pack | "ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-345) |
| **SSRE - Status, System Resources Exceeded, allowed limit exceeded** | Internal Limit exceeded (SSRE) | "RTRV-HDR: Retrieve header" (p. 3-2397) |
| **SSRE - Status, System Resources Exceeded, allowed limit of neighboring RCs exceeded** | Maximum Number of Neighboring RCs | "ENT-RC-NEIGHBOR: Add a routing controller to the list of neighboring routing controllers" (p. 3-1775) |
| **SSRE - Status, System Resources Exceeded, allowed limit of SCN DCC channels exceeded** | (SCN specific): Maximum number of channels assigned to SCN | "ENT-FECOM: Enter DCC channel related parameters" (p. 3-1552) |
| **SSRE - Status, System Resources Exceeded, allowed number of active ES64U packs exceeded** | Check number of active ES64U packs | "ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-345) |
| **SSRE - Status, System Resources Exceeded, allowed number of active LOXC packs exceeded** | Check number of active LOXC packs | "ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-345) |

| Error code | Meaning (validation rule) | Related to command |
|---|---|---|
| **SSRE - Status, System Resources Exceeded, allowed number of active TransMUX packs exceeded** | Check number of active TransMUX; packs | "ED-EQPT (CP): Edit equipment (circuit pack)" (p. 3-345) |
| **SSRE - Status, System Resources Exceeded, allowed number of MS SPRING and BLSR protection groups is exceeded** | maximum number of 2-fibre and 4-fibre MS SPRING / BLSR protection groups | "ENT-PROTN-GRP: Enter protection group" (p. 3-1730) |
| **SSRE - Status, System Resources Exceeded, ENNI limit of manual route entries exceeded** | Check if limit of 64 Manual Routes per ENNI Node exceeded | "ENT-ENNIMANROUTE: Enter manual route to the E-NNI node" (p. 3-1513) |
| **SSRE - Status, System Resources Exceeded, limit of IP-MAP entries exceeded** | Check if limit of 20 IP MAP entries exceeded | "ENT-IP-MAP: Enter TCP/IP map" (p. 3-1580) |
| **SSRE - Status, System Resources Exceeded, limit of manual route entries exceeded** | Check if limit of 20 Manual MCN IP Routes exceeded | "ENT-MANROUTE-MCN: Enter manual IP route for management communication" (p. 3-1600) |
| **SSRE - Status, System Resources Exceeded, limit of manual route entries exceeded** | Check if limit of 20 Manual Routes per LAN port exceeded | "ENT-ENNIMANROUTE: Enter manual route to the E-NNI node" (p. 3-1513); "ENT-MANROUTE-LAN: Enter manual route at LAN port" (p. 3-1595) |
| **SSRE - Status, System Resources Exceeded, limit of PJE counters exceeded** | Not more than one PJE PM monitor per port | "ED-STS1: Edit STS1 tributary" (p. 3-1175); "ED-VC3: Edit VC3 tributary" (p. 3-1334) |
| **SSRE - Status, System Resources Exceeded, limit of PM monitors exceeded** | maximum number of enabled PM monitors | "ED-T3: Edit DS3 port" (p. 3-1200) |

| Error code | Meaning (validation rule) | Related to command |
|---|---|---|
| **SSRE - Status, System Resources Exceeded, limit of PM monitors exceeded** | Maximum number of enabled PM monitors | "ED-EC1: Edit EC1 port" (p. 3-313); "ED-EPORT: Edit Ethernet port" (p. 3-325); "ED-OC192: Edit OC192 port" (p. 3-660); "ED-OC48: Edit OC48 port" (p. 3-583); "ED-OC48T: Edit OC48 transparent port" (p. 3-646); "ED-OTU2: Edit OTU2 port" (p. 3-727); "ED-PTF: Edit tributary with Path Termination Function (PTF)" (p. 3-824); "ED-STM16: Edit STM16 port" (p. 3-1032); "ED-STM16T: Edit STM16T port" (p. 3-1094); "ED-STM64: Edit STM64 port" (p. 3-1108); "ED-STS1: Edit STS1 tributary" (p. 3-1175); "ED-VC3: Edit VC3 tributary" (p. 3-1334); "ED-VCG: Edit virtual concatenation group" (p. 3-1349); "ED-VCGTRIB: Edit virtual concatenation group tributary" (p. 3-1410); "ED-VCG-TRANS: Edit virtual concatenation group for fully transparent application" (p. 3-1399) |
| **SSRE - Status, System Resources Exceeded, limit of PM monitors exceeded** | Maximum number of enabled PM monitors | "ED-OC12: Edit OC12 port" (p. 3-521); "ED-OC3: Edit OC3 port" (p. 3-458); "ED-STM1: Edit STM1 port" (p. 3-910); "ED-STM16T: Edit STM16T port" (p. 3-1094); "ED-STM1E: Edit STM1E port" (p. 3-865); "ED-STM4: Edit STM4 port" (p. 3-971) |
| **SSRE - Status, System Resources Exceeded, limit of ppgnames exceeded** | Maximum number of ppgnames exceeded | "CNVT-CCT: Convert cross-connection topology" (p. 3-73); "ED-PROTN-GRP: Edit protection group" (p. 3-798); "ENT-CRS: Enter cross-connection" (p. 3-1455) |
| **SSRE - Status, System Resources Exceeded, limit of profiles exceeded** | Maximum number of profiles | "ENT-ASAP-PROF: Enter alarm severity assignment profile" (p. 3-1439) |
| **SSRE - Status, System Resources Exceeded, limit of profiles exceeded** | Maximum number of TCA profiles reached | "ENT-TCA-PROF: Enter TCA Profile" (p. 3-1877) |
| **SSRE - Status, System Resources Exceeded, limit of transparent DCC cross-connections exceeded** | Maximum of DCC CCs exceeded with CTL/- or CTL/2 | "ENT-CRS-FECOM: Enter transparent DCC cross-connection" (p. 3-1503) |
| **SSRE - Status, System Resources Exceeded, limit of transparent DCC cross-connections exceeded** | Maximum of DCC CCs exceeded with CTL/3 | "ENT-CRS-FECOM: Enter transparent DCC cross-connection" (p. 3-1503) |

