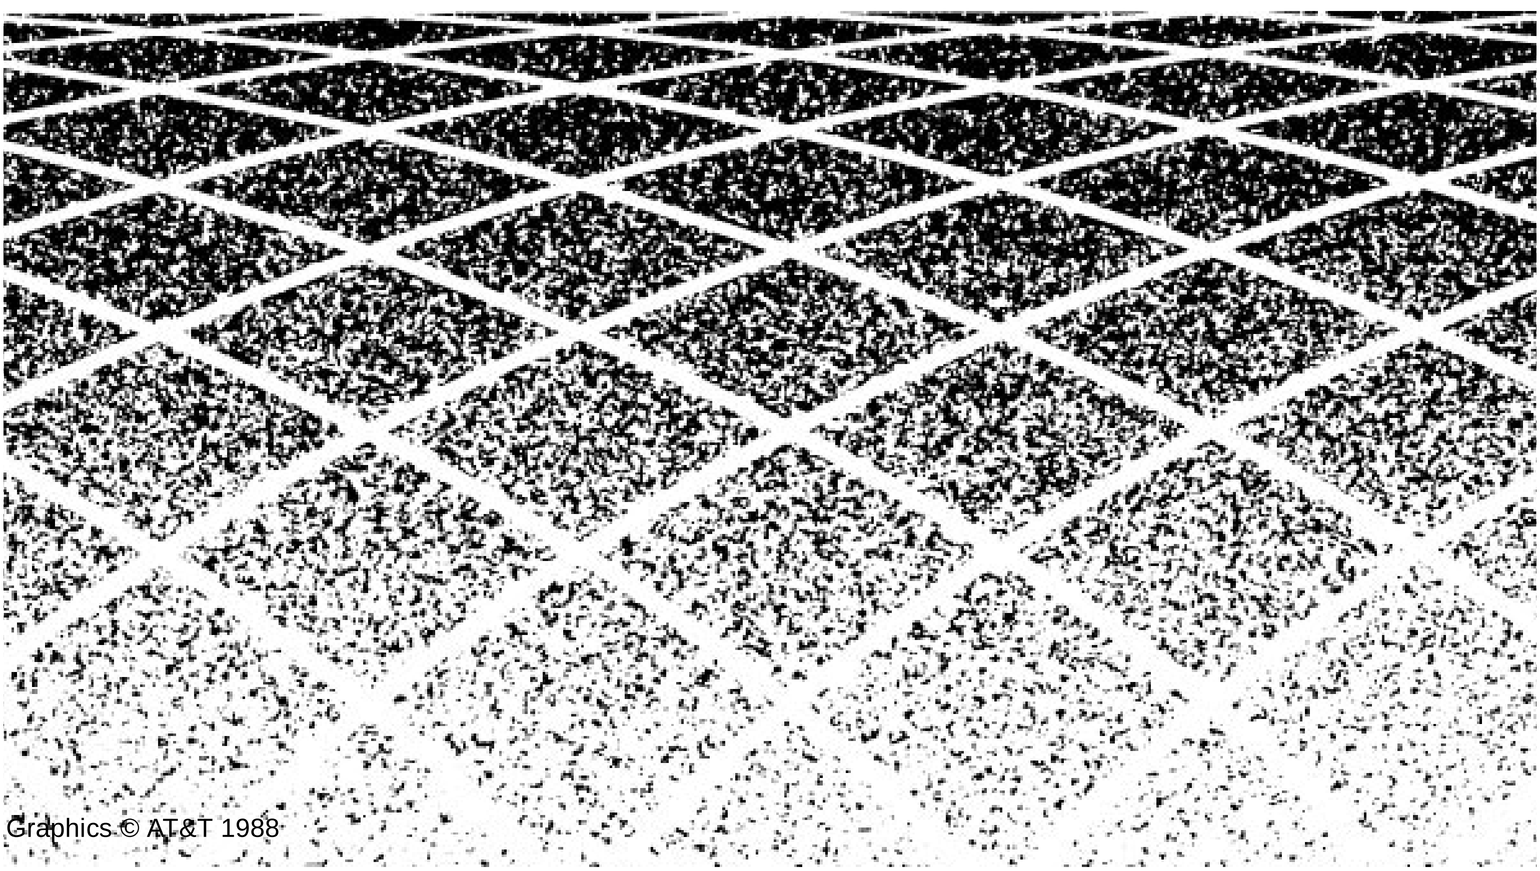
DEFINITY Enterprise Communications Server Release 5 Maintenance for R5vs/si



Contents

	About This Document	lxxi
	■ General	lxxi
	■ Conventions Used in This Document	lxxiii
	■ Organization	lxxiii
	■ Assumption	lxxv
	■ Safety Precautions	lxxv
	■ Security Issues	lxxvii
	■ Electromagnetic Compatibility Standards	lxxvii
	European Union Standards	lxxviii
	■ Trademarks and Service Marks	lxxviii
	■ Related Documents	lxxix
1	**Maintenance Architecture**	1-1
	■ General	1-1
	■ Maintenance Objects	1-1
	■ Alarm and Error Reporting	1-2
	■ Maintenance Testing	1-4
2	**Hardware Configurations and Power**	2-1
	■ General	2-1
	■ Generic 3 Circuit Packs	2-1
	■ Cabinet Configurations	2-6
	Control Carrier (J58890AH) With A TN790	2-13
	Duplicated Control Carrier (J58890AJ) With A TN790	2-15
	Basic Control Cabinet (J58890L)	2-31
	Duplicated Control Cabinet (J58890M)	2-33

Contents

- Power Controls 2-37
  - Multicarrier/Medium Cabinet 2-40
  - Enhanced Single Carrier/XE and Single Carrier/XE Cabinets 2-41
- Light-Emitting Diodes (LEDs) 2-43

3 **Management Terminals** 3-1

- General 3-1
- Manager I and Manager G3MT Terminals 3-1
  - Terminal Keyboard 3-2
- System Login Procedure 3-11
  - Forced Password Aging and Administrable Logins for G3V3 and Later Releases 3-11
  - Administering Customer Logins and Forced Password Aging for G3V3 and Later Releases 3-15
  - Command Line Details 3-35
  - Screen Forms 3-36
- Switch-Based Bulletin Board 3-36
  - System Bulletin Board Commands 3-37
- System Logoff Procedure 3-39
- DEC VT220 Terminal 3-40

4 **Initialization and Recovery** 4-1

- General 4-1
- Reset System 1 (System Warm Start) 4-2
- Reset System 2 (System Cold Start Without Translations Loading) 4-3
- Reset System 3 (System Cold Start With Translations Loading) 4-5
- Reset System 4 (System Reboot) 4-7
- Reset System 5 (System Reboot and Run All 24-Hour Tests) 4-12

Contents

- Reset System Interchange (High or Critical Reliability Systems Only) 4-17
- Procedure for SPE-Down Mode 4-18
- Procedure for Duplication Interface — Processing Element Communication Down 4-23

5 **Routine Maintenance Procedures** 5-1

- General 5-1
- INADS Alarm Origination—Activation/Deactivation 5-2
- Maintenance-Related System Parameters Form 5-3
- Handling Port Circuit Packs 5-3
  - Common Port Circuit Packs 5-5
  - Reseating Port Circuit Packs 5-6
  - Replacing Port Circuit Packs 5-8
- Handling Control Circuit Packs 5-8
  - PPN Control Circuit Packs 5-8
  - Network Control Circuit Pack 5-10
  - EPN Control Circuit Packs 5-13
- TN790 Processor Circuit Pack (Memory) 5-14
  - Removing the SIMM from the TN790 Processor Circuit Pack 5-17
- Removing Power 5-19
  - Procedure for a Multicarrier or Single Carrier Cabinet PPN 5-19
  - Procedure for a Multicarrier or a Single Carrier Cabinet EPN 5-21
- Restoring Power 5-22
  - Procedure for Multicarrier and Single Carrier Cabinet PPN 5-22
  - Procedure for Multicarrier and Single Carrier Cabinet EPN 5-23
- Troubleshooting Control Carrier Power Units 5-25
  - Procedure for a Multicarrier Cabinet Without High or Critical Reliability 5-26

Contents

Procedure for a Single-Carrier Cabinet Without High or Critical Reliability	5-27
Procedure for a Single Carrier Cabinet	5-27
Procedure for a Multicarrier Cabinet With High or Critical Reliability	5-29
Procedure for a Single-Carrier Cabinet With High or Critical Reliability	5-31
■ Replacing Components Within the G3vs or Release 5vs or later	5-31
Power Supply	5-35
Fans	5-35
■ System Backup	5-36
Save Translation	5-36
Save Recorded Announcements	5-38
Tape Backup for a 286 System Without High or Critical Reliability	5-38
Tape Backup for a High or Critical Reliability 286 System	5-40
Tape Errors	5-42
Memory Card Backup	5-43
Memory Card Errors	5-46
■ Software Upgrade	5-48
Procedure on a 286 System Without High or Critical Reliability	5-49
Procedure on a High or Critical Reliability 286 System	5-50
Procedure on a System using Memory Cards	5-53
Procedure for Replacing Standby SPE Processor	5-66
■ Preventive Maintenance Procedures	5-68
AT&T Preventive Maintenance Log	5-68
■ System Features	5-70
Automatic Circuit Assurance	5-70
Busy Verification of Terminals and Trunks	5-71
Trunk Group Busy/Warning Indicators to Attendant	5-71
Trunk Identification by Attendant	5-71
Facility Test Calls	5-72
Analog Tie Trunk Back-to-Back Testing	5-79

Contents

	Terminating Trunk Transmission Testing	5-88
	Troubleshooting ISDN-PRI Problems	5-90
	Troubleshooting PRI Endpoint Problems	5-92
	Troubleshooting ISDN-PRI Test Call Problems	5-94
	■ Troubleshooting Backplane Voltage Problems	5-98
6	**Accessing Alarms and Errors**	6-1
	■ General	6-1
	■ Error Generation/Tracking	6-1
	Alarm Generation Thresholds	6-2
	■ Alarm Log	6-3
	■ Alarm Log Reporting Strategy	6-3
	■ Alarm Log and System Reset Interactions	6-4
	■ Hardware Alarm Reports	6-4
	■ Typical Alarm Log	6-5
	■ Error Log	6-13
	■ Terminal Alarm Notification	6-13
7	**LED Interpretation**	7-1
	■ General	7-1
	■ Processor Circuit Pack and Maintenance Circuit Pack LEDs	7-2
	■ Duplication Interface Circuit Pack LEDs	7-3
	■ Attendant Console LEDs	7-5
	■ Carrier Power Unit LEDs	7-5
	■ Power Distribution Unit LEDs	7-5
	■ Control and Port Circuit Pack Status LEDs	7-5

Contents

8 **Reliability Systems: A Maintenance Aid** 8-1

- General 8-1
- Reliability Options 8-3
  - Standard Reliability 8-3
  - High Reliability 8-3
  - Critical Reliability 8-4
- Duplicated Hardware 8-4
  - SPE Duplication 8-4
  - Duplication Interface Circuit Pack 8-5
  - SPE Select Switches 8-6
  - Inter-Carrier Cable 8-7
  - Tone-Clock Circuit Pack Duplication 8-7
  - Time Division Multiplexed Bus Duplication 8-8
  - Packet Bus Redundancy 8-9
- Duplication Concepts 8-12
  - Memory Shadowing 8-12
  - SPE Modes 8-12
  - SPE-Interchanges 8-14
- System Technician Commands for High and Critical Reliability Systems 8-17
  - Commands for SPE Duplication 8-17
  - Commands for TDM Bus Duplication 8-20
  - Commands for Packet Bus Redundancy 8-20
  - Commands for Tone-Clock Circuit Pack Duplication 8-20
- Processor Complex Circuit Pack LED Strategies 8-21
- Repair Procedures for High and Critical Reliability 8-23
  - Replacing Defective SPE Circuit Packs 8-24
  - Handling SHDW-CIR and SHDW-LNK Alarms in the Active SPE 8-26
  - Handling DUPINT Alarms in the Active SPE 8-27
  - Upgrading SPE Circuit Packs 8-27
  - Circuit Pack Replacement Procedure 8-28
  - Additional Tests for Replaced DATA-CHL, PKT-CTRL, and PROCR Circuit Packs 8-33

Contents

- Procedure for Installing/Replacing the Inter-Carrier Cable 8-38
- Procedure for Blocking Standby SPE Maintenance Activities for System Technician Testing 8-39

9 Packet Bus Fault Isolation and Correction 9-1

- General 9-1
  - Remote Maintenance versus On-Site Maintenance 9-2
  - Tools for Packet Bus Fault Isolation and Correction 9-3
- What is the Packet Bus? 9-4
  - Packet Bus Usage 9-4
  - Packet Bus Faults 9-4
  - Packet Bus Connectivity Diagram 9-5
- Circuit Packs That Use the Packet Bus 9-6
  - Overview of the Circuit Packs and Related Maintenance Objects 9-6
  - Effect of Circuit Pack Failures on the Packet Bus 9-7
- Maintenance of the Packet Bus 9-9
  - Packet Bus and TDM Bus: a Comparison 9-9
  - Packet Bus Maintenance Software 9-10
  - Overview of Fault Correction Procedures 9-11
- The Maintenance/Test Circuit Pack (TN771) 9-12
  - Description 9-12
  - Normal Packet Functionality 9-12
  - Standalone Mode 9-13
  - Special Precaution Concerning the TN771 9-21
- Packet Bus Fault Isolation Flowchart 9-22
  - Flowchart Description and Supplement 9-25
- Packet Bus Fault Correction 9-27
  - Using and Interpreting Results from the Status System Command 9-27
  - Considerations for High and Critical Reliability Systems 9-28
  - Troubleshooting Procedures 9-28

10 Maintenance Commands and Trouble-Clearing Aids 10-1

- General 10-1
- Maintenance Commands 10-2
- General 10-1
- Maintenance Commands 10-2
- Command Groups 10-4
- busyout access-endpoint 10-26
- busyout board 10-29
- busyout cdr-link 10-33
- busyout data-module 10-36
- busyout journal-printer 10-39
- busyout link 10-42
- busyout mis 10-45
- busyout modem-pool 10-47
- busyout packet-control 10-50
- busyout pms-link 10-53
- busyout port 10-56
- busyout pri-endpoint 10-60
- busyout sp-link 10-63
- busyout spe-standby 10-65
- busyout station 10-68
- busyout tdm 10-71
- busyout tone-clock 10-74
- busyout trunk 10-77
- cancel hardware-group 10-80
- change circuit-packs 10-83
- change synchronization 10-88
- Change System-Parameters Maintenance 10-92

Contents

- 3clear audits 10-107
- clear errors 10-109
- clear interface 10-111
- clear isdn-testcall 10-114
- clear link 10-117
- clear mst 10-119
- clear pkt 10-121
- clear port 10-123
- copy update-file 10-125
- disable administered-connection 10-128
- disable mst 10-130
- disable synchronization-switch 10-132
- disable test-number 10-134
- display alarms 10-136
- display cabinet 10-145
- display communication-interface 10-147
- display disabled-tests 10-152
- display errors 10-153
- display events 10-166
- display initcauses 10-169
- display memory-configuration 10-177
- display port 10-181
- display synchronization 10-184
- display system-parameters maintenance 10-187
- display time 10-202
- download update-file 10-204
- enable administered-connection 10-211
- enable mst 10-213
- enable synchronization-switch 10-215
- enable test-number 10-217
- format card-mem 10-219
- get vector 10-222
- list configuration 10-226
- list config software-version 10-229
- list disabled-mos 10-236

Contents

- list history 10-239
- list isdn-testcall 10-243
- list marked-ports 10-245
- list measurements 10-247
- list mst 10-252
- list testcalls 10-288
- mark port 10-296
- monitor bcms 10-298
- monitor health 10-305
- monitor security-violations 10-310
- monitor system 10-313
- monitor traffic 10-321
- monitor trunk 10-324
- recycle carrier 10-327
- refresh spe-standby 10-330
- release access-endpoint 10-333
- release board 10-336
- release cdr-link 10-339
- release data-module 10-342
- release journal-printer 10-345
- release link 10-348
- release mis 10-351
- release modem-pool 10-353
- release packet-control 10-356
- release pms-link 10-359
- release port 10-362
- release pri-endpoint 10-365
- release sp-link 10-368
- release spe-standby 10-371
- release station 10-373
- release tdm 10-376
- release tone-clock 10-379
- release trunk 10-382
- reset board 10-385
- reset interface 10-388

Contents

- reset maintenance 10-392
- reset spe-standby 10-395
- reset system 10-398
- restore announcements 10-404
- resume hardware-group 10-408
- save announcements 10-411
- save translation 10-416
- set expansion-link 10-419
- set options 10-422
- set signaling-group 10-431
- set synchronization 10-433
- set tdm 10-436
- set time 10-440
- set tone-clock 10-445
- set vector 10-449
- status access-endpoint 10-455
- status administered-connection 10-459
- status attendant 10-463
- status audits 10-466
- status bri-port 10-478
- status card-mem 10-491
- status cdr-link 10-497
- status data-module 10-499
- status hardware-group 10-503
- status health 10-506
- status interface 10-511
- status isdn-testcall 10-514
- status journal-link 10-518
- status link 10-521
- status logins 10-530
- status mst 10-533
- status packet-control 10-536
- status periodic-scheduled 10-540
- status pms-link 10-543
- status pri-endpoint 10-546

Contents

- status processor-channel 10-550
- status signaling-group 10-553
- status sp-link 10-557
- status station 10-559
- status synchronization 10-563
- status system 10-566
- status trunk 10-582
- status tsc-administered 10-586
- status tti 10-589
- test access-endpoint 10-592
- test alarms 10-596
- test analog-testcall 10-606
- test board 10-611
- test card-mem 10-616
- test cdr-link 10-622
- test customer-alarm 10-626
- test data-module 10-629
- test ds1-loop 10-633
- test duplication-interface 10-637
- Test EDA-External-Device-Alrm 10-641
- test environment 10-645
- test hardware-group 10-650
- test inads-link 10-663
- test interface 10-666
- test isdn-testcall 10-670
- test journal-printer 10-674
- test led 10-678
- test link 10-680
- test maintenance 10-684
- test memory 10-688
- test modem-pool 10-692
- test network-control 10-696
- test packet-control 10-702
- test pkt 10-706
- test pms-link 10-710

Contents

- test port 10-714
- test pri-endpoint 10-718
- test processor 10-722
- test shadow-link 10-727
- test signaling-group 10-731
- test sp-link 10-735
- test spe-standby 10-738
- test station 10-742
- test synchronization 10-746
- test tape 10-750
- test tdm 10-754
- test tone-clock 10-758
- test trunk 10-762
- test tsc-administered 10-766
- upgrade software 10-770

11 Maintenance Object Repair Procedures 11-1

- General 11-1
- Error Generation/Tracking 11-3
- Error/Alarm Resolution 11-3
- Maintenance Object Test/Repair Procedures 11-4
- 12V-PWR (12 Volt Power Supply) 11-5
- ABRI-PORT (ASAI ISDN-BRI Port) 11-9
- AC-POWER (AC Power) for AC-Powered Systems 11-10
- AC-POWER (AC Power) for DC-Powered Systems 11-22
- ADM-CONN (Administered Connection) 11-27
- ADX16D-B (16 Port AUDIX Digital Circuit Pack) 11-32
- ADX16D -P (16-Port AUDIX Digital PORT) 11-33
- ADXCL-BD (AUDIX Control Link Circuit Pack) 11-48
- ADXCL-PT (16-Port AUDIX Analog Line/ Control Link Mode) 11-49
- ADXDP-BD (AUDIX Digital Circuit Pack) 11-61
- ADXDP-PT (AUDIX Digital Port) 11-62

Contents

- ALARM-PT (ALARM PORT) 11-75
- ANL-16-L (16-Port Neon Analog Line) 11-76
- ANL-BD (Analog Line Circuit Pack) 11-104
- ANL-LINE (8-Port Analog Line), ANL-NE-L (8-Port Neon Analog Line) 11-105
- ANN-BD (Announcement Circuit Pack) 11-136
- ANN-PT (Announcement Port) 11-164
- ANNOUNCE (Announce) 11-179
- ASAI-ADJ (Adjunct-Switch Application Interface) [G3iV1.1-286,G3iV2-386] 11-185
- BRI-BD/LGATE-BD (ISDN-BRI Line Circuit Pack) 11-186
- BRI-DAT (ISDN-BRI) 11-196
- BRI-PORT (ISDN-BRI Port), ABRI-PORT (ASAI ISDN-BRI Port) 11-197
- BRI-SET, ASAI-ADJ, BRI-DAT 11-228
- CABINET (Cabinet Sensors) 11-267
- CAP-MEM (Memory Card Capacity) [386 Systems] 11-284
- CARD-MEM (Memory Card) 11-289
- CARR-POW (Carrier Port Power Unit) for AC-Powered Systems 11-317
- CARR-POW (Carrier Port Power Unit) for DC-Powered Systems 11-337
- CLSFY-BD (Call Classifier Circuit Pack) 11-356
- CLSFY-PT (Call Classifier Port) 11-357
- CO-BD (Central Office Trunk Circuit Pack) 11-365
- CO-DS1 (DS1 CO Trunk) 11-366
- CO-TRK (CO Trunk) 11-388
- CONFIG (System Configuration) 11-424
- CUST-ALM (Customer-Provided Alarming Device) 11-437
- DATA-BD (Network Control Circuit Pack) 11-440
- DATA-CHL (Network Control Data Channel) 11-447
- DATA-CON (Network Control Driver) 11-487
- DAT-LINE (Data Line) 11-491
- DC-POWER (Single-Carrier Cabinet Power) 11-504
- DETR-BD 11-509
- DID-BD (Direct Inward Dial Trunk Circuit Pack) 11-510

Contents

- DID-DS1 (DS1 DID Trunk) 11-511
- DID-TRK (DID Trunk) 11-528
- DIG-BD (Digital Line Circuit Pack) 11-550
- DIG-LINE (Digital Line) 11-551
- DIOD-DS1 (DS1 DIOD Trunk) 11-586
- DIOD-TRK (DIOD Trunk), DIOD-BD (DIOD Circuit Pack) [G1.2SE] 11-600
- DIOD-TRK (DIOD Trunk) [G1.2SE] 11-601
- DS1-BD (DS1 Interface Circuit Pack) 11-616
- DT-LN-BD (Data Line Circuit Pack) 11-723
- DTMR-PT [Dual Tone Multifrequency Port (TTR)] 11-724
- DUPINT (Duplication Interface Circuit Pack) 11-730
- EMG-XFER (Emergency Transfer) 11-758
- EPN-SNTY (EPN Sanity Audit) 11-764
- ERR-LOG (Error Log) 11-766
- ETR-PT (Enhanced Tone Receiver Port) 11-768
- EXP-INTF (Expansion Interface Circuit Pack) 11-775
- EXP-LINK (Expansion Interface Link) 11-840
- EXT-DEV ADMIN? N (External Device Alarm) 11-842
- EXT-DEV ADMIN? Y (External Device Alarm) 11-848
- FL-DATA (Flash Data Consistency) 11-853
- GPTD-PT [General Purpose Tone Detector Port (CPTR)] 11-872
- HYB-BD (Hybrid Line Circuit Pack) 11-879
- HYB-LINE (Hybrid Line) 11-880
- INADS (INADS Link) 11-914
- ISDN-LNK (ISDN-PRI Signaling Link Port) [G1] 11-918
- ISDN-LNK (ISDN-PRI Signaling Link Port) 11-936
- ISDN-PLK (ISDN-PRI Signaling Link Port) 11-945
- ISDN-SGR (ISDN-PRI Signaling Group) 11-955
- ISDN-TRK (DS1 ISDN Trunk) 11-989
- JNL-PRNT (Journal Printer Link) 11-1023
- LOG-SVN (Login Security Violation) 11-1024

Contents

Volume 3

- MAINT (EPN Maintenance Circuit Pack) 11-1027
- MEM-BD (Memory) 11-1055
- MEMORY 11-1072
- MET-BD (MET Line Circuit Pack) 11-1073
- MET-LINE (MET Line) 11-1074
- MIS (Management Information System) 11-1105
- MODEM-BD (Modem Pool Circuit Pack) 11-1106
- MODEM-PT (Modem Pool Port) 11-1107
- M/T-ANL (Maintenance/Test Analog Port) 11-1128
- M/T-BD (Maintenance/Test Circuit Pack) 11-1141
- M/T-DIG (Maintenance/Test Digital Port) [G3iV1-1.286, G3iV2-386] 11-1142
- M/T-PKT (Maintenance/Test Packet Bus Port) 11-1160
- OPS-LINE (DS1 OPS Line) 11-1166
- PDMODULE, TDMODULE (Data Module) 11-1185
- PE-BCHL (PRI Endpoint Port) 11-1211
- PI-BD (Processor Interface Circuit Pack) 11-1234
- PI-LINK (Processor Interface Link) 11-1243
- PI-PT (Processor Interface Port) 11-1264
- PI-SCI (System Communication Interface) 11-1270
- PKT-BUS (Packet Bus) 11-1281
- PKT-CTRL (Packet Control Circuit Pack) 11-1296
- PMS-LINK (Property Management System Link) 11-1318
- PMS-PRNT/JNL-PRNT (PMS Printer Link) 11-1327
- POWER (Battery & Battery Charger) for AC-Powered Systems 11-1334
- POWER (Battery & Battery Charger) for DC-Powered Systems 11-1347
- PR-MAINT (MainTenance Processor [TN790 RISC Systems]) 11-1353
- PR-MAINT (MainTenance/Tape Processor [286 systems] or Maintenance Processor [386 Systems]) 11-1381
- PR-MEM (TN790 RISC Memory) 11-1405

Contents

- PRI-CDR/SEC-CDR (PRI-CDR Link) 11-1419
- PROC-SAN (Process Sanity Audits) 11-1427
- PROCR (TN790 RISC Processor Circuit Pack) 11-1428
- PROCR (Processor Circuit Pack) 11-1441
- RING-GEN (Analog Ring Generator) 11-1452
- S-SYN-BD (Speech Synthesis Circuit Pack) 11-1463
- S-SYN-PT (Speech Synthesis Port) 11-1464
- SEC-CDR (SEC-CDR Link Maintenance) 11-1484
- SHDW-CIR (Common Shadow Circuit) 11-1485
- SHDW-LNK (Memory Shadowing Link) 11-1496
- SPE-SELEC (SPE Select Switch) 11-1518
- STBY-SPE (Standby SPE) 11-1523
- STRAT-3 (Stratum 3 Clock)] 11-1571
- SVC-SLOT (Service Slot) 11-1587
- SW-CTL (Switch Control) 11-1589
- (Synchronization) 11-1607
- SYS-PRNT (System Printer) 11-1620
- SYSTEM (System) 11-1627
- TAPE (Tape Unit) [G3iV1.1-286] 11-1630
- TAPE-DAT (Tape Consistency) 11-1664
- TDMODULE (Trunk Data Module) 11-1678
- TDM-BUS (TDM Bus) 11-1679
- TDM-CLK (TDM Bus Clock) 11-1693
- TIE-BD (Tie Trunk Circuit Pack) 11-1714
- TIE-DS1 (DS1 Tie Trunk) 11-1715
- TIE-TRK (Tie Trunk) 11-1741
- TONE-BD (Tone-Clock Circuit Pack) 11-1775
- TONE-PT (Tone Generator) 11-1797
- TSC-ADM (Administered Temporary Signaling Connections) 11-1811
- TTR-LEV (TTR Level) 11-1820
- UDS1-BD (UDS1 Interface Circuit Pack) 11-1825
- WAE-PORT (Wideband Access Endpoint Port) 11-1943
- XXX-BD (Common Port Circuit Pack) 11-1953

About This Document

General

This manual provides the information needed to monitor, test, and maintain DEFINITY® Enterprise Communications Server Release 5, DEFINITY® Communications System Generic 3i/s/vs Version 4, Generic 3i Version 1.1-286, and Generic 1, and it covers many of the faults and troubles that can occur in the system. Most maintenance requirements are simple procedures due to the modular, self-testing nature of the system.

Simple, traditional trouble shooting methods still have a valid place in maintaining a system as advanced as this one, and those methods are sometimes sufficient to locate and clear faults. The traditional methods include terminal substitution, visual inspections, continuity checks, and clarification of operating procedures with users.

The information in this manual is intended for use by:

1. A maintenance technician dispatched to a DEFINITY System site in response to a trouble alarm or a user trouble report,
2. A maintenance technician located at a remote maintenance facility, or
3. The user's assigned maintenance technician. The technician is expected to have a knowledge of telecommunications fundamentals and of the DEFINITY® Enterprise Communications Server Release 5, DEFINITY® Communications System Generic 3i/s/vs Version 4, Generic 3i Version 1.1-286, and Generic 1, Systems to the extent that the procedures in this manual can be performed, in most cases, without assistance.

Each installed DEFINITY system has a user-designated System Manager who is responsible for administration of the system. This person's duties and capabilities with respect to the system are covered in the following manuals:

- *DEFINITY Communications System Generic 1 and Generic 3 System Management*, 555-230-500.
- *DEFINITY Communications System Generic 3 V2 Traffic Reports*, 555-230-511.
- *DEFINITY Communications System Generic 3 Implementation*, 555-230-653.

The maintenance technician should work closely with the user's System Manager.

This manual is not intended to solve all levels of trouble. It is limited to troubles that can be solved by using the Alarm Log, Error Log, trouble-clearing procedures, maintenance tests, and traditional troubleshooting methods. When the limits of trouble-clearing analysis are reached and the trouble still has not been resolved, it is your responsibility, as the maintenance technician, to escalate the problem to a higher level of technical support. Escalation should conform to the procedures in the *Technical and Administration Escalation Plan*.

The activity of a maintenance technician called to a DEFINITY System site to clear alarmed troubles will probably consist of replacing at least one piece of equipment. Multialarmed and user-reported troubles may require more investigation and analysis.

Using the maintenance procedures provided in this manual, the maintenance technician can do the following:

- Observe alarm conditions
- Perform emergency restoration procedures
- Replace system components
- Perform maintenance tests
- Analyze displays of alarms, errors, and test results

This issue replaces all previous issues of this manual. When features, screen displays, equipment, or operations differ between, for example, Generic 1 and Generic 3i, these differences are clearly identified by use of the following indicators: "[G3iV2-386]" for Generic 3i Version 2-386 System, "[G3sV2]" for Generic 3s Version 2, "[G3vsV2]" for Generic 3vs Version 2, "[G3iv1.1-286]" for Generic 3i Version 1.1-286 System, and "[G1]" for Generic 1.

International features and screen displays are identified by "[G31.2SE]" for International Generic 1.2 System Enhanced, by "[G3iV2-386]" for International Generic 3i System (also known as a Medium system), and by "[G1SE]" for International Generic 1 System Enhanced. A few MO sections are devoted to a specific Generic, and in those cases, the Generic number is listed in the MO title and headings. The rest of the International information is incorporated in existing MOs, but is clearly marked as such.

Conventions Used in This Document

The following conventions are used in this document:

- DEFINITY Systems are called G3V4, G3 Release 5; G3vs; G3si, and G3r
- All occurrences of G3siV4, G3siV4+m, G3siV5, and G3siV5+m are called G3si unless a specific configuration is required to differentiate between product offerings
- All occurrences of G3 with out a suffix following the “3” refer to G3vs, G3si, and G3r
- A component of a DEFINITY System, such as a circuit pack, occurring without a reference to any specific system, is part of G3

NOTE:
In this manual, the term “ASAI” is synonymous with the newer CallVisor ASAI.

Organization

This manual is organized into three volumes. Each volume contains the table of contents and index for the entire manual. Volume 1 contains the “About This Book” introduction that you are now reading and Chapters 1 through 10. Volume 2 contains the first part of Chapter 11, and Volume 3 contains the final portion of Chapter 11, Chapter 12, and Appendix A, “References.”

One goal of this introduction is to tell you the kind of information you can find in the manuals, where to find it, and how best to use the manual. The remaining chapters of this manual contain the following information:

- **Chapter 1, "Maintenance Architecture"** describes the system’s design and maintenance strategy.
- **Chapter 2, "Hardware Configurations and Power"** describes the system’s cabinets, carriers, and circuit packs. The chapter also explains how power is supplied to the system.
- **Chapter 3, "Management Terminals"** describes the terminals that can be used in the system. The chapter also discusses how to set up and use these terminals.
- **Chapter 4, "Initialization and Recovery"** describes the various reset and reboot processes, and it discusses how these processes are used to perform maintenance and to recover systems or subsystems that are out of service.

- **Chapter 5, "Routine Maintenance Procedures"** discusses common maintenance tasks, including: removing and installing circuit packs, removing and restoring power, performing system backups, upgrading software, as well as various testing and troubleshooting procedures.
- **Chapter 6, "Accessing Alarms and Errors"** provides general information about the maintenance subsystem and the separate entities—known as MOs—comprising it. Error generation and tracking, the Error and Alarm Logs, and associated reports are also described.
- **Chapter 7, "LED Interpretation"** is a quick reference to interpreting circuit pack LEDs.
- **Chapter 8, "Reliability Systems: A Maintenance Aid"** provides detailed hardware and functional descriptions as well as additional repair strategy (in addition to the procedures provided in Chapter 11) for Standard, High, and Critical Reliability systems.
- **Chapter 9, "Packet Bus Fault Isolation and Correction"** describes Pack Bus maintenance and the interactions of the bus with Packet circuit packs. The chapter also discusses how Packet Bus faults are isolated and corrected.
- **Chapter 10, "Maintenance Commands and Trouble-Clearing Aids"** presents the maintenance commands, and it explains how to use these commands via the management terminal. Maintenance commands are used to control, test, and obtain information associated with maintenance objects (MOs). Specific command syntax plus typical forms and display output are also provided in the chapter.
- **Chapter 11, "Maintenance Object Repair Procedures"** contains specific troubleshooting and repair instructions for every component in the system.The chapter contains repair procedures for both system-alarmed and user-reported troubles. Information on each MO is contained in a section solely devoted to that MO. For each MO, a table lists the alarm level(s), hardware error(s) associated with the MO, and the associated test that caused the error(s). The test sequences and the specific command line entry required to run the tests are provided, as is a brief description of each test. Explanations of error codes associated with each test are given, as are specific maintenance procedures to be used to resolve each problem.
- **Appendix A, "References"** is an abbreviated listing and brief description of Generic 1 and Generic 3 documents.
- **Abbreviations** provides a list of abbreviations and acronyms used in this manual.
- **Index** contains an alphabetical, subject-to-page number cross-reference.

As you will see, many routine maintenance tasks, such as removing and installing circuit packs, can be performed after reading the general repair information on this subject. There will be times, however, when you will want more equipment-specific information (for example, how to clear a major alarm raised against a particular MO). To help you, each MO is described in a separate section of Chapter 11, "Maintenance Object Repair Procedures". The individual sections are labeled with the name of the particular MO exactly as the name appears in the Alarm Log; for example, MAINT (for Maintenance circuit pack). The only exception is the MO name for Common Port Circuit Pack maintenance which is XXX-BD. The XXX-BD section contains a set of common tests used by certain circuit packs listed in the section. The common portion of these circuit packs is the generic hardware that interfaces with the TDM Bus. At times, you may need to reference information in more than one chapter at a time to repair the system. For example, if multiple alarms are present, you can determine which alarm should be repaired first by consulting Table 6-1 in Chapter 6, "Accessing Alarms and Errors", which shows all MOs, errors, and alarms in descending order of urgency. Then, consult the required MO section(s) in the suggested order. References to other chapters and sections are provided in this manual wherever deemed helpful. It is hoped that effective use of this manual will reduce repair and “down” time.

Lucent Technologies listens carefully to its readers. The organization of this manual is a direct result of user feedback. Your feedback is important. Use the feedback form at the back of this manual to send your comments to Lucent Technologies. After you have used this manual, please tell us what you think of it. We want to know!

Assumption

The maintenance procedures in this manual are based on the assumption that the system was initially installed and tested properly and all faults cleared.

Safety Precautions

When performing maintenance or translations procedures on the system switch equipment, certain precautions must be observed by user personnel. Observe all caution, warning, and danger statements contained within this manual to prevent loss of service, possible equipment damage, and the possibility of personal injury.

In addition, the following precautions regarding electromagnetic interference (EMI) and static electricity must be observed:

Electromagnetic Interference (EMI): This equipment generates, uses, and can radiate radio frequency energy. Electromagnetic fields radiating from the switch may cause noise to be introduced into the customer’s equipment. If the equipment is not installed and used in accordance with the instruction manual, radio interference may result.

WARNING:

To maintain the EMI integrity of the system switch, maintenance personnel (after performing any translations or maintenance activities) must ensure that all cabinet panels, covers, etc. are firmly secured before leaving the customer's premises.

Static Electricity: To prevent or reduce electrostatic discharge (ESD), maintenance personnel must always attach wrist grounding straps before working on switch components or handling circuit packs.

CAUTION:

Electrostatic discharge can damage or destroy circuit packs containing integrated circuits (ICs).

The ESD write strap, cable assembly, and spare fuses are packed in a plastic bag and placed in the top of the system cabinet.

The ESD wrist strap is to be used whenever troubleshooting, performing maintenance, or handling any circuit packs associated with the system switch.

CAUTION:

In an Expansion Port Network (EPN) system, do not cut or bend the fiber optic cable(s). Doing so may impede or sever communication between the Expansion Port Network cabinet [G3i] and the Processor Port Network cabinet.

CAUTION:

To avoid damaging the cable-to-connector interface when removing any Inter-Carrier Cable (A,B, or C) in a High or Critical Reliability system, take hold of the cable connector, not the cable itself.

Class 1 Laser Device

The DEFINITY ECS contains a Class 1 Laser device if single-mode fiber optic cable is connected to a remote Expansion Port Network (EPN). The LASER device operates within the following parameters:

Power Output: -5 dBm
Wavelength: 1310 nm
Mode Field Diameter: 8.8 microns

CAUTION:

Use of controls or sadjustments or performance of procedures other than those specified herein may result in hazardous radiation exposure.

Contact your Lucent Technolgies representative for more information.

Security Issues

A number of matters concerning maintenance are affected by security issues. For details, be sure to consult the *GBCS Products Security Handbook*, 555-025-600.

Electromagnetic Compatibility Standards

This product complies with and conforms to the following:

- Limits and Methods of Measurements of Radio Interference Characteristics of Information Technology Equipment, EN55022 (CISPR22), 1993
- EN50082-1, European Generic Immunity Standard
- FCC Parts 15 and 68
- Australia AS3548

NOTE:
The system conforms to Class A (industrial) equipment. Voice terminals meet Class B requirements.

- Electrostatic Discharge (ESD) IEC 1000-4-2
- Radiated radio frequency field IEC 1000-4-3
- Electrical Fast Transient IEC 1000-4-4
- Lightning effects IEC 1000-4-5
- Conducted radio frequency IEC 1000-4-6
- Mains frequency magnetic field IEC 1000-4-8
- Low frequency mains disturbance

The system conforms to the following:

- Electromagnetic compatibility General Immunity Standard, part 1; residential, commercial, light industry, EN50082-1, CENELEC, 1991
- Issue 1 (1984) and Issue 2 (1992), Electrostatic discharge immunity requirements (EN55024, Part 2) IEC 1000-4-2
- Radiated radio frequency field immunity requirements IEC 1000-4-3
- Electrical fast transient/burst immunity requirements IEC 1000-4-4

European Union Standards

Lucent Technologies Business Communications Systems declares that the DEFINITY equipment specified in this document bearing the “CE” mark conforms to the European Union Electromagnetic Compatibility Directives.

The “CE” (Conformité Européenne) mark indicates conformance to the European Union Electromagnetic Compatibility Directive (89/336/EEC) Low Voltage Directive (73/23/EEC) and Telecommunication Terminal Equipment (TTE) Directive (91/263/EEC) and with i-CTR3 Basic Rate Interface (BRI) and i-CTR4 Primary Rate Interface (PRI) as applicable.

The “CE” mark is applied to the following Release 5 products:

- Global AC powered Multi-Carrier Cabinet (MCC)
- DC powered Multi-Carrier Cabinet (MCC) with 25 Hz ring generator
- AC powered Single-Carrier Cabinet (SCC) with 25 Hz ring generator
- AC powered Compact Single-Carrier Cabinet (CSCC) with 25 Hz ring generator
- Enhanced DC Power System

Maintenance Architecture

1

General

The maintenance subsystem is that part of the software that is responsible for initializing and maintaining the system. This software continuously monitors system health, and it maintains a record of errors detected in the system. The maintenance subsystem also provides a user interface for on-demand testing.

This chapter provides a brief description of the G3iV1, G3iV2, G3sV2, and G3vsV2 maintenance strategy, and it presents background information on the system's overall functions. For detailed descriptions of components and subsystems, refer to related topics in Chapter 11, "Maintenance Object Repair Procedures".

Maintenance Objects

The system is partitioned into separate entities called maintenance objects (MOs). Each MO is referred to by an upper-case, mnemonic-like name that serves as an abbreviation for the MO. For example, "CO-TRK" stands for "Central Office Trunk," "DUPINT" stands for "Duplication Interface Circuit Pack," and "PI-LINK" stands for "Processor Interface Link." Each MO is monitored by the system and has its own maintenance strategy. Most MOs, such as the expansion interface circuit pack (EXP-INTF), are individual circuit packs. Some MOs are hardware components that reside on part of a circuit pack. For example, the TDM bus clock (TDM-CLK) and tone generator (TONE-PT) circuits reside on the tone/clock circuit pack (TONE-BD). Other MOs, such as cabinet environmental sensors (CABINET), represent larger subsystems or sets of monitors. Finally, some MOs, such as synchronization (SYNC), represent processes or a combination of processes and hardware.

"Maintenance names" are recorded in the error and alarm logs. Individual copies of a given MO are assigned an address that defines the MO's physical location in the system. These physical locations are displayed as the "PORT" field in the alarm and error logs and as output of various commands such as **test board**, **busy tdm-bus**, etc. Repair instructions and a description of each MO appear alphabetically in Chapter 11, "Maintenance Object Repair Procedures". See the Table of Contents for a list of all MOs.

Alarm and Error Reporting

During normal operations, software or firmware may detect error conditions relevant to specific MOs. The system attempts to fix or circumvent these problems automatically. However, if a hardware component incurs too many errors, an alarm is raised. Typically, an alarm is generated according to the following sequence of events:

1. An error occurs in an MO.
2. The component notifies the maintenance software of the error. An error is detected in one of two ways:
   - For "in-line" errors, firmware on the component detects the occurrence of an error during ongoing operations.
   - For other types of errors, a "periodic test" or a "scheduled test" executed by software detects the error. These tests run at regular intervals, and they are administered by the **change system-parameters** command. The overall status of periodic and scheduled maintenance is displayed by the **status periodic-scheduled** command. The technician can also run these tests on demand by using the maintenance commands described in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", and Chapter 11, "Maintenance Object Repair Procedures".
   - Software logs the error in the error log, and it increments the error counter for that error. Whenever an error counter is "active," (that is, greater than zero), a maintenance record is maintained for the MO. A routine based on the strategy for maintaining that component is queued and run when resources are available.
     - For some error types, the routine executes additional tests called "analysis tests" on the component. Error counters associated with the tests are incremented or decremented based on the success or failure of these tests. If all tests pass, the maintenance record is retired.
     - In-line error counters are generally not associated with any specific test. These counters are automatically decremented over time at a rate specific to the error type. If the error occurs at a rate lower than the leak rate, the count for that error gradually decreases. If the error does not recur for a

while, the counter drops to zero, and the relevant maintenance record is retired. This process is known as the "leaky bucket" mechanism.

- When a counter exceeds its specific threshold value, an alarm is raised. Most alarms are raised by specific test failures. Each alarm is logged in the alarm log, and it remains active until the problem is resolved. Further testing with no failures, no further errors over a period of time, or repair actions can resolve an alarm.

  The system keeps a record of every alarm detected in the system. This record, along with the alarm log and the error log, can be displayed locally on the manager terminal remotely by Initialization and Administration System (INADS) personnel.

  An alarm is classified as MAJOR, MINOR, or WARNING, depending on its effect on system operation. Alarms are also classified as ON-BOARD or OFF-BOARD.

  — MAJOR alarms identify failures that cause a critical degradation of service. These alarms require immediate attention.

  — MINOR alarms identify failures that cause some service degradation but that do not render a crucial portion of the system inoperable. MINOR alarms require attention. However, typically a MINOR alarm affects only a few trunks or stations or a single feature.

  — WARNING alarms identify failures that cause no significant degradation of service or equipment failures external to the switch. These failures are not reported to INADS or to the attendant console.

  — ON-BOARD problems originate in the circuitry on the alarmed circuit pack.

  — OFF-BOARD problems originate in a process or component that is external to the circuit pack.

  Alarms are discussed further in Chapter 6, "Accessing Alarms and Errors", and in Chapter 11, "Maintenance Object Repair Procedures".

Maintenance Testing

The DEFINITY Communications System was designed to be easy to maintain and to have minimal down time. Most troubles are reduced to the circuit pack level and can be identified by LEDs on the circuit packs and software reports generated by the system.

The maintenance tests in the system can be divided into three groups:

- Periodic

  Background tests are performed by software maintenance, usually on an hourly basis. These tests are nondestructive and can be run during high traffic periods without interfering with calls.

- Scheduled

  Background tests performed by software maintenance, usually on a daily basis, generally more thorough than periodic testing. The tests are considered destructive and are run usually only during off-hours so as not to interfere with calls.

- Fixed interval

  Background tests performed by software maintenance at regular time intervals (these intervals cannot be administered). These tests run concurrently with periodic maintenance. The following table lists the MOs that run fixed interval testing.

Maintenance Object	Interval(min.)
POWER	60
SPE-SELEC	60
STBY-SPE	120
TDM-BUS	10
TONE-PT	10

Demand tests are also run by the system when it detects a need for them or by maintenance personnel when required in trouble-clearing activities. Demand tests include periodic tests plus other tests that are required only when trouble occurs. Some nonperiodic demand tests may disrupt system operation. In this manual, destructive (that is, service-disrupting) tests are identified in boldface type.

Maintenance personnel can use the DEFINITY Manager I terminal [G1], the Manager G3MT terminal [G3iV1.1-286, G3V2], or the Digital Equipment Corportation (DEC) VT220 terminal [G3iV2-386]. to initiate the same tests that the system initiates. Test results are displayed on the terminal screen.

The primary goals of maintenance are to detect, report, and clear troubles as quickly as possible with a minimum of service disruptions. Errors are often detected and corrected before any apparent failure occurs. This goal is supported by maintenance tests, automatic software diagnostic programs, and fault detection hardware.

Hardware Configurations and Power

2

General

This chapter discusses the hardware configurations contained within and supported by the DEFINITY Generic 1 and Generic 3 switches. Where appropriate, detailed information down to the circuit pack level is provided. The chapter also discusses the power sources required to enable the various components within the appropriate switch.

Generic 3 Circuit Packs

The following tables list all circuit packs supported by DEFINITY Generic 3 Systems. For information concerning vintages and current versions, see *Reference Guide for Circuit Pack Vintages and Change Notices* which is published periodically as a special edition of the *AT&T Technical Monthly*. For more information concerning which circuit packs are required for different environments and locales, see the Application Notes section of *DEFINITY Communications System Generic 3 V2 Implementation,* 555-230-653 and *DEFINITY Communications System Generic 3 Version 5 Implementation,* 555-230-656.

Table 2-1 lists Generic 3 circuit packs by Apparatus Code, Name, and Type. See the *Reference Guide for Circuit Pack Vintages and Change Notices* for circuit packs that pertain to your system.

Cabinet Configurations

G1 and G3 DEFINITY supports a configuration consisting of a Processor Port Network (PPN) and up to two optional Expansion Port Networks (EPNs). (One EPN is supported in G1, and two EPNs are supported in G3i.) In G3s and G3vs, DEFINITY supports a configuration consisting of a single Processor Port Network (PPN).

NOTE:
G3s and G3vs do not support EPNs nor multicarrier cabinets.

In a G3i system, the PPN provides the control complex for the system along with a maximum of four port carriers in a multicarrier cabinet system and up to three port carriers in a single carrier cabinet system. If a G3i has High or Critical Reliability (see Chapter 8, "Reliability Systems: A Maintenance Aid"), the PPN cabinet has a second control carrier, and the maximum number of port carriers is reduced to three in a multicarrier cabinet system and to two port carriers in a single-carrier cabinet system. Each EPN enables the system to add up to four more port carriers in a multicarrier cabinet system and up to three in a single-carrier cabinet system. These cabinets house the main hardware of the system.

NOTE:
G3s and G3vs do not have High or Critical levels of Reliability.

The number of trunks and lines in a system determines the number of port carriers required. A fully-equipped PPN cabinet contains:

- Control Carrier—Houses power units, system logic, control circuit packs, and port circuit packs.
- Duplication Control Carrier [G3i or G3si+M only]—Optional, provides a second control complex, power units, control circuit packs, and port circuit packs.
- Port Carriers—House power units and up to 20 port circuit packs.
- Power Distribution Unit—
  - In a multicarrier cabinet system with AC power, provides backup power for system software and translations; contains a battery charger, and three batteries.
  - In a multicarrier cabinet system with DC power, provides a ringing voltage generator, an EMI filter, and a DC power relay.

— In a single-carrier cabinet system with AC power, provides a ringing voltage generator, an EMI filter, and a DC power relay.

— In a single-carrier cabinet system with DC power, provides a ringing voltage generator, an EMI filter, and a DC power relay.

- Wiring Harness and TDMLAN Cables.
- Fan Assembly—Circulates air through the cabinet.

Each fully equipped EPN contains [G3i or G3si only]:

- Expansion Control Carrier—Houses power units, the Expansion Interface circuit packs, up to 18 Port circuit packs, a Tone-Clock circuit pack, and a Maintenance circuit pack.
- Port Carriers—House power units and up to 20 Port circuit packs plus a service circuit pack.
- Power Distribution Unit—Provides a battery charger, three batteries, a ringing voltage generator, an EMI filter, and a DC power relay.
- Wiring Harness and Inter-Carrier TDM Cables.
- Fan Assembly—Circulates air through the cabinet.

In addition to the control carrier, each EPN can have up to four MCC port carriers (three in a single-carrier configuration). The number of trunks and lines in a system determines the number of port carriers needed. In a High or Critical Reliability system, an Expansion Interface circuit pack and a Tone-Clock circuit pack are housed in the port carrier located in EPN position B.

Figure 2-1 through Figure 2-23 show the various cabinet configurations available with the system. For more details, refer to *DEFINITY Communications System Generic 3 System Description*, 555-230-206.

Figure 2-1. Multicarrier Cabinet PPN Control Carrier A (J58890AH)

PPN System with a TN773 Processor[G3iV1.1 or G1]

Notes:

1. The TN772 Duplication Interface circuit pack is only for systems with High or Critical Reliability. In a Standard system, this slot is empty.
2. In G3iV1.1, this slot contains the TN770 Memory circuit pack. In G1, this slot is reserved for future use.
3. The TN765 Processor Interface circuit pack is an optional control circuit pack.
4. The Network Control Circuit Pack may be either a TN777 or a TN777B.
5. n G3iV1.1, the TN778 Packet Control circuit pack is an optional circuit pack. In G1, this slot is reserved for future use.
6. In G1, the Tone-Clock circuit pack must be a TN768. In G3iV1.1, the Tone-Clock circuit pack may be either a TN768 or TN780, depending on the external clock used. If the Stratum 3 clock is used, the Tone-Clock circuit pack must be a TN780. Refer to STRAT-3 (Stratum 3 Clock) Maintenance documentation for the difference between the TN768 and the TN780. To support a Stratum 3 Clock, a special installation for the TN780 Tone-Clock circuit pack is required. Refer to *DEFINITY Communications System Generic 3 V1.1 and V2 Upgrades and Additions*, 555-230-107 for details.

7. In G1, a TN776 Expansion Interface circuit pack must be inserted into port slot 1 if the system has an EPN. In a G3iV1.1 system in which packet-switching is supported, a TN570 Expansion Interface circuit pack must be inserted into port slot 1 if the system has one EPN. If the system has two EPNs, then a second TN570 Expansion Interface circuit pack must be inserted into port slot 2. If the system does not support packet-switching, then a TN776 Expansion Interface circuit pack may be substituted for the TN570. If the system does not require either a TN776 or a TN570 [G3iV1.1] Expansion Interface circuit pack, these slots support any Common Port circuit pack.
8. Port slots 1 through 9 support any Common Port circuit pack.
9. If this carrier contains a TN769 Analog Neon circuit pack, then a TN755B Power Unit circuit pack must be placed in port slots 8 and 9. Refer to "CARR-POW (Carrier Port Power Unit) for AC-Powered Systems" Maintenance documentation for more details.
10. If a multicarrier cabinet is powered from an AC source, then the power unit must be a 631DA or 631DB. If a multicarrier cabinet is powered from a DC source, then the power unit must be a 644A or 645B. (See Figure 2-1 for the correct power unit positions.)

PPN System with a TN786 Processor [G3iV2+]

Notes:

1. The TN772 Duplication Interface circuit pack is only for systems with High or Critical Reliability. In a Standard system, this slot is empty.

2. n G3iV2+, (expanded memory system) a memory child circuit pack (CPP1) is physically attached to the TN786B circuit pack, and it is considered part of this circuit pack.
3. This slot is empty.
4. The TN765 Processor Interface circuit pack is an optional control circuit pack in G1.
5. The Network Control circuit pack must be a TN777B. It cannot be a TN777.
6. The TN778 Packet Control circuit pack is an optional circuit pack.
7. The Tone-Clock circuit pack may be either a TN768 or TN780, depending on external clock used. If the Stratum 3 clock is used, the Tone-Clock circuit pack must be a TN780. Refer to "STRAT-3 (Stratum 3 Clock)]" Maintenance documentation for the difference between the TN768 and the TN780. To support a Stratum 3 Clock, a special installation for the TN780 Tone-Clock circuit pack is required. Refer to *DEFINITY Communications System Generic 3 V1.1 and V2 Upgrades and Additions*, 555-230-107 for details.
8. A TN776 Expansion Interface circuit pack must be inserted into port slot 1 if the system has an EPN. In a system in which packet-switching is supported, a TN570 Expansion Interface circuit pack must be inserted into port slot 1 if the system has one EPN. If the system has two EPNs, a second TN570 Expansion Interface circuit pack must be inserted into port slot 2. If the system does not support packet-switching, a TN776 Expansion Interface circuit pack may be substituted for the TN570. If the system does not require either a TN776 or a TN570 Expansion Interface circuit pack, these slots support any Common Port circuit pack.
9. Port slots 1 through 9 support any Common Port circuit pack.
10. If this carrier contains a TN769 Analog Neon circuit pack, then a TN755B Power Unit circuit pack must be placed in port slots 8 and 9. Refer to "CARR-POW (Carrier Port Power Unit) for AC-Powered Systems" Maintenance documentation for more details.
11. If a multicarrier cabinet is powered from an AC source, then the power unit must be a 631DA or 631DB. If a multicarrier cabinet is powered from a DC source, then the power unit must be a 644A or 645B. (See Figure 2-2 for the correct power unit positions.)

High and Critical Reliability PPN Systems Only with a TN773 Processor

Notes:

1. In a 286 system, this slot contains the TN770 Memory circuit pack. In G1, this slot is reserved for future use.
2. The TN765 Processor Interface circuit pack is an optional control circuit pack in Generic 1.
3. The Network Control Circuit Pack may be either a TN777 or a TN777B.
4. In G3iV1.1, the TN778 Packet Control circuit pack is an optional circuit pack. In G1, this slot is reserved for future use.
5. In G1, the Tone-Clock circuit pack must be a TN768. In G3iV1.1, the Tone-Clock circuit pack may be either a TN768 or TN780, depending on the external clock used. If the Stratum 3 clock is used, the Tone-Clock circuit pack must be a TN780. "STRAT-3 (Stratum 3 Clock)]" Maintenance documentation for the difference between the TN768 and the TN780. To support a Stratum 3 Clock, a special installation for the TN780 Tone-Clock circuit pack is required. Refer to *DEFINITY Communications System Generic 3 V1.1 and V2 Upgrades and Additions*, 555-230-107 for details.
6. In G1, a TN776 Expansion Interface circuit pack must be inserted into port slot 1 if the system has an EPN. In a G3iV1.1 system in which packet-switching is supported, a TN570 Expansion Interface circuit pack must be inserted into port slot 1 if the system has one EPN. If the system has two EPNs, then a second TN570 Expansion Interface circuit pack must be inserted into port slot 2. If the system does not support

packet-switching, then a TN776 Expansion Interface circuit pack may be substituted for the TN570. If the system does not require either a TN776 or a TN570 [G3iV1.1] Expansion Interface circuit pack, then these slots support any Common Port circuit pack.

7. Port slots 1 through 9 support any Common Port circuit pack.
8. If this carrier contains a TN769 Analog Neon circuit pack, then a TN755B Power Unit circuit pack must be placed in port slots 8 and 9. Refer to"CARR-POW (Carrier Port Power Unit) for AC-Powered Systems" Maintenance documentation for more details.
9. If a multicarrier cabinet is powered from an AC source, then the power unit must be a 631DA or 631DB. If a multicarrier cabinet is powered from a DC source, then the power unit must be a 644A or 645B. (See Figure 2-3 for the correct power unit positions.)

Figure 2-4. Multicarrier Cabinet PPN Control Carrier B (J58890AJ)

High and Critical Reliability PPN Systems Only with a TN786 Processor

Control Carrier (J58890AH) With A TN790

The J58890AH is used in G3siV4+m and G3siV5+m systems.

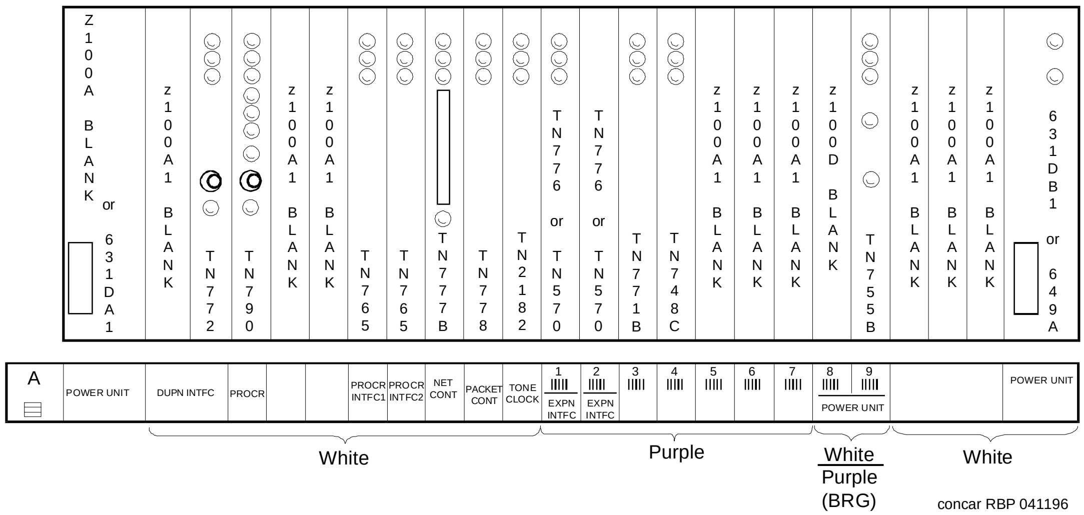

Figure 2-5. Control Carrier (J58890AH) — Front

This carrier has dedicated white-colored circuit pack slots that always contain specific control circuit packs. Purple-colored slots can contain any port circuit packs. Dual-colored slots may contain any port circuit pack or the designated white-colored circuit packs (such as an Expansion Interface or power unit). AC or DC power units supply power to the carrier.

NOTE:
The TN786B Processor circuit pack is used in G3siV4 and G3siV4+m systems. The optional CPP1 Memory circuit pack installed next to the TN786B Processor circuit pack is not used in G3 Release 5 and later systems. G3 Release 5 and later systems use the TN790 Processor circuit pack.

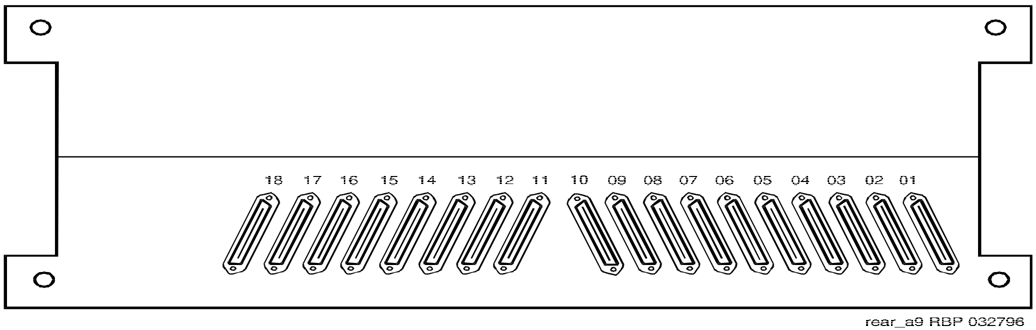

Figure 2-6. Control Carrier (J58890AH) — Rear

Table 2-2. Control Carrier (J58890AH) Connectors

Connector	Function
01 to 09 (B01 to B09)	50-pin connectors provide interfaces between port circuit packs and the Main Distribution Frame or fiber transceiver
AUX (Auxiliary)	Provides interface for customer alarms, attendant console power, or emergency power transfer panels. Provides interface for internal modem for remote maintenance
PI (Processor Interface)	Connects directly to the Processor Interface circuit pack. Provides a BX.25 protocol interface for communication between the circuit pack and external DCE equipment. This connection can only be used with standard reliability option
DCE (Data Communications Equipment)	Connects the processor to the Call Detail Recording (CDR) equipment or to an external modem for remote maintenance. This connector can be used with any reliability option
TERM (Terminal)	Connects a terminal to the processor in standard reliability systems. In critical reliability systems, connects a terminal to the processor in the Control Carrier
DOT (Duplication Option Terminal)	Used in high and critical reliability systems to connect an administration terminal to the active processor via the duplication interface slot position

Duplicated Control Carrier (J58890AJ) With A TN790

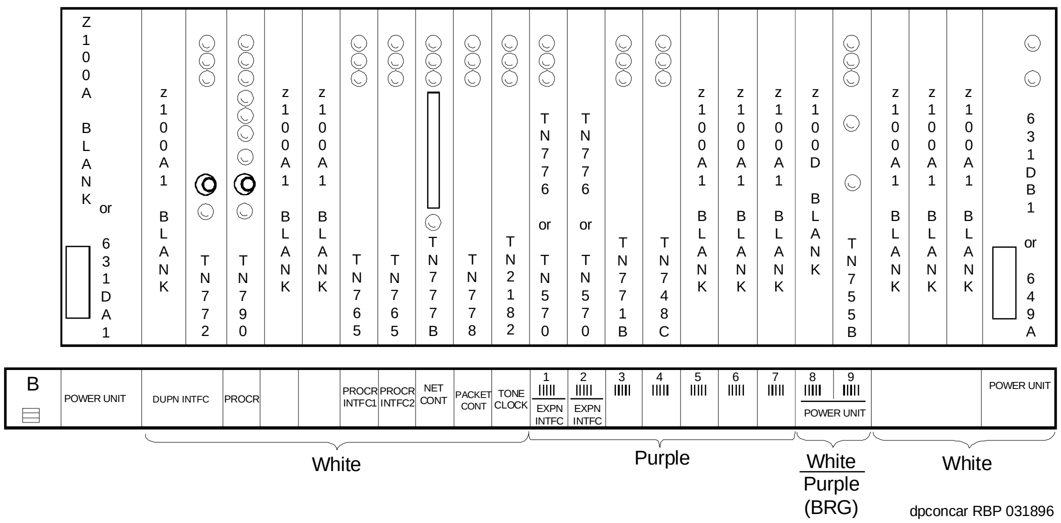

Figure 2-7. Duplicated Control Carrier (J58890AJ) — Front

The J58890AJ Duplicated Control Carrier is used in the G3siV4+m and G3siV5+m systems.

This carrier has dedicated white-colored circuit pack slots that always contain specific control circuit packs. The purple-colored circuit pack slots can be equipped with any port circuit packs. Dual-colored slots may contain any port circuit pack or the designated white-colored circuit packs (such as an Expansion Interface or power unit). AC or DC power units supply power to the carrier.

NOTE:
The TN786B Processor circuit pack is used in G3siV4 and G3siV4+m systems. The optional CPP1 Memory circuit pack installed next to the TN786B Processor circuit pack is not used in G3 Release 5 and later systems. G3 Release 5 and later systems use the TN790 Processor circuit pack.

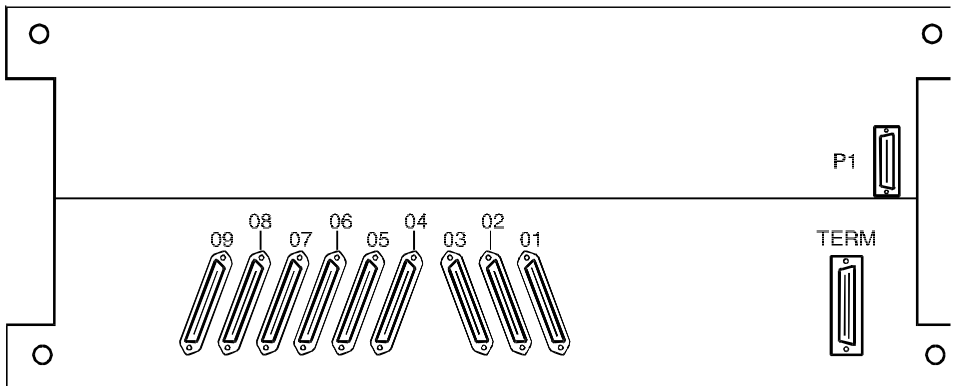

Figure 2-8. Duplicated Control Carrier (J58890AJ) — Rear View

Table 2-3. Duplicated Control Carrier (J58890AJ) Connectors

Connector	Function
01 to 09 (B01 to B09)	50-pin connectors provide interfaces between port circuit packs and the Main Distribution Frame (MDF) or fiber transceiver
TERM (Terminal)	Connects an administration terminal to the processor in the duplicated Control Carrier
AUX (Auxiliary)	Provides interface for customer alarms, attendant console power, emergency power transfer panels, and internal modem interface for remote maintenance

Notes

1. A memory child circuit pack (CPP1) is physically attached to the TN786B circuit pack, and it is considered part of this circuit pack.
2. This slot is empty.
3. The TN765 Processor Interface circuit pack is an optional control circuit pack in Generic 1.
4. The Network Control circuit pack must be a TN777B. It cannot be a TN777.
5. The TN778 Packet Control circuit pack is an optional circuit pack.
6. The Tone-Clock circuit pack may be either a TN768 or TN780, depending on external clock used. If the Stratum 3 clock is used, the Tone-Clock circuit pack must be a TN780. Refer to STRAT-3 (Stratum 3 Clock)

Maintenance documentation for the difference between the TN768 and the TN780. To support a Stratum 3 Clock, a special installation for the TN780 Tone-Clock circuit pack is required. Refer to *DEFINITY Communications System Generic 3 V1.1 and V2 Upgrades and Additions*, 555-230-107 for details.

7. A TN776 Expansion Interface circuit pack must be inserted into port slot 1 if the system has an EPN.
   In a system in which packet-switching is supported, a TN570 Expansion Interface circuit pack must be inserted into port slot 1 if the system has one EPN. If the system has two EPNs, then a second TN570 Expansion Interface circuit pack must be inserted into port slot 2. If the system does not support packet-switching, then a TN776 Expansion Interface circuit pack may be substituted for the TN570. If the system does not require either a TN776 or a TN570 Expansion Interface circuit pack, then these slots support any Common Port circuit pack.
8. Port slots 1 through 9 support any Common Port circuit pack.
9. If this carrier contains a TN769 Analog Neon circuit pack, then a TN755B Power Unit circuit pack must be placed in port slots 8 and 9. Refer to "CARR-POW (Carrier Port Power Unit) for AC-Powered Systems" Maintenance documentation for more details.
10. If a multicarrier cabinet is powered from an AC source, then the power unit must be a 631DA or 631DB. If a multicarrier cabinet is powered from a DC source, then the power unit must be a 644A or 645B. (See Figure 2-4 for the correct power unit positions.)

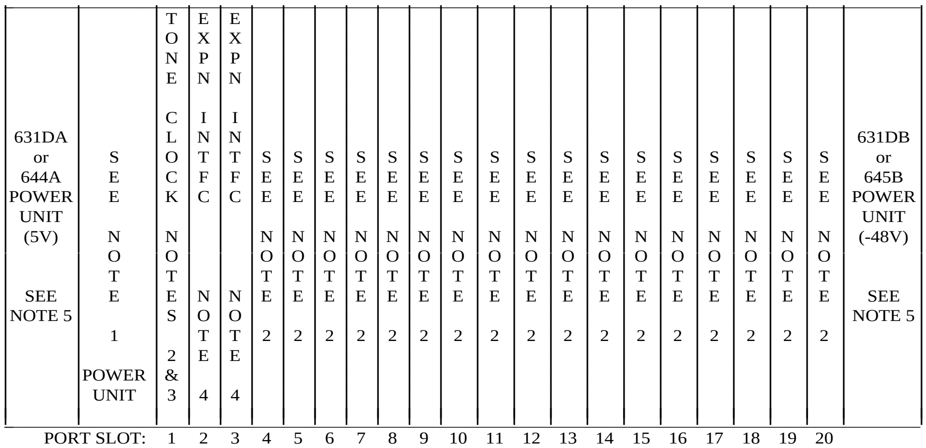

Figure 2-9. Multicarrier Cabinet Port Carrier (J58890BB)

PPN port carriers B [Standard Systems Only], C, D, and E EPN port carriers B, C, D, and E

Notes

1. If this carrier contains a TN769 Analog Neon circuit pack, then a TN755B Power Unit circuit pack must be placed in the slots labeled "Power Unit." If this slot is not needed for the power unit, it may contain any service circuit packs. Service circuit packs are packs that, when inserted into the system, require no administration of ports. Service circuit packs include the following: Call Classifier (TN744), Announcement (TN750), Maintenance/Test (TN771C), Speech Synthesizer (TN725B), and Tone Detector (TN748C).
2. Port slots 1 through 20 support any Common Port circuit pack.
3. If the Port Carrier is the B carrier in an EPN of a system with Critical Reliability, port slot 1 must contain a Tone-Clock circuit pack. Otherwise, port slot 1 supports any Common Port circuit pack. The Tone-Clock circuit pack must be a TN768 or TN2182. The TN780 circuit pack is not used in EPNs/.
4. In G1, a TN776 Expansion Interface circuit pack must be inserted into port slot 2 if the system has an EPN. In a system in which packet-switching is supported, a TN570 Expansion Interface circuit pack must be inserted into port slot 2 if the system has one EPN. If the system has two EPNs, then a second TN570 Expansion Interface circuit pack must be inserted into port slot 3. If the system does not support packet-switching, then a TN776 Expansion Interface circuit pack may be substituted for the TN570. If the system does not require either a TN776 or a TN570 Expansion Interface circuit pack, then these slots support any Common Port circuit pack.

5. If a multicarrier cabinet is powered from an AC source, then the power unit must be a 631DA or 631DB. If a multicarrier cabinet is powered from a DC source, then the power unit must be a 644A or 645B (See Figure 2-9 for the correct power unit positions.) or a 649A replaces the 645B in the 645B slot, and the 644A slot is left blank.

631DA or 644A POWER UNIT (5V) SEE NOTE 5	MAINTENANCE TN775	TONE CLOCK NOTE 1	EXPN INTFC NOTE 2	EXPN INTFC NOTE 2	SEE NOTE 3	SEE NOTE 3	SEE NOTE 3	SEE NOTE 3	SEE NOTE 3	SEE NOTE 3	SEE NOTE 3	SEE NOTE 3	SEE NOTE 3	SEE NOTE 3	SEE NOTE 3	SEE NOTE 3	SEE NOTE 3	SEE NOTE 3	SEE NOTE 3	SEE NOTE 4	SEE NOTE 4	631DB or 645B POWER UNIT (-48V) SEE NOTE 5

Figure 2-10. Multicarrier Cabinet EPN Control Carrier A (J58890AF)

High and Critical Reliability Systems and Standard EPN Systems

Notes:

1. The Tone-Clock circuit pack may be either a TN768 or TN2182.
2. A TN776 Expansion Interface circuit pack must be inserted into port slot 1 if the system has an EPN. In a system in which packet-switching is supported, a TN570 Expansion Interface circuit pack must be inserted into port slot 1 if the system has one EPN. If the system has two EPNs, then a second TN570 Expansion Interface circuit pack must be inserted into port slot 2. If the system does not support packet-switching, then a TN776 Expansion Interface circuit pack may be substituted for the TN570. If the system does not require either a TN776 or a TN570 Expansion Interface circuit pack, these slots support any Common Port circuit pack.
3. Port slots 1 through 19 support any Common Port circuit pack.
4. If this carrier contains a TN769 Analog Neon circuit pack, then a TN755B Power Unit circuit pack must be placed in the port slots 18 and 19. Refer to "CARR-POW (Carrier Port Power Unit) for AC-Powered Systems" Maintenance for more details.

5. If a multicarrier cabinet is powered from an AC source, then the power unit must be a 631DA or 631DB. If a multicarrier cabinet is powered from a DC source, then the power unit must be a 644A or 645B. (See Figure 2-10 for the correct power unit positions.)

6. Only one 649A converter is required per carrier except for Switch Node (SN) carriers. SN carriers require two converters; one on each end. The use of the 649A allows an increase in the number of terminals supported per carrier.

   The 649A is not compatible with the 644A or the 645B Power Converters and is used in G3V4R3 and later systems.

   The 649A Power Converter converts a -48 VDC input into outputs of -48 VDC at 10 Amps, +5 VDC, and -5 VDC at 6 Amps. The outputs are distributed to circuit pack slots in the carriers.

Figure 2-11. Single-Carrier Cabinet PPN Control Carrier A (J58890L-1,L1)

PPN System with a TN773 G3iV1.1 or G1 Processor

Notes

1. The TN772 Duplication Interface circuit pack is only for a High or Critical Reliability system. In a Standard system, this slot is empty.
2. In G3iV1.1, this slot contains the TN770 Memory circuit pack. In G1, this slot is reserved for future use.

3. The TN765 Processor Interface circuit pack is an optional control circuit pack in Generic 1.
4. The Network Control Circuit Pack may be either a TN777 or a TN777B.
5. In G3iV1.1, the TN778 Packet Control circuit pack is optional. In G1, this slot is reserved for future use.
6. On G1, the Tone-Clock circuit pack must be a TN768. In G3iV1.1-286, the Tone-Clock circuit pack may be either a TN76 , TN780, or TN2182 depending on the external clock used. If the Stratum 3 clock is used, the Tone-Clock circuit pack must be a TN780. Refer to STRAT-3 (Stratum 3 Clock) maintenance documentation for the difference between the TN768 and the TN780. To support a Stratum 3 Clock, a special installation for the TN780 Tone-Clock circuit pack is required. Refer to *DEFINITY Communications System Generic 3 V1.1 and V2 Upgrades and Additions*, 555-230-107 for details.
7. In G1, a TN776 Expansion Interface circuit pack must be inserted into port slot 1 if the system has an EPN. In a G3iV1.1 system in which packet-switching is supported, a TN570 Expansion Interface circuit pack must be inserted into port slot 1 if the system has one EPN. If the system has two EPNs, a second TN570 Expansion Interface circuit pack must be inserted into port slot 2. If the system does not support packet-switching, then a TN776 Expansion Interface circuit pack may be substituted for the TN570. If the system does not require either a TN776 or a TN570 Expansion Interface circuit pack, these slots support any Common Port circuit pack.
8. Port slots 1 through 10 support any Common Port circuit pack. If this carrier contains a TN769 Analog Neon circuit pack, a TN755B Power Unit circuit pack must be inserted in this carrier. The Power Unit circuit pack takes up two adjacent port slots. Refer to "CARR-POW (Carrier Port Power Unit) for AC-Powered Systems" Maintenance for more details.
9. If this carrier contains a TN769 Analog Neon circuit pack, a TN755B Power Unit circuit pack must be placed in port slots 8 and 9. Refer to "CARR-POW (Carrier Port Power Unit) for AC-Powered Systems" Maintenance documentation for more details.
10. If the single-carrier cabinet is powered from an AC Power source, then the power unit must be a WP-91153. However, if the single-carrier cabinet is powered from a DC Power source, the power unit must be a 676-B.

PPN System with a TN786 Processor [G3iV2+]

Notes:

1. The TN772 Duplication Interface circuit pack is only for High and Critical Reliability systems. In a Standard system, this slot is empty.
2. In G3iV2, a memory child circuit pack (CPP1) is physically attached to the TN786 circuit pack, and it is considered part of this circuit pack. In G3s, this slot is empty.
3. This slot is always blank.
4. The TN765 Processor Interface circuit pack is an optional control circuit pack.
5. The Network Control circuit pack must be a TN777B. It cannot be a TN777.
6. The TN778 Packet Control circuit pack is an optional circuit pack.
7. The Tone-Clock circuit pack may be either a TN768, TN780, or TN2182 depending on external clock used. If the Stratum 3 clock is used, the Tone-Clock circuit pack must be a TN780. Refer to STRAT-3 (Stratum 3 Clock) maintenance documentation for the difference between the TN768 and the TN780. To support a Stratum 3 Clock, a special installation for the TN780 Tone-Clock circuit pack is required. Refer to *DEFINITY Communications System Generic 3 V1.1 and V2 Upgrades and Additions*, 555-230-107 for details.

8. A TN776 Expansion Interface circuit pack must be inserted into port slot 1 if the system has an EPN. In a system in which packet-switching is supported, a TN570 Expansion Interface circuit pack must be inserted into port slot 1 if the system has one EPN. If the system has two EPNs, then a second TN570 Expansion Interface circuit pack must be inserted into port slot 2. If the system does not support packet-switching, then a TN776 Expansion Interface circuit pack may be substituted for the TN570. If the system does not require either a TN776 or a TN570 Expansion Interface circuit pack, then these slots support any Common Port circuit pack.
9. ort slots 1 through 10 support any Common Port circuit pack. If this carrier contains a TN769 Analog Neon circuit pack, then a TN755B Power Unit circuit pack must be inserted in this carrier. The Power Unit circuit pack takes up two adjacent port slots. Refer to "CARR-POW (Carrier Port Power Unit) for AC-Powered Systems" Maintenance for more details.
10. If the single-carrier cabinet is powered from an AC Power source, then the power unit must be a WP-91153. However, if the single-carrier cabinet is powered from a DC Power source, then the power unit must be a 676-B.

Figure 2-13. Single-Carrier Cabinet PPN Control Carrier B (J58890M-1,L1)

High and Critical Reliability PPN System Only with a TN773Processor [G1 or G3iV1.1]

Notes:

1. In G3iV1.1, this slot contains the TN770 Memory circuit pack. In G1, this slot is reserved for future use.
2. The TN765 Processor Interface circuit pack is an optional control circuit pack.
3. The Network Control Circuit pack can be a TN777B or a TN777.
4. In G3iV1.1, the TN778 Packet Control circuit pack is an optional circuit pack. In G1, this slot is reserved for future use.
5. In G1, the Tone-Clock circuit pack must be a TN768. In G3iV1.1, the Tone-Clock circuit pack may be either a TN768 or TN780, depending on external clock used. If the Stratum 3 clock is used, the Tone-Clock circuit pack must be a TN780. Refer to STRAT-3 (Stratum 3 Clock) Maintenance documentation for the difference between the TN768 and the TN780. To support a Stratum 3 Clock, a special installation for the TN780 Tone-Clock circuit pack is required. Refer to *DEFINITY Communications System Generic 3 V1.1 and V2 Upgrades and Additions*, 555-230-107 for details.
6. In G1, a TN776 Expansion Interface circuit pack must be inserted into port slot 1 if the system has an EPN. In a G3iV1.1 system in which packet-switching is supported, a TN570 Expansion Interface circuit pack

must be inserted into port slot 1 if the system has one EPN. If the system has two EPNs, a second TN570 Expansion Interface circuit pack must be inserted into port slot 2. If the system does not support packet-switching, then a TN776 Expansion Interface circuit pack may be substituted for the TN570. If the system does not require either a TN776 or a TN570 [G3iV1.1] Expansion Interface circuit pack, then these slots support any Common Port circuit pack.

7. Port slots 1 through 9 support any Common Port circuit pack.

8. If this carrier contains a TN769 Analog Neon circuit pack, then a TN755B Power Unit circuit pack must be placed in port slots 8 and 9. Refer to "CARR-POW (Carrier Port Power Unit) for AC-Powered Systems" Maintenance documentation for more details.

9. If the single-carrier cabinet is powered from an AC Power source, then the power unit must be a WP-91153. However, if the single-carrier cabinet is powered from a DC Power source, then the power unit must be a 676B.

High or Critical Reliability PPN System Only with a TN786 Processor

Notes:

1. In G3iV2+, a memory child circuit pack (CPP1) is physically attached to the TN786 circuit pack, and it is considered part of this circuit pack. In G3s, this slot is empty.

2. This slot is empty.

3. The TN765 Processor Interface circuit pack is an optional control circuit pack.
4. The TN778 Packet Control circuit pack is an optional circuit pack.
5. The Network Control circuit pack must be a TN777B. It cannot be a TN777.
6. The Tone-Clock circuit pack may be either a TN768, TN780 or TN2182 depending on external clock used. If the Stratum 3 clock is used, the Tone-Clock circuit pack must be a TN780. Refer to STRAT-3 (Stratum 3 Clock) Maintenance documentation for the difference between the TN768 and the TN780. To support a Stratum 3 Clock, a special installation for the TN780 Tone-Clock circuit pack is required. Refer to *DEFINITY Communications System Generic 3 V1.1 and V2 Upgrades and Additions*, 555-230-107 for details.
7. A TN776 Expansion Interface circuit pack must be inserted into port slot 1 if the system has an EPN. In a system in which packet-switching is supported, a TN570 Expansion Interface circuit pack must be inserted into port slot 1 if the system has one EPN. If the system has two EPNs, then a second TN570 Expansion Interface circuit pack must be inserted into port slot 2. If the system does not support packet-switching, then a TN776 Expansion Interface circuit pack may be substituted for the TN570. If the system does not require either a TN776 or a TN570 Expansion Interface circuit pack, then these slots support any Common Port circuit pack.
8. Port slots 1 through 9 support any Common Port circuit pack.
9. If this carrier contains a TN769 Analog Neon circuit pack, then a TN755B Power Unit circuit pack must be placed in port slots 8 and 9. Refer to "CARR-POW (Carrier Port Power Unit) for AC-Powered Systems" Maintenance documentation for more details.
10. If the single-carrier cabinet is powered from an AC Power source, then the power unit must be a WP-91153. However, if the single-carrier cabinet is powered from a DC Power source, then the power unit must be a 676B.