| Error code | Meaning (validation rule) | Related to command |
|---|---|---|
| **SSRE - Status, System Resources Exceeded, limit of tribs with loca, locz exceeded** | (ONNS specific): Maximum number of tributaries with loca, locz entries must not exceed 100 | "ED-STS1: Edit STS1 tributary" (p. 3-1175); "ED-VC3: Edit VC3 tributary" (p. 3-1334) |
| **SSRE - Status, System Resources Exceeded, limit of VLAN Identifiers exceeded** | Maximum number of entries in valid VLAN ID list exceeded | "ED-EPORT: Edit Ethernet port" (p. 3-325) |
| **SSRE - Status, System Resources Exceeded, no sufficient backplane bandwidth available** | Sufficient backplane bandwidth available | "ENT-VCG – Enter virtual concatenation group" (p. 3-1965) |
| **SSRE - Status, System Resources Exceeded, overall limit of DCC channels exceeded** | (UNI/E-NNI specific): Maximum number of channels assigned | "ENT-FECOM: Enter DCC channel related parameters" (p. 3-1552) |
| **SSRE - Status, System Resources Exceeded, overall limit of DCC channels exceeded** | Maximum number of channels assigned to MCN on CTL/- | "ENT-FECOM: Enter DCC channel related parameters" (p. 3-1552) |
| **SSRE - Status, System Resources Exceeded, overall limit of DCC channels exceeded** | Maximum number of channels assigned to MCN, SCN, UNI, and E-NNI on CTL/2 | "ENT-FECOM: Enter DCC channel related parameters" (p. 3-1552) |
| **SSRE - Status, System Resources Exceeded, overall limit of DCC channels exceeded** | Maximum number of channels assigned to MCN, SCN, UNI, and E-NNI on CTL/3 | "ENT-FECOM: Enter DCC channel related parameters" (p. 3-1552) |
| **SSRE - Status, System Resources Exceeded, overall limit of DCC channels exceeded** | Maximum number of channels assigned to MCN, SCN, UNI, and E-NNI on CTL4 | "ENT-FECOM: Enter DCC channel related parameters" (p. 3-1552) |
| **SSRE - Status, System Resources Exceeded, send another retrieve command with a startdate to get next portion of data** | Request cannot be completed within 5 minutes | "RTRV-LOG-TL1CMD: Retrieve TL1 command log" (p. 3-2458) |
| **SSTP - Status, Stopped, failed target hardware** | Failed Target Hardware (SSTP) | "RTRV-HDR: Retrieve header" (p. 3-2397) |
| **SWFA - Status, Working unit Failed, control hardware failed, missing or initializing** | Hardware Failed (SWFA) | "RTRV-HDR: Retrieve header" (p. 3-2397) |

# 15 User privilege codes

## List of user privilege codes

| TL1 command | User privilege code (UCFC/UCAL) |
|---|---|
| ACT-L1ROUTING | P1 |
| ACT-USER: Activate user | Any |
| ALW-MSG: Allow message | M3 |
| APPLY: Apply software generic or activate a downloaded database | S4 |
| AUD: Perform audit data | P3 |
| CANC-L1ROUTING | P1 |
| CANC-USER: Cancel user | Any |
| CANC-USER-SECU: Cancel user security | S5 |
| CHG-ACCMD: Change access mode | T4 |
| CNVT-CCT: Convert cross-connection topology | P3 |
| CONN-TACC: Connect test access | T4 |
| COPY-RFILE: Copy remote file | S4 |
| CPY-MEM: Copy memory | S4 |
| DISC-TACC: Disconnect test access | T4 |
| DLT-ASAP-PROF: Delete alarm severity assignment profile | M3 |
| DLT-CONN: Delete network connection | P3 |
| DLT-CRS: Delete cross-connection | P3 |
| DLT-CRS-FECOM: Delete transparent DCC cross-connection | M3 |
| DLT-ENNIMANROUTE: Delete manual route from the E-NNI node | S4 |
| DLT-EQPT (slot): Delete equipment (slot) | P3 |
| DLT-EQPT (socket): Delete equipment (socket) | P3 |
| DLT-IP-MAP: Delete TCP/IP map | S3 |
| DLT-MANROUTE-LAN: Delete manual route at LAN port | S4 |

| TL1 command | User privilege code (UCFC/UCAL) |
|---|---|
| DLT-MANROUTE-MCN: Delete one manual MCN IP route entry | S4 |
| DLT-OUC: Delete ONNS to UPSR/SNCP constructs | P3 |
| DLT-PATH: Delete ONNS path connection | P3 |
| DLT-PROTN-GRP: Delete protection group | M4 |
| DLT-RC-NEIGHBOR: Delete a routing controller from the list of neighboring routing controllers | S3 |
| DLT-TCA-PROF: Delete TCA profile | PM3 |
| DLT-ULSDCC-L3: Delete a node ID other than node-1 | S3 |
| DLT-ULSDCC-L4: Delete TARP manual adjacent NSAP address in layer 4 of the specified OSI stack | S3 |
| DLT-USER-SECU: Delete user security | S5 |
| DLT-VCG – Enter virtual concatenation group | P3 |
| ED-ASAP-PROF: Edit alarm severity assignment profile | M3 |
| ED-CRS: Edit cross-connection | P3 |
| ED-DAT: Edit date and time | S4 |
| ED-EC1: Edit EC1 port | P3 |
| ED-EPORT: Edit Ethernet port | P3 |
| ED-EQPT (CP): Edit equipment (circuit pack) | P3 |
| ED-EQPT (shelf): Edit equipment (shelf) | P3 |
| ED-EQPT (slot): Edit equipment (slot) | P3 |
| ED-EQPT (socket): Edit equipment | P3 |
| ED-EQPT (system): Edit equipment (system) | P3 |
| ED-FETID: Edit far end target identifier | S3 |
| ED-LONIM: Edit lower-order non-intrusive monitor | P3 |
| ED-LOPTF: Edit lower-order path termination function | P3 |
| ED-MAP-RING: Edit map ring | M3 |
| ED-NE: Edit NE | S3 |
| ED-NE-SECU: Edit NE security | S5 |
| ED-NNCNFG: Modify ONNS system configuration | P4 |
| ED-NNCRS: Edit NN cross-connection | P5 |
| ED-OC3: Edit OC3 port | P3 |
| ED-OC12: Edit OC12 port | P3 |
| ED-OC48: Edit OC48 port | P3 |
| ED-OC48T: Edit OC48 transparent port | P3 |
| ED-OC192: Edit OC192 port | P3 |

| TL1 command | User privilege code (UCFC/UCAL) |
|---|---|
| ED-OTU2: Edit OTU2 port | P3 |
| ED-PATH: Add or modify alias of ONNS connection | P3 |
| ED-PATH-PROT: Modify ONNS connection parameters or protection type | P3 |
| ED-PATH-ROLL: Modify ONNS connection route | P3 |
| ED-PID: Edit password identifier | S1 |
| ED-PROTN-GRP: Edit protection group | M4 |
| ED-PTF: Edit tributary with Path Termination Function (PTF) | P3 |
| ED-RC-GENERAL: Edit general routing controller settings | S3 |
| ED-RSVP: Modify RSVP parameters | S3 |
| ED-STATE-EQPT (system): Edit equipment state | M4 |
| ED-STM1E: Edit STM1E port | P3 |
| ED-STM1: Edit STM1 port | P3 |
| ED-STM4: Edit STM4 port | P3 |
| ED-STM16: Edit STM16 port | P3 |
| ED-STM16T: Edit STM16T port | P3 |
| ED-STM64: Edit STM64 port | P3 |
| ED-STS1: Edit STS1 tributary | P3 |
| ED-SUBS: Create or delete the lower-order substructure at a higher-order tributary. | P3 |
| ED-SYNCDATA: Synchronization of ONNS data | P3 |
| ED-T3: Edit DS3 port | P3 |
| ED-TCA-PROF: Edit TCA profile | PM3 |
| ED-TMAT3: Edit asynchronous adjunct port of the TransMUX card | P3 |
| ED-ULSDCC-L3: Enter layer 3 related parameters of the OSI stack | S4 |
| ED-USER: Edit user | S1 |
| ED-USER-SECU: Edit user security | S5 |
| ED-VC3: Edit VC3 tributary | P3 |
| ED-VCG: Edit virtual concatenation group | P3 |
| ED-VCG-TRANS: Edit virtual concatenation group for fully transparent application | P3 |
| ED-VCGTRIB: Edit virtual concatenation group tributary | P3 |
| ED-VRTSW: Edit virtual switch | P3 |
| ENT-ASAP-PROF: Enter alarm severity assignment profile | M3 |
| ENT-BANNER | S5 |
| ENT-CONN: Establish network connections with TNA address parameters | P3 |

| TL1 command | User privilege code (UCFC/UCAL) |
|---|---|
| ENT-CRS: Enter cross-connection | P3 |
| ENT-CRS-FECOM: Enter transparent DCC cross-connection | M3 |
| ENT-ENNIMANROUTE: Enter manual route to the E-NNI node | S4 |
| ENT-EQPT (slot): Enter equipment (slot) | P3 |
| ENT-EQPT (socket): Enter equipment (socket) | P3 |
| ENT-FECOM: Enter DCC channel related parameters | S3 |
| ENT-FECOM-LAN: Enter LAN related parameters | S4 |
| ENT-IP-MAP: Enter TCP/IP map | S3 |
| ENT-MANROUTE-LAN: Enter manual route at LAN port | S4 |
| ENT-MANROUTE-MCN: Enter manual IP route for management communication | S4 |
| ENT-OUC: Enter ONNS to UPSR/SNCP constructs | P3 |
| ENT-PATH: Create ONNS path connection | P3 |
| ENT-PROTN-GRP: Enter protection group | M4 |
| ENT-RC-NEIGHBOR: Add a routing controller to the list of neighboring routing controllers | S3 |
| ENT-ROLL: Enter roll | P3 |
| ENT-TCA-PROF: Enter TCA Profile | PM3 |
| ENT-ULS: Enter upper layer stack | S4 |
| ENT-ULSDCC-L3: Create a further OSI node | S4 |
| ENT-ULSDCC-L4: Enter layer 4 related parameters of the OSI stacks | S4 |
| ENT-USER-SECU: Enter user security | S5 |
| ENT-VCG – Enter virtual concatenation group | P3 |
| INH-MSG: Inhibit message | M3 |
| INIT-EQPT (slot): Initialize equipment (slot) | M4 |
| INIT-SYS: Initialize system | S4 |
| OPR-DEFRAG: Perform defragmentation | P3 |
| OPR-EXT-CONT: Operate external control | M3 |
| OPR-LPBK: Operate cross-connection loopback | T4 |
| OPR-LPBK: Operate facility loopback | T4 |
| OPR-MAINT-ONNS: Maintenance actions for the ONNS application | P5 |
| OPR-PATH: Operate path | P3 |
| OPR-PROTNSW: Operate protection switch | M4 |
| OPR-SYNCNSW: Operate synchronization switch | M4 |
| OPR-VCGTRIB: Operate virtual concatenation group tributary | M3 |

| TL1 command | User privilege code (UCFC/UCAL) |
|---|---|
| RLS-EXT-CONT: Release external control | M3 |
| RLS-LPBK: Release loopback (cross-connection) | T4 |
| RLS-LPBK: Release loopback (facility) | T4 |
| RLS-PROTNSW: Release protection switch | M4 |
| RLS-SYNCNSW: Release synchronization switch | M4 |
| RTRV-ACTL-CONT: Retrieve actual condition types | M1 |
| RTRV-ACTLCP: Retrieve acceptable circuit pack list | P1 |
| RTRV-ALL: Retrieve all (port) | P1 |
| RTRV-ALL: Retrieve all (tributary) | P1 |
| RTRV-ALM: Retrieve alarm | M1 |
| RTRV-ALM-ENV: Retrieve alarm environment | M1 |
| RTRV-AO: Retrieve autonomous output | S1 |
| RTRV-ASAP-ASGNMT: Retrieve ASAP assignment | M1 |
| RTRV-ASAP-PROF: Retrieve ASAP profile | M1 |
| RTRV-ATTR-CONT: Retrieve attribute control | M1 |
| RTRV-ATTR-ENV: Retrieve attribute environment | M1 |
| RTRV-ATTR-MSG: Retrieve attribute message | M1 |
| RTRV-AUDLOG: Retrieve audit result log for ONNS connection data | P1 |
| RTRV-BANNER | S1 |
| RTRV-CKT: Retrieve circuit | M1 |
| RTRV-COND: Retrieve condition | M1 |
| RTRV-CONN: Retrieve data relevant for network connections | P1 |
| RTRV-CRS: Retrieve cross-connection | P1 |
| RTRV-CRS-FECOM: Retrieve transparent DCC cross-connection | M1 |
| RTRV-EC1: Retrieve EC1 port | P1 |
| RTRV-ELDR: Retrieve ONNS external link data repository | P1 |
| RTRV-ENNIMANROUTE: Retrieve all manual routes of the E-NNI node | S1 |
| RTRV-EPM: Ethernet performance monitoring | PM1 |
| RTRV-EPORT: Retrieve Ethernet port | P1 |
| RTRV-EQPT (bay): Retrieve equipment (bay) | P1 |
| RTRV-EQPT (CP): Retrieve equipment (circuit pack) | P1 |
| RTRV-EQPT (shelf): Retrieve equipment (shelf) | P1 |
| RTRV-EQPT (slot): Retrieve equipment (slot) | P1 |
| RTRV-EQPT (socket): Retrieve equipment (socket) | P1 |