Figure 2-15. Single-Carrier Cabinet Port Carrier (J58890BD)

PPN Port Carriers B [Standard Reliability System only], C, and D EPN Port Carriers B, C, and D

Notes:

1. If the Port Carrier is the B carrier in an EPN of a High or Critical Reliability system, port slot 1 must contain a Tone-Clock circuit pack. Otherwise, port slot 1 supports any Common Port circuit pack.
2. A TN776 Expansion Interface circuit pack must be inserted into port slot 1 if the system has an EPN. In a system in which packet-switching is supported, a TN570 Expansion Interface circuit pack must be inserted into port slot 1 if the system has one EPN. If the system has two EPNs, then a second TN570 Expansion Interface circuit pack must be inserted into port slot 2. If the system does not support packet-switching, then a TN776 Expansion Interface circuit pack may be substituted for the TN570. If the system does not require either a TN776 or a TN570 Expansion Interface circuit pack, then these slots support any Common Port circuit pack.
3. Port slots 1 through 18 support any Common Port circuit pack. If this carrier contains a TN769 Analog Neon circuit pack, then a TN755B Power Unit circuit pack must be in this carrier. The Power Unit circuit pack takes up two adjacent ports slots. Refer to "CARR-POW (Carrier Port Power Unit) for AC-Powered Systems" Maintenance for more details.
4. If the single-carrier cabinet is powered from an AC Power source, then the power unit must be a WP-91153. However, if the single-carrier cabinet is powered from a DC Power source, the power unit must be a 676-B.

Figure 2-16. Single-Carrier Cabinet EPN Control Carrier A (J58890N)

Std, High and Critical Reliability EPN Systems

Notes:

1. In G1, the Tone-Clock circuit pack must be a TN768. In G3i or G3si, the Tone-Clock circuit pack can be a TN768 or TN2182. EPNs do not support the TN780 circuit pack.
2. In G1, a TN776 Expansion Interface circuit pack must be inserted into port slot 1 if the system has an EPN. In a G3 system in which packet-switching is supported, a TN570 Expansion Interface circuit pack must be inserted into port slot 1 if the system has one EPN. If the system has two EPNs, then a second TN570 Expansion Interface circuit pack must be inserted into port slot 2. If the system does not support packet-switching, then a TN776 Expansion Interface circuit pack may be substituted for the TN570. If the system does not require either a TN776 or a TN570 Expansion Interface circuit pack, then these slots support any Common Port circuit pack.
3. Port slots 1 through 17 support any Common Port circuit pack. If this carrier contains a TN769 Analog Neon circuit pack, then a TN755B Power Unit circuit pack must be in this carrier. The Power Unit circuit pack requires two adjacent port slots. Refer to "CARR-POW (Carrier Port Power Unit) for AC-Powered Systems" Maintenance for more details.
4. If the single-carrier cabinet is powered from an AC Power source, the power unit must be a WP-91153. However, if the single-carrier cabinet is powered from a DC Power source, the power unit must be a 676-B.

Figure 2-18. Enhanced Single Cabinet Carrier B (J58890M-1,L5)

High or Critical Reliability System with a TN786Processor

NOTE:
The following notes pertain to each of the two preceding carrier figures.

Notes:

1. In G3s, this slot is blank. In G3iV2+, this slot contains the TN772 Duplication Interface circuit pack.
2. In G3iV2+ (expanded memory system), a memory child circuit pack (CPP1) is physically attached to the TN786 circuit pack, and it is considered part of this circuit pack. In G3s, this slot is empty.
3. The TN765 Processor Interface circuit pack is an optional control circuit pack.
4. The Network Control circuit pack must be a TN777B. It cannot be a TN777.
5. The TN778 Packet Control circuit pack is an optional circuit pack
6. The Tone-Clock circuit pack may be either a TN768, TN780 or TN2182 depending on the external clock used. If the Stratum 3 clock is used, the Tone-Clock circuit pack must be a TN780. Refer to STRAT-3 (Stratum 3 Clock) Maintenance documentation for the difference between the TN768 and the TN780. To support a Stratum 3 Clock, a special installation for the

TN780 Tone-Clock circuit pack is required. Refer to *DEFINITY Communications System Generic 3 V1.1 and V2 Upgrades and Additions*, 555-230-107 for details.

7. Port slots 1 through 16 support any Common Port circuit pack.
8. This slot supports any Common Port circuit pack, except for the TN750 Announcement circuit pack.
9. If this carrier contains a TN769 Analog Neon circuit pack, a TN755B Power Unit circuit pack must be placed in port slots 15 and 16. Refer to "CARR-POW (Carrier Port Power Unit) for AC-Powered Systems" Maintenance documentation for more details.
10. If the single-carrier cabinet is powered from an AC Power source, the power unit must be a WP-91153/L2. However, if the single-carrier cabinet is powered from a DC Power source, the power unit must be a 676B.

Basic Control Cabinet (J58890L)

The basic Control Cabinet is located in the Processor Port Network (PPN) only and contains ports, a control complex to perform call processing, and an interface to an optional duplicated control cabinet.

Figure 2-19 shows a basic Control Cabinet containing dedicated white-colored circuit pack slots that house specific control circuit packs. Purple-colored slots can be equipped with any port circuit packs. Also see Table 2-4. Dual-colored slots may contain any port circuit pack or the designated white-colored circuit packs (such as an Expansion Interface or power unit). AC or DC power units supply power to the carrier.

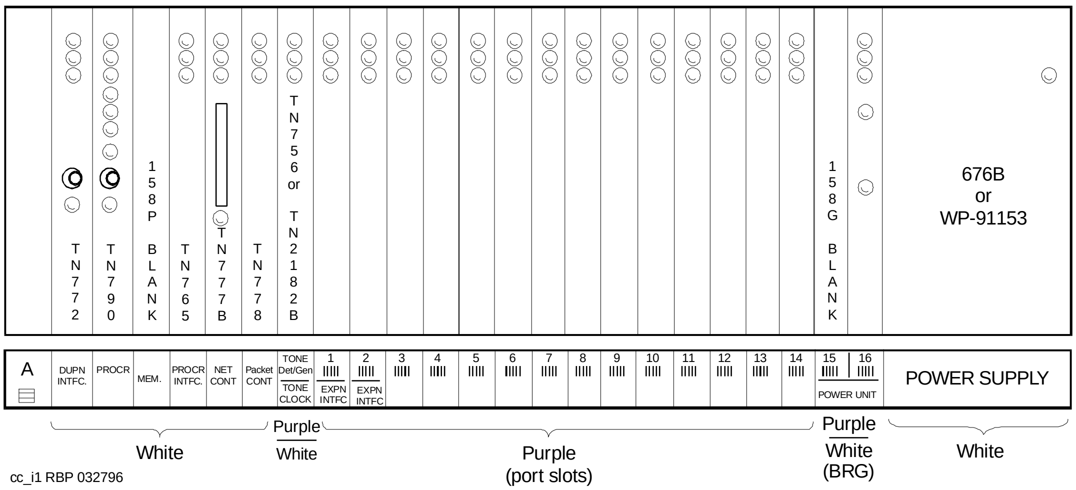

Figure 2-19. Basic Control Cabinet (J58890L) — Front

NOTE:
The TN786B Processor circuit pack is used in G3siV4 and G3siV4+m systems. The optional CPP1 Memory circuit pack installed next to the TN786B Processor circuit pack is not used in G3 Release 5 and later systems. G3 Release 5 and later systems use the TN790 Processor circuit pack.

Figure 2-20 and Table 2-4 describe connectors on the control cabinet rear panel.

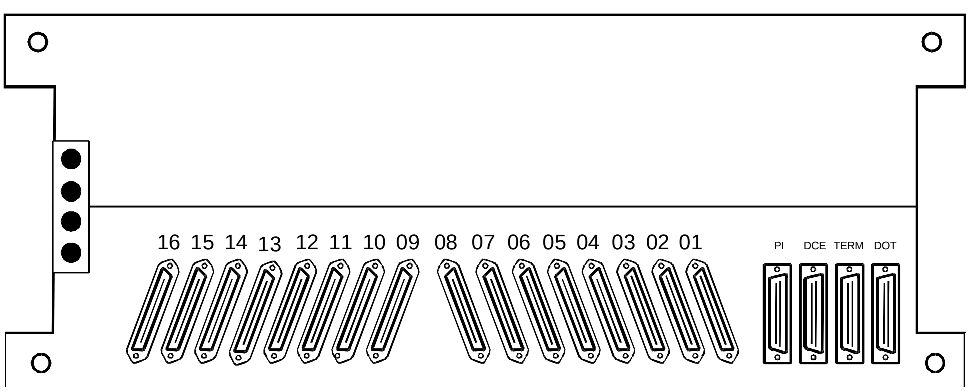

Figure 2-20. Basic Control Cabinet (J58890L) — Rear

Table 2-4. Basic Control Cabinet (J58890L) Connectors

Connector	Function
01 to 16 (A01 to A16)	50-pin connectors interface between port circuit packs and the Main Distribution Frame (MDF) or a fiber transceiver
AUX (Auxiliary)	Provides interface for customer alarms, attendant console power, emergency power transfer panels, and internal modem for remote maintenance
PI (Processor Interface)	Connects directly to the processor interface circuit pack. This connector is used only in AC-powered standard reliability systems
DCE (Digital Communications Equipment)	Connects the processor to Call Detail Recording (CDR) equipment or an external modem for remote maintenance
TERM (Terminal)	Connects an administration terminal to the processor circuit pack in standard reliability systems. Can be used to access the standby Switch Processing Element (SPE)
DOT (Duplication Option Terminal)	Used in high reliability and critical reliability systems to connect an administration terminal to the active processor via the duplication interface slot

Duplicated Control Cabinet (J58890M)

The Duplicated Control Cabinet is optional and is located only in the PPN in G3siV4+m and G3siV5+m. See Figure 2-21. This cabinet contains ports, a duplicated control complex, and an interface to a designated Expansion Control Cabinet.

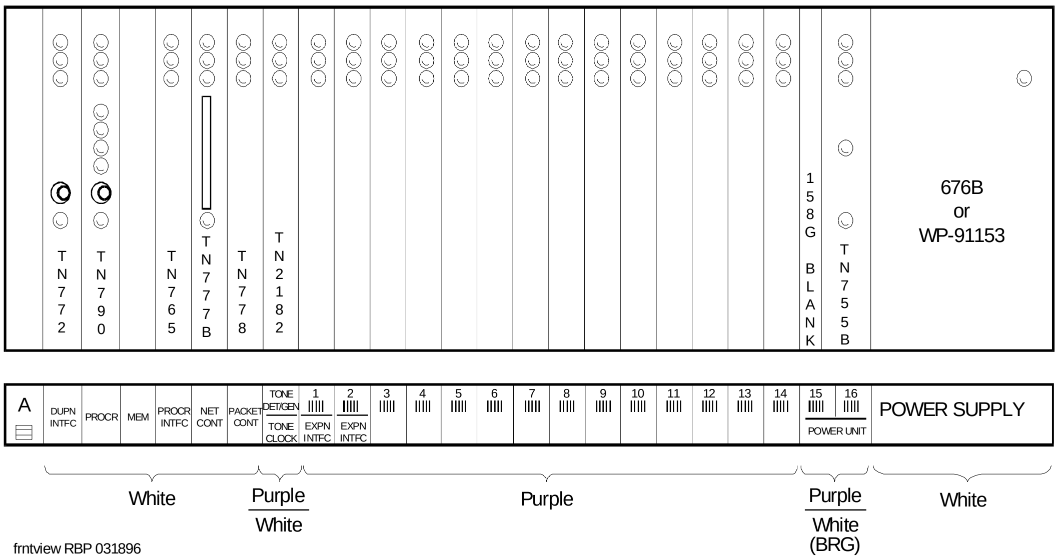

Figure 2-21. Duplicated Control Cabinet (J58890M) — Front

The cabinet contains dedicated white-colored circuit pack slots that are only equipped with designated control circuit packs. The purple-colored circuit pack slots can be equipped with any port circuit packs.

An AC or DC power supply, located at right side of the cabinet, supplies power to the cabinet. The cabinet is equipped with a duplication interface circuit pack in slot DUPN INTFC.

NOTE:

The TN786B Processor circuit pack is used in G3siV4 and G3siV4+m systems. The optional CPP1 Memory circuit pack installed next to the TN786B Processor circuit pack is not used in G3 Release 5 and later systems. G3 Release 5 and later systems use the TN790 Processor circuit pack.

Figure 2-22 and Table 2-5 describe the connectors on the rear of the Duplicated Control Cabinet.

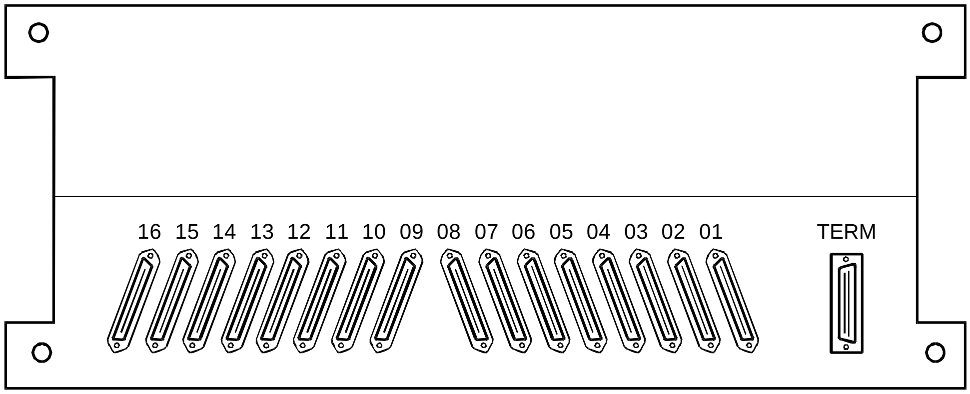

Figure 2-22. Duplicated Control Cabinet (J58890M) — Rear

Table 2-5. Duplicated Control Cabinet (J58890M) Connectors

Connector	Function
01 to 16 (A01 to A16)	50-pin connectors provide interfaces between port circuit packs and the Main Distribution Frame (MDF) or a cable access panel (if provided)
TERM (Terminal)	Connects an administration terminal to the Processor circuit pack in the duplicated control cabinet if the duplication interface circuit pack fails in the Control Carrier

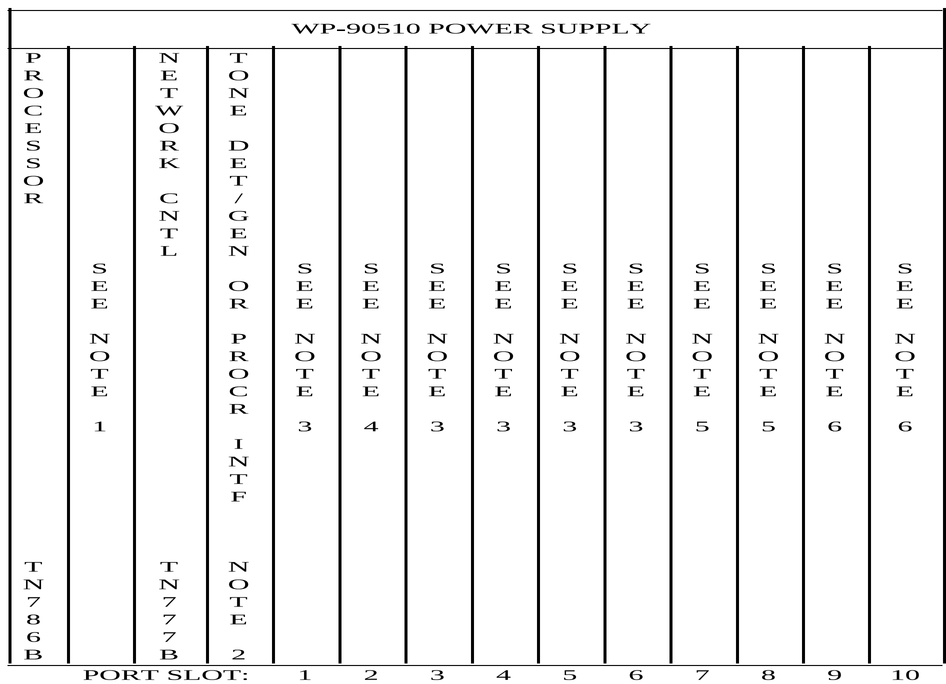

Figure 2-23. Compact Single Carrier Cabinet (J58890S)

Standard Reliability System with a TN786 or TN790 Processor

Notes:

1. This slot is always blank.
2. This slot can support either the TN765 Processor Interface circuit pack or the TN756 or the TN2182 Tone Detector/Generator circuit pack. However, the slot supports neither the TN780 Tone-Clock circuit pack nor the TN768 Tone-Clock circuit pack.
3. Slots 1 through 10 support any Common Port circuit pack.
4. If either Tone-Clock circuit pack (for example, a TN768 or TN780) is required in the system, it must be included in this slot. If neither of these circuit packs is required, this slot supports any Common Port circuit pack. Also, if the system includes both a TN765 Processor Interface circuit pack and a TN756 or TN2182 Tone Generator/Detector circuit pack, the TN756 or TN2182 circuit pack must be included in this slot. However, the TN756

Tone Detector/Generator circuit pack must be replaced with a TN2182, TN780 or TN768 Tone-Clock circuit pack whenever the system supports either a DS1 Interface or Outward Call Management.

5. If DEFINITY AUDIX. is included in the system, the assembly occupies port slots 7, 8, 9, and 10.
6. If a neon message waiting lamp (North America only) is included in the system, port slots 9 and 10 contain the TN755 circuit pack.

Power Controls

There are two basic powering options available with the DEFINITY G1, and or G3 switches. These options include Alternating Current (AC) and Direct Current (DC). The switch cabinets and their associated power supplies can be powered by 120/208 volts AC either directly or from a Universal Power Supply (UPS) system (System 75 has only the 120-volt AC option). Alternatively, the cabinets and their power supplies may be powered by -48 volts DC from a battery power plant (this requires DC-to-DC conversion power units in the switch).

The G3vsV2 system requires between 80 and 264 or between 90 and 132 volts AC. The system can be powered directly or from the WP-90510 power supply. The DC powering option is not available with the G3vsV2 system.

Except for the G3vs system, each control cabinet in an AC-powered system (but only the processor control cabinet in the ESCC/SCC/XE control cabinet) has an internal battery that provides a short term holdover to protect the system against short power interruptions. This method is known as the Nominal Power Holdover Strategy. The battery is connected so that it automatically provides power if the AC service fails. The time and extent of the holdover varies according to the type of cabinet and to whether or not the system has a duplicated control complex.

Table 2-6 summarizes the response to the interruption of power service in DEFINITY systems without an internal holdover battery.

Table 2-6. Response to Power Service Interruption in DEFINITY Systems without an Internal Holdover Battery.

Cabinet Power Interruption	Less Than Power Supply Decay	Greater Than Power Supply Decay
-48 volt DC external power or multicarrier cabinet with UPS, no internal battery.	None on system, some impact on 48-volt powered circuits.	All calls dropped, system reloads.

The next two tables indicate various responses to the interruption of power service in DEFINITY systems that are equipped with an internal holdover battery. Table 2-7 provides a summary of holdover times for various DEFINITY configurations. Table 2-8 indicates the types of cabinet power interruption in DEFINITY Systems based on power holdover durations.

Table 2-7. Response to Power Service Interruption in DEFINITY Systems with an Internal Holdover Battery

System and Configuration	Cabinet	Holdover for Entire Cabinet (in seconds)	Holdover for Entire Control Carrier (in minutes)
G1:			
Standard	PPNMCC	10	10
High, Critical	PPNMCC	5	5
Standard/High, Critical	PPN SCC/ESCC	1/4	2
Standard/High, Critical[1]	EPN MCC	15	none
Standard/High, Critical	EPN SCC/ESCC	1/4	none
G3:			
Standard	PPNMCC	10	10
High, Critical	PPNMCC	10	5
Standard/High, Critical	PPN SCC/ESCC	1/4	2
Standard/High, Critical[2]	EPN MCC	15	none
Standard/High, Critical	EPN SCC/ESCC	1/4	none
System 75:			
V1, V2, V3	Medium	10	10
V1, V2, V3	XE	1/4	2

1 The holdover times listed are in effect if the EPN contains a TN775 maintenance circuit pack. However, if the EPN contains a TN775B maintenance circuit pack, the holdover time for the entire cabinet is 10 seconds, and the holdover time for the control carrier is 10 minutes.

2 The holdover times listed are in effect if the EPN contains a TN775 maintenance circuit pack. However, if the EPN contains a TN775B maintenance circuit pack, the holdover time for the entire cabinet is 10 seconds, and the holdover time for the control carrier is 10 minutes.

NOTE:
The following list defines the abbreviations that appear in Table 2-7:

- PPN—Processor Port Network
- EPN—Expansion Port Network
- MCC—Multicarrier Cabinet

- SCC—Single Carrier Cabinet
- ESCC—Enhanced Single Carrier Cabinet

Table 2-8. Types of Cabinet Power Interruption in DEFINITY Systems

System and Cabinet	Shorter Holdover Than That for Entire Cabinet	Longer Holdover Than That for Entire Cabinet, Shorter Holdover Than That for Control Carrier	Longer Holdover That for Control Carrier
G1:			
PPNSCC	No calls dropped	All calls dropped	System reload
PPNMCC	No calls dropped	Control carrier calls held	All calls dropped, system reloads
EPNSCC	No calls dropped	All calls dropped	All calls dropped, system reloads.
EPNMCC	No calls dropped	All calls dropped	All calls dropped, system reloads
G3V1, G3V2:			
PPNMCC	No calls dropped	All calls dropped	System reloads
EPNMCC	No calls dropped	Control carrier calls held	System reloads
EPNSCC	No calls dropped	All calls dropped	System reloads
System 75:			
XE Cabinet	No calls dropped	All calls dropped	System reloads
Medium Cabinet	No calls dropped	Calls in control carrier held, others dropped	All calls dropped, system reloads

NOTE:
The following list defines the abbreviations that appear in the table:

- PPN—Processor Port Network
- EPN—Expansion Port Network
- MCC—Multicarrier Cabinet
- SCC—Single Carrier Cabinet
- ESCC—Enhanced Single Carrier Cabinet

NOTE:
XE/SCC/ESCC does not originate any alarms. MCC logs errors and originates miscellaneous alarms for some circuits. Older System 75s originates an AC power failure alarm.

NOTE:
When EPN power is interrupted for greater than the cabinet holdover but less than the control carrier holdover, calls in the control carrier are held for the duration of the interruption but are dropped when power is restored.

Multicarrier/Medium Cabinet

The multicarrier cabinets (MCCs) used by the G3, G1, and System 75 systems have an internal battery system that supplies holdover power to the whole cabinet for a specific amount of time. The duration of this holdover power depends upon the version and configuration of the switch. This information is provided in Table 2-3. In System 75 V1, V2 & V3 and in Standard G1, G3 systems, for example, the internal battery system supplies power to the cabinet for 10 seconds. In High or Critical Reliability G1, G3 systems, the internal battery system happens to supply power to the cabinet for the same amount of time. In either case, power is also supplied to the port carriers in the Processor Port Network.

Similarly, in most cases, holdover power for the control carrier is provided. Once again, the duration of this holdover power depends upon the version and configuration of the switch, as is illustrated in Table 2-4.

The following explanation assumes that we are considering a G3V2 system with a simplex configuration. As a result, the holdover power for the entire cabinet lasts for 10 seconds, and the holdover power for the control carrier lasts for 10 minutes.

NOTE:
To make the following explanation relevant to another system and configuration, simply replace the time expressed in seconds within the paragraphs with the relevant time expressed in seconds that appears in Table 2-3. Similarly, perform the same substitution for the time expressed in minutes.

An AC power interruption to the cabinet that lasts fewer than 10 seconds is not noticed by the customer. After 10 seconds, the system powers down the port carriers in each cabinet, but the entire control carrier continues to be powered for 10 minutes. The circuit packs in the port carriers are "removed" by the software and, as a result, all connections are dropped.

Connections and call processing are preserved on the control carrier for the entire holdover period. After 10 minutes, the control carriers are powered down and the connections are dropped. The 10 minute interval does not exhaust a fully charged battery. The system is designed to sustain multiple AC service interruptions before the battery has time to recharge fully. After power is restored, the batteries are recharged by a circuit that monitors current and time. If the battery takes longer than 30 hours to recharge, a minor alarm is sent to INADS. This alarm indicates that the battery should be replaced or that the charging circuit should be repaired.

The 397 Battery Charger Circuit immediately detects the loss of AC power. Once AC power loss is detected, an AC power alarm is generated. (In older System 75s, this results in an alarm origination being sent to INADS.) Included with the AC power fail alarm are several other alarms associated with the loss of power. Several maintenance objects cause a major alarm to be reported (e.g., processor interface links, external DS1 timing), but generally no specific power-related major or minor alarm results. If the switch is accessed during the 10 minute interval, an AC power warning alarm appears in the active alarm log. After AC is restored, the alarm is cleared and appears in the alarm log as "resolved."

If AC power is restored during the 10 second interval, no service interruption results. If AC power is restored between 10 seconds and 10 minutes, service to the port carriers is restored after the software "reinserts" the circuit packs. This can take up to one minute, depending on the size of the system. Links that have their connectivity through the control carriers remain up unless they rely on hardware that is powered externally to the switch (for example, channel service units for DS1 facilities). If the CSU is not connected to a power reserve system, the DS1 facility is dropped.

If AC power is restored after 10 minutes (or, if the battery does not have sufficient capacity, in less than 10 minutes), the switch must reload all software and translation data, and it must "reinsert" all circuit packs. This process can take several minutes, depending on the size of the system. All links are re-established according to their initialization requirements. Note that, in some cases, human intervention may be required if some central office equipment has been busied out.

As an option, the internal battery may be omitted on MCC systems that are ordered with UPS. If the battery is omitted, and if the AC from the UPS fails, the system does not report an alarm.

Critical services or services that take a long time to restore (for example, digital announcement circuit packs) should be placed in control carriers, where they can be held up the longest. If AC power interruptions of longer than 10 minutes are frequent, and if the customer’s service requirements warrant, consideration should be given to equipping the system with either an external UPS system or an external DC power system.

Enhanced Single Carrier/XE and Single Carrier/XE Cabinets

In single carrier/XE cabinets, there is no internal AC wiring or distribution and no software interaction with the power system. The power supplies themselves take about 250 milliseconds (1/4 second) for the voltages to drop below limits.

The (E)SCC/XE control cabinet that houses the switch processing element (SPE) is the only cabinet that has an internal battery reserve. All other control cabinets and port cabinets have the 250 millisecond power supply decay delay, after which all connections and links associated with the cabinets are dropped.

The SPE control cabinet has a battery that furnishes power to the processor memory complex for a minimum of two minutes if the battery is fully charged. This battery is recharged after power is restored, but the charging process is not monitored by the system. The cabinet is not able to detect AC power loss, and it notices only a DC power output failure as the power supply output decays.

The memory contents are preserved, and the processor continues operating during the two minute period. However, the tone-clock circuit pack is not held over, and as a result, no connections are possible. The battery does not supply all the voltages necessary for the internal modem circuit on the processor circuit pack. As a result, no call is originated to INADS, and the switch cannot answer any calls. Thus, the switch cannot report any internal or external alarms during this period. After two minutes (or, depending on the condition of the battery, after less than two minutes), the processor and memory are lost, and the system is totally inactive.

If power is restored in less than 1/4 of a second, no calls are dropped. If power is restored between 1/4 of a second and two minutes, all calls are dropped, and memory is maintained. However, since the tone-clock was lost, the system undergoes a reset once the AC restoral process clears all calls and the alarm log (in which errors are retained). The switch keeps a record of the restart in the error log, but it might not detect a power error if the outage is between 1/4 of a second and one minute, during which time only a loss of clock and not a loss of the power failure that caused the loss of clock is logged. After one minute, a power error is logged. If the outage exceeds the battery holdover interval, the error logs and alarm logs are lost (since they cannot be saved to tape). Depending on the size of the system, it can take up to one minute to restore service to the ports. After a power outage of two minutes following the restoral of AC power, the system re-initializes from the tape. It takes about 10 minutes to restore service. Again, if the customer has frequent power outages or critical service needs, an external UPS or DC power system should be considered.

NOTE:
For more power control information, refer to AC-POWER (AC-Powered Systems), AC Power (DC-Powered Systems), CARR-POW (AC-Powered Systems), CARR-POW (DC-Powered Systems), DC-POWER, POWER (AC-Powered Systems), and POWER (DC-Powered Systems) Maintenance documentation.

Light-Emitting Diodes (LEDs)

Light-emitting diodes, or LEDs, are small, button-shaped lights that are positioned on the processors and circuit packs within the maintenance architecture. LEDs emit one of three colors (red, green, or amber), and they are turned on or off by the system to indicate various statuses and procedures involving maintenance. LEDs are fully discussed in Chapter 7, "LED Interpretation".

Management Terminals

3

General

Maintenance personnel can use the DEFINITY Manager I [G1] terminal, the Manager G3MT terminal, or the Digital Equipment Corporation (DEC) VT220 terminal to initiate the same tests that the system initiates. Test results are displayed on the terminal screen. This chapter illustrates these terminals, explains how to use them, and identifies the typical maintenance tasks that can be performed from them.

Manager I and Manager G3MT Terminals

The maintenance interface for the system technician is either the Manager I terminal (which is used in G1) or the Manager G3MT terminal. Each of these terminals may be referred to as an *administration terminal*. In fact, from now on, this is the term we will use in this manual.

The following terminals are supported as administration terminals:

- 513 Business Communications Terminal (BCT)
- 4410 Data Terminal
- 4425 Data Terminal
- 610 BCT
- 615 MT
- 715 BCS

In a Standard Reliability system (that is, one without High or Critical Reliability), the administration terminal is connected to the Processor circuit pack. In the Processor Port Network (PPN) of a High or Critical Reliability system , the administration terminal is connected to the Duplication Interface circuit pack in the (PPN). In the Expansion Port Network (EPN) of a Standard Reliability system or of a High or Critical Reliability system, the administration terminal is connected to the Maintenance circuit pack in the EPN.

Duplication Interface circuit pack A controls and monitors the same environment leads as the Maintenance/Tape Processor in a PPN system without High or Critical Reliability. Duplication Interface circuit pack A also supports the serial channel to the administration terminal in a PPN for a High or Critical Reliability system. The administration terminal is connected to Duplication Interface circuit pack A via a connector, labeled **DOT** (Duplication Option Terminal), on the back of carrier A. At any time, the administration terminal may be disconnected from Duplication Interface circuit pack A and connected directly to the Active Processor circuit pack by attaching the terminal to the connector labeled **TERM** on the Active carrier. This connection should be made only if the administration terminal fails to function, since a problem with the Duplication Interface circuit pack A may be present.

Typical tasks that can be performed at the administration terminal by technicians using maintenance commands are shown in the list that follows. (Maintenance commands are described in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids".

- Display Error and Alarm logs
- Test circuit packs
- Test system functions
- Busyout and release system equipment
- Reset the system
- Monitor the system
- Check status of maintenance objects
- Check system translations

Most maintenance functions performed at the local administration terminal can also be done remotely at the INADS (Initialization and Administration System).

Terminal Keyboard

The keyboard is equipped with cursor keys that enable the user to obtain data and editing keys that allow the user to make changes and corrections. The keyboard is also equipped with transaction keys that enable the user to perform certain functions by single key strokes. The three types of keys are described here.

Cursor Keys: Cursor keys are used to move the cursor between fields and pages on a screen form. The cursor must be positioned on a field before the user can add or change information in that field.

Editing Keys: Two editing keys, BACK SPACE and CLEAR, are provided.

BACK SPACE is used to erase the character at the current cursor position. The cursor moves one position to the left each time the key is pressed. If the cursor is at the first position of the data entry field, it erases the character at the first position. CLEAR when pressed simultaneously with the SHIFT is used to clear all data in a field on a screen form. The cursor must be positioned at the field the user wants to clear before CLEAR is pressed.

Transaction Keys: Three transaction keys, CANCEL, ENTER, and HELP, are provided. CANCEL is used to erase a form or command. Once the key is pressed, the system returns the user to the command (tasks request) level and asks for a new command. ENTER is used to store the data entered on a screen form in the system's memory. HELP is used to display information on the type of data that can be entered into the field associated with the current cursor position. The system displays all the permissible entries the user can input for that field. This key can be pressed at the "enter command" level to obtain a list of all commands.

Table 3-1 provides a description of functions and associated keys for each type of administration terminal supported. Function keys f1 through f8, on the 4410 and 4425 data terminals are automatically programmed by the system to the key functions indicated in the table.

The keyboards are shown in Figure 3-1, Figure 3-2, Figure 3-3, Figure 3-4, and Figure 3-5 for the 513 BCT, 4410 Data Terminal, 4425 Data Terminal, 610 BCT and 615 MT, and 715 BCS, respectively.

Table 3-1. Terminal Keys

For This Function	Terminal Type: 715[1]	513 or 610 or 615 MT[2]	4410 or 610 or 615 MT[3]	4425
	Press Key Below:			
To cancel a screen form or command Once the key is pressed, the system returns the user to the **enter command:** (tasks request) level. Any data entered on a screen form prior to pressing CANCL (Cancel) or f1 is ignored. For the 4410 or 4425, the associated f1 screen label (CANCEL) is automatically assigned.	Cancel	CANCL	f1	f1
To clear and redraw a screen form The system redraws the same screen. For the 4410 or 4425, the associated f2 screen label (REFRESH) is displayed when the **add**, **change**, or **display** command is entered and the screen form is displayed.	Clr/ Rfrsh	CLEAR RFRSH	f2	f2
To clear all data in a field The cursor must be positioned at the field the user wants to clear before pressing this key. For the 4410 or 4425, the associated f4 screen label (CLEAR FIELD) is displayed when the **add** or **change** command is entered and the screen form is displayed.	(shift) **Clear Home**	CLEAR RFRSH (shift)	f4	f4
To display the next page of a screen form Used to display the next page of a screen form that has more than one page. For the 4410 or 4425, the associated f7 screen label (NEXT PAGE) appears when the screen form has more than one page.	PAGE	f7	f7	

Continued on next page

Table 3-1. Terminal Keys — *Continued*

	Terminal Type			
	715[1]	513 or 610 or 615 MT[2]	4410 or 610 or 615 MT[3]	4425
For This Function	**Press Key Below:**			
To display the next page of a screen form Used to display the next page of a screen form that has more than one page. For the 4410 or 4425, the associated f7 screen label (NEXT PAGE) appears when the screen form has more than one page.	Page Down	PAGE	f7	f7
To display the previous page of a screen form Used to display the previous page of a form which has more than one page. For the 4410 or 4425, the associated f8 screen label (PREV PAGE) is displayed only when the screen has more than one page.	Page Up	PAGE (shift)	f8	f8
To display the first page of a multiple screen form Used to display the first page of multiple forms when using the command (typical—**display station xxxx count 1-10**). For the 4410 or 4425, the associated f6 screen label (NEXT FORM) is displayed only when multiple forms are to be displayed.	—	—	f6	f6

Continued on next page

Table 3-1. Terminal Keys — *Continued*

	Terminal Type			
	715[1]	513 or 610 or 615 MT[2]	4410 or 610 or 615 MT[3]	4425
For This Function	**Press Key Below:**			
To display help information for a field or command Used to display help information on the type of data that can be entered into the field associated with the current cursor position. The system displays all the possible entries the user can input for that field. This key can also be pressed at the "enter command" level to obtain a list of all the system commands. The HELP key can be pressed at other command levels to obtain a list of objects and entries for identifiers. For the 4410 or 4425, the associated f5 screen label (HELP) is displayed when the user logs into the system.	HELP	HELP	f5	f5
To move the cursor to the next field on a line If the cursor is in the last field on a line, then it moves to the first field on the next line. If the cursor is in the last field on the last line, then it moves to the first field on the first line.	→ or TAB or Return	→ or TAB →	→ or TAB	→ or TAB
To move the cursor to the previous field on a line If the cursor is in the first field on a line, then it moves to the last field of the previous line. If it is in the first field of the first line, then it moves to the last field of the last line.	← or TAB (shift)	← or TAB (shift) ←	← or TAB (shift)	← or TAB (shift)

Continued on next page

Table 3-1. Terminal Keys — *Continued*

For This Function	Terminal Type: 715[1]	513 or 610 or 615 MT[2]	4410 or 610 or 615 MT[3]	4425
	Press Key Below:			
To move the cursor to the next line If the cursor is on the last line, it moves to the first line.	↓	ROLL ↓	0 ↓	↓
To move the cursor to the previous line If the cursor is on the first line, it moves to the last line.	↑	ROLL ↑	2 ↑	↑
To store the data entered on a screen form Used to enter into system memory the data that is displayed on a screen form. For the 4410 or 4425, the associated f3 screen label (ENTER) is displayed when the add or change command is entered and the associated screen form is displayed.	Enter	ENTER	f3	f3
To update the BCMS screen form using Monitor commands(G1) Used to obtain immediate update of real time status reports for agents and splits. Used only with the BCMS **monitor bcms split** and **monitor bcms system** commands.	f6	f6	f6	f6

1 The 715 must be set to the "BCS" emulation mode, which causes it to function like a 615 equipped with a 513 emulation cartridge.

2 If a 513 emulation cartridge is used for a 610 or 615 MT, the 610 or 615 MT terminal keys function the same as the 513 terminal keys.

3 If a 513 emulation cartridge is not used with a 610 or 615 MT, the 610 or 615 MT terminal keys function the same as the 4410 keys.

System Login Procedure

Forced Password Aging and Administrable Logins for G3V3 and Later Releases

G3V3 and later releases provide enhanced login/password security by adding a security feature that allows users to define their own logins/passwords and to specify a set of commands for each login. The system allows up to 11 customer logins. Each login name can be customized and must be made up of from 3 to 6 alphabetic/numeric characters, or a combination of both. A password must be from 4 to 11 characters in length and contain at least 1 alphabetic and 1 numeric symbol. Password aging is an optional feature that the super-user administering the logins can activate.

NOTE:
If several “users” are logging in and out at the same time , a user may see the message “Transient command conflict detected; please try later”. After the “users” have completed logging in or out, the System Access Terminal should be available for use, try executing the command again.

The password for each login can be aged starting with the date the password was created, or changed, and continuing for a specified number of days (1 to 99). The user is notified at the login prompt, 7 days before the password expiration date, that his/her password is about to expire. When the password expires the user is required to enter a new password into the system before logging in. If a login is added or removed, the “Security Measurement” reports are not updated until the next hourly poll, or a **clear measurements security-violations** command is entered. Once a non-super-user has changed his/her password, the user must wait 24 hours to change the password again.

G3V4 security is enhanced by providing a logoff notification screen to a system administrator when he/she logs off while either the facility test call or remote access features are still administered. The administrator can be required to acknowledge the notification before completing the logoff process. Logoff notification is administered on the Login Administration screen.

G3V3 and later releases are delivered to the customer with one customer “super-user” login/password defined. The customer is required to administer additional login/passwords as needed. The super-user login has full customer permissions and can customize any login that he/she creates.

Login permissions for a specified login can be set by the super-user to block any object that may compromise switch security. In G3V3 or later releases up to 40 administration or maintenance objects commands can be blocked for a specified login in. In releases prior to G3V3, up to 20 administration or maintenance objects commands can be blocked for a specified login in. When an object (administrative or maintenance command) is entered in the blocked object list on the Command Permissions Categories Restricted Object List form, the associated administrative or maintenance actions cannot be performed by the specified login.

G3V3 and later releases commands are grouped into three command categories. Each of the three command categories has a group of command subcategories listed under them, and each command subcategory has a list of command objects that the commands acts on. A super-user can set a users permissions to restrict or block access to any command in these categories. The three main categories are:

- Common Commands
  - Display Admin. and Maint. Data
  - System Measurements
- Administration Commands
  - Administer Stations
  - Administer Trunks
  - Additional Restrictions
  - Administer Features
  - Administer Permissions
- Maintenance Commands
  - Maintain Stations
  - Maintain Trunks
  - Maintain Systems
  - Maintain Switch Circuit Packs
  - Maintain Process Circuit Packs

These categories are displayed on the Command Permissions Categories form.

To Log In

To log in to the switch:

1. Enter your login name and password on the login and password screen.

   If your password has expired you see the message:

   `Your password has expired, enter a new one.`

   `Reenter current password:`

```
        Login: telmgr

     Password:
     Your Password has expired, enter a new one.

Reenter Current Password:

             New Password:

     Reenter New Password:
```

Screen 3-1. Password Expiration Screen

The Password Expiration screen is displayed when you log in. If your password is expired you are prompted to enter a new password. If your password is within 7 days of the expiration date, you see:

WARNING: Your password will expire in X days

To Logoff

To logoff, enter “logoff” at the command prompt.

If facility test call notification or remote access notification are enabled for your login (see Adding Customer Logins and Assigning Initial Passwords, below), you will receive a logoff screen. If either the facility test call or remote access acknowledgments are required, you will need to respond to the Proceed with Logoff? prompt on the logoff screen. The response is defaulted to “n”; you will need to enter “y” to override the default.

CAUTION:
To leave the Facility Test Call administered after you logoff poses a significant security risk.

CAUTION:
To leave the Remote Access feature administered after logging off poses a significant security risk if you are using the feature in conjunction with the Facility Test Call feature.

```
Facility Test Call Administered
Remote Access Administered

Proceed with Logoff? [n]
```

Screen 3-2. Logoff Screen

To Display a Login

To display a specified login:

1. Enter the command **display login [login name]** and press the ENTER key.

   The system displays the requested login's:

   - Name
   - Login type
   - Service level
   - Disable following a security violation value (V3)
   - Access to Inads Port value (V4)
   - Password aging cycle length
   - Facility test call notification and acknowledgment
   - Remote access notification and acknowledgment

To List Logins

To list all of the system logins and the status of each login:

1. Enter the command **list logins**.

   The system displays the following information for all current logins:

   - Name
   - Service level
   - Status (active, inactive, disabled, svn-disabled, void)
   - Password aging cycle length

   The system will display only those logins with the same, or lower, service level as the requestor.

To Remove a Login

To remove a login from the system:

1. Enter the command **remove login [login name]**.

   The system displays the Login Administration form.

2. Press the ENTER key to remove the login, or press Cancel to exit the remove login procedure without making a change.

To Test a Login

1. Enter your login name at the login prompt.

```
Login: telmgr
Password:vvvvvvvvcf
```

Screen 3-3. Login Prompt Form

After the user enters the correct login name and password and the login is administered correctly, the system displays the command line interface.

Administering Customer Logins and Forced Password Aging for G3V3 and Later Releases

Adding Customer Logins and Assigning Initial Password

To add a customer login you must be a super-user, have administrative permissions, and:

1. Enter the **add login [name]** command to access the Login Administration form.

2. Enter your super-user password in the Password of Login Making Change field on the Login Administration form.

   The 3- to 6-character login name (characters 0-9, a-z, A-Z) entered with the **add login [name]** command is displayed in the Login's Name field.

3. Enter “customer” in the Login Type field. The system default for the Login Type field is “customer.” The maximum number of customer logins of all types is 11.

4. Enter super-user or non-super-user in the Service Level field. Default is none-super-user.
   - “super-user” gives access to the **add, change, display, list,** and **remove** commands for all customer logins and passwords. The super-user can administer any mix of super-user/non-super-user logins up to a total of ten additional system logins.
   - “non-super-user” permissions are limited by restrictions specified by the super-user when administering the non-super-user login. A non-super-user can change his/her password with permission set by the super-user, however once a password has been changed the non-super-user must wait 24 hours before changing the password again. A non-super-user cannot change other user passwords, login characteristics, or permissions.
5. Enter “y” in the Disable Following a Security Violation field to disable a login following a login security threshold violation,. This field is a dynamic field and only appears on the Login Administration form when the SVN Login Violation Notification feature is enabled. The system default for the Disable Following a Security Violation field is “y.”
6. Enter “y” in the Access to INADS Port? field to allow access to the remote administration port,. This field will only display if Acct. has first enabled customer super-user access to the INADS Remote Administration Port. Default is “n”. This step is valid for G3V4 only.
7. Enter a password for the new login in the Login’s Password field. A password must be from 4 to 11 characters in length and contain at least 1 alphabetic and 1 numeric symbol. Valid characters include numbers, and!&*?;’^(),.:- (the system will not echo the password to the screen as you type).
8. Re-enter the password in the Login’s Password field. The system will not echo the password to the screen as you type.
9. Enter the number of days (1 to 99) from the current day, that you want the password to expire, in the Password Aging Cycle Length field. If a you enter a blank in this field, password aging does not apply to the login.
10. Decide whether or not to leave the default of yes (“y”) in the Facility Test Call Notification? field. If you retain the default, the user will receive notification at logoff that the facility test call feature access code is administered. If you do not want the notification to appear, set the field to “n”.

    CAUTION:
    Leaving The facility Test Call administered after logging off poses a significant security risk.

11. Decide whether or not to leave the default of yes (“y”) in the Facility Test Call Notification Acknowledgment Required field. If you retain the default, the user will be required to acknowledge that they wish to logoff while

Facility Test Call is still administered. If you do not want to force the user to acknowledge, set the field to “n”. This field will appear only if the Facility Test Call Notification field is set to 'y”

12. Decide whether or not to leave the default of yes (“y”) in the Remote Access Notification? field. If you retain the default, the user will receive notification at logoff that remote access is still administered. If you do not want the notification to appear, set the field to “n”.

CAUTION:
To Leave Remote Access feature administered after logging off poses a significant security risk if you are using the feature in conjunction with the Facility Test Call feature.

13. Decide whether or not to leave the default of yes (“y”) in the Remote Access Acknowledgment Required? field. If you retain the default, the user will be required to acknowledge that they wish to logoff while remote access is still administered. If you do not want to force the user to acknowledge, set the field to “n”. This field will appear only if the Facility Test Call Notification field is set to 'y”.

```
                      LOGIN ADMINISTRATION

            Password of Login Making Change:

        LOGIN BEING ADMINISTERED
                             Login’s Name:xxxxxxx
                               Login Type:
                            Service Level:
     Disable Following a Security Violation?
                     Access to INADS Port?

        LOGIN’S PASSWORD INFORMATION
                         Login’s Password:
                 Reenter Login’s Password:
            Password Aging Cycle Length:

      LOGOFF NOTIFICATION
        Facility Test Call Notification? y     Acknowledgment Required? y
             Remote Access Notification? y     Acknowledgment Required? y
```

Screen 3-4. Login Administration

Changing a Login’s Attributes

To change a customer login’s attributes you must be a super-user, have administrative permissions (specifically, the Administration Permission field must be set to “y” for the super-user), and:

1. Enter the **change login [name]** command to access the Login Administration form.

2. Enter your super-user password in the Password of Login Making Change field on the Login Administration form.

   The 3- to 6-character login name (characters 0-9, a-z, A-Z) entered with the **change login [name]** command is displayed in the Login's Name field.

3. Enter "customer" in the Login Type field.

4. Enter "super-user" or "non-super-user" in the Service Level field.

   NOTE:
   You cannot change your own service level.

5. To disable a login following a login security threshold violation, enter "y" in the Disable Following a Security Violation field. This field is a dynamic field and only appears on the Login Administration form when the SVN Login Violation Notification feature is enabled.

6. To allow access to the remote administration port, enter "y" in the Access to INADS Port? field. This field will only display if Lucent Technologies has first enabled customer super-user access to the INADS Remote Administration Port and the G# version is V3 or later.

7. Enter a password for the new login in the Login's Password field. A password must be from 4 to 11 characters in length and contain at least 1 alphabetic and 1 numeric symbol. Valid characters include numbers, and!&*?;'^(),.:- (the system will not echo the password to the screen as you type).

8. Re-enter the password in the Login's Password field. The system will not echo the password to the screen as you type.

9. Enter the number of days (1 to 99) from the current day, when you wish the password to expire, in the Password Aging Cycle Length field. If a blank is entered in this field, password aging does not apply to the login.

Administering Login Command Permissions

Users with super-user permissions can set the permissions of the logins they create. The Command Permissions Categories form displays fields to which a user with super-user permissions can give or limit access. G3V3 and V4 commands are divided into three categories:

- Common Command
- Administration Commands
- Optional Maintenance Commands

Each of the three main categories have subcategories listed under them that when set to a "y" give permission to use the command sets associated with that category. When the Command Permissions Categories form is displayed for a login, the subcategories fields appear with the fields set to give the login full permissions for that login type. The super-user administering login permissions can set any of these field to deny access to a command category for the specified login. If the super-user making the assignments has full super-user permissions and would like to limit permissions for a category, the super-user can do so by entering “y” in the Additional Restrictions field located under the Administration Category section of the Command Permissions Categories form.

Refer to the Command Permissions Form Entries Tables at the end of this section for a list of command Objects and Actions by:

- Display Administration and Maintenance
- Administer Features
- Administer Permissions
- Administer Stations
- Administer Trunks

The information is the tables will help you to establish command permissions for user logins.

To administer command permissions, log in as super-user and:

1. Access the Command Permissions Categories form by entering the command **change permissions login [login name]**. When the Command Permission Categories form is displayed for a login, the default permissions for that “login type” are shown on the form. The super-user administering the login can change a “y” to “n” for each subcategory field on the form.
2. Select a category for the login and enter “y” in each field where permission to perform an administrative or maintenance action is needed. The command object you select must be within the permissions for the login type you are administering.

   If the Maintenance option is set to “y” on the Customer Options form, the super-user can enter “y” in the Maintain Switch Circuit Packs? or Maintain Process Circuit Packs fields.
3. A super-user with full super-user permissions (super-user administering the login cannot have the Additional Restrictions field set to “y” for his/her own login) can restrict additional administrative or maintenance actions for a specified login by entering “y” in the Additional Restrictions field on the Command Permission Categories form. Enter the additional restrictions for a login in the Restricted object list fields on the Command Permission Categories Restricted Object List form. In G3V3 and G3V4 you can enter up to 40 command names (object names) to block actions associated with a command category for a specified login; prior to G3V3 you can enter 20.

```
                                                        Page 1 of 3

Testing a Login

1. Enter your login name at the login prompt.

```
Login: telmgr

Password:
```

Screen 3-8. Login Prompt Form

After the user enters the correct login name and password and the login is administered correctly, the system displays the command line interface.

To log into the system, do the following:

1. Turn on the administration terminal. Verify that the screen displays: `login:`
2. Enter your login name, then press RETURN. Verify that the screen displays: `password:`
3. Enter your password, then press RETURN.

   For security reasons, the password is not displayed as you type it. The system verifies that a valid login and password name were entered. If an invalid login or password name was entered, the screen displays:

   `login incorrect:`, and you must repeat the procedure.

   If the system recognizes the login and password name, verify that the screen displays the software version. The software version in the sample display below is *only an example*. *Software Version: G1V5.0.b4.0*

   NOTE:
   The software version is displayed in G3iV1.1-286 and G3iV2-386 only.

   Terminal Type (Enter 513, 715, VT220, 4410, or 4425): [513]

4. For your terminal type, complete one of the following:
   a. If the terminal is a 513 BCT, press RETURN. The 513 in brackets [513] is the system default terminal.
   b. If the terminal is a 4410 Data Terminal, enter 4410 and press RETURN.
   c. If the terminal is a 4425 Data Terminal, enter 4425 and press RETURN.
   d. If the terminal is a 610 BCT or a 615 MT that has a 513 emulation cartridge, press RETURN.

e. If the terminal is a 610 BCT or a 615 MT that does not have a 513 emulation cartridge, enter 4410 and press RETURN.

You may suppress INADS alarm origination whenever you log in as ”system technician.” After you supply the terminal type information requested, the system displays the following if Alarm Origination is currently activated per the Maintenance-Related System Parameters Form:

`Suppress Alarm Origination: [y]`

The default answer is ”yes.” If you do NOT wish to suppress alarm origination, you must enter either ”n” or ”no.” If you press any other key or combination of keys, the system interprets your answer as ”yes.”

NOTE:
The **test inads-link** command works regardless of whether you have overridden INADS alarm origination.

5. Verify that the screen displays: `enter command:`

   You may enter the desired command, such as **display station xxxx** or press HELP to obtain the list of permissible commands. (Refer to Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a detailed description of the commands available for system maintenance.)

Command Line Details

After a successful login, the administration terminal displays `enter command:` and waits for entry of a command.

A command is made up of multiple words that are typed on the keyboard and that instruct the system to perform a particular task. The system’s command structure follows the format: Action, Object, and Qualifier.

The first word entered is the *Action*. It specifies the operation to be done (for example, test, display, or reset).

The second word entered is the *Object*. It specifies the object to receive the action (for example, station, trunk group, or hunt group).

The third word(s) entered is/are the *Qualifier*. The Qualifier is one or more words or digits used to further identify or complete the Object. Depending on the Object used, a Qualifier may or may not be used.

An example of a command line used to do a short test twice on a station with the extension number 1212 is: *test station 1212 short r 2*.

In the preceding example, *test* is the Action, *station* is the Object, and *1212 short r 2* is the Qualifier.

Spaces separate the Action, Object, and Qualifier on the command line.

> **NOTE:**
> Command line words do not have to be completely spelled out. All that is required is to type enough letters to make the word unique.

Screen Forms

After the user completes a command line (see Note), the terminal displays the appropriate screen form(s). Screen forms are system-generated forms that are formatted to allow easy entry of translation data.

Screen forms enable the user to change the translations of the system by typing parameters on the keyboard. Screen forms also allow system technician to display errors and alarms.

Each screen form consists of a title, page number, body area, and a help and error message line. Specific screen forms exist for each type of administrable function.

DEFINITY Communications System Generic 3 Implementation, 555-230-653, contains detailed information and examples of the screen forms generated by the system.

Switch-Based Bulletin Board

This feature will allow a SAT user to leave messages in the system in order to communicate with other system users.

> **NOTE:**
> This feature is not intended as a substitute for the existing procedures for escalating problems, but only as an aid to the existing process.

Description

The bulletin board service provides an easy interface for the customer and Lucent Technologies to leave messages on the system.

The bulletin board feature will make it very easy for the customer to communicate with Lucent Technologies (and vise-versa). For example, when a new load is installed on a switch in the customer's system, Lucent Technologies will be able to leave the customer messages which describe new functionality. This feature will also allow Lucent Technologies to keep the customer informed on the progress of trouble items. In addition, the feature can be used by the customer to provide additional information concerning problems that have already been escalated by the normal procedure.

Accessing the Bulletin Board

Any user with the appropriate permissions can log into the system and have access to the bulletin board. User's who have "Maintain System" or "Administer Features" permissions can enter, change, display, print, or schedule to print a message. Users who have "Display Admen" and "Maintain Data" permission can display the bulletin board. Any user who has "Display" permission can display, print, and schedule to print the contents of the bulletin board.

When logging onto the system, users will be notified of any messages on the bulletin board. The notification message will indicate the last time the bulletin board was updated, if any "High-Priority" message exists, and if the bulletin board is 80% or more full. If a "High-Priority" message exists, the command prompt will change to the following message:

- `High-Priority Bulletin Board Messages Entered:`

After the next command is entered, the default command prompt will return to the screen.

User Considerations

- Only one user at a time may edit a message on the bulletin board.
- The user must have the proper permissions to access the bulletin board.
- The user must maintain the information stored on the bulletin board. It is the user's responsibility to delete old messages. If the bulletin board is full, any new messages overwrite old messages.

System Considerations

- The switch software must be G3V3/G3V4.
- The Bulletin Board feature provides up to 3 pages of text for each message. Each page is limited to 20 lines of text, and each line of text is limited to 40 characters per line. The first 10 lines of text on page 1 is reserved for Lucent Technologies Service's High-Priority messages.

System Bulletin Board Commands

The system commands "**change bulletin board**," "**display bulletin board**," and existing commands in the user interface are provided for use in the Switch Based Bulletin Board.

Editing a Bulletin Board Message

To edit or enter a message on the Switch Based Bulletin Board the user must:

1. Log into the system with “Maintain System or Administer Features” Permissions.
2. Enter the command “**change bulletin-board**.”
3. Follow system prompts.

To display messages on the Switch Based Bulletin Board the user must:

1. Log into the system with “Maintain System”, “Display Admin”, or “Maint Data” permissions.
2. Enter the command “**display bulletin board**.”
3. Follow system prompts.

Editing a Switch-Based Bulletin Board Message

A message may contain up to three pages of information. Message lines 1 through 10 on page 1 are reserved for Lucent Technologies Services *High-Priority* messages (the “init” and “inads” logins can edit the first 10 lines on page one). Pages 2 and 3 will allow up to 20 lines of text, and each line of text may be up to 40 characters per line. Each line of text has an associated date field that is populated automatically by the system each time the line is modified.

The control keys used to edit existing feature forms must be used to edit a message in the Switch Based Bulletin Board. The following characters are allowed for use in the text field:

- Uppercase/Lowercase letters, spaces, numerals, and !@#$%^&*()_ -+=[]{};’”<>./?.

NOTE:
Tab characters are not allowed. The existing command line interface will cause the cursor to move to the next field if a Tab character is entered.

If a user changes any lines that cause two or more consecutive blank lines, then the bulletin board will be automatically reorganized (upon submittal). Two or more blank lines will be consolidated into a single blank line. If a blank line is at the top of a form, it will also be deleted. This function will help prevent holes in the bulletin board screens as old entries are deleted.

To save a message entered into the bulletin board text field, the user must execute the **save translation** command.

G3V3 software is required for the bulletin board feature. The bulletin board feature, as described in this document is available in G3V4. The G3V3/G3V4 feature on the systems-parameters customers-options form need not be enabled.

The following screen is an example of bulletin board messages between Lucent Technologies and a customer who is having trouble with trunk group translations:

```
display bulletin-board          Page 1 of 3

          Messages (* indicates high-priority)       Date

      * AT&T is in the process of                   02/02/95
      * investigating your trunk lockup problem.    02/02/95
      * The Bulletin Board will be updated as       02/02/95
      * information is found.                       02/02/95
      * We have identified the problem.             02/02/95
      * The trunk you added does not provide        02/02/95
      * disconnect supervision, however your trunk  02/02/95
      * group was administered as such.             02/02/95
      * Please call for details.                    02/02/95
      *
       We recently added a new trunk group (14)     02/03/95
       and have had trunk group members locking up. 02/03/95
       We see the error - Thanks for checking.      02/03/95
```

System Logoff Procedure

The system logoff procedure should be done any time the terminal is not being used. This assures that system translations are not accidentally corrupted. The **monitor system** command, when canceled, automatically causes a terminal user to be logged off and, thus, prevents unauthorized use of the terminal.

Use the following procedure to log off the system:

1. Verify that the screen displays: `enter command:`
2. Enter logoff and press RETURN. The screen displays: *login:*

If after either logging on as system technician or issuing a system technician command no additional command is issued for 30 minutes, an automatic time-out and logoff occurs. At that time, any alarms in the system previously unreported to INADS are reported. If you are logged in at two separate administration terminals, the system waits until the second terminal times out or until you log off before reporting such alarms to INADS.

System Logoff Procedure G3V4

Logoff Notification (G3V4) will alert system administrators during log off from the system administration and maintenance interface of features that present a significant security risk are enabled. A message will be displayed on the system administration/maintenance interface during logoff if a security risk feature is enabled. Additionally, the user can be required to acknowledge the notification before the logoff is completed.

DEC VT220 Terminal

The G3iV3-386 system supports use of the DEC VT220 as a Manager I terminal. The VT220 is connected to the system and used in the same way as the other Manager I terminals. When logging in, at the terminal-type prompt the user should enter "VT220" to initialize the correct parameters. Keyboard definitions shown in Table 3-7 are in effect:

Initialization and Recovery

4

General

When the system is powered up, or when it experiences a catastrophic fault that interrupts its basic functions, the system undergoes a reboot. Besides "reboot," there are several less severe resets available to the system that allows it to recover from disrupting errors. The user can initiate these resets by using the reset system commands. These commands are used to manually restart the system at various levels, depending on the required test activity. The reset system commands are discussed in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids".

A system is reset due to a loss of power, or via one of the following:

- Reset commands at the administration terminal.
- Maintenance software, from which the system can reset itself. (This process starts when certain software and hardware errors are detected by the software.)
- "Interchange," which is a type of reset that can be scheduled as part of daily maintenance in High or Critical Reliability systems.

WARNING:
When the system is rebooted or reset at level 2, 3, 4, or 5, all voice terminal and attendant console features are adversely affected. Users should be advised of services that are lost and that, as a result, must be reactivated. The affected services are described in the "Removing Power" section in Chapter 5, "Routine Maintenance Procedures".

The administration terminal display and circuit pack LEDs indicate the progress of the recovery process. LEDs are discussed in Chapter 7, ''LED Interpretation''.

The sections that follow discuss successful system resets. For each level of reset, a typical administration terminal display is provided. Note that any hexadecimal numbers that are shown in parentheses, such as "(=8B89)," are only examples and are subject to change. Susbsequent sections discuss the recovery process following an SPE-Down Mode and for "duplication interface-processing element communication down."

NOTE:
If any of the diagnostic tests fail, the system may or may not function properly, and the LMM may or may not proceed with the restart. If the LMM does not proceed with the restart, the system goes into SPE-Down Mode. In failure cases, the appropriate part (for example, the Processor circuit pack, the Memory circuit pack, or the Tape Unit, etc.) should be replaced.

NOTE:
Use and check the results of the **set/get vector** command found in the ''Set Commands'' section in Chapter 10, ''Maintenance Commands and Trouble-Clearing Aids'', "Maintenance Commands and Trouble-Clearing Aids" to determine how much time should be added for the recovery levels. Also, if an update file is applied on a system reset, add from 30 seconds to one minute to the recovery time for that reset.

Reset System 1 (System Warm Start)

This recovery takes about 30 seconds. All stable phone calls remain up. In-progress calls are dropped. No new calls can be made during this time.

In this restart, all software (Oryx/Pecos, drivers, maintenance, etc.) is reset.

Typical Display

```
RESET 1 (WARM) PERFORMED
```

Reset System 2 (System Cold Start Without Translations Loading)

All Port circuit packs are reset. All phone sessions are dropped. Phones begin to be reconnected to the switch within 30 seconds. In a large system, reconnection of all phones may take up to five minutes.

In this restart, all software (Oryx/Pecos, drivers, maintenance, etc.) is reset. In addition, the TDM Bus and all port circuit packs are reset. Typical displays in a 286 system, in a 386 system, and in a Release 5vs/si system follow:

Typical Display [286 systems]

ROM CHECKSUM TEST (= 8B89)	PASSED
DUAL PORT RAM TEST	PASSED
SOFT INT TEST	PASSED
NMI TEST	PASSED
RESET 2 (Cold_2) PERFORMED	

Typical Display [386 systems]

TN786 FLMM	
ROM CHECKSUM TEST (= 22C4)	PASSED
SOFT INT TEST	PASSED
NMI TEST	PASSED
RESET 2 (COLD_2) PERFORMED	

Typical Display [Release 5vs/si and later systems]

LOCAL BUS TEST	PASSED
ROM CHECKSUM TEST	PASSED
CONTROL STATUS TEST	PASSED
DCACHE TEST	PASSED
ICACHE TEST	PASSED
WRITE BUFFER TEST	PASSED
BTO TEST	PASSED
TIMER TEST	PASSED
RESET 2 (COLD_2) PERFORMED	

Reset System 3 (System Cold Start With Translations Loading)

Emergency Transfer is invoked. Translations are reloaded from tape in a 286 system or from a memory card in a 386 system. Depending on the translations, the reloading process could take from 30 seconds to five minutes in a 286 system from five seconds to 30 seconds in a 386 system. Thereafter, regardless of the system involved, all port circuit packs are reset, and all phone sessions are dropped. Phones begin to be reconnected to the switch within 30 seconds. In a large system, reconnection of all phones may take up to five minutes.

In this restart, all software (Oryx/Pecos, drivers, maintenance, etc.) is reset. After the software is reset, all translations are loaded from tape. In addition, the TDM Bus and all port circuit packs are reset. Typical displays in a 286 system in a 386 system and in a Release 5 vs/si system, follow:

Typical Display [286 system])

LMM VERSION 07.0.0	
INVOKING EMERGENCY TRANSFER	
ROM CHECKSUM TEST (= 8B89)	PASSED
DUAL PORT RAM TEST	PASSED
SOFT INT TEST	PASSED
NMI TEST	PASSED
RESET 3 (Cold_1) PERFORMED	

Typical Display [386 system]

TN786 FLMM	
INVOKING EMERGENCY TRANSFER	
ROM CHECKSUM TEST (= 22C4)	PASSED
SOFT INT TEST	PASSED
NMI TEST	PASSED
RESET 3 (COLD_1) PERFORMED	

Typical Display [TN790 Release 5vs/si and later systems]

INTERNAL REGISTER TEST	PASSED
LOCAL BUS TEST	PASSED
ROM CHECKSUM TEST	PASSED
CONTROL STATUS TEST	PASSED
DCACHE TEST	PASSED
ICACHE TEST	PASSED
WRITE BUFFER TEST	PASSED
BTO TEST	PASSED
TIMER TEST	PASSED
RESET 3 (COLD_1) PERFORMED	

Reset System 4 (System Reboot)

Emergency Transfer is invoked. In G1 and G3i 286, the LMM performs a series of diagnostics on the processor memory and on the tape. This takes less than two minutes. Then, the boot image is loaded from the tape. This takes less than four minutes. Translations are reloaded from the tape. Depending on the translations, the reloading process takes from 30 seconds to five minutes.

In a 386 system, however, the boot image is already in the flash ROM memory. The system is rebooted immediately after the LMM performs a series of diagnostics on the processor and memory. Translations are reloaded from the memory card. Depending on the translation, the reloading process takes from five to 30 seconds.

Thereafter, regardless of the system involved, all port circuit packs are reset, and all phone sessions are dropped. Phones begin to be reconnected to the switch within 30 seconds. In a large system, reconnection of all phones may take up to five minutes. Typical displays in a 286 system, in a 386 system and in a Release 5 system, follow:

Typical Display [G3iV1.1-286]

Reset System 5 (System Reboot and Run All 24-Hour Tests)

Emergency Transfer is invoked. The LMM performs a series of diagnostics on the processor, on memory, and on the tape [286 system] or memory card [386 system]. (Some of the diagnostics are performed twice.) This takes less than three minutes.

Then, in a 286 system, the boot image is loaded from tape. This takes less than four minutes. Translations are reloaded from the tape. Depending on the translations, the reloading process takes from 30 seconds to five minutes.

In a 386 system, however, the boot image is already in the flash ROM memory. The system is rebooted immediately after the LMM performs a series of diagnostics on the processor and memory. Translations are reloaded from the memory card. Depending on the translation, the reloading process takes from five to 30 seconds. Thereafter, regardless of the system involved, all port circuit packs are reset, and all phone sessions are dropped. Phones begin to be reconnected to the switch within 30 seconds. In a large system, reconnection of all phones may take up to five minutes. Finally, scheduled maintenance is initiated.

Typical displays in a 286 system in a 386 system and in a Release 5vs/si system, follow:

Reset System Interchange (High or Critical Reliability Systems Only)

SPE-interchange (system hot start) is denoted by an "i" in the initcauses log. This restart is used to transfer control from the Active SPE to the Standby SPE in the least disruptive manner. Interchange (i) is the most transparent of all levels of restart and causes no disruption of service to telephone users. This restart takes fewer than two seconds.

NOTE:
The administration terminal is logged off. No diagnostics are performed, and only the login prompt is displayed.

An interchange (i) can be performed in one of the following three ways:

a. System Technician-Demanded: via **reset system interchange** command

b. Scheduled Maintenance

c. Software-Requested: The software requests the interchange when it determines that the Standby SPE is healthier than the current Active SPE

NOTE:
For most SPE alarms, interchange to the Standby SPE is achieved using the hot restart (i). However, there may be other alarms for which another restart level (1 through 4) must be used to achieve a transition to the Standby SPE. See Table 8-1, “Software-Requested Interchanges Caused by Alarm Conditions” in Chapter 8, "Reliability Systems: A Maintenance Aid", for a complete list of alarms and restart levels.

Procedure for SPE-Down Mode

Due to fatal hardware and software problems, it is possible for a system to go into SPE-Down Mode. In this mode, the system invokes emergency transfer and does not provide any other service. Moreover, while in this mode, the software does not (or cannot) run at all. In a High or Critical Reliability system the system goes into SPE-Down mode **only when both SPEs go into SPE-Down mode**.

There is an interface to the system via maintenance. The Processor circuit pack, is responsible for maintenance in a Standard Reliability system. In a High or Critical Reliability system, the maintenance is provided by the A-carrier Duplication Interface (DUPINT-A) TN772 circuit pack with help from the processor.

The administration terminal, which is connected directly to the processor in a Standard Reliability system and to DUPINT-A in a High or Critical Reliability system, provides a very limited interface to the system. Technicians can display alarms or restart the system. Only a subset of control complex alarms is displayed.

The following are sample displays for SPE-Down mode and the alarms displayed.

Display for SPE-Down in a Standard Reliability system:

**************SPE DOWN MODE*************
You can display alarms and reset system(4).
SPE_DOWN->

Screen 4-1 and Screen 4-2 show all possible SPE-Down alarms in a Standard Reliability system and in a High or Critical Reliability system, respectively.

```
DISPLAY ALARMS:

     Physical   Logical   On       Alternate   Alarm       Date        Date
     Name       Name      Board?   Name        Type        Alarmed     Resolved

     ------     PROC_BD   y        -----       MAJOR       ------      ------
     ------     MEM_BD_0  y        -----       MAJOR       ------      ------
     ------     M_BUS     y        -----       MAJOR       ------      ------
     ------     MAINT*    y        -----       MAJOR       ------      ------
     ------     NETCON_BD y        -----       MAJOR       ------      ------
     ------     TAPE_UNIT ------   -----       MAJOR       ------      ------
     ------     NO_TAPE   ------   -----       MAJOR       ------      ------
```

Screen 4-1. Display Alarms Command

* The "MAINT" designation is used for PR-MAINT.

Display for SPE-Down in a High or Critical Reliability System:

**************SPE DOWN MODE************
You can display alarms [a|b] and reset system(4) [a|b].
SPE_DOWN->

Screen 4-2 shows only one SPE-Down alarm in a High or Critical Reliability system after entering the **display b** command:

```
DISPLAY ALARMS B:

    Physical   Logical   On        Alternate   Alarm       Date        Date
    Name       Name      Board?    Name        Type        Alarmed     Resolved

      ------    PROC_BD   y            -----    MAJOR       ------       ------
```

Screen 4-2. Display Alarms (one SPE-Down)

NOTE:
A Standard Reliability system tries to restart itself every 20 minutes. A High or Critical system tries to restart itself every ten minutes.

The first step is to determine the location of the problem. It is possible for two or more circuit packs to have failed. It is also possible for a fatal problem with one circuit pack to affect another circuit pack. This is especially true for the Processor and Memory circuit packs, where a failure in one affects the other. All three of the following methods should be employed to determine where the fatal fault lies.

1. Use **display alarms** command:

   Issuing the **display alarms [a | b]** command at the administration terminal shows where maintenance thinks the problem lies. The alarms are a good indication of why the system went down. They should be used with the following two methods.

2. Observe red LEDs:

   Observe the red LEDs on the circuit pack to determine where software or processor firmware (LMM) had a problem.

3. Use the **reset** command:

   In 286 system, issuing the **reset** command (Standard Reliability system) or the **reset [a | b]** command (High or Critical Reliability system) causes the system to attempt a **reset system 4**. Observe all the diagnostics on the screen, and note if the LMM has a problem with any of the diagnostics, as this information should give a good indication of where the problem lies.

The procedure to get a system out of SPE-Down mode follows.

NOTE:
This is important! If you cannot complete the first step or have problems with the maintenance interface, then the first step should be to replace the Processor circuit pack. In a High or Critical Reliability system the DUPINT-A circuit pack can also cause SPE-Down.

WARNING:
Powering down or reseating the Processor or Memory circuit packs in a G3i-286 system causes all memory to be lost (including the initcause log). Thus, it may then be difficult to determine the original cause of the problem. However, since the primary goal is to return the switch to service, this action is justifiable.

1. If the alarms indicate a tape failure, replace the tape or tape drive and go to Step 3. Otherwise, verify that there is a good tape in the tape drive. If a tape is not present or if either the tape or tape drive is defective, then restarting the system via the **reset** command causes the system to go down again.
2. In a High or Critical Reliability system, select a carrier to repair first.

   When it is possible to accurately determine the location of the problem, use the **display alarms [a | b]** command to display alarms for both SPEs and check the red LEDs on the processor complex circuit packs. Select the carrier where the red LEDs indicate the circuit pack alarmed. Bring up the system on that carrier and then refer to Standby SPE Maintenance documentation to repair the Standby SPE.

   In a Standard Reliability system or after a carrier is chosen in a High or Critical Reliability system, determine which circuit pack is defective by displaying alarms and observing the red LEDs (as discussed previously). Depending on the alarms, use the appropriate table on the following pages to replace the circuit packs indicated, one by one, in the order shown. Table 4-1 is for a 286 system, and Table 4-2 is for a 386 system.

Table 4-1. Order of Circuit Pack Replacement [286 system]

Alarm	Suggested Circuit Packs To Replace
PROC-BD	1) Processor
	2) Memory
	3) Network Control
MEM-BD-0	1) Memory 1
	2) Memory 2 (if present)
	3) Processor
MEM-BD-1	1) Memory 2
(G3iV1.1-286 only)	2) Memory 1
	3) Processor
MAINT[1]	1) Processor
M-BUS	2) Memory
NETCON-BD	1) Network Control
	2) Processor
TAPE-UNIT	1) Tape Cartridge
NO-TAPE	2) Tape Drive
	3) Processor

1 The "MAINT" designation is used for PR-MAINT.

Table 4-2. Order of Circuit Pack Replacement

Alarm	Suggested Circuit Packs To Replace
PROC_BD	1) Processor 2) Network Control
MEM_BUS	1) Processor 2) Network Control
PROC_MEM	1) Processor
OFFBD_MEM	1) Processor 2) Network Control
INVALID_ERR	1) Processor 2) Network Control
MAINT_BD	1) Processor 2) Network Control
NETCON_ABSENT	1) Network Control 2) Processor
NO_CARTRIDGE	1) Memory Card 2) Network Control 3) Processor

In G3iV1.1-286, restart the system via the **reset** command (Standard Reliability system) or via the **reset [a | b]** command for the standby proccesor (High or Critical Reliability system). Observe the diagnostics results on the administration terminal carefully. If a problem still exists, the diagnostics provide the best clue to determine what the next step should be.

Procedure for Duplication Interface — Processing Element Communication Down

In a High or Critical Reliability system, it is possible for both SPEs to stop communicating with the A-carrier TN772 Duplication Interface (DUPINT-A) circuit pack. Thus, the DUPINT-A, which is in charge of maintenance, prints the following message on the administration terminal:

```
Duplication Interface-Processing Element Communication down
```

The system may continue to function on one of the SPEs. However, the system is not able to provide any interface to the administration terminal.

If the system is still providing service, connect the administration terminal to the Active SPE (check the amber LED on the Processor circuit pack). Then, if software provides a login on the administration terminal, you can determine the problems via the **display alarms** command.

If the system is not providing service, there is a problem with the Processor circuit packs and/or DUPINT-A. Replace these circuit packs, one by one, until the system starts functioning normally.

Routine Maintenance Procedures

5

General

The following general purpose maintenance procedures may be used with other repair strategies to clear system-alarmed and user-reported troubles. The procedures are:

- INADS Alarm Origination—Activation/Deactivation
- Maintenance-Related System Parameters Form
- Handling Port Circuit Packs
- Handling Control Circuit Packs
- Performing a Memory Upgrade on a TN790 Processor
- Removing Power
- Restoring Power
- Troubleshooting Control Carrier Power Units
- System Backup
- Software Upgrade
- Preventive Maintenance Procedures
- System Features
- Troubleshooting Backplane Voltage Problems

Preventive maintenance strategies for air filters, tape head, and batteries are also provided in "Preventive Maintenance Procedures" in this chapter.

INADS Alarm Origination— Activation/Deactivation

Alarm origination suppression enables you to stop alarm origination while you work on the switch. If you elect to suppress alarm origination, the system still originates a cleared alarm message if the repair activity resolves all previously reported Major and Minor alarms.

Before performing any of the maintenance procedures, such as replacing a circuit pack or removing power, the alarm origination to Initialization and Administration System (INADS) should be deactivated. This action prevents INADS from receiving alarms caused by the maintenance activity.

NOTE:
No alarms are reported while the remote maintenance port (that is, INADS port on the Processor circuit pack) is in use. Thus, any alarms generated during a remote maintenance session are not reported until the session is terminated. Furthermore, if any alarms are retired before the maintenance session is complete, they are not reported at all.

The alarm origination should be reactivated when the maintenance activity has been completed.

You may activate/deactivate INADS alarm origination whenever you log in as "system technician." After you supply the terminal type information requested, the system displays the following if Alarm Origination is currently activated in the Maintenance-Related System Parameters Form:

Suppress Alarm Origination: [y]

The default answer is "yes." If you do NOT want to suppress alarm origination, enter either "n" or "no." If you press any other key or combination of keys, the system interprets your answer as a "yes."

If, after logging on as system technician, or after issuing a command, no additional system technician command is entered for 30 minutes, an automatic time-out and logoff occurs. At that time, any alarms in the system previously unreported to INADS are reported. If you are logged in as system technician at two separate administration terminals, the system waits until the second terminal times out or until you log off before reporting such alarms to INADS.

NOTE:
The **test inads-link** command works whether or not you have overridden INADS alarm origination.

Maintenance-Related System Parameters Form

See the **change system-parameters maintenance** command in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids"".

Handling Port Circuit Packs

WARNING:
Electrostatic discharge can destroy or severely damage integrated circuits or circuit packs. Always wear the electrostatic discharge (ESD) wrist grounding strap when handling circuit packs. In a multicarrier cabinet (MCC) system, a jack for the ESD strap is provided on the cabinet near the control carrier (see Figure 5-1). In a single-carrier cabinet (SCC) system, the jack for the ESD strap is located above the circuit packs (see Figure 5-2).

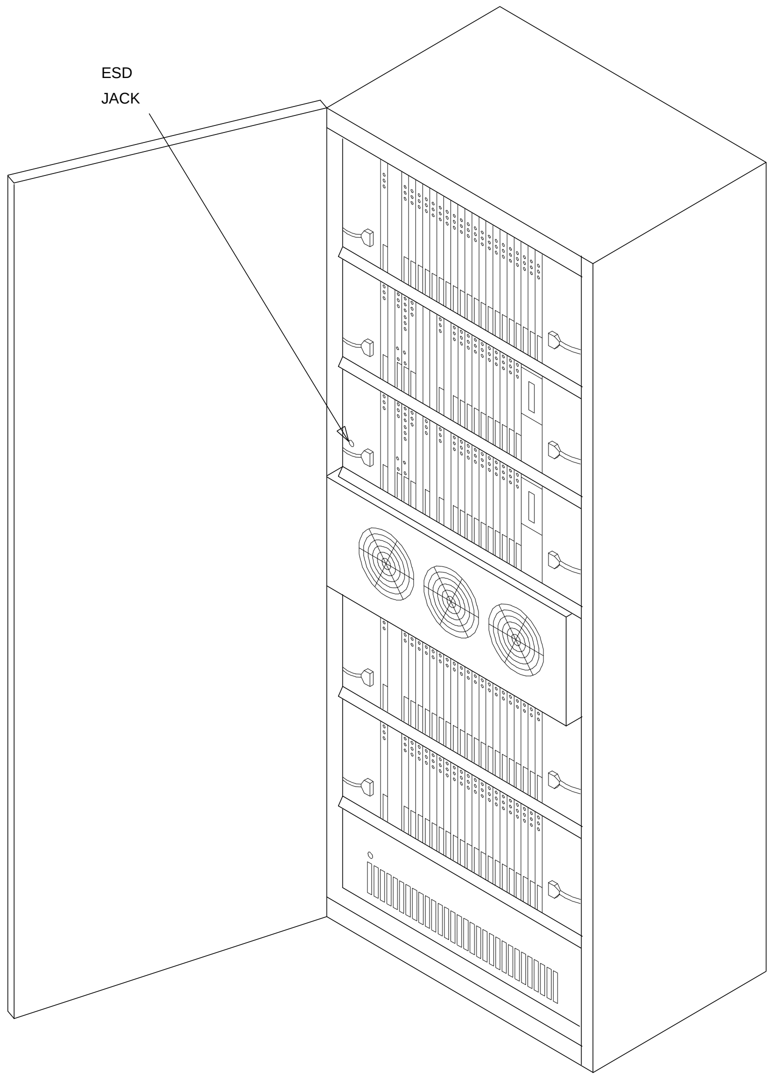

Figure 5-1. ESD Wrist Strap Grounding Locations on Carriers—Multicarrier Cabinet

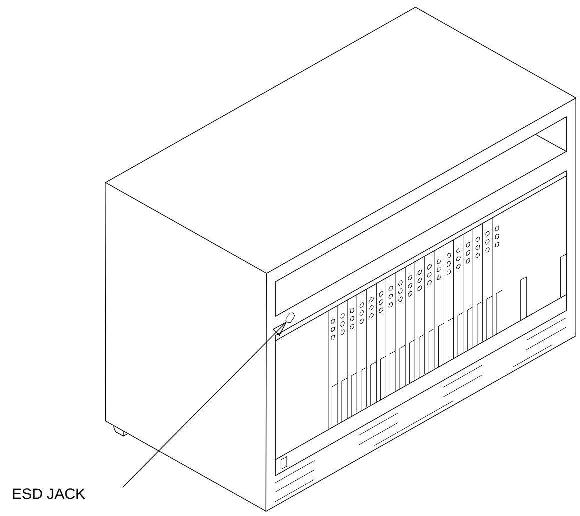

Figure 5-2. ESD Wrist Strap Grounding Locations on Carriers—Single Carrier Cabinet

The following procedures are for unseating, reseating, and replacing port circuit packs and are common to all maintenance activities that involve port circuit packs. The procedures are identical for both the PPN and EPN cabinets.

Common Port Circuit Packs

When any of the Common Port circuit packs (except the TN754 and TN754B Digital Line and TN758 Pooled Modem circuit packs) are physically removed from the backplane, no alarm is logged for about 11 minutes. For the Digital Line and Pooled Modem circuit packs, about 21 minutes elapse before an alarm is logged. When a circuit pack that has been removed is alarmed, the alarm type is Minor and is classified as an on-board alarm. The time delay permits maintenance activity to be performed without triggering an additional alarm. **An alarm is logged only against a Common Port circuit pack on which ports have been administered.**

NOTE:
In a heavily loaded system, the interval between the removal of a Common Port circuit pack and the logging of the alarm may be several minutes longer.

Reseating Port Circuit Packs

WARNING:
In general, it is NOT recommended that you reseat circuit packs unless the maintenance documentation specifically instructs you to do so. If the documentation does instruct you to unseat and reseat a port circuit pack, implement the following instructions for unseating and reseating port circuit packs.

CAUTION:
Any time a circuit pack is unseated, service is interrupted if the amber (busy) LED is lighted.

Each circuit pack has a latch pin and a locking lever on the lower part of its front panel (see Figure 5-3).

To unseat a circuit pack:

1. Slide the latch pin upward to unlock the locking lever.
2. Pull down on the locking lever until the pack is disconnected from its socket.
3. Pull the circuit pack just enough to break contact with the backplane connector, but do not remove it from the cabinet.

To reseat a circuit pack:

1. Push the unseated circuit pack back into the backplane connector.
2. Lift the locking lever until the pin engages.

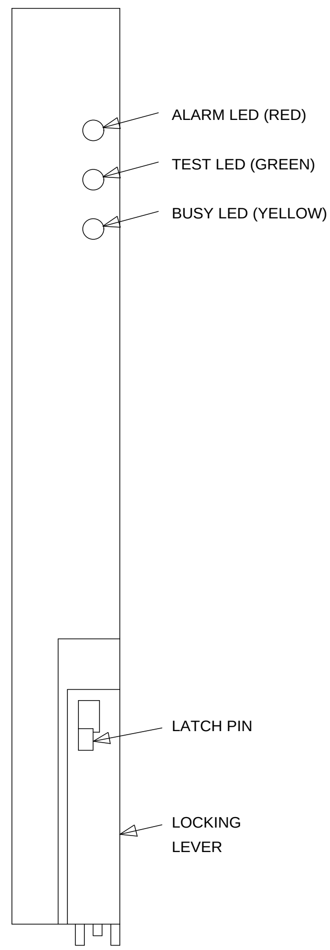

Figure 5-3. Typical TN-Coded Circuit Pack

Replacing Port Circuit Packs

Use the following procedures when replacing port circuit packs:

WARNING:
Replacing a port circuit pack temporarily clears any associated alarms; however, if the trouble still exists, the alarm(s) reappear(s).

1. Unseat the circuit pack.
2. Slide the circuit pack out of the slot.
3. Replace the circuit pack as per the following procedure:

   NOTE:
   If a new circuit pack does not correct the problem, install the original circuit pack.

To install a new circuit pack, or return the original one to service:

1. Carefully insert the circuit pack and push it all the way into its mounting slot.
2. Lift the locking lever until the latch pin engages.
3. Verify that the circuit pack LED indications are correct.

Handling Control Circuit Packs

PPN Control Circuit Packs

WARNING:
In general, it is NOT recommended that you reseat circuit packs unless the maintenance documentation specifically instructs you to do so. If the documentation does instruct you to unseat and reseat a circuit pack, then follow the instructions below which explain how to unseat, reseat, and replace circuit packs.

The procedures for unseating, reseating, and replacing control circuit packs vary depending on the system configuration. Therefore, before performing these maintenance activities, refer to the appropriate procedure below.

Procedure for a Multicarrier or Single Carrier Cabinet Without High or Critical Reliability

NOTE:
Each circuit pack has a latch pin and a locking lever on the lower part of its front panel (see Figure 5-3).

To unseat a Control circuit pack:

1. Remove power from the PPN using the appropriate procedure provided in the "Removing Power" section.
2. Slide the latch pin upward to unlock the locking lever.
3. Pull down on the locking lever until the circuit pack is disconnected from its socket.
4. Pull the circuit pack just enough to break contact with the backplane connector, but do not remove it from the cabinet.

To reseat a circuit pack:

1. Push the unseated circuit pack back into the backplane connector.
2. Lift the locking lever until the pin engages.
3. Restore power to the PPN using the appropriate procedure provided in the "Restoring Power" section.

To replace Control circuit packs:

1. Remove power from the PPN using the appropriate procedure in the "Removing Power" section.

1. Unseat the circuit pack.
2. Slide the circuit pack out of the slot.
3. Replace the circuit pack as per the following procedure:

   NOTE:
   If a new circuit pack does not correct the problem, install the original circuit pack.

NOTE:
If replacing a TN790 circuit pack refer to "TN790 Processor Circuit Pack (Memory)" in this chapter.

To install a new circuit pack or return the original one to service:

1. Carefully insert the circuit pack and push it all the way into its mounting slot.
2. Lift the locking lever until the latch pin engages.

3. Restore power to the PPN using the appropriate procedure in the "Restoring Power" section.
4. Verify that the circuit pack LED indications are correct.
5. Test the replaced control circuit pack(s) by issuing the appropriate system technician commands after power has been restored.

Network Control Circuit Pack

In a 286 system, the TN777 Network Control circuit pack is used. In a 386 system, the TN777B Network Control circuit pack is used.

Procedure for a 286 System

WARNING:
Whenever a TN777 Network Control circuit pack is reseated or replaced, the correct date and time setting must be manually entered and verified.

To reset the date and time, issue the **set time** command at the administration terminal. After *carefully* entering the desired information, issue the **display time** command to verify the accuracy of the date and time. Refer to Chapter 8, "Reliability Systems: A Maintenance Aid", for specific procedures when handling circuit packs in the control (processor) complex of a High or Critical Reliability system.

Procedure for a Multicarrier] or Single Carrier Cabinet With High or Critical Reliability

Refer to the "Circuit Pack Replacement Procedure" section in Chapter 8, "Reliability Systems: A Maintenance Aid".

Procedure for a 386 System

WARNING:
Whenever a TN777B Network Control circuit pack is reseated or replaced, the correct date and time setting must be manually entered and verified.

The TN777B Network Control Pack holds a memory card. Before this circuit pack can be handled (that is, unseated, reseated, replaced, or installed), the memory card must be removed. Figure 5-4 and Figure 5-5 present two views of the TN777B Network Control circuit pack:

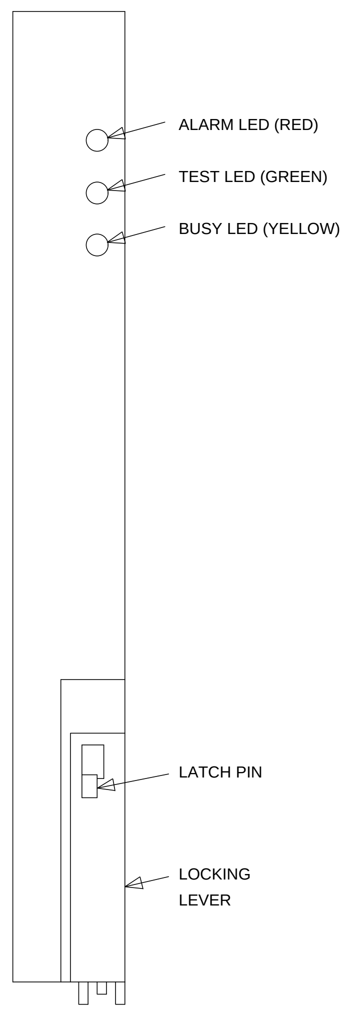

Figure 5-4. TN777B Network Control Circuit Pack (Front View)

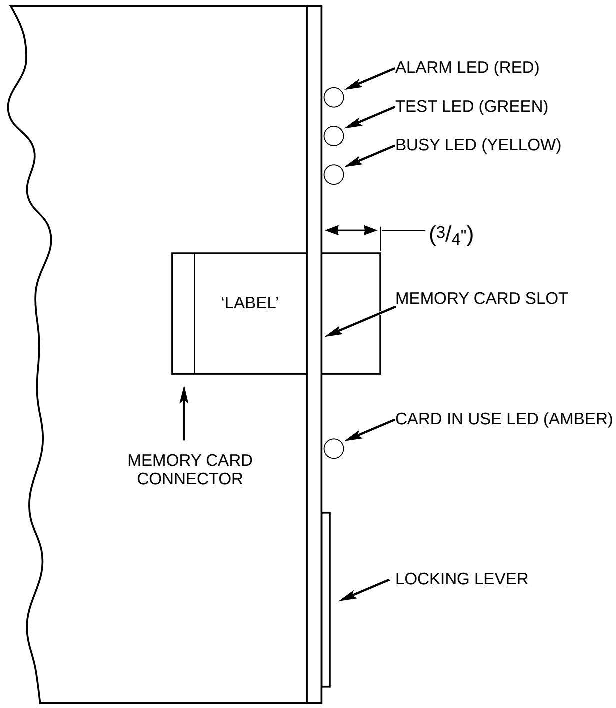

Figure 5-5. TN777B Network Control Circuit Pack (Side View)

To remove the memory card from the memory card slot in the TN777B circuit pack, do the following:

1. Check that the "card in use" LED is not lighted. Otherwise, removing the memory card may damage the data recorded on it.
2. Carefully pull the memory card from the memory card slot.

To insert the memory card into the memory card slot in the TN777B circuit pack, do the following:

1. Take the memory card and hold it in front of you so that the card's label is facing to your left.
2. With the memory card in this position, insert the shorter edge of the card into the mounting slot. Then, gently push the card forward until you feel some resistance at the opposite edge of the card. Once you feel this resistance, the memory card is inserted. About 3/4 of an inch of a fully inserted memory card should appear outside of the memory card slot.

WARNING:
Remember, assuming you are directly facing the circuit pack, the memory card label should be facing to your left. If this is not the case, remove the memory card according to the instructions provided previously in this section, and start again.

3. Test the inserted memory card by issuing the **test card-mem** system technician command (described in Chapter 8, "Reliability Systems: A Maintenance Aid").

EPN Control Circuit Packs

Control circuit packs (TN768, TN780, TN775, TN776, TN570 in the EPN) are unseated, reseated, replaced, and tested in the same way as Port circuit packs. **It is not necessary to remove power from the EPN [G1.2].** Refer to the "Handling Port Circuit Packs" section in this chapter. Note the special precautions required when handling the TN776 and TN570 Expansion Interface (EXP-INTF) circuit packs and the EPN TN768 and TN780 [G.2] Tone-Clock circuit packs.

EPN Expansion Interface Circuit Packs

If the system has High or Critical Reliability, verify that the Expansion Interface to be unseated or replaced is NOT a part of the Active Expansion Interface Link. Issue the **status system** command. If the Expansion Interface circuit pack is shown to be a part of the Active Expansion Interface Link, use the **set expansion-link PCSS** command to make the current Standby link the Active one.

EPN Tone-Clock Circuit Packs

If the EPN has redundant Tone-Clock circuit packs, make sure the Tone-Clock to be unseated or replaced is the Standby circuit pack. Issue the **status system** command. If the Tone-Clock is shown as Active, use the **set tone-clock PC** command to make the current Standby Tone-Clock the Active one.

TN790 Processor Circuit Pack (Memory)

The TN790 must have the same number of SIMMs as the replaced circuit pack.

CAUTION:
Be sure to use a Lucent Technologies-provided SIMM. Other brands may have incompatible edge connectors and could produce unpredictable results.

Install the SIMM on the TN790 Processor Circuit Pack

WARNING:
Before handling the circuit pack or the SIMM, put on a wrist strap and attach its plug or clip to the cabinet's frame.

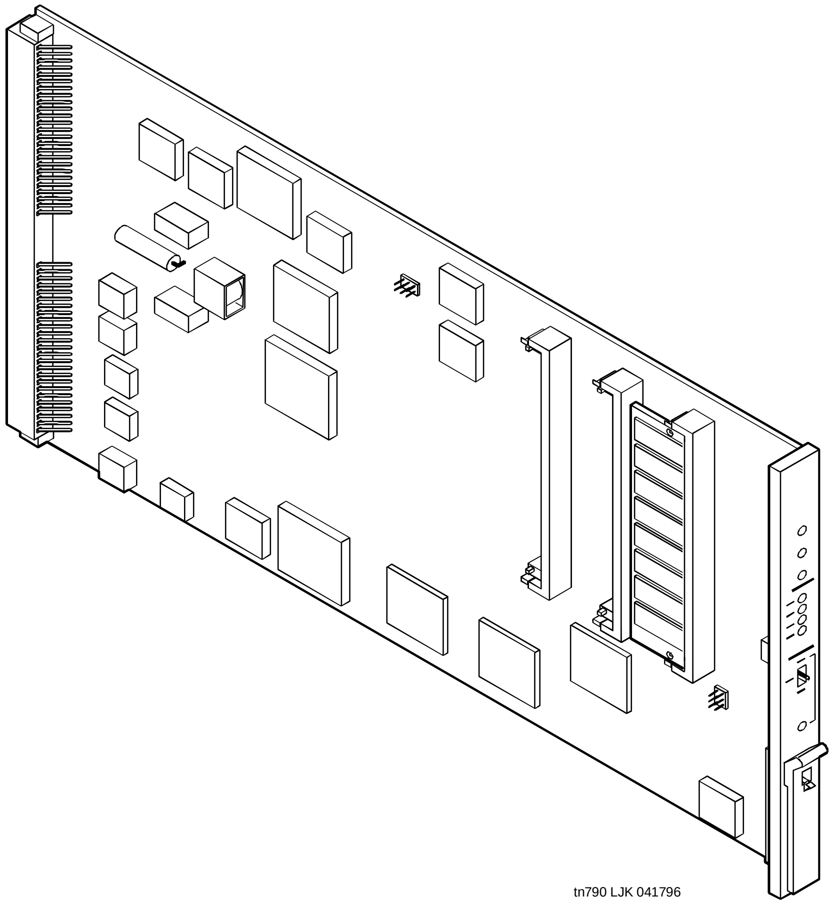

Figure 5-6. TN790 Processor Circuit Pack

Use the following procedure to install a SIMM:

1. Remove the TN790 Processor circuit pack from the control carrier.
2. Place the TN790 Processor circuit pack on an ESD-approved work station, such as the anti-static circuit pack packaging or anti-static mat.
3. Locate the Notch cutout area on one corner of the SIMM. See Figure 5-3. See WARNING.

WARNING:
Do not touch the SIMM's edge connector. Oils from your fingers can cause corrosion and/or oxidation to the contacts.

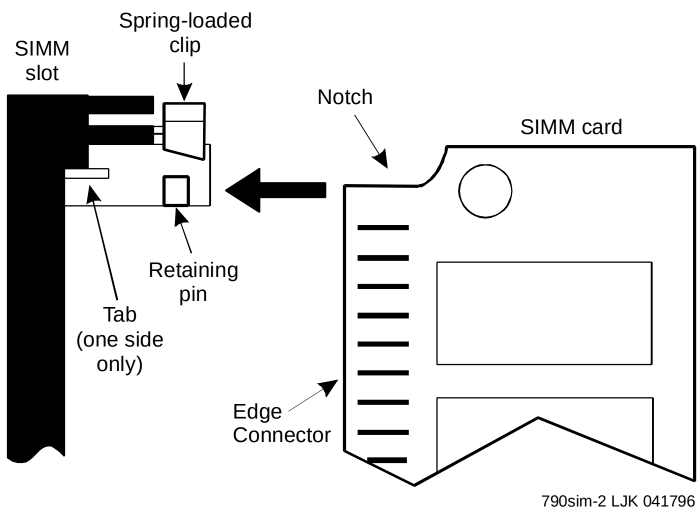

Figure 5-7. Align the SIMM with the SIMM Socket

4. Align the SIMM with the slot in the center of the SIMM socket.

   (See Figure 5-3).

   Hold the SIMM at a 45-degree angle, with the notch pointing towards the front face plate of the circuit pack. Align the SIMM's edge connector with the slot in the center of the SIMM socket. See WARNING.

   WARNING:
   Do not use force when inserting the SIMM into the SIMM socket. When the SIMM is installed correctly, it will snap easily into place.

5. Press the SIMM's edge connector firmly into the SIMM socket.

   Pivot the SIMM up and towards the circuit pack until it clicks into place (as shown in Figure 5-4).

   The metal tabs at each end of the socket snap into place around the SIMM and the small retaining pins snap into the holes at each end of the SIMM.

   If you have misaligned or only partially seated the SIMM, you will not hear a sharp click, and the retaining pins will not snap cleanly into the holes. You can easily remove the SIMM (see the next section, "Removing a SIMM,") and reinstall it.

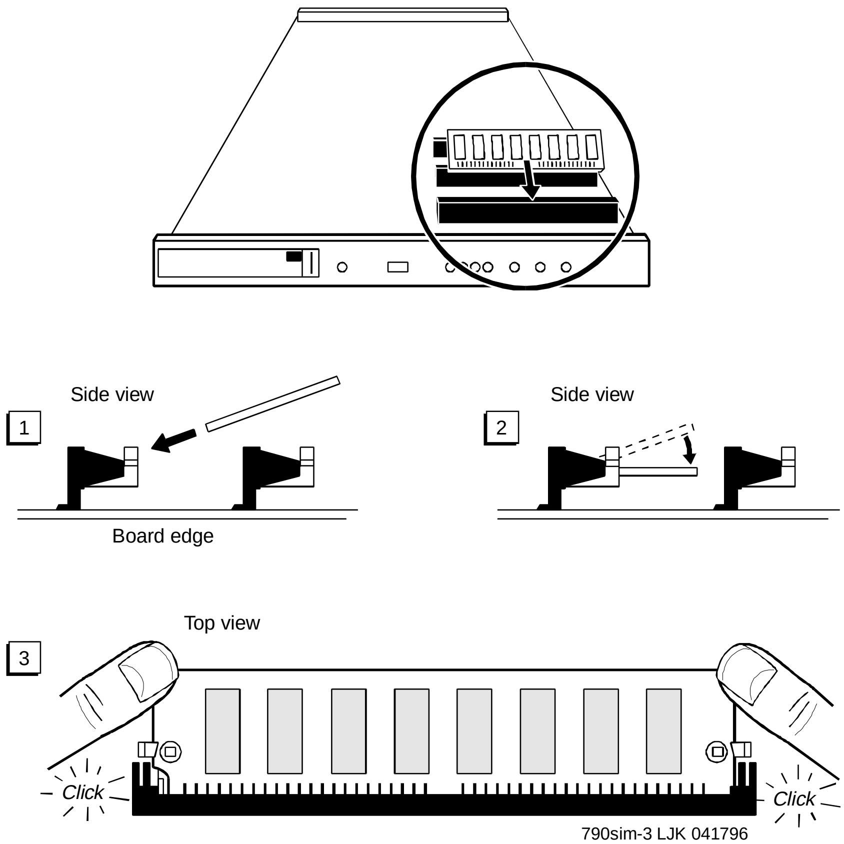

Figure 5-8. SIMM Insertion Procedure

Removing the SIMM from the TN790 Processor Circuit Pack

See WARNING.

> **WARNING:**
> *Before handling the circuit pack or the SIMM, put on a wrist strap and attach its plug or clip to the cabinet's frame.*

See Figure 5-2 to locate the SIMM sockets on the TN790 processor circuit pack.

Use the following procedure to remove a SIMM:

1. Place the TN790 Processor circuit pack on an ESD-approved work station, such as the circuit-pack packging or an anti-static mat.

2. Carefully press the spring-loaded clips, located at each end of the SIMM socket, away from the SIMM. The SIMM will reposition itself at an angle when both clips are released. See Figure 5-9.

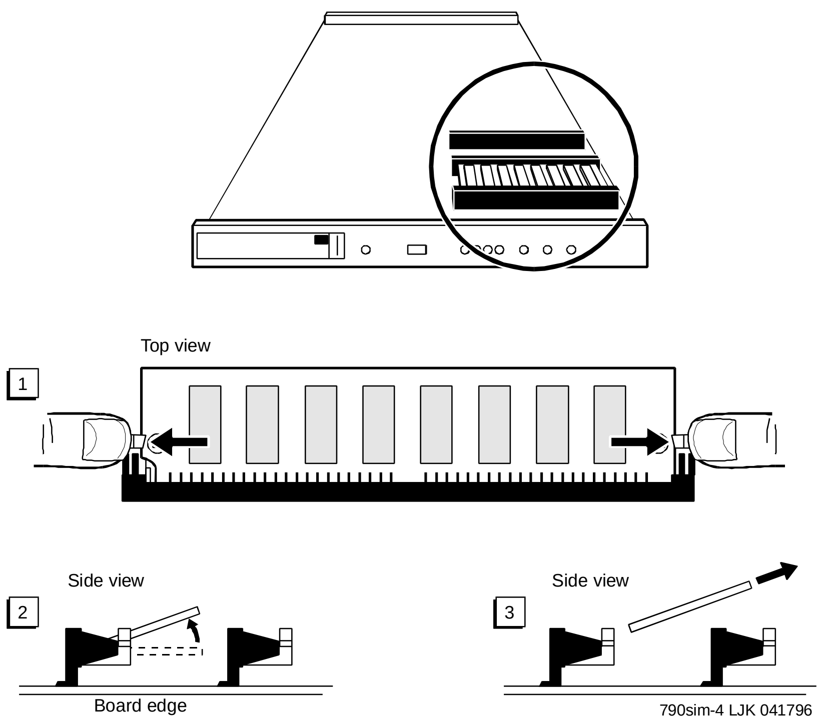

Figure 5-9. Removing a SIMM from its Socket

3. Remove the SIMM and place it in an ESD bag.

Removing Power

When power is removed, the following features, if activated, are deactivated:

- Attendant Trunk Group Control
- Automatic Callback
- Call Park
- Make Busy for Direct Department Calling (DDC) and Uniform Call Distribution (UCD)

The procedures for removing power vary depending on the system configuration. Therefore, before performing these maintenance activities, refer to the following appropriate procedure.

Procedure for a Multicarrier or Single Carrier Cabinet PPN

This procedure applies to a multicarrier or single carrier cabinet PPN with or without High or Critical Reliability, where the cabinet is powered by either an AC or a DC power source. For a G3sV2 or G3vsV2 system, this procedure applies to a single-carrier cabinet PPN, where the cabinet is powered by either an AC or a DC power source [G3sV2] or by an AC power source [G3vsV2].

NOTE:
286 Systems use Tape Storage, 386 Systems use memory card storage.

WARNING:
If a Tape Alarm is present, or if a tape problem is suspected, do not save translations on either of the two tapes provided with the system (current tape and backup tape). An attempt to save translations can destroy all data on the tape. Obtain a spare third tape or do not save translations.

WARNING:
If a memory card alarm is present, or if a memory card problem is suspected, do not save translations of the memory card that is provided with the system.

To remove power, do the following:

1. Check that the tape cartridge is in the tape drive. or check that the memory card is in the TN777B Network Control circuit pack.
2. At the administration terminal, enter the **save translations** command, unless a tape drive problem or a memory card problem is active.

3. In a standard reliability system on the Processor circuit pack in the PPN, and on the Maintenance circuit pack in the EPN, set the Emergency Transfer switch to "ON."

CAUTION:
When removing power, Error Log information is lost. If the data is to be retained, enter the ***reset system 4*** *command. This command restarts the system and may take several minutes. Wait for the login prompt before proceeding.*

4. To remove power from the cabinet or carrier (single carrier cabinet), proceed as follows:
   - In an AC-Powered multicarrier cabinet system, set the circuit breaker to OFF at the Power Distribution Unit (see Figure 5-4).
   - In a DC-Powered multicarrier cabinet system, turn off the DC Power supply.
   - In an AC-Powered single carrier cabinet system, turn off the power in each carrier individually. The ON/OFF switch is located at the back of the carrier behind the WP-91153 Power Unit.
   - In a DC-Powered single carrier cabinet system, turn off the power in each carrier individually. The ON/OFF switch is located at the back of the carrier behind the 676B Power Unit.

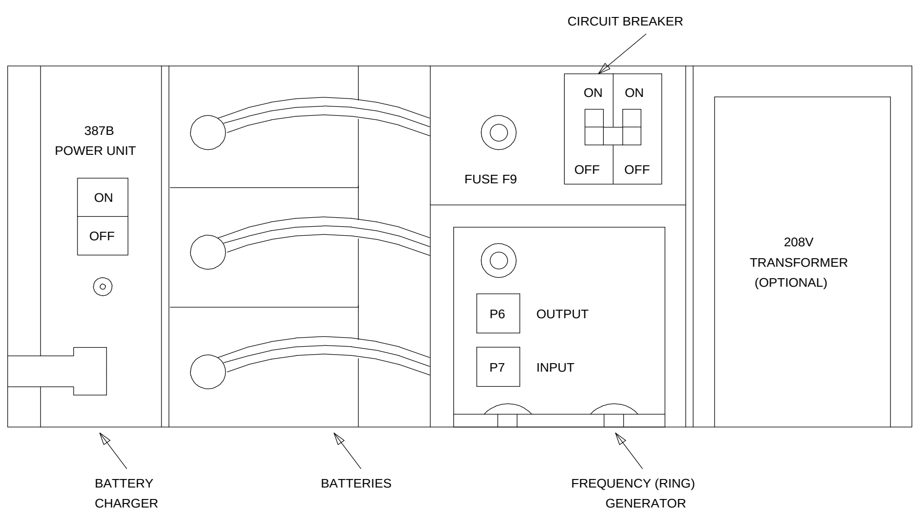

Figure 5-10. Power Distribution Unit

Procedure for a Multicarrier or Single Carrier Cabinet EPN

This procedure applies to a multicarrier cabinet EPN or a single carrier EPN with or without High or Critical Reliability, where the cabinet is powered by either an AC or a DC power source.

Power may be removed from the EPN without affecting the PPN.

NOTE:
In a High or Critical Reliability system, if power is to be removed from an individual carrier only, make sure that the affected carrier does not contain an Expansion Interface circuit pack that is part of the Active Expansion Link or an Active Tone-Clock. To determine which Expansion Interface Link and Tone-Clock are active, issue the **status system** command. To determine the synchronization reference, use the **display synchronization** command.

1. To remove power from the cabinet (multicarrier cabinet) or carrier (single-carrier cabinet), proceed as follows:
   - In an AC-Powered multicarrier cabinet system, set the circuit breaker to OFF at the Power Distribution Unit (see Figure 5-4).
   - In a DC-Powered multicarrier cabinet system, turn off the DC Power supply.
   - In an AC-Powered single-carrier cabinet system, turn off the power in each carrier individually. The ON/OFF switch is located at the back of the carrier behind the WP-91153 Power Unit.
   - In a DC-Powered single-carrier cabinet system, turn off the power in each carrier individually. The ON/OFF switch is located at the back of the carrier behind the 676B Power Unit.

Restoring Power

The procedures you need to restore power depend on the system configuration. Therefore, before performing these maintenance activities, refer to the following appropriate procedure.

Procedure for Multicarrier and Single Carrier Cabinet PPN

This procedure applies to both multicarrier and single-carrier cabinet PPNs with or without High or Critical Reliability, where the cabinet is powered by either an AC or DC power source. In G3sV2 or G3vsV2, this procedures applies to single-carrier PPNs that are powered by either an AC or DC power source [G3sV2] or by an AC power source [G3vsV2].

NOTE:
In a High or Critical Reliability system, if power is to be removed from an individual carrier only, make sure that the affected carrier does not contain an Expansion Interface circuit pack that is part of the Active Expansion Link or an Active Tone-Clock. To determine which Expansion Interface Link and Tone-Clock are active, issue the **status system** command. To determine the synchronization reference, use the **display synchronization** command.

1. Restore power as follows:

   NOTE:
   If the carrier is powered by a 676B Power Unit, the 676B must have been powered off for at least 10 seconds before being powered on. If not, the 676B Power Unit does not restart.

   - In an AC-Powered multicarrier cabinet system, set the circuit breaker to ON at the Power Distribution Unit (see Figure 5-4).
   - In a DC-Powered multicarrier cabinet syste, turn off the DC Power supply.
   - In an AC-Powered single carrier cabinet system, turn on the power in each carrier individually. The ON/OFF switch is located at the back of the carrier behind the WP-91153 Power Unit.
   - In a DC-Powered single carrier cabinet system, turn on the power in each carrier individually. The ON/OFF switch is located at the back of the carrier behind the 676B Power Unit.

2. If this system uses a memory card, make sure that the memory card is properly inserted into the slot.

3. The system now goes through the rebooting process. In a 286 system, the system program and the translations are loaded from the tape. The translations are loaded from the memory card, and rebooting requires about three minutes.
4. When system power is restored, the appropriate display is shown on the administration terminal.

   The display is the same as a **reset system 4** that is described in Chapter 4, "Reset System 4 (System Reboot)".
5. After the system reboot is finished and all trouble is cleared, return the EMER XFER (Emergency Transfer) switch(es) to AUTO. This restores the system to the normal operating mode.
6. Reset the time using the **set time** command. Use **display time** command to verify.

Procedure for Multicarrier and Single Carrier Cabinet EPN

Power may be restored to the EPN without affecting the PPN.

This procedure applies to both multicarrier and single-carrier cabinet EPNs with or without High or Critical Reliability, where the cabinet is powered by either an AC or DC power source.

NOTE:
In a High or Critical Reliability system, if power is to be removed from an individual carrier only, make sure that the affected carrier does not contain an Expansion Interface circuit pack that is part of the Active Expansion Link or an Active Tone-Clock. To determine which Expansion Interface Link and Tone-Clock are active, issue the **status system** command. To determine the synchronization reference, use the **display synchronization** command.

1. To restore power to the cabinet (multicarrier cabinet) or carrier (single-carrier cabinet), proceed as follows:

   NOTE:
   If the carrier is powered by a 676B Power Unit, the 676B must have been powered off for at least 10 seconds before being powered on. If not, the 676B Power Unit does not restart.

   - In an AC-Powered multicarrier cabinet system, set the circuit breaker to ON at the Power Distribution Unit (see Figure 5-4).
   - In a DC-Powered multicarrier cabinet system, turn on the DC Power supply.
   - In an AC-Powered single-carrier cabinet system, turn on the power in each carrier individually. The ON/OFF switch is located at the back of the carrier behind the WP-91153 Power Unit.
   - In a DC-Powered single-carrier cabinet system, turn on the power in each carrier individually. The ON/OFF switch is located at the back of the carrier behind the 676B Power Unit.
2. The EPN circuit packs is inserted and the EPN is available for call processing.
3. After the system reboot is finished and all trouble is cleared, return the Emergency Transfer switch to AUTO. This restores the system to the normal operating mode.

Troubleshooting Control Carrier Power Units

For an AC- or DC-powered multicarrier cabinet system with or without High or Critical Reliability, the CARR-POW (Carrier Port Power Unit) MO represents the pair of power units that provide power for each carrier in a multicarrier cabinet system. If a problem is reported by hardware for a power unit in a port carrier, the system can recycle the pair of power units in the port carrier. However, if the problem is reported in a control carrier, the **recycle carrier PC** command can be used *only* for power units in the B carrier of the following configurations:

- Multicarrier Cabinet PPN
- Multicarrier Cabinet EPN with High or Critical Reliability
- Multicarrier Cabinet EPN

Therefore, special troubleshooting procedures have been provided for your use if a problem is suspected in one of the power units in an A carrier or the B carrier of a PPN in a High or Critical Reliability system when the "recycle" command should not be used. Recall that in a multicarrier cabinet (PPN or EPN), carrier A is the control carrier, and carriers B, C, D, and E are the port carriers. In a multicarrier cabinet system with High or Critical Reliability, carriers A and B are the control carriers and carriers C, D, and E are the port carriers. In a control carrier, if the LED on one of the power units is red and an alarm has been raised in the Alarm Log against the CARR-POW MO, the power units may be defective. If it is defective, it should be replaced. However, occasionally a red LED on a control carrier power unit may indicate a defective circuit pack (control or port) in that carrier, a defective backplane, or a transient problem of no significance rather than a defective power unit. Use the following appropriate procedure to troubleshoot control carrier power units in a multicarrier cabinet system with or without High or Critical Reliability.

Recall that in a multicarrier cabinet (PPN or EPN), carrier A is the control carrier, and carriers B, C, D, and E are the port carriers. In a multicarrier cabinet system with High or Critical Reliability, carriers A and B are the control carriers and carriers C, D, and E are the port carriers. In a control carrier, if the LED on one of the power units is red and an alarm has been raised in the Alarm Log against the CARR-POW MO, the power units may be defective. If it is defective, it should be replaced. However, occasionally a red LED on a control carrier power unit may indicate a defective circuit pack (control or port) in that carrier, a defective backplane, or a transient problem of no significance rather than a defective power unit. Use the following appropriate procedure to troubleshoot control carrier power units in a multicarrier cabinet system with or without High or Critical Reliability.

Procedure for a Multicarrier Cabinet Without High or Critical Reliability

WARNING:
If a Tape Alarm is present or a tape problem is suspected, do not save translations on either of the two tapes provided with the system (current tape and backup tape). An attempt to save translations could destroy all data on the tape. Obtain a spare third tape or do not save translations.

1. Check that the tape cartridge is in the Tape Transport.
2. At the administration terminal, enter the save translations command, unless a tape drive problem is active.
3. On both the Processor circuit pack in the PPN and on the Maintenance circuit pack in the EPN, set the EMER XFER (Emergency Transfer) switch to ON. This locks the system in the Transfer Mode until the trouble is cleared.

   WARNING:
   Electrostatic discharge can destroy or severely damage integrated circuits or circuit packs. Always wear the electrostatic discharge (ESD) wrist grounding strap when handling circuit packs. Connect the wrist strap to one of the metal tabs located on the lower left or right side of one of the carriers (see Figure 5-1 and Figure 5-2).

4. Unplug the power unit.
5. Move the locking slide on the suspect power unit to the extreme left position, and unlatch the locking lever.
6. Unseat the power unit.
7. Unseat all the control carrier circuit packs.
8. Reseat the power unit.
9. Plug in the power unit.
   a. If the red LED on the suspect power unit lights immediately, then the control circuit packs can be presumed to be healthy.
   b. If the red LED on the suspect power unit does **not** light immediately, continue with the next step.

10. Reseat the circuit packs one at a time while observing the LED on the power unit.
    a. If the red LED lights when a specific circuit pack is reseated, unseat and reseat the same circuit pack again to rule out a transient problem. If the red LED lights again, then the problem is with the circuit pack, and the power unit is functioning properly. Replace the defective circuit pack.
    b. If the red LED on the suspect power unit does **not** light during the reseating of the control circuit packs, continue with the next step.
11. Unseat all port circuit packs.
12. Reseat the port circuit packs one at a time following the same steps outlined above for control circuit packs.
13. If none of the control or port circuit packs appears to be defective, then the power unit is defective and should be replaced. Refer to the CARR-POW (Carrier Port Power Unit for AC-Powered or DC-Powered Systems) Maintenance documentation in Chapter 11, "Maintenance Object Repair Procedures", for instructions on replacing the various types of power units.
14. When the new power unit has been installed and the system reboot has completed, return the EMER XFER (Emergency Transfer) switch to AUTO. This restores the system to the normal operating mode.

Procedure for a Single-Carrier Cabinet Without High or Critical Reliability

The same procedure outlined in "Procedure for a Multicarrier Cabinet without High or Critical Reliability [G3iV1.1-286]" can be used with the exception of using information provided by the red LED on Multicarrier cabinets (Steps 9 and 10). Single-Carrier Cabinet power units have only a yellow LED. If the yellow LED is on, the power unit is operating as normal. If the LED is off, no external power is being supplied, or the power unit has a fault. So, for Steps 9 and 10, the yellow LED going off is the indicator of a problem with a circuit pack (given there is external power).

Procedure for a Single Carrier Cabinet

The following procedure is relevant only to a system that uses a memory card instead of tape.

1. Check that the memory card is in the TN777B circuit pack.
2. At the administration terminal, enter the **save translation** command, unless a a memory card problem is active.

3. On the Processor circuit pack in the PPN, set the EMER XFER (Emergency Transfer) switch to ON. This locks the system in the Transfer Mode until the trouble is cleared.

   WARNING:
   Electrostatic discharge can destroy or severely damage integrated circuits or circuit packs. Always wear the electrostatic discharge (ESD) wrist grounding strap when handling circuit packs. Connect the wrist strap to one of the metal tabs located on the lower left or right side of one of the carriers (see Figure 5-1 and Figure 5-2).

4. Unplug the power unit.
5. Move the locking slide on the suspect power unit to the extreme left position, and unlatch the locking lever.
6. Unseat the power unit.
7. Unseat all the control circuit packs.
8. Reseat the power unit.
9. Plug in the power unit.
   a. If the yellow LED on the suspect power unit lights immediately, the control circuit packs can be presumed to be healthy.
   b. If the yellow LED on the suspect power unit does **not** light immediately, continue with the next step.
10. Reseat the circuit packs one at a time while observing the LED on the power unit.
    a. If the yellow LED lights when a specific circuit pack is reseated, unseat and reseat the same circuit pack again to rule out a transient problem. If the yellow LED lights again, the problem is with the circuit pack, and the power unit is functioning properly. Replace the defective circuit pack.
    b. If the yellow LED on the suspect power unit does **not** light during the reseating of the control circuit packs, continue with the next step.
11. Unseat all port circuit packs.
12. Reseat the port circuit packs one at a time following the same steps outlined above for control circuit packs.
13. If none of the control or port circuit packs appears to be defective, the power unit is defective and should be replaced. Refer to the CARR-POW (Carrier Port Power Unit for AC-Powered or DC-Powered Systems) Maintenance documentation in Chapter 11, "Maintenance Object Repair Procedures", for instructions on replacing the various types of power units.

14. When the new power unit has been installed and the system reboot has completed, return the EMER XFER (Emergency Transfer) switch to AUTO. This restores the system to the normal operating mode.

Procedure for a Multicarrier Cabinet With High or Critical Reliability

CAUTION:
When any troubleshooting or maintenance activity is performed in a carrier housing a suspect power unit, the carrier must be in Standby mode.

1. By issuing the **status system** command at the administration terminal, determine the mode (Active or Standby) of the control carrier or housing the suspect power unit.

   If the carrier with the suspect power unit is the Active carrier, clear any alarms associated with the Standby carrier. For detailed instructions on processor complex repair procedures, refer to the "STBY-SPE (Standby SPE)" Maintenance documentation in Chapter 11, "Maintenance Object Repair Procedures", and to the "Repair Procedures for High and Critical Reliability" section in Chapter 8, "Reliability Systems: A Maintenance Aid".

   Issue the **reset system interchange** command.

2. Reissue the **status system** command to verify that the control carrier containing the suspect power unit is still in Standby mode.

3. To override any attempt by the system software to make the Standby SPE the Active SPE, the SPE Select Switches on the Duplication Interface circuit packs must be moved as follows:

   a. If the suspect power unit is in control carrier A, move both SPE Select Switches to the SPE-B position (that is, to the right) one at a time.

   b. If the suspect power unit is in control carrier B, move both SPE Select Switches to the SPE-A position (that is, to the left) one at a time.

   WARNING:
   Electrostatic discharge can destroy or severely damage integrated circuits or circuit packs. Always wear the electrostatic discharge (ESD) wrist grounding strap when handling circuit packs. Connect the wrist strap to one of the metal tabs located on the lower left or right side of one of the carriers (see Figure 5-1 and Figure 5-2).

4. Unplug the suspect power unit.
5. Move the locking slide on the suspect power unit to the extreme left position and unlatch the locking lever.
6. Unseat the power unit.
7. Unseat all control carrier circuit packs.
8. Reseat the power unit.
9. Plug in the power unit.
   a. If the red LED on the suspect power unit lights immediately, then the control circuit packs can be presumed to be healthy.
   b. If the red LED on the suspect power unit does **not** light immediately, continue with the next step.
10. Reseat the control circuit packs, one at a time, while observing the LED on the power unit.
    a. If the red LED lights when a specific circuit pack is reseated, unseat and reseat the same pack again to rule out a transient problem. If the red LED lights again, then the problem is with the circuit pack, and the power unit is functioning properly. Replace the defective circuit pack.
    b. If the red LED on the suspect power unit does **not** light during the reseating of the control circuit packs, continue with the next step.
11. Unseat all port circuit packs.
12. Reseat the port circuit packs, one at a time, following the same steps outlined above for control circuit packs.
13. If none of the control or port circuit packs appear to be defective, then the power unit is defective and should be replaced. Refer to the CARR-POW (Carrier Port Power Unit for AC-Powered or DC-Powered Systems) Maintenance documentation in Chapter 11, "Maintenance Object Repair Procedures", for instructions on replacing the various types of power units.
14. Return the SPE switches to the AUTO position, one at a time.
15. If you wish to issue **test** commands on Standby SPE components, issue the **refresh** command. Then, perform all desired **test** commands.

    NOTE:
    It may be necessary to issue the **refresh spe-standby** command multiple times to preempt all Standby SPE maintenance activity. If the **refresh spe-standby** command is issued five times without the Standby SPE becoming labeled "standby" on the status system form, escalate the problem.

16. After all desired **test** commands have been executed, issue the **test spe-standby long** command since the **refresh spe-standby** command preempted a Standby SPE maintenance activity.
17. If the **refresh spe-standby** command was used in the time frame in which scheduled maintenance with a translation save was to have been conducted, issue the save translation command to ensure that the current translation data has been written to both the Active and Standby tapes.

Procedure for a Single-Carrier Cabinet With High or Critical Reliability

The same procedure outlined in "Procedure for a Multicarrier Cabinet with High or Critical Reliability" can be used with the exception of using information provided by the red LED on Multicarrier cabinets (Steps 9 and 10). Single-Carrier Cabinet power units have only a yellow LED. If the yellow LED is on, the power unit is operating as normal. If the LED is off, no external power is being supplied, or the power unit has a fault. So, for Steps 9 and 10, the yellow LED going off is the indicator of a problem with a circuit pack (given there is external power).

Replacing Components Within the G3vs or Release 5vs or later

Components within the G3vs unit can be replaced while the unit is attached to the wall. Also, if the wires and cables at the back of the cabinet that connect the unit to the wall are neatly bundled, these wires and cables need not be disconnected as a prelude to replacing components.

Figure 5-11 and Figure 5-12 that follow provide views of the power supply sub-assembly. Figure 5-13 provides a view of the fan sub-assembly. The sections following the figures discuss how to disassemble the G3vs unit and then replace the power supply or fans within the unit.

CAUTION:
Whenever you are replacing either the power supply or the fans within a G3vs unit in cases where the unit is already attached to the wall, you should disconnect the entire fan panel from the unit. Otherwise, if the fan panel is left to dangle, the cable assemblies leading out from the fans (which are connected to the fan panel) and into the backplane might become damaged or disconnected from the backplane.

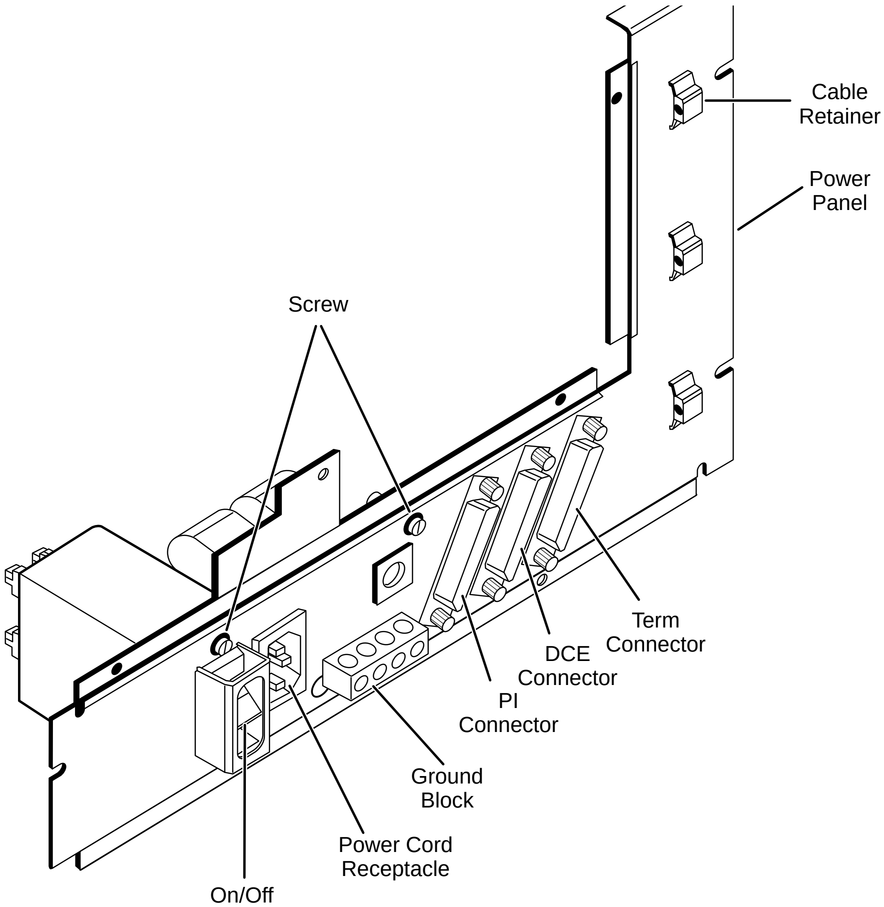

Figure 5-11. Power Supply Sub-Assembly (Outside View)

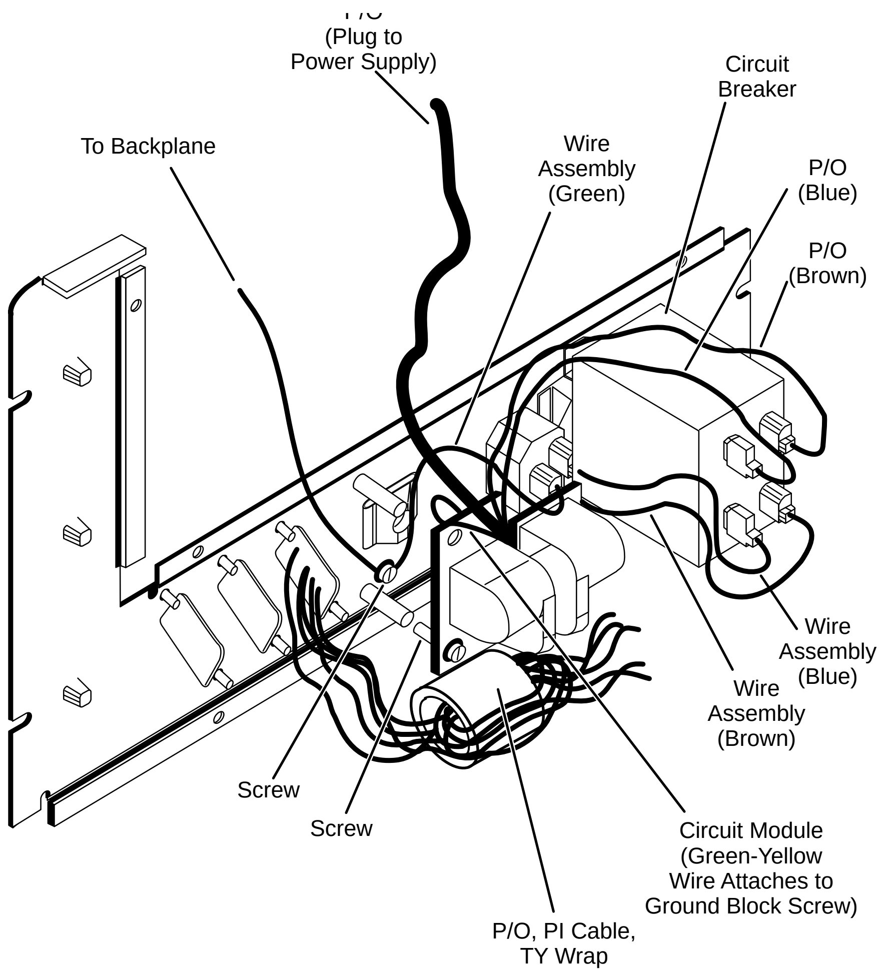

Figure 5-12. Power Supply Sub-Assembly (Inside View)

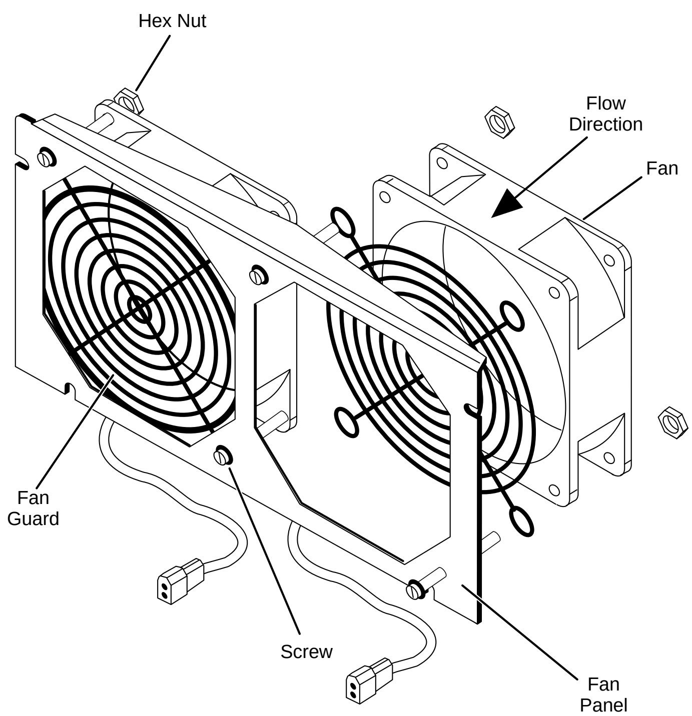

Figure 5-13. Fan Sub-Assembly

Power Supply

To replace the power supply, do the following:

1. Remove the four screws on the top of the CSCC.
2. Remove the four screws from the fan panel at the back of the unit. Then remove the fan panel.
3. If the G3vs unit is already attached to the wall, disconnect the entire fan panel.
4. Extending out from the power supply is a cord consisting of numerous individual wires. This cord plugs into the backplane. A Burndy connector is at the end of the cord. Squeeze the sides of the connector to release the latch. Then pull the connector off of the backplane.
5. Remove the power supply from the unit. Once the power supply is removed, disconnect the AC power cord.
6. Reconnect the AC power cord, insert the new power supply, reconnect the Burndy connector and the cord, reinsert (if removed) the reconnected fan panel, screw the fan panel back onto the unit, and reinsert the screws on the top of the unit.

Fans

To replace the fan(s), do the following:

1. At the back of the unit, remove the four screws from the fan panel. Then remove the panel.
2. If the G3vs unit is already attached to the wall, disconnect the entire fan panel.

   CAUTION:
   The power cord for each fan extends from a plug on the backplane. Do not tug on any of these cords. Otherwise, the corresponding plug on the backplane might come off.

3. Each fan has a power cord. At the end of each power cord is a plug and receptacle. Disconnect the plug for each fan that is to be replaced. Then remove the appropriate fan(s).
4. Install the new fan(s), reconnect the fan plug(s), reconnect the fan panel (if disconnected), and screw the fan panel back onto the back of the unit.

System Backup

System translations can be restored by using the data on the system or on the backup tape or memory card if the length of power failure is appropriate for the corresponding system. Table 5-1 lists the requirements:

Table 5-1. Requirements for System Backup

Minimum Length of Power Failure (in Minutes)	System
10	Multicarrier Cabinet Standard System
5	Multicarrier Cabinet High or Critical Reliability System
2	Single Carrier Cabinet Standard System
2	Single Carrier Cabinet High or Critical Reliability System

Save Translation

To ensure that the tape drive cassette tape or memory card contains the most recent copy of the translation data, the system can automatically save the translation data onto the cassette tape or memory card every 24 hours.

NOTE:
Automatic daily backup of the system translation data is controlled by an entry in the system parameters that is defaulted to "daily," which means the system automatically saves translation every 24 hours.

If many translation data changes are made, it is recommended that you save the translation data using the **save translation** command. This action saves the new changes on the cassette tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2] without having to wait for the next automatic daily translation backup.

NOTE:
The **save translation** command, which includes saving translations as a part of scheduled maintenance, blocks all maintenance commands except some **list, display, monitor** and **status** commands.

The system blocks the execution of any commands that change translations, read the tape, or trigger a maintenance action (for example, **test board**, **busyout port**, etc.). Any attempt to issue such commands causes the system to display the following error message: "tape command active."

In systems that use memory cards, the **status card-mem** command is blocked during the save translation operation.

In a High or Critical Reliability system , if the **save translations** command is entered without a qualifier, an attempt is made to save the translations on *both* the Active and Standby SPE. If the command is qualified with either "spe-active" or "spe-standby," the translations are saved only on the specified SPE. For example, if, when the **save translations** command was issued, the translations were successfully saved on the Active SPE’s memory card, but were not successfully saved on the Standby SPE’s memory card, you would issue the **save translations spe-standby** command to save the translations on the Standby SPE’s tape as well.

In a 286 system, if extensive changes, additions, or deletions are made, translations should be saved more frequently, alternating the two tapes in the process. Then, in case of a power outage, only the data entered since the last "save" are lost. See the following sections on tape backup.

The system blocks the execution of any commands that change the translation, access a memory card, or trigger a maintenance action.

WARNING:
It is recommended that "save translations" be performed after business hours so that dial tone delays are not encountered.

WARNING:
Do not issue the "save translations" command when alarm conditions are present.

Save Recorded Announcements

In a 286 system, the recorded announcements in the system can be saved on the system cassette tape by entering the **save announcements spe active** or **spe standby** command. In later systems, such announcements can be saved on the system memory card by entering the **save announcements** command.

In a High or Critical Reliability system, if the **save announcements** command is entered without a qualifier, an attempt is made to save the integrated announcements on *both* the Active and Standby SPE. If the command is qualified with either "spe-active" or "spe-standby," the integrated announcements are saved only on the specified SPE. For example, if, when the **save announcements** command was issued, the integrated announcements were successfully saved on the Active SPE's memory card, but were not successfully saved on the Standby SPE's memory card, then you would issue the **save announcements spe-standby** command to save the announcements on the Standby SPE's tape as well.

WARNING:
The "save announcements" commands should only be used after business hours or when the system is operating during a low usage period. The system takes about 45 minutes to one hour to transfer the recorded announcements from the Announcement circuit pack to the system tape. During this interval, use of the administration terminal is blocked for other activities until the command completes.

Tape Backup for a 286 System Without High or Critical Reliability

Two cassette tapes are provided with the system. **It is recommended that a backup copy of the translation data be made weekly,** or after many changes have been made to the translation data. This minimizes the loss of recent translation data changes if the cassette tape in the system becomes damaged. Also, if a TN750 Announcement circuit pack is present, **it is recommended that a backup copy of the recorded announcements be made whenever they are changed.**

NOTE:
If there is an update file on the system cassette tape, contact the TSC to place a copy of the update file on the backup cassette tape. This step is not necessary if the backup cassette tape already contains a copy of the update file. Refer to the software configuration reports in the "list config software-version" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids" to determine if there is an update file on the system cassette tape and backup cassette tape.

The following procedure can be used to make a backup tape.

1. Verify that the tape is not in motion. Place finger tips on tape cartridge and feel for tape movement. The LED on the TN774 Tape Drive circuit pack only lights while a read/write function is performed. The tape may be moving because of periodic maintenance or completion of a previously executed command that has caused the tape to operate. **Failure to do this may cause a tape alarm.** Remove the cassette tape from the tape drive.
2. Insert the other cassette tape into the tape drive.
3. Log in to the terminal.
4. Verify screen displays:

   enter command:
5. Enter `save translation` and press Return. This command instructs the system to take all translation information in memory and write it onto the cassette tape.
6. Screen displays:

SAVE TRANSLATION

Processor	Command Completion Status	Error Code
SPE_A	success/specific error message	x*

* where x = Error Code 0, 1, or 2.

The list of possible error codes and their interpretations for the `save translation` command is provided as follows:

Save Translation Command Error Codes

Code	Interpretation
0	The save operation was a complete success; both copies of tape translation data were updated.
1	The save operation was a partial success: only one of the two copies of tape translation data was updated. The tape drive should be repaired before any further save translation operation should take place.
2	The save operation failed completely; no translation was saved to either tape copy of translation data. The tape drive should be repaired before any further save translation operation should take place.

7. If a TN750 Announcement Circuit is present, enter `save announcements` and press Return. This command instructs the system to copy all the recorded integrated announcements from the system and write them onto the cassette tape. **This step is not necessary if the backup cassette tape already contains a copy of the current recorded announcements**. Refer to the software configuration reports in the "list config software-version" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", to determine the date of the announcement file on the backup cassette tape.
8. Remove the cassette tape from the tape drive and insert the other cassette tape into the tape drive.
9. Label the backup cassette tape with the date and time it was created. A special notation may be put on the tape to clearly distinguish it from other cassette tapes.
10. Store the backup tape in a secure place.

Tape Backup for a High or Critical Reliability 286 System

Four cassette tapes are provided with the system. **It is recommended that backup copies of the translation data be made weekly,** or after many changes have been made to the translation data. This minimizes the loss of recent translation data changes if the cassette tapes in the system become damaged. Also, if a TN750 Announcement circuit pack is present, **it is recommended that a backup copy of the recorded announcements be made whenever they are changed.**

NOTE:
If there is an update file on the system cassette tapes, contact the TSC to place a copy of the update file on the backup cassette tapes. This step is not necessary if the backup cassette tapes already contain a copy of the update file. Refer to the software configuration reports in the "list config software-version" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", to determine if there is an update file on the system cassette tapes and backup cassette tapes.

The following procedure can be used to make backup tapes:

1. Verify that the tape is not in motion. Place finger tips on tape cartridge and feel for tape movement. The LED on the TN774 Tape Drive circuit pack only lights while a read/write function is performed. The tape may be moving because of periodic maintenance or completion of a previously executed command that has caused the tape to operate. **Failure to do this may cause a tape alarm and an SPE interchange.**
2. Remove the two cassette tapes from the tape drives.

3. Insert the other two cassette tapes into the tape drives.
4. Log in to the terminal.
5. Verify screen displays:

   enter command:
6. Enter **save translation** and press RETURN. This command instructs the system to take all translation information in memory and write it onto the two cassette tapes.
7. Screen displays:

SAVE TRANSLATION

Processor	Command Completion Status	Error Code
SPE_A[1]	success/specific error message	x[2]
SPE_B[1]	success/specific error message	x[2]

1 The Active SPE's status is always displayed first. The upper right portion of the display illustrates the Active SPE. In a High or Critical Reliability system, if a qualifier is used to save translation for only one SPE, only that SPE's status is given

2 where x = Error Code 0, 1, or 2.

The list of possible error codes and their interpretations for the save translation command is provided below:

Save Translation Command Error Codes

Code	Interpretation
0	The save operation was a complete success; both copies of tape translation data were updated.
1	The save operation was a partial success: only one of the two copies of tape translation data was updated. The tape drive should be repaired before any further save translation operation should take place.
2	The save operation failed completely; no translation was saved to either tape copy of translation data. The tape drive should be repaired before any further save translation operation should take place.

8. If a TN750 Announcement Circuit is present, enter save announcements and press RETURN. This command instructs the system to copy all the recorded integrated announcements from the system and write them onto the two cassette tapes. **This step is not necessary if the backup**

cassette tapes already contain a copy of the current recorded announcements. Refer to the software configuration reports in the "list config software-version" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", to determine the dates of the announcement files on the backup cassette tapes.

9. Remove cassette tapes from the tape drives and insert the other two cassette tapes into the tape drives.
10. Label the two backup cassette tapes with the date and time they were created. A special notation may be put on the tapes to clearly distinguish them from other cassette tapes.
11. Store the backup tapes in a secure place.

Tape Errors

Since the tape drive is a mechanical device, tape-related failures may occur. When these failures occur, the system responds with "tape error messages." The following is a list of the "tape error messages" and recommended responses to each. Check for the proper operation after each response is done.

1. **Tape access failure; no tape cartridge or device failure**—Implies that the cassette tape is missing or improperly seated. This error can also occur if the tape drive has a hardware problem.

   Response: Check tape drive for missing or improperly seated cassette tape.

   Check tape drive for missing or improperly seated cassette tape.

   Check cassette tape to determine if write-protect latch is in the "RECORD" position. If so, turn latch away from "RECORD" position to allow "write" capability.

   Refer to the "Tape Drive Head Cleaning Procedure" section in the "TAPE (Tape Unit) [G3iV1.1-286]" Maintenance documentation.

   WARNING:
   Check for damaged or worn cassette tape. If cassette tape is damaged, do not insert the backup tape. If the backup tape is inserted, it may also be destroyed.

2. **Tape currently in use**—Implies that the system is currently accessing the tape for administration or maintenance purposes.

   Response: Wait a few minutes and repeat command that generated tape error message.

3. **Tape write failure; cartridge or device failure**—Implies that there was a failure in writing to the tape.

   Response: Refer to the procedures in message 1.

4. **Tape read failure; cartridge or device failure**—Implies there was a failure reading from the tape.

   Response: Refer to the procedures in message 1.

5. **System error; please try again later.**

   Response: Follow normal maintenance procedures for resets. Refer to "System Reset and Reboot Indications." Wait one minute and try again.

6. **Internal translation data is corrupted**—Implies that the translation data is inconsistent and the translation was not saved on tape.

   Response: Replace cassette tape with system backup tape.

   Enter the **reset system 3** command. After command completes, remove the backup tape and install the original tape, and then repeat the command that generated the error message. If the same error message is displayed again, escalate the problem.

7. **Translation file is too large to fit on the tape**—Implies that the system software has malfunctioned.

   Response: Follow normal escalation procedures.

8. **Cannot access the Standby SPE at this time**—Implies that the Standby SPE in a High or Critical Reliability system is not accessible. To determine state of the SPE, issue the **status system** command. If the Standby SPE is in Maintenance Mode, try again later.

9. **Tape translation data corrupted**—Implies error encountered in saving translation. If error occurs again, escalate the problem.

10. **Error encountered, can't complete request**—Implies error encountered in saving translation. If error occurs again, escalate the problem.

Memory Card Backup

In case of a power failure, the system translations can be restored using the Memory Card.

Translation data can be saved during the daily scheduled maintenance. However, if the translation data changes frequently, translations should be saved frequently to ensure that the most up-to-date information is kept.

Note that only one Memory Card is provided with the system. It is recommended that the customer purchase additional Memory Cards to serve as backup or replacement Memory Cards. Memory Cards should be alternated periodically.

It is also recommended that backup copies of the translation data be made weekly, or after many changes have been made to the translation data. This minimizes the loss of recent translation data changes if the Memory Card in the system becomes damaged.

WARNING:
"Save translation" should not be performed if any Memory Card alarm conditions occur or if the system is having problems.

WARNING:
It is recommended that "save translation" be performed after business hours so that dial tone delays are not encountered.

Enter the **save announcements** command to save the recorded announcements in the system on the system Memory Card.

NOTE:
A 10 Mb Memory Card or larger is required to save and restore announcements.

The system takes about 30 minutes to complete this task. Because the administration terminal is unavailable during this time, it is recommended that this command be used after business hours. During this time period, the administration terminal cannot be used to administer the system until the transfer is complete; however, all other administration terminals (if provided) are allowed to perform administration procedures.

Enter the **restore announcements** command to restore the recorded announcements from the Memory Card back into system memory. The system takes about 22 minutes to complete this task. **After completing the task, the system performs an audit to make sure that the announcements on the announcement circuit pack match the announcements administered in the switch.**

The working copy of the announcements is stored on the announcement circuit pack. A backup copy should be made on a 10 Mb Memory Card or larger. The following procedure is used to make a backup Memory Card:

1. Remove the Memory Card from the Netcon circuit pack.
2. Insert the backup Memory Card into the Netcon circuit pack.
3. Log in to the terminal.
4. Verify that the screen displays: `enter command:`
5. Enter the **save translation** command and press RETURN. This command instructs the system to take all translation information in memory and transfer it into the Memory Card.

The following display appears:

```
 save translation                                                    SPE A
                              SAVE TRANSLATION

Processor                       Command Completion Status        Error Code

SPE_A                                   Success                      0

Command successfully completely

enter command:
```

Screen 5-1. Save Translation — SPEA

6. Verify that the command successfully completes. If it does not successfully complete, an error message appears instead. In such a case, refer to the "Memory Card Errors" section.
7. If the system is equipped with a TN750 Announcement circuit pack, the recorded announcements can be saved using the **save announcement** commands. Enter the command and press RETURN.

   The following display appears:

```
save announcements
                              SAVE ANNOUNCEMENTS

Processor                     Command Completion Status          Error Code

SPE_A                                 Success                        0

Command successfully completely

enter command:
```

Screen 5-2. Save Announcements Screen — SPEA

8. Verify that the command successfully completes. If it does not successfully complete, an error message appears instead. In such a case, refer to the "Memory Card Errors" section.
9. Remove the backup Memory Card from the slot in which it is installed, and insert the original Memory Card into that slot.

10. Label the backup Memory Card with the date and time it was updated. A special notation may be put on the card to clearly distinguish it from other Memory Cards.
11. Store the backup Memory Card in a secure place.

Memory Card Errors

Memory Card-related failures may occur for two reasons: the card is at fault, or the Netcon circuit pack is at fault. When either failure occurs, the system responds with "error messages." The following is a list of the error messages and recommended responses to each message. Check for proper operation after each response is done.

1. **Cannot access file storage area**—Implies that the wrong Memory Card may be installed.

   Response: Check to see which Memory Card is installed. If the correct one is installed, test it. If it passes, and if the problem still persists, escalate the problem to the next level of support.

2. **Cannot turn on 12 volt power supply**—Implies that something may be wrong with the Netcon circuit pack, which contains the power supply.

   Response: Test the 12-volt power supply by entering the **test card-mem** command from the system administration terminal. Executing this command causes the system to run Test 701 (12 Volt Power Supply Test). If the power supply test fails, replace the Netcon circuit pack. To do this, follow the instructions in the Maintenance manual for the

   12V-PWR MO. Then repeat whichever command failed.

3. **Invalid directory on Card-Mem**—Implies that the Memory Card needs refreshing.

   Response: Run **test card-mem** and be sure all tests pass.

4. **Card-Mem is unusable**—Implies that something is wrong with the Memory Card.

   Response: Replace the Memory Card.

5. **Could not write to Card-Mem**—Implies that something may be wrong with the Memory Card.

   Response: Test the Memory Card.

6. **Cannot access mass storage system now; try again later**—Implies that the storage system is in use.

   Response: Try again later.

7. **Request is incompatible with currently running operations**—Implies that the storage system is in use.

   Response: Try again later.

8. **Card-Mem is not inserted in the system**

   Response: Insert the Memory Card.

9. **Cannot access file; wrong type of Card-Mem is inserted**—Implies that the correct Memory Card for the desired operation has not been inserted.

   Response: Load the appropriate Memory Card.

10. **File size exceeded**—Implies that there is no more file space.

    Response: Call your Lucent Technologies representative.

11. **Upgrade Memory Card inserted**—Implies that the System Upgrade Memory Card may have been inserted instead of the translations memory card.

    Response: Insert the translation Memory Card.

12. **Card-Mem is write-protected**—Implies that the switch on the top side of the Memory Card is incorrectly set.

    Response: Move the switch to the correct position, as shown in Figure 5-14:

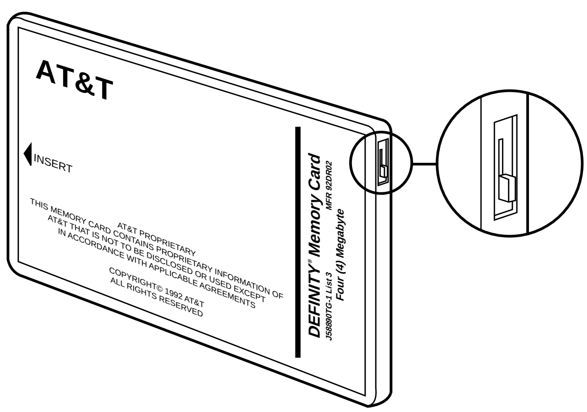

Figure 5-14. Memory Card Switch Position

13. **Transmission problem; please try later**—Implies that there is a problem communicating with the announcement circuit pack.

Response: Check to see that the announcement circuit pack has been correctly administered. Use the **change data** *<extension_number>* command. Verify that the announcement circuit pack is in the correct slot in the processor. If so, wait and retry.

14. **Command has been aborted; please try later**—Implies that the command has been pre-empted.

    Response: Try again later.

15. **Saved copy of translations is unusable**—Implies that the copy of the translations on your Memory Card is faulty.

    Response: Re-enter the **save translation** command.

Software Upgrade

The software upgrade feature permits a DEFINITY system to upgrade its software to include new features and to fix software problems. In a 286 system, performing an upgrade on a system without High or Critical Reliability requires a **reset system 4** (reboot) and thus causes a service disruption (refer to Chapter 4, "Initialization and Recovery". Performing an upgrade on a system equipped with High or Critical Reliability requires only a **reset system 2** (Cold-2) restart that is less disruptive (once again, refer to Chapter 4, "Initialization and Recovery").

WARNING:
No administration changes should be entered during the following software upgrade procedure. There can be substantial time gaps between steps and, since the system cannot prevent administration changes, it is up to the system technician to make sure that none are attempted during the entire software upgrade process.

NOTE:
This section does not apply to processor hardware upgrades such as upgrading a 386 system to a Release 5 vs/si or later system. See "Upgrades and Additions/Software Upgrades".

Procedure on a 286 System Without High or Critical Reliability

1. Perform a sanity check on translations by issuing the **list station** and **display station <ext>** commands. The translations are corrupted if the response "Error encountered, can't complete request" appears or if too few or many stations are listed for the **list station** command or if the response "Entry is bad" appears for the **display station <ext>** command. If the translations are corrupted, use the **list configuration software** command to determine the date and time of the translations in memory and the tape. Then insert the backup tape and use the **list configuration software** command to determine the date and time of the backup translations on the tape. If the primary and backup translations were saved at times less than a day apart, read in the backup tape via the **reset system 3** command to load translations from the backup. **Note that this operation causes a service interruption (up to 5 minutes depending on system size).** Then check the newly-loaded translations as above. If the backup is also corrupted or the primary and backup translations are more than a day different (the newer translations may have changes on it), escalate the problem.

   WARNING:
   *The **reset system 3** command must run to completion with the tape cartridge in the tape drive. If the tape cartridge is removed before the "Login" prompt is displayed on the administration terminal, the system may contain partial translations. If the tape cartridge contains new firmware (Processor Interface or Packet Control), wait until the firmware is downloaded before removing the tape cartridge. Do not use the state of the yellow LED on the tape drive to determine when the tape cartridge can be removed while executing this command.*

2. Reserve one old tape and issue the **save translations** command to the remaining copies. Check that the command successfully completes before proceeding. This stores current translations. The reserved tape leaves a backup in the event of storing corrupted, partial, or no translations to the other copies.
3. Replace the old tape cartridge with the new tape cartridge containing the new software.

4. Save translations to the new tape using the **save translations** command.

   WARNING:
   The command response on the administration terminal should indicate that the command successfully completed. If the tape cartridge is removed before the result is displayed on the administration terminal, the tape cartridge may contain no translations or just one of the two copies of the translations that are stored. Do not use the state of the yellow LED on the tape drive to determine when the tape cartridge can be removed while executing this command.

5. If a TN750 Announcement circuit pack is present, save recorded announcements to the new tape cartridge using the **save announcements** command. This operation takes approximately 45 minutes. Check that the command successfully completes (via the administration terminal) before proceeding.
6. Enter **upgrade software4** to load in and run the new software.

   NOTE:
   This step does not have to be performed immediately after the previous step. It can be performed remotely later at a more convenient time.

7. Issue the **save translations** command to the other copies of the new software.
8. If a TN750 Announcement circuit pack is present, issue the **save announcements** command to the other copies of the new software. This operation takes approximately 45 minutes per copy. Check that the command successfully completes (via the administration terminal) before proceeding.
9. If the system is not running properly or the translations seem to be incorrect, the reserved tape cartridge can be used to go back to the old release via the **upgrade software** command.

Procedure on a High or Critical Reliability 286 System

1. Perform a sanity check on translations by issuing **list station** and **display station <ext>** commands. The translations are corrupted if the response "Error encountered, can't complete request" appears or if too few or many stations are listed for the **list station** command or if the response "Entry is bad" appears for the **display station <ext>** command. If the translations are corrupted, use the **list configuration software** command to determine the date and time of the translations in memory and tape. Then insert the backup tape in the Active SPE and use the **list configuration software** command to determine the date and time of the backup

translations. If the primary and backup translations were saved at times less than a day apart, you have the option of reading in the backup tape via the **reset system 3** command to load translations from the backup.

NOTE:
This operation causes a service interruption (up to five minutes depending on system size).

If you exercise this option, check the newly loaded translations as above. If the backup is also corrupted or the primary and backup translations are more than a day different (the newer translations may have changes on it), escalate the problem.

WARNING:
The reset system 3 command must run to completion with the tape cartridge in the tape drive. If the tape cartridge is removed before the "Login" prompt is displayed on the administration terminal, the system may contain partial translations. If the tape cartridge contains new firmware (Processor Interface or Packet Control), wait until the firmware is downloaded before removing the tape cartridge. Do not use the tape drive to determine when the tape cartridge can be removed while executing this command.

2. Reserve one old tape and issue the **status system** command to determine the state of the Standby SPE. If the Standby SPE is "down," this problem must be fixed before proceeding. If the Standby SPE is in the "standby" mode, issue the **save translations** command to the remaining old copies. Check that the command successfully completes before proceeding. This stores current translations. The reserved tape leaves a backup in the event of storing corrupted, partial, or no translations to the other copies.
3. Replace the old tape cartridges with the new tape cartridges containing the new software in both SPEs.
4. Save translations to the new tapes using the **save translations** command.

WARNING:
This command must pass on both tapes before you can proceed. Both new tapes must contain translations (rely on the output on the administration terminal rather than the yellow LED on the tape drive). If the save translations command fails, repeat the command. If there is a hardware failure causing translations saves to fail, this problem must be resolved before a software upgrade can be performed.

5. If a TN750 Announcement circuit pack is present, save recorded announcements to the new tape cartridges using the **save announcements** command. This operation takes approximately 90 minutes. Check that the command successfully completes (via the administration terminal) before proceeding.

6. Issue the **upgrade software** command. The Active SPE releases the Standby SPE that reboots from the new tape. The Standby software proceeds to the point where it has loaded in translations and awaits further instructions from the Active SPE. During this procedure, the following error codes (listed in the order in which they could occur) are possible:

   ```
   "Standby SPE busy with another task; for
   information use ‘status system’"
   ```

   ```
   "Upgrade failed; no communication with standby
   after new software booted"
   ```

   ```
   "Software Upgrade failed, could not perform an
   interchange"
   ```

   Once the Active SPE receives the message from the Standby SPE that it has finished loading in translations, the Active SPE initiates an SPE-interchange. The standby enters Active mode with a reset 2 (Cold-2). All calls are dropped, the system technician is logged off, and all port circuit packs are reset (may take several minutes to reset all circuit packs in a large system). Links are brought back up after the circuits packs are reset.

7. Upon restarting, the "new" Active SPE waits 5 minutes before initiating maintenance on the "new" Standby SPE. Use the 5-minute period to verify that the new software works. If it does not work, use the SPE-Select Switches to hard-select the former Active SPE (which still should have the old software). The system can restart with old working software. After these first 5 minutes, maintenance downloads the Processor Interface and Packet Control firmware to the Standby TN765 and TN778 circuit packs to ensure that these circuit packs are upgraded with the most current version of firmware.

8. Login to the "new" Active SPE.

9. Issue the **save translations** command to the other copies of the new software (see Warning in Step 4).

   NOTE:
   This can be done at Step 4.

   If, later, it is necessary to return to the old software, this upgrade procedure can be repeated using the tapes containing old software. In this case, repeat the preceding upgrade steps except for the save translations command. If the translations seem to be incorrect, the reserved tape cartridge can be used to read in translation (via reset system 3).

WARNING:
This procedure removes any administration changes that were entered after the initial upgrade was performed.

10. If a TN750 Announcement circuit pack is present, issue the **save announcements** command to the other copies of the new software. This operation takes approximately 45 minutes per copy. Check that the command successfully completes (via the administration terminal).

If the upgrade procedure fails in a High or Critical Reliability system, first verify that both SPEs are healthy (that is, no hardware problems are inhibiting the upgrade process). If it is not possible to upgrade because of problems, and if both SPEs are healthy, move the SPE-Select Switches to the Active SPE and use the preceding software upgrade procedure for a system without High or Critical Reliability. This causes a reset system 4.

Procedure on a System using Memory Cards

The software in a DEFINITY 386 or Release 5 vs/si or later system can be upgraded to include new features and to fix software problems. Performing an upgrade on a Standard Reliability system (that is, a system without High or Critical Reliability) requires a Reset System 4 (reboot) and thus causes a service disruption (refer to Chapter 4, "Initialization and Recovery". Performing an upgrade on a High or Critical Reliability system requires only a Reset System 2 (Cold-2) restart, which is less disruptive (refer to Chapter 4, "Initialization and Recovery").

CAUTION:
Be sure to read this section before attempting a software upgrade using memory cards. Upgrading with the procedure for a 286 system will only yield serious failures!

Also, do not enter any administration changes during the following software upgrade procedure. There can be substantial time gaps between steps and, since the system cannot prevent administration changes, it is up to the system technician to make sure that none are attempted during the entire software upgrade process. This includes making sure that no one (including the customer) is making administration changes through connections other than through the local administration terminal.

Operational Differences between Tape and Memory Card Systems

These systems contain flash memory technology instead of tape. Therefore, keep in mind the following operational differences when upgrading in such systems:

- **No Software Shadowing**. Unlike a 286 system, in which the software can be shadowed from the Active SPE to the Standby SPE, the flash memory on both SPEs must be upgraded individually. However, the shadowing of the translation data is preserved. The **upgrade software** command upgrades both SPEs, one at a time.

  NOTE:
  Be sure to execute the **list configuration software-vintage long** command after a software upgrade to check if both SPEs are running the same software release.

- **Processor Replacement**. Because software shadowing is not available, the standby processor circuit pack must contain the correct release or must be upgraded to the correct release as described in the circuit pack replacement procedure. See the "Repair Procedures for High and Critical Reliability" section in Chapter 8, "Reliability Systems: A Maintenance Aid" for details. A less detailed Standby Processor circuit pack replacement procedure is also provided in this "Software Upgrade" section.
- **Translation/Software Separate**. Unlike in a 286 system, where the software and translations reside on the tape, the software and translations reside in separate flash memory cards. Therefore, during a software upgrade, the software memory card(s) and the translation memory card(s) must be swapped at different stages of the upgrade. The user should sit through the entire duration of the **upgrade software** command execution in order to be in a position to swap memory cards correctly and in a timely fashion. If the cards are not swapped in such a manner, the **upgrade software** command might need to be re-executed.
- **No Translation Backup**. Due to the high cost of the flash memory cards, the customer may not have a backup translation memory card. Therefore, after a software upgrade, and before saving translations to the translation memory card, the user should ensure that the new software is running normally and that a backout procedure is not needed. Otherwise, the memory card **cannot** be used to bring up translations in the system if the new software is backed out with the old software.
- **Power Recycling**. In a system, a last resort recovery can be done by recycling power to the entire system during any failed software upgrade attempt. In a system with memory card(s) , **do not recycle power to invoke an upgrade software.** Refer to the "Standby SPEs" section for more details.
- **Failed Upgrades**. The Standby SPE must be in the Standby Mode before the **upgrade software** command can be executed in a High or Critical Reliability system. However, if an **upgrade software** command is accepted by the system and fails, the Standby SPE does not have to be in the Standby Mode for any subsequent **upgrade software** command to execute.

- **No Remote Upgrade**. Because software memory cards and translation memory cards must be swapped, the **upgrade software** command must be executed at the local administration terminal.
- **Software Memory Card**. The software currently running on a 286 system is available on the customer's premises. However, software memory cards are not available on the customer's premises. Therefore, it is important to ensure that the software memory card containing the software currently running on the switch is available before performing the software upgrade process. If a system has problems running the new software, the software memory card can be used in the software backout process. Make sure that no software backout is needed before saving translations with the new software because the new translation is not backward compatible to the old software.
- **G3MT Output**. A software upgrade is always performed on the Standby SPE. During a software upgrade, the output on the Standby SPE being upgraded is displayed on the G3MT. If any action is done to disrupt the upgrade (such as removing the software memory card), the Standby display remains in effect until a 20 minute timer expires. The timer is started upon execution of the **upgrade software** command. In the meantime, the G3MT displays only messages from the Standby SPE.

Standard Reliability (Simplex) Systems

The software upgrade for a Standard Reliability system takes up to 85 minutes, during which time service is interrupted for about 15 minutes. Upgrade software cannot be done remotely, and it must be performed at the local G3MT.

Ensure that the following items are available before proceeding:

- Software memory card with the software release running currently in the system
- Software memory card containing the new software to which the upgrade is to be done
- Translation memory card on which the system translations are to be saved (the card should already be in the system)
- Software patch (if it exists) that is currently applied to the system (this patch is downloaded if a software backout is required)
- Software release label to be applied to the processor circuit pack after a successful upgrade.

The following table indicates the processes and their corresponding time allotment for the upgrade procedure.

Process	Time (minutes)
save translation	10
save announcement	45
upgrade software	10
save translation	10
save announcements	45
miscellaneous	10
Total Time	130

CAUTION:
Be sure to read the "Operational Differences between Tape and Memory Card Systems" section before implementing the following procedure.

Figure 5-15 illustrates the output that appears on the G3MT during the upgrade procedure.