| TL1 command | User privilege code (UCFC/UCAL) |
|---|---|
| RTRV-EQPT (system): Retrieve Equipment (system) | P1 |
| RTRV-EXT-CONT: Retrieve external control | M1 |
| RTRV-FECOM: Retrieve DCC related parameters | M1 |
| RTRV-FECOM-LAN: Retrieve LAN channel related parameters | S1 |
| RTRV-HDR: Retrieve header | Any |
| RTRV-IP-MAP: Retrieve TCP/IP map | S1 |
| RTRV-L1ADR: Retrieve level 1 Address Data Repository | P1 |
| RTRV-L1TDR: Retrieve level 1 topology data repository | P1 |
| RTRV-LOG-ALM: Retrieve log alarm | S1 |
| RTRV-LOG-NNEVT: Retrieve NN event log | S1 |
| RTRV-LOG-NTFCN: Retrieve notification log | S1 |
| RTRV-LOG-PROTNSW: Retrieve log protection switch | S1 |
| RTRV-LOG-SECU: Retrieve log security | S5 |
| RTRV-LOG-TL1CMD: Retrieve TL1 command log; | S5 |
| RTRV-LOPTF: Retrieve low-order path termination function | P1 |
| RTRV-LONIM: Low-order non-intrusive monitor | P1 |
| RTRV-LOXCPM: Retrieve performance monitoring data of LOXC pack | PM1 |
| RTRV-LPBK (cross-connection): Retrieve loopback (cross-connection) | T1 |
| RTRV-LPBK (facility): Retrieve loopback (facility) | T1 |
| RTRV-MANROUTE-MCN: Retrieve manual IP route for management communication | S1 |
| RTRV-MAP-NEIGHBOR: Retrieve map neighbor | S1 |
| RTRV-MAP-NETWORK: Retrieve network map | S1 |
| RTRV-MAP-RING: Retrieve map ring | M1 |
| RTRV-NADR: Retrieve ONNS network (domain) address data repository | P1 |
| RTRV-NE: Retrieve NE | S1 |
| RTRV-NE-SECU: Retrieve NE security | S1 |
| RTRV-NNCNFG: Retrieve ONNS configuration data | P1 |
| RTRV-NNDR: Retrieve ONNS neighbor nodal data repository | P1 |
| RTRV-NNEVT-TCA | P1 |
| RTRV-NTDR: Retrieve ONNS network topology data repository | P1 |
| RTRV-OC3: Retrieve OC3 port | P1 |
| RTRV-OC12: Retrieve OC12 port | P1 |
| RTRV-OC48: Retrieve OC48 port | P1 |

| TL1 command | User privilege code (UCFC/UCAL) |
|---|---|
| RTRV-OC48T: Retrieve OC48T port | P1 |
| RTRV-OC192: Retrieve OC192 port | P1 |
| RTRV-OTU2: Retrieve OTU2 port | P1 |
| RTRV-OUC: Retrieve ONNS to UPSR/SNCP constructs | P1 |
| RTRV-OW: Retrieve orderwire and user bytes | M1 |
| RTRV-PATH: Retrieve ONNS connection data | P1 |
| RTRV-PM: Retrieve performance monitoring | PM1 |
| RTRV-PREDEFRAG: Perform an ONNS fragmentation analysis | P1 |
| RTRV-PRMTR-DATA: Retrieve parameter data | S1 |
| RTRV-PRMTR-SFTWR: Retrieve parameter software | S1 |
| RTRV-PROTN-GRP: Retrieve protection group | M1 |
| RTRV-PTF: Retrieve tributary with path termination function | P1 |
| RTRV-RC-GENERAL: Retrieve general routing controller settings | S1 |
| RTRV-RC-NEIGHBOR: Retrieve all neighboring routing controllers | S1 |
| RTRV-RESALLOC-VCG: Retrieve resource allocation virtual concatenation group | P1 |
| RTRV-RSVP: Retrieve RSVP parameters | S1 |
| RTRV-SCN-NEIGHBOR: Retrieve SCN neighbor | S1 |
| RTRV-SPANSWS: Retrieve SPAN switch state | M1 |
| RTRV-STATE-EQPT (CP): Retrieve equipment state (circuit pack) | M1 |
| RTRV-STATE-EQPT (slot): Retrieve equipment state (slot) | M1 |
| RTRV-STATE-EQPT (socket): Retrieve equipment state | M1 |
| RTRV-STATE-EQPT (system): Retrieve equipment state (system) | M1 |
| RTRV-STM1E: Retrieve STM1E port | P1 |
| RTRV-STM1: Retrieve STM1 port | P1 |
| RTRV-STM4: Retrieve STM4 port | P1 |
| RTRV-STM16: Retrieve STM16 port | P1 |
| RTRV-STM16T: Retrieve STM16T port | P1 |
| RTRV-STM64: Retrieve STM64 port | P1 |
| RTRV-STS1: Retrieve STS1 tributary | P1 |
| RTRV-SYNCN: Retrieve synchronization | M1 |
| RTRV-T3: Retrieve DS3 port | P1 |
| RTRV-TACC: Retrieve test access | T1 |
| RTRV-TCA-ASGNMT: Retrieve TCA assignment | PM1 |
| RTRV-TCA-PROF: Retrieve TCA profile | PM1 |

| TL1 command | User privilege code (UCFC/UCAL) |
|---|---|
| RTRV-TMAT3: Retrieve asynchronous adjunct port of the TransMUX card | P1 |
| RTRV-TMST3: Retrieve synchronous adjunct port of the TransMUX card | P1 |
| RTRV-TMUXPM: Retrieve performance monitoring data of TransMUX pack | PM1 |
| RTRV-ULS: Retrieve upper layer stack | S1 |
| RTRV-ULSDCC-L3: Retrieve layer 3 related parameters | S1 |
| RTRV-ULSDCC-L4: Retrieve OSI layer 4 related parameters | S1 |
| RTRV-USER: Retrieve user | S2 |
| RTRV-USER-SECU: Retrieve user security | S4 |
| RTRV-VC3: Retrieve VC3 tributary | P1 |
| RTRV-VCG: Retrieve virtual concatenation group | P1 |
| RTRV-VCG-TRANS: Retrieve virtual concatenation group transparent | P1 |
| RTRV-VCGTRIB: Retrieve virtual concatenation group tributary | P1 |
| RTRV-VRTSW: Retrieve virtual switch | P1 |
| SET-ATTR-CONT: Set attribute control | M3 |
| SET-ATTR-ENV: Set attribute environment | M3 |
| SET-MAP-RING: Set map ring | M3 |
| SET-OW: Set orderwire and user bytes | M3 |
| SET-SID: Set SID | S4 |

# 16 Amendments

## Overview

### Purpose

The amendments are divided into:

- general amendments
- TL1-related amendments.