```
INITIATING SOFTWARE UPGRADE
MEM-CARD CHECKSUM                        PASSED
REPROGRAMMING MTP                        PASSED
ERASING MEMORY                           PASSED
REPROGRAMMING SPE                        PASSED
UPGRADE COMPLETE

RESET 4 (REBOOT) PERFORMED
```

Figure 5-15. G3MT Output for a Simplex System Software Upgrade (Typical TN786B. Output)

If translation corruption is detected the following message will be displayed on the copyright screen:

`WARNING: translation corruption detected; call AT&T distributor immediately`

The upgrade procedure is as follows:

1. Disable TTI during the upgrade using the **change system parameters feature** command (note that it must restore after the update).
2. Issue the **list configuration software-vintage** command to determine whether any patches have been applied.

   NOTE:
   If the switch is restored to the old software, the correct patches must be re-downloaded.

3. Verify that a software memory card containing the current system software is at hand. This card is needed in case the new software must be backed out.
4. Save translations to the translation memory card in the switch by issuing the **save translation** command. This step insures that the translation mem-card has the latest changes. Move slide on mem-card to write protect position. This command takes approximately 10 minutes to complete.

   NOTE:
   This step ensures that the translation memory card has the latest changes and can load translations if the new software must be backed out.

5. If a TN750 Announcement circuit pack is present, save the recorded announcements to the memory card on the switch by issuing the **save announcement** command. This command takes approximately 45 minutes to complete.

   NOTE:
   Make sure that the carrier containing the TN750 Announcement circuit pack is not powered down before the **save announcement** command successfully completes. Otherwise, all recorded announcements will be lost!

6. Verify that the new software memory card contains the correct software by checking the label on the card, and replace the translation memory card. Enter the **list configuration software-vintage** command to ensure that the software memory card contains the correct release.
7. Enter the **upgrade software** command at the G3MT. This command takes approximately 10 minutes (including system reboot) to complete.

The following is the explanation of the messages output to the G3MT. For a list of error messages of the **upgrade software** command, refer to Chapter 10, "Maintenance Commands and Trouble-Clearing Aids".

MEM-CARD CHECKSUM: Verify that the first test passes. If the checksum fails, refer to the "CARD-MEM (Memory Card)" section in Chapter 11, "Maintenance Object Repair Procedures".

REPROGRAMMING MTP: This step should complete almost instantaneously. If this step fails, the G3MT will not be functional, and the remainder of the upgrade will not be visible. Recover by recycling the power of the system. The system should automatically perform another upgrade due to the presence of the software memory card.

ERASING MEMORY: This step should take approximately three minutes.

REPROGRAMMING SPE: This step should take approximately two minutes. If this step fails, the system enters SPE-down mode. Recycle the power of the system to recover.

8. **REPLACE SOFTWARE MEM-CARD WITH TRANSLATION MEM-CARD:** Prompt with beeping to replace the software memory card with the translation memory card.

   NOTE:
   Perform this operation within two minutes, Otherwise, the system will boot up without translations. If this is the case, execute the **reset system 3** command with the translation memory card in the system to restore the translations to the system.

9. **FLASH TEXT CHECKSUM:** Verify that this test at the end of the booting diagnostics passes. If the checksum fails, refer to the "MEMORY" (386 system) or "PR-MEM (TN790 RISC Memory)" section in Chapter 11, "Maintenance Object Repair Procedures", for the processor circuit pack diagnosis before proceeding with a software upgrade retry.
10. Log into the system.
11. Issue the **list configuration software-vintage** command to check if the system is upgraded to the correct software version.
12. If the TTI was disabled in step 1 of the upgrade use the **change system parameters feature** command to enable the TTI.
13. Set the system time to the correct time of day.
14. Perform a sanity check on the system running the new software by executing the following commands in the order provided:
    1. **status system 1** (to check out unusual status in the system)
    2. **list station** (to ensure that the translation is read in properly)
    3. **display alarm** (to ensure that no alarm is raised in the system)

4. **list trunk-group** (to ensure that the translation is read in properly)
5. **list hunt-group** (to ensure that the translation is read in properly)

15. Once the system is determined to be sane and no software backout is needed, enter the **save translation** command to save translations onto the translation memory card. This ensures that there is no translation corruption and that the translation can be saved with the new software.

    NOTE:
    Once the translations are saved onto the translation memory card, the card cannot be used to read in translations if the new software is backed out with the old software.

16. Save announcements to the same translation mem-card as the upgraded translations. *This step is necessary only if* the **display announcements** lists announcements that are administered.
17. Re-label the processor circuit pack with the software release label supplied with the software memory card.
18. Return the Software Memory Card to Lucent Technologies.

Backout Procedures

If the system is not running properly or the translations seem to be incorrect, follow the technical escalation procedure. If the new load must be backed out (i.e., returned to the previous software load), the reserved mem-card can be used to go back to the old release via the **upgrade software** command.

High and Critical Reliability (Duplex) Systems

The upgrade procedure for High and Critical Reliability Systems takes up to two hours. Service is interrupted for about five minutes. The procedure cannot be done remotely, and it must be performed at the PPN (local) G3MT.

Ensure that the following items are available before proceeding:

1. Software memory card with the software release currently running in the system
2. Software memory card containing the new software to which upgrades are to be made
3. Translation memory cards on which to save system translations (these cards should already be in the system)
4. Software patch (if it exists) that is currently applied to the system (this patch is downloaded if a software backout is required)
5. Software release label to be applied to the processor circuit pack after a successful upgrade

The following table indicates the processes and their corresponding time allotment for the upgrade procedure.

Process	Time (minutes)
save translation	9
save announcement	45
upgrade software	15
save translation	9
miscellaneous	11
Total Time	90

CAUTION:
Be sure to read the ""Operational Differences between Tape and Memory Card Systems" section before starting this procedure.

Figure 5-16 presents output that appears on the G3MT during this procedure.

```

```

Figure 5-16. G3MT Output for a Duplex System Software Upgrade (Typical TN786 Output)

If translation corruption is detected the following message will be displayed on the copyright screen:

`WARNING: translation corruption detected; call AT&T distributor immediately`

1. Disable TTI during the upgrade using the change **system parameters feature** command (note that it must restore after the update).
2. Issue the **list configuration software-vintage long** command to determine whether any patches have been applied.

   NOTE:
   If the switch is restored to the old software, the patches **must** be downloaded again.

3. Verify that a software memory card containing the current system software is at hand. This software is needed in case the new software must be backed out.

4. Save the translations to the translation memory card in the switch by issuing the **save translation** command. This command takes approximately 10 minutes to complete.

   NOTE:
   This step ensures that the translation memory card has the latest changes. This command must pass on both memory cards. Otherwise, the translations will be lost. If the **save translation** command fails, repeat the command. If there is a hardware failure causing the **save translation** command to fail, this problem must be resolved before a software upgrade can be performed.

5. If a TN750 Announcement circuit pack is present, save the recorded announcements to the memory cards on the switch by issuing the **save announcement** command. This command takes approximately 80 minutes to complete.

   NOTE:
   Make sure that the carrier containing the TN750 Announcement circuit pack is not powered down before this **save announcement** command completes successfully. Otherwise, all recorded announcements will be lost!

6. Verify that the new software memory card contains the correct software by checking the label on the card, and replace the translation memory card in the Standby SPE. Enter the **list configuration software-vintage long** command to make sure that the software memory card contains the correct release.
7. Enter the **status system 1** command to check if the Standby SPE is in Standby Mode.
8. If not, issue the **refresh spe-standby** command to put the Standby SPE into Standby Mode.
9. Again enter the **status system 1** command to check if the Standby SPE is now in Standby Mode.
10. Alternatively, the **busyout spe-standby** command followed by the **release spe-standby** command can be used if the **refresh spe-standby** command is not successful.
11. Again enter the **status system 1** command to check if the Standby SPE is in Standby Mode.
12. Enter the **upgrade software** command at the G3MT. The Standby SPE starts software upgrade from the software memory card. Progress of the upgrade is displayed on the G3MT.

    The following is the explanation of the messages output to the G3MT. For a list of the error messages for the **upgrade software** command, refer to the "Upgrade Software" section of Chapter 10, "Maintenance Commands and Trouble-Clearing Aids".

MEM-CARD CHECKSUM: Verify that the first test passes. If the checksum fails, refer to the "CARD-MEM (Memory Card)" section in Chapter 11, "Maintenance Object Repair Procedures".

REPROGRAMMING MTP: This step should complete almost instantaneously. If the Standby MTP programming fails, G3MT screen updates disappear even though the upgrade may continue. The Active SPE finally resets the screen, and the upgrade fails.

ERASING MEMORY: This step should take approximately three minutes.

REPROGRAMMING SPE: This step should take approximately two minutes. If the reprogramming fails in the midst of the upgrade, the Standby SPE is put into *SPE-down* mode. The display of the failed upgrade remains until the Active SPE resets the screen again. Retry the upgrade.

13. **REPLACE SOFTWARE MEM-CARD ON <STANDBY SPE> WITH TRANSLATION MEM-CARD:** Prompt with beeping to replace the software memory card in the Standby SPE with the translation memory card. The Standby SPE then boots up with translations, and it informs the Active SPE that it is ready to take over as the Active SPE.

   NOTE:
   Perform this operation within two minutes. Otherwise, the upgrade will abort. If the upgrade aborts, re-execute the **upgrade software** command.

14. **REPLACE TRANSLATION MEM-CARD ON <ACTIVE SPE> WITH SOFTWARE MEM-CARD:** Replace the translation memory card in the Active SPE with the software memory card. The presence of the software memory card in the Active SPE causes the system to perform a Level-2 SPE Interchange. All calls are dropped. While the new Active SPE is booting up, the new Standby SPE undergoes a similar software upgrade. The upgrade status continues to be reported on the G3MT, and no system technician login is displayed.

   NOTE:
   Perform this operation within two minutes. Otherwise, the upgrade will abort. If the upgrade aborts, re-execute the **upgrade software** command.

15. **REPLACE SOFTWARE MEM-CARD ON <STANDBY SPE> WITH TRANSLATION MEM-CARD:** Replace the software memory card in the new Standby SPE with the translation memory card. Upon inserting the translation memory card, the system technician login prompt is displayed on the G3MT and the Standby SPE boots up.

   NOTE:
   Perform this operation within two minutes, Otherwise, the Standby SPE will boot up without translations. However, it will recover the translation when the Active SPE enables memory shadowing and

puts the Standby SPE into Standby Mode about 15 minutes after the SPE Interchange.

16. Log into the system.
17. Issue the **display initcauses** command to ensure that the failure upgrade is not present. The following is an example of the output:

```
                INITIALIZATION CAUSES

    CauseActionEscalatedCarrierTime

Upgrade Software4no1B07/19 15:35
Upgrade Software2no1B07/19 15:42
```

18. Issue the **list configuration software-vintage long** command to ensure that both SPEs are running the same and correct software. If the software running on both SPEs is not the same, follow the instructions in the "Standby SPEs" section to recover the situation.
19. If the TTI was disabled in step 1 of the upgrade use the **change system parameters feature** command to enable the TTI.
20. Set the system clock to the correct time of day.
21. Perform a sanity check on the system running the new software by executing the following commands in the order provided:
    1. **status system 1** (to check out unusual status in the system)
    2. **list station** (to ensure that the translation is read in properly)
    3. **display alarm** (to ensure that no alarm is raised in the system)
    4. **list trunk-group** (to ensure that the translation is read in properly)
    5. **list hunt-group** (to ensure that the translation is read in properly)
22. Once the system is determined to be sane and no software backout is needed, enter the **save translation** command to save translations to the translation memory cards. This ensures that there is no translation corruption and that translations can be saved with the new software. If this step returns an error concerning corrupt translations, investigate to determine if the system is operating normally and escalate to the TSC. **DO NOT** override and save translations until you are **ABSOLUTLY** sure the system is operating properly. Failure to do this may result in loss of translations and require re-translation of the entire switch.
23. Save announcements to the same translation mem-card as the upgraded translations. *This step is necessary only if* the **display announcements** lists announcements that are administered.

NOTE:
Once translations are saved to the translation memory cards, translations cannot be read in if the new software is backed out with the old software.

24. Re-label the processor circuit packs with the software release labels supplied with the software memory card.
25. Return the Software Memory Card to Lucent Technologies.

Standby SPEs

The following procedure is used for upgrading just the Standby SPE in a High or Critical Reliability system due to software corruption (bad checksum) or reconciling situations like both SPEs are running different software versions. The procedure below is written from the perspective that the Standby SPE is in carrier B. *This procedure is NOT USED for replacing the Standby Processor.*

If you are not sure that the software memory card contains the correct software, plug it into the Active SPE and issue the list configuration software command. If the software matches and the UPDATE FILE Identifier displays none, continue with this procedure; otherwise escalate. Be sure to replace the translation memory card in the Active SPE.

1. Make sure that the SPE to be upgraded is running as the Standby SPE. Issue the status system 1 command and verify that the correct SPE is the Standby. If the SPE to be upgraded is the Standby, skip to Step 3, else continue with Step 2.
2. Issue the *reset system interchange* command to force SPE, which is to be upgraded, to be in the Standby Mode.
3. Enter the **status system 1** command to check if the Standby SPE is in Standby Mode. If the Standby SPE is in the Standby Mode, skip to Step 8, otherwise continue with Step 4.
4. Issue the **refresh spe-standby** command to put the Standby SPE into Standby Mode. A.
5. Enter the **status system 1** command to check if the Standby SPE is in Standby Mode. If the Standby SPE is in the Standby Mode, skip to Step 8, otherwise continue with Step 6.
6. Issue the **busyout spe-standby** command followed by the **release spe-standby** command.
7. Enter the **status system 1** command to check if the Standby SPE is in Standby Mode. If the Standby SPE is in the Standby Mode, continue with Step 8. Else escalate.
8. Enter the **upgrade software** command at the G3MT.
9. At the prompt of **REPLACE SOFTWARE MEM-CARD ON <STANDBY SPE> WITH TRANSLATION MEM-CARD**, replace the software memory card in the Standby SPE with the translation memory card. The Standby SPE then boots up with the translation.

   NOTE:
   Perform this operation within two minutes. Otherwise, the upgrade will abort.

10. At the prompt of **REPLACE TRANSLATION MEM-CARD ON <ACTIVE SPE> WITH SOFTWARE MEM-CARD**, IGNORE the prompt and hard-select the Active SPE by throwing the SPE-Select switches. This causes the upgrade to terminate without performing the SPE-Interchange.
11. Issue a **list configuration software-vintage long** command to check out the version of software running on both SPEs.
12. Apply the software release label supplied with the software memory card to the TN786B processor circuit pack on the Standby SPE.

Procedure for Replacing Standby SPE Processor

This procedure is used when the Standby Processor circuit pack is being replaced and the software is being loaded from the software memory card into the Processor circuit pack. This procedure is also used when the SPE to be upgraded contains no or partially erased software. The G3MT messages in this procedure assume carrier A is the Active SPE. This procedure is also described in greater detail in the “Circuit Pack Replacement Procedure” for any Standby SPE circuit pack in Chapter 8, "Reliability Systems: A Maintenance Aid".

1. Hard-select the current Active SPE by throwing the SPE-Select switches. This may cause a tone/clock switch to the Active SPE if the Tone-Clock circuit pack on the Standby SPE is active. However, this does not cause service disruption.
2. Insert the software mem-card into the Active SPE. Issue the list configuration software command. If the software matches and the UPDATE FILE Identifier displays none, continue with this procedure; otherwise escalate the problem. *Be sure to replace the translation memory card in the Active SPE.*
3. Insert the software memory card into the Standby SPE (that is the SPE to be upgraded).

CAUTION:
Do not insert the software memory card into the Active SPE and recycle power on the Active SPE. This causes an upgrade on the Active SPE without G3MT output! A software upgrade is always done in the Standby SPE.

4. Unseat the Standby Processor and plug in the replacement processor. If the problem is missing software, plug in the same processor. The G3MT displays progress of Software Upgrade.

CAUTION:
DO NOT remove power to the Standby SPE Carrier

5. At the prompt of **REPLACE SOFTWARE MEM-CARD ON <STANDBY SPE> WITH TRANSLATION MEM-CARD**, replace the software memory card in the Standby SPE with the translation memory card. The Standby SPE will then boot up with the translation.

   NOTE:
   Perform this operation within two minutes. Otherwise the Standby SPE will boot up without translations. However, it will recover the translations when the Active SPE enables memory shadowing to the Standby SPE.

6. At the prompt of **REPLACE TRANSLATION MEM-CARD ON <ACTIVE SPE> WITH SOFTWARE MEM-CARD**, *IGNORE* the prompt. Wait 3 minutes for the Standby SPE to initialize before proceeding to the next step.
7. Hit the "return" or the "cancel" key to get back the G3MT command prompt. Issue the **list configuration software-vintage long** command to ensure that both SPEs are running the correct software. Use the next step if the this command will not display the software versions, otherwise skip the next step.
8. Issue the busyout spe-standby followed by the release spe-standby commands. Wait 5 minutes for the Standby SPE to initialize and issue the status system 1 command. If the Standby SPE Mode is down, the Standby Processor failed to initialize. If the Standby SPE Mode is maint/init or maint/entering, issue this pair of commands up to 2 more times. *If this Step did not succeed, try this procedure again or escalate the problem*.
9. Issue the **status system 1** command and if SPE alarm counts are displayed, run component tests to resolve these alarms. Allowed tests include test spe-standby, test duplication-interface, and test shadow-link.
10. Throw the SPE-Select switches back to the neutral position. After 10 minutes, issue the status system 1 command to verify the Standby SPE Mode standby and no SPE alarm counts. If these conditions cannot be verified within 30 minutes, escalate the problem.
11. Apply the software release label supplied with the software memory card to the processor circuit pack on the Standby SPE.

Preventive Maintenance Procedures

The following preventive maintenance procedures should be followed when you are visiting customer sites:

Air Filters

Air filters should be inspected annually. If a filter is dirty or clogged, first tap it on the ground. If the filter is still dirty or clogged, then wash it with warm water and a mild detergent. A vacuum cleaner can be used if one is available. If there is no facility for washing or vacuuming the air filter, then replace the filter. Refer to CABINET Maintenance documentation for more information on air filters and fans.

Tape Head/Capstan

The tape drive head (also called the tape head) should be cleaned at least once a year. **Moreover, it should be cleaned as part of the preventive maintenance strategy. It is recommended that you inspect the tape head during each maintenance visit and that you clean the tape head several times a year**. In addition, a dated label should be placed on the tape drive unit after the tape head is cleaned. New tapes leave more abrasive particles on the tape head.

The tape head can be accessed for cleaning from the front of the drive by opening the tape access door with your finger. Refer to TAPE Maintenance documentation found in Chapter 11, "Maintenance Object Repair Procedures" for more details on cleaning the tape head.

Batteries

The batteries should be replaced every four years or whenever a POWER alarm occurs in the system.

AT&T Preventive Maintenance Log

Figure 5-17 shows a sample of the AT&T Preventive Maintenance Log. Whenever you complete any of the preventive maintenance procedures described in this section, be sure to fill in the requested information on the log form before you leave the customer's premises.

Figure 5-17. Preventive Maintenance Log

System Features

In addition to the various maintenance and test commands (described in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids") that are available, the following system features may also be useful in troubleshooting certain system resources:

- Automatic Circuit Assurance (ACA)
- Busy Verification of Terminals and Trunks
- Trunk Group Busy/Warning Indicators to Attendant
- Trunk Identification by Attendant
- Facility Test Calls
- Analog Tie Trunk Back-to-Back Testing
- Terminating Trunk Transmission Testing
- Troubleshooting ISDN-PRI Problems
- Troubleshooting PRI Endpoint Problems
- Troubleshooting ISDN-PRI Test Calls

Complete descriptions of each feature are provided in the *DEFINITY Communications System Generic 3 Feature Description*, 555-230-204. Refer to *DEFINITY Communications System Generic 1 and Generic 3 — Console Operations*, 555-230-700, and *DEFINITY Communications System Generic 1 and Generic 3 Voice Terminal Operations* as required for detailed operating procedures (does not include Facility Test Calls, Analog Tie Trunk Back-to-Back Testing, Terminating Trunk Transmission Testing, Troubleshooting ISDN-PRI Problems, Troubleshooting ISDN-PRI Test Calls, or Troubleshooting ISDN-BRI Problems described in this chapter.)

Automatic Circuit Assurance

Requires the use of a display-equipped voice terminal (may be nondisplay type if the Voice Message Retrieval feature is provided) or an attendant console. An "ACA activate/deactivate" button (one per system) is required on the voice terminal or attendant console.

Automatic Circuit Assurance (ACA) assists users in identifying possible trunk malfunctions. The system maintains a record of the performance of individual trunks relative to short and long holding time calls. The system automatically initiates a referral call to an attendant console or display-equipped voice terminal when a possible failure is detected.

Holding time is the elapsed time from when a trunk is accessed to the time a trunk is released. When ACA is enabled via administration, the system measures the holding time of each call.

A short holding time limit and a long holding time limit are preset by the System Manager for each trunk group. The short holding time limit can be from 0 to 160 seconds. The long holding time limit can be from 0 to 10 hours. The measured holding time for each call is compared to the preset limits for the trunk group being used.

Measurements are not made on personal CO lines, out-of-service trunks, or trunks undergoing maintenance testing.

Busy Verification of Terminals and Trunks

Requires the use of a multi-appearance voice terminal or attendant console equipped with a "verify" button.

Busy Verification of Terminals and Trunks allows a user at a voice terminal or attendant console to make test calls to trunks, voice terminals, and hunt groups (DDC/UCD). These test calls check the status of an apparently busy resource. This provides an easy method to distinguish between a voice terminal or resource that is truly busy and one that only appears busy because of a trouble condition.

Trunk Group Busy/Warning Indicators to Attendant

Requires the use of an attendant console.

Trunk Group Busy/Warning Indicators to Attendant provides the console user with a visual indication of the trunk group status for each trunk group associated with the 12 Trunk Group Select buttons located on the console. Trunk groups with busy indications during nonbusy periods should be checked to ensure that the trunks are busy and not out-of-service. Use the Busy Verification of Terminals and Trunks feature to test the suspected faulty trunks.

Trunk Identification by Attendant

Requires the use of a display-equipped voice terminal or an attendant console equipped with a "trunk id" button.

Trunk Identification by Attendant allows a voice terminal or attendant console user to identify a specific trunk being used on a call. This is useful when a user experiences noise or poor transmission on a trunk call. The trunk identification (access code and group number) is displayed when the "trunk id" button is pressed while on a trunk call. Use of this feature is denied if there are more than two trunks on a call. If the call is trunk-to-trunk, the identification displayed is of the last trunk added to the call.

Facility Test Calls

The Facility Test Calls feature provides a voice terminal user the capability of placing test calls to access specific trunks, touch-tone (DTMF) receivers, time slots, and system tones. The test call can be made by a local voice terminal user by dialing an access code.

NOTE:
For the ISDN-PRI Test Call feature, see "Troubleshooting ISDN-PRI Test Call Problems" later in this chapter.

NOTE:
The following test call descriptions are for voice terminal users:

Trunk Test Call

The trunk test call accesses specific Tie or CO trunks. DID trunks cannot be accessed.

To place a call:

1. Dial the Facility Test Call Feature Access Code (for example, 197, see Note), and listen for dial tone.

   NOTE:
   The Facility Test Call Access Code (FAC) is administered on the Feature Access Codes Form. The 197 FAC code used here is an example. For more information on FAC, refer to *DEFINITY Communications System Generic 3 Implementation*, 555-230-653.

2. Dial the 6-digit port number "PCSSpp"

P	=	Part network number (1 for PPN or 2 or 3 for EPN)
C	=	Carrier number (A=1, B=2, C=3, D=4, E=5)
SS	=	Slot number (01—20)
pp	=	Port number

   The channels on a DS1 trunk are addressed by using the channel number for the port number.

3. Listen for one of the following tones:

   - Dial Tone or Silence—trunk is connected. Go to Step 4. If you hear a dial tone, it is coming from the far end. If the far end has been disabled, you do not hear dial tone. However, depending on far-end administration, you may still be able to dial digits. All digits dialed after the port number are transmitted using end-to-end DTMF signaling; therefore, if the trunk being tested is a rotary trunk, it is not possible to break dial tone.

- Reorder Tone—trunk is busy or maintenance busy.
- Intercept Tone— a trunk or touch-tone (DTMF) receiver has not been accessed.

4. Place a call. Even if you do not hear a dial tone, you may still be able to dial digits, depending on the administration of the far-end switch.

   All digits dialed after the port number are transmitted using end-to-end DTMF signaling; therefore, if the trunk being tested is a rotary trunk, it will not be possible to break dial tone.

   If the call does not go through (that is, no ringing), determine if the trunk circuit pack has been removed.

Touch-tone (DTMF) Receiver Test Call

The touch-tone (DTMF) receiver call accesses and tests the four touch-tone (DTMF) receivers located on the Tone Detector circuit pack. **To place the call:**

1. Dial the Facility Test Call Feature Access Code (for example, 197, see Note), and listen for dial tone.

   NOTE:
   The Feature Access Code (FAC) is administered on the Feature Access Codes Form. The 197 FAC code used here is an example.

2. Dial the 6-digit port number "PCSSpp":

P	=	Part network number (1 for PPN or 2 or 3 for EPN)
C	=	Carrier number (A=1, B=2, C=3, D=4, E=5)
SS	=	Slot number (01—20)
pp	=	Touch-tone (DTMF) Receiver Port number (01, 02, 05, or 06))

3. Listen for one of the following tones:
   - Confirmation Tone—touch-tone (DTMF) receiver is connected. Go to Step 4.
   - Reorder Tone—touch-tone (DTMF) receiver is busy.
   - Intercept Tone—a touch-tone (DTMF) receiver or trunk has not been accessed.
4. Dial **1234567890*#** and listen for Confirmation tone (test passed) or intercept tone (test failed). The test fails if the touch-tone (DTMF) receiver does not recognize all the touch-tone (DTMF) signals.
5. To test another touch-tone (DTMF) receiver, repeat Steps 2 through 4.
6. To terminate the test call, hang up the station set used for testing.

Time Slot Test Call

The time slot test call connects the voice terminal user to a specific time slot located on the TDM Buses (A or B) or out-of-service time slots. **Specific Time Slots To place the call:**

1. Dial the Facility Test Call Feature Access Code (for example, 197, see Note), and listen for dial tone.

   NOTE:
   The Feature Access Code (FAC) is administered on the Feature Access Codes Form. The 197 FAC code used here is an example.

2. Dial port network number (1 for PPN or 2 or 3 for EPN), then press # and the 3-digit time slot number "xxx," where:

   xxx = Time slot number (000 through 255 on Bus A and 256 through 511 on Bus B)

3. Listen for one of the following tones:
   - Confirmation Tone—time slot is idle or maintenance busy
   - Reorder Tone—time slot is busy
   - Dedicated Tone—One of the following tones is heard (see Table 5-2)

Table 5-2. TDM Bus Time Slot Numbers

TDM Bus A time slot	TDM Bus B time slot	Tone Heard
000	256	Reorder
001	257	Reorder
002	258	Reorder
003	259	Reorder
004	260	Reorder
005	261	Touch Tone 1 - 697Hz
006	262	Touch Tone 2 - 770 Hz
007	263	Touch Tone 3 - 852Hz
008	264	Touch Tone 4 - 941 Hz
009	265	Touch Tone 5 - 1209 Hz
010	266	Touch Tone 6 - 1336Hz
011	267	Touch Tone 7 - 1447 Hz
012	268	Touch Tone 8 - 1633 Hz
013	269	Dial Tone
014	270	Reorder Tone
015	271	Alert Tone
016	272	Busy Tone
017	273	Ringback Tone
018	274	Special Ringback Tone
019	275	2225 Hz Tone
020	276	Music
021	277	Tone on Hold
022-253	278-509	Confirmation (used for calls)
254	510	Reorder
255	511	Confirmation

Out-of-Service Time Slots To place the call:

1. Dial the Facility Test Call Feature Access Code (for instance, 197, see Note), and listen for dial tone.

   NOTE:
   The Feature Access Code (FAC) is administered on the Feature Access Codes Form. The 197 FAC code used here is an example.

2. Dial port network number (1 for PPN or 2 or 3 for EPN), then dial ****** and listen for the following tones:
   - Confirmation Tone—Connection is made. Go to Step 3.
   - Reorder Tone—No time slots are out-of-service.
3. Repeat from Step 1 to alternate between out-of-service time slots on TDM Bus A and B.

System Tone Test Call

The system tone test call connects the voice terminal user to a specific system tone. **To place the call:**

1. Dial the Facility Test Call Feature Access Code (for instance, 197, see Note), and listen for dial tone.

   NOTE:
   The Facility Test Call Access Code (FAC) is administered on the Feature Access Codes Form. The 197 FAC code used here is an example.

2. Dial port network number (1 for PPN or 2 or 3 for EPN), then dial * followed by the two-digit tone identification number listed in Table 5-3.
3. Listen for the tone that was specified.

NOTE:
For a definition of Call Progress Tones see *DEFINITY Communications System Generic 3 System Descriptions and Specifications, Issue 4 AT&T 555-230-206* Chapter 11, "Maintenance Object Repair Procedures".

Table 5-3. System Tone Identification Numbers

Number	Description
00	Null tone
01	Dial tone

62	Forced music tone
63	Zip tone (first of 2 sent)
64	Incoming call ID (first of 2 sent)
65	Tone on hold
66	CO dial tone
67	Repetitive confirmation tone
68	Conference/bridging tone

Analog Tie Trunk Back-to-Back Testing

The TN760B circuit pack can be configured for back-to-back testing (also known as connectivity testing) by making translation and cross-connect changes. This testing configuration allows for the connection of Tie Trunks back-to-back in the same switch to verify the operation of Tie Trunk ports. The tests can be performed in either the E&M or simplex modes.

E&M Mode Test Procedure

The procedures to perform the Analog Tie Trunk port test in the E&M mode are as follows:

1. At the administration terminal, enter **list configuration trunks** command to determine which ports are assigned on the Tie Trunk circuit pack.

2. Enter **display dialplan** command to determine the Trunk Access Code (TAC) format.
3. Enter **display port xx** command for all ports defined in Step 1. This action displays the trunk groups to which the ports belong (that is, of which the ports are members).

   NOTE:
   See the "Handling Port Circuit Packs" section in this chapter for details on how to remove and replace port circuit packs.

4. Insert the circuit pack back into the slot.
5. Enter **display trunk xx p** command for each trunk group identified in Step 3. This command displays the specified trunk group on the administration terminal screen and prints a hard copy on the printer. Save this data for later use.
6. Remove all members defined by these ports from the trunk group(s) using the **ch trunk xx** command.
7. Remove the Tie Trunk circuit pack from the carrier slot.
8. Set the dip (option) switches for each of the two ports to be tested on the Tie Trunk circuit pack to "E&M mode" and "unprotected."
9. Enter **add trunk n** command to add a new (test) trunk group. Then enter the following information:
   - Group Type — tie
   - TAC — (use trunk access code obtained from dial plan)
   - Trunk Type (in/out) — wink/wink
   - Port — assign two of the ports from the tie trunk
   - Mode — E&M
   - Type — specify one port as t1 standard and other port as t1 compatible

   Examples of the Trunk Group forms are shown in Screen 5-3 and Screen 5-4.

Screen 5-4. Trunk Group Form — E&M Mode (Page 2 of 2)

10. Locate the Tie Trunk port terminal connections at the cross-connect field. For systems equipped with 110-type hardware, see Table 5-4; for systems equipped with 66-type hardware, see Table 5-5.
11. At the cross-connect field, disconnect outside trunk facilities from the Tie Trunk ports and mark the disconnected wires for later reconnecting the Tie Trunk ports back to normal operation. The D Impact Tool (AT-8762) is required to perform this step.
12. Use jumper wires (DT 24M-Y/BL/R/G and DT 24P-W/BRN) and the D Impact Tool to connect wiring between the two ports assigned in Step 9 at the cross-connect field. For example, if the two ports on the Analog Tie Trunk circuit pack are port 1 and 2, connect the wirings as shown below:

Port 1	Port 2
T1	T12
R1	R12
T11	T2
R11	R2
E1	M2
M1	E2
t1 stan E&M	t1 comp E&M

13. Check all wirings to verify good connections between the two test ports.
14. Place a call from one voice terminal to another voice terminal using the Tie Trunk ports assigned. Dial TAC and extension. For example, if TAC of Tie Trunk group is 110 and station number is 5012, then dial 110 5012. If the call cannot be made, either one of these ports could be defective. There are four ports on TN760B (port 1, 2, 3, and 4), try different combinations to determine defective ports.
15. If there is a defective port on the circuit pack, try to switch to an unused port. However, if all ports are normally used, then replace the circuit pack.
16. Disconnect the jumpers between two ports. Then use administration terminal and trunk printouts to restore all trunk group changes to normal values.

Simplex Mode Test Procedure

The procedures to perform the Analog Tie Trunk Port Test in the simplex mode are as follows:

1. Repeat Steps 1 through 7 of the E&M Mode Test Procedure.
2. Set the dip (option) switches for each of the two ports to be tested on the Tie Trunk circuit pack to simplex mode.
3. Enter **add trunk n** command to add a new (test) trunk group. Then enter the following information:
   - Group Type — tie
   - TAC — (use trunk access code obtained from dial plan)
   - Trunk Type (in/out) — wink/wink
   - Port — assign two of the ports from the tie trunk
   - Mode — simplex
   - Type — type 5

   An example of the Trunk Group Form Page 2 is shown in Screen 5-5.

```

4. Locate the Tie Trunk port terminal connections at the cross-connect field. For systems equipped with 110-type hardware, see Table 5-4. For systems equipped with 66-type hardware, see Table 5-5.

5. At the cross-connect field, disconnect outside trunk facilities from the Analog Tie Trunk ports and mark the disconnected wires for later when the Tie Trunk ports are placed back into normal operation. The D Impact Tool (AT-8762) is required to perform this step.
6. Use jumper wires (DT 24M-Y/BL/R/G) and the D Impact Tool to connect wiring between the two ports assigned in Step 4 at the cross-connect field. For example, if the two ports on the Analog Tie Trunk circuit pack are ports 1 and 2, connect the wirings as shown below:

Port 1		Port 2
T1	————	T12
R1	————	R12
T11	————	T2
R11	————	R2
type 5 simplex		type 5 simplex

7. Repeat Steps 13 through 16 of the E&M Mode Test Procedure.

Terminating Trunk Transmission Testing

The Terminating Trunk Transmission (TTT) (noninteractive) feature provides for extension number access to three tone sequences that can be used for trunk transmission testing from the far end of the trunks.

The three test types should have extension numbers assigned on the Maintenance-Related System Parameters Form.

Test Type 100:_____ Test Type 102:_____ Test Type 105:_____

Test Type 100 provides:

1. 5.5 seconds of 1004 Hz tone at 0dB
2. Quiet until disconnect; disconnect is forced after one minute

Test Type 102 provides:

1. 9 seconds of 1004 Hz tone at 0dB
2. 1 second of quiet
3. This cycle is repeated until disconnect; disconnect is forced after 24 hours.

Test Type 105 provides:

1. nine seconds of 1004 Hz at -16dB
2. one second of quiet
3. nine seconds of 404 Hz at -16dB
4. one second of quiet
5. nine seconds of 2804 Hz at -16dB
6. 30 seconds of quiet
7. one half second of Test Progress Tone (2225 Hz)
8. approximately five seconds of quiet
9. forced disconnect

Troubleshooting ISDN-PRI Problems

The following flowchart, Figure 5-18 and Figure 5-19, defines a layered approach when troubleshooting ISDN-PRI problems. Since a problem at a lower layer affects upper layers, layers are investigated from low to high. In the flowchart, the DS1 facility is layer 1, the TN765 Processor Interface is layer 2, and the ISDN trunks are layer 3. Transient problems are diagnosed on Page 2 of the flowchart, Figure 5-19.

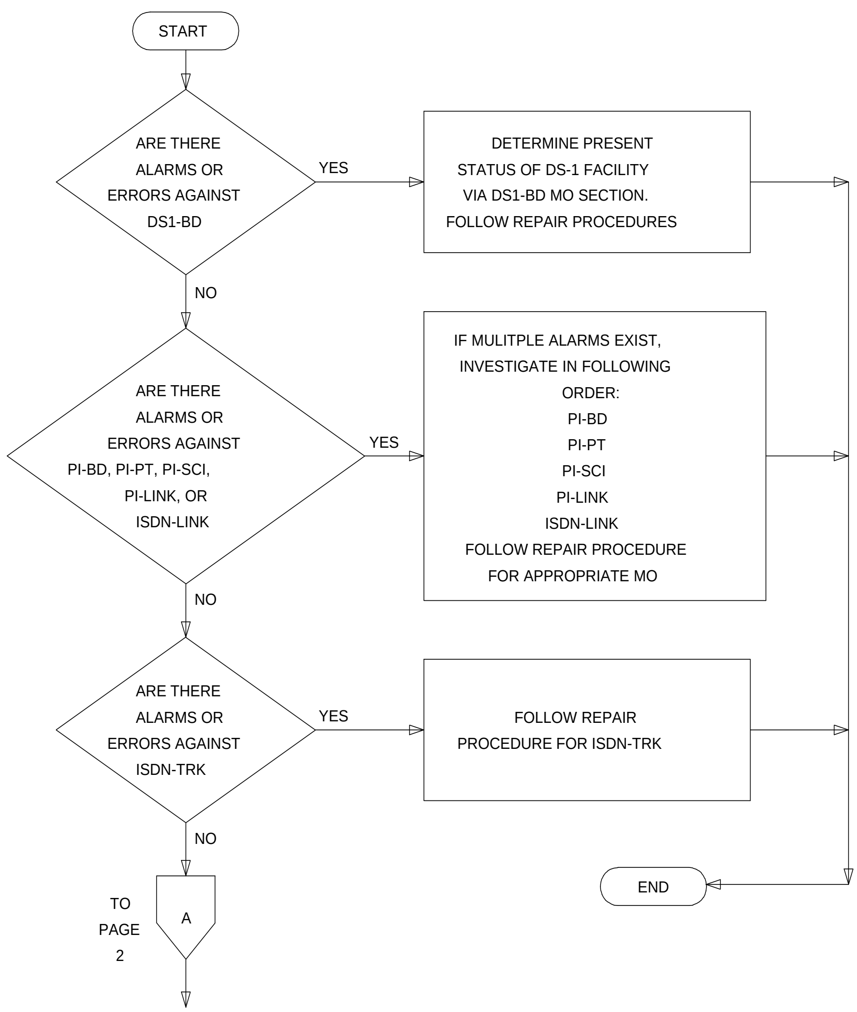

Figure 5-18. Processing of ISDN-PRI Problems (Page 1 of 2)

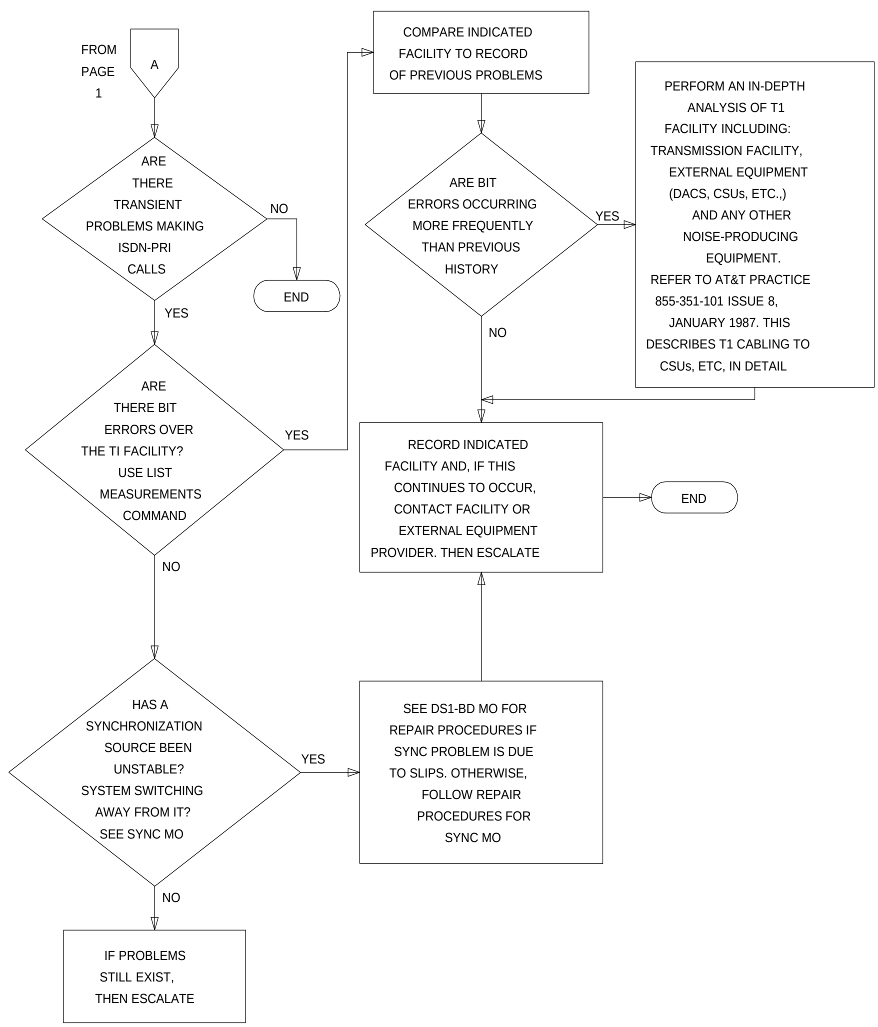

Figure 5-19. Processing of ISDN-PRI Problems (Page 2 of 2)

Troubleshooting PRI Endpoint Problems

The following flowchart, Figure 5-20 and Figure 5-21, defines a layered approach when troubleshooting PRI endpoint problems. Since a problem at a lower layer affects upper layers, layers are investigated from low to high. In the flowchart, the DS1 facility is layer 1, the TN765 Processor Interface is layer 2, and the ISDN trunks are layer 3.

The troubleshooting procedure described here diagnoses faults between the switch and the line-side PRI terminal adapter/ISDN-PRI endpoint equipment. Problems encountered on the network-side of a wideband connection or problems with end-to-end equipment compatibility are out of the scope of this section.

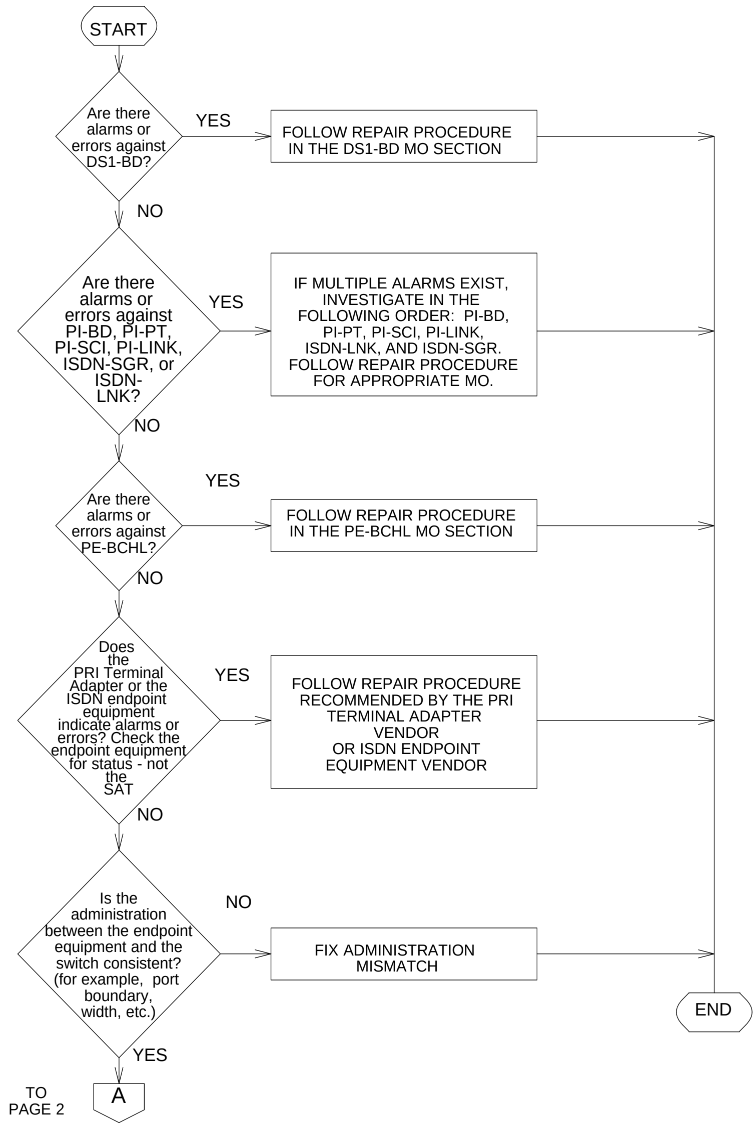

Figure 5-20. Processing of PRI Endpoint Problems (Page 1 of 2)

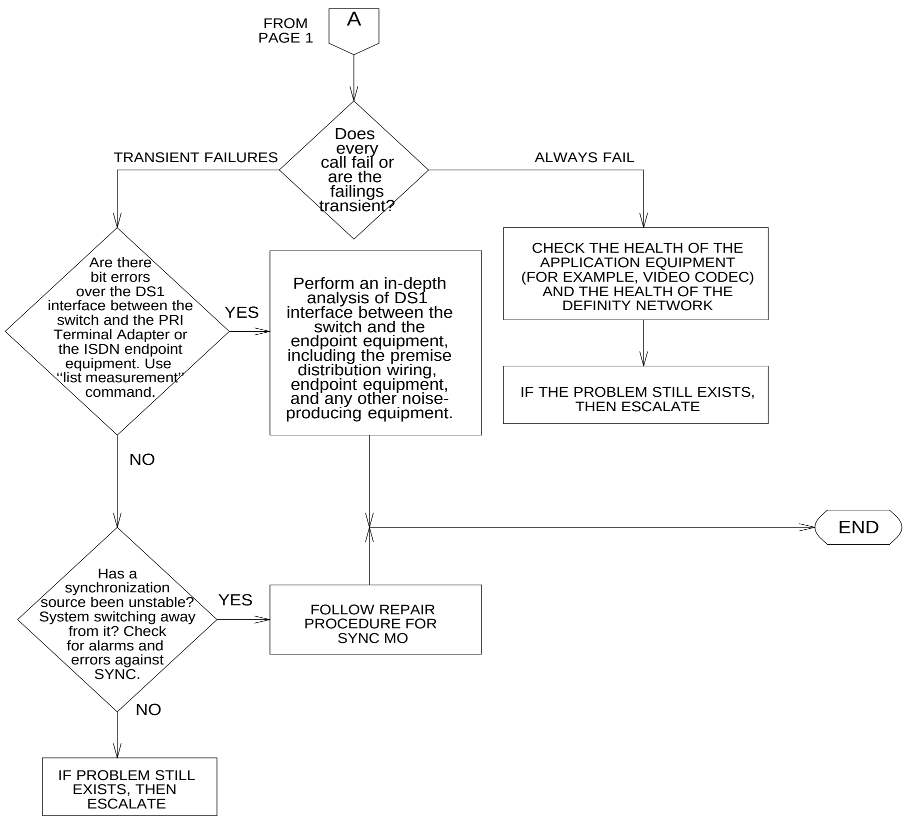

Figure 5-21. Processing of PRI Endpoint Problems (Page 2 of 2)

Troubleshooting ISDN-PRI Test Call Problems

An ISDN-PRI test call is a call of a diagnostic nature that is placed across an ISDN-PRI user-network interface to a previously designated number. An ISDN-PRI test call is also a maintenance procedure concerned with the identification and verification ISDN-PRI user-network interface problems. The ISDN-PRI test call can access ISDN-PRI trunks only.

Placing an Outgoing ISDN-PRI Test Call

NOTE:
An ISDN-PRI test call can be placed only if the circuit translates to an ISDN-PRI trunk.

An ISDN-PRI test call can be originated via either the *synchronous* or the *asynchronous* method. Each method is described below.

Synchronous Method

One command is used in this method to start, stop and query an ISDN-PRI test call. In the synchronous method, an outgoing ISDN-PRI test call may be part of a system technician-demanded long test sequence to test a circuit pack, port, or trunk. Therefore, the command line entry can be any of the following:

test trunk <grp>/<mbr> long [repeat #]

test port PCSSpp long [repeat #]

test board PCSS long [repeat #]

The "long" qualifier must be entered in the above commands in order for the ISDN test call to run. The repeat number (#) can be any number from 1 through 99 (default = 1).

The following information is displayed in response to the above commands:

- **Port**: The port address (PCSSpp) is the port network number, carrier designation, slot, and circuit of the maintenance object under test.
- **Maintenance Name**: The type of maintenance object tested.
- **Test Number**: The actual test that was run.
- **Test Results**: Indicates whether the test passes, fails, or aborts.
- **Error Code**: Additional information about the results of the test. (See the ISDN Trunk Maintenance documentation for details.)

Asynchronous Method

NOTE:
The asynchronous method requires a Maintenance/Test circuit pack to be physically present in the system.

In this method, four commands are used to start, stop, query, and list an outgoing ISDN-PRI test call. These commands are as follows:

clear isdn-testcall <grp>/<mbr> (stop)

list isdn-testcall (list)

status isdn-testcall <grp>/<mbr> (query)

test isdn-testcall <grp>/<mbr> [minutes] (start)

NOTE:
Before placing an outgoing ISDN-PRI test call, verify that the FAC on the System Features Form has been administered as well as the Far End Test Line No and TestCall Bearer Capability Class (BCC) on the Trunk Group Administration Form. Furthermore, if the ISDN-PRI trunk is of the "cbc" (call by call) service type, then the Testcall Service field on Trunk Group Administration Form must have been administered also.

To initiate an outgoing ISDN-PRI test call in the asynchronous method, issue the following command:

test isdn-testcall <grp>/<mbr> [minutes]

This command enables you to specify a specific the trunk on which to originate the ISDN-PRI test call.

NOTE:
The optional qualifier can also be used that specifies in minutes the duration of the test call. If no duration is specified, the default duration is used which is 8.4 or 9.6 seconds. The qualifier "minutes" accepts the numeric values one through 120 (that is, two hours = 120 minutes).

Screen 5-6 shows a typical response to the **test isdn-testcall** command:

```
test isdn-testcall

Port    Maintenance Name   Test Number   Test Result  Error Code

1B1501  ISDN-TRK             258           PASS
```

Screen 5-6. Typical Response to Test ISDN-Testcall Command

The meaning of the information displayed in response to the above command is described in the following list.

- **Port**: The port address (PCSSpp) is the port network number, carrier designation, slot, and circuit of the maintenance object under test.
- **Maintenance Name**: The type of maintenance object tested.
- **Test Number**: The actual test that was run.
- **Test Results**: Indicates whether the test passes, fails, or aborts.
- **Error Code**: Additional information about the results of the test. (See the ISDN Trunk Maintenance documentation for details.)

The functions of the **clear**, **list**, and **status** commands associated with the ISDN Testcall are summarized in the following list. For more detailed information, refer to the appropriate sections as directed.

- **Clear isdn-testcall <grp>/<mbr>** enables you to cancel an in-progress ISDN-PRI test call and allow another test call to start. For details on this command, refer to the **clear isdn-testcall** command description in the "Clear Commands" section of Chapter 10, "Maintenance Commands and Trouble-Clearing Aids".

- **List isdn-testcall <grp>/<mbr>** enables you to list all the ISDN-PRI trunks in use for an ISDN-PRI test call in the system. For details on this command, refer to the **list isdn-testcall** command description in the "List Commands" section of Chapter 10, "Maintenance Commands and Trouble-Clearing Aids".
- **Status isdn-testcall <grp>/<mbr no> [minutes]** enables you to check on the progress of an outgoing test call. When an outgoing ISDN-PRI test call completes in a specific port network, another ISDN-PRI trunk from the same port network is available for testing (regardless of whether the **status** information has been displayed). For details on this command, refer to the **status isdn-testcall** command description in the "Status Commands" section of Chapter 10, "Maintenance Commands and Trouble-Clearing Aids".

Troubleshooting the Outgoing ISDN-Testcall Command

If the TestCall BCC field appears on the Trunk Group Administration Form, make sure the TestCall BCC field indicates the correct BCC for the service provisioned on the ISDN-PRI trunk. The TestCall BCC values are defined as follows:

- 0—Voice
- 1—Digital Communications Protocol Mode 1
- 2—Mode 2 Asynchronous
- 3—Mode 3 Circuit
- 4—Digital Communications Protocol Mode 0 (which is usually the default).

NOTE:
If the ISDN-PRI trunk is of type "cbc," make sure the TestCall Service field on the Trunk Group Administration Form indicates the correct service so that a network facility message can be sent across the ISDN-PRI network.

If the outgoing ISDN-PRI test call keeps aborting, please make sure that the far-end device can handle DCP Mode 0 or DCP Mode 1.

NOTE:
Before attempting to make an ISDN-PRI test call to the public network (that is, the network is the far-end), make sure that test call service is provisioned by the network. The user must subscribe to Test Type 108 service and have the correct far-end test call number administered on the trunk group form for the call to be allowed.

Troubleshooting Backplane Voltage Problems

The TN2036 Voltage Range circuit pack is a test tool that allows easy access to the backplane pins that provide various voltages to control and port slots. Probes from a voltmeter can be plugged into the access point for the desired voltage and a ground access point to measure the voltage. This circuit pack itself has instructions for use printed on the side as well as a listing of the voltage tolerance range for each voltage on the front panel. The voltages and tolerances are as follows:

ringing voltage: 75 -> 115 VAC

+12 VDC: 11.4 -> 12.6 VDC

+5 VDC: 4.95 -> 5.35 VDC

-5 VDC: -4.95 -> -5.35 VDC

-48 VDC: -43 -> -53 VDC

neon message waiting voltage: -80 VDC -> -165 VDC

The type of carrier cabinet determines where the circuit is placed to measure the voltages. For a multicarrier cabinet, all voltages except +12 VDC can be measured from any port slot. However, the neon message waiting voltage requires that the system have a TN752 or TN755 Power Unit circuit pack. The +12 VDC is not provided in multicarrier cabinets.

For single-carrier cabinets, all voltages except +12 VDC and +5 VDC can be measured from any port slot. However, the neon message waiting voltage requires that the system have a TN752 or TN755 Power Unit circuit pack. The Tape Drive slot is used to measure +12 VDC.

NOTE:
All control circuit packs should be removed from the backplane before this measurement is made.

The +5 VDC measurement must be made in two separate cabinet locations since the power unit has two independent +5 VDC outputs [+5 VDC and +5(B) VDC]. Each output supplies a different section of the cabinet with power. For the control cabinet, make one measurement in the processor slot and another in any port slot. For an EPN control cabinet, make one measurement in any port slot from 1 to 4 and another in any port slot from 5 to 16. For a port cabinet, make 1 measurement in any port slot from 1 to 6 and another in any port slot from 7 to 18.

Accessing Alarms and Errors

6

General

The maintenance subsystem is that part of the software that is responsible for initializing and maintaining the system. Through Error and Alarm Logs, the maintenance subsystem maintains an error history of problems discovered in the system. The maintenance subsystem provides a user interface for on-demand testing.

The system is divided into separate entities called maintenance objects (MOs). Each MO is treated independently and is identified by what type of object it is (maintenance name) and where it is located in the system (physical name). Some examples of MOs are:

Maintenance Name	Physical Name
CO-TRK	1E1903
DETR-BD	1B05
TAPE	1A

The first two columns of the Error and Alarm Logs reflect similar information.

Error Generation/Tracking

All types of errors logged against an MO are kept in a maintenance record for that MO. This record is created when the first error is reported and remains active until maintenance determines that the problem no longer exists. A counter is kept for each type of error, and each time the error recurs, the associated counter is increased.

Maintenance monitors the status of the MO as long as a counter is active. (An active counter is a counter that has a non-zero value.) To prevent the record from being active forever, a "leaky bucket" mechanism operates on each in-line error counter to slowly reduce the counter value over time. An "in-line error" is the term used to describe an event or problem usually associated with a circuit pack or a port that occurs either during normal operation or during scheduled testing. Depending on the severity and frequency of an in-line error, the error may be resolved via the "leaky bucket" mechanism. Periodically (usually 15 minutes), these counter amounts are reduced. If the error is still being reported, the "leaky bucket" won't have much effect. However, if the problem is transient and errors are no longer being reported, the "leaky bucket" method provides a mechanism for the counters to be reduced and the maintenance record to be retired.

Once a maintenance record becomes active, testing is scheduled to run more frequently in order to monitor the behavior of the MO. The results of any tests that fail are recorded in the maintenance record. Each test has a counter associated with it; the counter is incremented when the test fails and is decremented when the test passes. If the tests abort because the object to be tested is in use, the counters are not incremented or decremented. The "leaky bucket" method is not used for counters associated with tests.

Alarm Generation Thresholds

Each error and test counter is assigned a threshold value. Accelerated testing begins when the error counter becomes active (that is, when its value becomes non-zero). In general, alarms are raised only by test failures; in-line errors, in most cases, do not raise alarms. An alarm is not resolved until "all" tests have passed and all alarming counters go to 0. The maintenance record is active until all counters are reduced to 0. Also, the Alarm Log shows an alarm for every active error in the Error Log. The alarm level is the highest level of alarm for all errors and test counters which still have non-zero values.

The following example illustrates these points: If there is an active error against an MO that causes a MINOR alarm and an active error that causes a MAJOR alarm, then the Alarm Log would show two MAJOR alarms. If the MINOR alarm problem is resolved first, the error is still marked as alarmed until the MAJOR alarm problem is resolved, and the Alarm Log would still show two MAJOR alarms. If the MAJOR alarm problem is resolved first, the error is still marked as alarmed until the MINOR alarm problem is resolved, and the Alarm Log would now show two MINOR alarms.

The active Hardware Error Log entries and the Alarm Log entries against a particular MO are not cleared from the logs until all the problems causing the alarms have been resolved.

Alarm Log

The system produces a software record of every alarm detected in the system. This record, the Alarm Log, can be displayed on the administration terminal or can be displayed remotely by Initialization and Administration System (INADS) personnel.

An entry in the Alarm Log is generated as a result of errors detected on an MO by automatic system tests, demand tests, and in-line error detection. The high-level software determines if the errors are serious enough, or if enough errors have occurred to warrant alarm status.

Alarms are retired if the problem is resolved and further maintenance tests indicate that the problem no longer exists. Alarms are also retired if the errors causing the alarm have not been reported for a predetermined time interval.

The Alarm Log is restricted in size. If the log is full, a new entry overwrites the oldest resolved alarm. If there are no resolved alarms, the oldest error (which is not alarmed) is overwritten. If the log consists of only active alarms, the new alarm is dropped. The Error Log is saved on tape by issuing a **reset system 4** or **reset system 5** command. Refer to Chapter 4, "Initialization and Recovery", for more information on the **reset** commands.

NOTE:
It is not recommended that a system restart be performed for the sole reason of saving the Error Logs to tape. In a MCC cabinet the Error Log is also saved to tape when the Processor Port Network (PPN) experiences an AC power loss that requires power to the port carriers in the PPN to be shut down (see "AC-POWER (AC Power) for AC-Powered Systems" Maintenance documentation for details). Caution should be used in relying on the Error Logs on a duplicated switch in a MCC cabinet after a power failure. If the active carrier was the A carrier at the time of the power failure the error logs will be saved to the A carrier mass-storage system. However when the power is restored the system will boot with the B carrier active. Also the old Error Log will be read in from the B carrier mass-storage system, thus the previously saved error logs will not be accessible.

Alarm Log Reporting Strategy

All Major and Minor alarms and possibly downgraded Warning alarms are reported to INADS. (For details on downgraded Warning alarms, refer to the description of the **set options** command in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids".) When the system raises one of these alarms, an attempt is made to call INADS. If the call to INADS fails for whatever reason, the call is retried when the Repeated Dial Interval time has expired (The valid Repeat Dial Interval range is 1-20 minutes; the default value is 7 minutes.). After a total of four failed call attempts, the system waits one hour, after the hour is up, the system starts over with the same four call attempts. This cycle repeats until either the call to INADS successfully completes or until the "four call attempts cycle" is repeated six times. If at any time during the one hour interval, a new alarm is raised by the system that should be reported to INADS, all timers and counts are reset and the strategy is repeated from the very beginning.

During each of the four call attempts portion of the scenario described above, the ACK lamp on the attendant console is turned off. The ACK lamp flashes during the one hour interval, this indicates that the system is having trouble reporting alarms to INADS. At the end of the entire scenario just described, if the system could not report the alarm to INADS, the ACK lamp continues to flash.

Alarm Log and System Reset Interactions

In general, system restarts result in the removal of all Alarm Log entries and their associated Error Log entries from their respective logs. However, there are exceptions to this rule. Since alarms on processor complex MOs can cause PEIs (Processor Element Interchanges) followed by a Warm or Cold 1 restart on the new Active SPE, if these alarms were wiped out of the log during the restart, then information about what caused the PEI would be lost. Therefore, the following rules are used to determine which alarms are retired on system restarts.

- Warm and Cold 2 restarts—All alarms except those against the following Standby SPE MOs are resolved: DATA-CHL, DATA-BD, DATA-CON, PKT-CTRL, PI-BD, PI-PT, PROCR, MEM-BD, SW-CTL, TAPE, PR-MAINT, SHDW-CIR, DUPINT, CARR-POW (carriers A and B in the PPN only), STBY-SPE, SHDW-LNK.
- Cold 1 restarts—All alarms except those against the following Standby SPE MO are resolved: TAPE (only if there is a TAPE alarm of Error Type 3329).
- Reboots—All alarms are resolved.

NOTE:
The previous rules imply that on a standard system all alarms are resolved on all system restarts.

Hardware Alarm Reports

See the **display alarms** command in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for details.

Typical Alarm Log

Screen 6-1 is a typical Alarm Log display.

```

Screen 6-1. Alarm Log Display Output

Information contained on the display is listed under columns as follows:

- **Port:** Physical location of the MO.
- **Maintenance Name:** Abbreviated identifying name of the MO.
- **On Board?:** A "y" (yes) means that the fault detected is on the associated circuit pack. An "n" (no) means that the fault has not been localized to a circuit pack. On-board alarms cause the red LED on the circuit pack to light, whereas off-board alarms do not.
- **Alt Name:** Extension number for terminals or trunk group number for trunk groups.
- **Alarm Type:** "MAJOR," "MINOR," or "WARNING."
- **Svc State:** "IN," "OUT," or "RDY."
  - — "IN" stands for "in-service" and indicates that an MO is currently in-service.
  - — "OUT" stands for "out-of-service" and indicates that an MO is currently not operational.

— "RDY" stands for "ready-for-service" and indicates that an MO (a trunk, for example) has been busied out by system technician at the local end. Therefore, while no outgoing calls are permitted, a trunk may still attempt to service incoming calls.

- **Ack?:** A "y" (yes) or "n" (no) indicates whether or not the alarm has been acknowledged. A "c" in the Resolved Alarm Log indicates a cleared alarm notification message was acknowledged by INADS.
- **Date Alarmed:** Month, day, hour, and minute that the alarm was raised.
- **Date Resolved:** Month, day, hour, and minute that the alarm was resolved. **00/00/00:00** is displayed for active alarms.

If a number of alarms are active, the log can be used with the List of Alarms in Table 6-1 to determine which alarms should be cleared first. The list presents all the alarms that can occur in the system in their descending order of urgency. Alarms should always be cleared in this order.

Table 6-1. List of Alarms

Maintenance Name	Alarm Level	On / Off Board[1]	Circuit Pack Name
AC-POWER	Major	On	AC Power
DC-POWER	Major	On	SCC[2] Environmental Sensors
PROCR	Major	On	Processor
MEMORY	Major	On	Memory

PMS-PRNT	Warning	Off	PMS Log Printer
JNL-PRNT	Warning	Off	Journal Printer
SYS-PRNT	Warning	Off	System Printer
AUDIX-RES		On	DEFINITY AUDIX

1 On Board means that the fault detected is on the associated circuit pack.
Off Board means that the fault has not been localized to a circuit pack.

2 SCC stands for Single-Carrier Cabinet.

3 G3iV1.1-286, G3iV2-386

4 Alarms on this MO may appear as warnings. Use the **set options** command to determine current valid settings.

Error Log

See the **display errors** command in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for details.

Terminal Alarm Notification

This type of alarm exists for customers who have administered feature buttons on voice terminals or the attendant console to represent several types of alarms. A maximum of 10 digital and/or hybrid voice terminals may be used.

When an alarm occurs, the green (status) lamp associated with the assigned button assumes a steady state.

The lamp may be turned off by pressing the button associated with the lighted alarm lamp. If the lamp is turned off, and the alarm has not been resolved by the time maintenance reschedules testing, the green (status) lamp resumes its steady state.

Each alarm type and its meaning is described here:

NOTE:
The text of each button label appears in parenthesis.

- Administered Connection Alarm (ac-alarm)—lights if a locally administered connection (ADM-CONN) has a Major, Minor, or Warning alarm active.
- Auto Wakeup Journal Printer Alarm (pr-awu-alm)—lights if the automatic wakeup journal printer has a Major, Minor, or Warning alarm active.
- DS1 Facility Alarm (ds1-alarm)—lights if a DS1-BD has an off-board Major, Minor, or Warning alarm active.
- Facility Access Alarm (trk-ac-alm)—lights when the facility access trunk test feature is used.
- Major Alarm (major-alrm)—lights if any Major alarm in the system is active.
- Major/Minor Alarm (mj/mn-alrm)—lights if any Major or Minor alarm in the system is active.
- PI Link Alarm (link-alarm)—lights if links (1 through 8) have a Major, Minor, or Warning alarm active.
- PMS Printer (pr-pms-alm)—lights if the PMS printer has a Major, Minor, or Warning alarm active.
- RS-Alert (rs-alert)—lights if a system **reset system 2 or 3** is performed.
- CDR1-Alarm (smdr1-alrm)—lights if the Primary Link has a Major, Minor, or Warning alarm active.

- CDR2-Alarm (smdr2-alrm)—lights if the Secondary Link has a Major, Minor, or Warning alarm active.
- System Printer Alarm (pr-sys-alm)—lights if the System Printer (SYS-PRNT) has a Major, Minor, or Warning alarm active.

LED Interpretation

7

General

The lighting and unlighting of LEDs indicates to the system user the status of various maintenance components in the system. LEDS are located on the attendant console, on all circuit packs in the switch cabinets and, optionally, on customer-designated voice terminals. The following LEDS are included in the system:

- Processor circuit pack and maintenance circuit pack LEDs
- Duplication interface circuit pack LEDs
- Attendant console LEDs
- Carrier power unit LEDs
- Power distribution unit LEDs
- Control and port circuit pack status LEDs

Processor Circuit Pack and Maintenance Circuit Pack LEDs

The front panels of the Processor circuit pack (PPN carrier A, PPN carrier B in a High or Critical Reliability system) and Maintenance circuit pack (EPN carrier A) are identical. Each has two groups of LEDs. One group indicates the status of the pack, and the other group (which includes the Major, Minor, and Warning alarms described previously) reflects maintenance conditions in the entire system (that is, the PPN and EPN cabinets). See Figure 7-1.

- Red (alarm)—the system has detected a fault in this circuit pack.

  NOTE:
  Alarms on the TAPE, PROCR, and PR-MAINT MOs [286 System] or on the PROCR, PR-MAINT, and MEMORY MOs [386 System], PR-MEM [Release 5vs/si and later] are indicated by the red LED on the Processor circuit pack.

- Green (test)—the system is running tests on this circuit pack.

  NOTE:
  On the Standby Processor circuit pack, green means that the Standby Switch Processing Element (SPE) is not refreshed (that is, it is in Maintenance or Down Mode).

  NOTE:
  On the Maintenance circuit pack, the green LED may blink very faintly once per second. This is the normal operating state of the Maintenance circuit pack. The faint blink is due to a once-per-second self-test executed by the Maintenance circuit pack.

- Amber (busy)—this circuit pack is in use. In a High or Critical Reliability system, the amber LED is always unlit on the Standby Processor and Memory circuit packs even when in Maint mode.
- MAJOR ALARMS (red)
- MINOR ALARMS (red)
- WRNG (warning) ALARMS (amber)
- ACK (acknowledgment) (green)—indicates Major or Minor alarms have been reported to INADS
- EMERGENCY TRANSFER (red)—indicates emergency transfer has been invoked

  NOTE:
  If the AC power cord is unplugged from the control SCC, the emergency transfer feature will be invoked, however the

EMERGENCY TRANSFER LED (red) will not be lit, due to loss of AC power.

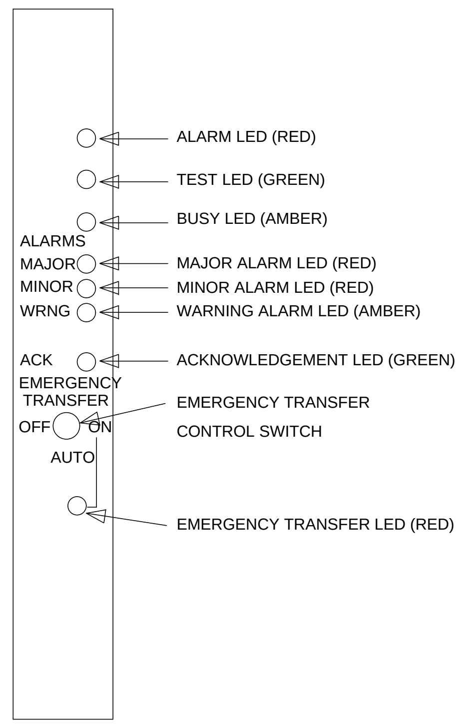

Figure 7-1. Indicators on Maintenance and Processor Circuit Packs

Duplication Interface Circuit Pack LEDs

In a High or Critical Reliability system, there are two Duplication Interface circuit packs. One is located in carrier A and one in carrier B of the PPN. Each circuit pack has two groups of LEDs. The top three have the traditional function of indicating the status of the pack. The LED located at the bottom of the faceplate directly beneath the SPE AUTO switch is labeled OVERRIDE. Under normal operating conditions, the SPE AUTO switch is in the AUTO (center) position (see Figure 7-2). This means that the system controls which SPE is active. However, there will be times (during maintenance activity, for example) when you, the technician, may choose to manually override the SPE selection function. To override system selection of the Active processor, move the SPE Select switches one at a time on *both* Duplication Interface circuit packs from the AUTO position to either the ‘‘A’’ position or the ‘‘B’’ position. Thus, when both SPE Select switches have been moved to either ‘‘A’’ or ‘‘B,’’ the OVERRIDE LED turns red and lights steadily.

NOTE:
Failure to move both SPE Select switches to the same position causes the system to retain control of processor selection.

To return control of the SPE selection to the system, return the SPE Select switches on both Duplication Interface circuit packs to the AUTO position (one at a time to avoid accidentally selecting the other SPE). The OVERRIDE LED goes dark.

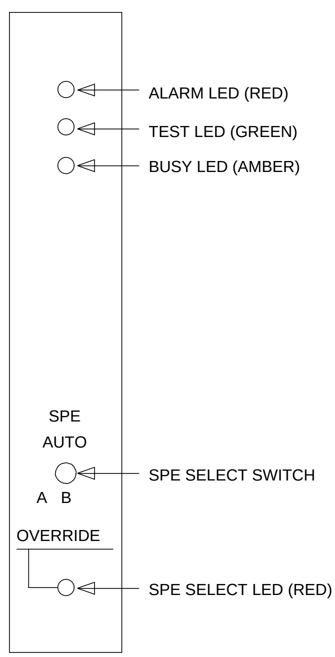

Figure 7-2. Duplication Interface Circuit Pack Indicators

Attendant Console LEDs

The console has two red LEDs, labeled ALM and ACK, on the left side of the dial. The left LED lights steadily when there is a Major or Minor alarm at the switch cabinet. The right LED lights steadily if the alarm has been successfully reported to INADS. If the system is unable to report the alarm to INADS, the LED flashes; this signals the attendant to call INADS and report the alarm.

Carrier Power Unit LEDs

For a description of Carrier Power Unit LEDs, refer to "CARR-POW (Carrier Port Power Unit) for AC-Powered Systems" and "CARR-POW (Carrier Port Power Unit) for DC-Powered Systems" Maintenance documentation found in Chapter 11, "Maintenance Object Repair Procedures".

Power Distribution Unit LEDs

For a description of Power Distribution LEDs, refer to "CARR-POW (Carrier Port Power Unit) for AC-Powered Systems" and "CARR-POW (Carrier Port Power Unit) for DC-Powered Systems" Maintenance documentation.

Control and Port Circuit Pack Status LEDs

Each circuit pack in the switch cabinet has three LEDs on the front panel visible at the front of the carrier (see Figure 7-3). On all circuit packs, except the TN736 Power Unit, the LEDs indicate the following when lighted:

1. Red (alarm)—If the circuit pack is communicating with the system, the system has detected a fault in this circuit pack. An on-board alarm for this circuit pack is displayed in the Alarm Log.

   The circuit pack also lights on this LED when either the circuit pack has not yet initialized communication with the system or when the circuit pack loses contact with the system and therefore stops functioning (circuit pack is said to be ‘‘in reset’’). In these cases, there may not be an alarm in the Alarm Log. To determine if the red LED is lit because the circuit pack is not in contact with the system, issue the **list configuration board PCSS** command, where PCSS refers to the slot containing this circuit pack. If the system does not detect the circuit pack, this command returns ‘‘Identifier not assigned’’ or ‘‘no board.’’

   If the circuit pack has just been inserted, the system may still be initializing the circuit pack. If, after five minutes, the circuit pack still has not initialized communications with the system, check the Maintenance documentation for this MO for any special instructions (for example, EPN Maintenance circuit pack can stop EXP-INTF circuit pack from initializing). If the Maintenance documentation you consult does not provide the needed information, execute the following four steps:

- Check the Hardware Error Log for TONE-BD and TDM-BUS errors. Issue the **test tdm P** command where P is the port network containing the relevant slot. Refer to "Restarting Nonfunctioning Port Circuit Packs" in Chapter 11, "Maintenance Object Repair Procedures" in the general description of the "TDM-BUS (TDM Bus)" Maintenance documentation section. Issue the **test tone-clock PC** command, where P is the network containing the relevant slot, and C is the carrier containing the relevant slot. Follow appropriate Maintenance documentation sections for any TONE-BD and TDM-BUS errors. If the problem persists, go to the next step.
- Reseat the suspect circuit pack. For instructions on reseating circuit packs, refer to the "Handling Port Circuit Packs" and "Handling Control Circuit Packs" sections in Chapter 5, "Routine Maintenance Procedures".

WARNING:
Reseating some circuit packs may be very destructive (for example, Control Carrier circuit packs.)

Wait five minutes. Then issue the **list configuration board PCSS** command. If the result indicates that the system still has not registered the circuit pack, go to next step.

- Try to insert the circuit pack into a different slot and try to insert a different circuit pack into the suspect slot (provided the maintenance documentation for this circuit pack does not warn against either of these actions).
- If the system seems to be functioning correctly, but the circuit pack does not start communicating with the system, replace the circuit pack.

2. Green (test)—The system is running tests on this circuit pack.
3. Amber/Yellow (busy)—Indicates that the circuit pack is in use.

NOTE:
A port circuit pack also lights its red LED when it performs initialization tests (for example, when the circuit pack is initially inserted into the system). If all initialization tests pass, the red LED is turned off. If any initialization tests fail, the red LED remains lighted and the circuit pack is not placed into service.

Packet circuit packs such as the TN556 ISDN BRI-Line and TN570 Expansion Interface perform extensive initialization tests and light both the red and green LEDs during that testing.

During the various states of operation (start-up testing, normal operation, circuit failure, etc.) circuit pack status LED indications appear as shown in Table 7-1.

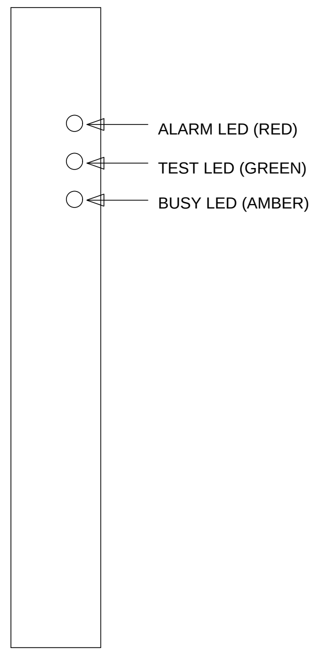

Figure 7-3. Circuit Pack Indicators

Table 7-1. Circuit Pack Status LEDs

Equipment Type	LED	Description
Port Circuit Packs	Red	Lighted briefly during power up, circuit pack reseating, resetting, and system reset. Lighted steadily if circuit pack fails start-up test or fails while in use. Otherwise, dark during normal operation.
	Green	Lighted briefly during circuit pack testing following power up, circuit pack reseating, and system reset. Also lighted during periodic, scheduled, and system technician-demanded testing. Otherwise, dark during normal operation.
	Amber	Lighted steadily when any port in the circuit pack is in use. Otherwise, dark. **NOTE:** The amber LED on the TN771 Maintenance/Test circuit pack may blink. This has special meaning for systems that use the Packet Bus. Refer to Packet Bus Maintenance documentation for more information.
Control Circuit Packs	Red	Lighted briefly during power up and system reset. Lighted steadily if circuit pack fails start-up test or fails while in use. Otherwise, dark during normal operation.
	Green	Lighted briefly during circuit pack testing following power up and system reset. Also lighted during periodic, scheduled, and system technician-demanded testing. Otherwise, dark during normal operation.
Control Circuit Packs *(continued)*	Amber	Network Control —On the TN777B network Control circuit pack, a fourth amber LED with the label ‘‘Card in use’’ is lighted whenever the memory card is in use.

Continued on next page

Table 7-1. Circuit Pack Status LEDs — *Continued*

Equipment Type	LED	Description
Control Circuit Packs *(continued)*	Amber	Processor—Lighted during processor initialization. Lighted steady on the Active SPE and dark during normal operation on the Standby SPE. Memory—Lighted during system initialization (stays lighted until Emergency Transfer is turned off). Lighted steady on the Active SPE and dark during normal operation on the Standby SPE. Network Control—Lighted when one of the data channels is in use. Packet Control —Lighted when at least one Packet Control is in use. Packet Control LEDs do not light up (not even for the *test led* command) if the packet feature is not enabled on the Systems-Parameters Maintenance screen. Tone Detector/Generator—Slow blinking when clock is in use. Otherwise, dark. Processor Interface—Lighted when one (or more) channels (links) is in use. Otherwise, dark. Duplication Interface—Lighted steady on the Active SPE and dark during normal operation on the Standby SPE, with the following exception. Duplication Interface Circuit Pack A has the amber LED lighted steady if Tone/Clock Circuit Pack 1B is active, regardless of which SPE is active and which is standby.
Tape Drive Circuit Pack	Amber	Lighted steadily when the SPE is reading from or writing to the tape. Otherwise, dark.

Reliability Systems: A Maintenance Aid

8

General

A High or Critical Reliability system provides highly-available call processing because single points-of-failure in the system that result in loss of call processing are minimized. Such a system uses the existing duplicated Time Division Multiplex (TDM) Buses, provides the Switch Processing Element (SPE), Tape Unit [286 systems] Memory Card [386 and later systems] , and TN768 and TN780 Tone-Clock circuit pack duplication, and it utilizes Packet Bus redundancy. These components are each single points-of-failure in a Standard Reliability system.

The SPE is fully duplicated. The two SPEs are mounted in separate carriers and are powered by different carrier power supplies. As a result, a High or Critical Reliability system has two control carriers: the A control carrier and the B control carrier (also known as carrier A and carrier B, respectively).

Since the circuit packs in the two SPEs are the same, the SPEs have identical capabilities. Either SPE can act as the Active SPE. However, only one of the SPEs can be the Active SPE at any given time. The Active SPE performs the same operations that the single SPE performs in a Standard system; that is, all call processing, administration, and maintenance activities being performed by the switch. All memory writes performed on the Active SPE are shadowed to the other SPE. The other SPE is known as the Standby SPE. Its role is to take over as the Active SPE if the current Active SPE fails. If the Active SPE (or a component of the Active SPE) fails, the system automatically switches to the Standby SPE.

Under normal conditions, the system operates using both TDM Buses. If the system detects transmission problems on one of the buses, it takes that bus out-of-service and operates with only one bus. This action results in a reduction in capacity. However, if the system detects a problem with one of the Tone-Clock circuit packs, it is able to take that circuit pack out-of-service without any impact on system capacity or performance.

The Packet Bus is NOT duplicated in the same way that the TDM Bus is duplicated (that is, there is one Packet Bus, while there are two TDM Buses). However, there are several spare leads on the Packet Bus itself that are not normally used. In a High or Critical Reliability system, the TN771 Maintenance/Test circuit pack is provided. This circuit pack has ability to detect faulty Packet Bus leads and to instruct all Packet circuit packs (for example ISDN-BRI, Packet Control, TN570 Expansion Interface circuit packs) to use up to three spare leads in place of defective ones.

The rest of this chapter provides a detailed description of the High and Critical Reliability systems that are available in as well as of the Standard system that is available across the board. The chapter explains the duplicated hardware and includes a description of the TN772 Duplication Interface circuit pack. It provides a look at the following concepts relevant to High and Critical Reliability systems: memory shadowing, SPE modes, and SPE-interchanges.

In addition, this chapter contains technical descriptions important to the general maintenance of High and Critical Reliability systems, such as a list of the appropriate system technician commands, SPE circuit pack LED strategies, installation and replacement procedures for SPE Control Carrier circuit packs, and for the Inter-Carrier Cable (ICC).

This chapter uses the term "Standard Reliability system" or "Standard system" to denote a system without duplication.

Reliability Options

The G3i or Release 5 systems or available in three different reliability options: Standard, High and Critical Reliability. An increased level of reliability is implemented by duplicating various components so that standby components can take over (interchange) when a failure occurs on an active component. Most interchanges take place with no disruption of current service, and they allow for repairs to be made without disruption. Furthermore, duplication allows for the upgrading and maintenance of duplicated components and software without service disruption. The following sections describe which components are duplicated with each option.

Standard Reliability

On Standard Reliability systems, the 512-time-slot TDM bus is divided into two duplicate 256-time-slot buses, A and B. Call traffic is shared between the two buses. The first five time slots on each bus are reserved for the control channel, which is active on only one of the two buses at a time. Likewise, the next 17 time slots are reserved for carrying system tones. The tone time slots are not necessarily on the same bus (A or B) as the control channel. If any failure that affects the ability of the active control channel or the tone time slots to function takes place, the other bus becomes active for those time slots. For more information, see TDM-BUS Maintenance section in Chapter 11, "Maintenance Object Repair Procedures", and the **set tdm** command in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids".

High Reliability

High Reliability systems duplicate components that are critical to the viability of the system as a whole to prevent a single failure from dropping all service. These components include the following:

- PPN control carrier and carrier power units (OLSs)
- All SPE circuit packs, including the Processor, Memory, Network Controller, Tape [286 Systems], Memory Card [386 Systems], Processor Interface, Packet Controller, and Duplication Interface circuit packs
- PPN Tone Clock circuit pack (EPN Tone-Clocks are not duplicated)
- TDM buses (described in the previous section)

The duplicated SPEs operate in active/standby fashion. Operation of this duplication is described in the STBY-SPE and DUPINT MO sections in Chapter 11, "Maintenance Object Repair Procedures". Interchanges of the SPE and of PPN Tone-Clocks operate independently unless induced by use of the SPE-select switches.

Critical Reliability

Critical Reliability systems include all of the features of the High Reliability option described in the previous section. Additionally, these systems duplicate components of Port Network Connectivity (PNC) and of other components that are critical to the viability of each EPN. These components include the following:

- PPN and EPN Tone-Clock circuit packs
- PPN and EPN Expansion Interface circuit packs
- Inter-PN cabling

The entire direct-connected fiber connectivity is duplicated between each pair of port networks. Each duplicated fiber pair operates in an active/standby manner with all inter-PN calls set up on both fibers so that the active SPE can assume control without disruption of service. Each fiber pair between a pair of port networks operates independently of the other fiber pairs with respect to the active/standby operation (that is, the A-carrier fiber can be active between the PPN and EPN 1, and the B-carrier fiber can be active between the PPN and EPN 2).

The Tone-Clocks in each EPN operate in an active/standby manner independently from other duplication strategies.

Duplicated Hardware

A description of the hardware components used in a High or Critical Reliability system follows.

SPE Duplication

Each SPE in a High or Critical Reliability system consists of the following circuit packs:

- Processor Circuit Pack (TN773 [286 system] or TN786B [386 system])
- Memory Circuit Packs (2) (TN770 [286 system])
- Memory Expansion Board (CPP1 [386 system])
- Network Control Circuit Pack (TN777[B])
- Packet Control Circuit Pack (TN778)

NOTE:
There may be zero or one Packet Control circuit packs. However, both SPEs must have an equal number of circuit packs.

- Processor Interface Circuit Pack(s) (TN765)

  NOTE:
  In a multicarrier cabinet, there may be zero, one, or two Processor Interface circuit pack(s). In a single-carrier cabinet, there may be zero or one Processor Interface circuit pack(s). However, both SPEs must have an equal number of Processor Interface circuit packs.

- Tape Unit (TN774 [286 system])
- Duplication Interface Circuit Pack (TN772)

Duplication Interface Circuit Pack

The Duplication Interface circuit pack is required to support SPE duplication. Duplication Interface A is part of the SPE in the A control carrier, and Duplication Interface B is part of the SPE in the B control carrier.

The Duplication Interface circuit packs provide a broad range of functionality. Alone, Duplication Interface A provides control of the following components: the duplicated Processor circuit packs, the duplicated Tone-Clock circuit packs, the environmental maintenance monitoring and control, and G3MT terminal connection. Together, Duplication Interface A and Duplication Interface B provide memory shadowing from Active SPE Memory to Standby SPE Memory and communication between software on the Active SPE and the Standby SPE.

Duplication Interface A controls a lead that indicates to the duplicated Processor and Network Control circuit packs, respectively, which SPE is currently the Active SPE. This lead is known as the SPE Select lead. Duplication Interface A controls another set of leads that indicate to the duplicated TN768 and TN780 8

Tone-Clock circuit packs which of the two is currently the active one. These leads are known as the Tone-Clock Select leads. System software can request that the SPE Select lead and/or the Tone-Clock Select leads be changed. Duplication Interface A controls and monitors in the PPN of a High or Critical Reliability system the same set of environmental leads that the EPN TN775 or TN775B Maintenance circuit pack controls and monitors in an EPN.

The Duplication Interface circuit packs communicate with one another over the Inter-Carrier Cable (ICC). In a multicarrier cabinet, the ICC physically consists of two 25-pin connector cables known as ICC-A and ICC-B. In a single-carrier cabinet, the ICC physically consists of three 25-pin connector cables known as ICC-A, ICC-B, and ICC-C. The ICC connects the Duplication Interface circuit packs via pin fields on the backplane. The pin fields where ICC-A and ICC-B (and ICC-C in a single-carrier cabinet) are connected are labeled on the backplane near the pin fields for the Duplication Interface circuit packs. The ICC carries leads related to maintaining a High or Critical Reliability system. Furthermore, without the ICC properly attached, the system cannot function as either a High or Critical Reliability system or as a Standard system.

The Duplication Interface circuit packs support serial links that provide for G3 MT connection, memory shadowing from Active SPE Memory to Standby SPE Memory, and communication between software on the Active SPE and the Standby SPE. Four serial links are supported:

1. The serial link from Duplication Interface A to the G3 MT.
2. The serial link from Duplication Interface A to the Maintenance/Tape Processor in carrier A.
3. The serial link from Duplication Interface A to the Maintenance/Tape Processor in carrier B.
4. The serial link from Duplication Interface A to Duplication Interface B.

NOTE:
The Duplication Interface B circuit pack does not communicate directly with either Maintenance/Tape Processor or with the G3MT.

Duplication Interface A supports the serial channel to the G3MT that is connected to the Duplication Interface A circuit pack via a connector on the back of carrier A labeled "DOT" (Duplication Option Terminal). If the Duplication Interface A circuit pack becomes defective, and the B carrier becomes the Active SPE, the terminal can be connected to the Maintenance/Tape Processor in carrier B by connecting the terminal to the connector labeled "TERM" on the back of carrier B. If the Duplication Interface A circuit pack becomes defective and carrier A becomes the Active SPE, the terminal can be connected to the Maintenance/Tape Processor in carrier A by connecting the terminal to the connector labeled "TERM" on the back of carrier A.

Communication between software on the Active SPE and the Standby SPE is conducted via a message flow between the two Processors. The flow of messages from the Processor in carrier A to the Processor in carrier B is as follows: Processor A to Maintenance/Tape Processor A over the serial link to Duplication Interface A over the serial link to Maintenance/Tape Processor B to Processor B. The flow in the reverse direction is exactly opposite.

The serial link between Duplication Interface A and Duplication Interface B is involved only in memory shadowing from the Active SPE to the Standby SPE as described in the "Memory Shadowing" section.

SPE Select Switches

The SPE-SELEC (SPE Select) switches are located on the TN772 Duplication Interface circuit packs and are used to hard-select the Active SPE in a High or Critical Reliability system. "Hard-select" means that the SPE Select switches can be moved from the AUTO position to force the current Active SPE to remain the Active SPE or to force the current Standby SPE to become the Active SPE. Hard selection of the Active SPE using the SPE Select switches overrides any attempts by the system software to switch to the Standby SPE to make it become the Active SPE.

Each switch has three positions:

- SPE-A (the left position)
- AUTO (the middle position)
- SPE-B (the right position)

To hard-select SPE A as the Active SPE, *both* SPE Select switches must be moved **one at a time** to the SPE-A position. To hard-select SPE-B as the Active SPE, *both* SPE Select switches must be moved to the SPE-B position. Any other combination of SPE Select switches leave control of the Active SPE to the system software.

Inter-Carrier Cable

As described previously, the ICC connects the two TN772 Duplication Interface circuit packs and is a basis of support for the Duplication Interface circuit pack functionality described previously.

The ICC carries leads related to maintaining a High or Critical Reliability system. The SPE Select lead indicates which SPE is the Active SPE. The Tone-Clock Select leads indicate which Tone-Clock circuit pack is active. SPE Select switch state leads indicate the position of the SPE Select switches. Emergency Transfer leads indicate whether Emergency Transfer is on or off in the PPN cabinet. Other leads "combine" the INADS, CDR, and the Customer-Provided Alarming device channels from the two Maintenance/Tape Processors.

The ICC also carries an indication of whether memory shadowing is enabled or disabled. Information to be shadowed is sent over the serial link between Duplication Interface B and Duplication Interface A; this serial link is carried over the ICC.

Communication between software on the Active SPE and the Standby SPE is sent over the serial link between Duplication Interface A and the Maintenance/Tape Processor in carrier B. This serial link is also carried over the ICC.

The presence of the ICC also causes ID pins on the backplane to indicate that the system is a High or Critical Reliability system rather than a Standard Reliability system.

The ICC is difficult to connect, and its proper connection is critical to the operation of the system. Refer to the "Procedure for Installing/Replacing the Inter-Carrier Cable" section for details on how to properly connect the ICC.

Tone-Clock Circuit Pack Duplication

For more information about the Tone-Clock circuit packs see TONE-BD Maintenance Object in Chapter 11, "Maintenance Object Repair Procedures".

The TONE-BD (Tone-Clock) MO functionality is made up of the TONE-PT (Tone Generator) and the TDM-CLK (TDM Bus Clock). The Tone Generator provides all tones required by the system; the TDM Bus Clock provides synchronization for the TDM Bus and aids in monitoring and selection of SYNC (Synchronization) references.

Each High or Critical Reliability system provides two Tone-Clock circuit packs. In this configuration, a failed Tone-Clock circuit pack is switched off-line and an operational circuit pack is put on-line. Duplication Interface A selects the Active Tone-Clock circuit pack by driving the Tone-Clock Select lead. The selection of the Active Tone-Clock circuit pack is independent of the selection of the Active SPE.

Time Division Multiplexed Bus Duplication

The TDM Bus is composed of two separate, independent buses called bus A and bus B. The first five time slots of both buses are reserved for communication between the SPE and port circuit packs. These time slots are known as the control channel. The control channel is a vital component and must be operational for the system to provide meaningful customer voice and data services. In addition to the control channel time slots, several other time slots are reserved for system use. These additional time slots are for the standard tones. The standard tones include the dial tone and the touch tones.

The ability to move the control channel and tones from a defective TDM Bus to an operational TDM Bus is a key component of a highly-available system. The system can detect transmission errors on the control channel, errors can be diagnosed, and corrective actions can be taken when necessary. If a bus is found to be defective, it is taken out-of-service. All existing calls on the out-of-service bus are maintained, but no new calls are assigned to the out-of-service bus.

In addition to the system software’s ability to detect a defective bus and perform a TDM Bus switch, the user also has the ability to specify if and when a scheduled control channel switch is to be performed.

Figure 8-1 shows the communication path between the Active SPE and the Standby SPE in a 286 system, and Figure 8-2 shows the same in a 386 system. These figures show the duplicated SPE (and all SPE circuit packs) and the duplicated TN768 (and TN780) Tone-Clock circuit packs. The TN772 Duplication Interface circuit packs are shown in these figures. The dotted lines depict the serial connections supported by the Duplication Interface circuit packs as described previously. The SPE Select and Tone-Clock Select leads are shown. Finally, the ICC is shown as it physically appears on the system, that is, as two 25-pin cables called ICC-A and ICC-B in a multicarrier cabinet and three 25-pin cables called ICC-A, ICC-B, and ICC-C in a single-carrier cabinet. The high-level functionality that the ICC provides is also depicted in the figures.

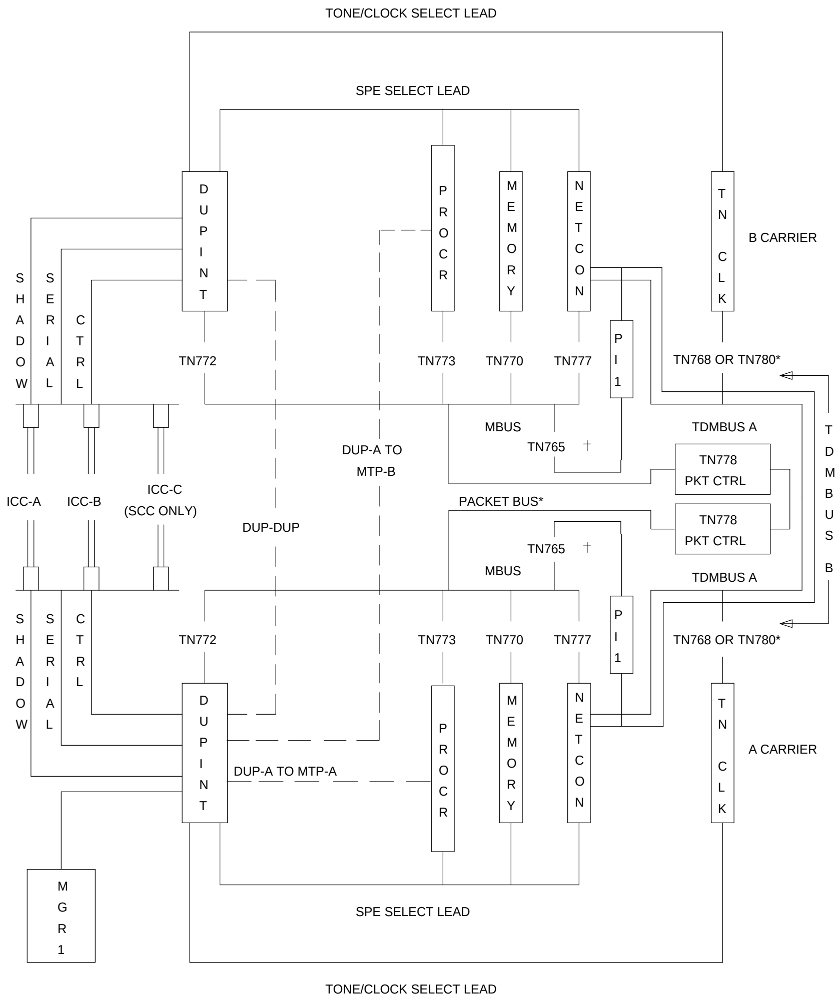
These figure may also be useful when reading the following "Duplication Concepts" section.

Packet Bus Redundancy

The Packet Bus is used to provide ISDN-BRI signaling via the TN778 Packet Control circuit pack. The Packet Bus is not physically duplicated in the same way that the TDM Bus is duplicated. However, there are several spare leads on the Packet Bus itself that are not normally used. In a High or Critical Reliability system that is using the Packet Bus, a TN771 Maintenance/Test circuit pack is provided for each port network. The Maintenance/Test circuit pack has the ability to test the Packet Bus and discover shorted or open leads on the Packet Bus. When such a fault is discovered, the Maintenance/Test circuit pack sends a message to each circuit pack that uses the Packet Bus, instructing that circuit pack to use one of the spare leads in place of the defective lead.

The Maintenance/Test circuit pack can recover up to three Packet Bus lead failures via this mechanism. This provides high availability by decreasing the chance of a blocking Packet Bus fault by two orders of magnitude.

The Maintenance/Test circuit pack has other capabilities, primarily with respect to ISDN-PRI Test Call features. Because of these other capabilities, the Maintenance/Test circuit pack is available as an option in Standard Reliability systems or in High and Critical Reliability systems that are not using the Packet Bus. In such systems, the Packet Bus redundancy capabilities of the Maintenance/Test circuit pack are NOT enabled.



* G1.2 ONLY.

† MCC ONLY.

(IN A SINGLE-CARRIER CABINET CONFIGURATION, THERE CAN BE EITHER 0 or 1 PROCESSOR INTERFACE CIRCUIT PACK. IN A MULTI-CARRIER CABINET CONFIGURATION, THERE CAN BE 0, 1, OR 2 PROCESSOR INTERFACE CIRCUIT PACKS.)

Figure 8-1. Communication Between Active SPE and Standby SPE [286 Systems]

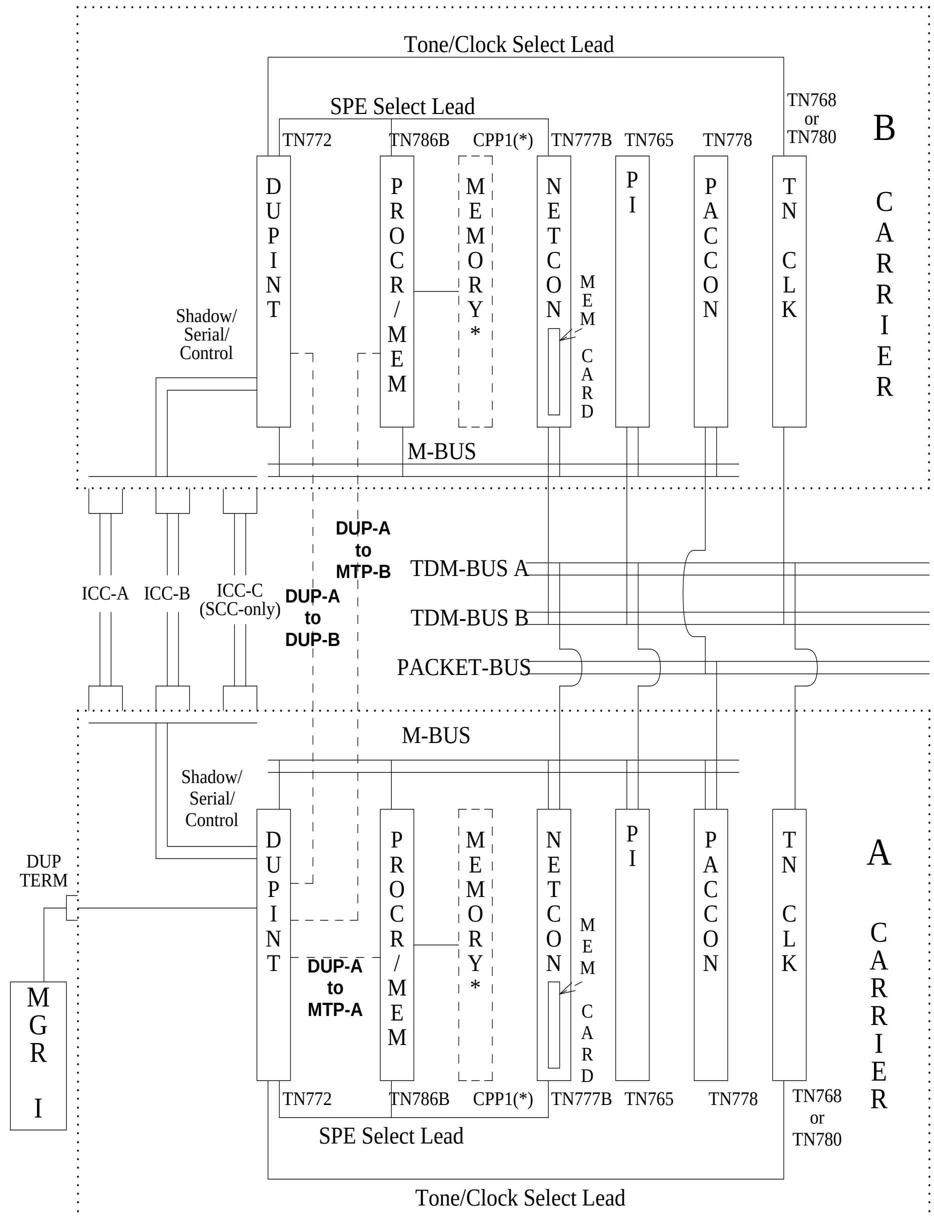


Figure 8-2. Communication Between Active SPE and Standby SPE [386 Systems]

Duplication Concepts

High and Critical Reliability systems employ several concepts of duplication. These are described in the following sections.

Memory Shadowing

Most of the time the Standby SPE is in a mode known as Standby Mode (see "SPE Modes" section) in which it is ready to assume the role of the Active SPE. To be ready to assume the role of the Active SPE, Standby SPE MEM-BD 286, MEMORY-386, and PR-MEM Release 5vs/si and later must be an up-to-date reflection of Active SPE Memory. This is accomplished via the memory shadowing mechanism.

The SHDW-CIR (Common Shadow Circuitry) on the Active SPE TN772 DUPINT (Duplication Interface) detects all memory writes that the Active SPE PROCR (Processor) makes to Active SPE Memory. The Active SPE Common Shadow Circuitry sends this information to the Common Shadow Circuitry on the Standby SPE Duplication Interface via the ICC. The Common Shadow Circuitry on the Standby SPE Duplication Interface then writes the data to Standby SPE Memory. This logical connection between Active SPE Memory and Standby SPE Memory is known as the SHDW-LNK (Memory Shadowing Link).

Although most of the components making up the Memory Shadowing Link (that is, Active SPE Memory, both sets of Common Shadow Circuitry, and Standby SPE Memory) are tested and maintained individually, the integrity of the entire logical connection is also tested and maintained to make sure that the shadowing mechanism is functional and that Standby SPE Memory is the same as Active SPE Memory. Therefore, this testing is done under the guise of the Memory Shadowing Link.

SPE Modes

As described earlier, the Active SPE is the SPE that is currently responsible for all call processing, administration, and maintenance activities being performed by the switch. The Active SPE is always in Active Mode.

The role of the Standby SPE is to be ready to take over as the Active SPE in the event that the current Active SPE fails. The Standby SPE does not perform Call Processing or Administration activities. It does perform Maintenance activity, but this is carried out completely under the direction of the Active SPE in order to monitor and maintain the health of the Standby SPE.

The Standby SPE is always in one of three modes: Standby, Maintenance, Busyout, or Down. Usually the Standby SPE is in Standby Mode. In this mode, the SW-CTL (Switch Control) on the Standby SPE Network Control circuit pack is isolated from the TDM Bus so that it does not attempt to control the bus and interfere with the Switch Control on the Active SPE Network Control circuit pack.

Similarly, the Standby SPE Packet Control circuit pack is isolated from the Packet Bus so that it does not attempt to control the Packet bus, and thus interfere with the Active SPE Packet Control circuit pack. The Standby SPE PROCR (Processor) is held in a reset state so that it does not run software. Finally, Standby SPE is being shadowed into from Active SPE Memory—meaning that Standby SPE Memory is updated to reflect every change in Active SPE Memory (for example, calls and administration changes). In Standby Mode, the Standby SPE is available to assume the role of the Active SPE.

In certain circumstances, the Standby SPE is put into Maintenance Mode by the Active SPE. In this mode, the Standby SPE is still isolated from the TDM and Packet Buses, but is no longer having its Memory shadowed into; its Processor is no longer held in a reset state. In Maintenance Mode, the Standby SPE accepts maintenance activity requests from the Active SPE to perform testing on Standby SPE components. For many of the requested activities, system software on the Standby SPE is brought up to conduct the activity. Translation saves and announcement saves may be performed on the Standby SPE when it is in Maintenance Mode. While in Maintenance Mode, the Standby SPE is not as readily available to assume the role of the Active SPE, but may do so depending on the severity of the Active SPE fault(s).

In Busyout Mode, the Standby SPE is busied out via the *busyout SPE-standby* command. Only system technician-requested activities are carried out on the Standby SPE until a *release SPE-standby* command is executed. Refer to the **status system** command in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for information concerning Standby Modes.

Whenever the Standby SPE is returned to Standby Mode from Maintenance Mode, its Memory is refreshed.

NOTE:
Verify that the Standby SPE is functional (no duplication alarms exist and the SPE has returned to the Standby Mode) by running the **status system 1** command. If the standby SPE is in the maint/idle mode with no standby alarms, use the **standby refresh** command to put the standby SPE into the standby mode. Verify the results by using the **status system 1** command. For more information about the **status system** command see Chapter 10 .

NOTE:
The system software automatically returns the Standby SPE from Maintenance Mode to Standby Mode at the completion of any maintenance activity. However, it is also possible to force the Standby SPE to return to Standby Mode by issuing the **refresh spe-standby** command from the G3MT terminal. The **refresh spe-standby** command preempts Standby SPE Maintenance Mode except that of entering maintenance mode. See the "System Technician Commands for High and Critical Reliability Systems" section for a description of the **refresh spe-standby** command.

This means that all of Active SPE DRAM Memory is shadowed over into Standby SPE Memory. The refresh is necessary because, while in Maintenance Mode, memory shadowing to the Standby SPE is disabled, and Standby SPE Memory is not updated to reflect changes in Active SPE Memory. After the refresh, Standby SPE Memory is again an up-to-date reflection of Active SPE Memory.

The Standby SPE goes into Down Mode when certain error conditions are detected. These error conditions are described in detail in the "Hardware Error Log Entries and Test to Clear Values" section of STBY-SPE (Standby SPE) Maintenance documentation in Chapter 11, "Maintenance Object Repair Procedures". Once the error condition(s) that caused the Standby SPE to go into Down Mode is (are) corrected, the Standby SPE is first put into Maintenance Mode to conduct testing on Standby SPE components and is then returned to Standby Mode.

The current mode of the Standby SPE can be determined by issuing the **status system** command.

SPE-Interchanges

The process by which the Standby SPE takes over for the Active SPE is referred to as an SPE-interchange. There are six conditions under which an SPE-interchange is initiated:

- Upgrade Software

  Issuing the **upgrade software** command to upgrade the software on a High or Critical Reliability system reboots the Standby SPE from the standby tape [286 systems] or memory card [386 or later systems] and then invokes an SPE-interchange so that the system is now running on the new software.

- System Technician Command

  Issuing the **reset system interchange** command on the G3MT terminal causes an SPE-interchange to be initiated.

- Alarm Condition

  If a Major or Minor alarm is activated on any circuit pack, an SPE-interchange is initiated, provided the health of the Standby SPE is better than that of the Active SPE. Table 8-1 lists the MOs, the alarm levels, the level of SPE-interchange initiated, and the severity given to the alarm for all MOs that can cause software requested SPE-interchanges. The health of an SPE is based upon the single most severe alarm active within that SPE. The higher the severity level, the more severe the problem. The restart level of the interchange also depends on the single most severe alarm within the active SPE. Hot Restarts occur only when the Standby SPE is in standby mode. For example, the active SPE has a MAJOR SHDW-CIR and a MINOR DATA-BD alarm, and the standby SPE has a MAJOR TAPE alarm. In this case, the severity level of the active is 60, the severity level of the standby is 65, and no SPE-interchange would occur.

- SPE Select Switches

  An SPE-interchange can be initiated by moving both SPE Select Switches, **one at a time**, to the position that selects the Standby SPE for Active Mode. The SPE Select Switches were described earlier in this chapter.

- Scheduled Maintenance

  An SPE-interchange can be requested as a part of scheduled maintenance. This mechanism is used to exercise both SPEs. An SPE-interchange can be requested as part of scheduled maintenance by issuing the **change system-parameters maintenance** command and updating the form.

- Processor Insanity

  Duplication Interface A (DUPINT, TN772) periodically audits the sanity of each of the Processor circuit packs. If the Active SPE does not respond to the sanity audit, Duplication Interface A initiates an SPE-interchange.

Table 8-1. Software-Requested Interchanges Caused by Alarm Conditions

Maintenance Object	Alarm Level	On/Off Board	Fault Severity Level	Restart Level
STBY-SPE	WARNING	OFF	120	None
MEM-BD	MAJOR or MINOR	ON	110	Hot or Warm[1]
MEMORY	MAJOR or MINOR	ON	110	Hot or Warm[1]
STBY-SPE	MAJOR	ON	100	None
PROCR	MAJOR	ON	70	Hot or Warm[1]
SW-CTL	MAJOR	ON	65	Cold 2
TAPE	MAJOR	OFF	65	Cold 1
MEM-CARD	MAJOR	OFF	65	Cold 1
12V-PWR	MIN	ON	65	Hot
DUPINT	MAJOR	ON	61	Hot
CARR-POW	MAJOR	ON	61	Cold 2
SHDW-CIR	MAJOR	ON or OFF	60	Warm
SHDW-LINK	MAJOR	ON	60	Warm
SW-CTL	MINOR	ON	40	Hot
PR-MAINT	MINOR	ON	30	Hot
PI-BD	MAJOR or MINOR	ON	20	Hot
PKT-CTRL	MAJOR	ON or OFF	20	Hot
PKT-CTRL	MINOR	ON or OFF	15	Hot
PI-PT	MAJOR	ON	15	Hot
DATA-CHL	MINOR	ON	15	Hot
DATA-CON	MINOR	ON	15	Hot
DATA-BD	MINOR	ON	15	Hot
TAPE	MINOR	ON or OFF	10	Hot
CARD-MEM	MINOR	ON or OFF	10	Hot
PR-MAINT	MINOR	OFF	8	Hot

1 If the Standby SPE is in Standby mode when the alarm occurs, a Hot SPE-Interchange occurs. If the Standby is in Maintenance mode when the alarm occurs, however, a Warm SPE-Interchange rather than a Hot SPE-Interchange occurs.

Regardless of the condition that initiates an SPE-interchange, the G3MT is always logged off as a result of the SPE-interchange. The G3MT is available to log into after the SPE-interchange is complete and the "login" prompt is displayed.

System Technician Commands for High and Critical Reliability Systems

The following system technician commands support High and Critical Reliability systems. Complete descriptions of all these commands can be found in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids".

Commands for SPE Duplication

- The **busyout SPE-standby** command stops all background maintenance activities on the Standby SPE, and it doubles memory shadowing.
- The **release SPE-standby** command refreshes the Standby SPE, and it allows all background standby maintenance activities to continue.
- The **status system** command displays the status of the Active SPE and the Standby SPE (among other information).

  NOTE:
  Verify that the Standby SPE is functional (no duplication alarms exist and the SPE has returned to the Standby Mode) by running the **status system 1** command. If the standby SPE is in the maint/idle mode with no standby alarms, use the **standby refresh** command to put the standby SPE into the standby mode. Verify the results by using the **status system 1** command. For more information about the **status system** command see Chapter 10.

- The **status mem-card [0[1]] a|b** command displays the status of the Active SPE Memory Card or the status of the Standby SPE Memory Card [G3iV2-386].
- The **test processor [0[1]] a | b [short | long]** command tests the specified Processor circuit pack (which includes memory in a 386 or later System).
- The **test memory [0[1]] a | b [short | long]** command tests either the specified TN770 Memory circuit packs [286] or the on circuit pack memory with an optional Memory Expansion circuit pack [386].
- The **test card-mem [0[1]] a | b [short | long]** command tests either the Active SPE Memory Card or the Standby SPE Memory Card [386 or later system].
- The **test network-control [0[1]] a | b [short | long]** command tests the specified TN777[B] Network Control circuit pack and the Memory Card [G3iV2-386].

- The **test packet-control [0[1]] a | b [short | long]** command tests the specified TN778 Packet Control circuit pack.
- The **test interface [0[1]] a1 | b1 [short | long]** command tests the specified first TN765 Processor Interface circuit pack.
- The **test interface [0[1]] a2 | b2 [short | long]** command tests the specified second TN765 Processor Interface circuit pack.
- The **test tape [0[1]] a | b [short | long]** command tests the specified TN774 Tape Unit [286].
- The **test duplication-interface [0[1]] a | b [short | long]** command tests the specified TN772 Duplication Interface circuit pack.
- The **test shadow-link** command tests the SHDW-LINK (Memory Shadowing Link). Refer to the "MEM-BD (Memory circuit pack)" Maintenance documentation in Chapter 11, "Maintenance Object Repair Procedures", for a detailed description of this command.
- The **set vector <level> [spe-active | spe-standby | spe-maint]** command requests that a core dump be taken when a system restart of level **<level>** occurs.
- The **reset system interchange** command requests an SPE-interchange.
- The **test spe-standby [short | long]** command tests the Processor, Memory, Network Control, Processor Interface, Duplication Interface, and Tape Unit [286 system] or Memory Card [386 or later system] circuit packs in the control carrier containing the Standby SPE. Refer to the "STBY-SPE (Standby SPE)" Maintenance documentation in Chapter 11, "Maintenance Object Repair Procedures", for a detailed description of this command.
- The **refresh spe-standby** puts the Standby SPE into Standby mode.

CAUTION:
Because of the power of the "refresh spe-standby" command, its full impact is described here so that it is clearly understood.

The **refresh spe-standby** command is used to immediately put the Standby SPE into Standby Mode. The command conducts the same activities regardless of whether the Standby SPE is already in Standby Mode or whether it is in Maintenance Mode. When this command is issued, most Standby SPE maintenance activity that is currently in progress is preempted, the Standby SPE Processor is held reset, and the Standby SPE Memory is refreshed (that is, all of Active SPE DRAM Memory is shadowed to Standby SPE Memory). Recall that the refresh is necessary because, while the Standby SPE is in Maintenance Mode, memory shadowing is disabled. When the Standby SPE is returned to Standby Mode, its Memory must be brought up-to-date with Active SPE Memory. If the system was trying to enter Maintenance Mode, the **refresh spe-standby** command aborts with the message, "Cannot interrupt Standby SPE while entering maintenance mode; please try later."

WARNING:
Because of its power to preempt Standby SPE maintenance activities, the "refresh spe-standby" command should be used judiciously. If the Standby SPE is in Maintenance Mode when the "refresh spe-standby" command is issued, the maintenance activity that is being conducted by the Standby SPE is immediately terminated.

The following side-effects may occur:

- Testing of the Standby SPE components that are the target of the maintenance activity may not have completed. Depending on the maintenance activity and the point at which it is terminated, tests that detect faults and/or lack of faults on those Standby SPE components may not have had the opportunity to run. Accordingly, alarms are not raised or retired on the components.
- If the maintenance activity is scheduled maintenance, and if the **refresh spe-standby** command is issued before a scheduled translation save is performed, the translation save is not done, and the translation data on both the Active SPE and Standby SPE tapes or memory cards do not reflect changes made since the last translation save.

In general, after a **refresh spe-standby** command has been used and the user has finished working with the system, the **test spe-standby long** command should be issued if the **refresh spe-standby** command preempted a Standby SPE maintenance activity.

Additionally, if the **refresh spe-standby** command was used in the time frame in which scheduled maintenance with a translation save was to have been conducted, the **save translation** command should be issued to ensure that the current translation data has been written to the Active SPE and Standby SPE tapes or Memory Cards. When using the **refresh spe-standby** command to preempt Standby SPE maintenance activities, it may be necessary to issue the **refresh spe-standby** command multiple times to preempt all Standby SPE maintenance activity. If the **refresh spe-standby** command successfully completes five times without the Standby SPE becoming labeled "standby" on the status system form, wait 20 minutes. This does not include cases where the command completes with the G3MT terminal message "Refresh not successful; use ‘display errors’ to check for STBY-SPE errors" or "Cannot interrupt Standby SPE while entering maintenance mode; please try later." Issue the **refresh spe-standby** command once more. If the Standby SPE is not labeled "standby" on the status system form after this attempt, escalate the problem.

Commands for TDM Bus Duplication

- The **status system** command displays the bus on which the control channel and tones currently reside (among other information).
- The **test tdm port-network [1 | 2 | 3] [short | long]** command tests both TDM Buses.
- The **set tdm port-network [1 | 2 | 3] a | b [override]** command moves the control channel and dedicated tones to the specified TDM Bus.
- The **busyout tdm port-network [1 | 2 3] bus a | b** command places the specified bus in a maintenance busy state.
- The **release tdm port-network [1 | 2 3] bus a | b** command places a busied-out bus back in service.

Commands for Packet Bus Redundancy

- The **status system** command displays the status of the Packet Bus, and the number of faulty and open leads that the Maintenance/Test circuit pack has found.
- The **test pkt port-network [1 | 2 | 3]** command tests the Packet Bus.

Commands for Tone-Clock Circuit Pack Duplication

- The **status system** command displays the Tone-Clock circuit pack that is currently supplying tones and clocks (among other information).
- The **test tone-clock [1 | 2 |3] a | b [short | long]** command tests the specified TN768 Tone-Clock circuit pack.
- The **set tone-clock [1 | 2 |3] a | b [override]** command makes the specified Tone-Clock circuit pack active.
- The **busyout tone-clock [1 | 2 |3] a | b** command places the specified Tone-Clock circuit pack in the maintenance busy state.

  NOTE:
  This cannot be the one that is currently active.

- The **release tone-clock [1 | 2 |3] a | b** command removes the specified Tone-Clock circuit pack from the maintenance busy state.

Processor Complex Circuit Pack LED Strategies

The LEDs (light-emitting diodes) on the circuit packs in the two SPEs have the following meanings:

- Processor Circuit Pack (TN773 [286 Systems] or TN786B [386 Systems] or TN790 Release 5 systems):

  The use of the standard amber/green/red LEDs is as follows:

  — Amber-on/Green-off: SPE in Active Mode

  — Amber-on/Green-on: SPE in Active Mode; PROCR (Processor circuit pack), PR-MAINT (Maintenance/Tape Processor), or TAPE (Tape) maintenance running [286 Systems] or PROCR, PR-MAINT, or MEMORY [386 Systems]

  — Amber-off/Green-on: SPE in Maintenance Mode or Memory is not refreshed

  — Amber-off/Green-off: SPE in Standby Mode; Memory is refreshed

  — Red-on: fault on Processor circuit pack (PROCR, PR-MAINT, or TAPE) [286 Systems] or (PROCR, PR-MAINT, or MEMORY) [386 Systems], or PR-MEM [Release 5vs/si and later systems]

  In addition to the standard LEDs, the Processor circuit pack has the red major and minor alarm LEDs, an amber warning LED, a green ack LED, and a red Emergency Transfer LED.

- Memory Circuit Pack (TN770) or Memory Expansion (CPP1):

  The use of the standard amber/green/red LEDs is as follows:

  — Amber-on: SPE in Active Mode

  — Amber-off: SPE in Standby Mode

  — Green-on: maintenance running on Memory circuit pack

  — Red-on: fault on Memory circuit pack

- Duplication Interface Circuit Pack (B carrier) (TN772):

  The use of the standard amber/green/red LEDs is as follows:

  — Amber-on: SPE in Active Mode

  — Green-on: maintenance running on Duplication Interface circuit pack

  — Red-on: fault on Duplication Interface circuit pack

- Duplication Interface Circuit Pack (A carrier) (TN772):

  The use of the standard amber/green/red LEDs is as follows:

  — Amber-on: SPE in Active Mode or A carrier Tone-Clock circuit pack active

  — Green-on: maintenance running on Duplication Interface circuit pack

  — Red-on: fault on Duplication Interface circuit pack

  Each Duplication Interface circuit pack has another red LED associated with the SPE Select Switch. The purpose of the red switch LED is to serve as a reminder that an SPE is being forced to be the Active SPE and, therefore, the system is not duplicated. Both SPE Select Switch LEDs (one on each Duplication Interface circuit pack) are on when an SPE is being forced to be the Active SPE by the consistent positions of the two SPE Select Switches. Both LEDs are extinguished when the SPE Select Switch positions are inconsistent or when both SPE Select Switches are in the position. In the latter two cases, the Active SPE is automatically selected by the system software.

- Processor Interface Circuit Pack (TN765):

  The use of the standard amber/green/red LEDs is as follows:

  — Amber-on: link terminated at Processor Interface circuit pack

  — Green-on: maintenance running on Processor Interface circuit pack

  — Red-on: fault on Processor Interface circuit pack

- Network Control Circuit Pack (TN777[B]):

  The use of the standard amber/green/red LEDs is as follows:

  — Amber-on: link terminated at Network Control circuit pack

  — Green-on: maintenance running on Network Control circuit pack

  — Red-on: fault on Network Control circuit pack

  — Amber-on: (below Memory Card slot) Memory Card in use

- Packet Control Circuit Pack (TN778)

  The use of the standard amber/green/red LEDs is as follows:

  — Amber-on: link terminated at Packet Control circuit pack

  — Green-on: maintenance running on Packet Control circuit pack

  — Red-on: fault on Packet Control circuit pack

- Tone-Clock Circuit Pack:

  NOTE:
  For information on the standard amber/green/red LEDs see TONE-BD Maintenance Object in Chapter 11, "Maintenance Object Repair Procedures".

The modes of the two SPEs can be determined by looking at the amber and green LEDs on the Processor circuit packs. Two important pieces of information can be obtained from these LEDs: an indication of the Active SPE and the Standby SPE and an indication of whether the Standby SPE is ready to take over as the Active SPE (that is, shadowing is enabled and Memory has been refreshed). This information can be determined as follows:

- Indication of Active SPE:
  - Processor Circuit Pack: amber-on
- Indication of Standby SPE:
  - Processor Circuit Pack: amber-off
- Standby SPE in Standby Mode ready to take over for Active SPE:
  - Processor Circuit Pack: amber-off, green-off.

Repair Procedures for High and Critical Reliability

This section describes the procedure for installing or replacing Standby SPE circuit packs. These circuit packs are:

- Processor Circuit Pack (TN773 [286 system] or TN786B [386 system])
- Memory Circuit Packs (2) (TN770 [286 system])
- Memory Expansion Board (CPP1 [386 system])
- Network Control Circuit Pack (TN777[B])
- Packet Control circuit pack (TN778) [386 system and Global]
- Processor Interface circuit pack(s) (TN765)
- Tape Unit (TN774) (G3iV1.1-286 system)
- Duplication Interface circuit pack (TN772).

This procedure does **not apply** to the TN768 or TN780 Tone-Clock circuit pack. Refer to the TONE-BD (Tone-Clock Circuit Pack), the TONE-PT (Tone Generator), or the TDM-CLK (TDM Bus Clock) documentation in Chapter 11, "Maintenance Object Repair Procedures", for the procedure to replace the Tone-Clock circuit pack.

CAUTION:
When circuit packs in the Active SPE are to be replaced, this section provides procedures for performing an SPE-interchange that results in the circuit packs being in the Standby SPE. SPE circuit packs should never be replaced while they are located in the Active SPE.

This section should be used as follows:

1. When defective (that is, alarmed) Active or Standby SPE circuit packs are to be replaced, the procedure begins at the "Replacing Defective SPE Circuit Packs" section. Ignore the "Upgrading SPE Circuit Packs" section, as it does **not apply** to replacing defective Standby SPE circuit packs.
2. When healthy Standby SPE circuit packs are to be upgraded, the procedure begins at the "Upgrading SPE Circuit Packs" section. Ignore the "Replacing Defective SPE Circuit Packs" as it does **not apply** to upgrading Standby SPE circuit packs.

The "Circuit Pack Replacement Procedure" and "Additional Tests for Replaced DATA-CHL, PKT-CTRL, and PROCR Circuit Packs" sections apply to both situations but should be referred to only **after** reading the appropriate sections as instructed previously.

Replacing Defective SPE Circuit Packs

Determine that software is running by looking at the G3MT and verifying that it does not have either the "SPE DOWN MODE" or the "Duplication Interface - Processing Element Communication Down" message displayed. If system software is not running or if it stops running at any point during this procedure, the following is a suggested ranked order list of Processor Complex circuit packs to replace in an attempt to fix the SPE down problem:

- Processor Circuit Pack (TN773 [286 system] or TN786B [386 system] TN790 [Release 5])
- Memory Circuit Packs (2) (TN770 [286])
- Memory Expansion Board (CPP1 [386])
- Network Control Circuit Pack (TN777[B])
- Packet Control circuit pack (TN778)
- Duplication Interface circuit pack (TN772)
- Network Control circuit pack (TN777[B])
- Processor Interface circuit pack (TN765)
- Packet Control circuit pack (TN778)

If replacing Processor Complex circuit packs fails to repair the system, escalate the problem.

If system software is running, determine which SPE is the Standby SPE by issuing the **status system** command from the G3MT terminal. Look at the SPE and MODE fields in the upper left corner of the form to determine which SPE (A or B) is the Active SPE; it is labeled as "active." The other SPE is the Standby SPE and is labeled as either "standby," "maint," or "down."

Follow the "Circuit Pack Replacement Procedure" described later **for each Standby SPE circuit pack to be replaced.**

Continue with this procedure as follows.

1. If alarms are against the Active SHDW-CIR, Active DUPINT, or SHDW-LNK, the Duplication Interface circuit pack must be replaced. Proceed to the "Handling SHDW-CIR and SHDW-LNK Alarms in the Active SPE" or "Handling DUPINT Alarms in the Active SPE" sections as applicable.
2. If these sections do not need to be referenced, proceed to the "Circuit Pack Replacement Procedure" section.

The rest of this section describes how the system behaves when there are faulty circuit packs in the SPEs and is meant to be informative rather than part of the general procedure of replacing SPE circuit packs.

In most cases, when circuit packs **other than the Duplication Interface circuit pack in the Active SPE** are defective, the SPE containing the more severely defective circuit packs is always in the Standby SPE. The reasons are:

- If one or more circuit packs are defective and all of them are located in the same SPE, the system software automatically performs an SPE interchange to force that SPE to be the Standby SPE.
- If two or more circuit packs are defective and the defective circuit packs are located in both SPEs, the system software forces the SPE that contains the more severely defective circuit packs to be the Standby SPE. After the defective circuit packs in the Standby SPE are replaced according to the "Circuit Pack Replacement Procedure" described later, the system software automatically performs an SPE interchange to force that SPE to be the Active SPE. The remaining defective circuit packs are then located in the Standby SPE.

If the Duplication Interface circuit pack in the Active SPE becomes defective, the system software **may not** perform an SPE interchange to force that SPE to be the Standby SPE. The reason is:

- Failure of the Duplication Interface circuit pack may result in breakage of the SHDW-LINK (Memory Shadowing Link) or SHDW-CIR (Common Shadow Circuit), ultimately leading to corruption of Standby SPE Memory. An SPE-interchange to a Standby SPE with corrupted memory would result in an unplanned reboot of the system.

Handling SHDW-CIR and SHDW-LNK Alarms in the Active SPE

Check for the existence of SHDW-CIR alarms against the Active SPE Duplication Interface circuit pack or SHDW-LNK alarms. If there are Active SPE SHDW-CIR or SHDW-LNK alarms, inform the customer that a COLD 2 restart of the system is required and determine a time at which the restart may be done. At that time, complete the following steps:

1. Make sure that the tape (memory card) in the Active SPE tape unit (memory card slot) has the most current translations. If it does not, issue the **save translations spe-active** command to put the most current translations on it.
2. Exchange the tapes (memory cards) in the Active SPE and Standby SPE so that the Standby SPE tape unit (memory card slot) contains the tape (memory card) with the most current translations (from the previous step).
3. For a 286 system, issue the **upgrade software** command. This command may take up to 10 minutes to complete. If the command returns immediately with one of the following error messages: "Standby SPE not available; for information use 'status system"' or "Standby SPE busy with another task; for information use 'status system'," issue the **refresh spe-standby** command and retry the **upgrade software** command.

   NOTE:
   It may be necessary to issue the **refresh spe-standby** command multiple times to preempt all Standby SPE maintenance activity. If the **refresh spe-standby** command is issued five times without the Standby SPE becoming labeled "standby" on the status system form, wait 20 minutes. Issue the **refresh spe-standby** command once more. If the Standby SPE is not labeled "standby" on the status system form after this attempt, escalate the problem.

   For a 386 system, if the Standby SPE is not in standby mode, issue the **refresh spe-standby** command to put it into standby mode if possible (see the previous Note). If the Standby SPE was successfully put into standby mode, then issue the **reset system interchange** command to cause a PEI. If the refresh or system interchange are unsuccessful, then use the SPE select switches to hard select the Standby SPE (this will result in a COLD 2 restart of the system).
4. If the **upgrade software** (**reset system interchange**) command is successful, an SPE-interchange will have been performed resulting in the new Active SPE performing a COLD 2 (HOT) restart. Follow the "Circuit Pack Replacement Procedure" described later. If the **upgrade software** command failed, determine why the failure occurred, resolve the problem, and repeat this entire procedure.

Handling DUPINT Alarms in the Active SPE

Check for the existence of DUPINT alarms against the Active SPE Duplication Interface circuit pack. If there are Active SPE DUPINT alarms, inform the customer that a reboot of the system may be required and determine a time at which a reboot may be done. At that time, complete the following steps:

1. Make sure that the tape (memory card) in the Active SPE tape unit (memory card slot) has the most current translations. If it does not, issue **save translations spe-active** to put the most current translations on it.
2. Exchange the tapes (memory cards) in the Active SPE and Standby SPE so that the Standby SPE tape unit (memory card slot) contains the tape (memory card) with the most current translations.
3. Throw the SPE Select Switches on the TN772 Duplication Interface circuit packs to force an SPE-interchange so that the current Standby SPE becomes the new Active SPE. If SPE B is currently the Standby SPE, throw both SPE Select Switches to the right. If SPE A is currently the Standby SPE, throw both SPE Select Switches to the left.

   If the Duplication Interface circuit pack actually severed the Memory Shadowing Link resulting in corruption of Standby SPE Memory, the SPE-interchange results in the new Active SPE performing a Reboot (from the tape in a 286 system). However, if the defect in the Duplication Interface circuit pack did not sever the Memory Shadowing Link, the SPE-interchange results in the new Active SPE performing a Warm Start instead.
4. After the SPE-interchange is complete, log into the G3MT terminal. Follow the "Circuit Pack Replacement Procedure" described later **for each circuit pack to be replaced in the new Standby SPE.**

Upgrading SPE Circuit Packs

Determine which SPE is the Standby SPE by issuing the **status system** command from the G3MT. Look at the SPE and MODE fields in the upper left corner of the form to determine which SPE (A or B) is the Active SPE; it is labeled as "active." The other SPE is the Standby SPE and is labeled as either "standby," "maint," or "down."

Follow the "Circuit Pack Replacement Procedure" described later **for each Standby SPE circuit pack to be upgraded**.

When all Standby SPE circuit packs have been upgraded, force the Active SPE to become the Standby SPE as follows:

1. Issue the **status system** command from the G3MT terminal. Look at the SPE and MODE fields in the upper left corner of the form to determine the status of the Standby SPE. Recall that the Standby SPE is labeled as either "standby," "maint," or "down."

2. If the Standby SPE is labeled as "maint," continue issuing the **refresh spe-standby** command followed by the **status system** command until the Standby SPE is labeled "standby."

   NOTE:
   It may be necessary to issue the **refresh spe-standby** command multiple times to preempt all Standby SPE maintenance activity. If the **refresh spe-standby** command successfully completes five times without the Standby SPE becoming labeled "standby" on the status system form, wait 20 minutes. Issue the **refresh spe-standby** command once more. If the Standby SPE is not labeled "standby" on the status system form after this attempt, escalate the problem.

3. If the Standby SPE is labeled "standby," issue the **reset system interchange** command from the G3MT. After the SPE-interchange is complete, log into the terminal, issue the **status system** command, and verify that the SPEs have reversed roles.
4. Then, follow the "Circuit Pack Replacement Procedure" **for each circuit pack to be upgraded in the new Standby SPE.**

Circuit Pack Replacement Procedure

This procedure **does not** apply to the TN768 Tone-Clock circuit pack. Please refer to the TONE-BD (Tone-Clock Circuit Pack), TONE-PT (Tone Generator), or TDM-CLK (TDM Bus Clock) Maintenance documentation in Chapter 11, "Maintenance Object Repair Procedures" for the procedure to replace the Tone-Clock circuit pack.

NOTE:
See the flowchart of the procedure for installing or replacing Standby SPE Circuit Packs In Duplication Option Systems at the end of this section, for use as a circuit pack replacement maintenance aid.

The following procedure involves throwing the SPE Select Switches to hard-select the current Active SPE. After completing the circuit pack replacement procedure, verify that the SPE Select Switches have been returned to the AUTO position both by noting their position and by noting that the SPE Select Switch LEDs on the TN772 Duplication Interface circuit packs are not on.

1. Throw the SPE Select Switches, **one at a time**, to force selection of the current Active SPE. If SPE B is currently the Active SPE, throw both SPE Select Switches, **one at a time**, to the right. If SPE A is currently the Active SPE, throw both SPE Select Switches, **one at a time**, to the left. Throwing the SPE Select Switches automatically disables shadowing.

   NOTE:
   Do not remove power before proceeding with step 2. All PPN Control Carriers used in High or Critical Reliability Systems (A slot for the

Duplication Interface circuit pack identifies these carriers.) have staggered pins to support the hot plug-in of circuit packs.

2. Unseat the Standby SPE Processor circuit pack. (It is not necessary to entirely remove the Standby SPE Processor circuit pack from its slot.)

3. If the circuit pack to be replaced is the TN772 Duplication Interface in the A carrier, continue with this step. Otherwise, proceed to Step 4.

   Issue the **status system** command from the G3MT terminal, and check the status of the Tone-Clock in the 1B carrier:

   a. If the SERVICE STATE field indicates that the 1B carrier Tone-Clock is “in” (that is, in service) and the SYSTEM CLOCK and SYSTEM TONES fields indicate that it is “active,” proceed to Step 4.

   b. If the SERVICE STATE field indicates that the 1B carrier Tone-Clock is "in" (that is, in service) but the SYSTEM CLOCK and SYSTEM TONES fields indicate that it is "standby," then check the Error Log for an active Error Type 3329 against the 1B TONE-BD by issuing the **display error** command. If this error exists, proceed to Step 4.

      NOTE:
      Error Type 3329 implies that the Tone-Clock circuit pack probably cannot provide system clocks and an attempt to set the system clocks to this circuit pack would result in a **reset system 2** of the system. When the 1A Duplication Interface circuit pack is replaced, however, the system experiences a loss of clock, and a **reset system 2** occurs.

      If an active Error Type 3329 is not logged against the 1B TONE-BD, issue the **set tone-clock 1B** command from the G3MT terminal to make the 1B carrier Tone-Clock active. Verify that the switch occurs by issuing the **status system** command and checking that the SERVICE STATE, SYSTEM CLOCK and SYSTEM TONES fields are now "in" and "active." Proceed to Step 4.

      NOTE:
      If the 1B Tone-Clock circuit pack is defective the switch may have failed and a **reset system 2** may have occurred. In this case, proceed to Step 4. However, the system experiences a loss of clock and another **reset system 2** when the 1A Duplication Interface circuit pack is replaced.

   c. If the SERVICE STATE field indicates that the 1B carrier Tone-Clock is "out" (that is, out-of-service), refer to the TONE-BD (Tone-Clock circuit pack), TONE-PT (Tone Generator), and TDM-CLK (TDM Bus Clock) Maintenance documentation in Chapter 11, "Maintenance

Object Repair Procedures", to restore it to service. Proceed to Step 4 regardless of whether or not the attempt to restore the 1B Tone-Clock to service was successful.

NOTE:
If the 1B Tone-Clock was not successfully restored to service, the system experiences a loss of clock, and a **reset system 2** when the 1A Duplication Interface circuit pack is replaced.

4. If the circuit pack to be replaced is the TN772 Duplication Interface, throw the SPE Select Switch of the replacement Duplication Interface circuit pack to the same position as the SPE Select Switch on the Duplication Interface circuit pack that was removed.

   If the Standby Processor is not being replaced Install the replacement circuit pack and reinsert the Standby SPE Processor circuit pack.

   a. If the circuit pack that was replaced was the TN772 Duplication Interface in the A carrier, the G3MT terminal is logged off. Log in to the Manager I terminal and proceed to Step 7.

   b. If the circuit pack that was replaced was the TN770 Memory circuit pack, all LEDs on the circuit pack remain on until Step 7 has been completed.

5. If the circuit pack to be replaced is a TN786B or TN790 Standby SPE Processor circuit pack loaded with the same software as loaded in the Active Processor or is a TN770 Standby SPE Processor circuit pack, install the circuit pack and proceed to Step 7.

6. If the circuit pack to be replaced is a TN786B or TN790 Standby SPE Processor circuit pack and the software is being loaded from the software memory card, continue with the following steps:

NOTE:
The TN790 must have the same number of SIMMs as the replaced circuit pack.

   a. Insert the software memory card into the Active SPE. Issue the **list configuration software-versions** Command from the G3MT terminal. If the software matches and the UPDATE FILE Identifier displays **none**, continue with this procedure; otherwise escalate the problem. *Replace the translation memory card in the Active SPE.*

   b. Insert the software memory card into the Standby SPE.

   c. Install the TN786B Standby Processor circuit pack. When the Standby Processor starts to initialize and detects the software memory card, it does a software upgrade and displays the progress of this upgrade on the G3MT terminal.

d. At the prompt of **REPLACE SOFTWARE MEM-CARD ON <STANDBY SPE> WITH TRANSLATION MEM-CARD**, replace the software memory card in the Standby SPE with the translation memory card. The Standby SPE will then boot up with the translation.

NOTE:
Perform this operation within two minutes. Otherwise the Standby SPE will boot up without translations. However, it will recover the translations when the Active SPE enables memory shadowing to the Standby SPE.

e. At the prompt of **REPLACE TRANSLATION MEM-CARD ON <ACTIVE SPE> WITH SOFTWARE MEM-CARD**. Wait 3 minutes for the Standby SPE to initialize before proceeding to next step.

f. Issue the **list configuration software-versions long** command to ensure that both SPEs are running identical software. Use the next step if the this command will not display the software versions, otherwise skip the next step.

g. Issue the **busyout spe-standby** command followed by the **release spe-standby** command to force the Standby SPE into a mode to accept the **list configuration software-versions long** command. Wait 5 minutes for the Standby SPE to initialize and issue the **status system 1st-cabinet** command. The Standby SPE failed to initialize if the Standby SPE Mode is **down**. If the Standby SPE Mode is **maint/init** or **maint/entering**, execute the **busyout spe-standby** and **release spe-standby** command up to 2 more times. *If this step did not succeed, try this procedure again or escalate the problem.*

7. Issue the **status system 1st-cabinet** command from the G3MT terminal. The status system form indicates the presence of MAJOR and MINOR alarms on both SPEs. If SPE alarm counts are displayed, run component tests to resolve these alarms. Allowed tests include **test spe-standby**, **test duplication-interface**, and **test shadow-link**. Use the next step if the allowed test commands are not accepted, otherwise skip the next step.

CAUTION:
If the Duplication Interface circuit pack is being tested, Test #278 fails because the SPE Select Switches are thrown.

8. Issue the **busyout spe-standby** command followed by the **release spe-standby** command to force the Standby SPE into a mode to accept the **test commands** attempted in the previous step. Wait 5 minutes for the Standby SPE to initialize and issue the **status system 1st-cabinet** command. If the Standby SPE failed to initialize if the Standby SPE Mode is **down**. If the Standby SPE Mode is **maint/init** or **maint/entering**,

execute the **busyout spe-standby** and **release spe-standby** command up to 2 more times. *If this step did not succeed, try this procedure again or escalate the problem*.

9. If other Standby SPE circuit packs are to be replaced, return to Step 2.

10. Move each SPE Select Switch back to the AUTO position. If any of the TN777[B] Network Control or the Processor circuit packs were replaced, please refer to the "Additional Tests for Replaced DATA-CHL, PKT-CTRL, and PROCR Circuit Packs" section.

WARNING:
Move only one SPE Select Switch at a time. DO NOT move both switches at the same time.

CAUTION:
If the Active SPE has alarms in it, an SPE-interchange may occur after moving each SPE Select Switch back to the AUTO position.

Maintenance activity is performed automatically on the Standby SPE after the SPE Select Switches are returned to their AUTO positions in Step 10. This can be verified by issuing the **status system** command and noting that the Standby SPE is labeled as "maint." It may take up to five minutes for this activity to begin. The maintenance activity itself takes from 10 to 30 minutes to complete.

NOTE:
The time required for the maintenance activity to complete depends on the number of TN765 Processor Interface circuit packs, the number of administered ports on the Processor Interface circuit packs, the number of administered data channels on the TN777[B] Network Control circuit pack, and the current load on the system.

The completion of the maintenance activity can be verified by issuing the **status system 1** command and noting whether the Standby SPE is labeled as "standby."

Although not recommended at this stage of the procedure, the maintenance activity on the Standby SPE can be preempted using the **refresh spe-standby** command. To preempt the maintenance activity, continue issuing the **refresh spe-standby** command followed by **status system 1** command until the status system form shows that the Standby SPE is labeled "standby."

It may be necessary to issue the **refresh spe-standby** command multiple times to preempt all Standby SPE maintenance activity. If the **refresh spe-standby** command successfully completes five times without the Standby SPE becoming labeled "standby" on the status system form, wait 20 minutes. Issue the **refresh spe-standby** command once more. If the Standby SPE is not labeled "standby" on the status system form after this attempt, escalate the problem.

If the **status system 1** command continues to show SPE alarms, issue the appropriate command(s) from the G3MT terminal to test these alarmed MOs.

After Step 10, if the Active SPE contains more severely defective circuit packs than the Standby SPE, an SPE-interchange may occur. The presence of alarms in the Active and Standby SPE can be verified by issuing the **status system** command. The status system form indicates the presence of MAJOR and MINOR alarms on both SPEs. If the Active SPE has alarms in it, an SPE-interchange may occur. The occurrence of the SPE-interchange can be verified by issuing the **status system** command to determine which SPE is now the Active SPE.

Additional Tests for Replaced DATA-CHL, PKT-CTRL, and PROCR Circuit Packs

After **all** affected circuit packs have been replaced, if the replaced circuit packs include the TN777[B] Network Control circuit pack(s), the TN778 Packet Control circuit pack(s), or the Processor circuit pack(s), additional testing is required to ensure that the new circuit packs are healthy. This testing must be done on these circuit packs when they are located in the Active SPE. Issue the **status system** command to determine which SPE is currently the Active SPE and determine the SPE, Active or Standby, in which each replaced Network Control, Packet Control, and/or Processor circuit pack resides.

If any of the replaced circuit packs are located in the Active SPE, test it by issuing the **test network-control [a | b]**, **test packet-control [a | b]**, or **test processor [a | b]** command, as appropriate. If any tests fail or abort, refer to the SW-CTL (Switch Control), DATA-CHL (Network Control Data Channel), PKT-CTRL (Packet Control Circuit Pack, DATA-BD (Network Control Circuit Pack), or PROCR, and PR-MAINT (Maintenance/Tape Processor) Maintenance documentation in Chapter 11, "Maintenance Object Repair Procedures", as appropriate.

If any of these circuit packs are located in the Standby SPE, force the Standby SPE to become the Active SPE as described in "Upgrading SPE Circuit Packs." However, before the Standby SPE is made to become the Active SPE, the replaced circuit pack should first be tested while on the Standby SPE. Then, test these circuit packs (that are now located in the Active SPE) by issuing the **test network-control [a | b]**, **test packet-control [a | b]**, or **test processor [a | b]** command, as appropriate. If any tests fail or abort, refer to the SW-CTL (Switch Control), DATA-CHL (Network Control Data Channel), DATA-BD (Network Control Circuit Pack), PKT-CTRL (Packet Control Circuit Pack), or PROCR, and PR-MAINT (Maintenance/Tape Processor) Maintenance documentation in Chapter 11, "Maintenance Object Repair Procedures", as appropriate.

WARNING:
Before leaving the system, verify that the SPE Select Switches have been returned to their proper position. The switches should be in the AUTO position and the SPE Select Switch LEDs should be off on both the TN772 Duplication Interface circuit packs.

See the following flowchart, Figure 8-3, Figure 8-4 and Figure 8-5, for the procedure for installing or replacing Standby SPE Circuit Packs in Duplication Option System.

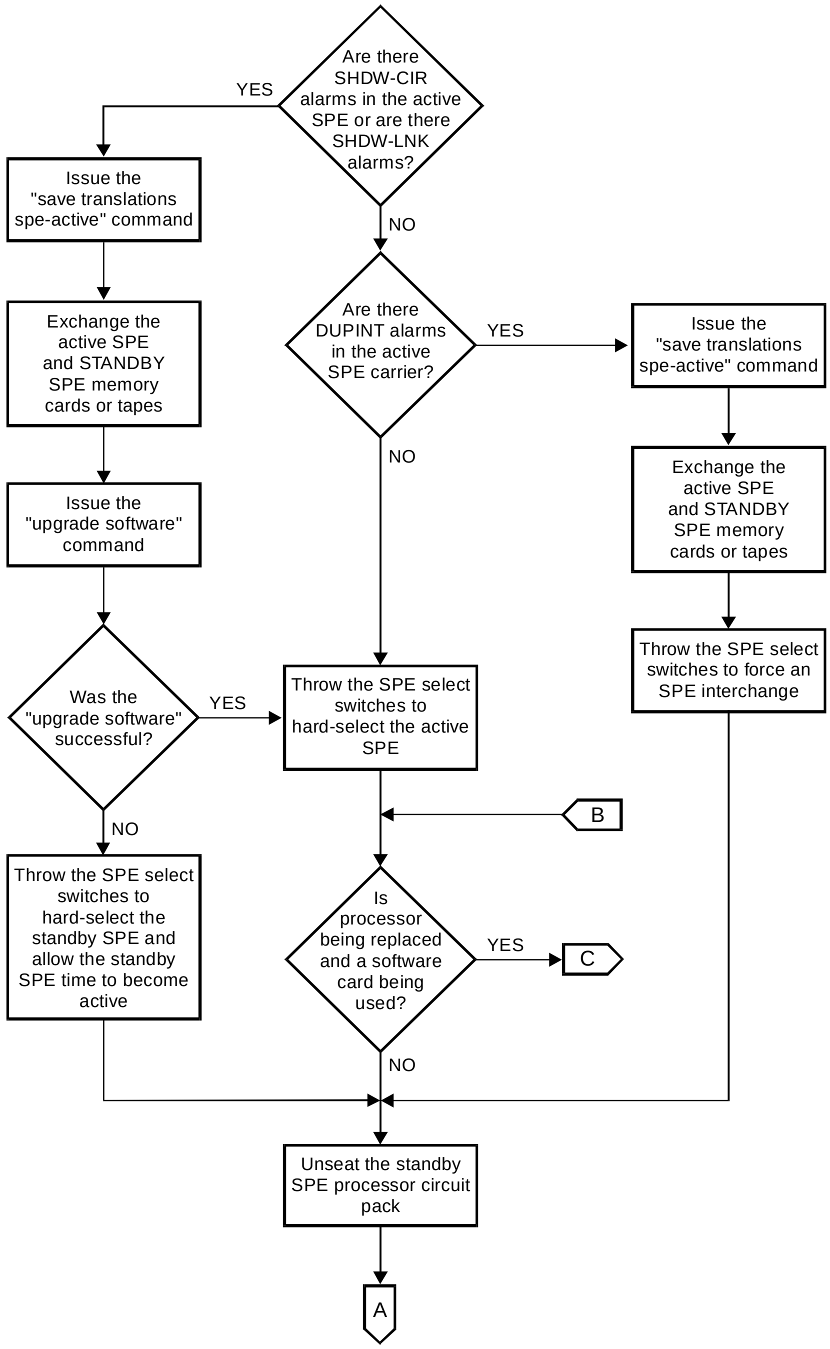

Figure 8-3. Page 1 Procedure for Replacing Standby SPE Circuit Packs

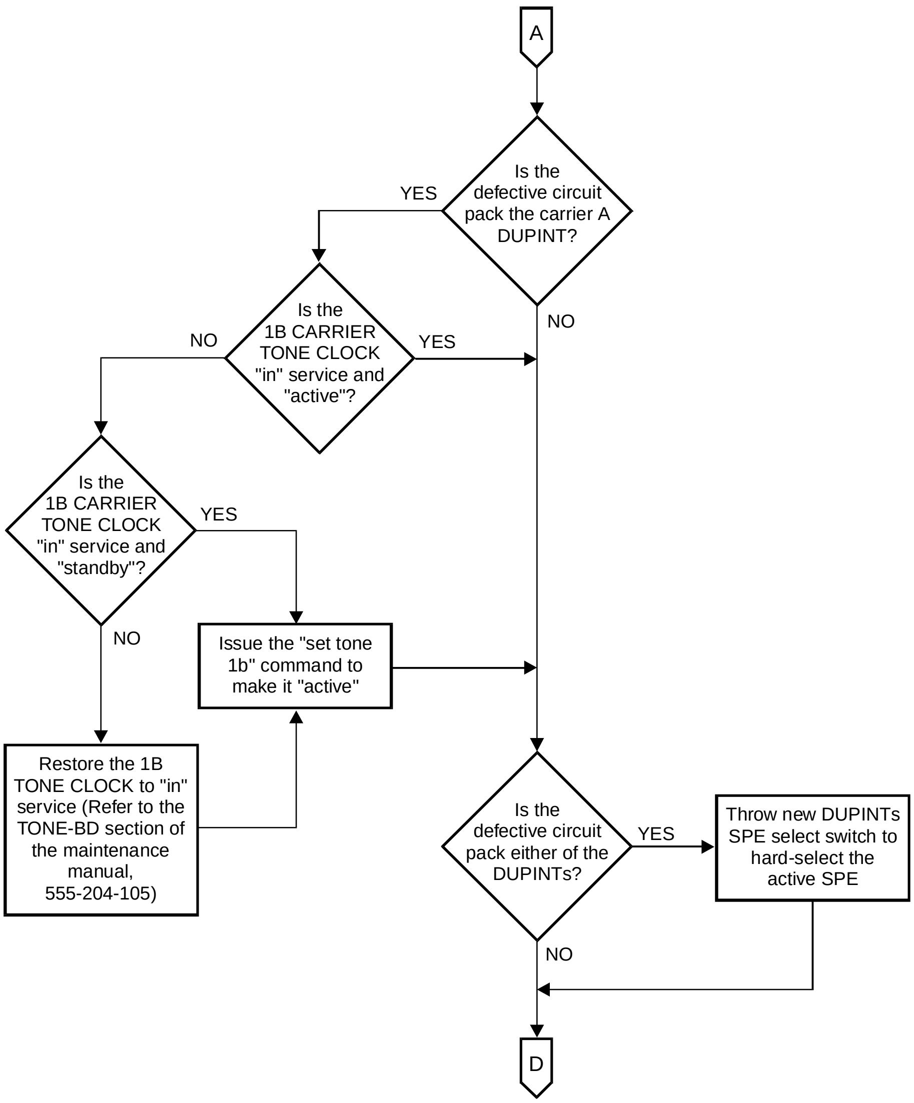

Figure 8-4. Page 2 Procedure for Replacing Standby SPE Circuit Packs

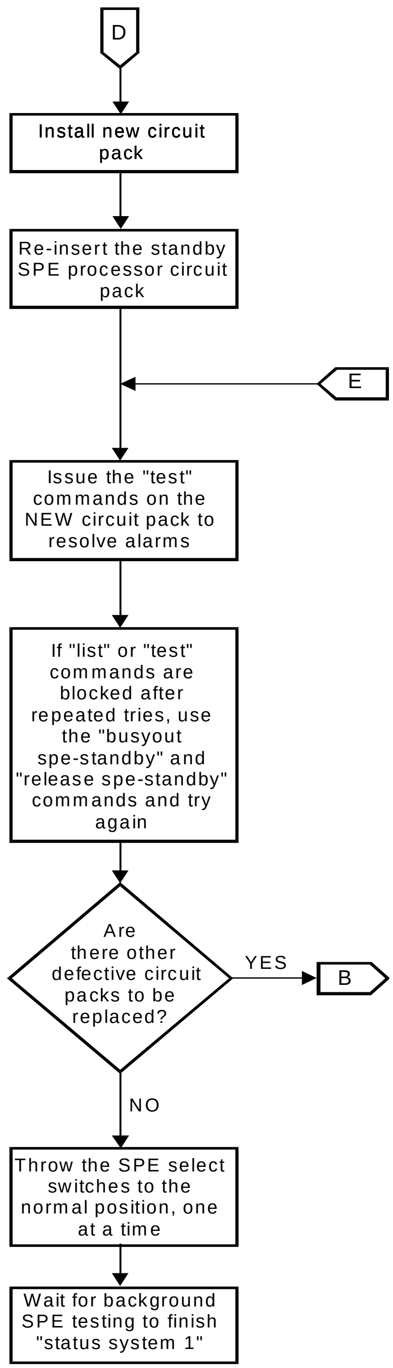

Figure 8-5. Page 3 Procedure for Replacing Standby SPE Circuit Packs

Procedure for Installing/Replacing the Inter-Carrier Cable

The Inter-Carrier Cables (ICCs) are physically located on the back of the cabinet behind the panels and between the A control carrier and the B control carrier. The panels must first be opened to see the ICCs.

> **WARNING:**
> *Damage can be done to the Inter-Carrier Cables during removal or installation. Follow the guidelines listed below to minimize the possibility of damage to the cables and later need of replacement.*

To remove ICC-A, ICC-B, or ICC-C, carefully perform the following steps:

1. Remove power from the system. Refer to the "Removing Power" section in Chapter 5, "Routine Maintenance Procedures".
2. Take hold of the cable connector, not the cable itself. Attempting to remove a cable by pulling on the cable itself can damage the cable-to-connector interface.
3. Pull straight out. Pulling the connector from the backplane at an angle can bend the backplane pins, making it difficult to re-install the cable.
4. Push the ICC connector onto the insulated sleeves.

   > **CAUTION:**
   > *The pins should not show through the back of this connector. If they do, they ICC may be shorted out.*

The only way to check the connector-cable-connector integrity is with a continuity test.

To re-install ICC-A, ICC-B, or ICC-C carefully perform the following steps:

1. Verify that the backplane pins are not bent. If any are bent, they must be straightened or replaced before continuing.
2. Align the ICC connector with the backplane pins and push partially into place.
3. Use a dental mirror and light to view the back sides of the connector. Determine that all 50 backplane pins are seated correctly in the ICC connector.
4. Push the ICC connectors fully onto the insulated sleeves. The pins should not show through the back of the connectors. If the pins show through, the ICC may be shorted out.

Procedure for Blocking Standby SPE Maintenance Activities for System Technician Testing

Sometimes it is necessary to block Standby SPE maintenance activities so that System Technician commands that test Standby SPE components can be conducted without being blocked with the G3MT terminal message line "Standby SPE busy with another task; for information use 'status system'." To block Standby SPE maintenance activities, perform the steps listed below.

WARNING:
The following procedure involves throwing the SPE Select Switches to hard-select the current Active SPE. After completing the circuit pack replacement procedure, verify that the SPE Select Switches have been returned to the AUTO position both by noting their position and by noting that the SPE Select Switch LEDs on the TN772 Duplication Interface circuit packs are not on.

1. Throw the SPE Select Switches (on the TN772 Duplication Interface circuit packs) to force selection of the current Active SPE. If SPE-B is currently the Active SPE, throw both SPE Select Switches to the right. If SPE-A is currently the Active SPE, throw both SPE Select Switches to the left.
2. Issue the **status system 1st-cabinet** command from the G3MT terminal. The status system form indicates the presence of MAJOR and MINOR alarms on both SPEs. If SPE alarm counts are displayed, run component tests to resolve these alarms. Allowed tests include test spe-standby, test duplication-interface, and test shadow-link. Use the next step if the allowed test commands are not accepted, otherwise skip the next step.

   CAUTION:
   If the Duplication Interface circuit pack is being tested, Test #278 fails because the SPE Select Switches are thrown.

3. Issue the busyout spe-standby command followed by the release spe-standby command to force the Standby SPE into a mode to accept the **test commands** attempted in the previous step. Wait 5 minutes for the Standby SPE to initialize and issue the status system 1st-cabinet command. If the Standby SPE failed to initialize if the Standby SPE Mode is down. If the Standby SPE Mode is **maint/init** or maint/entering, execute the busyout spe-standby and release spe-standby command up to 2 more times. *If this step did not succeed, try this procedure again or escalate the problem.*

4. Move each SPE Select Switch back to the AUTO position.

> **WARNING:**
> *Move only one SPE Select Switch at a time. DO NOT move both Switches at the same time.*

Maintenance activity is performed automatically on the Standby SPE after the SPE Select Switches are returned to their AUTO positions in Step 4. This can be verified by issuing the **status system** command and noting that the Standby SPE is labeled as "maint." The maintenance activity takes from 10 to 30 minutes to complete. (The time required for the maintenance activity to complete depends upon the number of TN765 Processor Interface circuit packs, the number of administered ports on the Processor Interface circuit packs, the number of administered data channels on the TN777[B] Network Control circuit pack, and the current load on the system.) The completion of the maintenance activity can be verified by issuing the **status system** command and noting whether the Standby SPE is labeled as "standby."

Although not recommended at this stage of the procedure, the maintenance activity on the Standby SPE can be preempted using the **refresh spe-standby** command. To preempt the maintenance activity, continue issuing the **refresh spe-standby** command followed by **status system** command until the status system form shows that the Standby SPE is labeled "standby."

It **may** be necessary to issue the **refresh spe-standby** command multiple times to preempt all Standby SPE maintenance activity. If the **refresh spe-standby** command successfully completes five times without the Standby SPE becoming labeled "standby" on the status system form, wait 20 minutes. This **does not include** cases where the command completes with the G3MT terminal message line errors "Refresh not successful; use ‘display errors’ to check for STBY-SPE errors" or "Cannot interrupt Standby SPE while entering maintenance mode; please try later."

Issue the **refresh spe-standby** command once more. If the Standby SPE is not labeled "standby" on the status system form after this attempt, escalate the problem.

Packet Bus Fault Isolation and Correction

9

General

This chapter describes the fault isolation/correction procedures for the Packet Bus and for the various maintenance objects that use the Packet Bus. Because the Packet Bus is shared by all circuit packs that must communicate on it, a faulty circuit pack can disrupt communication over the Packet Bus. In addition, a circuit pack that does not use the Packet Bus can cause service disruptions if the physical configuration of the switch is being modified (this is discussed in more detail later). For these reasons, isolating the cause of Packet Bus failure can be complicated. In this chapter, a flowchart is provided to aid in this isolation effort, as are detailed discussions of the tools and procedures used in the fault isolation and correction.

This chapter is organized into several sections that provide introductory information, as well as the Packet Bus Fault Isolation and Correction Procedures. The sections of the chapter are as follows:

- **Remote Maintenance Versus On-Site Maintenance** discusses the strategy and the requirements for performing remote maintenance and on-site maintenance for the Packet Bus.
- **Tools for Packet Bus Fault Isolation and Correction** discusses the tools that are needed to isolate and correct Packet Bus faults.
- **What is the Packet Bus?** describes the Packet Bus, its use, and the types of faults that can occur on the Packet Bus. A diagram that shows the physical and logical connections between circuit packs connected to the Packet Bus is also included.

- **Circuit Packs That Use the Packet Bus** describes the various circuit packs, ports, and endpoints that use the Packet Bus. The section discusses how these maintenance objects interact, how a failure of one maintenance object can affect another, and also the failure symptoms of these maintenance objects.
- **Maintenance of the Packet Bus** describes the Packet Bus maintenance software strategy. Similarities and differences between the Packet Bus and the TDM Bus are discussed. An overview of the Fault Isolation and Correction Procedures is also presented.
- **The Maintenance/Test Circuit Pack (TN771)** discusses the use of the Maintenance/Test circuit pack in normal switch maintenance, as well as its role in Packet Bus fault isolation. The standalone mode of the Maintenance/Test (which is used to perform the Packet Bus Fault Isolation and Correction procedures on-site) is discussed in detail.
- **Packet Bus Fault Isolation Flowchart** presents a flowchart that is used to isolate a Packet Bus problem. This flowchart is the starting point for this process, and it is used to determine if a failure of service is caused by the Packet Bus itself or by another maintenance object on the Packet Bus.
- **Packet Bus Fault Correction** presents the procedures required to correct either a problem with the Packet Bus itself or one that is caused by a circuit pack connected to the Packet Bus.

The Packet Bus Fault Isolation Flowchart is intended to be the normal starting point for isolating and resolving Packet Bus problems. However, anyone who is unfamiliar with Packet Bus maintenance should read the introductory sections to gain a good understanding of the Packet Bus maintenance and the procedures involved.

Remote Maintenance versus On-Site Maintenance

Most Packet Bus Fault Isolation and Repair procedures require a technician to be on-site. This is true because a Packet Bus failure is caused by a hardware failure of the Packet Bus itself or by a circuit pack that is connected to it. However, initial diagnoses can be made via use of the flowchart presented in the "Packet Bus Fault Isolation Flowchart" section of this chapter. However, before the Maintenance/Test Standalone Mode Procedure (described later) and the Packet Bus Fault Correction Procedure can be implemented, a technician must be on-site. Accordingly, the procedures are presented with this requirement in mind.

The flowchart as presented refers to the repair procedures in Chapter 11, "Maintenance Object Repair Procedures", for various maintenance objects. When one of the decision points is reached, a remote technician can refer to the appropriate section and attempt to resolve any fault conditions. If the procedures for any maintenance object require a dispatch, this should be done. In addition, the remote technician can examine some of the other maintenance objects on the flowchart and determine if those procedures also require a dispatch. Keep in mind that if a maintenance object that appears early on the flowchart fails, this failure can cause alarms with maintenance objects that appear later in the flowchart. However, multiple dispatches can be prevented by checking subsequent stages on the flowchart. Accordingly, the on-site technician can be prepared to replace more components.

The Maintenance/Test Packet Bus port (described in detail later in this chapter) can give the remote technician information about the state of the Packet Bus. This information can be obtained via the **status system** command and via the PKT-BUS test sequence. As described later, the Maintenance/Test circuit pack may or may not be present at a customer site, depending on the configuration of the switch. If a Maintenance/Test circuit pack is not present, one must be taken to the customer site when a dispatch is done for a loss of Packet Bus service.

In a High or Critical Reliability system, a Processor Interchange may resolve the Packet Bus problem. This operation can be done remotely, and it is discussed in the "Packet Bus Fault Correction" section in this chapter.

Tools for Packet Bus Fault Isolation and Correction

The following list discusses several tools that are (or may be) required to perform Packet Bus Fault Isolation and Correction. The technician should be provided with these tools at the customer site:

- TN771 Maintenance/Test circuit pack for use in standalone mode, as well as the required connectors and cables. (Refer to the "The Maintenance/Test Circuit Pack (TN771)" section in this chapter.)
- Replacement TN771 Maintenance/Test circuit pack may be needed. Conditions for requirement, and the relevant implementation steps are documented in the "Special Precaution Concerning the TN771" section in this chapter.
- Backplane pin-replacement kit may be required in the procedures described in the "Packet Bus Fault Correction" section of this chapter. If the kit is not available, replacement of a carrier may be required.

What is the Packet Bus?

The Packet Bus is a set of 24 leads in the backplane of the Port Network. Twenty of these leads are data leads, three are control leads, and one is a spare. This distinction is important only for understanding why some circuit packs are able to detect only certain faults; the distinction does not affect fault isolation and repair. Each Port Network has its own Packet Bus, and, accordingly, there is one Packet Bus maintenance object in each port network. The Packet Bus is not duplicated, as is the TDM Bus. However, there are several spare leads on the Packet Bus and, in High and Critical Reliability systems, these spare leads are used to recover from some failures on the Packet Bus.

Packet Bus Usage

The Packet Bus is used to carry ISDN-BRI signaling information for ISDN-BRI stations and data modules and for ASAI adjunct connections. The TN556 ISDN-BRI circuit pack is used for these connections. The SPE interface to the Packet Bus is the TN778 Packet Control (in High and Critical Reliability systems, there is one TN778 in each SPE). For systems with multiple Port Networks, the TN570 Expansion Interface is used to pass messages from the Packet Bus in one Port Network to the Packet Bus in its neighbor. The TN771 Maintenance/Test Circuit Pack (discussed in detail later) provides Packet Bus maintenance testing and reconfiguration capabilities.

Packet Bus Faults

Two types of Packet Bus failures can occur, as follows:

- **Shorts**. A short occurs when leads on the Packet Bus become connected together. Such a connection can occur due to component failures on the Packet Bus interface of a circuit pack, a failure of the cables between carriers or the TDM/LAN terminators, or by pins being bent together on the backplane. Usually, a failure that occurs during the normal operation of a switch is caused by a circuit pack failure. However, if the switch configuration is being modified (for example, circuit packs are being moved), the cause of a subsequent Packet Bus failure is probably bent pins.
- **Opens**. An open occurs when there is a break on the Packet Bus such that the electrical path to the termination resistors is broken. Usually, this break is caused by a failed TDM/LAN cable or by a failed TDM/LAN terminator. The break can also be caused by a failure in the backplane of a carrier, although this is unlikely.

Shorts on the Packet Bus occur much more often than do opens. This is true because the incorrect insertion of a circuit pack can cause leads to be shorted together. It is possible, in fact, for a circuit pack to be the cause of a Packet Bus fault but still exhibit trouble-free operation. For example, the insertion of a TDM-only circuit pack (for example, TN754 Digital Line) could bend the Packet

Bus pins on the backplane. However, since the circuit pack does not communicate on the Packet Bus, the pack is not affected by the problem.

Packet Bus faults do not necessarily cause service interruptions. However, most Packet Bus shorts do cause these interruptions. Depending on what leads are defective, the system may be able to recover and continue to communicate. While this scenario is advantageous in that the system continues to function, the scenario is also detrimental because it makes isolating the fault difficult. The Maintenance/Test circuit pack provides the capability to detect, and, in some cases, correct Packet Bus faults.

Packet Bus Connectivity Diagram

Figure 9-1 shows the various circuit packs that communicate on the Packet Bus. Logical and physical connections are illustrated. Connectivity with three port networks is similar.

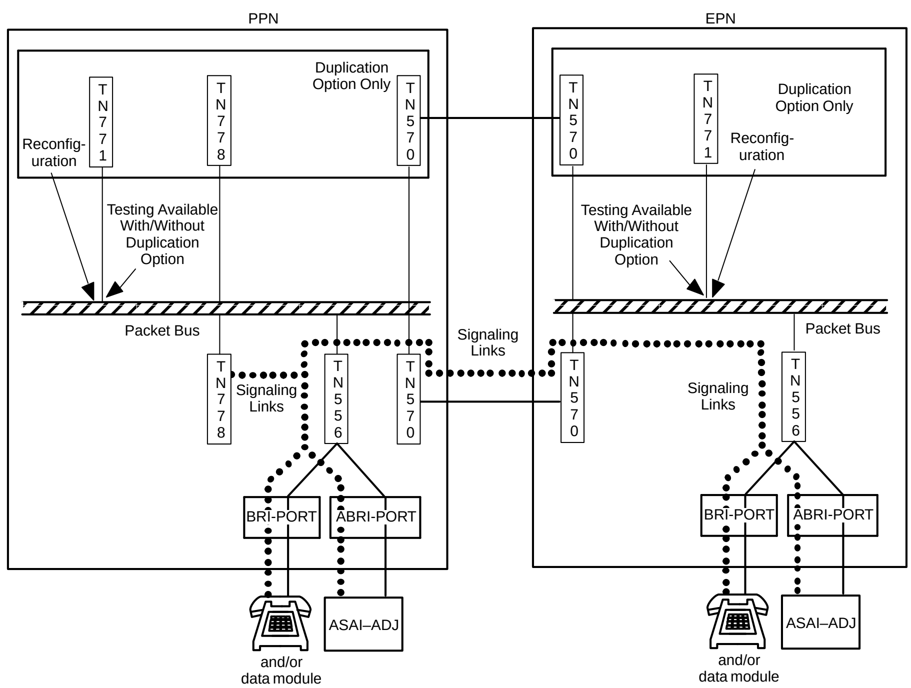

Figure 9-1. ISDN-BRI/Packet Bus Connectivity

For details on ISDN-BRI and ASAI connectivity, refer to BRI-PORT and BRI-SET/ASAI-ADJ documentation in Chapter 11, "Maintenance Object Repair Procedures". For details on Expansion Interface connectivity, refer to EXP-INTF documentation in Chapter 11, "Maintenance Object Repair Procedures".

Circuit Packs That Use the Packet Bus

This section gives a brief description of the DEFINITY circuit packs that use the Packet Bus. The section explains how a Packet Bus failure can affect these circuit packs, and also how a failure of one of these circuit packs can cause a Packet Bus failure.

Overview of the Circuit Packs and Related Maintenance Objects

Four circuit packs can use the Packet Bus. The following list identifies and discusses each circuit pack. An explanation of how each circuit pack assists in Packet Bus maintenance is also included.

NOTE:
The maintenance object(s) involved with each circuit pack are listed in brackets. Documentation for each maintenance object is provided in Chapter 11, "Maintenance Object Repair Procedures".

- **TN778 Packet Control** [PKT-CTRL] provides the SPE interface to the Packet Bus, just as the TN777 Network Control does to the TDM Bus. All traffic on the Packet Bus passes through the Packet Control.

  The Packet Control can detect failures of certain control leads on the bus. Such failures are indicated by an inability to transmit data. The Packet Control can also detect data errors on the Packet Bus.

- **TN570 Expansion Interface** [EXP-INTF] is used to connect the Port Networks (PNs) in the system. For systems that use the Packet Bus, all Port Network connections must be made with TN570 circuit packs (and not the TN776 Expansion Interface circuit packs used in DEFINITY G1 and non-Packet DEFINITY. All Packet traffic between PNs passes through a pair of TN570s (one in each port network).

  The Expansion Interface can detect a subset of control lead failures (though not so many as the Packet Control), and it can detect many data lead failures via parity errors on received data.

- **TN556, TN2198 and TN2208 ISDN-BRI circuit packs** [BRI-BD, BRI-PORT, ABRI-PORT, BRI-SET, BRI-DAT, ASAI-ADJ] provides connections for ISDN-BRI station sets and data modules and for ASAI adjuncts. The Packet Bus is used to carry signaling information for sets and data modules. The Packet Bus passes signaling information and ASAI messages between the SPE and the ASAI adjunct. The ISDN-BRI circuit pack has the same fault detection capabilities as the TN570 Expansion Interface.

- **TN771 Maintenance/Test circuit pack** [M/T-BD, M/T-DIG, M/T-PKT] is the workhorse of Packet Bus maintenance. This circuit pack can detect all Packet Bus failures for the Port Network in which it resides. In High and Critical Reliability systems, the circuit pack enables the reconfiguring of the Packet Bus around a small number of failed leads. The TN771D circuit pack provides a standalone mode (that is, one that does not involve communication with the SPE) for inspecting the Packet Bus for faults. This is a critical tool for the Packet Bus Fault Correction procedures, which are described later.

NOTE:
All Maintenance/Test circuit packs to be used in DEFINITY must be of vintage TN771D or later. The circuit pack is also used for ISDN-PRI trunk testing (M/T-DIG). This functionality is not relevant to Packet Bus maintenance, and it is discussed in Chapter 11, "Maintenance Object Repair Procedures".

Effect of Circuit Pack Failures on the Packet Bus

A failure of any of the circuit packs described in the previous section can disrupt traffic on the Packet Bus. Some failures cause actual Packet Bus failures with corresponding alarms, while others cause service outages without alarming the Packet Bus (although the failed circuit pack(s) should be alarmed).

The following list discusses the effects on the Packet Bus of a failure on each circuit pack that uses the Packet Bus.

- **TN778 Packet Control**. A failure of the Packet Control typically causes all Packet traffic in the system to fail. As a result, ISDN-BRI sets are not able to make or receive calls, and communication with an ASAI adjunct fails. A failure of the Packet Control may also cause a failure of the Packet Bus itself if the failure is on the interface circuitry. Otherwise, only the Packet Control is alarmed.

  In a High or Critical Reliability system, there is one TN778 Packet Control in each SPE. If a Packet Control failure in the active SPE causes a Packet Bus disruption, performing an SPE interchange may restore service. In some cases, circuit pack failures may require that the circuit pack be replaced before service is restored.

- **TN570 Expansion Interface**. A failure of the Expansion Interface typically causes all Packet traffic in the connected EPN to fail. If the failure is on the Packet Bus interface, the Packet Bus may be alarmed as well.

In a High or Critical Reliability system, there is one EPN link in each control carrier for each EPN. If an active Expansion Interface failure causes a Packet Bus disruption, performing an Expansion Link switch may restore service. In some cases, circuit pack failures may require that the circuit pack be replaced before service is restored.

- **TN556 ISDN-BRI Circuit Pack**. A failure of the ISDN-BRI circuit pack typically causes some or all ISDN-BRI sets and data modules and/or an ASAI adjunct connected to the circuit pack to fail to function. If the failure is on the Packet Bus interface, the Packet Bus may be alarmed as well.
- **TN771 Maintenance/Test**. A failure of the Maintenance/Test may cause an incorrect indication of a Packet Bus failure or the inability to detect such a failure. A failure of the Packet Bus interface of the circuit pack may cause the Packet Bus to be alarmed.

As is indicated in the previous list, a failure of the Packet Bus interface on any of the circuit packs discussed can cause the Packet Bus to be alarmed. This is true because such a failure may result in shorting Packet Bus leads together. This typically disrupts ALL Packet Bus traffic in the affected port network. Remember that a failure of the Packet Bus in the PPN affects packet traffic in the EPNs as well. Also, Packet Bus failures that do not affect all endpoints on that Packet Bus may occur. Therefore, a Packet Bus failure should not be ruled out even if some Packet service is still present.

A circuit pack can fail in a manner such that it transmits bad data on the Packet Bus. If the Packet Control fails in such a fashion, all Packet traffic is disrupted (because all traffic requires the Packet Control). Likewise, such a failure on the Expansion Interface may disrupt all Packet traffic in that port network.

However, if an ISDN-BRI circuit pack fails such that it transmits bad data, all devices connected to the circuit pack fail to function. This failure may also disrupt the entire Packet Bus whenever the circuit pack tries to transmit data. Such a disruption may be indicated by Packet Bus alarms that occur and go away, intermittent failures of other Packet circuit packs, and/or interference with other connected endpoints. The failures mentioned are difficult to isolate because of their intermittent nature. In most cases, the failed circuit pack is usually alarmed, and all connected endpoints on the circuit pack are out of service until the circuit pack is replaced. These symptoms help in isolating the fault.

Maintenance of the Packet Bus

This section discusses the maintenance of the Packet Bus. Accordingly, the following topics are discussed:

- Comparison between the Packet Bus and the TDM Bus
- Packet Bus Maintenance Software
- Overview of Fault Correction Procedures

Packet Bus and TDM Bus: a Comparison

Although the Packet Bus is similar to the TDM Bus in many ways, there are some important differences. For example, there are two physical TDM Busses in the switch (refer to the TDM-BUS section in Chapter 11, "Maintenance Object Repair Procedures", for more information), and one of these busses can fail without affecting the other (although half of the call-carrying capacity is lost in this case). On the other hand, there is only a single Packet Bus in the switch, and a failure of that bus can disrupt all traffic on the Packet Bus.

In High or Critical Reliability systems, the Maintenance/Test circuit pack provides Packet Bus reconfiguration capabilities. This allows the Packet Bus to remain in service with up to three lead failures. There is no corresponding facility on the TDM Bus, where the second physical TDM Bus continues to carry traffic until repairs are completed.

In addition, the system response varies according to the type of bus failure. Specifically, a catastrophic TDM Bus failure (one that affects both TDM Buses) disables ALL traffic in the system, while a catastrophic Packet Bus failure affects only Packet traffic. This means that all TDM traffic is unaffected, while all BRI and ASAI traffic does not work. The significance of this distinction depends on the customer's application. (For example, a customer whose primary application requires ASAI would consider the switch to be out of service, while a customer with a large number of Digital/Analog/Hybrid sets and a small number of ISDN-BRI sets would probably not consider the Packet Bus failure a catastrophic problem.) The only way a Packet Bus failure can affect TDM traffic is via possible impact on system response time in a large switch due to ISDN-BRI endpoint maintenance running. This should rarely happen because the Packet Bus maintenance software is able to prevent this impact for most Packet Bus faults (see the next section).

CAUTION:
Since the correction procedures and some of the fault isolation procedures for the Packet Bus are highly destructive to service throughout the system (inasmuch as the procedures primarily involve removing circuit packs), particular attention must be paid to nondestructive fault isolation. Also, for the same reason, the time taken with destructive procedures must be minimized. This is the major reason that maintenance of the Packet Bus and of the Packet maintenance objects is described in such detail.

Packet Bus Maintenance Software

Packet Bus maintenance software involves the traditional set of error conditions, tests, and alarms relevant to Packet Bus faults. These are described in the PKT-BUS section in Chapter 11, ''Maintenance Object Repair Procedures'', and they are similar in design to the maintenance strategy for most maintenance objects.

In addition, because a Packet Bus failure can cause all BRI/ASAI endpoints in the affected Port Network (and their associated ports and circuit packs) to report failures, special care must be taken to ensure that the flood of error messages from the affected maintenance objects does not overload the system and interfere with TDM Bus traffic. When such a failure occurs, maintenance of Packet circuit packs is affected in the following manner:

- ISDN-BRI circuit pack (BRI-BD) in-line errors indicating possible Packet Bus failures are placed into the error log, but are not acted upon.
- ISDN-BRI port (BRI-PORT, ABRI-PORT) in-line errors indicating possible Packet Bus failures **are neither placed into the error log nor acted upon.**
- ISDN-BRI endpoint (BRI-SET, BRI-DAT, ASAI-ADJ) in-line error **are neither placed into the error log nor acted upon.**
- Circuit pack and port in-line errors that are not related to the Packet Bus, or that indicate a circuit pack failure, are acted upon in the normal fashion.
- Normal background maintenance (periodic and scheduled) is not affected.
- Foreground maintenance (for example, commands executed on the Manager I terminal) are not affected.

These interactions allow normal, non-Packet, system traffic to continue unaffected, and they reduce the number of extraneous entries into the Error/Alarm Logs. If the Packet Bus failure is caused by a failed circuit pack, the circuit pack should appear in the Error/Alarm Logs, which aids in fault isolation.

The following events indicate a Packet Bus failure that requires the actions in the previous paragraph to occur:

- In-line errors that indicate a possible Packet Bus failure reported by two or more Packet circuit packs
- Packet Bus Uncorrectable report from the Maintenance/Test Packet Bus port (M/T-PKT)
- Packet Bus Interface Failure from the Packet Control (PKT-CTRL)

If such a failure occurs, this information will be available in an Error Log entry for PKT-BUS. Refer to the PKT-BUS section in Chapter 11, ''Maintenance Object Repair Procedures'', for more detailed information.

Overview of Fault Correction Procedures

This section gives an overview of the procedures used to (1) isolate the cause of Packet Bus faults and to (2) correct the Packet Bus faults. These procedures are applicable to High and Critical Reliability systems, and they are detailed fully later in this chapter:

1. The first procedure attempts to determine if a circuit pack that interfaces to the Packet Bus is the cause of the Packet Bus problem. The error and alarm logs are examined for entries for these circuit packs, and the normal maintenance procedures for those circuit packs are attempted.
2. If the Packet Bus problem still exists, port circuit packs (those in the purple slots) are removed to look for circuit pack(s) that have failed and/or have damaged the Packet Bus pins (a diagram of the backplane pins is provided later).
3. If the Packet Bus problem is still not resolved, the same procedure is attempted for the control complex circuit packs.
4. If the problem is still not resolved, or if the Packet Bus faults are known to have open leads, a procedure is undertaken in which the bus terminators and cables are replaced. If this does not resolve the problem, the carrier connectivity of the port network is reconfigured to attempt to isolate a faulty carrier.

The Maintenance/Test Circuit Pack (TN771)

Description

The TN771 Maintenance/Test circuit pack provides the following functions:

- ISDN-PRI Trunk Testing
- Packet Bus Testing
- Packet Bus Reconfiguration

Packet Bus reconfiguration is available only in High and Critical Reliability systems. In such systems that use the Packet Bus, a Maintenance/Test is required in each port network. In other configurations (for example, Standard Systems, no Packet Bus use), the circuit pack is optional. The ISDN-PRI Trunk Testing functions are discussed in the ISDN-PRI and M/T-DIG sections in Chapter 11, "Maintenance Object Repair Procedures".

CAUTION:
All TN771 circuit packs must be of TN771D vintage or later.

Normal Packet Functionality

The Maintenance/Test Packet Bus Port (M/T-PKT) provides the Packet Bus testing and reconfiguration capabilities. When the port is in service, the port continuously monitors the Packet Bus for faults (or recovery from faults), and it reports this information to Packet Bus (PKT-BUS) maintenance.

The yellow LED on the TN771 Maintenance/Test circuit pack provides a visual indication of the state of the Packet Bus, as follows:

- **Blinking** at a rate of 1 per sec — the Maintenance/Test Packet Bus port cannot swap leads to correct a Packet Bus fault (that is, there are too many faults). **The Packet Bus may be unusable**. If the failures detected by the Maintenance/Test Packet Bus port are open lead failures, the Packet Bus may still be operating.
- **On steady** — the Maintenance/Test Packet Bus port has swapped leads on the Packet Bus. **The Packet Bus is still operating**.

  NOTE:
  Because the yellow LED on the Maintenance/Test circuit pack can also be on steady when the other ports on the circuit pack are in use, the ports on the Maintenance/Test circuit pack used for ISDN-PRI trunk testing must be busied out before the Maintenance/Test circuit pack is used to help resolve Packet Bus faults. This is done via the

busyout port PCSS02 and **busyout port PCSS03** commands. Also, be sure to release these ports when the process is completed.

- **Off** — there is no Packet Bus fault present.

  NOTE:
  It takes 5 to 10 seconds for the LED to respond to a change in the state of the Packet Bus.

In normal switch operation, the Maintenance/Test provides the visual feedback of the Packet Bus state. When standalone mode (described in the next section) is in effect, these visual indications are still provided; however, the Packet Bus is never reconfigured, and, as a result, the yellow LED either blinks or is off.

Standalone Mode

The TN771D Maintenance/Test provides a standalone mode for detecting Packet Bus faults. In the standalone mode, a terminal is connected to the Maintenance/Test circuit pack via the Amphenol™ connector on the back of the cabinet. This setup allows the System Technician to determine the state of the Packet Bus without having to access the Manager I terminal to provide these functions, even if the switch is not in service. Note that the Maintenance/Test does not reconfigure the Packet Bus when it is operating in standalone mode.

Standalone mode is used in the Packet Bus Fault Correction procedures. As a result, **a TN771 and a corresponding terminal must be available to the technician who is to perform such procedures**. A High or Critical Reliability system has a TN771 in each port network. However, the customer of a system that does not have High or Critical Reliability may have purchased a TN771 for ISDN-PRI trunk testing, or to increase the system's ability to detect Packet Bus failures.

The **list configuration** command is used to check for the presence of a circuit pack in the system. If a circuit pack is not present in the system, one must be taken to the customer site. The "Special Precaution Concerning the TN771" section in this chapter discusses the special cases when a spare TN771 must be taken to the customer site.

NOTE:
When in standalone mode, the yellow LED on the TN771 blinks if there is a Packet Bus fault. If there is no such fault, the yellow LED is off. This is true because Packet Bus reconfiguration cannot occur in standalone mode.

Required Hardware for Standalone Mode

In addition to the TN771, the following equipment is required to use the standalone mode:

1. Terminal or PC with terminal-emulation software. The EIA-232 (RS-232) port should be configured at 1200 baud, no parity, 8 data bits, and one stop bit. This is **not** the same configuration as for the Manager I terminal. Therefore, if the Manager I can be used for this operation (and this depends on the switch configuration and on customer requirements), remember to restore the original communication parameters before returning the Manager I to service.
2. 355A EIA-232 Adapter (COMCODE 105 012 637). This adapter is illustrated in Figure 9-2.
3. 258B Six-Port Male Amphenol Adapter (COMCODE 103 923 025). This adapter is illustrated in Figure 9-3.
4. D8W 8-wire modular cable of an appropriate length to connect the 258A on the back of the cabinet to the 355A adapter. The relevant COMCODE is determined by the length of the cable, as follows:
   - 103 786 786 (7 feet)
   - 103 786 802 (14 feet)
   - 103 786 828 (25 feet)
   - 103 866 109 (50 feet)

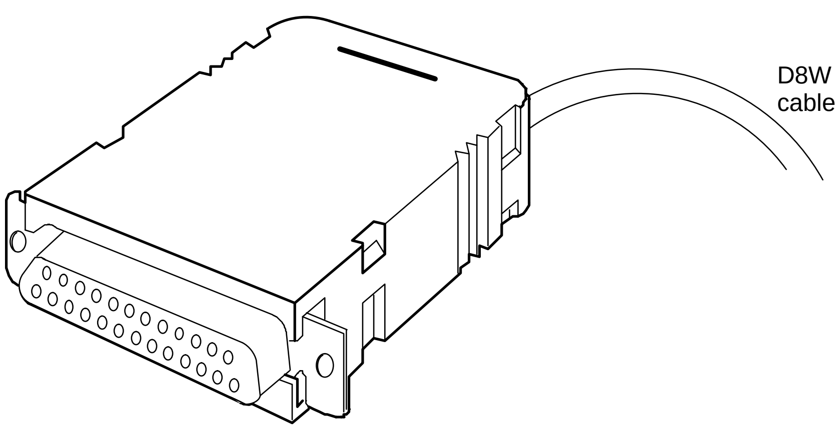

Figure 9-2. 355A EIA-232 Adapter

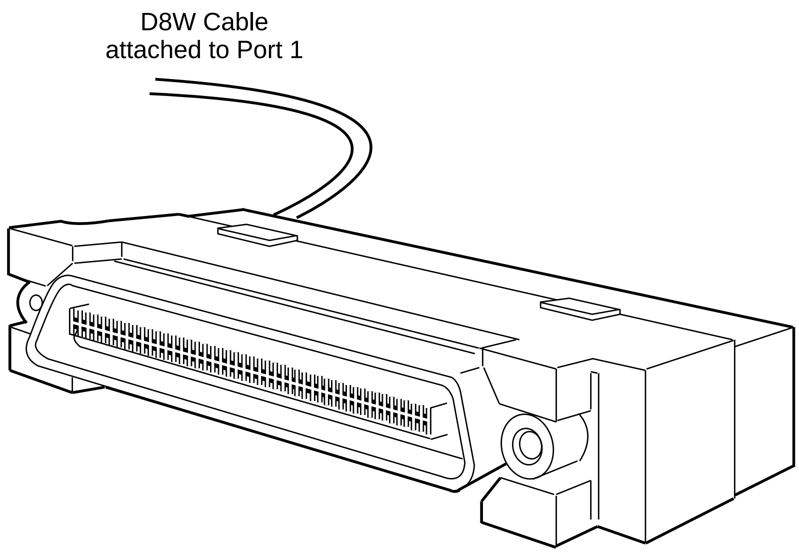

Figure 9-3. 258B Six-Port Male Amphenol Adapter

Slot Selection for Standalone Mode

When selecting a carrier slot to use for standalone mode in a port network that does not already contain a TN771, keep the following points in mind:

- A port circuit slot (indicated by a purple label) should be used.
- -5 volt power supply must be available in the carrier. (Refer to CARR-POW maintenance in Chapter 11, ''Maintenance Object Repair Procedures''. This section describes the power supply configurations that provide this power supply.)
- It is preferable that the slot chosen is in the A carrier if a free slot that matches the criteria presented in the first two items of information in this list is available.

Entering and Exiting Standalone Mode

NOTE:
When in standalone mode, the red LED on the TN771 is lit. This function is correct, and it serves as a reminder to remove the TN771 from standalone mode.

CAUTION:
The TN771 in standalone must be the ONLY TN771 in the port network. If a TN771 is already in the port network, place that TN771 in standalone mode. Do not insert a second TN771 into standalone mode. System behavior is rendered as undefined if this is done. In addition, the system is not able to detect the extra circuit pack in this case because a TN771 in standalone mode is invisible to the SPE.

CAUTION:
If the TN771 Packet Bus port has reconfigured the Packet Bus in a switch with a High or Critical Reliability system, (indicated by error type 2049 against PKT-BUS), placing the Maintenance/Test in standalone mode causes a loss of service to the Packet Bus. This is true because reconfiguration is not performed in standalone mode. Therefore, this procedure should be considered a service-disrupting procedure.

If the system has a TN771 installed in the Port Network to be examined, use the following steps to enter the standalone mode:

1. Ensure that Alarm Origination is suppressed either at login time or via the Maintenance-Related System Parameters form.
2. Attach the 258B Six-Port Male Amphenol Adapter to the Amphenol connector for the TN771's slot. Connect one end of a D8W 8-wire modular cable to port 1 of the 258B. Connect the other end of the cable to a 355A EIA-232 Adapter. Plug the EIA-232 Adapter into the terminal to be used, and turn the terminal on.
3. Reseat the TN771 circuit pack.

   NOTE:
   In a High or Critical Reliability system, this causes a Minor, Off-board alarm to be raised against the Packet Bus. This alarm is not resolved until the TN771 (in particular, the Packet Bus port (M/T-PKT)) is returned to service. To ensure that Packet Bus alarms have been cleared, it may be necessary to restore the TN771 to normal mode.

If there is no TN771 in the Port Network, use the following steps to enter the standalone mode:

1. Attach the 258A Six-Port Male Amphenol Adapter to the Amphenol connector for the slot into which the TN771 is to be inserted. Connect one end of a D8W 8-wire modular cable to port 1 of the 258A. Connect the other end of the cable to a 355A EIA-232 Adapter. Plug the EIA-232 Adapter into the terminal to be used, and turn the terminal on.
2. Insert the TN771 circuit pack into the slot. The system does not recognize the presence of the circuit pack.

If the standalone mode is entered successfully, the following is displayed on the connected terminal:

```
TN771 STANDALONE MODE
(Type "?" at the prompt for help)

Command:
```

Figure 9-4. Normal Standalone Mode Display

CAUTION:
If the display in Figure 9-4 does not appear, be sure to check the wiring between the terminal and the TN771, and also the terminal parameters. If these are correct, the TN771 may be defective. In such a case, follow the procedures to exit standalone mode (described in the next paragraph). Then test the Maintenance/Test circuit pack (refer to M/T-BD and M/T-PKT in Chapter 11, "Maintenance Object Repair Procedures").

NOTE:
If the TN771 fails while in standalone mode, the message **TN771 circuit pack failed** is displayed, and no further input is accepted on the terminal. The circuit pack must be replaced.

Use the following procedures to exit standalone mode:

1. Remove the 258A Adapter from the Amphenol connector.
2. If the TN771 was installed for this procedure, remove it. Otherwise, reseat the TN771.
3. Be sure that alarm origination is re-enabled on the ‘‘Maintenance-Related System Parameters’’ form if it was disabled there (if it was disabled at login, it is automatically re-enabled at logoff).

Using Standalone Mode in Packet Bus Fault Isolation and Correction

When the TN771 is in standalone mode, three commands can be used at the terminal:

- **ds** displays the current state of the Packet Bus leads.
- **dsa** toggles auto-report mode on and off. In auto-report mode, the state of the Packet Bus leads are displayed and the terminal beeps whenever a change occurs.
- **?** displays the available commands.

Figure 9-5 presents an example of a standalone mode display. In the display, an 'S' indicates a shorted lead, an 'O' indicates an open lead, and a blank indicates no fault.

```
L L L L L L L L L L H H H H H H H H H H S S S L
P 0 1 2 3 4 5 6 7 8 P 0 1 2 3 4 5 6 7 8 S F B F
------------------------------------------------
S S                             O
Command:
```

Figure 9-5. Example Standalone Mode Display

The information within a standalone mode display is used in the Packet Bus Fault Correction procedures that follow. The TN771 display indicates the specific leads on the backplane to examine for bent or damaged pins. Figure 9-6 shows the location of the Packet Bus leads on the backplane as viewed from the front of the carrier, while Figure 9-7 shows the same slot as viewed from the back of the carrier.

NOTE:

This information is available only from the standalone mode and with an on-site connected terminal. This information is not available from the Manager I, and, thus, it is not available remotely. This is not a concern, inasmuch as this information cannot be used effectively if testing is not on site.

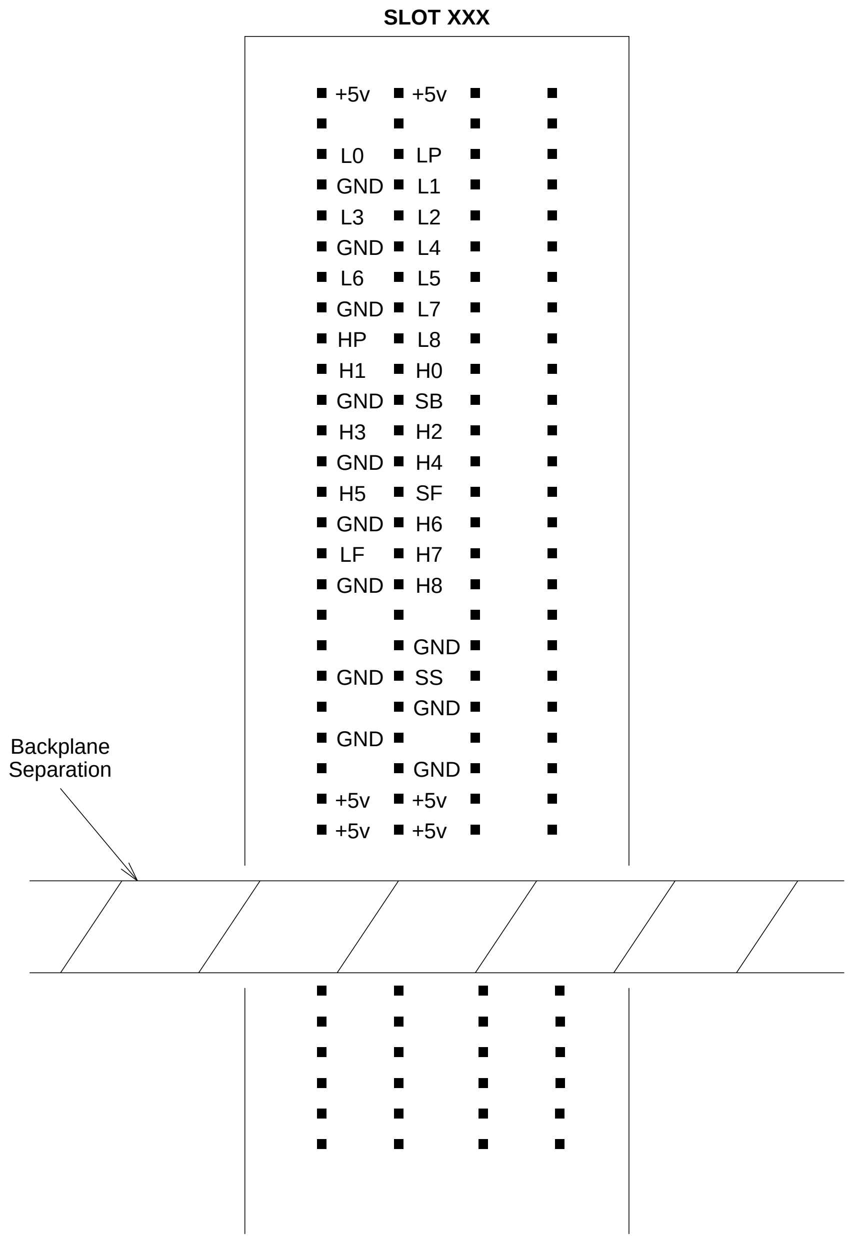

Figure 9-6. Packet Bus Leads on the Backplane - Front View

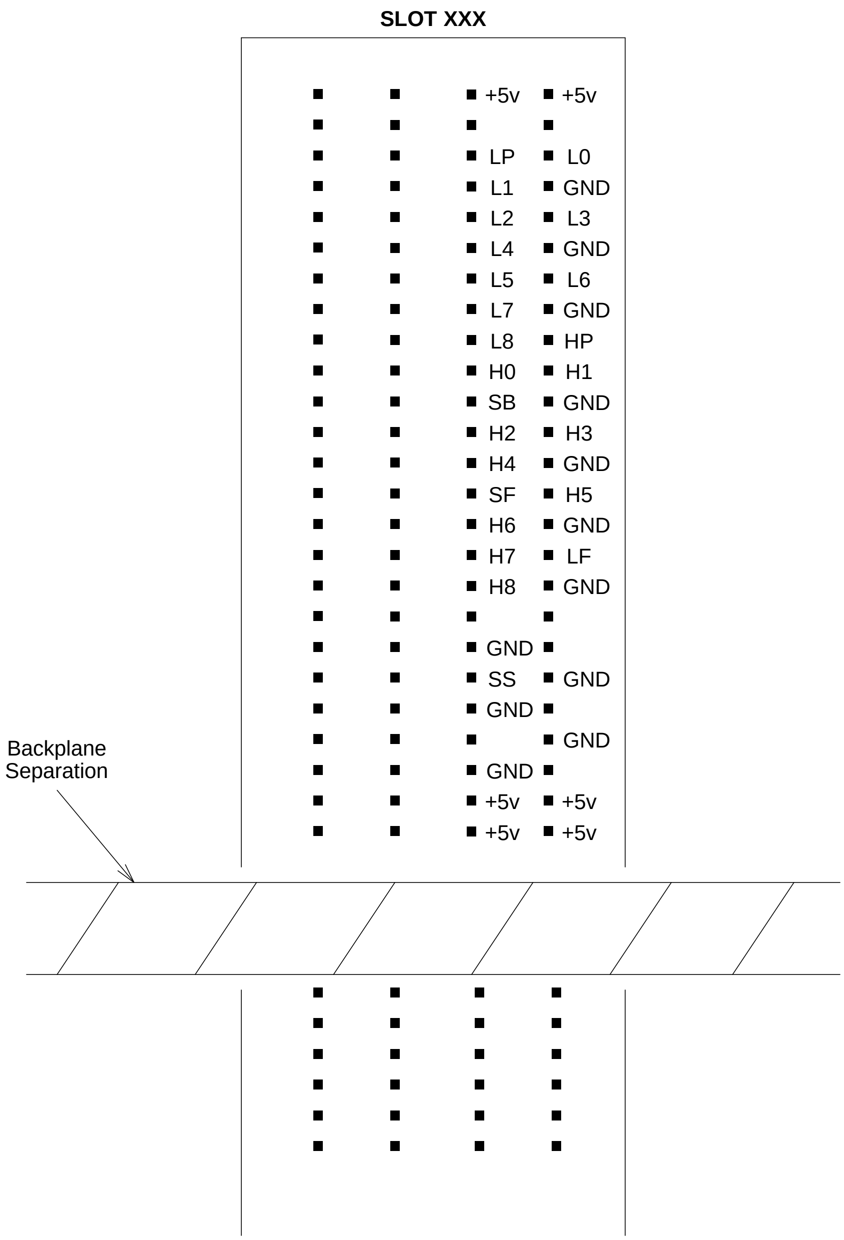

Figure 9-7. Packet Bus Leads on the Backplane - Back View

Special Precaution Concerning the TN771

A new TN771 Maintenance/Test circuit pack must be taken to the customer site whenever the following is true:

- Maintenance/Test Packet Bus port indicates that a Packet Bus fault is present.

  NOTE:
  Such a fault is indicated by a Major or Minor alarm against the Packet Bus. A Major alarm is indicated in the error log by Error Type 513, while a Minor alarm is indicated by Error Type 2049.

- Test #572 of the PKT-BUS test sequence is the only test that fails.

This precaution is taken because certain failures of the Maintenance/Test circuit pack can appear as Packet Bus failures. To ensure that the problem is indeed with the Packet Bus, implement the following steps:

1. Refer to the M/T-PKT Maintenance documentation in Chapter 11, "Maintenance Object Repair Procedures". Correct any problems with the TN771 Maintenance/Test Packet Bus port as described in that section. If the TN771 Maintenance/Test circuit pack is replaced during the correction process, enter the **test pkt P long** command to determine if the Packet Bus faults have been resolved. If there are still Packet Bus problems, correct them by using the procedures in the sections that follow.
2. If the Maintenance/Test circuit pack was not replaced, enter the **test pkt P** command. Record the results (PASS/FAIL/ABORT) and error codes for Test #572.
3. Enter the **status system P** command. Record the information listed for the Packet Bus.
4. Busyout the Maintenance/Test circuit pack by entering the **busyout board PCSS** command.
5. Replace the Maintenance/Test circuit pack with the new circuit pack.
6. Release the Maintenance/Test circuit pack by entering the **release board PCSS** command.
7. Enter the **test pkt P** and **status system P** commands as described in Steps 2 and 3.

8. If the data matches the previously recorded data, a Packet Bus problem exists. The original TN771 Maintenance/Test circuit pack is not defective, and it does not need to be returned to the factory. Replace the original TN771, then correct the Packet Bus problem by using the procedures in the sections that follow.
9. If the data does **NOT** match the previously recorded data, **the original TN771 Maintenance/Test circuit pack is defective.** If there are still indications of Packet Bus problems, correct them by using the procedures in the sections that follow.

Packet Bus Fault Isolation Flowchart

The flowchart in this section presents the steps to be taken for isolating and resolving Packet Bus problems. The order in which the maintenance objects should be examined can be determined by assessing how wide-spread the failure is. For example, since all ISDN-BRI devices communicate with the TN778 Packet Control circuit pack, this MO should be examined early in the sequence. On the other hand, a failure of a TN570 circuit pack in an EPN may cause ISDN-BRI failure in an EPN, but it could not be the cause of a failure in the PPN.

Whenever the flowchart refers to the Maintenance documentation for a specific MO, keep in mind that the repair procedure for that MO may in turn refer to another MO's repair procedure. The flowchart tries to coordinate these procedures so that a logical flow is maintained if the Packet Bus problems are not resolved via the first set of repair procedures. However, a Packet Bus failure can lead to a somewhat haphazard referencing of various MO procedures that may result in your implementing steps that either have already been completed or are not necessary. If this occurs, return to the flowchart at the step that follows the reference to Chapter 11, "Maintenance Object Repair Procedures", and then continue.

NOTE:
The following **status** commands can also help diagnose Packet Bus problems:

- **status system**
- **status packet-control**
- **status bri-port**
- **status station**
- **status data-module**

For a description of these commands, refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids". The commands provide information about the service state of various Packet maintenance objects. This information can be useful for remote maintenance, inasmuch it can explain the impact of the failure(s) on the system.

The Packet Bus Fault Isolation Flowchart appears on the following two pages.

NOTE:
See the "Flowchart Description and Supplement" section following the flowchart for a description of the flowchart as well as for supplementary information, the availability of which is indicated by the uppercase letters in bold that appear within some of the es and diamonds in the flowchart.

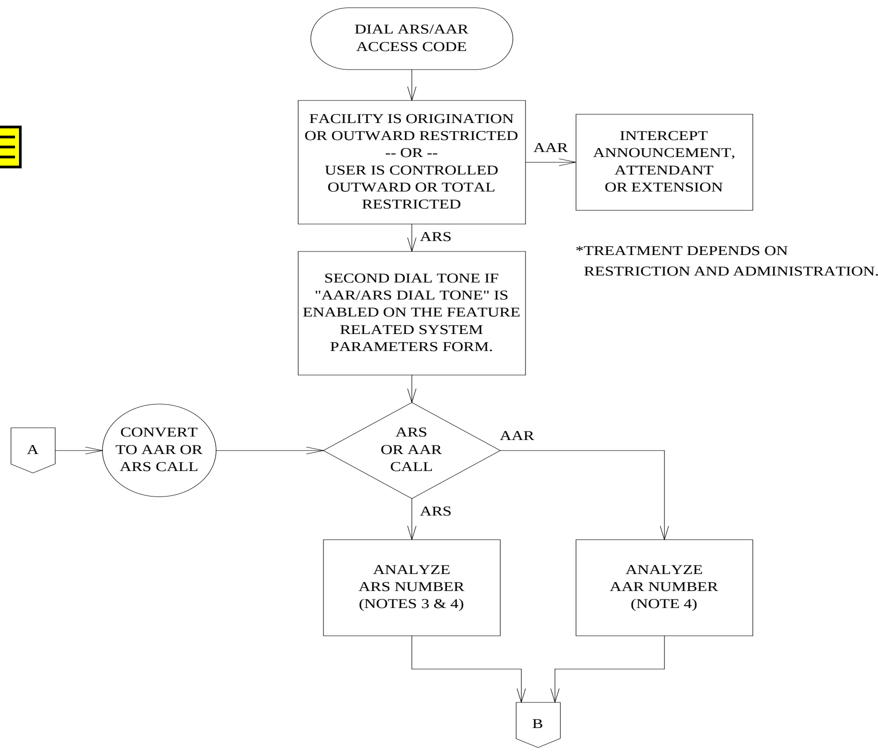

Figure 9-8. Processing of Packet Bus Problems (Page 1 of 2)

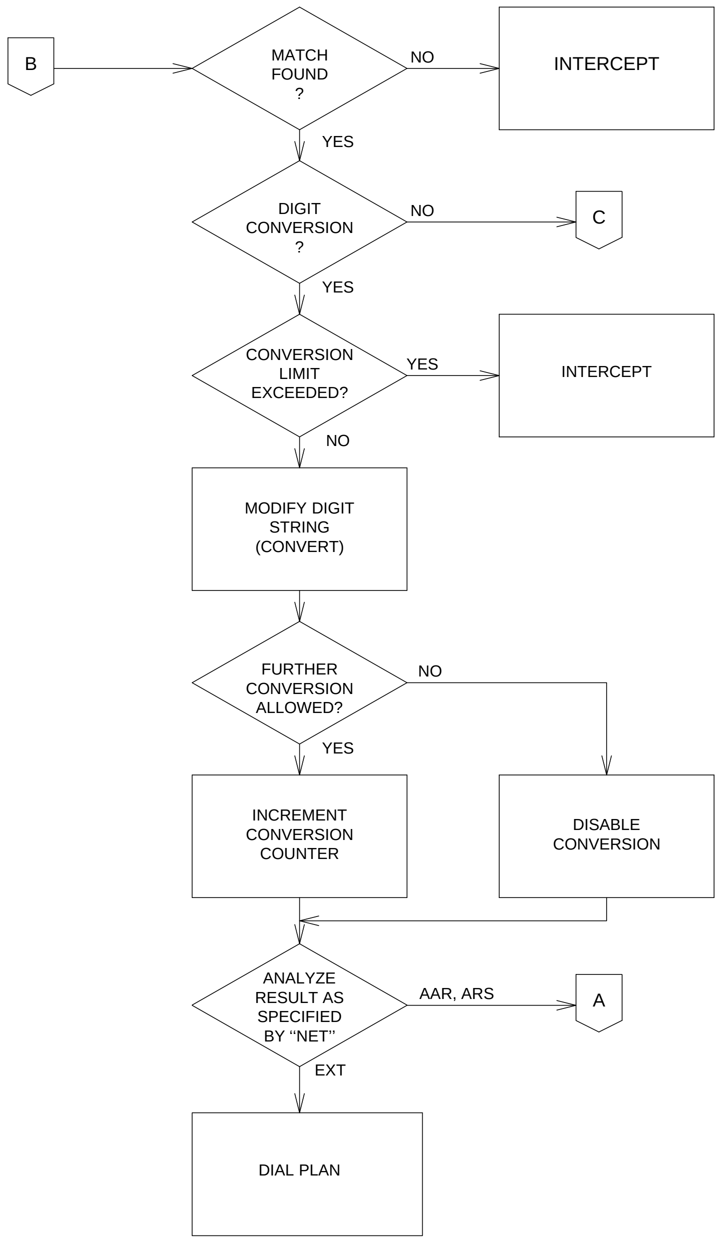

Figure 9-9. Processing of Packet Bus Problems (Page 2 of 2)

Flowchart Description and Supplement

A number of the es and diamonds in the flowchart contain an uppercase letter in bold (for example, **A, B, C,** etc.). Each of these es and diamonds is supplemented by the paragraph in this section that is introduced by the same letter that appears in the box or diamond. Each of these paragraphs gives details about the relevant process that could not fit into the appropriate box or diamond.

> **NOTE:**
> Due to space restrictions, individual error codes and alarms are not detailed on the flowchart. The maintenance object descriptions in Chapter 11, "Maintenance Object Repair Procedures", discuss which errors and alarms could cause or be indicative of Packet Bus problems. In general, unless an error, alarm, or test refers explicitly to the TDM Bus, the error, alarm, or test should be considered a possible cause of Packet Bus problems.

The following paragraphs supplement the appropriate or diamond in the flowchart.

a. Problems with the system clock (TDM-CLK) can cause service disruptions on the Packet Bus as well as on the TDM Bus. Therefore, if there are alarms active against TDM-CLK, these alarms should be resolved before any other Packet Bus fault isolation is attempted.

   > **NOTE:**
   > All TDM-CLK problems should be resolved before the process is continued, even if the problems refer only to the TDM Bus. (This is an exception to the previous note.) This is recommended because a Packet Bus problem cannot cause a TDM-CLK problem, while a TDM-CLK problem can cause a Packet Bus problem.

b. The question ‘‘Are the Packet Bus problems resolved?’’ appears several times on the flowchart. This is a general question that can involve several checks. The basic question is “Are the problems that caused you to use this flowchart resolved?’’ Some of the more specific questions might be:

   - Are all Packet Bus alarms resolved?
   - Are all Packet circuit pack (port, endpoint) alarms resolved?

     > **NOTE:**
     > If all alarms are resolved, issue the **clear pkt** command. This command attempts to put the switch back into the service state by resolving any BRI problems that exist. Refer to Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for more information.

- Are all ISDN-BRI stations/data modules and/or ASAI adjuncts in service?
- Does the Maintenance/Test Packet Bus port (in normal or standalone mode) still indicate a Packet Bus fault?

c. If only a single EPN is affected, the Packet Control is probably not the source of the problem. However, if all of the ISDN-BRI circuit packs are located in a single EPN, assume that the answer to this question is ‘‘No,’’ and check the Packet Control.

d. A Packet problem that affects more than one port network is probably caused by either a Packet Control failure or a PPN Packet Bus failure. The Packet Control is checked before the Packet Bus Fault Correction procedures are implemented.

e. Because the Packet Bus in each port network is physically separate, each affected port network must be checked individually. The PPN should be checked first, however, since any EPN Packet problems are usually resolved once the PPN Packet problem is resolved. After resolving the problem in one port network, be sure to check if the problems in other port networks have also been resolved.

f. This step applies only when an attempt to resolve an EPN Packet Bus problem is made. When checking the Expansion Interfaces in an EPN, be sure to check the corresponding ones in the PPN. Also, recall that all Expansion Interfaces in 286 systems, 386 systems, or later systems that are using the Packet Bus must be TN570s. Using TN776s results in an EPN where TDM traffic works but Packet traffic does not work.

g. If a TN771 is not present, one must be installed to accommodate the standalone mode, which is discussed earlier in this chapter.

h. If a TN771 is present, it can fail in such a fashion that it eventually disrupts the Packet Bus or misinterprets a Packet Bus problem.

i. If work is being done on-site, follow the procedures described earlier in this chapter for placing the TN771 into standalone mode. If work is not being done on-site, go to the next step.

j. The answer is ‘‘Yes’’ if the TN771 in standalone mode indicates any faulty leads. The answer is also “Yes’’ if Test #572 in the PKT-BUS test sequence fails, and/or if the **status system** display indicates that faulty leads are present (and the TN771 in the port network is known to be functioning correctly).

k. If the non-functional endpoints are isolated to a single circuit pack, the circuit pack is probably the cause of the problem.

l. The procedures that must be executed are determined by which maintenance objects on the circuit packs are alarmed. Start with the procedures for the circuit pack errors/alarms, then continue with those for the port. Finally, execute the procedures for the endpoint.

m. Follow the procedures outlined later in this chapter. If the Packet Bus problem cannot be resolved by executing these procedures, escalate the problem.

Packet Bus Fault Correction

Using and Interpreting Results from the Status System Command

The **status system** command can be issued to retrieve information about the Packet Bus. This command is described fully in the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids".

The **status system** command provides the service state, alarm status, and (if the Maintenance/Test Packet Bus port is activated) the number of faulty and open leads. This information can be used to determine the urgency of the repair. In general, a service state of ‘‘out’’ indicates extreme urgency, while a service state of ‘‘reconfig’’ indicates moderate urgency.

CAUTION:
Ultimately, the urgency of a repair is determined by the customer's requirements. A customer who uses ISDN-BRI for station sets probably considers a Packet Bus failure critical. However, a customer with only a small percentage of ISDN-BRI service may consider even an uncorrectable Packet Bus fault to be of minor importance and may prefer to delay performing repairs, due to their destructive nature.

NOTE:
If maintenance is actively running on the Packet Bus at the time the **status system** command is issued, the data reported for the Packet Bus may be inconsistent. The reason is that this data is updated by the maintenance tests that are running. If the data seems inconsistent, enter the command again.

If test results or the results of the **status system** command indicate that there are 24 faults on the Packet Bus, the problem is probably caused by faulty cables between carriers, or by defective bus terminators. However, before proceeding, make sure that the report is not being falsely given by the Maintenance/Test Packet Bus port. Accordingly, look for an M/T-PKT error in the error log. Then test the Maintenance/Test Packet Bus port by entering the **test port** command. Refer to the "Special Precaution Concerning the TN771" section earlier in this chapter if any problems are suspected.

If the carrier into which a TN771 Maintenance/Test circuit pack is installed does not have a -5 volt power supply, the Maintenance/Test Packet Bus port reports 24 open leads on the Packet Bus (via the **status system** command and via Test

#572 of the PKT-BUS test sequence). No failure of the TN771 is indicated in this case because the TN771 is not defective. Refer to CARR-POW maintenance in Chapter 11, "Maintenance Object Repair Procedures", and ensure that a -5 volt power supply is available.

Considerations for High and Critical Reliability Systems

If a High or Critical Reliability system is involved, special considerations involving the features of this type of system must be kept in mind. In particular, if a Packet Bus problem is caused by a duplicated component, switching to the standby component may both alleviate the problem and isolate the faulty circuit pack. Therefore, the commands in the following list should be executed first in a High or Critical reliability system. For more information on these commands, refer to Chapter 10, "Maintenance Commands and Trouble-Clearing Aids".

- **reset system interchange**. If this command resolves the Packet Bus problem, the problem is with the Packet Control in the (new) standby SPE. Refer to PKT-CTRL maintenance in Chapter 11, "Maintenance Object Repair Procedures".
- **set exp-link**. If this command resolves the Packet Bus problem, the problem is with either the (new) standby EI Link or the EIs at either end. Refer to EXP-INTF maintenance in Chapter 11, "Maintenance Object Repair Procedures".
- **set tone-clock**. If this command resolves the Packet Bus problem, the problem is with the (new) standby Tone-Clock. Refer to TDM-CLK maintenance in Chapter 11, "Maintenance Object Repair Procedures".

NOTE:
Keep in mind that, even though the steps discussed in the previous list may fail to resolve the problem, the steps are not necessarily fault-proof. Continue with the procedures in the next section.

Troubleshooting Procedures

As we discussed earlier in this chapter, Packet Bus faults are usually caused by a defective circuit pack connected to the backplane, by bent pins on the backplane, or by defective cables/terminators that make up the Packet Bus. The first two faults cause shorts, while the third fault causes either shorts or opens.

There are four procedures for correcting Packet Bus faults. The number of procedures that are to be used to correct faults depends upon a number of factors relevant to system performance and to the content of the procedures themselves. For example, if the Maintenance/Test Packet Bus port is activated, and if there is an indication of open leads on the Packet Bus (either via the **status system** command or via Test #572 failure), **go directly to Procedure 4**. The reason for this is that Procedures 1 through 3 try to locate faulty circuit packs or bent pins behind circuit packs. Since these types of failures can never cause open faults, Procedures 1 through 3 need not be implemented in this case. However, if there are both shorts and opens, execute Procedure 4, then return to Procedure 1 if there are still shorts after the open lead problems are resolved.

CAUTION:
Since Packet Bus fault isolation procedures involve removing circuit packs and possibly disconnecting entire carriers, these procedure have a profound effect on service. Therefore, if possible, implement these procedures after hours or during hours of minimum system use.

NOTE:
Each of these procedures contains one or more steps that require a determination as to whether the Packet Bus problem has been resolved. Accordingly, several condition checks must be performed. We can present each such check in the form of a question, as follows:

- Did the Maintenance/Test circuit pack standalone mode initially indicate the existence of faulty leads, and are these leads no longer indicated?
- Have all alarms against the Packet Bus and Packet circuit packs been resolved?

  NOTE:
  If all alarms are resolved, issue the ‘‘clear pkt’’ command. This command attempts to put the switch back into the service state by resolving any BRI problems that exist. Refer to Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for more information.

- Are all ISDN-BRI stations and data modules as well as any relevant ASAI adjuncts in service?

Note that if one of these conditions is not yet met, the others need not be checked.

The following sections discuss the four procedures for correcting Packet Bus faults.

Procedure 1

Procedure 1 determines if any circuit packs that use the Packet Bus have faults. For each circuit pack type (see Table 9-1), perform the following steps:

NOTE:
The circuit packs need not be checked in the order presented **if the flowchart in this chapter has been followed**. However, if newly added circuit packs are involved, check these packs first, inasmuch as the packs are most likely to have caused a problem.

1. Display the Error and Alarm Logs for the circuit pack via the **display errors** and **display alarms** commands.
2. If there are errors for the circuit pack, refer to the appropriate aintenance documentation in Chapter 11, ''Maintenance Object Repair Procedures'', and follow the recommended maintenance procedure to resolve the errors. Note that some of these procedures may refer to PKT-BUS maintenance as the cause of the fault; if so, implement these Packet Bus Fault Correction procedures at that point.
3. After implementing the repair procedure for the circuit pack (and regardless of whether this procedure succeeds or fails), determine if the Packet Bus fault is still present.
4. If the Packet Bus fault is still present, implement Procedure 1 for the next circuit pack.
5. If there are no more circuit packs in the list, go to Procedure 2.
6. If the Packet Bus fault has been resolved, the procedures are completed.

Table 9-1. Packet Circuit Packs

Circuit Pack Name	Circuit Pack Code	Associated Maintenance Objects
ISDN-BRI	TN556	BRI-BD, BRI-PORT, ABRI-PORT, BRI-SET, BRI-DAT, ASAI-ADJ
Maintenance/Test	TN771	M/T-BD, M/T-PKT
Packet Control	TN778	PKT-CTRL
Expansion Interface	TN570	EXP-INTF

Procedure 2

Procedure 2 removes and reinserts port circuit packs (those in the purple slots) one or several at a time. Use Procedure 2 for each port circuit pack in the port network until either (1) the problem is resolved or (2) there are no more circuit packs in the port network.

NOTE:
This procedure should also be used for the TN570 Expansion Interface circuit pack in a standard system. For a High or Critical Reliability system, refer to Procedure 3 for the Expansion Interface circuit pack. Also, refer to Procedure 3 for the TN768 or TN780 Tone-Clock circuit pack in a switch with a High or Critical Reliability system.

CAUTION:
The Expansion Interface circuit pack should be the last one checked in this procedure, since removing this circuit pack disconnects its EPN. The

Tone-Clock circuit pack should be the next-to-last one checked. In addition, the TN771 must be reseated after the Tone-Clock is reinstalled.

If the Packet Bus problem is present when the circuit pack is inserted, but is resolved when the circuit pack is removed, either the circuit pack or the backplane pins in that slot caused the problem. If the backplane pins are intact, replace the circuit pack.

NOTE:
In a multiple failure situation, the circuit pack could be one cause of the Packet Bus problem. However, there could also be other failures that are causing Packet Bus faults.

In Procedure 2, an option of working either with one circuit pack at a time or with multiple circuit packs simultaneously is available. In view of this, determine the level of service interruption to be allowed during this procedure. If causing a disruption to all users in the port network is deemed permissible, large groups of circuit packs should be worked with. This option allows faster job completion. **However, if large service disruptions are to be avoided, work with one circuit pack at a time**. This option is slower, but it disrupts only the users of a single circuit pack.

CAUTION:
If the TN771 Standalone mode does NOT indicate Packet Bus faults, perform Procedure 2 for ONLY the port (purple) slot Packet circuit packs listed in Table 9-1. Also, problems with the backplane pins need not be checked for. Determining if the problem is resolved by removing circuit packs is sufficient.

Here are the steps for Procedure 2:

1. Remove one or several circuit packs as appropriate, according to the considerations presented in the previous paragraphs. Any circuit pack(s) (whether Packet or non-Packet) that have been recently inserted should be checked first. It is likely that such a circuit pack caused a new problem. Keep in mind that Packet circuit packs should be checked before non-Packet circuit packs.

   If the decision is made to remove multiple circuit packs, consider working with an entire carrier at a time to ensure a good granularity.

2. Determine if the Packet Bus fault is still present.
3. If the Packet Bus fault is still present:
   - Determine if the backplane pins in the removed circuit pack's slot are bent. Use the output from the Maintenance/Test standalone mode and Figure 9-6 and Figure 9-7.

- If the backplane pins are bent, power down the carrier (refer to the "Removing Power" section in Chapter 5, "Routine Maintenance Procedures", straighten or replace the pins, reinsert the circuit pack, restore power (refer to the "Restoring Power" section in Chapter 5, "Routine Maintenance Procedures", and repeat Procedure 2, beginning with Step 2, for the same circuit pack.

WARNING:
If this is a High or Critical Reliability system, and if the slot is in the Active control carrier, perform an SPE interchange before changing the circuit pack. Follow the procedures presented in Chapter 8, "Reliability Systems: A Maintenance Aid".

- If the backplane pins are not bent, reinsert the circuit pack(s), and perform Procedure 2 for the next set of circuit packs.

4. If the Packet Bus fault is not present, do the following:
   - Reinsert a circuit pack. If multiple circuit packs have been removed, reinsert the circuit packs **one at a time**, and repeat the following substeps until all of the circuit packs have been reinserted.
   - Determine if the Packet Bus fault has returned.
   - If the Packet Bus fault has returned, the reinserted circuit pack is defective. Replace the circuit pack and then continue.
   - If the Packet Bus fault does not return when all of the circuit packs have been reinserted, the procedure is completed.

Continue with Procedure 3 if all the port circuit packs have been checked, but the Packet Bus fault is still not resolved.

Procedure 3

Procedure 3 removes and reinserts control carrier circuit packs one at a time. The Packet Control, Tone-Clock, and Expansion Interface circuit packs are the only processor complex circuit packs that communicate on the Packet Bus. In addition, the Memory 1 and EPN Maintenance Board circuit packs are connected to the Packet Bus in the backplane (while the Memory 2 circuit pack is not). Therefore, these are the only processor complex circuit packs that are likely to cause a Packet Bus problem in a stable system. As a result, Procedure 3 should be performed only on the Packet Control, Memory 1, and EPN Maintenance Board circuit packs in all systems, and on the Expansion Interface and Tone-Clock circuit packs in High and Critical Reliability systems.

CAUTION:
If the TN771 Standalone mode does NOT indicate Packet Bus faults, perform Procedure 3 for ONLY the Packet Control, Expansion Interface, and Tone-Clock circuit packs. Also, problems with the backplane pins need not

be checked for. Determining if the problem is resolved by removing circuit packs is sufficient.

In a system without High or Critical Reliability, do the following:

1. Power down the control carrier. Refer to the "Removing Power" section in Chapter 5, "Routine Maintenance Procedures".
2. Remove the suspect circuit pack.
3. As in Procedure 2, determine if the backplane pins in the removed circuit pack's slot are bent.
4. If the backplane pins are bent, do the following:
   a. Straighten or replace the pins
   b. Insert the same circuit pack
5. If the backplane pins are not bent, replace the circuit pack (reinsert the circuit pack if a replacement is not available).
6. Turn the power back on to reboot the system. Refer to the "Restoring Power" section in Chapter 5, "Routine Maintenance Procedures".
7. Determine if the Packet Bus fault is still present.
8. If the Packet Bus fault is still present, do the following:
   a. If the circuit pack was reinserted in Step 5, replace the circuit pack, and repeat Procedure 3.
   b. If the circuit pack was replaced in Step 5, repeat Procedure 3 for the next processor complex circuit pack.
9. If the Packet Bus fault does not recur, the procedure is completed.

If Procedure 3 fails to identify the cause of the problem, go to Procedure 4.

In a High or Critical Reliability System, do the following:

1. If the circuit pack to be replaced is in the SPE, perform an SPE interchange by entering the **reset system interchange** command. For an Expansion Interface circuit pack, enter the **set exp-link** command to switch to the standby expansion link. For a Tone-Clock circuit pack, enter the **set tone-clock** command to switch to the standby Tone-Clock circuit pack.
2. Remove the newly-inactive suspect circuit pack. For a circuit pack in the processor complex, use the procedures in Chapter 8, "Reliability Systems: A Maintenance Aid".
3. As in Procedure 2, determine if the backplane pins in the removed circuit pack's slot are bent.

4. If the pins are bent, do the following:
   a. Power down the carrier. Refer to the "Removing Power" section in Chapter 5, "Routine Maintenance Procedures".
   b. Straighten or replace the pins.
   c. Insert the same circuit pack.
   d. Restore power to the carrier. Refer to the "Restoring Power" section in Chapter 5, "Routine Maintenance Procedures".
5. If the backplane pins are not bent, insert or replace the circuit pack.
6. Determine if the Packet Bus fault is still present.
7. If the Packet Bus fault is still present, do the following:
   a. If the circuit pack was reinserted in Step 5, replace the circuit pack. Then repeat Procedure 3, starting at Step 2.
   b. If the circuit pack was replaced in Step 5, continue with Step 9.
8. If the Packet Bus fault does not recur, the procedure is completed.
9. If the suspect circuit pack has been tested in the other control carrier, go to Step 10. Otherwise, implement Step 1, then Steps 2 through 8.
10. Repeat the procedure in the previous step for the next suspect circuit pack.

If all processor complex circuit packs have been checked and the problem is not resolved, continue with Procedure 4.

Procedure 4

Procedure 4 tries to isolate the failure to a particular set of carriers. Only the circuit packs in those carriers are checked. Procedure 4 is used if the preceding procedures fail, because it can help locate multiple circuit pack failures as well as failures of the carrier hardware. The procedure is also used if there are open leads on the Packet Bus. (The faults detected by Procedures 1 through 3 cannot cause open leads.)

In Procedure 4, the TDM/LAN Cable Assemblies and TDM/LAN termination resistor packs are replaced. If this action does not resolve the Packet Bus fault, the carriers are reconfigured by moving the termination resistor packs in such a manner that certain carriers are disconnected from the bus. This is done by moving the termination resistors on the carrier backplanes. To terminate the Packet Bus at the end of a particular carrier, first unplug the cable that connects the carrier to the next carrier and then replace the cable with a termination resistor (see Figure 9-9). When the length of the Packet Bus is modified via this procedure, circuit packs that are essential to system operation (for example, Processor Complex, Tone-Clock) must still be connected to the new ‘‘shortened’’ Packet (and TDM) Bus. In addition, the Maintenance/Test circuit pack (in standalone mode) must be connected to the ‘‘shortened’’ bus.

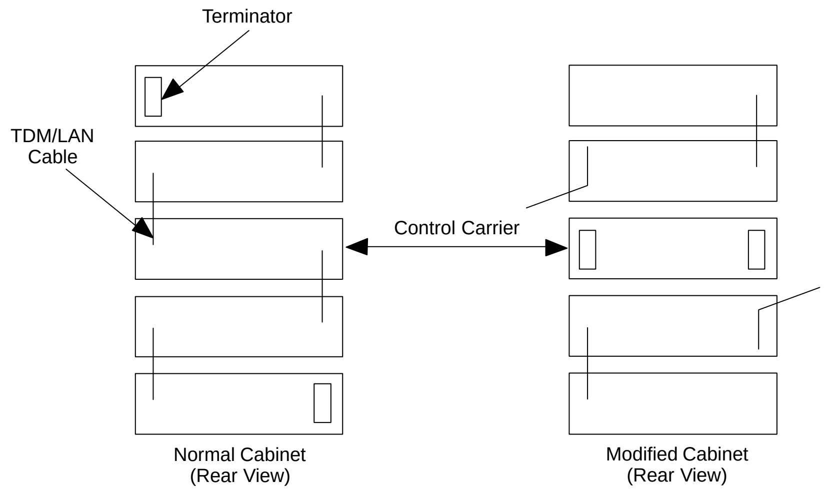

Figure 9-10. Carrier Rewiring Example

WARNING:
Power must be removed from the entire port network before any cables or terminators are removed. Failure to do so can cause damage to circuit packs and power supplies and can be hazardous to the technician. After cabling changes are made and verified, power must be restored to the port network. Use the TN771 Standalone mode to determine if the Packet Bus fault is resolved.

CAUTION:
Circuit packs in carriers that are not part of the shortened bus are not inserted. As a result, these circuit packs are not alarmed. Ignore these alarms for now. All alarms should be resolved when the cabinet is restored to its original configuration.

Procedure 4 is organized into two parts, as follows:

Part 1:

1. Power down the port network. Refer to the "Removing Power" section in Chapter 5, "Routine Maintenance Procedures".
2. Replace all of the TDM/LAN Cable Assemblies and both TDM/LAN Terminators.

3. Restore power to the port network. Refer to the "Restoring Power" section in Chapter 5, "Routine Maintenance Procedures".
4. Determine if the Packet Bus fault is still present.
5. If the Packet Bus fault is resolved, the procedure is completed. Otherwise, go to Part 2.

Part 2:

(Steps for a Processor Port Network):

1. Terminate the Packet Bus so that it extends only from the Active control carrier (that is, the carrier that contains the Active SPE) to the carrier that contains the Maintenance/Test circuit pack. To allow this procedure to isolate the failure to the smallest possible number of carriers, place the Maintenance/Test circuit pack into a carrier that contains a processor complex, if possible.
2. Determine if the Packet Bus fault is still present. If so, and if there are shorts on the Packet Bus, perform Procedure 2 and/or Procedure 3 for only the circuit packs in those carriers that are connected to the "shortened" Packet Bus. (Procedure 2 is performed for port circuit packs, and Procedure 3 is performed for processor complex circuit packs.)
3. If the Packet Bus fault is not present, extend the Packet Bus to another carrier, and repeat the procedure in the previous step. When a carrier that causes the fault to recur is added, and if there are shorts, perform Procedure 2 and/or Procedure 3 for only the circuit packs in that carrier.
4. If the Packet Bus fault recurs as the Packet Bus is extended, and if Procedures 2 and 3 (if performed) do not resolve the problem, the added carrier(s) that caused the problem to recur are defective and must be replaced.

(Steps for other Port Networks):

1. Terminate the Packet Bus so that it extends only from the carrier that contains the Active Expansion Interface to the nearest carrier that contains the Maintenance/Test circuit pack. Place the Maintenance/Test circuit pack into a carrier that contains an Expansion Interface circuit pack in order to allow the procedure to isolate the failure to the smallest possible number of carriers.
2. Determine if the Packet Bus fault is still present. If so, and if there are shorts on the Packet Bus, perform Procedure 2 and/or Procedure 3 for only the circuit packs in those carriers that are connected to the "shortened" Packet Bus.
3. If the Packet Bus fault is not present, extend the Packet Bus to another carrier, and repeat the procedure in the previous step. When a carrier that causes the fault to recur is added, and if there are shorts, perform Procedure 2 and/or Procedure 3 for only the circuit packs in that carrier.

4. If the Packet Bus fault recurs as the Packet Bus is extended, and if Procedures 2 and 3 (if performed) do not resolve the problem, the added carrier(s) that caused the problem to recur are defective and must be replaced.

If the Packet Bus problems are still not resolved, escalate the problem.

Maintenance Commands and Trouble-Clearing Aids

10

General

This chapter provides additional trouble-clearing information for resolving both system-alarmed and user-reported troubles. This chapter supplements the information found in Chapter 11, "Maintenance Object Repair Procedures". The information consists of using the maintenance commands as trouble-clearing aids. The maintenance commands are used to control, test, and obtain information associated with maintenance objects (MOs). The commands require the use of the administration terminal or remote Initialization and Administration System (INADS) interface (a valid login and password to perform maintenance are required).

In this chapter, the commands are first identified and organized into categories. Thereafter, each command is described individually.

Maintenance Commands

Maintenance commands entered at the administration terminal or by the INADS provide a means of demand testing, monitoring, or controlling maintenance objects in the system. The commands are classified as follows:

- Busyout/Release
- Cancel
- Change
- Clear
- Copy
- Disable
  — Disable Synchronization-Switch (see "Set Commands")
- Display
- Download
- Enable
  — Enable Synchronization-Switch (see "Set Commands")
- Get
- List
- Mark Port
- Monitor
- Recycle Carrier
- Refresh
- Release
- Reset
- Restore
- Resume
- Save
- Set
- Status
- Test (See "Test Command" section of this chapter for details.)
- Upgrade Software

In general, a maintenance object or other system entity can be acted upon by only one command at a time. This restriction applies to action commands such as:

- — busyout
- — change
- — clear
- — recycle
- — release
- — set
- — test
- — display
- — status
- — get
- — monitor

Error codes are provided in the test results for the **test**, **reset**, **busyout**, and **recycle** commands.

NOTE:
Any maintenance command keyword (action/object/qualifier) can be abbreviated as long as enough letters are present in the command word to distinguish that word from all other legal possibilities. For example, "r," "re," and "rep" are all legal abbreviations for "repeat" as used in the **test** commands.

Command Groups

This section identifies the command groups, and it list the commands within each group. If applicable, the appropriate error codes are also provided.

Busyout/Release Commands

The busyout/release commands are used to busyout and return to operation the following maintenance objects:

- Access Endpoint (access-endpoint)
- CDR Link (cdr-link)
- CMS Link (mis)
- Data Modules (data-module)
- Journal Printer (journal-printer)
- Links (link)
- Modem Pool (modem-pool)
- Packet Control (packet-control)
- PMS Link (pms-link)
- Port Circuit Packs (port)
- Port Circuit Packs (board)
- PRI Endpoint (pri-endpoint)
- SPE Standby (spe-standby)
- System Printer Link (sp-link)
- TDM Bus (tdm-bus)
- Tone-Clocks (tone-clock)
- Trunks/Trunk Groups (trunk)
- Voice Terminal Extensions (station)

Busyout Commands: Any of the above MOs that are administered can be busied out, provided they have been installed. If a circuit pack is not physically installed, and you try to busyout that circuit pack, the message "board not assigned" is displayed (except for the Packet Control circuit pack in which case "Packet Bus use not enabled (no Packet Control)" is displayed instead). The result of the **busyout** command is that the MO is placed in a maintenance busy state until it is released by the **release** command. This prevents call processing software from using the busied-out resource. In addition, a warning alarm is logged to indicate the busied-out status.

In a system with the duplication option, a busyout of the links (PI-LINK), Network Control Circuit Pack data modules (DATA-CHL), and the Packet Control

(PKT-CTRL) are preserved across an SPE interchange. When an SPE interchange occurs, and one of the MOs is busied out, the busyout command is transferred to the corresponding MO on the new active SPE while the MO on the former active SPE is released.

NOTE:
All busied-out MOs can be displayed by entering Error Type 18 in the Error Type field of the Hardware Errors Report Form.

Release Commands: These commands are used to release the MOs busied out by the **busyout** command. The results of a **release** command are displayed at the administration terminal or at the INADS. If the MO is not installed, the "board not assigned" message is displayed (except for the Packet Control circuit pack in which case "Packet Bus use not enabled (no Packet Control)" is displayed instead).

Otherwise, the results are the same as those for the **busyout** command described previously. The warning alarm generated by the **busyout** command is resolved.

Screen 10-1 [G1] and Screen 10-2 are examples of typical busyout command results.

```
                                                   Page 1

busyout port 2e0401

Port      Maintenance Name     Result     Error Code

2E0401      ANL-LINE             PASS
```

Screen 10-1. Busyout Command Results [G1]

busyout port 2e0401
                              COMMAND RESULTS

Port      Maintenance Name   Alt. Name   Result     Error Code

2E0401      ANL-LINE            1009       PASS
```

Screen 10-2. Busyout Command Results

The following information is contained in the results:

- **Port:** Maintenance object's physical location—port network number (1 for PPN or 2 or 3 for EPN), carrier, slot number, port number for ports, and channel number for data channels. If the port network number is not entered in the command, then the system assumes a 1 for the PPN.

  NOTE:
  All port numbers busied out are listed.

- **Maintenance Name:** Maintenance object's logical name.
- **Alt. Name:** The alternate means of identifying the maintenance object. This field contains the extension when the object is a station or data module, and it contains xx/yy when the object is a trunk, where xx is the trunk group number and yy is the member number. It contains P/xx when the object is a Private Co line, where xx is the Private Co line group number.
- **Result:** The results of the command for each port busied out—"PASS" or "FAIL," or "ABORT."
- **Error Code:** A system-generated number that tells why a **busyout** or **release** command failed. See Table 10-1.

Busyout/Release Error Codes

Table 10-1 contains common error codes that can be returned from any **busyout** or **release** command when a failure or an abort is returned.

Table 10-1. Busyout/Release Command Error Codes

Error Code	Test Result	Description/ Recommendation
0	ABORT	Internal system error. 1. Retry the command at one-minute intervals a maximum of five times. 2. If command still aborts, then escalate the problem.
1010	ABORT	Attempt was made to busyout an object that was already busied out.
1011	ABORT	Attempt was made to release an object that was not first busied out.
1026	ABORT	Cannot busyout this TDM Bus because control channel or system tones are present. If this is a High or Critical Reliability System, use the **set tdm PC** command to switch TDM Buses. Then this TDM Bus may be busied out.
2012 2500	ABORT	Internal system error.
2100	ABORT	System resources unavailable. 1. Retry the command at one-minute intervals a maximum of five times. 2. If command still aborts, then escalate the problem.

Continued on next page

Table 10-1. Busyout/Release Command Error Codes — *Continued*

Error Code	Test Result	Description/ Recommendation
62524 62525 62526	ABORT	System resources required to begin maintenance activity on this MO are unavailable. Maintenance is currently active on the maximum number of maintenance objects that the system can support. A typical reason for this condition is that the system contains a large number of stations and/or trunks that have been administered but that are not physically connected. However, the circuit packs on which they have been administered are physically present in the system. 1. Resolve as many alarms as possible on the station and trunk MOs or busyout these MOs to stop maintenance activity on them. 2. Rerun the test.
	NO BOARD	Circuit pack has been removed. Cannot busyout/release object.
	FAIL	Object could not be busied out or released.
	PASS	Object successfully busied out or released.
	EXTRA BD	Certain circuit packs have limitations on how many circuit packs can be in the system or port network such as the Maintenance Test Circuit Pack (TN771), the Tone Detector Circuit Pack (TN748B, TN748C or TN748D) and the Call Classifier (TN744). The Maintenance Test Circuit Pack allows only one circuit pack per port network. The Tone Detector and the Call Classifier allow only 10 circuit packs in each system. All additional circuit packs return EXTRA-BD and should be removed.

CMS LINK (mis)

Command: **busyout** (or **release**) **mis**

DATA MODULE (data-module)

Command: **busyout** (or **release**) **data-module** "qualifier"

Qualifier:

Data Module extension number (for example, 3277)

JOURNAL PRINTER (journal-printer)

Command: **busyout** (or **release**) **journal-printer** "qualifier"

Qualifier: **pms-log** or **wake-up log**

LINK (link)

Command: **busyout** (or **release**) **link** "qualifier"

Qualifier: Link number (**1, 2, 3, 4, 5, 6, 7,** or **8**). Links 1 through 4 reside on Processor Interface circuit pack "1a1" or "1b1" and links 5 through 8 reside on Processor Interface circuit pack "1a2" or "1b2."

MODEM POOL (modem-pool)

Command: **busyout** (or **release**) **modem-pool** "qualifier"

Qualifier: Modem pool group number (**1, 2, 3, 4,** or **5**) followed by a slash (/) and the member number (**1** through **16**), for example 2/4. If the modem pool group number only is entered, all members in the group are busied out.

PACKET CONTROL (packet-control)

Command: **busyout** (or **release**) **packet-control** "qualifier"

Qualifier: In a standard system, no qualifier is required. In a system with High or Critical Reliability, the carrier that contains the Packet Control circuit pack to be busied out or released must be specified as "a" or "b."

NOTE:
Only the Packet Control circuit pack in the Active carrier may be busied out or released; if the Standby carrier is specified, an error message is displayed.

PMS LINK (pms-link)

Command: **busyout** (or **release**) **pms-link**

PORT (port)

Command: **busyout** (or **release**) **port** "qualifier"

Qualifier: Location of port on port circuit pack (for example, 2b0401)

PORT CIRCUIT PACK (board)

Command: **busyout** (or **release**) **board** "qualifier"

Qualifier: Circuit pack location for port circuit pack (for example, 2b04)

CDR-LINK (cdr-link)

Command: **busyout** (or **release**) **cdr-link** "qualifier"

Qualifier: **primary** or **secondary**

SYSTEM PRINTER LINK (sp-link)

Command: **busyout** (or **release**) **sp-link**

TDM BUS (tdm-bus)

Command: **busyout** (or **release**) **tdm** "qualifier"

Qualifier: The port network number (**1** for PPN or **2** or **3** for EPN) and the TDM Bus number **a** or **b** (for example, 1a).

TONE-CLOCK (tone-clock)

Command: **busyout** (or **release**) **tone-clock** "qualifier"

Qualifier: The port network number (**1** for PPN or **2** or **3** for EPN) and the carrier that contains the Tone-Clock circuit pack to be busied out or released (identified as **a** or **b**), for example 1a. The "b" carriers only contain Tone-Clock circuit packs when the system is equipped with High or Critical Reliability.

TRUNK/TRUNK GROUP (trunk)

Command: **busyout** (or **release**) **trunk** "qualifier"

Qualifier: Trunk group number followed by a slash (/) and the member number (for example, 40/3). If only the trunk group number is entered, all trunks in the group are busied out.

VOICE TERMINAL EXTENSION (station)

Command: **busyout** (or **release**) **station** "qualifier"

Qualifier: Terminal extension number (for example, 3277)

Cancel Commands

There is only one cancel command (hardware-group).

Change Commands

The **change** command is used to change the following:

- Circuit Packs (circuit-packs)
- Maintenance-Related System Parameters (system-parameters maintenance).
- Synchronization (synchronization)

NOTE:
This command is described in the "Maintenance-Related System Parameters Form" section of Chapter 5, "Routine Maintenance Procedures"

Clear Commands

The **clear** command is used to clear the following:

- Audits (audits)
- Errors (errors)
- Interface (interface)
- ISDN test call (isdn-testcall)
- Link (link)
- MST (mst)
- Packet Bus (pkt)
- Port (port)

Copy Update-File Command

In a High or Critical Reliability System only, the **copy update-file** command provides a mechanism for copying an update file from the Active SPE's tape to the Standby SPE's tape provided that the file on the Active SPE's tape is newer than the one on the Standby SPE's tape.

NOTE:
This command is only available to INADS.

Disable Commands

The **disable** commands are used to suspend the activity of the following:

- Administered Connection (administered-connection)
- MST (mst)

- Synchronization Switch (synchronization-switch)
- Test Number (test-number)

NOTE:
System Technician-demanded testing is not permitted. A test that has been disabled is displayed as "disabled" in the test results.

The **disable MO** and **disable test** commands listed above is used by Lucent Technologies.

Tier 3 and Tier 4 maintenance organizations to suspend system maintenance on one or all of the MOs or on the tests in the system. While maintenance is suspended on an MO, periodic and scheduled maintenance are not performed and in-line error reports are ignored. System Technician-demanded testing is permitted, but all such test results are ignored. When a test has been disabled, an attempt to execute the disabled test produces a "disabled" test result. The **display disabled-tests** command can be used to determine which (if any) tests have been disabled.

The **disable** command is not a true "trouble-clearing" aid, but rather is designed to troubleshoot a suspected problem with system maintenance. If it is believed that system maintenance is causing a problem, then the **disable** command can be used by the appropriate level of technical maintenance support to turn off maintenance on a particular MO or to prevent the execution of a particular test.

For detailed information on how and when to use the **disable** command, contact the next higher level maintenance support.

The second **disable** command listed above is the **disable synchronization-switch** command. This command is used to suspend the ability of Synchronization Maintenance to switch between synchronization references.

Display Commands

The **display** commands are used to display the following items:

- Alarm Log (alarms)
- Communication Interface (communication-interface)
- Current Time (time)
- Disabled Tests (disabled-tests)
- Error Log (errors)
- Initialization Causes (initcauses)
- Maintenance-Related System Parameters (system-parameters maintenance)

- Port Information (port)
- Synchronization (synchronization)
- Vector Events (events)

Download Command

There is only one download command (update-file).

Enable Commands

The **enable** commands are used to restart the previously suspended maintenance activity or operation of the following:

- Administered Connection (administered-connection)
- MST (mst)
- Synchronization Switch (synchronization-switch)
- Test Number (test-number)

The **enable** command is used to restart system maintenance on one or all of the maintenance objects in the system that have been disabled via the **disable** command. The **enable** command is also used to allow specific maintenance tests that were previously disabled to run again. See the "Disable Commands" description in this chapter for more details.

The **enable synchronization-switch** command is used to restore the ability of Synchronization Maintenance to switch between synchronization references.

Get Command

There is only one get command (vector).

List Commands

The **list** commands are used to list data for the following:

- Configuration Reports (configuration)
- Disabled MOs (disabled-MOs)
- History (history)
- ISDN-PRI Test Calls (isdn-testcall)
- Marked Ports (marked-ports)
- Measurements (measurements)

- MST (mst)
- Test Calls (testcalls)

  NOTE:
  This command should only be used with Tier 3 and Tier 4 assistance.

Mark Command

There is only one mark command (port).

Monitor Command

The monitor commands provide an on-line System Status Report that is continuously updated. The status report is displayed until the command is canceled. If the command is canceled, the user is logged off automatically. This feature prevents unauthorized use of the administration terminal when it is left unguarded. This command is not available to the "inads" login. The monitor commands are used to monitor the following items:

- BCMS (bcms)
- Health (health)
- Security Violations (security-violations)
- System (system)
- Traffic (traffic)
- Trunk (trunk group member)

Recycle Carrier Command

This command (recycle carrier) recycles the power on one specific carrier. When a power unit is replaced in a carrier, this command must be entered to recycle the power on that carrier.

Refresh Command

This command (spe-standby) allows the system technician to return the Standby processing element that is in the Maintenance Mode to the Standby Mode. The Standby processing element’s memory is refreshed from the contents of the Active processing element’s memory.

Release Commands

The **release** commands are used to release the following items:

- Access Endpoint (access-endpoint)
- Release Board (board)
- CDR Link (cdr-link)
- Data Module (data-module)
- Fiber Link (fiber-link) (unsupported for the D92I)
- Journal Printer (journal-printer)
- Link (link)
- Mis (mis)
- Modem Pool (modem-pool)
- Packet Control (packet-control)
- PMS Link (pms-link)
- Port (port)
- PRI Endpoint (pri-endpoint)
- SP Link (sp-link)
- SPE Standby (spe-standby)
- Station (station)
- TDM (tdm)
- Tone Clock (tone-clock)
- Trunk (trunk)

Reset Commands

The reset command is used to reset the following:

- Port Circuit Packs (board)
- Processor Interface Circuit Pack (interface)
- EPN Maintenance Circuit Pack (maintenance)
- Switch Processing Element (spe-standby)
- Switch Processing Element System (system)

Reset Error Codes

Table 10-2 indicates the common error codes that can be returned from any reset command when a failure or an abort is returned.

Table 10-2. Reset Command Error Codes

Error Code	Command Result	Description/ Recommendation
	ABORT	System resources are unavailable. 1. Retry the command at one-minute intervals a maximum of five times.
1005	ABORT	Applies only to DS1 interface circuit packs. The DS1 interface circuit pack to be reset is currently supplying the on-line synchronization reference. 1. To reset this circuit pack, the **set sync** command must be used to designate a new DS1 interface circuit pack as the on-line reference.
1015	ABORT	All objects on the circuit pack are not in the out-of-service state. 1. Use the **busyout board** command to place all objects on the circuit pack in the out-of-service state. 2. Then repeat the **reset** command.
1030	ABORT	This test, which is being requested on a circuit pack that is a part of the Standby SPE, is not allowed.
1	FAIL	Circuit pack was not successfully halted. Replace the circuit pack.
2	FAIL	Circuit pack was not successfully restarted after being halted. Replace the circuit pack.
	PASS	Circuit pack was successfully reset and is running. 1. The **test board PCSS** command should be run to verify that the circuit pack is functioning properly.

Continued on next page

Table 10-2. Reset Command Error Codes — *Continued*

Error Code	Command Result	Description/ Recommendation
	EXTRA BD	This result can appear for the Maintenance/Test, Call Classifier, Tone Detector, Announcement and Speech Synthesis circuit packs. Each of these circuit packs has restrictions on how many can be in the system or a port network. The restrictions are as follows: a. Maintenance/Test circuit pack — 1 per port network b. Tone Detector circuit pack — up to 10 per system c. Call Classifier circuit pack — up to 10 per system d. Speech Synthesis circuit pack — up to 6 per system e. Announcement circuit pack — 1 per port network Remove this circuit pack.
62524 62525 62526	ABORT	System resources required to begin maintenance activity on this MO are unavailable. Maintenance is currently active on the maximum number of maintenance objects that the system can support. A typical reason for this condition is that the system contains a large number of stations and/or trunks that have been administered but that are not physically connected. However, the circuit packs on which they have been administered are physically present in the system. 1. Resolve as many alarms as possible on the station and trunk MOs or busyout these MOs to stop maintenance activity on them. 2. Rerun the test.

Restore Command

There is only one restore command (announcements).

Resume Command

There is only one resume command (hardware-group).