The syntax of the amendment number (for example, “Amendment 2.0 -nb12345”) is as follows:

- first part: the amendment is known since this release
- second part: internal number.

### Contents

| | |
|---|---|
| **General amendments** | 16-2 |
| General | 16-3 |
| Configuration management | 16-4 |
| Protection (BLSR/S-SPRing, DRI/DNI, APS/MSP, UPSR/SNCP) | 16-6 |
| Area DCN/DCC management | 16-7 |
| **TL1 amendments** | 16-8 |
| Transmission and cross-connection handling | 16-9 |
| Configuration management | 16-15 |
| Optical network navigation system (ONNS) | 16-16 |
| Protection (BLSR/S-SPRing, DRI/DNI, APS/MSP, UPSR/SNCP) | 16-19 |
| Fault/Alarm management | 16-21 |
| Remote test access | 16-22 |
| DCN/DCC management | 16-23 |

# General amendments

## Overview

### Purpose

This section lists the general amendments.

### Contents

| | |
|---|---|
| General | 16-3 |
| Configuration management | 16-4 |
| Protection (BLSR/S-SPRing, DRI/DNI, APS/MSP, UPSR/SNCP) | 16-6 |
| Area DCN/DCC management | 16-7 |

# General

### Amendment 9.0 – nb74169

#### Traffic hits of about 2 ms when plugging the standby XC

When plugging the standby XC pack unexpected traffic hits of about 2 ms can be observed.

### Amendment 10.0 – nb80809

#### Temporary CPFail alarm for standby CTL on autonomous reboot

When the standby CTL reboots autonomously after it was operational (that means *opstate* = OS_Enabled) a temporary `CPFail` alarm is raised for this pack. This alarm clears again after about two minutes, when the standby CTL has started the initial DB synchronization of the CF-Disk contents (that means *opstate* = OS_SYNCHING).

An autonomous reboot of the CTL may happen, for example, due to the following:

- a program exception on standby CTL
- detection that the CF-Disk synchronization does not work anymore

In case of an operator-driven reboot through TL1, `CPFail` is not raised.

# Configuration management

### Amendment 3.0.1 - nb19693

#### Unallowed changes of cross-connection parameters while remote test access sessions are provisioned are not rejected properly

If the operator tries to change the interface standard or tributary mode while a test access session for this cross-connection is active then a slightly wrong error message will be returned.

### Amendment 3.0.1 - nb03284

#### IDNV TL1 error code without parameter name

A simple parameter problem within a TL1 command (for example, parameter out of range) will result in an anonymous IDNV error, without mentioning the affected parameter:

```
IDNV /*Input, Data Not Valid */
```

In most cases the TL1 commands are hidden behind the GUI (of for example, *WaveStar*® CIT or EMS), which does those checks up-front or does not allow to enter wrong values.

### Amendment 8.0 - nb56630

#### Not possible to set lower-order switch capacity and ASAPs for LOXC pack together

If the command **`ED-EQPT`** is executed for a LOXC pack which has the lower-order switch capacity (parameter *loswcap*) and the ASAPs (parameters *eqptpn* and *eqptprotpn*) specified, then the command is denied.

#### Workaround

The operator should change lower-order switch capacity and ASAPs in two separate commands.

### Amendment 10.5.2 - nb89118

#### Deletion of removed circuit pack wrongly denied in case of DCC channels of UNI or ENNI ports on this pack still being assigned to UNI or ENNI node

In case of a physically removed circuit pack to be deleted, this action may be denied with `IDRG - Input, Data Range Error, osinode`, although all documented conditions for successful deletion are fulfilled. This wrong denial is issued in case of UNI or ENNI ports existing on the pack with at least one corresponding DCC channel still being assigned to UNI node or ENNI node.

### Workaround

Check UNI or ENNI ports on the affected pack for DCC channels still being assigned to UNI node or ENNI node. Remove all such assignments found (for example, by executing **ENT-FECOM** TL1 command)

# Protection (BLSR/S-SPRing, DRI/DNI, APS/MSP, UPSR/SNCP)

## Amendment 8.0.1 – nb68076

### RTRV-CKT does not return the actual AID for add and drop tributaries in the local node

The Retrieve Circuit TL1 command (**`RTRV-CKT`**) provides the view of the local node on MS-SPRing / BLSR service and extra traffic circuits.

Currently the command does not return the actual AID of tributaries with ring add or drop cross-connections in the local node. Instead the string “REMAID” is returned as it is also done for tributaries of add and drop cross-connections in remote nodes.

# Area DCN/DCC management

### Amendment 3.0.1 - nb17090

#### No specific error message when 64 DCC channel limit is reached

When the maximum number of available DCC channels is reached, the supplied error message does not distinguish the possible reasons and always replies with:

```
SSRE, System Resources Exceeded, allowed limit of DCC channels exceeded.
```

There is no distinction if the number of

- SCN (Signaling Communication Network) assignments or
- MCN (Management Communication Network) assignments or
- a combination of both.

is exceeded.

# TL1 amendments

## Overview

### Purpose

This section lists the amendments related to the TL1 commands.

### Contents

| | |
|---|---|
| Transmission and cross-connection handling | 16-9 |
| Configuration management | 16-15 |
| Optical network navigation system (ONNS) | 16-16 |
| Protection (BLSR/S-SPRing, DRI/DNI, APS/MSP, UPSR/SNCP) | 16-19 |
| Fault/Alarm management | 16-21 |
| Remote test access | 16-22 |
| DCN/DCC management | 16-23 |

# Transmission and cross-connection handling

### Amendment 9.1 – nb58910

**Running LOXC script causes system to respond with** "Status, All Resources Busy, System limit exceed"**, setup or roll of lower-order cross-connections on LOXC40 might fail when issued to fast, e.g. via TL1 script**

When setting up or rolling a lot of lower-order cross-connections being switched on a LambdaUnite NE equipped with LOXC40 it must be avoided to issue the **ENT-CRS** or **ENT-ROLL** commands too fast.

If the command sequence is sent to the NE too fast some lower-order cross-connection might not be set up correctly on LOXC40 even though all commands are correctly acknowledged by the COMPLD indication.

A reboot by applying a controller reset to the CTL or to the LOXC40 cleans up configuration and ensures to have all cross-connections set up correctly in HW. Waiting for the COMPLD is not sufficient.

When using the ranging support of *WaveStar*® CIT to set up lower-order cross-connections, the issue does not occur because at most 63 lower-order cross-connections can be set up with a single request which does not yet lead to the overload condition on LOXC40.