Save Commands

The save command can save the following:

- Announcements (announcements)
- Translation (announcements)

Set Commands

The set command is used to activate the following items:

- Expansion-Link (exp-link)
- ISDN-PRI Signaling-Group (signaling-group)
- Options (options)
- Synchronization (synchronization)
- TDM-Bus (tdm)
- Time (time)
- Tone-Clock (tone-clock)
- Vector (vector)

Status Commands

The status commands are used to check the operational status of:

- Access Endpoint (access-endpoint)
- Administered Connection (administered-connection)
- Administered Temporary Signaling Connection (tsc-administered)
- Attendant Console (attendant)
- Audits (audits)
- Card Memory (card-mem) [386 systems]
- CDR Link (cdr-link)
- Data Module (data-module)

- Hardware Group (hardware-group)
- Health (health)
- ISDN-BRI Port (bri-port)
- ISDN-PRI Signaling Group (signaling-group)
- ISDN Test Call (isdn-testcall)
- Interface (interface)
- Journal Link (journal-link)
- Link (link)
- Logins (logins)
- MST (mst)
- Packet Control (packet-control)
- Processor Channel (processor-channel)
- Station (station)
- Synchronization (synchronization)
- System (system)
- System Printer Link (sp-link)
- Terminal Translation Initialization (tti)
- Trunk (trunk)

The status commands provide internal software state information for diagnosis. Also, if the specified maintenance object (facility) is busy, the commands can help locate other facilities to which the facility is communicating. Thus, the time spent performing maintenance can be reduced.

Test Command

Command: **testobject location** "qualifiers"

testobject location "qualifiers"

The **test** command is used to invoke specific hardware diagnostic tests on a particular MO.

The **test** command can be used on the following objects:

- Access Endpoint (access-endpoint)
- Alarms (alarms)
- Analog Test Call (analog-testcall)
- Board (board)

- Call Detail Recording Link (cdr-link)
- Customer Alarm (customer-alarm)
- Data Module (data-module)
- Duplication Interface (duplication-interface)
- Environment (environment)
- Hardware Group (hardware-group)
- INADS Link (inads-link)
- Interface (interface)
- ISDN Test Call (isdn-testcall)
- Journal Printer (journal-printer)
- LED (led)
- Link (link)
- Maintenance (maintenance)
- Memory Card (card-mem)
- Modem Pool (modem-pool)
- Network Control (network-control)
- Packet Control (packet-control)
- Packet Bus (pkt)
- Property Management System Line (pms-link)
- Port Circuit (port)
- PRI Endpoint (pri-endpoint)
- Processor Circuit Pack (processor)
- Shadow Link (shadow-link)
- Signaling Group (signaling-group)
- Standby Switching Processing Element (spe-standby)
- Station (station)
- System Printer Link (sp-link)
- Synchronization (synchronization)
- Tape (tape)
- TDM Bus (tdm)
- Temporary Signaling Connection (tsc-administered)
- Trunk Group (trunk)
- Tone Clock Board (tone-clock)

The various segments of the command line are defined as follows:

- **object:** a specific maintenance object (for example, circuit pack, port, trunk).
- **location:** the physical address of the MO under test. Depending on the MO, one or more of the following must be supplied: P for port network number (1 for PPN or 2 or 3 for EPN); C for carrier designation.

  (A, B, C, D, or E); SS for address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ...etc.); and pp for the 2-digit port number.
- **qualifiers:**
  - — **sh** for short test sequence
  - — **l** for long test sequence
  - — **r** for repeat number
  - — **sch** for scheduled report
  - — **clear** for "test [to] clear" (See "Test Clear Option" for a description.)

NOTE:
Use of the **clear** option with the **test** command is recommended to retire alarms of the "leaky bucket" type (that is, with error counters that cannot be decremented via system technician-demanded tests). Refer to the "Test Command" description in this chapter.

WARNING:
If a maintenance test has been disabled, it is not run when the test command is issued. Refer to the "Disable Commands" and "Enable Commands" sections in this chapter.

A typical command line entry to test the Maintenance circuit pack (which is identified as MAINT in the Hardware Error and Alarm Logs) is as follows:

test maint sh r 3

This tells the maintenance software to test the MAINT MO by invoking the short sequence of tests and to repeat the test three times.

The test commands cause tests to be run on the MOs. Any tests that are considered destructive (that is, tests that may affect service and/or cause loss or corruption of data) are clearly labeled as such in the MO sections in this chapter. The short tests are those that the maintenance software automatically runs each hour and are not service-affecting. The long tests are basically those tests that the maintenance software automatically runs once every 24 hours and are more destructive than the short tests. When a long test is specified, the short tests are run also.

NOTE:
If you do not specify either the long or short test sequence, the system runs the short test sequence (which is the default).

The tests can be repeated as required by inserting **r** at the end of the command line and entering the number of times that the test is to be run.

NOTE:
The identifier "r" (repeat) must be entered before the number (of times to repeat) in order for the field to be recognized.

Some of the tests can be disabled by administering forms on the administration terminal.

All test results are displayed at the administration terminal or at the INADS Center. Screen 10-3 [G1] and Screen 10-4 are examples of the test results for a port circuit when the clear option is not used.

```
  test port 2B1905 long

                            TEST RESULTS

 Port     Maintenance Name   Test No.   Result   Error Code
 2B1905    DIG-LINE           9          ABORT    62524
 2B1905    DIG-LINE           11         PASS
 2B1905    DIG-LINE           13         PASS
 2B1905    DIG-LINE           16         PASS
 2B1905    DIG-LINE           17         PASS
```

Screen 10-3. Demand Test Results [G1]

```
  test port 2B1905 long

                              TEST RESULTS

 Port     Maintenance Name   Alt. Name  Test No.   Result   Error Code
 2B1905    DIG-LINE          1010        9         PASS
 2B1905    DIG-LINE          1010        11        PASS
 2B1905    DIG-LINE          1010        13        PASS
 2B1905    DIG-LINE          1010        16        PASS
 2B1905    DIG-LINE          1010        17        PASS
```

Screen 10-4. Demand Test Results

The following information is contained in the test results:

- **Port:** Maintenance object's physical location—port network number (1 for PPN or 2 or 3 for EPN), carrier, slot number, port number. If the port network number is not entered in the command, then the system assumes a 1 for the PPN.

  NOTE:
  This information does not apply to fixed-position circuit packs.

- **Maintenance Name:** Maintenance object's logical name.
- **Alt. name:** The alternate means of identifying the maintenance object. This field contains the extension when the object is a station or data module, and it contains xx/yy when the object is a trunk, where xx is the trunk group number and yy is the member number. It contains P/xx when the object is a Private Co line, where xx is the Private Co line group number.
- **Test No.:** A system identifying number for the individual tests. Descriptions of the tests according to "Test No." are provided for each MO.
- **Result:** The results of the individual test—"PASS," "FAIL," "ABORT," "NO BOARD," "EXTRA BD," "DISABLED".

  Abort codes 62524, 62525, and 62526 also can occur for all test commands. For details, see the "Busyout/Release Error Codes" in this chapter.

  NOTE:
  All tests for a port on an intelligent port circuit pack abort if that port is busy.

- **Error Code:** A system-generated number that tells why the individual test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

Test Command Error Codes

Table 10-3 indicates the common error codes that can be returned from any test command when a failure or an abort is returned.

Table 10-3. Test Command Error Codes

Error Code	Test Result	Description/ Recommendation
0	ABORT	Internal system error. 1. Retry the command at one-minute intervals a maximum of five times. 2. If command still aborts, then escalate the problem.
2012 2500	ABORT	Internal system error.
2100	ABORT	System resources unavailable. 1. Retry the command at one-minute intervals a maximum of five times. 2. If command still aborts, then escalate the problem.
62524 62525 62526	ABORT	System resources required to begin maintenance activity on this MO are unavailable. Maintenance is currently active on the maximum number of maintenance objects that the system can support. A typical reason for this condition is that the system contains a large number of stations and/or trunks that have been administered but that are not physically connected. However, the circuit packs on which they have been administered are physically present in the system. 1. Resolve as many alarms as possible on the station and trunk MOs or busyout these MOs to stop maintenance activity on them. 2. Rerun the test.
	NO BOARD	Circuit pack has been removed. Cannot test object.
	EXTRA BD	Certain circuit packs have limitations on how many circuit packs can be in the system or port network such as the Maintenance Test Circuit Pack (TN771B or TN771C), the Tone Detector Circuit Pack (TN748B, TN748C or TN748D) and the Call Classifier (TN744). The Maintenance Test Circuit Pack allows only one circuit pack per port network. The Tone Detector and the Call Classifier allow only 10 circuit packs in each system. All additional circuit packs return EXTRA-BD and should be removed.

Test LED Command

NOTE:
Since most **test** commands exercise a specific MO or group of related MOs, their appropriate use is outlined in the various MO sections. However, since the **test led** command does not fall under any one MO described in Chapter 11, "Maintenance Object Repair Procedures", it is described as follows:

The **test led** command enables the technician to check LEDs on a specific network or on the entire system.

Upgrade Software Command

This command (upgrade software) causes the Standby processing element to boot with the new software from tape, load in translations, initiate an interchange of the processing elements, and enter the active mode via a Cold 2 restart (reset system 2).

busyout access-endpoint

This command will busyout a specified access endpoint.

SYNOPSIS

busyout access-endpoint extension

PERMISSIONS

The following default logins may execute this command: system technician, inads, init, nms.

EXAMPLES

busyout access-endpoint 25012
busyout access-endpoint 77868

DESCRIPTION

The busyout access-endpoint command will put all the ports associated with the specified access endpoint in a maintenance busy (system technician busy) state. There will be no periodic or scheduled tests performed on the busied out access endpoint ports until they are released. When the access endpoint ports are maintenance busy (system technician busy) then the access endpoint is removed from active service on the switch (i.e., no call processing activity may include the busied objects). Warning alarms are generated on each busied out port in the access endpoint. The release access-endpoint command will return all the ports associated with the specified access endpoint to operation.

Defaults

No defaults.

Parameters

Extension	An extension number associated with the desired access endpoint. The number of digits in an extension is determined by the dial-plan.

Help Messages

If the user presses HELP after entering "busyout access-endpoint," the following message is displayed:

```
Enter assigned extension
```

Error Messages

If the format for the extension is incorrect, the following error message will be displayed:

```
Extension invalid
```

If the EPN on which the access endpoint resides is not accessible, the following message will be displayed:

```
EPN is not available
```

If the extension is not administered, the following message will be displayed:

```
Extension not assigned
```

If the object associated with the specified extension is not an access endpoint, the following message will be displayed:

```
Extension assigned to object other than access-endpoint
```

If the board that contains the access endpoint is not inserted in the system, the following message will be displayed:

```
Board not inserted
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
’login id’:’command’ has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out.
Maintenance Name	The type of maintenance object that is being busied out. For wideband access endpoint the maintenance name for each port is "WAE-PORT." For single port access endpoint the maintenance name is 'TIE-DS1."
Alt. Name	The alternate way of identifying the maintenance object. This field contains the extension number of the access endpoint.
Result	An indicator as to whether the object is successfully busied out. The possible values are: PASS, FAIL and ABORT.
Error Code	A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes can be in the "Busyout/Release Error Codes" section of this chapter.

For the following output example, the command "busyout access-endpoint 22502" was entered. Assume that the access endpoint ports for extension 22502 are in cabinet 1, carrier C, slot 11, circuit 1 to 6.

```
busyout access-endpoint 22502                       SPE A

                           COMMAND RESULTS

  Port    Maintenance Name  Alt. Name   Result       Error Code
  01C1101   WAE-PORT        22502       PASS
  01C1102   WAE-PORT        22502       PASS
  01C1103   WAE-PORT        22502       PASS
  01C1104   WAE-PORT        22502       PASS
  01C1105   WAE-PORT        22502       PASS
  01C1106   WAE-PORT        22502       PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

If there is an active call on the specified access endpoint, the busyout command will cause the call to drop. This command is destructive.

busyout board

This command will busyout each maintenance object on the specified board.

SYNOPSIS

busyout board location

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

busyout board 01c11
busyout board 02c15

DESCRIPTION

The busyout board command will put every administered maintenance object on the circuit pack at the specified location in a maintenance busy state. There will be no periodic or scheduled tests performed on the busied out objects until they are released. The ports on the board may not be used for call processing (i.e., terminals on the administered ports will not receive dial-tone, etc.). Warning alarms are generated (error type 18) on each maintenance object busied out, so that INADS can access the state of the objects. The release board command will return every administered maintenance object on the circuit pack at the specified location to operation.

WARNING:
This command is service disrupting and may cause extraneous alarms.

Defaults

No defaults.

Parameters

location	A "location" represents the physical position of the board to be busied out and is entered as "UUcSS" where "UU" represents the cabinet number (1-3), "c" represents the carrier, and "SS" represents the slot position. A "location" represents the physical position of the port to be marked and is entered as "PCSSpp" where P is the port network number (1 for PPN, 2 for EPN, and 3 for the second EPN); C is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ...etc.), and "pp" represents the circuit (port). A single digit cabinet (1 - 3) may be entered with or without a leading zero (0).

Help Messages

If the system technician presses HELP after entering "busyout board," the following message will be displayed:

```
Enter 5 character board number
```

Error Messages

If the format of the board location is incorrect, the following error message will be displayed:

```
Port/Board invalid
```

If the EPN on which the board resides is not available, the following message will be displayed:

```
EPN is not available
```

If a board is not inserted in the specified location, the following message will be displayed:

```
Board not assigned
```

If the specified board does not have any maintenance objects associated with it, the following message will be displayed:

```
No MO in this board
```

If the specified board is part of the DCS link, the board cannot be busied out unless the link itself is busied out first. If the DCS link is not busied out, the following message will be displayed:

```
Must first busyout SCI link
```

If the specified board is an EI board and it is part of the active link, the following message will be displayed:

```
Illegal Command for active object; use 'set' to switch to standby
```

If a busyout is attempted on an invalid board in the service slot, the following message is displayed:

```
Board invalid
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out.
Maintenance Name	The type of maintenance object that is being busied out.
Alt. Name	The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number.
Result	An indicator as to whether the object was successfully busied out. The result of the busyout -"PASS," "ABORT," "FAIL."
Error Code	A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes can be in the "Busyout/Release Error Codes" section of this Chapter.

For the following output example, assume that the board in cabinet 1, carrier c, slot 7 is an analog board with three ports administered. The command that was entered is "busyout board 1c07."

```
busyout board 01C07                            SPE A

                            COMMAND RESULTS

  Port    Maintenance Name  Alt. Name   Result       Error Code
  01C07     ANL-BD                      PASS
  01C0702   ANL-LINE                    PASS
  01C0701   ANL-LINE         51001      PASS
  01C0703   ANL-LINE                    PASS

Command successfully completed
```

FEATURE INTERACTIONS

None.

busyout cdr-link

This command will busyout a maintenance object associated with the specified call detail recording (cdr)-link.

SYNOPSIS

busyout cdr-link link-id

PERMISSIONS

The following default logins may execute this command: system technician, inads, init, nms.

EXAMPLES

busyout cdr-link primary
busyout cdr-link secondary

DESCRIPTION

The busyout cdr-link command will put the maintenance object associated with a specified call detail recording (cdr)-link in a maintenance busy state. There will be no periodic or scheduled tests performed on the busied out maintenance object until it is released. When the object is maintenance busy then the object is removed from active service on the switch (i.e., no call processing activity may include the busied out object) and the link will be dropped. Warning alarms are generated (error type 18) on each maintenance object busied out, so that INADS can access the state of the objects. The release cdr-link command will return the object to operation.

A link is made up of several components. It involves a far end data module, a simulated data channel on a PKTINT board, a manager that initiates and maintains the link, and a controller/protocol that services the link. A controller/protocol is usually a transient process that exists for as long as the link is up. A link is considered up if a physical connection is established. A link can be considered to be up while no useful work can be performed over it, in this case the link is insane and should be torn down. These links provide asynchronous data connections from the switch to peripherals.

For information on what a CDR link is and does, see the second paragraph in the DESCRIPTION section of the "status cdr-link" manual pages.

Defaults

Primary.

Parameters

link-id	The link identifier is either "primary" or "secondary."

Help Messages

If the system technician presses HELP after entering "busyout cdr-link," the following message will be displayed:

```
primary     secondary
```

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out. With this maintenance object a port address of 1 represents the primary link, while a 2 port address is associated with the secondary link.
Maintenance Name	The type of maintenance object that is being busied out.
Alt. Name	The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number.
Result	An indicator as to whether the object was successfully busied out.
Error Code	A numerical description of why the command failed.

For the following output example, assume that the command that was entered is "busyout cdr-link primary."

```
busyout cdr-link primary                                   SPE A
                            COMMAND RESULTS

  Port    Maintenance Name  Alt. Name   Result       Error Code
  1        CDR-LNK                      PASS

Command successfully completed
```

FEATURE INTERACTIONS

None.

busyout data-module

This command will busyout a system technician specified data module or data channel.

SYNOPSIS

busyout data-module extension

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, init, nms.

EXAMPLES

busyout data-module 31300

DESCRIPTION

The busyout data module command will put the specified data module in a maintenance busy state, even those data modules that are not installed. There will be no periodic or scheduled tests performed on the busied out data module or data channel until it is released. Also no call processing may be executed on the data modules or over the data channels. Warning alarms are generated (error type 18) on each maintenance object busied out, so that INADS can access the state of the objects. The release data module command will return the specified data module (or data channel) to operation.

On a system with the duplication option, a busyout of a Network Control Data Channel, DATA-CHL, or a Processor Interface Port Data Channels, PI-PT, will be preserved across SPE interchanges. The data channel extension must be released before the data channel can be brought back into service.

Defaults

No defaults.

Parameters

extension	An extension number associated with the desired data module or data channel. The number of digits in an extension is determined by a dial-plan.

Help Messages

If the system technician presses HELP after entering "busyout data-module," the following message will be displayed:

```
Enter assigned extension
```

Error Messages

If the length or format of the extension is incorrect, the following error message will be displayed:

```
Extension invalid
```

If the specified extension is not administered, then the following message will be displayed:

```
Extension not assigned
```

If the specified extension is not a data module or a data channel, then the following message will be displayed:

```
Extension exists but assigned to a different object
```

If the EPN that contains the data module port is not available, the following message will be displayed:

```
EPN is not available
```

If the board containing the data module port is part of the SCI link, the following message will be displayed:

```
Cannot busyout/release part of SCI link
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out, or the number of the data channel.
Maintenance Name	The type of maintenance object that is being busied out.
Alt. Name	The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number.
Result	An indicator as to whether the object was successfully busied out.
Error Code	A numerical description of why the command failed.

For the following output example, assume that the command that was entered is "busyout data-module 300."

```
busyout data-module 300                          SPE A

                            COMMAND RESULTS

  Port    Maintenance Name  Alt. Name   Result       Error Code
  01C1103   DIG-LINE         300         PASS

Command successfully completed
```

SYSTEM 85 R3 AND SYSTEM 75 R1 RELEASE DIFFERENCES

In System 75 R1 a data module that resides on a board that is part of the DCS link cannot be busied unless the link is busied out first.

FEATURE INTERACTIONS

None.

busyout journal-printer

This command will busyout a maintenance object associated with the system technician specified pms-log or wakeup-log.

SYNOPSIS

busyout journal-printer [pms-log | wakeup-log]

PERMISSIONS

The following default logins may execute this command: system technician, inads, init, nms.

EXAMPLES

busyout journal-printer pms-log
busyout journal-printer wakeup-log

DESCRIPTION

The busyout journal-printer command will put the maintenance object associated with a specified pms-log or wakeup-log link in a maintenance busy state. There will be no periodic or scheduled tests performed on the busied out maintenance object until it is released. Also, no activity will occur over the links (i.e. no data will be transferred to the printer) and the link will be dropped. Warning alarms are generated (error type 18) on each maintenance object busied out, so that INADS can access the state of the objects. The release journal-printer command will return the object to operation.

A link is comprised of several components. It involves a far end data module, a simulated data channel on a PKTINT board, a manager that initiates and maintains the link, and a controller/protocol that services the link. A controller/protocol is usually a transient process that exists for as long as the link is up. A link is considered up if a physical connection is established. A link can be considered to be up while no useful work can be performed over it, in this case the link is insane and should be torn down. These links provide asynchronous data connections from the switch to peripherals.

For general information on journal printer links, see the second paragraph in the DESCRIPTION section of the "busyout pms-link" manual pages.

For information on what a journal printer is and does, see the second paragraph in the DESCRIPTION section of the "status journal-link" manual pages.

Defaults

None.

Parameters

pms-log	This will busyout the link to the pms printer. In the output the port name for the pms link is 1.
wakeup-log	This will busyout the link to the wakeup logging facility. In the output the port name for this object is 0.

Help Messages

If the system technician presses HELP after entering "busyout journal-printer," the following object command word choices will be displayed:

```
pms-log          wakeup-log
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

Error Message

```
Link not administered not enabled
```

OUTPUT

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out. In this case, the physical object port address will be a 0 for wakeup log and a 1 for the pms log.
Maintenance Name	The type of maintenance object that is being busied out.
Alt. Name	Not applicable.
Result	An indicator as to whether the object was successfully busied out.
Error Code	A numerical description of why the command failed.

For the following output example, assume that the command that was entered is "busyout journal-printer wakeup-log."

```
busyout journal-printer wakeup-log                      SPE A

                            COMMAND RESULTS

  Port    Maintenance Name  Alt. Name   Result       Error Code
  0       JRNL-LINK                     PASS

Command successfully completed
```

FEATURE INTERACTIONS

The maintenance of a particular component on a link will sometimes interfere with the maintenance of the link itself. Maintenance can put a link component in a busy state causing link set-up to fail. Frequent attempts at re-setup of a link may delay the recover of a faulty component, due to the maintenance test of a component only taking place when the component is idle. Therefore, the technician needs to be able to disable the attempted re-setup of a link. The busyout command is used to do this, and will not cause the link to be torn down. If the link is already down, the busyout command will stop periodic re-setup trys on the link.

busyout link

This command will busyout the system technician specified link.

SYNOPSIS

busyout link link-id

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

busyout link 1

DESCRIPTION

The busyout link command will put the maintenance objects associated with a specified link in a maintenance busy state. There will be no periodic or scheduled tests performed on the busied out maintenance objects until they are released. Also the link will be marked out of service and inaccessible to call processing for use. Warning alarms are generated (error type 18) on each maintenance object busied out, so that INADS can access the state of the objects. The release link command will return the objects to operation.

Defaults

None.

Parameters

link-id	The link-id is a number associated with each link between 1-8. Link 1 through 4 reside on Processor Interface circuit pack "1a1" or "1b1" and 5 through 8 reside on Processor Interface circuit pack "1a2" or "1b2."

Help Messages

If the system technician presses HELP after entering "busyout link," the following message will be displayed:

```
Enter 1 character link number
```

Error Messages

If the link identifier is not valid, the following error message is displayed:

```
Link out of range, please press HELP
```

If the link is not administered, the following error message is displayed:

```
Link not administered or not enabled
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message is displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out. With this command the Port address represents the link-id.
Maintenance Name	The type of maintenance object that is being busied out.
Alt. Name	Not applicable.
Result	"PASS," "ABORT," "FAIL."
Error Code	A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes can be found in the "Busyout/Release Error Codes" section of this chapter.

For the following output example, assume that the command that was entered is "busyout link 1."

```
busyout link 1                                 SPE A

                            COMMAND RESULTS

  Port    Maintenance Name  Alt. Name   Result       Error Code
  01C0301   PI-LINK                     PASS

Command successfully completed
```

FEATURE INTERACTIONS

None.

busyout mis

This will busyout a specified management information system.

SYNOPSIS

busyout mis

PERMISSIONS

The following default logins may execute this command: system technician, inads, init, cust, rcust.

EXAMPLES

busyout mis

DESCRIPTION

The busyout mis command will put a management information system in the maintenance busy state. There will be no periodic or scheduled maintenance performed on the busied out mis until it is released. When the object is busied out no call processing activity may be performed over the link. A warning alarm is generated (error type 18) on the mis that has been busied out, so that INADS can access the state of it. The release mis command will return the busied out mis to operation.

Defaults

None.

Parameters

None.

Help Messages

If the system technician presses HELP after entering "busyout mis" the following message will be displayed:

```
Entry is not required
```

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	Not applicable
Maintenance Name	The type of maintenance object that is being busied out. For this command the field is always MIS.
Alt. Name	Not applicable
Result	An indicator as to whether the object was successfully busied out. PASS or ABORT will typically be here.
Error Code	A numerical description of why the command failed or was aborted. 1010 - already busied out

For the following output example, assume that the command that was entered is "busyout mis."

```
busyout mis                                SPE A

                         COMMAND RESULTS

  Port    Maintenance Name  Alt. Name   Result       Error Code
          MIS                           PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

None.

busyout modem-pool

This command will allow all members of a modem pool group to be busied out.

SYNOPSIS

busyout modem-pool group/*member*

PERMISSIONS

The following default logins may execute this command: init, inads, system technician.

EXAMPLES

busyout modem-pool 1
busyout modem-pool 4/3

DESCRIPTION

The "busyout modem-pool" command will put the specified modem pool group or group member in the maintenance busy state, even those groups that are not installed. There will be no periodic or scheduled tests performed on the busied out modem pool groups or group members until they are released. When the object is maintenance busy then the object is removed from active service on the switch (i.e., no call processing activity may include the busied object). A single group member can be busied out by specifying the group number, a "/," and the member number. All members in a modem pool group can be busied out by specifying the modem pool group number only. Warning alarms are generated (error type 18) on each maintenance object busied out, so that INADS can access the state of the objects. The "release modem-pool" command will return the specified modem pool group or group member to operation.

Defaults

None.

Parameters

group number	The group number is assigned from administration. The group number may be any administered group from 1-5.
member number	The member number is assigned from administration. A member is a pair of analog and digital line ports (or two pair for the Integrated modem-pool case). The member number may be any administered group member from 1-32.

Help Messages

If the system technician presses HELP after entering "busyout modem-pool" the following message will be displayed:

```
Enter assigned group number between 1-5
 Or press CANCEL to cancel the command
```

Error Messages

If the "busyout modem-pool" command is entered from a login for which the command is not valid, then the following message will be displayed:

```
"busyout" is an invalid entry; please press HELP
```

If the group or member numbers entered are not in a valid format, the following message will be displayed:

```
Identifier invalid
```

If the group number entered is not within the range of groups or the member number is not within the member range, then the following message will be displayed:

```
Boards not assigned
```

If the specific group or member are not administered, then the following message will be displayed:

```
Group not assigned, or group assigned but with no member
```

If a software fault is encountered while the command is executing, the following message will be displayed:

```
Error encountered, can’t complete request
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
’login id’:’command’ has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

When each modem pool member has been busied out, the following information will be displayed:

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object which is being busied out.
Maintenance Name	The type of maintenance object that is being busied out. This is always MODEM-PT.
Alt. Name	This field is not applicable to this command.
Result	The result of the busyout -"PASS," "ABORT," "FAIL,"
Error Code	A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes can be in the "Busyout/Release Error Codes" section of this chapter.

In the following output example, the command "busyout modem-pool 1" was entered.

```
busyout modem-pool 1                            SPE B

                         COMMAND RESULTS

  Port    Maintenance Name  Alt. Name   Result       Error Code

  01C0701   MODEM-PT                     PASS
  01C0703   MODEM-PT                     PASS

Command successfully completed
```

FEATURE INTERACTIONS

None.

busyout packet-control

This command will busyout the specified packet-control.

SYNOPSIS

busyout packet-control *location*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init

EXAMPLES

busyout packet-control 1A
busyout packet-control 1B

DESCRIPTION

The busyout packet-control command will put the packet-control circuit pack in a maintenance busy state, and tear-down each point-to-point signaling link that is terminated on this packet-control. There will be no periodic or scheduled test performed on the busied out packet-control until it is released. A warning alarm is generated (error type 18) on the busied out packet-control so that INADS can access the state of the object. The release packet-control command will return the board to a normal operation state and initiate recovery on all point-to-point signaling links terminated on this packet-control.

Defaults

For simplex systems, the location is optional and defaults to cabinet 1, carrier A. For duplex systems, the cabinet default is again cabinet 1, but there is no default for the carrier.

Parameters

location	The location only applies to duplicated configurations. If the configuration is a simplex, the location parameter is not used and thus is not valid. For duplicated configurations, a "location" represents the carrier that the packet-control resides on in the system. Valid locations are either 1A or 1B.

Help Messages

If the system technician presses HELP after entering "busyout packet-control," the following message is displayed:

```
Enter Packet Control location: [cabinet(1)];carrier(A-B)
```

Error Messages

If this command is entered for a packet-control that resides on the stand-by control complex of a duplicated system, the following message is displayed:

```
Command only applies to the active Packet Control
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	This field represents the Cabinet-Carrier in which the Packet-Control resides.
Maintenance Name	The type of maintenance object that is being busied out (which in this case is always PKT-CTRL).
Alt. Name	This field is not used in this output display.
Result	An indicator as to whether the object was successfully busied out ("PASS," "ABORT," or "FAIL").
Error Code	A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes is present in the "Busyout/Release Error Codes" section of this chapter.

For the following output example, the command busyout packet-control 1A was entered.

```
busyout packet-control 1A                          SPE A

                            COMMAND RESULTS

  Port    Maintenance Name  Alt. Name   Result       Error Code

  1A       PKT-CTRL                     PASS

Command successfully completed
```

FEATURE INTERACTIONS

In a duplicated system, an attempt to busyout the packet-control that resides in the standby processor complex will be disallowed.

When the packet-control in the active control complex is busied out, all connectivity across the Packet Bus will be severed. Thus, all ISDN-BRI point-to-point signaling links that have been established via the active packet-control will be torn down by the busyout packet-control command. The release packet-control command will reestablish all Packet Bus connectivity.

busyout pms-link

This command will busyout a specified property management system link.

SYNOPSIS

busyout pms-link

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

busyout pms-link

DESCRIPTION

The busyout pms-link command will put all maintenance objects associated with a property management system link in the maintenance busy state. There will be no periodic or scheduled maintenance performed on the busied out maintenance objects until they are released. When the object is maintenance busy then the object is removed from active service on the switch (i.e., no call processing activity may include the busied object) and the link will be dropped. Warning alarms are generated (error type 18) on each maintenance object busied out, so that INADS can access the state of the objects. The release pms link command will return the busied out objects on the link to operation.

A link is made up of several components. It involves a far end data module, a simulated data channel on a NETCON board, a manager that initiates and maintains the link, and a controller/protocol that services the link. A controller/protocol is usually a transient process that exists for as long as the link is up. A link is considered up if a physical connection is established. A link can be considered to be up while no useful work can be performed over it, in this case the link is insane and should be torn down. These links provide asynchronous data connections from the switch to peripherals.

For information on what a PMS is and does, see the second paragraph in the DESCRIPTION section of the "status pms-link" manual pages.

Defaults

None.

Parameters

None.

Help Messages

If the system technician presses HELP after entering "busyout pms-link" the following message will be displayed:

```
Entry is not required
```

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	With this maintenance object the port field is left blank.
Maintenance Name	The type of maintenance object that is being busied out (always PMS-LINK).
Alt. Name	Not applicable.
Result	The result of the busyout -"PASS", "ABORT", "FAIL".
Error Code	A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes can be in the "Busyout/Release Error Codes" section of this chapter.

For the following output example, assume that the command that was entered is "busyout pms-link."

```
busyout pms-link                                       SPE A

                                COMMAND RESULTS

  Port    Maintenance Name  Alt. Name   Result       Error Code
            PMS-LINK                     PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

The maintenance of a particular component on a link will sometimes interfere with the maintenance of the link itself. Maintenance can put a link component in a busy state causing link set-up to fail. Frequent attempts at re-setup of a link may delay the recover of a faulty component, due to the maintenance test of a component only taking place when the component is idle. Therefore, the technician needs to be able to disable the attempted re-setup of a link. The busyout command is used to do this, and will not cause the link to be torn down. If the link is already down, the busyout command will stop periodic re-setup trys on the link.

busyout port

This command will busyout a specified port on a circuit pack.

SYNOPSIS

busyout port location

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

busyout port 01c1101
busyout port 02c1501

DESCRIPTION

The busyout port command will put the specified port on a circuit pack in a maintenance busy state. There will be no periodic or scheduled tests performed on the busied out port until it is released. When the object is maintenance busy then the object is removed from active service on the switch (i.e., no call processing activity may include the busied object). Warning alarms are generated (error type 18) on each maintenance object busied out, so that INADS can access the state of the objects. The release port command will return the administered port on a circuit pack at a specified location to operation.

Defaults

No defaults.

Parameters

location

A "location" represents the physical position of the port to be busied out and is entered as "UUcSSpp" where "UU" represents the cabinet number (1-3), "c" represents the carrier, "SS" represents the slot position, and "pp" represents the circuit (port).

A "location" represents the physical position of the port to be marked and is entered as "PCSSpp" where P is the port network number (1 for PPN, 2 for EPN, and 3 for the second EPN); C is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ...etc.), and "pp" represents the circuit (port). A single digit cabinet (1 - 3) may be entered with or without a leading zero (0).

Help Messages

If the system technician presses HELP after entering "busyout port," the following message will be displayed:

```
Enter 7 character port number
```

Error Messages

If the format of the port location is incorrect, the following error message will be displayed:

```
Port/Board invalid
```

If the EPN on which the port resides is unavailable, the following message will be displayed:

```
EPN is not available
```

If the board on which the port resides is not administered, the following error message will be displayed:

```
Port not assigned
```

If the board on which the port resides is part of the SCI link, the following error message will be displayed:

```
Cannot busyout/release part of SCI link
```

If the port is translated within a Wideband Access Endpoint, the following error message will be displayed:

```
Port within wideband access endpt; Use busyout access-endpoint <ext> instead
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out.
Alt. Name	The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number.
Maintenance Name	The type of maintenance object that is being busied out.
Result	The result of the busyout -"PASS," "ABORT," "FAIL,"
Error Code	A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes can be in the "Busyout/Release Error Codes" section of this chapter.

For the following output example, assume that the port in cabinet 1, carrier c, slot 7, circuit 1 is an analog port. The command that was entered is "busyout port 1c0701."

```
busyout port 01C0701                                   SPE A

                          COMMAND RESULTS

  Port    Maintenance Name  Alt. Name   Result       Error Code
  01C0701   ANL-LINE                     PASS

Command successfully completed
```

FEATURE INTERACTIONS

None.

busyout pri-endpoint

This command will busyout a specified PRI endpoint.

SYNOPSIS

busyout pri-endpoint extension

PERMISSIONS

The following default logins may execute this command: system technician, inads, init, nms.

EXAMPLES

busyout pri-endpoint 25012
busyout pri-endpoint 77868

DESCRIPTION

The busyout pri-endpoint command will put all PRI endpoint ports (B-channels) associated with the specified PRI endpoint in a maintenance busy (system technician busy) state. There will be no periodic or scheduled tests performed on the busied out PRI endpoint ports until they are released. When the PRI endpoint port is maintenance busy (system technician busy) then the port is removed from active service on the switch (i.e., no call processing activity may include the busied object). Warning alarms are generated on each busied out port. The release pri-endpoint command will return all ports (B-channels) associated with the specified PRI endpoint extension to operation. When released, the switch will attempt to negotiate with the far-end PRI terminal adapter to put each PRI endpoint port (B-channel) into in-service state.

Defaults

No defaults.

Parameters

extension	An extension number associated with the desired PRI endpoint. The number of digits in an extension is determined by the dial-plan.

Help Messages

If the user presses HELP after entering "busyout pri-endpoint," the following message is displayed:

```
Enter assigned extension
```

Error Messages

If the format for the extension is incorrect, the following error message will be displayed:

```
Extension invalid
```

If the EPN on which the PRI endpoint resides is not accessible, the following message will be displayed:

```
EPN is not available
```

If the extension is not administered, the following message will be displayed:

```
Extension not assigned
```

If the object associated with the specified extension is not a PRI endpoint, the following message will be displayed:

```
Extension assigned to object other than pri-endpoint
```

If the board that contains the PRI endpoint is not inserted in the system, the following message will be displayed:

```
Board not inserted
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out.
Maintenance Name	The type of maintenance object that is being busied out. The name for PRI endpoint port is "PE-BCHL."
Alt. Name	The alternate way of identifying the maintenance object. This field contains the extension number of the PRI endpoint.
Result	An indicator as to whether the object is successfully busied out. The possible values are: PASS, FAIL or ABORT.
Error Code	A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes can be in the "Busyout/Release Error Codes" section of this chapter.

For the following output example, the command "busyout pri-endpoint 22501" was entered. Assume that the PRI endpoint ports for extension 22501 are in cabinet 1, carrier B, slot 20, circuit 1 to 6.

```
busyout pri-endpoint 22501                          SPE A

                            COMMAND RESULTS

  Port    Maintenance Name  Alt. Name   Result       Error Code
  01B2001   PE-BCHL          22501       PASS
  01B2002   PE-BCHL          22501       PASS
  01B2003   PE-BCHL          22501       PASS
  01B2004   PE-BCHL          22501       PASS
  01B2005   PE-BCHL          22501       PASS
  01B2006   PE-BCHL          22501       PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

If there is an active call on the specified PRI endpoint, the busyout command will cause the call to drop. This command is destructive.

Once the PRI endpoint is in the maintenance busy (system technician busy) state, all call attempts from the far-end PRI terminal adapter will be denied with a cause value 17 (User Busy).

busyout sp-link

This command will busyout the system printer link.

SYNOPSIS

busyout sp-link

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

busyout sp-link

DESCRIPTION

The busyout sp-link command will put the system printer link into a maintenance busy state. There will be no periodic or scheduled maintenance performed on the busied out system printer link until it is released. Warning alarms are generated (error type 18) on each maintenance object busied out, so that INADS can access the state of the object. Placing the system printer link in a busyout state will prevent access to the system printer. The release sp-link command will return the system printer link to operation.

The system printer link is a link from the switch to an external printer over which jobs can be printed. This link is created by administering the system printer extension and setting up a call to the system printer.

Defaults

No defaults.

Parameters

None.

Help Messages

If the system technician presses HELP after entering "busyout sp-link," the following is displayed:

```
Entry is not required
```

Error Messages

If the system printer link is not administered, the following message is displayed:

```
Link not administered or not enabled
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message is displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	Not applicable. Will always be blank.
Maintenance Name	The type of maintenance object that is being busied out will always be SYS-PRNT.
Alt. Name	Not applicable. Will always be blank.
Result	The result of the busyout - "PASS," "ABORT," "FAIL".
Error Code	A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes can be found in the "Busyout/Release Error Codes" section of this chapter.

For the following output example the command entered was "busyout sp-link."

```
busyout sp-link                                  SPE A

                              COMMAND RESULTS

  Port    Maintenance Name  Alt. Name   Result       Error Code
          SYS-PRNT                       PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

None.

busyout spe-standby

This command allows the technician to busyout the standby Switch Processing Element (SPE)

SYNOPSIS

busyout spe-standby

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

busyout spe-standby

DESCRIPTION

The busyout spe-standby command raises the Fault Severity Level of the Standby SPE (see reference 5) of the standby Switch Processing Element (SPE) by raising a Warning Off-board alarm against STBY-SPE. Because a Warning Off-board STBY-SPE alarm is defined to have the highest Fault Severity of all alarms the affect the health of an SPE (refer to the Reset System MUS), the chance that an SPE interchange will occur is diminished, but does not guarantee that an SPE interchange will not occur. Once the standby SPE is busied out, an SPE interchange will only occur if the standby SPE is hard selected via the SPE Select switches or the active SPE goes into SPE down mode. This command will also stop any activity currently executing on the standby SPE and will disable memory shadowing to the standby SPE. Periodic and scheduled testing **will** be prevented from starting on the standby SPE while it is busied out. The busyout state of the standby SPE and the STBY-SPE Warning alarm will be maintained across a reset system 1 (Warm restart) and a reset system 2 (Cold 2 restart) but will be removed after all other levels of restart.

Defaults

No defaults.

Parameters

None.

Help Messages

If the system technician presses HELP after entering "busyout spe-standby" the following message will be displayed:

```
Entry is not required
```

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If this command is issued while an **upgrade software** command is active the following message will be displayed:

```
Standby SPE upgrade in progress, command denied
```

OUTPUT

Port	The port address will display the cabinet and carrier location of the standby SPE. The standby SPE port address will always be 01A or 01B.
Maintenance Name	"STBY-SPE" for the standby SPE maintenance object.
Alt. Name	Always blank for this command.
Result	The result of the busyout -"PASS," "ABORT," "FAIL,"
Error Code	A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes can be in the "Busyout/Release Error Codes" section of this chapter.

For the following output example, assume that the standby SPE is located in carrier "B." The command that was entered is "busyout spe-standby."

```
busyout spe-standby                                         SPE A

                                  COMMAND RESULTS

  Port    Maintenance Name  Alt. Name   Result        Error Code
  01B     STBY-SPE                       PASS

Command successfully completed
```

FEATURE INTERACTIONS

When a busyout of the standby SPE is performed, the fault severity level of the standby SPE is set to the highest possible value and memory shadowing is turned off. This is done to lessen the probability that the system will switch to the standby SPE. However, in some cases a "spontaneous" (hard) interchange of the SPEs may still occur.

This command can be used as a mechanism to turn off memory shadowing of the standby SPE.

If the standby SPE is in poor health (less than optimum), memory shadowing can not be disabled, or communication to the standby is impossible a busyout of the standby SPE will still be successful.

busyout station

This command will busyout a specified station.

SYNOPSIS

busyout station extension

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

busyout station 10020
busyout station 32770

DESCRIPTION

The busyout station command will put the specified administered voice terminal extension (station) in a maintenance busy state, even those stations that are not installed. There will be no periodic or scheduled tests performed on the busied out station until it is released. When the object is maintenance busy then the object is removed from active service on the switch (i.e., no call processing activity may include the busied object). Warning alarms are generated (error type 18) on each maintenance object busied out, so that INADS can access the state of the objects. The release station command will return the specified voice terminal extension to operation.

Defaults

No defaults.

Parameters

extension	An extension number associated with the desired voice terminal. The number of digits in an extension is determined by a dial-plan.

Help Messages

If the system technician presses HELP after entering "busyout station," the following message will be displayed:

```
Enter extension for an assigned station
```

Error Messages

If the format of the extension is incorrect, the following error message will be displayed:

```
Extension invalid
```

If the specified extension is not administered, then the following message will be displayed:

```
Extension not assigned
```

If the specified extension does not belong to a station or attendant console, the following message will be displayed:

```
Extension exists but assigned to a different object
```

If the station port resides on an EPN that is unavailable, the following message will be displayed:

```
EPN is not available
```

If the station port resides on a board that is not inserted in the system, the following message will be displayed:

```
Board not assigned
```

If the station port resides on a board that is part of the SCI link, the following message will be displayed:

```
Cannot busyout/release part of SCI link
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out.
Maintenance Name	The type of maintenance object that is being busied out.
Alt. Name	The alternate means of identifying the maintenance object. This field contains the extension.
Result	The results of trying to busyout the station - "PASS," "FAIL," "ABORT."
Error Code	A numerical description of why the command aborted or failed.

For the following output example, assume that the command that was entered is "busyout station 1002."

```
busyout station 1002                                     SPE A

                           COMMAND RESULTS

  Port    Maintenance Name  Alt. Name   Result       Error Code
  01C1102   DIG-LINE                     PASS

Command successfully completed
```

FEATURE INTERACTIONS

None.

busyout tdm

This command will busyout a TDM bus on the PPN or any EPN. The TDM bus with system tones can not be busied out.

SYNOPSIS

busyout tdm pn number bus

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

busyout tdm 1a

DESCRIPTION

The busyout tdm command will put the specified tdm bus in a maintenance busy state. There will be no periodic or scheduled tests performed on the busied out bus until it is released. When the object is maintenance busy then the object is removed from active service on the switch (i.e., no call processing activity may include the busied object). Warning alarms are generated (error type 18) on each tdm bus busied out, so that INADS can access the state of the objects. The release tdm command will return the specified tdm bus to operation.

Defaults

No defaults.

Parameters

pn number	The PN number specifies the Port Network number of the TDM bus to be busied out.
bus	The TDM bus ("a" or "b") specifies which half of the TDM bus is desired. Each 512 time slot TDM bus is configured as two duplicate 256 time slot buses. This division allows for duplication of control channels and dedicated tone time slots. The default control bus (carrying the control channel) is the "a" bus, while the default tone bus (carrying dedicated tones) is the "b" bus. A port-network number (1 - 3) may be entered with or without a leading zero (0).

Help Messages

If the system technician presses HELP after entering "busyout tdm," the following message will be displayed:

```
Enter TDM bus location: [network(1-3)];carrier(A-B)
```

Error Messages

If the technician does not enter a port network number followed by bus, the following message will be displayed:

```
Identifier invalid
```

If the port network on which the desired TDM bus resides is unavailable, the following message will be displayed:

```
EPN is not available
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	The port address is displayed as PN followed by the port network number and bus (A or B) associated with the TDM bus.
Alt. Name	Not applicable.
Maintenance Name	The type of maintenance object that is being busied out. In this case it is always TDM-BUS.
Result	The result of the busyout -"PASS," "ABORT," "FAIL".
Error Code	A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes can be in the "Busyout/Release Error Codes" section of this chapter.

For the following output example, assume that the command that was entered is "busyout tdm port-network 1 bus a."

```
busyout tdm port-network 1 bus a                       SPE A

                          COMMAND RESULTS

  Port    Maintenance Name  Alt. Name   Result       Error Code
  PN 01A  TDM-BUS                        PASS

Command successfully completed
```

FEATURE INTERACTIONS

If a bus is busied out, no calls will be torn down. However, no new calls will be set up on the busied out bus.

Dedicated tone time slots must be moved to another bus (the other half of the duplicated bus) before a busyout of a particular bus will be allowed.

busyout tone-clock

This command will busyout a tone/clock circuit pack.

SYNOPSIS

busyout tone-clock location

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

busyout tone-clock 01c
busyout tone-clock 03d

DESCRIPTION

The busyout tone-clock command will put the specified tone/clock in a maintenance busy state. There will be no periodic or scheduled tests performed on the busied out object until it is released. When the object is maintenance busy then the object is removed from active service on the switch (i.e., no call processing activity may include the busied object). Warning alarms are generated (error type 18) on each tone clock circuit pack busied out, so that INADS can access the state of the objects. The release tone-clock command will return the specified tone/clock to operation.

Defaults

The cabinet number will default to 1 (one).

Parameters

location	A "location" represents the physical position of the tone/clock to be busied out and is entered as "UUc" where "UU" represents the cabinet number, and "c" represents the carrier. A cabinet number (1 - 3) may be entered with or without a leading zero (0).

Help Messages

If the system technician presses HELP after entering "busyout tone-clock," the following message will be displayed:

```
Enter tone/clock location: [cabinet(1-3];(carrier(A-E))
```

Error Messages

If an identifier greater than 3 (three) characters is entered, or the cabinet entered is not a digit (number), the following message will be displayed:

```
Identifier invalid
```

If the carrier entered is invalid, the following message will be displayed:

```
Invalid carrier specified
```

If the cabinet entered is not within the valid range of cabinets or the cabinet is not administered, the following message will be displayed:

```
Cabinet number not assigned
```

If there is no tone/clock board at the specified location, one of the following messages will be displayed:

```
Board not inserted
Board not assigned
```

If the specified cabinet carrier location is that of a switch node, the following message will be displayed:

```
Switch Node carrier specified; invalid command for SN carrier
```

If the cabinet carrier location entered is that of an EPN that is not available, the following message will be displayed:

```
EPN is not available
```

If the tone/clock is active and the specified action is busyout, the following message will be displayed:

```
Illegal Command for active object; use ’set’ to switch to standby
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
’login id’:’command’ has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	The tone clock maintenance object will only display the cabinet and carrier of the desired tone/clock board.
Maintenance Name	The type of tone clock circuit pack that is being busied out which is TONE-PT, TDM-CLK and TONE-BD.
Alt. name	Not applicable.
Result	The result of the busyout -"PASS," "ABORT," "FAIL".
Error Code	A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes can be in the "Busyout/Release Error Codes" section of this chapter.

For the following output example, assume that the command that was entered is "busyout tone-clock 1a."

```
busyout tone-clock 1a                               SPE A

                           COMMAND RESULTS

  Port    Maintenance Name  Alt. Name   Result       Error Code
  01A     TONE-PT                       PASS
  01A     TDM-CLK                       PASS
  01A     TONE-BD                       PASS

Command successfully completed
```

FEATURE INTERACTIONS

None.

busyout trunk

This command will busyout a specified trunk group or trunk group member.

SYNOPSIS

busyout trunk group*/member*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

busyout trunk 78
busyout trunk 78/1

DESCRIPTION

The busyout trunk command will put the specified trunk group or trunk group member in a maintenance busy state, even trunk groups that are not installed. There will be no periodic or scheduled tests performed on the busied out trunk groups or trunk group members until they are released. When the object is maintenance busy then the object is removed from active service on the switch (i.e., no call processing activity may include the busied object). A single group member can be busied out by specifying the group number, a "/," and the member number. All members in a trunk group can be busied out by specifying the trunk group number only. Warning alarms are generated (error type 18) on each maintenance object busied out, so that INADS can access the state of the objects. The release trunk command will return the specified trunk group or group member to operation.

NOTE:
While not recommended, if the user enters "busyout trunk <group number>/," the lowest port-location in the group will be busied out.

Defaults

No defaults.

Parameters

group	The group number is an administered number associated with each trunk group. The valid range is 1 - 99.
member	The member number is an administered number identifying a particular trunk within a trunk group. The valid range is 1 - 99.

Help Messages

If the system technician presses HELP after entering "busyout trunk," the following message will be displayed:

```
Enter assigned trunk group number [or group/member]
```

Error Messages

If the format of the identifier is invalid, the following message will be displayed:

```
Format invalid
```

If the range of the trunk group is incorrect, the following error message will be displayed:

```
Trunk or trunk group invalid
```

If the specified trunk group is not administered or has no members, the following message will be displayed:

```
Group not assigned, or group assigned but with no member
```

If the specified member is not administered, the following message will be displayed:

```
Group member not assigned
```

If the specified trunk group is part of the SCI link, the following message will be displayed:

```
Cannot busyout/release part of SCI link
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out.
Maintenance Name	The type of maintenance object that is being busied out.
Alt. Name	The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number.
Result	The result of the busyout - "PASS", "ABORT", "FAIL".
Error Code	A system-generated number that tells why the busyout failed or aborted. A detailed list of the codes can be found in the "Busyout/Release Error Codes" section of this chapter.

For the following output example, assume that the command that was entered is "busyout trunk 78/1."

```
busyout trunk 78/1                                SPE A

                          COMMAND RESULTS

  Port    Maintenance Name  Alt. Name   Result       Error Code
  01C1505   CO-TRK           78/01       PASS

Command successfully completed
```

FEATURE INTERACTIONS

None.

cancel hardware-group

This command allows a user to cancel an active "test hardware-group" command executing in the background or foreground mode.

SYNOPSIS

cancel hardware-group

PERMISSIONS

The following logins may execute this command: inads, init.

EXAMPLES

cancel hardware-group

DESCRIPTION

A system technician, in the course of the execution of a "test hardware-group" command may find the need to halt the testing either temporarily or permanently. This can be accomplished by entering the "cancel hardware-group" command on the SAT. The canceled "test hardware-group" command may be restarted where it left off with the "resume hardware-group" command or another "test hardware-group" may be entered.

In addition to the "cancel hardware-group" command, the 'cancel' key on the SAT may be pressed to cancel a hardware-group command executing in the foreground.

The status of a canceled "test hardware-group" command will show up as 'canceled' on the "status hardware-group" screen.

When a "test hardware-group" command is executing in the foreground with the 'continuously' option and the 'cancel' key on the SAT is pressed or the "cancel hardware-group" command is entered, then the hardware-group command is canceled and for security reasons, the SAT running the "test hardware-group" command will be logged off. However, after logging back on the system, the user still maintains the capability to restart the canceled "test hardware-group" command with the "resume hardware-group" command.

Defaults

None.

Parameters

None.

Help Messages

If the system technician presses help after entering "cancel hardware-group" the following message will be displayed:

```
Entry is not required
```

Error Messages

If there is no "test hardware-group" command currently active to be canceled, the following message will be displayed:

```
Command aborted - no hardware-group test in progress
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

OUTPUT

If a "test hardware-group" command executing in the background is successfully canceled with the "cancel hardware-group" command, the following response will be displayed:

```
Hardware-group command successfully canceled
```

If a "test hardware-group" command executing in the foreground is successfully canceled with a "cancel hardware-group" command from another SAT terminal, the following response will be displayed on the SAT terminal where the hardware-group command was executing:

```
Hardware-group command aborted with cancel command entered from another SAT
```

FEATURE INTERACTIONS

Scheduled and Periodic Maintenance

When a "test hardware-group" is entered, all activity related to scheduled background maintenance, periodic background maintenance, and data audits is suspended for the duration of the execution of the "test hardware-group" command. All activity related to scheduled background maintenance, periodic background maintenance, and data audits will restart if the "test hardware-group" command is canceled.

Status Hardware-group

The state of a canceled "test hardware-group" command can be displayed by means of the "status hardware-group" command and the state will show up as 'canceled'.

change circuit-packs

This command allows the user to add, change, or remove circuit packs which are administered.

SYNOPSIS

change circuit-packs cabinet number

PERMISSIONS

The following default logins may execute this command: system technician, cust, inads, init, nms.

EXAMPLES

change circuit-packs 1
change circuit-packs 2

DESCRIPTION

This command allows the user to administer the circuit packs that are to be inserted into the system port, expansion control, and switch node carriers. It is used to configure the system when the circuit packs have not yet been physically inserted.

Defaults

If no cabinet number is entered, this value defaults to "1."

Parameters

cabinet number	The number of the cabinet containing the circuit packs that the user wishes to modify.

Help Messages

If the system technician presses HELP after entering "change circuit-packs" the following message is displayed:

```
Enter number between [1-3]
```

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If an invalid cabinet number is entered on the command line the following message will be displayed:

```
"n" Identifier not assigned
```

OUTPUT

Cabinet	The administered number of the cabinet.
Cabinet Layout	Type of cabinet (e.g., single-carrier or enhanced-multi-carrier).
Carrier	Each page of this form reports the information for a specific carrier, this field tells the user which carrier of the cabinet that this page refers to.
Carrier Type	For each carrier - A, B, C, D, or E, what its function is (e.g., port, processor or expansion-control).
Slot	Lists the slot numbers from 0 - 21 depending on the type of carrier.
Code	The circuit pack code (TN number). This number identifies the circuit pack type to the system. The proper format are the letters "TN" followed by a three digit number.
Sfx	For suffix, lists the suffix if the particular circuit pack has one.
Name	This field contains the alphanumeric name for the circuit pack. It is provided to aid the user in entering the circuit pack codes.

For the following output example, the command entered is "change circuit-packs 1" which is an enhanced-single-carrier cabinet. All five pages are shown here.

```

```

FEATURE INTERACTIONS

None.

change synchronization

This command changes/updates the translation data associated with the existing synchronization hierarchy.

SYNOPSIS

change synchronization

PERMISSIONS

The following logins may execute this command: system technician, cust, inads, init, rcust, bcms.

EXAMPLES

change synchronization
change synch

DESCRIPTION

The change synchronization command changes/updates the translation data associated with the existing synchronization hierarchy.

A hierarchy of sources exists within each system that should be used for timing synchronization. For stratum 3 synchronization, this hierarchy should be reflected by the DS1 inputs to the external stratum 3 clock. For stratum 4 synchronization, this hierarchy should be reflected in the primary and secondary fields. If all fields are left blank then the tone clock board within each port network will provide timing for that port network.

Defaults

None.

Parameters

None.

Help Messages

If the user presses HELP after entering "change synchronization" the following message is displayed:

```
Entry is not required
```

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict.
```

OUTPUT/INPUT

Stratum: This field specifies the synchronization stratum that will be used. The only entries that are acceptable are "3" and "4." If "4" is entered in this field, the message

Primary: This field designates the first choice system synchronization source. A blank entry means no synchronization. This field is valid only if stratum 4 synchronization is specified.

— FIELD HELP:

```
Enter 5 character board number;
                cabinet(1-3):carrier(A-E):slot(0-21)
```

— FIELD ERROR(S):

- — "entry" Board location invalid
- — "entry" Circuit Pack must be a DS1 or a UDS1 board
- — "entry" Circuit pack must be installed first
- — Cannot administer synchronization sources on a port network remoted via DS1C

Secondary: This field designates the second choice system synchronization source. A blank entry means no synchronization. This field is valid only if stratum 4 synchronization is specified.

— FIELD HELP:

```
Enter 5 character board number; cabinet(1-3):carrier(A-E):
 slot(0-21)
```

— FIELD ERROR(S):

- — "entry" Board location invalid
- — "entry" Circuit Pack must be a DS1 or a UDS1 board
- — "entry" Circuit pack must be installed first
- — Secondary source requires primary synchronization source
- — Duplicate entry
- — Synchronization sources must be in same port network

Location: The circuit pack location (port network, carrier and board slot) of all administered DS1 circuit packs are listed here.

Name: If a user defined name is administered for the DS1 circuit pack, it will be displayed here. Blank means no user defined name was given to this DS1 circuit pack.

Slip: If the DS1 circuit pack has slip alarm, this field will show 'y'. Otherwise it will show 'n'.

Port Network: This field is only valid for stratum 3 synchronization. The field is a display only field and specifies the port network that supplies synchronization via the tone clock circuit pack.

For the following example, the command that was entered is "change synchronization" and "4" was entered in the stratum field.

```
change synchronization                      Page   1 of   1

             SYNCHRONIZATION PLAN

      SYNCHRONIZATION SOURCE (DS1 circuit pack location)
          Stratum: 4
          Primary: _____    Secondary: _____
Location  Name    Slip        Location  Name    Slip

 NOTE: TN722B DS1 source will result in stratum 4, type II synchronization
```

For the following example, the command that was entered is "change synchronization" and "3" was entered in the stratum field.

```
change synchronization                      Page   1 of   1

             SYNCHRONIZATION PLAN

      SYNCHRONIZATION SOURCE (DS1 circuit pack location)
            Stratum: 3
       Port Network: 1
```

FEATURE INTERACTIONS

A DS1 interface or a UDS1 board that has been selected as either a primary or secondary synchronization source cannot be removed on the DS1 circuit pack administration form or the regular circuit pack administration form.

Change System-Parameters Maintenance

change system-parameters maintenance

The maintenance-related system parameters form is used to specify and display scheduled maintenance operations and maintenance support functions.

This form can also be used to activate and deactivate INADS alarm origination when performing repairs. To deactivate alarm origination:

1. Make a note of the current entries in the Cleared Alarm Notification, CPE Alarm, and Alarm Origination Activated fields so you can restore them when you are done.
2. If Cleared Alarm Notification field = "y," change it to "n."
3. If Alarm Origination to OSS Numbers field is not "neither," change it to "neither."
4. If CPE Alarm Activation Level field is "major," "minor," or "warning," change to "none."
5. If daily scheduled maintenance must be prevented from starting during a maintenance procedure, set the `Start Time` field to a time after the session will end. If daily Scheduled Maintenance is already running and needs to be shut off, set the `Stop Time` field to one minute after the current time.
6. Press ENTER and verify that the screen displays the message:

   `Command successfully completed`

NOTE:
When finished working on the switch be sure to return all fields to their original settings.

EXAMPLES

change system-parameters maintenance

Output

An input form is displayed with the following fields. Defaults for data entry fields are listed in parentheses.

Operations Support Parameters

Product Identification	This is a 10-digit number starting with 1 that identifies the switch to an Operations Support System (OSS), for example, INADS.
First OSS Telephone Number	The first telephone number that the switch uses to report alarms to, for example, INADS or Trouble Tracker. The number must be obtained from the National Customer Support Center (NCSC) or the TSC. **#** and ***** are not allowed in the telephone number.
Abbrev Alarm Report	Enables the Abbreviated Alarm Report feature for the first OSS. (yes)
Second OSS Telephone Number	The second telephone number that the switch uses to report alarms to, for example, INADS or Definity SNMP. The number must be obtained from the National Customer Support Center (NCSC) or the TSC. **#** and ***** are not allowed in the telephone number.
Abbrev Alarm Report	Enables the Abbreviated Alarm Report feature for the second OSS. (no)
Alarm Origination to OSS Numbers	Indicates one of four options for alarm origination (neither): ■ If this field is set to “both,” all Major and Minor alarms result in an automatic call to both OSS telephone numbers. Both OSS telephone numbers must be administered. ■ If this field is set to “first-only,” all Major and Minor alarms result in an automatic call to the first OSS number only. The switch does not call the second OSS telephone number even if the number is administered. The first OSS telephone number must be administered ■ If this field is set to “neither,” alarm origination does not take place. Warning alarms are not reported to either numbers. ■ If this field is set to “second-as-backup,” all Major and Minor alarms result in an automatic call to the first OSS telephone number. If calling the first OSS telephone number fails four attempts, the switch starts to call the second OSS telephone number as a backup until calling the first OSS telephone number becomes successful. Both OSS telephone numbers must be administered.
Cleared Alarm Notification	Enables the switch to originate a call to the OSS and send an alarm resolution message whenever all previously reported Major and Minor alarms are resolved. Alarm Origination must be activated in order for Cleared Alarm Notification to work. (no)
Restart Notification	Enables the switch to originate a call to the OSS and report any system restarts caused by problems with the switch.

Test Remote Access Port	Specifies whether testing of the remote access port on the SYSAM circuit pack is enabled. This field should be set to "yes" whenever there is an INADS line connected to the switch and there is a maintenance contract in effect so that alarm origination capability is maintained. If no equipment is connected to the remote access port, or if a trunk for remote access and alarm origination is not provided, running tests on the remote access port on the SYSAM results in test failures. This causes unnecessary maintenance alarms and allows potentially destructive tests to be run. Setting this field to "no" prevents this. (no)
CPE Alarm Activation Level	Indicates the minimum level (Major, Minor or Warning) at which the Customer-Provided Equipment (CPE) alarm is activated. If the level is ''none,'' the CPE does is not activated for any alarm. (none) **NOTE:** The CPE alarm is always activated when the switch goes into Emergency Transfer, regardless of the CPE Alarm Activation Level setting.

Packet Bus Activated	Enables the system Packet Bus. If this field is set to ‘‘yes'', then maintenance software assumes that there is a Packet Control circuit pack installed in the system. The packet endpoints (for example, ASAI, and/or BRI) may be administered, and maintenance testing runs on both the Packet Control circuit pack and on the Packet Bus (This field should be set to “yes” after a packet control circuit pack is installed.). If a Packet Control circuit pack is not installed in the system, then a major alarm is raised against the PKT-CTRL MO. This field can only be changed from ‘‘yes'' to ‘‘no'' if there are no packet endpoints administered, thus ensuring that there can be no packet endpoints administered if the packet bus is not activated. This field should be set to “yes” after a Packet Control circuit pack is installed. If a Packet Control circuit pack is not installed, then this field should be set to ‘‘no'' (the only exception is when setting up translations for a system for which not all of the required hardware is available). (no)
Customer Access to INADS Port	Provides the capability to prohibit access to system administration and maintenance interface, via the INADS port when using customer login ID’s. This field can only be activated by Lucent Technologies services through system-parameters maintenance administration.(no)
Repeat Dial Interval (MMS)	Indicates the number of minutes that the system must wait before attempting another call origination to an OSS. This timer is triggered by the lack of a far-end acknowledgment. (7)

Scheduled Maintenance

A series of maintenance tests and operations runs automatically every day according to the schedule and settings specified in the following fields

Table 10-4. Scheduled Maintenance Settings

Start Time	The hour and minute in 24-hour notation at which daily scheduled maintenance will begin running. (22:00)
Stop Time	The hour and minute when scheduled daily maintenance will stop running. If any daily maintenance operations are not completed by this time, the system will note where in the sequence it stopped and perform those operations during the next scheduled daily maintenance.
Daily Maintenance	This display-only field simply represents the series of tests that are always run by maintenance software as part of daily maintenance.
Save Translation	This field indicates on which days translation data in memory will automatically be saved to the Mass Storage System disk and/or tape devices during scheduled maintenance. The save operation is first made to disk, followed by a disk backup to tape. On systems with duplicated SPEs, translation data is saved on both SPEs. Valid entries are **daily**, days of the week, or **no**. "No" specifies that no automatic saves are to be executed. (daily)
Control Channel Interchange	Each port network has a pair of TDM busses called A and B, each of which has a set of time slots dedicated to use by the control channel. At any one time, the control channel in each PN is carried on only one of the two busses. This field indicates on which days the control channel in each port network will be switched from one of the paired TDM busses to the other. Valid entries are **daily**, days of the week, or **no**. "No" specifies that no interchange be executed. (no)

Continued on next page

Table 10-4. Scheduled Maintenance Settings — *Continued*

System Clocks Interchange	On High and Critical Reliability systems, this option causes a Tone-Clock interchange in each port network with duplicated Tone-Clock circuit packs. Each port network interchanges into the standby Tone-Clock for 20 seconds and then back to the Tone-Clock that was originally active. This field indicates on which days the interchanges are to take place. Valid entries are daily, days of the week, or no. "No" specifies that interchanges be executed. (no) The system performs a Tone-Clock interchange, making the stand by Tone-Clock active. The newly active Tone-Clock circuit pack is tested and, while active, provides system clocks for the port network in which it resides. The system then interchanges back to the originally active Tone-Clock circuit pack.
SPE Interchange	On systems with duplicated SPEs, this field indicates on which days an SPE interchange will be executed during scheduled maintenance. Valid entries are **daily**, days of the week, or **no**. "No" specifies no scheduled interchanges. (no)
EXP-LINK Interchange	This field indicates whether or not the expansion links between port-networks are interchanged as part of scheduled maintenance. The value ‘‘daily'' means that EXP-LINK interchange occurs automatically everyday. The value ‘‘no'' means that EXP-LINK interchange is not done automatically as part of scheduled maintenance. Values represented by the days of the week mean that EXP-LINK interchange occurs automatically on the specified day only. Since EXP-LINK interchange only applies to duplicated systems, simplex systems do not display this field. (no)

Continued on next page

Table 10-4. Scheduled Maintenance Settings — *Continued*

Minimum Threshold for TTRs	When the number of touch tone receivers (TTRs) in service falls below this number (4 to 200), a WARNING alarm is raised against TTR-LEV (see TTR-LEV in Chapter 11, "Maintenance Object Repair Procedures"). These are also known as dual-tone multifrequency receivers (DTMRs). There are 4 TTRs on each TN748 Tone Detector circuit pack, and up to 50 TN748s in a system. To alarm the first occurrence of a TTR being taken out of service, set this field to 4 times the number of TN748s. If this number is set to more than three less than the total number of TTRs, a port network with only one TN748 could lose all of its TTRs before this alarm is raised.
Minimum Threshold for CPTRs	When the number of call progress tone receivers in service falls below this number (2 to 100), a WARNING alarm is raised against TTR-LEV (see TTR-LEV in Chapter 11, "Maintenance Object Repair Procedures"). These are also known as general purpose tone detectors (GPTDs). There are 2 CPTRs on each TN748 Tone Detector circuit pack, and up to 50 TN748s in a system. To alarm the first occurrence of a CPTR being taken out of service, set this field to 2 times the number of TN748s. If this number is set to more than one less than the total number of TTRs, a port network with only one TN748 could lose all of its CPTRs before this alarm is raised.
Minimum Threshold for Call Classifier Ports	When the number of call classifier ports (CLSFY-PTs) in service falls below this number, a WARNING alarm is raised against TTR-LEV (see TTR-LEV in Chapter 11, "Maintenance Object Repair Procedures"). Valid entries are 1 to 200. There are 8 ports on each TN744 Call Classifier circuit pack, and up to 25 TN744s in a system. To alarm the first occurrence of a CLSFY-PT being taken out of service, set this field to 8 times the number of TN744s. If this number is set to more than 7 less than the total number of CSLFY-PTs in the system, a port network with only one TN744 could lose all of its CLSFY-PTS before the alarm is raised. If there are no TN744s in the system, leave this field blank.

Table 10-4. Scheduled Maintenance Settings — *Continued*

Test Type 100, Test Type 102, Test Type 105	An extension assigned to receive tie-trunk calls from other switches with test line origination capability. The system responds by sending a sequence of test tones. Test Type 100 tests far end to near end loss and C-message by sending: ■ 5.5 seconds of 1004 Hz tone at 0dB ■ Quiet until disconnect; disconnect is forced after one minute Test Type 102 tests far end to near end loss by sending: ■ 9 seconds of 1004 Hz tone at 0dB ■ 1 second of quiet ■ This cycle is repeated until disconnect; disconnect is forced after 24 hours. Test Type 105 tests 2-way loss, gain slope, and C-message and C-notch noise by sending: ■ nine seconds of 1004 Hz at -16dB ■ one second of quiet ■ nine seconds of 404 Hz at -16dB ■ one second of quiet ■ nine seconds of 2804 Hz at -16dB ■ 30 seconds of quiet ■ one half second of Test Progress Tone (2225 Hz) ■ approximately five seconds of quiet ■ forced disconnect
ISDN-PRI Test Call Extension	The extension used by a far-end ISDN node to place a call to the system to test the ISDN-PRI trunks between the far-end and the system.

Continued on next page

Table 10-4. Scheduled Maintenance Settings — *Continued*

ISDN-BRI Service SPID	This field shows whether or not the link is associated with the Service SPID. If the link is associated with the Service SPID, the field contains a number from "0 to 99999" this number is the test spid (See SPID Facility Test in Chapter 11, "Maintenance Object Repair Procedures" under BRI-SET MO) otherwise, this field is blank. Service SPID is a feature used by the system technician to check building wiring between the switch and the BRI endpoint.
DSO Loop-Around Test Call Extension	The extension used by the network service provider to set up a DSO loop around connection for testing non-ISDN DS1 trunks The DSO Loop-Around Test Call feature is used primarily for testing DSO channels associated with non ISDN-PRI trunks. The loop-around is activated by dialing the test extension number. Multiple DSO Loop-Around connections can be set up by placing multiple calls to the loop-around extension. For more information see "Facility Test Calls" in Chapter 5, "Routine Maintenance Procedures".
Loss Plan	Use only when extra loss is required to maintain quality of transmission on conference calls. Leave this field blank if no extra loss is required. If extra loss is required, enter digits as shown below.

No. Of Parties To Be Conferenced	Enter Digit
3	2
4	3
5	4
6	5
7	6

SPE Optional Boards:	These fields indicate whether a Disk circuit pack is present in the system, and which Packet Interface slots are administered. If a Packet Interface circuit pack is physically present, the corresponding Packet Interface field is set to y when the system boots, and no change to that field is allowed. If the system is equipped with duplicated SPEs, a Packet Interface field is set to y when either SPE carrier contains a Packet Interface circuit pack in the corresponding position. If a Packet Interface circuit pack is not present, then the value for the Packet Interface field is read from translation data stored on disk or tape. If the field is set to n, a Packet Interface circuit pack may be administered by changing the corresponding Packet Interface field to y.

Modem Connection

On page 3 of the example forms shown below, there are 11 fields that are hidden when the “Modem Connection?” field is set to internal. In this example the “Modem Connection” field is set to “external” and these additional 11 fields are visible.

The first 2 fields on page 3 help setup the data format for the serial data from the switch to the modem. The field names are, “Data Bits:”, and “Parity?”. There are only two valid combinations for these 2 fields:

- Data Bits = 8, Parity = None
- Data Bits = 7, Parity =(odd , even, mark, or space)

The remaining fields are listed below:

Modem Connection	The only valid entries for this field are “internal” or “external”. The default is set to internal. (internal)
Modem Name	This field is 20 characters long and will permit alpha-numeric characters to provide a unique qualifier for a given modem. The field is called “Modem Name: ”. ( )
RTS/CTS Enabled	This field will inform the modem that communication with the data source UART will be driven with RTS/CTS flow control. This field is 6 characters long with a default of “\Q3”. This field is case in-sensitive; however, the default will be in upper case. (\Q3)

Asynchronous Data Mode	This field will configure the modem as an asynchronous communications device. This field is 8 characters long with a default of “&M0&Q0”. This field is case in-sensitive; however, the default will be in upper case. (&M0&Q0)
DTE Auto-Data Speed	This option will adjust the speed of the data source (DTE) UART to the outgoing (modem-to-modem) data rate. So, at maximum this speed would be 9600 baud. This field is 6 characters long with a blank as default . This field is case in-sensitive. ( )
Disable Data Compression	This field will turn off the default data compression algorithms that are in use by most consumer modems. This field is 6 characters long with blank as the default. The AT commands that control this capability are supported by similar commands; however, these commands do not operate in the same manner. The Intel modems require the use of “H%C0” to disable V.42bis & MNP Class 5 data compression algorithms; however, the Paradyne products only use “%C0” to disable both algorithms. This field is case in-sensitive; with blank as the default. ( )
Enable Error Control	This field will turn on the V.42 LAPM and MNP error control protocols, if available on the modem. This field is 6 characters long with “blank” as the default. This V.42/MNP/Buffer mode first attempts to negotiate V.42 error control with the remote modem. If this fails, then the modem transitions to MNP, and if this fails then no error control is used. This field is case in-sensitive. ( )

Misc. Init. Param	This field is 20 characters long with blank as the default. This field supports any initialization parameters that are not already specified. The AT commands specified in this free-form field will be always the last initialization parameters to be sent to the external modem. This field is case in-sensitive; however, the default will be in upper case. ( )
Auto-Answer Ring Count	This field controls the number of rings required before the modem will automatically answer an incoming call. This field is 6 characters long with “S0=10” as the default. Typically, the maximum permissible value for this register is 255. The values 1-255 denote the number of incoming ring cycles. This field is case in-sensitive; however, the default will be in upper case. (S0=10)
Dial Type	This field controls the type of inter-register signaling to be used between the modem and the Central Office. The field name is “Dial Type: ” with a default of ”T “ for tone dialing. Pulse dialing is indicated by “P”. The field length should be 3 characters long. This field will be concatenated with the dial string. This field will be case in-sensitive; however, the default will be in upper case. (T)

Adjustable Make/Break Ratio	This field can be of particular importance when using a modem that may be transferable from country to country. The intent of this field is to control the make/break ratios of pulses and DTMF dialing. The Intel product information has support for the different make/break options for pulse dialing only. Intel uses the option “&P0” to select a ratio of 39% make and 61% break for communication within the U.S. and Canada. The option “&P1” sets a ration of 33% make and 67% break for the U.K. and Hong Kong. This field is 5 characters long with blank as the default. This field will be case in-sensitive. ( )
Dial Command	This field is 3 characters long with “D” as the default.. This field simply denotes the dialing command of the modem. This is a fairly standard command. This field will be case in-sensitive; however, the default will be in upper case. (D)
No Answer Time-Out	Most off-the-shelf external modems provide a timer that abandons any outbound data call after a predetermined interval. Some modems provide for this timer to be disabled, thus allowing an outbound call to ring indefinitely. AT&T Paradyne does not provide this capability with their modem line, because it is generally undesirable to have an outbound call attempt ring indefinitely. The internal modem must have this parameter disabled or set to at least 255 seconds. This is a non-administrable parameter. For the external modem connection, this parameter will be the first initialization string to be transmitted to the external modem. This field will be visible on the administration form in display mode only. This hardcoded constant can be overriden for type approval applications, specifically in the U.K and other Western European nations, by the use of the “Misc. Init. Param:” field. (S7=255)

3clear audits

This command is used to clear the cumulative and/or peak hour's data that has been collected about the status of each data relation audit.

SYNOPSIS

clear audits [cumulative **|** peak-hour]

PERMISSIONS

The following default logins may execute this command: inads, init.

EXAMPLES

clear audits cumulative
clear audits peak-hour

DESCRIPTION

This command is used to clear the cumulative and/or peak hour's data that has been collected for each data relation audit. The purpose of this command is to clear old data so that when the "status audits" command is used only data collected since the last "clear audits" command is displayed. With this command, the user can clear the peak hour's data that has been collected or both the peak hour and cumulative data (refer to the "status audits" manual page for more information).

Defaults

None

Parameters

cumulative	This option will cause the data collected since the last reboot or "clear audits cumulative" command and the data collected about the peak hour to be cleared.
peak-hour	This option will cause the data collected about the peak hour to be cleared.

Help Messages

If the technician presses HELP after entering "clear audits" the following message will be displayed:

```
peak-hour    cumulative
```

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

If the clear audits command is successful, the following message will be displayed on the SAT:

```
Command successfully completed
```

If the clear audits command is unsuccessful, the following message will be displayed on the SAT:

```
Error encountered, can’t complete request
```

FEATURE INTERACTIONS

The data cleared by the "clear audits" command is displayed using the "status audits" command. After the "clear audits" command is executed successfully the "display audits cumulative" and/or "display audits peak-hour" commands will only display information collected since the "clear audits" command was executed. The start date displayed on the status audits screen will reflect the time that the "clear audits" command was executed.

clear errors

This command moves errors and resolved alarms to the cleared-error list. alarms from the error log.

SYNOPSIS

clear errors

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

clear errors

DESCRIPTION

The clear errors command moves all errors and resolved alarms to the cleared-error list, thereby making room for new incoming error messages which might otherwise be dropped. This command will not clear active alarms from the alarm log. This command should be used with care because the information cleared may be lost if these entries are overwritten.

Cleared error entries will be the first entries overwritten when additional entries are needed to log new errors.

Defaults

No defaults.

Parameters

None.

Help Messages

If the system technician presses HELP after entering "clear errors," the following message will be displayed:

```
Entry is not required
```

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

If the clear errors command is successful, the following message will be displayed on the SAT:

```
Command successfully completed
```

If the clear errors command is unsuccessful, the following message will be displayed on the SAT:

```
Error encountered, can't complete request
```

FEATURE INTERACTIONS

Cleared errors can be displayed using the "display errors" command.

clear interface

This command will clear all values of counters maintained by the processor interface.

SYNOPSIS

clear interface location

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

clear interface 01a1
clear interface 01a2
clear interface a2

DESCRIPTION

The clear interface command will cause all counter values maintained by the Processor Interface (PI) circuit pack to be reinitialized. (These counters are displayed via the status interface command which is for use in the development environment only.) The PI circuit pack is a front end processor implementing the packet layer and link layer of the BX.25 protocol, and the integrated services digital network (ISDN) procedure-D protocol.

Defaults

No defaults.

Parameters

location	The location (cabinet-carrier-position) of the processor interface. The position determines which processor interface circuit pack will be cleared. A position of 1 is the first processor interface in the carrier, while a position of 2 is the second processor interface in the carrier.

Help Messages

If the system technician presses HELP after entering "clear interface," the following message will be displayed:

```
Enter location: [cabinet(1)], carrier(A-B), pos(1-2)
```

Error Messages

If the specified carrier is not the active PE, the following message will be displayed:

`Command must be executed from active SPE`

If the technician-entered cabinet and carrier is invalid for a PPN, the following message will be displayed:

`Invalid port-network specified`

If the technician-entered carrier is not a valid carrier, the following message will be displayed:

`Invalid carrier specified`

If the technician-entered carrier is not active, the following message will be displayed:

`Board invalid`

If there isn't a processor interface circuit pack administered for the specified position, but the specified carrier is active, the following error message will be displayed:

`Processor Interface (TN765) not started or is being started`

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

`'login id':'command' has a command conflict`

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

`Command resources busy; Press CANCEL to clear, and then resubmit`

If all of the available maintenance resources are currently in use, then the following message will be displayed:

`All maintenance resources busy; try again later`

OUTPUT

If the clear interface command is successful, the following message will be displayed on the SAT:

`Command successfully completed`

If the clear interface command is unsuccessful, the following message will be displayed on the SAT:

`Error encountered, can't complete request`

FEATURE INTERACTIONS

None.

clear isdn-testcall

This command cancels a ISDN-PRI test call already in progress.

SYNOPSIS

clear isdn-testcall group number/member number

PERMISSIONS

The following default logins may execute this command: system technician, inads, init

EXAMPLES

clear isdn-testcall 80/1
clear isdn-testcall 78/2

DESCRIPTION

The clear isdn-testcall command cancels an ISDN-PRI test call if one is currently in progress. Once a running test call is cleared, another test call is allowed to run.

Defaults

None.

Parameters

group number	The group number is an administered number associated with each trunk group.
member number	The member number is an administered number identifying a particular trunk within a trunk group.

Help Messages

If the system technician presses HELP after entering "clear isdn-testcall," the following is displayed:

```
Enter group #/member #
```

Error Messages

If the specified format of the trunk location is incorrect, the following message is displayed:

```
Format invalid
```

If the specified trunk group or member range is invalid, the following message is displayed:

```
Trunk or trunk group invalid
```

If a trunk group and member is not specified, the following message is displayed:

```
Must specify group/member pair
```

If the specified trunk group is not administered or has no members administered, the following message is displayed:

```
Group not assigned, or group assigned but with no member
```

If the specified trunk group member is not administered, the following message is displayed:

```
Group member not assigned
```

If the board on which the port resides is not administered, the following message is displayed:

```
Port not assigned
```

If a test call is currently not in progress when the command is entered, the following message is displayed:

```
Test Call not in progress
```

If the specified trunk is not an ISDN-PRI trunk, the following message is displayed:

```
Invalid non ISDN-PRI trunk specified
```

If the test call has already completed, the following message is displayed:

```
Test Call already terminated
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message is displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

If the clear isdn-testcall command is successful, the following message is displayed on the SAT:

```
Command successfully completed
```

If the clear isdn-testcall command is unsuccessful, the following message is displayed on the SAT:

```
Error encountered, can’t complete request
```

FEATURE INTERACTIONS

None.

clear link

This command will clear a link by performing a reset.

SYNOPSIS

clear link link-id

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

clear link 1
clear link 8

DESCRIPTION

The clear link command will clear the hardware error counters associated with the ports on the Processor Interface circuit pack (displayed via the status link command).

Defaults

None.

Parameters

link-id	The link-id is a number associated with each link (1-8). The link number is assigned via the communication-interface links form.

Help Messages

If the system technician presses HELP after entering "clear link," the following message will be displayed:

```
Enter 1 character link number
```

Error Messages

If the link identifier is not within the valid range, the following error message is displayed:

```
Link out of range, please press HELP
```

If the link is not administered, the following error message is displayed:

```
Link not administered or not enabled
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message is displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

If the clear link command is successful, the following message is displayed on the SAT:

```
Command successfully completed
```

If the clear link command is unsuccessful, the following message is displayed on the SAT:

```
Error encountered, can't complete request
```

FEATURE INTERACTIONS

None.

clear mst

This command will clear the trace buffer.

SYNOPSIS

clear mst

PERMISSIONS

The following default logins may execute this command: inads, init.

EXAMPLES

clear mst

DESCRIPTION

The clear mst command will clear the message trace buffer. This command is usually used before enabling the trace. It may be used while the trace is enabled to clear unwanted data.

Defaults

None.

Parameters

None.

Help Messages

If HELP is pressed after entering "clear mst," the following message will be displayed:

```
Entry is not required
```

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. A conflict could occur if another user was executing an enable, disable or clear message sequence trace command at the same time. The message is as follows:

```
'login id':'command' has a command conflict
```

OUTPUT

After the user has entered the command the following message appears at the bottom of the screen:

```
Command successfully completed
```

FEATURE INTERACTIONS

None.

clear pkt

This command forces a packet bus 'clear stimuli' to be sent over the packet bus.

SYNOPSIS

clear pkt port-network location

PERMISSIONS

The following default logins may execute this command: cust, inads, init.

EXAMPLES

clear pkt port-network 1

DESCRIPTION

This command provides the mechanism that will give a system technician the tool to resolve problems where the packet bus is not providing service to the system.

Parameters

location	A "location" represents the physical position of the packet bus that will be forced to send a 'clear stimuli' to all boards connected to it. A digit (1 - 3) must be entered.

Help Messages

If the system technician presses HELP after entering "clear pkt," the following message will be displayed:

```
Enter port-network; port network number (1-3)
```

Error Messages

If the packet bus is not administered, the following error message will be displayed:

```
Packet Bus is not activated, check system-parameters maintenance form
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

If the clear pkt command is successful, the following message will be displayed on the SAT:

```
Command successfully completed
```

FEATURE INTERACTIONS

None. For additional information please refer to EDD document 23154.

clear port

This command removes the maintenance mark from a port.