**Workaround:**

When issuing a lot of **ENT-CRS** commands to set up lower-order cross-connections or **ENT-ROLL** commands to roll lower-order cross-connections (for example, through TL1 script),

- limit the number of instances for one command series to 63,
- make the script wait for the NE reaction (COMPLD or DENY) after each single TL1-command sent to the Unite NE before sending the next one, and
- add delays of 500 ms, especially in the case of VC12 and VT1.5 connections, 800 ms in the case of LO-VC3 connections between the e.g. **ENT-CRS** commands.

See script examples adding delay below.

Sample of current script:

```
#delay=500
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-1-192-28,1-1-#-#-35-2-1-1:26882::1WAY;

ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-16,1-1-#-#-35-2-1-17:26898::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-17,1-1-#-#-35-2-1-18:26899::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-18,1-1-#-#-35-2-1-19:26900::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-19,1-1-#-#-35-2-1-20:26901::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-20,1-1-#-#-35-2-1-21:26902::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-21,1-1-#-#-35-2-1-22:26903::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-22,1-1-#-#-35-2-1-23:26904::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-23,1-1-#-#-35-2-1-24:26905::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-24,1-1-#-#-35-2-1-25:26906::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-25,1-1-#-#-35-2-1-26:26907::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-26,1-1-#-#-35-2-1-27:26908::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-27,1-1-#-#-35-2-1-28:26909::1WAY;
#delay=500
```

A) adding a delay of 500 ms or more if required, will prevent the CTL reboot

Example:

#delay=500, where the delay value is in milliseconds (that is, 500 ms).

B) adding delay more frequently through the script, will also prevent the CTL reboot

Example:

```
#delay=500
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-1-192-28,1-1-#-#-35-2-1-1:26882::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-1,1-1-#-#-35-2-1-2:26883::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-2,1-1-#-#-35-2-1-3:26884::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-3,1-1-#-#-35-2-1-4:26885::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-4,1-1-#-#-35-2-1-5:26886::1WAY;
#delay=500
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-5,1-1-#-#-35-2-1-6:26887::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-6,1-1-#-#-35-2-1-7:26888::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-7,1-1-#-#-35-2-1-8:26889::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-8,1-1-#-#-35-2-1-9:26890::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-9,1-1-#-#-35-2-1-10:26891::1WAY;
#delay=500
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-10,1-1-#-#-35-2-1-11:26892::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-11,1-1-#-#-35-2-1-12:26893::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-12,1-1-#-#-35-2-1-13:26894::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-13,1-1-#-#-35-2-1-14:26895::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-14,1-1-#-#-35-2-1-15:26896::1WAY;
#delay=500
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-15,1-1-#-#-35-2-1-16:26897::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-16,1-1-#-#-35-2-1-17:26898::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-17,1-1-#-#-35-2-1-18:26899::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-18,1-1-#-#-35-2-1-19:26900::1WAY;
ENT-CRS-LOVT1:WESTFORD:1-1-#-#-35-2-1-19,1-1-#-#-35-2-1-20:26901::1WAY;
#delay=500
```

Should the system still exhibit undesired behavior, increase the delay times by a factor of at least 2. If there is a suspicion that not all lower-order cross-connections have been setup as expected, apply a controller reset to the CTL or LOXC pack.

## Amendment 9.1 – nb74339

### Wrong error code when creating conversion cross-connection with not allowed parameters

If an AU3/AU4 conversion cross-connection is created, and path protection related parameters are specified in the **ENT-CRS** command, then the command is denied with one of the wrong error codes:

```
Status – Not in Valid State, Parameter(s) present which are not allowed
Status – Command Not Found, command not recognized or command
   parameters not valid
```

The correct error code is:

```
Input – Data Not Valid, Parameter(s) present which are not allowed
```

## Amendment 10.0 - ch00243

### Wrong error when setting outgoing J0 section trace with wrong length

If it is tried to set the outgoing J0 section trace to a value with a length that does not fit to the J0 format specified in the same command, then the **ED-rr** command is denied with the wrong error code:

```
IDNV – Input, Data Not Valid, invalid strcout
```

The correct error code is:

```
IDNC – Input, Data Not Consistent, strcout length must match the given
   outgoing J0 trace mode
```

## Amendment 10.0 - nb83337

### ED-VCG returns incorrect error codes for GE10PL1 related VCGs

The system returns the following incorrect error codes on **ED-VCG** for GE10PL1 related VCGs:

1. Try to set *vcat*="DISABLE" for a 1 GbE port on GE10PL1:
   ```
   SDNC – Status, Data Not Consistent, Not allowed on GE10PL1
   pack
   ```
   The correct error code is:
   ```
   SNVS – Status, Not in Valid State, Not allowed for 1 GE
   interfaces
   ```
2. Try to set *istd*="SONET" for a 1 GbE port on GE10PL1:
   ```
   SDNC – Status, Data Not Consistent, Not allowed on GE10PL1
   ```
   The correct error code is:
   ```
   IDNV – Input, Data Not Valid, Interface Standard cannot be
   modified
   ```
3. Try to set *inputsig*="644" for a 10 GbE port while *vcat* is disabled:
   ```
   SDNC – Status, Data Not Consistent, Not allowed on GE10PL1
   pack
   ```
   The correct error code is:
   ```
   SNVS – Status, Not in Valid State, Not allowed if VCAT
   disabled
   ```
4. Try to set *istd*="SONET" for a 10 GbE port on GE10PL1:
   ```
   IDNV – Input, Data Not Valid
   ```

The correct error code is:
`IDNV – Input, Data Not Valid, Interface Standard cannot be modified`

### Amendment 11.0 - nb86776

#### Wrong error code when creating a cross-connection at tributaries which are involved in a test access session

If it is tried to create a lower-order cross-connection with an input or output tributary which is used in a lower-order test access session, then the **ENT-CRS** command is denied with the wrong error code:

`SNVS, Status, Not in Valid State, output is already cross connected`

The required error code is:

`SNVS , Status, Not in Valid State, Tributary used in test access session`

### Amendment 11.0 - nb86586

#### Wrong error code when modifying VCG parameters not supported on ES64U

If it is tried to modify parameters of a VGC on an ES64U pack, and the parameters specified in the command are not supported by the ES64U (that means, the parameters can be retrieved but not modified), then the **ED-VCG-ES64U** command is denied with the wrong error code:

`SDNC – Status, Data Not Consistent, Not allowed on GE10PL1 pack`

The correct error code would be:

`SDNC – Status, Data Not Consistent, Not allowed on ES64U pack`

### Amendment 11.0 - nb87553

#### Wrong error code when creating cross-connections using lower-order tributaries which are used in a lower-order test access session

When trying to create lower-order cross-connections using lower-order tributaries which are used as E-trib or F-trib of a lower-order remote test access session, this request is rejected as required. However, the returned error code is misleading.

`Status, Not in Valid State, Too many crossconnection originating  from same tributary`

The correct error code would be:

`Status, Not in Valid State, tributary used in test access session`

## Amendment 11.0 – nb87448

### DBCHG ENT-CRS-LOxx missing parameters for converting 1way to 2way for lower-order rates

The database change notification of the TL1 command **ENT-CRS-LOxx** for the creation of lower-order cross-connections does not follow the specification. The NE does not report the parameters *rtnxcappl*, *rtnxcnum*, and *rtnomode* in the **DBCHG** notification, if an existing 1way lower-order cross-connection is converted to a 2way lower-order cross-connection by the creation of a appropriate cross-connection in the opposite direction.

#### Workaround

Use the **RTRV-CRS-LOxx** command to retrieve the parameters.

## Amendment 10.5.2 – nb89338

### Missing parameter eportControl in ENT-VCG notification

When creating a VCG of GE10PL1 by provisioning an optical module the resulting **ENT-VCG** notification does not contain the parameter *eportControl*. When retrieving the VCG later on, the parameter is reported as expected. The missing reporting in the **ENT** notification is not considered critical as this parameter is not needed as long is *eportClass* is not changed away from TRADITIONAL.

#### Workaround

Send a **RTRV-VCG** command to get the current value of *eportControl*.

# Configuration management

### Amendment 10.0 - nb82887

#### Wrong error code if CNVT-CCT is used with incorrect spec block parameter

When a **CNVT-CCT** command is applied to convert an unprotected cross-connection into a path-protected one using an incorrect value for the SNC type parameter, then the command is denied with the wrong error code:

```
SCNF /* Status, Command Not Found, command not recognized or command
   parameters not valid */
```

The required error code is:

```
IDNV /* Input, Data Not Valid */
```

### Amendment 10.0 - nb83149

#### Wrong error code if port of a 2F MS-SPRing/BLSR protection group is set to ENNI

If it is tried to set the port class of a port in a MS-SPRing/BLSR protection group to ENNI, then the **ED-rr** command is denied with the wrong error code:

```
SNVS – Status, Not in Valid State, port used for MSSPRING/BLSR
```

The required error code is:

```
SNVS – Status, Not in Valid State, Port must not be a member of a BLSR/
   MS-SPRing protection group
```

### Amendment 10.5.2 - nb88914

#### Wrong error responses for ED-VCG-1GEPL

The error response of the TL1 command ED-VCG-1GEPL does not follow the specification.

If the parameter *plcrthr* or *wtr* shall be set to a not allowed value the system responses:

```
Status, Command Not Found, command not recognized or command parameters
   not valid
```

The required error code is:

```
Input, Data Not Valid
```

#### Workaround

If the command is rejected check which constraint is not met.

# Optical network navigation system (ONNS)

### Amendment 5.0.1 - nb31503

#### Grouped NN connection setup via TL1 cut-through accepted with egress EDGE port not being a VCG

When using TL1 cut-through commands it is possible to switch a group of more than one NN connection with ingress EDGE port being a VCG as required, but with the EDGE port being a standard SDH/SONET port.

The connections will be switched according to the ingress and egress tributary number association restrictions as defined for grouped connection setup between VCGs, i.e. there will be a one-to-one mapping of the egress tributary numbers to the ingress tributary numbers selected, egress tributary numbers will not be selectable separately.

Thus, connections out of this grouped setup might not be switched, if for example, corresponding egress tributaries are occupied already. Connections that are switched, however, will work properly.

#### Workaround

Be careful in choosing egress EDGE VCG identifier, if using **ENT-PATH** command in cut-through mode to execute grouped NN connection setup with VCGs.

Connections that might have been set up by accident between a VCG and an SDH/SONET EDGE port can be deleted using the normal connection deletion facility.

### Amendment 7.0 - nb42305

#### Wrong notifications for autorv-connections

Some information in the PTHEVT notifications of a restored autorevertive connection by a signal change from no incoming signal to a valid incoming signal is misleading.

The event text of the PTHEVT notification of the failed path of a restored autorevertive connection is incorrect and shall be ignored. The text should indicate that the failed path of a successful restored connection is still available.

### Amendment 8.0 - nb51731

#### Misleading error-message in case of failed path-roll

When setup a path with 3 legs using ED-PATH the following error message can occur:

```
Error=E018:\" Status, Edge Port Used up \":NodeID=29.54.173.73&1-
1-5-1-4
```

### Amendment 8.0 - nb61009

#### Inconsistent PTHEVT if trib is outside portrange

In case an ONNS connection setup is issued with an EDGE tributary on a GE1 port given, that is out of the allowed range, additionally to the expected rejection with the failure reason “Invalid EDGE port” and a corresponding **REPT PTHEVT** notification with the same failure reason a second **REPT PTHEVT** notification is sent with the incorrect and misleading failure reason “EDGE port used up” is sent.

### Amendment 9.1 – nb78136

#### SRLGS not shown in output of RTRV-L1TDR

The TL1 command **RTRV-L1TDR** does not show shared risk link groups (SLRGs).

### Amendment 9.1 – nb78498

#### Link defragmentation (OPR-DEFRAG) executed to ports of port class other than INNI formally accepted or denied with misleading error code

Although link defragmentation including “empty port” is only supported for INNI links, that is, can only be executed to ports of port class INNI, the following misbehavior may be observed:

If **OPR-DEFRAG** executed to a port of port class other than INNI, the action may be formally answered with completion code (thus pretending acceptance) or may be rejected with the misleading error response:

```
E621, No Target Port available
```

However, also if command is wrongly formally accepted, no action will be really executed and no traffic will be affected.

#### Workaround

Take care to execute link defragmentation (including “empty port”) only to INNI ports. Otherwise ignore responses as described above.

### Amendment 10.0 – nb82588

#### Missing validations related to allowed values and uniqueness when configuring ONNS SCN IP addresses

When configuring ONNS SCN IP addresses via **ENT-ULS**, there are no validations applied in the NE or in the management systems to deny invalid values or value ranges (for example, values 0.0.0.0 or 1.1.1.1) or to check uniqueness of ONNS SCN IP address within a domain. As a consequence, corresponding wrong settings would be accepted.

Such wrongly configured ONNS SCN IP addresses could lead to unpredictable behavior of the ONNS network.

#### Workaround

Be careful when configuring ONNS SCN IP addresses.

## Amendment 10.5 – nb85192

### RCDEAD alarm contains neighbor RC IP address instead of RA ID

The RCDEAD alarm raised by a routing controller in case of a routing controller (RC) in a neighbor routing area (RA) not being reachable will contain the IP address of the affected neighbor RC instead of the corresponding RA ID.

### Workaround

As long as RC redundancy is not implemented, there is a 1 to 1 relationship between RA ID and RC IP address.

## Amendment 10.5.2 – nb87890

### Denial for syntactically incorrect RTRV-CONN command may be missing

In case a **RTRV-CONN** command is executed, which is syntactically not correct, the TL1 **DENY** answer may not be sent by the affected node in certain cases. However, the command will correctly not be executed.

# Protection (BLSR/S-SPRing, DRI/DNI, APS/MSP, UPSR/SNCP)

### Amendment 3.0.1 - nb 18762

#### 1+1 MSP accept incomplete Operate Protection Switch commands

For 1+1 MSP, incomplete Operate Protection Switch commands are accepted:

- Operate Protection Switch command with parameter source *sc=lockout* and without parameter destination *dest* is accepted. This is not a real problem, because the *dest* is redundant information.
- Operate Protection Switch command with parameter destination *dest=wkg* should not be accepted without the source information. The resultant state Manual Switch is not worse because it does not prevent further automatic switching.

### Amendment 6.0 - nb35660

#### Wrong error code if tributary of OPT2G5 is used as input for path protection

If a path protected cross-connection is created with a tributary of an OPT2G5 as protection leg, then the command is denied with the unspecific error code:

```
IDNV - Input, Data Not Valid
```

The expected error code is:

```
IDNC - Input, Data Not Consistent, no OPT2G5-trib as input-trib in
   pathprotected crossconnection
```

(This correct error code is returned if the working leg is on an OPT2G5.)

### Amendment 6.0 - nb40929

#### Unprecise error message for ED-MAP-RING

When the TL1 command **ED-MAP-RING** is used to provision the MS-SPRing / BLSR ring topology and different numbers of ring node identifiers and ring node target identifiers are entered, the command is denied. However, the related error message is not precise enough, but it simply states:

```
Input, Data Not Valid
```

The expected error code is:

```
Input, Data Not Valid, different number of values in rnids and rtids
```

### Amendment 9.0 - nb74289

#### Wrong error code when creating TOPEX protection group with SONET ports

When it is tried to create a 4F TOPEX protection group using 4 SONET ports, then the **ENT-PROTN-GRP** command is denied with the wrong error code:

```
SNVS - Status, Not in Valid State, port rate not supported for
this protection type
```

The correct error code is:

```
SNVS – Status, Not in Valid State, SONET port not allowed for TOP
```

## Amendment 10.0 - nb83091

### Unsupported parameters reported with RTRV-PTF-HOSTS1 and the ENT-PTF-HOSTS1 notification

When it is tried to create a 4F TOPEX protection group using 4 SONET ports, then the **ENT-PROTN-GRP** command is denied with the wrong error code:

```
SNVS – Status, Not in Valid State, port rate not supported for
this protection type
```

The correct error code is:

```
SNVS – Status, Not in Valid State, SONET port not allowed for TOP
```

## Amendment 10.5.2 - nb87043

### RTRV-PROTN-GRP wrongly denied for EQP, if used with “all” AID and specific protection type

If the **RTRV-PROTN-GRP** command is used for equipment protection groups with the **1-1-eall** AID and one of the specific protection types EQPTSWFBR, EQPTCTL, EQPTEP155, EQPTEP51, EQPTLOXC or EQPTTMUX, then the command is denied. The correct behavior would be that the command completes and returns all protection groups of the specified type.

#### Workaround

The **RTRV-PROTN-GRP** command works correctly with **1-1-eall** AID and the unspecific protection type ALL.

# Fault/Alarm management

### Amendment 3.0.1 – nb20283

#### Changes of tributary output modes for test access sessions are not notified

Changing test modes of a remote test access session does not generate change notification for *eomode* or *fomode*, but the value really changes. However the retrieval of this test access session delivers the correct values.

### Amendment 11.0 – nb86806

#### RTRV-LOG-ALM with reply type DBSYNC does not return log entries

If the **RTRV-LOG-ALM** command is used with reply type DBSYNC and no start date and time specified, then the command does not complete (time-out on management systems or *WaveStar*® CIT).

# Remote test access

### Amendment 3.0.1 - nb19569

#### Establishment of remote test access for bridged cross-connections is not rejected properly

If an operator tries to create a remote test access session on a cross-connection which is bridged (broadcast) then the operator gets a wrong error message.

### Amendment 4.0 - nb20634

#### Changes of tributary output modes of test access sessions are not notified

Changing test modes of remote test access session does not generate change notification for *eomode* or *fomode* if the value really changes. However the retrieval of this test access session is correct.

### Amendment 11.0 - nb87012

#### Wrong error code when creating lower-order test access in MONEF mode without secondary test access tributary

If the **CONN-TACC-LOVT1** command is executed which has the test access mode (*tstmde*) MONEF specified, but no secondary test access tributary (*tatrib2*), then the command is denied with the wrong error code:

```
IENE – Input, Entity Not Exists, Specified tributary/tributaries
do not exist
```

### Amendment 11.1 - nb87732

#### Wrong Error Code when creating cross-connections using lower-order tributaries which are used in a lower-order test access session

When trying to create lower-order cross-connections using lower-order tributaries which are used as E-trib or F-trib of a lower-order remote test access session, this request is rejected. However, the returned error code is misleading:

Instead of

```
Status, Not in Valid State, tributary used in test access session
```

the system returns

```
Status, Not in Valid State, Too many crossconnection originating  from
   same tributary
```

# DCN/DCC management

### Amendment 3.0.1 - nb21562

#### No specific error message when 64 DCC channel limit reached

When the maximum number of available DCC channels is reached, the supplied error message does not distinguish the possible reasons and always replies with:
`SSRE, System Resources Exceeded, allowed limit of DCC channels exceeded`

In case the maximum number is exceeded due to SCN assignments, expected message is:
`SSRE, System Resources Exceeded, allowed limit of SCN DCC channels exceeded`

In case the maximum number is exceeded due to combined MCN+SCN assignments, expected message is:
`SSRE, System Resources Exceeded, overall limit of DCC channels exceeded`

### Amendment 10.5.2 - nb86749

#### RTRV-MANROUTE-LAN not properly denied, command is not completed at all

If **`RTRV-MANROUTE-LAN`** is executed on a LAN port which is not assigned to the UNI node, then the command is not denied with an error code. The command is not completed at all. This will lead to time-out on management systems or CIT, and cause waiting time and delays. The user gets no indication of the problem with the command.