SYNOPSIS

clear port location

PERMISSIONS

The following default logins may execute this command: cust, inads, init, nms.

EXAMPLES

clear port 01c1102

DESCRIPTION

This command is used in conjunction with the "mark port" command. This command will remove the mark from the port and allow it to be usable.

Parameters

location	A "location" represents the physical position of the port to be busied out and is entered as "UUcSSrr" where "UU" represents the cabinet number, "c" represents the carrier, "SS" represents the slot position, and "rr" represents the circuit (port). A single digit cabinet (1 - 9) may be entered with or without a leading zero (0).

Help Messages

If the system technician presses HELP after entering "clear port," the following message will be displayed:

```
Enter 7 character port number
```

Error Messages

If the port is not administered, the following error message will be displayed:

```
Port not marked
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

If the clear port command is successful, the following message will be displayed on the SAT:

```
Command successfully completed
```

If the clear port command is unsuccessful, the following message will be displayed on the SAT:

```
Error encountered, cannot complete request
```

SYSTEM 85 R3 AND SYSTEM 75 R1 RELEASE DIFFERENCES

None.

FEATURE INTERACTIONS

None.

copy update-file

This command provides a mechanism for copying a field update file from the active SPE to the standby SPE

SYNOPSIS

copy update-file *override*

PERMISSIONS

The following default logins may execute this command: inads and init.

EXAMPLES

copy update-file
copy update-file override

DESCRIPTION

In a Duplex system only, the copy update-file will copy a field update file from the active SPE to the standby SPE. This command is intended to permit the user to recover from situations whereby the standby SPE was not available when a field update("patch") file was downloaded to the switch. All validation checks are made on the standby as it receives the file. If there is a newer, valid update file on the standby, the override option must be used to force the copy.

Parameters

override	The override parameter allows the user to copy the update file from the active SPE to the standby SPE regardless of the dates.

Help Messages

If the system technician presses HELP after entering "copy update-file" on a duplex SPE system the following message is displayed:

```
['override']
```

Error Messages

If the standby SPE contains a newer patch file than the active SPE and the override option was NOT used, the following message is displayed:

```
Active SPE's update file is older than standby's
```

If the vintage of the standby SPE doesn't match the vintage of the active SPE, the following message is displayed:

```
Update file vintage does not match standby SPE core vintage
```

If there is no update file on active processor, the following message is displayed:

```
No update file on tape
```

If the standby SPE is NOT in standby mode, the following message is displayed: is displayed:

```
Cannot access the standby SPE at this time
```

If the active SPE cannot establish a communication path to the standby SPE, the following message is displayed:

```
Could not establish netcon data call between SPE's
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If the update file is too large to fit on device, the following message is displayed:

```
Update file is too large to fit on device
```

If the checksum of the files is not correct, the following message is displayed:

```
Update file checksum failed
```

If the update is successful the following message is displayed:

```
Command completed successfully
```

OUTPUT

None.

FEATURE INTERACTIONS

386 System:

The form displayed for the list configuration software-vintage command has been modified to reflect the changes imposed by the flash architecture. The form is basically the same as for the tape based Intel system, but does not include fields such as "Tape Resident Vintage" which don't apply to 386 systems. It is these differences in the "list configuration software" command that should allow INADS to determine, with one query, the hardware configuration, software vintage and patch identifier.

There is no interaction with routine periodic or scheduled maintenance because patches are only applied on restarts before the system is in normal operation.

The flash checksum test acts as a backup check to make sure the entire field update file was applied correctly. It can fail because of a bad checksum update from a poorly constructed update file or because the patching operation has aborted. When the flash Checksum Test fails, a MAJOR on-board alarm is raised on the processor/memory circuit pack. Maintenance runs a data consistency test on a daily basis to check that copies of translations, announcements and software files are consistent across both processors in a High or Critical Reliability System. If the test detects a difference, a minor, off-board alarm is generated.

When checking the software, the test compares the memory resident software version and patch identifier. It also checks for the presence of a field update file and, if found, compares the old and new patch identifiers to make sure the same patch file id loaded on each processor. If the software or update files are inconsistent, the "list configuration software" command can be used to display the status of the patch file.

286 System:

The form displayed for the list configuration software-vintage is basically the same as that for the flash based Intel system, but includes the "Tape Resident" fields instead of the "Memory Card Resident" and "Flash Resident" fields which don’t apply to tape based intel systems. The "list configuration software" command allows INADS to determine, with one query, the hardware configuration, software vintage and patch identifier.

disable administered-connection

This command stops periodic and scheduled maintenance from being performed on a single administered connection or all administered connections.

SYNOPSIS

disable administered-connection [ac number | all]

PERMISSIONS

The following default logins may execute this command: inads, init, system technician, cust, rcust, mis.

EXAMPLES

disable administered-connection all
disable administered-connection 1
disable administered-connection 128

DESCRIPTION

The disable administered connection command inhibits scheduled and periodic testing from being performed on all or a single administered connection(s). This command stops the processing of in-line errors for all or the selected administered connection(s).

Defaults

None.

Parameters

ac number	The number of the administered connection being disabled.
all	If "all" is entered then all administered connections are disabled.

Help Messages

If the user presses HELP after entering "disable administered-connection," the following message will be displayed:

```
Enter assigned administered connection number(1-128) or ’all’
```

Error Messages

If the administered connection number entered is not "all" and is non numeric, the following message is displayed:

```
Identifier invalid
```

If the administered connection number entered is not within the valid range of connections, the following message is displayed:

```
Entry out of range
```

If the connection number entered is not administered, the following message is displayed:

```
Identifier not assigned
```

If the administered connection number entered is already disabled, the following message is displayed:

```
Administered connection already disabled
```

If the software data cannot be sent to the SAT, the following message will be displayed:

```
Error encountered, can’t complete request
```

If the command entered is in conflict with another currently executing command, then a message is displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
’login id’:’command’ has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

OUTPUT

After the user has entered the command and the command is successful, the following message appears at the bottom of the screen:

```
Command successfully completed
```

FEATURE INTERACTIONS

None.

disable mst

This command will allow the user to disable the mst.

SYNOPSIS

disable mst

PERMISSIONS

The following default logins may execute this command: inads, init.

EXAMPLES

disable mst

DESCRIPTION

The disable mst command will disable the message trace. If the trace was not already disabled for some other reason, a GAP marker will be inserted into the trace. The contents are then frozen, and can be viewed via the "list mst" command.

The command should be executed when done using the trace facility. If left enabled, the trace will continue to use CPU time until the run time limit expires.

Executing a disable mst command when the trace is already disabled will have no effect, and will indicate that it worked.

Defaults

None.

Parameters

None.

Help Messages

If the user presses HELP after entering "disable mst," the following message will be displayed:

```
Entry is not required
```

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

OUTPUT

After the user has entered the command the following message appears at the bottom of the screen:

```
Command successfully completed
```

SYSTEM 85 R3 AND SYSTEM 75 R1 RELEASE DIFFERENCES

None.

FEATURE INTERACTIONS

None.

disable synchronization-switch

This command disables automatic clock switching.

SYNOPSIS

disable synchronization-switch

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

disable synchronization-switch

DESCRIPTION

The disable synchronization command stops the automatic clock switching capability of the maintenance subsystem. Clock refers to the oscillator on a tone/clock or DS1 interface.

The synchronization subsystem provides error free digital communication between the switch and other PBXs, COs, or customer premise equipment. The subsystem is made up of system components involved in synchronization: TDM bus clock, DS1 trunk board, maintenance and administration software resident in the SPE.

Defaults

No defaults.

Parameters

None.

Help Messages

If the system technician presses help after entering "disable synchronization" the following message will be displayed:

```
Entry is not required
```

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear,and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

If the disable synchronization command is successful, the following message will be displayed on the SAT:

```
Command successfully completed
```

If the disable synchronization command is unsuccessful, the following message will be displayed on the SAT:

```
Error encountered, can't complete request
```

If the disable command is run and synchronization is currently disabled, the following message will be displayed on the SAT:

```
Synchronization-switch already disabled
```

FEATURE INTERACTIONS

None.

disable test-number

This command stops a specified test number from being performed during demand and periodic or scheduled maintenance.

SYNOPSIS

disable test-number number *[print | schedule]*

PERMISSIONS

The following default logins may execute this command: inads, init.

EXAMPLES

disable test-number 710
disable test-number 710 print
disable test-number 510 schedule

DESCRIPTION

The disable test-number command makes the user specified test number unavailable for any maintenance testing. An enable test-number must be issued to make the test number available.

Parameters

number	The number of the test that is to be maintenance disabled.
print	If specified, this parameter will cause the information displayed by this command to be sent to the printer attached to the terminal as well as to the screen.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "disable test-number," the following message will be displayed:

```
Enter test number
```

Error Messages

If the test-number entered is not a valid system test number, the following error message will be displayed:

```
Test number invalid
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

If the disable test-number command is successful, the following message is displayed:

```
Command successfully completed
```

If the disable test-number command is unsuccessful, the following message is displayed:

```
Error encountered, can't complete request
```

FEATURE INTERACTIONS

None.

display alarms

This command will display an options form which allows the technician to choose which alarms are to be displayed.

SYNOPSIS

display alarms *[print | schedule]*

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, rcust, bcms, init, browse.

EXAMPLES

display alarms
display alarms print
display alarms schedule

DESCRIPTION

The display alarms command brings up a hardware alarm report. This screen allows the technician various different options to select which alarms will be displayed on the alarm report. There are no parameters entered on the command line, parameters are selected on the hardware alarm report form instead.

An alarm can occur for any hardware object when it has been determined by the maintenance subsystem that a problem definitely exists. The impact of the problem is indicated by the alarm type:

Warning alarm—A problem which has been deemed important enough to log, or may be external to the system, but not severe enough to cause a noticeable degradation of service.

Minor alarm—A problem which could disable a local area of the system and so noticeably degrade the system.

Major alarm—A problem which widely degrades the system and seriously impairs service. This would cause a call to be placed to INADS.

A resolved alarm is a problem which has been corrected, and the alarmed component of the system is functioning correctly again. The alarm will be stamped with a resolved date and time, indicating that it is no longer a concern (any errors associated with the alarms will also be considered "resolved").

System Reboots and the Error and Alarm Logs

The system attempts to save the error and alarm logs to the memory card or tape for the 286, on the *active* SPE when any of the following events take place:

- The **save translation** command is executed.
- Translations are saved as part of scheduled maintenance (as administered on the maintenance-related system parameters form).
- A demand or software-escalated system reboot takes place.
- The PPN is about to lose all power after having been on battery backup.

Conditions such as unavailability of the MSS can prevent this attempt from succeeding.

Whenever the system reboots, the error log is restored from the disk on the SPE that becomes active with the reboot. Since the logs are saved to the disk on the SPE that was active before the reboot, the versions restored at reboot time may not be current. This occurs when either:

- The attempt to save at reboot did not succeed.
- The SPE that is active coming out of the reboot is not the same one to which the logs were last saved.

In such a case, the logs will not show the errors and alarms that have been logged since the last time a save was made to the SPE that became active with the reboot. When looking at errors that precede the last reboot, look for indications preceding the reboot to determine whether the logs restored at reboot are complete.

System resets less severe than a reboot rarely affect the error and alarm logs.

NOTE:
If there are SYSTEM errors in the Error Log, use **display initcauses** to obtain additional information. Information that could not be logged during a system reset may be found here.

Defaults

All alarms will be displayed.

Parameters

print	This will cause the report to be printed if a printer is linked to the SAT.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [4] for more details.

There are no parameters entered on the command line, parameters are selected on the hardware alarm report form instead.

Backward Paging of the Alarm/Error Log

G3V3 and later software allows the user to display the next and previous pages of the alarm/error log. When the user executes the **display alarm/error** command to view the alarm/error log. If more than one page of alarms/errors is stored by the system, the user may use the NEXT PAGE key or the PREV PAGE key (513 or 715 terminals only use *F8* or *F7* for all other terminals) to toggle between pages (up to a maximum of two pages). If the system has storied one or less than one page of alarms/errors the command will display the alarms/errors and echo *Command successfully completed* and exit. Help messages/Key actions:

Next Page—The command will display the next page . If the user is not viewing the first page of alarms/errors, is not viewing a page as a result of depressing the *Prev Page* key, and there are more entries to display, the help message will be:

press CANCEL to abort, NEXT PAGE to complete, or PREV PAGE for previous page.

Prev Page—Press previous page key to return to the previous page. The system will display the help message:

press CANCEL to abort or NEXT PAGE for next page If the user is not viewing the first page of alarms/errors, is not currently viewing a page as a result of pressing the *prev Page* key, and there are no remaining entries to display, the help message will be:

press CANCEL to abort, NEXT PAGE to complete, or PREV PAGE for previous page.

Help Messages

If the technician presses HELP after entering "display alarms" the following message will be displayed:

```
['print' or 'schedule']
```

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

FORM INPUT

After entering the command "display alarms," the system technician will be presented with an options form.

Alarm Types	The type of alarm to be displayed is specified by placing a 'y' or 'n' in the alarm type fields. The technician can choose a combination of active alarms, major, minor, warning, or resolved alarms.
Interval	Display alarm records for the last (m)onth, last (h)our, last (d)ay, last (w)eek, or (a)ll. The default is all.

From	Display alarm records from the time specified by mm/dd/hh/mm, where mm is the month, dd is the day, hh is the hour and mm is the minute. If no "from" date is entered, then no checking is done. This will give the user all the alarms active since a month prior to the current time.
To	Display alarm record to the time specified by mm/dd/hh/mm, where mm is the month, dd is the day, hh is the hour and mm is the minute. If no "to" date is entered, any alarm which is active after the from date will be selected.
Equipment Type	The technician can choose between seven different equipment types. If there is no input to any of these fields, the system will default to all the equipment. The user can select one of the following fields:

- Cabinet: This allows the technician to display all alarms associated with a particular cabinet. Alarms for a cabinet are referenced by a number ranging from 1 to 3 which is assigned during cabinet administration.
- Port Network: This allows the technician to display all alarms associated with a particular port network. Alarms for a port network are referenced by a number ranging from 1 to 3.
- Board Number: This allows the technician to choose all alarms associated with a particular circuit pack for display. Alarms for a (cabinet-carrier-slot). If the cabinet number is omitted, the system will default to 1.
- Port: This allows the technician to choose all alarms associated with a particular port on a circuit pack for display. Alarms for a port circuit are referenced by port location (cabinet-carrier-slot-circuit). If the cabinet number is omitted, the system will default to 1.
- Category: Alarms for a particular equipment category.
- Extension: Alarms associated with an extension number.
- Trunk (group/member): The technician can choose to view all alarms associated with a particular trunk group or trunk group member. The group identifier should be entered to view all alarms associated with a trunk group XXX/___. The group identifier and member identifier should both be entered to view all alarms associated with a specific trunk group member XXX/XXX.

```
display alarms                                                  Page 1 of 1
                                 ALARM REPORTS

        The following options control which alarms will be displayed.
        ALARM TYPES
                   Active? y_      Resolved? n_
                    Major? y_         Minor? y_      Warning? y_
        REPORT PERIOD
                 Interval: m_    From: __/__/__:__  To: __/__/__:__
        EQUIPMENT TYPE ( Choose only one, if any, of the following )
                              Cabinet: ____
                         Port Network: __
                         Board Number: _______
                                 Port: ________
                             Category: ________
                            Extension: _____
                Trunk ( group/member ): ___/___
```

Field Help

Following are the help messages that the system technician will see upon tabbing to the specified field and pressing the HELP key.

Active?	"n(o) y(es)"
Resolved?	"n(o) y(es)"
Major?	"n(o) y(es)"
Minor?	"n(o) y(es)"
Warning?	"n(o) y(es)"
Interval:	The interval field help is a list of objects. This list includes m(onth), h(our), d(ay), w(eek), a(ll).
	"From (month) "Enter month between 1-12"
From (day)	"Enter day between 0-31"
From (hour)	"Enter hour between 0-23"
From (minute)	"Enter minute between 0-59"
To (month)	"Enter month between 1-12"
To (day)	"Enter day between 0-31"
To (hour)	"Enter hour between 0-23"
To (minute)	"Enter minute between 0-59"
Cabinet:	"Enter cabinet number (1-3)"
Port Network:	"Enter port network number (1-3)"
Board Number:	"Enter 5 character board number; cabinet(01-3):carrier(A-E):slot(00-20)"

Port:	"Enter port number; [cabinet(1-3)]:carrier(A-E):slot(0-20):circuit(01-31)"
Category:	The category field help is a list of objects. This list includes the following: adm-conn, announce, bri/asai, card-mem, cdr, data-mod, detector, dup-spe, environ, exp-intf, ext-dev, generatr, inads-link, infc, maint, mbus, memory, misc, mnt-test, modem, netcon, pkt, pkt-ctrl pms/jrnl, procr, quick-st s-syn, stabd, stacrk, stations, sys-prnt, tape, tdm, tone, trkbd, trkcrk, trunk, wideband. For a table describing the category entries in greater detail, see the "display errors" command.
Extension:	"Enter assigned extension"
Trunk (group)	"Enter group number between 1-99"
Trunk (member)	"Enter group member between 1-99, or blank"

Field Error Messages

Following are the error messages that will be displayed on the screen. The messages are displayed when the system technician tabs out of a field and the validation routines are executed. In the following messages, an "x" represents the character that was entered by the user.

Active?	""x" is an invalid entry; please press HELP"
Resolved?	""x" is an invalid entry; please press HELP"
Major?	""x" is an invalid entry; please press HELP"
Minor?	""x" is an invalid entry; please press HELP"
Warning?	""x" is an invalid entry; please press HELP"
Interval:	""x" is an invalid entry; please press HELP"
From (month)	"Entry must be all digits"
From (day)	"Entry must be all digits"
From (hour)	"Entry must be all digits"
From (minute)	"Entry must be all digits"
To (month)	"Entry must be all digits"
To (day)	"Entry must be all digits"
To (hour)	"Entry must be all digits"
To (minute)	"Entry must be all digits"
Cabinet:	"Entry invalid"
Port Network:	"Entry invalid"
Board Number:	"Board invalid"

Port:	"Port invalid"
Category:	""xxxxxxxx" is an invalid entry; please press HELP"
Extension:	"Entry must be all digits"
Trunk (group)	"Entry must be all digits"
Trunk (member)	"Entry must be all digits"

FORM OUTPUT

After valid options are entered by the technician, an alarm report is displayed. The data displayed on this form will be:

Port	The location of the alarmed object. For installed circuit packs, the location is displayed as "cabinet-carrier-[slot]-[circuit]." For Port Network-related objects, the location is displayed as "PN UUB," where "UU" is the Port Network number and B is the bus (A or B). For Fiber Link-related objects, the location is displayed as "x a-PNC" where "x" is the Fiber Link number and "a" is the PNC side (A or B). This is the same identifier as used by the alarm log.
Maintenance Name	The logical name of the maintenance object which has been alarmed.
On Brd	Whether the fault detected is on the associated circuit pack, or an off board element connected to the circuit pack.
Alt Name	The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number.
Alarm Type	"MAJOR," "MINOR," or "WARNING." This is an indicator to the seriousness of the alarm raised.
Service State	"RDY" (ready for service), "OUT" (out of service), or "IN" (in service). This is the current service state of the station and trunk ports shown. If a blank is displayed in this field it means that no service state is associated with the MO.

Ack?	The columns under the “1” and “2” headings denote if the alarm has been acknowledged by the first and second OSS telephone numbers, respectively. A "y" in this field means that the alarm has been acknowledged. A "n" means that the alarm has not been acknowledged. A "c" means that the alarm resolved and cleared and the alarm notification was acknowledged. A blank means that there will be no attempt to report the alarm.
Date Alarmed	Day, hour, and minute of alarm.
Date Resolved	Day, hour, and minute of resolution. For active alarms this field will be zero (0).

For the following output example, the ENTER key was pressed immediately after entering the display alarms command.

```

```

FEATURE INTERACTIONS

If the alarm origination is disabled via "change system-parameters maintenance," the "Ack?" field displays blanks no matter what the true acknowledge state is for the alarm.

display cabinet

display cabinet UU **[print | schedule]**

The display cabinet command displays the port network number, type, layout, room, floor, building, and carriers for for the specified cabinet.Output

CABINET DESCRIPTION	
Cabinet	The administered number of the cabinet.
Cabinet Layout	Type of cabinet (five-carrier or single-carrier-stack).
Cabinet Type	The type of port network housed in the cabinet (processor or expansion).
Number of Portnetworks	The number of port networks in the cabinet (1 or 2).
Room	Room where cabinet is located, if administered on the cabinet form.
Floor	Floor where cabinet is located, if administered on the cabinet form.
Building	Building where cabinet is located, if administered on the cabinet form.
CARRIER DESCRIPTION	
Carrier	Letter designation of the carrier.
Carrier Type	Port, processor, switch-node, fan or not-used.
Number	The administered port network number or switch node number.

The following display shows a typical result when **display cabinet 1** is entered.

```
display cabinet 1
                               CABINET

                             CABINET

 CABINET DESCRIPTION
                  Cabinet: 3
           Cabinet Layout: single-carrier-stack
             Cabinet Type: expansion-portnetwork
   Number of Portnetworks: 1
                     Room: 30n46
                    Floor: first
                 Building: main

 CARRIER DESCRIPTION
   Carrier       Carrier Type        Number

      D        not-used            PN  03
      D        not-used            PN  03
      B        port                PN  03
      A        expansion-control   PN  03
```

display communication-interface

display communication-interface
hop-channels | links | processor-channels
[print | schedule]

The display communication-interface command displays three different forms depending on the object specified by the user. See also **status link** for more details.

The **hop-channels** object displays translation data for hop channels. A hop channel is a bi-directional network channel between two interface links for DCS message hopping. A hop channel is used to tandem DCS messages from one interface link to another interface link.

The **processor-channels** object displays translation information for each of the local processor channels. A processor channel is one several data streams which are multiplexed by the X.25 protocol onto a single data link. The system has 128 total processor channels; up to 64 can be assigned to a single link.

The **links** object displays translation information for each communication interface link. A link is an electronic communication channel transmitted over the Packet Bus for carrying packet-switched data. There are 16 links which terminate at one end on the Packet Interface circuit pack in the SPE. At the physical and link layers, the link terminates at the other end on a port on the PBX's switching matrix. At a higher level, the link continues over a transmission facility to another endpoint, such as a DCS node or AUDIX. The link carries application messages between the SPE and other switches or adjuncts.

Output for Hop-channels qualifier

Link/Channel A	Identifies the first of the two link/channels joined by the hop channel. Links range from 1 to 16, channels from 1 to 64. The link/channel must not be assigned to a local processor channel, and the link must not be assigned to a PRI local processor channel.
Link/Channel B	Identifies the second of the two link/channels joined by the hop channel. Links range from 1 to 16, channels from 1 to 64. The link/channel pair must not be assigned to a local processor channel, and the link must not be assigned to a PRI local processor channel.

The number of the local processor channel used to hop the interface link channels is not shown. The following display shows a typical result when **display comm hop** is entered.

```
display communication-interface hop-channels         Page   1 of   4

                            HOP CHANNEL ASSIGNMENT

    Link/Channel A   Link/Channel B       Link/Channel A   Link/Channel B

     3     1           4     12
```

Output for Links Object

Link	**The physical link number.**
Enabled	"Yes" indicates the link is enabled for normal operation. "No," the default, indicates that message flow over the link is suppressed. The link can only be enabled if the corresponding data module has been administered.
X.25 Extension	The extension of the TN577 Packet Gateway port through which the link is routed.
Destination Number	"External" indicates the link goes to equipment connected locally to an external port on a Packet Gateway circuit pack. Such ports must show a "y" in the Establish Connection field.

Establish Connection	This field indicates whether the local switch is responsible for any part of call set-up with the far-end data module. If the physical link is through a pair of data modules, each switch terminating the link must set up a connection to its PDM/TDM. If the physical link is over a DS-1 interface, it is possible for one switch to set up the entire connection without any initiation by the other end. However, ISDN signaling links must be set to 'y' at both ends of the interface.
Connected Data Module	The extension of a PDM/MPDM directly connected to a PGATE port cable or to a a cable to an adjunct in an administered connection arrangement.
Identification	This field records the type and identification number of the machine connected to this link. This field is for informational purposes only.

The following display shows a typical result when **display communication-interface links** is entered.

```
display communication-interface links                       SPE A

                            INTERFACE LINKS

                 X.25     Destination  Establish    Connected
Link  Enabled  Extension    Number     Connection  Data Module  Identification

14:      n
15:      n
16:      n
```

Output for Processor-Channel Object

Proc Chan	The Processor Channel denotes one of the processor channels on the processor link. With this link/logical channel pair and the one specified in the interface link and interface channel field, a network channel to a remote machine is specified. The valid range for link is 1 to 16, specifying one of the 16 interface links. Each interface link corresponds to a port on a PGATE board. The Processor channel is not administerable.
Application	This field specifies the type of application that connects to this processor channel. The following lists the valid entries:
Interface Link	The interface link to which the processor channel is connected.
Interface Chan	The channel on the interface link to which the processor channel is connected.
Local Port	The switch application port used by the local session.
Remote Port	The application port used by the remote session.
Adjunct Name	The name of the adjunct connected to this processor channel. These are defined in the Adjunct Name Form. Only AUDIX and MSA channels (AUDIX, MSAAMWL, MSAHLWC, MSALLWC, and MSAMCS) require entries in this field.
Machine-ID	This is the network machine ID for the remote machine. Machine IDs are required only for the AUDIX adjunct and DCS connections.

The following display shows a typical result for **display comm proc**.

```
display communication-interface processor-channels        Page   1 of 8

display disabled-tests

display disabled-tests [print | schedule]

The display disabled-tests command displays the numbers off all maintenance tests that have been disabled by INADS. These tests will not be available for background or demand testing.

Output

Test Number   The numbers of the disabled tests

The following display shows a typical result when **display disabled-tests** is entered.

```
display disabled-tests                                  SPE A

                         DISABLED TEST INFORMATION

         Test Number

         710

Command successfully completed
```

display errors

This command will display an options form that allows the technician to choose which errors are to be displayed.

SYNOPSIS

display errors *high-resolution [print | schedule]*

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, init, nms, browse.

EXAMPLES

display errors
display errors print
display errors schedule
display errors high-resolution print

DESCRIPTION

The display errors command brings up an error report. This screen allows the technician various different options to select which errors will be displayed on the hardware error report. There are no query parameters entered on the command line. Those type of parameters are selected on the error report form instead.

Errors can result from in-line firmware errors, periodic tests, failures detected while executing a test command, software inconsistency, or a data audit discrepancy.

System Reboots and the Error and Alarm Logs

The system attempts to save the error and alarm logs to the memory card (or tape for the 286 system), on the *active* SPE when any of the following events take place:

- — The **save translation** command is executed.
- — Translations are saved as part of scheduled maintenance (as administered on the maintenance-related system parameters form).
- — A demand or software-escalated system reboot takes place.
- — The PPN is about to lose all power after having been on battery backup.

Conditions such as unavailability of the MSS can prevent this attempt from succeeding.

Whenever the system reboots, the error log is restored from the disk on the SPE that becomes active with the reboot. Since the logs are saved to the disk on the SPE that was active before the reboot, the versions restored at reboot time may not be current. This occurs when either:

- — The attempt to save at reboot did not succeed.
- — The SPE that is active coming out of the reboot is not the same one to which the logs were last saved.

In such a case, the logs will not show the errors and alarms that have been logged since the last time a save was made to the SPE that became active with the reboot. When looking at errors that precede the last reboot, look for indications preceding the reboot to determine whether the logs restored at reboot are complete.

System resets less severe than a reboot rarely affect the error and alarm logs.

NOTE:
If there are SYSTEM errors in the Error Log, use **display initcauses** to obtain additional information. Information that could not be logged during a system reset may be found here.

Defaults

All errors will be displayed.

Parameters

high-resolution	This option specifies that the error report should be displayed with high resolution time stamps for the first occurrence and last occurrence of the error. This high resolution time stamp includes seconds and a sequence count within a second. The sequence count starts over for each second.
print	This will cause the report to be printed if a printer is linked to the SAT.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Backward Paging of the Alarm/Error Log

G3V3 software allows the user to display the next and previous pages of the alarm/error log. When the user executes the **display alarm/error** command to view the alarm/error log. If more than one page of alarms/errors is stored by the system, the user may use the NEXT PAGE key or the PREV KEY key (513 or 715 terminals only use *F8* or *F7* for all other terminals) to toggle between pages (up to a maximum of two pages). If the system has storied one or less than one page of alarms/errors the command will display the alarms/errors and echo *Command successfully completed* and exit. Help messages/Key actions:

Next Page—The command will display the next page . If the user is not viewing the first page of alarms/errors, is not viewing a page as a result of depressing the PREV PAGE key, and there are more entries to display, the help message will be:

press CANCEL to abort, NEXT PAGE to complete, or PREV PAGE for previous page.

Prev Page—Press previous page key to return to the previous page. The system will display the help message:

press CANCEL to abort or NEXT PAGE for next page If the user is not viewing the first page of alarms/errors, is not currently viewing a page as a result of pressing the PREV PAGE key, and there are no remaining entries to display, the help message will be:

press CANCEL to abort, NEXT PAGE to complete, or PREV PAGE for previous page.

Help Messages

If the technician presses HELP after entering "display errors" the following message will be displayed:

```
['high-resolution'], ['print' or 'schedule']
```

Error Messages

If the the software data cannot be sent to the SAT, the following message will be displayed:

```
Error encountered, can't complete request
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

FORM INPUT

After entering the command "display errors," the system technician will be presented with an options form.

Error Type	The type of error to be displayed is specified by choosing an error type. This field defaults to display all errors.
Error List	The user may select which error list the error entries will be selected from by entering 'active-alarms', 'errors', or 'cleared-errors'. This field defaults to the 'active-alarms' error list. The error list selected will affect the Report Title on the output form.
Report Period	The technician can specify a starting and stopping time from which errors should be reported.
Interval	Display only error records for the last hour, last day, last week or all. The default is the last day.

From	Display only error records from the time specified by dd/hh/mm, where dd is the day, hh is the hour and mm is the minute. The default is the earliest time of the existing error records in the log.
To	Display only error records to the time specified by dd/hh/mm, where dd is the day, hh is the hour and mm is the minute. The default is the current time.
Equipment Type	The technician can choose between seven different equipment types: Cabinet: This allows the technician to display all errors associated with a particular cabinet. Errors for a cabinet are referenced by a number ranging from 1 to 3 which is assigned during cabinet administration. Port Network Number: This allows the technician to display all errors associated with a particular port network number. Errors for a port network are referenced by a number ranging from 1 to 3. Board Number: This allows the technician to choose all errors associated with a particular circuit pack for display. Errors for a circuit pack are referenced by circuit pack location (cabinet-carrier-slot). Port: This allows the technician to choose all errors associated with a particular port on a circuit pack for display. Errors for a port circuit are referenced by port location (cabinet-carrier-slot-circuit). Category: Errors for a particular equipment category. Extension: Errors associated with an extension number. Trunk (group/member): The technician can choose to view all errors associated with a particular trunk group or trunk group member. The group identifier should be entered to view all errors associated with a trunk group XXX/___. The group identifier and member identifier should both be entered to view all errors associated with a specific trunk group member XXX/XXX.

```
display errors                                                  Page   1 of   1
                                    ERROR REPORT
     The following options control which errors will be displayed.
         ERROR TYPES
            Error Type: _____         Error List: active-alarms
         REPORT PERIOD
            Interval: _      From: __/__/__:__ To: __/__/__:__
         EQUIPMENT TYPE ( Choose only one, if any, of the following )
                                Cabinet: __
                           Port Network: __
                           Board Number: ____
                                   Port: ______
                               Category: ________
                              Extension: _____
              Trunk ( group/member ): ___/___
```

Field Help

Following are the help messages that the system technician will see upon tabbing to the specified field and pressing the HELP key.

Error Type:	"Enter error type"
Error List:	The Error List field help provides the following help list: active-alarms, errors, cleared-errors.
Interval:	The interval field help provides the following help list: h(our), d(ay), w(eek), m(onth), a(ll).
From (month)	"Enter month between 1-12"
From (day)	"Enter day between 0-31"
From (hour)	"Enter hour between 0-23"
From (minute)	"Enter minute between 0-59"
To (month)	"Enter month between 1-12"
To (day)	"Enter day between 0-31"
To (hour)	"Enter hour between 0-23"
To (minute)	"Enter minute between 0-59"
Cabinet:	"Enter cabinet number (1-3)"
Port Network:	"Enter port network number (1-3)"

Board Number: "Enter 5 character board number; cabinet(1-3):carrier(A-E):slot(0-20)"

Port: "Enter port number; [cabinet(1-3)]:carrier(A-E):slot(0-20):circuit(01-31)"

Category: The category field help is a list of objects. This list includes the following: adm-conn, announce, bri/asai, cdr, data-mod, detector, dup-spe, environ, exp-intf, ext-dev, generatr, inads-link, infc, maint, mbus, memory, misc, mnt-test, modem, netcon, pkt, pkt-ctrl pms/jrnl, procr, quick-st s-syn, stabd, stacrk, stations, sys-prnt, tape, tdm, tone, trkbd, trkcrk, trunks. Field Error Messages

Following are the error messages that will be displayed on the screen. The messages are displayed when the system technician tabs out of a field and the validation routines are executed. In the following messages, an "x" or "xxxxxxxx" represents the characters that were entered by the user.

Interval: '"x" is an invalid entry; please press HELP key"

Error Type: 'Entry must be all digits"

From (month) 'Entry must be all digits"

From (day) 'Entry must be all digits"

From (hour) 'Entry must be all digits"

From (minute) 'Entry must be all digits"

To (month) 'Entry must be all digits"

To (day) 'Entry must be all digits"

To (hour) 'Entry must be all digits"

To (minute) 'Entry must be all digits"

Cabinet "Cabinet invalid"

Port Network Number:	"Port Network invalid"
Board Number:	"Board invalid"
Port:	"Port invalid"
Category:	""xxxxxxxx" is an invalid entry; please press HELP"
Extension:	"Entry must be all digits"
Trunk (group)	"Entry must be all digits"
Trunk (member)	"Entry must be all digits"

FORM OUTPUT

After valid options are entered by the technician, a hardware error report is displayed. The data displayed on this form will be:

Port	The location of the maintenance object. For installed circuit packs, the location is displayed as "cabinet-carrier-[slot]-[circuit]." For Port Network-related objects, the location is displayed as "PN xx," where "xx" is the Port Network number.
Maintenance Name	The logical name of the maintenance object which has had an error logged against it.
Alt Name	The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xx when the object is a private CO line, where xx is the private CO line group number.
Error Type	A code identifying the type of problem encountered for this maintenance object. Because the error code is generally specific to the individual maintenance object and the total number of error codes may be extensive, only the error number is displayed. The technician must use this error number in conjunction with the logical name information to determine the exact nature of the error.
Aux Data	Additional information concerning the maintenance object error condition which may be useful to the technician. Like the error type, this data will be specific to the maintenance object type. However, unlike the error code, only the most recent value of the auxiliary data will be retained for each error record.

First Occur	The month, day, hour, and minute (and second if the high-resolution command line option is used) that the error was first recorded.
Seq Cnt	Sequence Count - This number indicates the order of errors logged within a second for the time stamps associated with the first occurrence and last occurrence of an error. This information is displayed only if the "high-resolution" command line option is entered. There may be gaps for the sequence numbers within a given second since the last occurrence of an error may replace an existing entry that had been assigned the missing sequence number, and since sequence counts are also used with software event information not shown in the hardware error log.
Last Occur	The month, day, hour, and minute (and second if the high-resolution command line option is used) of the most recent error. Note: if the system is unable to retrieve the time of day when the error occurred, a 'dummy' date will be stamped in the log so as to distinguish it from reliable data. It would appear as "00/00/01:07".
Err Cnt	Error Count - The total number of times that the error type has occurred for this maintenance object. Should this field exceed the display space allowed on the terminal screen (three characters), the numbers will be replaced by '256' This should inform the technician that a larger number was encountered, but could not be displayed correctly.
Err Rt	Error Rate - The average rate at which the errors have occurred from the first occurrence to the present. Should this field exceed the display space allowed on the terminal screen (three characters), the numbers will be replaced by '256' This should inform the technician that a larger number was encountered, but could not be displayed correctly.

Rt/Hr	Rate per Hour - An approximation of the rate that this error occurred in the last hour. Should this field exceed the display space allowed on the terminal screen (three characters), the numbers will be replaced by '256' This should inform the technician that a larger number was encountered, but could not be displayed correctly.
Al St	Alarm Status - A character indicating the status of this maintenance object in the error and alarm logs. The allowed values are: "n" for not alarmed, "a" for active alarm, "r" for a resolved alarm, "s" for "software restart requested" as a result of a software requested (non-demand) system restart, and "c" for a resolved alarm that was forcibly resolved via the "clear" option of the *test* command.
Ac	Active? - A flag indicating whether or not the maintenance object is still under active consideration by the maintenance subsystem. If set to 'no', maintenance no longer considers that this error report indicates a problem.

Example of the Hardware Error Log Display without the High-Resolution Command Line Option

For the following output example, the ENTER key was pressed immediately after entering the display errors command without the "high-resolution" command line option. Only those errors associated with alarms are displayed since the "Error List" field on the options form defaults to 'active_alarms'.

```
display errors                                                    Page  1   SPE A

display events

display events [print]

A vector event is the occurrence of something unexpected during a vector-routed call due to resource exhaustion or faulty vector programming. (For example, route-step failures are typically due to the programming of an invalid extension.) These types of failures are not due to faulty hardware or system software error and do not constitute incorrect feature operation. This command allows you to diagnose and correct vectoring problems due to the above-mentioned causes. See *DEFINITY Communications System Generic 3 Call Vectoring and Expert Agent Selection (EAS) Guide*, 555-230-520, for information on how to interpret this report.

Input Form

The following entry form is displayed to allow limiting the report to events of a certain type or from a certain time period. Enter the desired parameters and press ENTER.

Category	"Vector'' specifies the type of event report to display and is the only valid entry.
Report Period	The fields in this section allow you to view only those vector events that occurred within a specific time period. If these are left blank, all vector events recorded are displayed.
Interval:	This field specifies a display of all events within the last time period of the type Enter the first letter of one of the following selections: *a*ll, *m*onth, *d*ay, *h*our, *m*inute.
Start/Stop Time	The starting and ending times, in 24-hour notation, of the interval to be reported.
Vector Number	The number of the vector (1-256) for which events will be reported. If this field is left blank, events for all vectors will be reported.
Event Type	Specific types of vector events are associated with numbers from 50000 to 50999. Entering one of these numbers will limit the report to events of this type. If this field is left blank, events for all types of vectors will be reported.

Output

See *DEFINITY Communications System Generic 3 Call Vectoring and Expert Agent Selection (EAS) Guide*, 555-230-520, for more information on how to interpret this report. In particular, the Event Data 2 field will be associated with possible causes and repair strategies for the event.

Event Type	A number from 50000 to 50999 that identifies what type of vector event occurred.
Event Description	A text string describing the event.
Event Data 1	If in the format *number*/*number* such as ‘‘200/10’’, this indicates the vector number and step number associated with the event. If in the format “Split *number*’’ such as “Split 2’’, this indicates the split number.
Event Data 2	Additional data concerning the event encoded as a hex number.
First Occur	The date and time when the vector event first occurred.
Last Occur	The date and time when the vector event last occurred.
Evnt Cnt	The total number of times, up to 255, that vector events of this type have occurred.

The following example shows the input form for **display events**:

```
display events                                     Page  1 of  1   SPE B

                         EVENT REPORT

  The following options control which events will be displayed.

         EVENT CATEGORY

            Category: vector

         REPORT PERIOD

            Interval: _a_    From: __/__/__:__ To: __/__/__:__

```

display initcauses

This command records and displays a history of restarts performed by the system.

SYNOPSIS

display initcauses [print | schedule]

PERMISSIONS

The following default logins may execute this command: system technician, inads, init, nms.

EXAMPLES

display initcauses
display initcauses print
display initcauses schedule

DESCRIPTION

The display initcauses command displays a history of recovery steps taken by the system. *This command displays information for restarts of the active processor only*. Every time the system performs some type of recovery (due to user request or a hardware or software problem), the recovery information is stored. The software error log also contains information pertaining to restarts. If a reset 4 (reboot) occurs, the software error log will also be stored on tape. Information in the software error log should be used in conjunction with information in the initcauses log.

The history of the last 16 restarts performed by the system will be recorded to the initcauses buffer in chronological order. This buffer will fill an entire screen with information if it is completely full. Power failures in the processor complex wipe out the entire initcauses buffer which is stored by the software. In duplex systems, both processors have to lose power before the information will be lost.

Defaults

No defaults.

Parameters

print This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses HELP after entering "display initcauses" the following message will be displayed:

```
['print' or 'schedule']
```

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Cause

The cause field indicates the reason for the restart. Some of the possible reasons for a restart follow:

- **Active Down:** (High or Critical Reliability System only) The Active SPE went into SPE Down mode. The Duplication Interface initiated an SPE-interchange to the Standby SPE. If this initcause triggers an SPE interchange when the Standby is NOT in Maintenance mode, the previous entry in the log may actually represent a restart that occurred on the Standby SPE. See the preceding description of **display initcauses** for a complete explanation. If a High or Critical Reliability System does a PEI with a warm start, the system software often requests a Cold 2 restart to recover properly only minutes after the warm start has occurred.
- **Bad Handshake:** (High or Critical Reliability system only) The Duplication Interface received inconsistent handshakes from the Active SPE. Thus, the Duplication Interface initiated an SPE-interchange to the Standby SPE. If this initcause triggers an SPE interchange when the Standby is NOT in Maintenance mode, the previous entry in the log may actually represent a restart that occurred on the Standby SPE. See the preceding description of **display initcauses** for a complete explanation. If a High or Critical Reliability System does a PEI with a warm start, the system software often requests a COLD 2 restart to recover properly only minutes after the warm start has occurred.
- **Bad Memory:** A defective memory circuit pack generating too many errors caused a restart.
- **System Technician Request:** The restart was performed because of system technician demand. A system technician-requested **reset system 4** command entry should always precede an **upgrade software** command entry.
- **Failed Interchange:** A "hot-start" interchange (system technician-demanded, scheduled, or software-requested) failed because shadowing was disabled.
- **From Monitor (mon):** (For Development Environment only)
- **Initialized:** This is always the first entry in the history and is present until more than 15 restarts have been performed. It indicates power-up and also occurs if the Maintenance/Tape Processor is reset during initialization.

- **LMM Request:** A sanity time-out was requested by the LMM firmware. The three processor circuit pack LEDs blink until the sanity timer goes off. The LMM requests a restart like this when it gets into trouble, usually with memory.
- **Maintenance Reset:** The Maintenance/Tape Processor or Duplication Interface reset the system. This refers to resets of the SPE by maintenance in SPE Down mode in which maintenance periodically tries to awaken the SPE.
- **No Handshake:** (High or Critical Reliability System only) The Duplication Interface lost handshaking with the active SPE. Thus, the Duplication Interface initiated an SPE-interchange to the Standby SPE. A defective tape drive may cause the Active SPE to miss handshakes with the Duplication Interface which, in turn, could result in an initialization cause of "No Handshake." Check the Hardware Error Log for TAPE-related error types and alarms and follow the recommended repair procedures in the TAPE Maintenance documentation. If this initcause triggers an SPE interchange when the Standby is NOT in Maintenance mode, the previous entry in the log may actually represent a restart that occurred on the Standby SPE. See the preceding description of **display initcauses** for a complete explanation. If a High or Critical Reliability System does a PEI with a warm start, the system software often requests a Cold 2 restart to recover properly only minutes after the warm start has occurred.
- **Oryx Request:** A sanity time-out was requested by the Oryx operating system. The three processor circuit pack LEDs blink until the sanity timer goes off. Oryx requests a restart like this when it gets into trouble, usually with software or the 80286 processor.
- **Sanity Timer Reset:** The sanity timer on the processor timed out and reset the system. This event usually indicates a software fault.
- **Scheduled Interchange:** A scheduled SPE-interchange occurred.

- **Software Request:** Software requested the system restart. In a system equipped with High or Critical Reliability, software can also request SPE-interchanges when it detects problems. See the Software Requested Interchanges Caused by Alarm Conditions table (Table 8-1) in the "SPE-Interchanges" section of Chapter 8, "Reliability Systems: A Maintenance Aid". If this initcause triggers an SPE interchange when the Standby is NOT in Maintenance mode, the previous entry in the log may actually represent a restart that occurred on the Standby SPE. See the preceding description of **display initcauses** for a complete explanation.
- **SPE-Select Lead Change:** (High or Critical Reliability System only) The system could not determine why the SPE changed its status from Active or Standby. However, this change usually indicates a transition from Active to Standby. If a High or Critical Reliability System does a PEI with a warm start, the system software often requests a Cold 2 restart to recover properly only minutes after the warm start has occurred.
- **SPE-Select Switch:** (High or Critical Reliability System only) The SPE-Select switches on the Duplication Interface circuit packs were thrown to select the Standby SPE, which became the Active SPE, using the restart level shown. It is also possible to get an initialization cause of SPE-Select Switch when SPE B is active and power to carrier B is lost. In this case, an SPE switch to SPE A occurs and the initialization cause can show either SPE-Select Switch or SPE Down. If this initcause triggers an SPE-interchange when the Standby is NOT in Maintenance mode, the previous entry in the log may actually represent a restart that occurred on the Standby SPE. See the preceding description of **display initcauses** for a complete explanation.
- **Stby-SPE Core Dump:** (High or Critical Reliability System only) The Standby SPE had finished a core dump when an interchange took place that made the Standby SPE the Active SPE. If this initcause triggers an SPE-interchange when the Standby is NOT in Maintenance mode, the previous entry in the log may actually represent a restart that occurred on the Standby SPE. See the preceding description of **display initcauses** for a complete explanation. If a High or Critical Reliability System does a PEI with a warm start, the system software often requests a Cold 2 restart to recover properly only minutes after the warm start has occurred.

- **Stby-SPE Tests:** (High or Critical Reliability System only) The Standby SPE was in the process of running tests at the request of the Active SPE when an interchange occurred. If this initcause triggers an SPE-interchange when the Standby is NOT in Maintenance mode, the previous entry in the log may actually represent a restart that occurred on the Standby SPE. See the preceding description of **display initcauses** for a complete explanation. If a High or Critical Reliability System does a PEI with a warm start, the system software often requests a Cold 2 restart to recover properly only minutes after the warm start has occurred.
- **Unknown:** A restart that could not be classified. The Software Error Log may contain more information about the restart.
- **Upgrade Software:** (High or Critical Reliability System only) This indicates that the system was upgraded to a new software generic using the Standby SPE to load the new software via the **upgrade software** command. A system technician-requested **reset system 4** command should be the previous entry.
- **LMM Put Fail:** This initcause occurs when the LMM has failed to place the request for initcause message in the DPR. This could occur if the MTP does not respond to the DPR handshake. Level of Restart: Warm (escalation turned on).
- **LMM Get Fail:** This initcause occurs when the LMM does not receive a response to the request for initcause message from the MTP. This could occur if the MTP is not taking messages out of the DPR. Level of Restart: Warm (escalation turned on).
- **Dupint Unknown:** This initcause occurs when the LMM receives an UNKNOWN initcause from the Dupint. This could occur in a High or Critical Reliability System where the MTP thinks a PEI has occurred but the dupint disagrees. Level of Restart: Warm (escalation turned on).
- **MTP Reset Unknown:** This initcause occurs when the LMM has reset the MTP during the process of trying to get initcause from the MTP. Level of Restart: Warm (escalation turned on).
- **S-vintage Mismatch:** This initcause occurs when a mismatch in the duplication super vintage is detected by the LMM. Level of Restart: Reboot (no escalation).

- **Monitor Reset:** (For Development Environment Only) This initcause occurs when "ini 1" is executed from the Flash Monitor. This initcause can occur only in systems with SBB. Level of Restart: Reboot (no escalation).
- **Bad GDT:** (For Development Environment Only) This initcause occurs when the LMM fails to transfer control to Oryx/Pecos because of absence of entry in GDT to point at O/P. This usually occurs in a system with no Idata. Again, this should only occur in systems with SBB.

Action — The level of recovery performed by the system. The recovery levels follow:

- Reset system 1 (Warm)
- Reset system 2 (Cold-2)
- Reset system 3 (Cold-1)
- Reset system 4 (Reboot)
- Reset system 5 (Extended Reboot)
- Reset system interchange (High or Critical Reliability System only - hot restart interchange)

Escalated — Whether the restart was escalated to a higher level to clear the problem. There is a software escalation strategy which can cause a higher level of restart than the one previously performed to be executed if the need arises.

Carrier — The "carrier" statement indicates the carrier on which the recovery was performed (possible values are **1A** and **1B**). In most cases, this "carrier" is the Active SPE carrier when the restart occurs. However, it is possible in a High or Critical Reliability System that this carrier was the Standby carrier. See the preceding description of **display initcauses** for a complete explanation.

Time — The date (month and day) and time of the restart.

For the following output example, the command display initcauses was entered.

```
display initcauses

                            INITIALIZATION CAUSES

     Cause                Action   Escalated    Carrier     Time

FEATURE INTERACTIONS

None.

display memory-configuration

This command displays the active and standby processor Flash Read-Only Memory and Dynamic Random Access Memory configurations.

SYNOPSIS

display memory-configuration [long]

PERMISSIONS

The following default logins may execute this command: browse, system technician, cust, inads, init.

EXAMPLES

display memory-configuration
display memory-configuration long

DESCRIPTION

The maintenance command, display memory-configuration, will indicate the total memory available for the active, and if present the standby, processor(s). This command is a single page display with hidden fields for the standby-processor; these hidden fields will only be visible if a standby processor is available in the system.

Defaults

No defaults.

Parameters

long	The “long” command parameter is required to display the standby SPE Flash ROM and DRAM configuration.
print	If specified, this parameter will cause the information displayed by this command to be sent to the printer attached to the terminal as well as to the screen.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen.

Help Messages

If the system technician presses help after entering "display memory-configuration" the following message will be displayed:

```
Enter [‘long’] [‘print’ or ‘schedule’]
```

Error Messages

If “display memory-configuration” is executed on G3V5r systems, the following error message will appear on the SAT status line:

```
“memory-configuration” is an invalid entry; please press HELP
```

If ““display memory-configuration long” is executed on a simplex system, the following error message will appear on the SAT status line:

```
”long” is an invalid identifier; please press HELP
```

If “display memory-configuration long” is executed when the standby processor is not available, the following message will appear on the SAT status line:

```
Cannot access the standby SPE at this time
```

OUTPUT

FEATURE INTERACTIONS

None

display port

This command displays information for a specified port.

SYNOPSIS

display port location [print **|** schedule]

PERMISSIONS

The following default logins may execute this command: browse, system technician, cust, inads, init.

EXAMPLES

display port 1c0801
display port 1c0802 print
display port 2c1504 schedule

DESCRIPTION

The display port command displays the port location, the equipment connected to the port, and the means by which the port can be identified (e.g. an extension number, the trunk group and member, etc.).

Defaults

No defaults.

Parameters

llocation	the location represents the physical position of the port to be displayed and is entered as "UUcSSpp" where "UU" represents the cabinet number (1-3), "c" represents the carrier, "SS" represents the slot position, and "pp" represents the circuit. A single digit cabinet (1 - 9) may be entered with or without a leading zero (0).
print	If specified, this parameter will cause the information displayed by this command to be sent to the printer attached to the terminal as well as to the screen.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses help after entering "display port" the following message will be displayed:

```
Enter assigned port, [’print’ or ’schedule’]
```

Error Messages

If the format for the port location is incorrect, the following message is displayed:

```
Identifier invalid
```

If the port location is not administered, the following message is displayed:

```
Identifier not assigned
```

If the specified port location is out of range, the following message is displayed:

```
Port/Board location invalid
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

OUTPUT

Port:	The port address (cabinet-carrier-slot-circuit) of the specified user specified port.
Equipment Type:	The hardware that is physically connected to the user specified port.
Identification:	This depends on the hardware that is physically connected to the port. If a station is connected to the port the station extension is displayed, if a trunk is connected to the port a trunk group and member is displayed, If a modem pool is connected to the port, the modem pool group is displayed, etc.

For the following output example the command "display port 1c0801" was entered.

```
display port 1c0801                            SPE A

                      PORT INFORMATION

                        Port: 01C0801
              Equipment Type: Station
              Identification: 1021
```

FEATURE INTERACTIONS

display synchronization

This command displays the system synchronization administration such as stratum level (3,4), primary and secondary synchronization reference sources and DS1 boards.

SYNOPSIS

display synchronization [print | schedule]

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, rcust, bcms, init, browse.

EXAMPLES

display synchronization
display synchronization print
display synchronization schedule

DESCRIPTION

The display synchronization command will bring up the synchronization form. The administered synchronization stratum and reference sources will be displayed on this form. This command does not allow for any changes to be made to the system synchronization.

Defaults

No defaults.

Parameters

print	This will cause the report to be printed if a printer is linked to the SAT.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen.

Help Messages

If the system technician presses HELP after entering "display time" the following message will be displayed:

```
['print' or 'schedule']
```

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Stratum:	This field specifies the synchronization stratum that is used. The only possible entries are "3" and "4."
Primary:	This field designate the first choice system synchronization source. A blank entry means no synchronization. This field is valid only if stratum 4 synchronization is specified.
Secondary:	This field designate the second choice system synchronization source. A blank entry means no synchronization. This field is valid only if stratum 4 synchronization is specified.
Location:	The circuit pack location (cabinet-carrier-slot) of all administered DS1 circuit packs are listed here.
Name:	If a user defined name is administered for the DS1 circuit pack, it will be displayed here. Blank means no user defined name was given to this DS1 circuit pack.
Slip:	If the DS1 circuit pack has slip alarm, this field will show 'y'. Otherwise it will show 'n'.
Port Network:	This field is only valid for stratum 3 synchronization. The field specifies the port network that supplies synchronization via the tone clock circuit pack.

For the following output example, the command display synchronization was entered.

```
display synchronization                       Page  1 of  2

       SYNCHRONIZATION SOURCE (DS1 circuit pack location)

           Stratum: 4
           Primary:      Secondary:

                        DS1 CIRCUIT PACKS

 Location    Name     Slip        Location    Name     Slip
 02B10 D92D1 ds1 2b10   n
 02B11 d92D1 ds1 2b11   n
 01C10 D92D1 ds1 1c10   n
 01C11 D92D1 ds1 1c11   n

 NOTE: TN722B DS1 sources result in stratum 4, type II synchronization
```

```
display synchronization                       Page  2 of  2

                       SYNCHRONIZATION PLAN
                        DS1 CIRCUIT PACKS

 Location  Name    Slip        Location  Name    Slip
```

FEATURE INTERACTIONS

A DS1 interface or a UDS1 board that has been selected as either a primary or secondary synchronization source cannot be removed on the DS1 circuit pack administration form or the regular circuit pack administration form.

display system-parameters maintenance

This command displays existing maintenance-related system parameters.

SYNOPSIS

display system-parameters maintenance [high-resolution] [print | schedule]

PERMISSIONS

Logins with the following service levels may execute this command: craft, inads, init, super-user, or logins with Maintain Switch Circuit Packs permissions enabled.

EXAMPLES

display system-parameters maintenance
display system-parameters maintenance print
display system-parameters maintenance schedule

DESCRIPTION

The "display system-parameters maintenance" command displays the translation data for maintenance related system parameters.

Parameters

Print	This option will cause the report to be printed if a printer is linked to the SAT.
Schedule	When the schedule option is specified, the command is validated and a schedule form is displayed to allow the technician to schedule execution of the command at a specified time. The information displayed by the command will be sent to the system printer instead of the screen.

For more information see "Command Groups" at the beginning of this chapter.

Help Messages

The following help message will be displayed when the system technician presses the help key after entering the "**display system-parameters maintenance**" command:

```
['Print' or 'schedule']
```

Output

An input form is displayed with the following fields. Defaults for data entry fields are listed in parentheses.

Product Identification	This is a 10-digit number starting with 1 that identifies the switch to an Operations Support System (OSS), for example, INADS.
First OSS Telephone Number	The first telephone number that the switch uses to report alarms to, for example, INADS or Trouble Tracker. The number must be obtained from the National Customer Support Center (NCSC) or the TSC. **#** and ***** are not allowed in the telephone number.
Abbrev Alarm Report	Enables the Abbreviated Alarm Report feature for the first OSS. (yes)
Second OSS Telephone Number	The second telephone number that the switch uses to report alarms to, for example, INADS or Definity SNMP. The number must be obtained from the National Customer Support Center (NCSC) or the TSC. **#** and ***** are not allowed in the telephone number.
Abbrev Alarm Report	Enables the Abbreviated Alarm Report feature for the second OSS. (no)

Alarm Origination to OSS Numbers	Indicates one of four options for alarm origination (neither): ■ If "both," all Major and Minor alarms result in an automatic call to both OSS telephone numbers. Both OSS telephone numbers must be administered. ■ If "first-only," all Major and Minor alarms result in an automatic call to the first OSS number only. The switch does not call the second OSS telephone number even if the number is administered. The first OSS telephone number must be administered ■ If "neither," alarm origination does not take place. Warning alarms are not reported to either numbers. ■ If "second-as-backup," all Major and Minor alarms result in an automatic call to the first OSS telephone number. If calling the first OSS telephone number fails four attempts, the switch starts to call the second OSS telephone number as a backup until calling the first OSS telephone number becomes successful. Both OSS telephone numbers must be administered.
Cleared Alarm Notification	Enables the switch to originate a call to the OSS and send an alarm resolution message whenever all previously reported Major and Minor alarms are resolved. Alarm Origination must be activated in order for Cleared Alarm Notification to work. (no)
Restart Notification	Enables the switch to originate a call to the OSS and report any system restarts caused by problems with the switch.
Test Remote Access Port	Specifies whether testing of the remote access port on the SYSAM circuit pack is enabled. This field should be set to "yes" whenever there is an INADS line connected to the switch and there is a maintenance contract in effect so that alarm origination capability is maintained.

CPE Alarm Activation Level	Indicates the minimum level (Major, Minor or Warning) at which the Customer-Provided Equipment (CPE) alarm is activated. If the level is "none," the CPE does is not activated for any alarm. (none) **NOTE:** The CPE alarm is always activated when the switch goes into Emergency Transfer, regardless of the CPE Alarm Activation Level setting.
Packet Bus Activated	Enables the system Packet Bus. If this field is set to ‘‘yes'', then maintenance software assumes that there is a Packet Control circuit pack installed in the system. The packet endpoints (for example, ASAI, and/or BRI) may be administered, and maintenance testing runs on both the Packet Control circuit pack and on the Packet Bus (This field should be set to “yes” after a packet control circuit pack is installed.). If a Packet Control circuit pack is not installed in the system, then a major alarm is raised against the PKT-CTRL MO. This field can only be changed from ‘‘yes'' to ‘‘no'' if there are no packet endpoints administered, thus ensuring that there can be no packet endpoints administered if the packet bus is not activated. This field should be set to “yes” after a Packet Control circuit pack is installed. If a Packet Control circuit pack is not installed, then this field should be set to ‘‘no'' (the only exception is when setting up translations for a system for which not all of the required hardware is available). (no)
Customer Access to INADS Port	Provides the capability to prohibit access to system administration and maintenance interface, via the INADS port when using customer login ID’s. This field can only be activated by Lucent services through system-parameters maintenance administration.(no)
Repeat Dial Interval (MMS)	Indicates the number of minutes that the system must wait before attempting another call origination to an OSS. This timer is triggered by the lack of a far-end acknowledgment. (7)

Scheduled Maintenance

A series of maintenance tests and operations runs automatically every day according to the schedule and settings specified in the following fields.

Start Time	The hour and minute in 24-hour notation at which daily scheduled maintenance will begin running. (22:00)
Stop Time	The hour and minute when scheduled daily maintenance will stop running. If any daily maintenance operations are not completed by this time, the system will note where in the sequence it stopped and perform those operations during the next scheduled daily maintenance.
Daily Maintenance	This display-only field simply represents the series of tests that are always run by maintenance software as part of daily maintenance.
Save Translation	This field indicates on which days translation data in memory will automatically be saved to the Mass Storage System disk and/or tape devices during scheduled maintenance. The save operation is first made to disk, followed by a disk backup to tape. On systems with duplicated SPEs, translation data is saved on both SPEs. Valid entries are **daily**, days of the week, or **no**. "No" specifies that no automatic saves are to be executed. (daily)
Control Channel Interchange	Each port network has a pair of TDM busses called A and B, each of which has a set of time slots dedicated to use by the control channel. At any one time, the control channel in each PN is carried on only one of the two busses. This field indicates on which days the control channel in each port network will be switched from one of the paired TDM busses to the other. Valid entries are **daily**, days of the week, or **no**. "No" specifies that no interchange be executed. (no)
System Clocks Interchange	On High and Critical Reliability systems, this option causes a Tone-Clock interchange in each port network with duplicated Tone-Clock circuit packs. Each port network interchanges into the standby Tone-Clock for 20 seconds and then back to the Tone-Clock that was originally active. This field indicates on which days the interchanges are to take place. Valid entries are **daily**, days of the week, or **no**. "No" specifies that interchanges be executed. (no)

SPE Interchange	On systems with duplicated SPEs, this field indicates on which days an SPE interchange will be executed during scheduled maintenance. Valid entries are **daily**, days of the week, or **no**. "No" specifies no scheduled interchanges. (no)
EXP-LINK Interchange	This field indicates whether or not the expansion links between port-networks are interchanged as part of scheduled maintenance. The value ‘‘daily'' means that EXP-LINK interchange occurs automatically everyday. The value ‘‘no'' means that EXP-LINK interchange is not done automatically as part of scheduled maintenance. Values represented by the days of the week mean that EXP-LINK interchange occurs automatically on the specified day only. Since EXP-LINK interchange only applies to duplicated systems, simplex systems do not display this field. (no)
Minimum Threshold for TTRs	When the number of touch tone receivers (TTRs) in service falls below this number (4 to 200), a WARNING alarm is raised against TTR-LEV (see "TTR-LEV (TTR Level)" in Chapter 11, "Maintenance Object Repair Procedures"). These are also known as dual-tone multifrequency receivers (DTMRs). There are 4 TTRs on each TN748 Tone Detector circuit pack, and up to 50 TN748s in a system. To alarm the first occurrence of a TTR being taken out of service, set this field to 4 times the number of TN748s. If this number is set to more than three less than the total number of TTRs, a port network with only one TN748 could lose all of its TTRs before this alarm is raised.
Minimum Threshold for CPTRs	When the number of call progress tone receivers in service falls below this number (2 to 100), a WARNING alarm is raised against TTR-LEV (see "TTR-LEV (TTR Level)" in Chapter 11, "Maintenance Object Repair Procedures"). These are also known as general purpose tone detectors (GPTDs). There are 2 CPTRs on each TN748 Tone Detector circuit pack, and up to 50 TN748s in a system. To alarm the first occurrence of a CPTR being taken out of service, set this field to 2 times the number of TN748s. If this number is set to more than one less than the total number of TTRs, a port network with only one TN748 could lose all of its CPTRs before this alarm is raised.

Minimum Threshold for Call Classifier Ports	When the number of call classifier ports (CLSFY-PTs) in service falls below this number, a WARNING alarm is raised against TTR-LEV (see "TTR-LEV (TTR Level)" in Chapter 11, "Maintenance Object Repair Procedures"). Valid entries are 1 to 200. There are 8 ports on each TN744 Call Classifier circuit pack, and up to 25 TN744s in a system. To alarm the first occurrence of a CLSFY-PT being taken out of service, set this field to 8 times the number of TN744s. If this number is set to more than 7 less than the total number of CSLFY-PTs in the system, a port network with only one TN744 could lose all of its CLSFY-PTS before the alarm is raised. If there are no TN744s in the system, leave this field blank.
Test Type 100, Test Type 102, Test Type 105	An extension assigned to receive tie-trunk calls from other switches with test line origination capability. The system responds by sending a sequence of test tones. Test Type 100 tests far-end to near-end loss and C-message by sending: ■ 5.5 seconds of 1004 Hz tone at 0dB ■ Quiet until disconnect; disconnect is forced after one minute
ISDN-PRI Test Call Extension	The extension used by a far-end ISDN node to place a call to the system to test the ISDN-PRI trunks between the far-end and the system.

ISDN-BRI Service SPID	This field shows whether or not the link is associated with the Service SPID. If the link is associated with the Service SPID, this field contains a "yes" and the extension field is blank; otherwise, this field is blank. Service SPID is a feature used by the system technician to check building wiring between the switch and the BRI endpoint.

DSO Loop-Around Test Call Extension	This field contains the extension number for the test call extension number. This test extension number will be used to establish a loop-around connection on the selected trunk.

The DSO Loop-Around Test Call feature is used primarily for testing DSO channels associated with non-ISDN-PRI trunks. The loop-around is activated by dialing the test extension number. Multiple DSO Loop-Around connections can be set up by placing multiple calls to the loop-around extension.

The DS0 Loop Around feature provides a loop around connection for incoming non-ISDN DS1 trunk data calls. This feature is similar to the far-end loop around connection provided for the ISDN Test Call feature. This DS0 loop around is provided primarily to allow a network service provider to perform facility testing at the DS0 level before video teleconferencing terminals are installed at the PBX.

The feature is activated on a call-by-call basis by dialing a test call extension specified on the second page of the System Parameters Maintenance form. No special hardware is required. When the test call extension is received by the PBX, a non-inverting, 64 kbps connection is set up on the PBX's Time Division Multiplexed bus. More than one loop around call can be active at the same time.

For calls routed over the public network using the ACCUNET Switched Digital Service (SDS) or Software Defined Data Network (SDDN), the data transmission rate is 56 Kbps, since robbed bit signaling is used. For calls established over a private network using common channel signaling, the full 64 kbps data rate is available.

When the incoming trunk group is used only for data calls (SDS), the Communications Type on the associated Trunk Group form should be set to "data." When the incoming trunk group is used for robbed bit alternate voice and/or data (SDN/SDDN), the Communications Type on the Trunk Group form should be set to "rbavd" (robbed bit alternate voice data). For private network trunks using common channel signaling, the Communications Type on the associated Trunk Group form can be set to "avd."

Loss Plan

Use only when extra loss is required to maintain quality of transmission on conference calls. Leave this field blank if no extra loss is required. If extra loss is required, enter digits as shown below.

No. Of Parties To Be Conferenced	Enter Digit
3	2
4	3
5	4
6	5
7	6

SPE Optional Boards:

These fields indicate whether a Disk circuit pack is present in the system, and which Packet Interface slots are administered. If a Packet Interface circuit pack is physically present, the corresponding Packet Interface field is set to y when the system boots, and no change to that field is allowed. If the system is equipped with duplicated SPEs, a Packet Interface field is set to y when either SPE carrier contains a Packet Interface circuit pack in the corresponding position. If a Packet Interface circuit pack is not present, then the value for the Packet Interface field is read from translation data stored on disk or tape. If the field is set to n, a Packet Interface circuit pack may be administered by changing the corresponding Packet Interface field to y.

Modem Connection

On page 3 of the example forms shown below, there are 11 fields that are hidden when the “Modem Connection?” field is set to internal. In this example the “Modem Connection” field is set to “external” and these additional 11 fields are visible.

The first 2 fields on page 3 help setup the data format for the serial data from the switch to the modem. The field names are, “Data Bits:”, and “Parity?”. There are only two valid combinations for these 2 fields:

- Data Bits = 8, Parity = None
- Data Bits = 7, Parity =(odd , even, mark, or space)

The remaining fields are listed below:

Modem Connection	The only valid entries for this field are “internal” or “external”. The default is set to internal. (internal)
Modem Name	This field is 20 characters long and will permit alpha-numeric characters to provide a unique qualifier for a given modem. The field is called “Modem Name: ”. ( )
RTS/CTS Enabled	This field will inform the modem that communication with the data source UART will be driven with RTS/CTS flow control. This field is 6 characters long with a default of “\Q3”. This field is case in-sensitive; however, the default will be in upper case. (\Q3)
Asynchronous Data Mode	This field will configure the modem as an asynchronous communications device. This field is 8 characters long with a default of “&M0&Q0”. This field is case in-sensitive; however, the default will be in upper case. (&M0&Q0)
DTE Auto-Data Speed	This option will adjust the speed of the data source (DTE) UART to the outgoing (modem-to-modem) data rate. So, at maximum this speed would be 9600 baud. This field is 6 characters long with a blank as default . This field is case in-sensitive. ( )
Disable Data Compression	This field will turn off the default data compression algorithms that are in use by most consumer modems. This field is 6 characters long with blank as the default. The AT commands that control this capability are supported by similar commands; however, these commands do not operate in the same manner. The Intel modems require the use of “H%C0” to disable V.42bis & MNP Class 5 data compression algorithms; however, the Paradyne products only use “%C0” to disable both algorithms. This field is case in-sensitive; with blank as the default. ( )

Enable Error Control	This field will turn on the V.42 LAPM and MNP error control protocols, if available on the modem. This field is 6 characters long with blank as the default. This V.42/MNP/Buffer mode first attempts to negotiate V.42 error control with the remote modem. If this fails, then the modem transitions to MNP, and if this fails then no error control is used. This field is case in-sensitive. ( )
Misc. Init. Param	This field is 20 characters long with blank as the default. This field supports any initialization parameters that are not already specified. The AT commands specified in this free-form field will be always the last initialization parameters to be sent to the external modem. This field is case in-sensitive; however, the default will be in upper case. ( )
Auto-Answer Ring Count	This field controls the number of rings required before the modem will automatically answer an incoming call. This field is 6 characters long with “S0=10” as the default. Typically, the maximum permissible value for this register is 255. The values 1-255 denote the number of incoming ring cycles. This field is case in-sensitive; however, the default will be in upper case. (S0=10)
Dial Type	This field controls the type of inter-register signaling to be used between the modem and the Central Office. The field name is “Dial Type: ” with a default of “T” for tone dialing. Pulse dialing is indicated by “P”. The field length should be 3 characters long. This field will be concatenated with the dial string. This field will be case in-sensitive; however, the default will be in upper case. (T)

Adjustable Make/Break Ratio	This field can be of particular importance when using a modem that may be transferable from country to country. The intent of this field is to control the make/break ratios of pulses and DTMF dialing. The Intel product information has support for the different make/break options for pulse dialing only. Intel uses the option “&P0” to select a ratio of 39% make and 61% break for communication within the U.S. and Canada. The option “&P1” sets a ration of 33% make and 67% break for the U.K. and Hong Kong. This field is 5 characters long with blank as the default. This field will be case in-sensitive. ( )
Dial Command	This field is 3 characters long with “D” as the default.. This field simply denotes the dialing command of the modem. This is a fairly standard command. This field will be case in-sensitive; however, the default will be in upper case. (D)
No Answer Time-Out	Most off-the-shelf external modems provide a timer that abandons any outbound data call after a predetermined interval. Some modems provide for this timer to be disabled, thus allowing an outbound call to ring indefinitely. AT&T Paradyne does not provide this capability with their modem line, because it is generally undesirable to have an outbound call attempt ring indefinitely. The internal modem must have this parameter disabled or set to at least 255 seconds. This is a non-administrable parameter. For the external modem connection, this parameter will be the first initialization string to be transmitted to the external modem. This field will be visible on the administration form in display mode only. This hardcoded constant can be overriden for type approval applications, specifically in the U.K and other Western European nations, by the use of the “Misc. Init. Param:” field. (S7=255)

The following display shows a typical result when **display system-parameters maintenance** is entered.

display time

This command displays the system time.

SYNOPSIS

display time *[print | schedule]*

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, init, browse.

EXAMPLES

display time
display time print
display time schedule

DESCRIPTION

The display time command will bring up the time form. The system time will be displayed on this form. This command does not allow for any changes to be made to the system time.

Defaults

No defaults.

Parameters

print	This will cause the report to be printed if a printer is linked to the SAT.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [2] for more details.

Help Messages

If the system technician presses HELP after entering "display time" the following message will be displayed:

```
['print' or 'schedule']
```

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Day of the Week	The day of the week that the system has stored.
Day of the Month	The numerical day of the month.
Month	The month of the year stored by the system.
Year	The current year stored by the system.
Hour	The hour of the current day.
Minute	The number of minutes into the hour.
Second	The number of seconds into the minute stored by the system.

For the following output example, the command display time was entered.

```
display time

                     DATE AND TIME

    DATE
       Day of the Week:  Sunday       Month: January
       Day of the Month: 1            Year:  1990

    TIME
                   Hour: 6          Second: 20
                 Minute: 8
```

FEATURE INTERACTIONS

The date and time are generally used by the switch.

download update-file

This command provides a mechanism for downloading a field update file from INADS or a personal computer using the XMODEM protocol.

SYNOPSIS

download update-file

PERMISSIONS

The following default logins may execute this command: inads and init.

EXAMPLES

download update-file

DESCRIPTION

The update file is transferred to the switch asynchronously from either an INADS host or a personnel computer (PC) using the XMODEM protocol. The switch is called asynchronously (either using the "call" command from an INADS host, or by dialing the switch directly with a modem. Once the connection has been established, the user logs into the switch as a remote system access terminal (SAT), using the inads login.

Only the INADS and INIT logins have the necessary permission to send an update file to the switch.

The command "download update-file" is entered at the SAT to initiate the download of the update file and, when this command is entered, the switch will respond with "Please wait ...". After some initialization at the switch has completed, the command displays: "Please start file transmission now...". At this point, an XMODEM session should be started up on the remote end and the update file should be sent. If an INADS host is being used, enter ~dload <file_ name> to start the file transmission. If a PC is being used, follow the instructions in the emulator's manual for invoking an XMODEM session to send the update file.

As each block is received by the switch, it is written to tape or flash. Error detection and retransmission are provided by the link level of XMODEM. Additional protection is provided within the application level. After the entire file has been written to tape or flash it is read back and each update file block is validated. The file checksum is also checked. If the file appears to be sound, the status word in the header block is then changed to indicate that there is a valid update file. At this point, for 286 systems only, any immediate sub-patches will be applied. Immediate subpatches are not supported for 386 systems.

There may be a delay (of up to 5 minutes on a duplex system) between the end of the file transmission and command completion. This delay is caused by the patch application of any immediate sub-patches and, if on a duplex system, the automatic copy of the update file to the standby SPE which take place as a result of the reception of a valid update file.

In a High or Critical Reliability System, the connection to the INADS host computer may be dropped (by the INADS side) but the process of copying the patch file to the standby processor continues. The standby is placed in maintenance mode and a call placed between active and standby via the data channels. The file is transmitted in the same way for both tape and flash based systems. The same checks are made on the receiving side as were made during and after the original download. If no errors are found, the file is marked valid.

There is no feedback to the user on the status of the standby copy. If an error is encountered during the copy or validation process on the standby, an error is logged in the software error log. The data consistency audit will discover that the two patch files are inconsistent and the user must manually copy the valid file on the active processor to the standby processor.

The software does not indicate when the copy has completed, so scripts run by the TSC must not issue an immediate reset on High or Critical Reliability Systems. This will interrupt the copy and guarantee that the field update files on the two processors are inconsistent. This problem can be avoided by using one of the following techniques:

- Use two scripts: the first to apply the patch and a second, to be run later, to issue the reset that applies the patch. This requires two calls to each duplicated switch.
- Put a delay into the scripts which causes the scripts to wait a period of time after downloading the file and before issuing the reset. This requires only one call, but the amount of delay time required is not well defined as it depends on system load.
- Use a manual means of detecting when the copy has completed: either a "PASS" on the data consistency audit or a match on the *"list configuration software"* form. This requires only one call and introduces less delay in requesting the reset.

Help Messages

There is no associated help message as the command has no options.

Error Messages

If the vintage of the standby SPE doesn't match the vintage of the active SPE, the following message is displayed:

286

```
Update file vintage does not match standby SPE core vintage on tape
```

386

```
Update file vintage does not match standby SPE core vintage
```

If the patch identifier in the update file does not match the patch identifier in memory, the following message is displayed:

386

```
Update file patch identifier does not match SPE patch identifier
```

If an update file which is created for a different system (i.e.,. a patch file is created for a tape system and downloaded to a flash system), the following message is displayed:

286 and 386

```
Update file designed for a different configuration, file will not be used
```

If the update file is too large to fit in the remaining space, the following message is displayed:

286 and 386

```
Update file is too large to fit on device
```

If the calculated file checksum is incorrect, the following message will be displayed:

286

```
File checksum failed; file on tape will not be used
```

386

```
File checksum failed; file will not be used
```

If an invalid update file block was found, the following message will be displayed:

286

```
Found a bad file block; file on tape will not be used
```

386

```
Found a bad file block; file will not be used
```

If the total number of blocks listed in the header block of the update file did not match the number of blocks received by the SPE, the following message is displayed:

286 and 386

```
Received an invalid number of blocks; file will be ignored
```

The total number of subpatches listed in the header of the update file did not match the number of subpatches received by the switch

286 and 386

```
Received wrong number of subpatches for update file
```

286

Tape cartridge removed or failure to access tape

```
Tape access failure; no tape cartridge or device failure on standby SPE
```

Tape cartridge write protected

286

```
Tape write failure;tape cartridge or device failure on standby SPE
```

Read failures occurring while accessing tape. The tape may be worn or defective.

286

```
Tape read failure;tape cartridge or device failure on standby SPE
```

OUTPUT

None

FEATURE INTERACTIONS

386

The form displayed for the list configuration software-vintage command has been modified to reflect the changes imposed by the flash architecture. The form is basically the same as for the tape based Intel system, but does not include fields such as "Tape Resident Vintage" which don't apply to 386 systems. It is these differences in the "list configuration software" command that should allow INADS to determine, with one query, the hardware configuration, software vintage and patch identifier.

There is no interaction with routine periodic or scheduled maintenance because patches are only applied on restarts before the system is in normal operation.

The flash checksum test acts as a backup check to make sure the entire field update file was applied correctly. It can fail because of a bad checksum update from a poorly constructed update file or because the patching operation has aborted. When the flash Checksum Test fails, a MAJOR on-board alarm is raised on the processor/memory circuit pack. Maintenance runs a data consistency test on a daily basis to check that copies of translations, announcements and software files are consistent across both processors in a High or Critical Reliability System. If the test detects a difference, a minor, off-board alarm is generated.

When checking the software, the test compares the memory resident software version and patch identifier. It also checks for the presence of a field update file and, if found, compares the old and new patch identifiers to make sure the same patch file id loaded on each processor. If the software or update files are inconsistent, the "list configuration software" command can be used to display the status of the patch file.

286

The form displayed for the list configuration software-vintage is basically the same as that for the flash based Intel system, but includes the "Tape Resident" fields instead of the "Memory Card Resident" and "Flash Resident" fields which don't apply to tape based intel systems. The "list configuration software" command allows INADS to determine, with one query, the hardware configuration, software vintage and patch identifier.

RECOVERY PROCEDURES

This sections describes the procedures to be followed to recover from failures encountered during the download and application of the update file. The instructions apply to both simplex and duplex switches; additional detail is given when needed.

Error on the Transmission of the Download

If the error displayed on the terminal indicates that the download step in the process failed, there are several culprits:

1. The transmission line could have been noisy. Retry after making all the following checks. Failed attempts take up room in the hard patch file and may require a warm start to clear the file.
2. The user may have downloaded the tape/MIPS version of the patch instead of the flash version.
3. The vintage of the update file may not match the vintage of software currently running in the system. Check the customer's vintage using "list config software" and patch vintage provided in the documentation.
4. The switch may have had difficulty in writing to the hard patch file. Check the hardware error log for processor/memory board failures.
5. The hard patch file may be full. Issue a "reset system 1". This should cause valid files to be applied and invalid ones to be erased.

Error on Application of the Patch

A patch may not have been applied for the following reasons:

1. The memory card was write-protected. Remove this protection and issue a "reset system X."
2. The patch identifiers were inconsistent. Run "list configuration software" and compare the old_patch identifier with the values in the update file.
3. The LMM encountered a problem with the patch file. This is unlikely because the same checks, and more, were performed when the file was downloaded, prior to marking the file valid. This implies that the memory which stored the update file was corrupted. Apply the back out file immediately to back out the changes. Run the flash checksum test to make sure the system is back to its prepatch state. Check the validity of the file again with the development community and then try redownloading and applying the patch immediately.
4. The LMM reports a hard error. The symptoms of this is an entry in the hardware error log for the processor/memory board, if you're lucky, or extremely odd switch behavior followed by SPE down mode if you're not. The problem is that the LMM couldn't complete the programming of memory with the result that memory is in a corrupted state. The only recovery is to visit the site armed with new software and processor/ memory circuit packs.

   In a High or Critical Reliability System, the failure causes a switch to the standby processor. The hardware on the standby must be repaired and the patch redownloaded. (There was nothing wrong with the patch)

Good Application - Bad Patch

This error is caused, not by a failure in the download or application, but by a fault in the patch file itself. To recover from this type of problem, the back out file which backs out the patch should be downloaded and applied. Clearly, this requires that the system be sane enough to receive the file correctly and be able to apply it.

In a High or Critical Reliability System, the user has about eight minutes to recognize that a problem exists and force an interchange to the standby processor. If this can be done, the file on the newly active processor can be invalidated using a file containing a destroy tuple or the *wp byte* command. The standby can be restored to a normal state using the back out file.

Inconsistent Software Versions on a Duplicated Switch

Inconsistent software, as indicated by a failure in the data consistency test, can be caused by problems copying the update file to the standby or validation test failures on the standby. Unlike the tape or MIPS systems which revert to the same version of software as a result of a refresh, a flash system remains inconsistent until manually initiated steps are taken. Use the *list config software* command to determine the status of the vintages, patch identifiers and patch file data on both the active and standby processor.

1. If one processor looks as if it has been patched (updated patch identifier and no update file) and the other looks as if the patch file is still present (no patch identifier and valid update file), the application of the patch can be forced by making that processor active and requesting the system restart indicated in the accompanying documentation.

2. If one processor has a copy of the update file and the other doesn't (neither has been patched), the file can be copied using the command *copy update-file*.

3. If patch identifiers disagree but neither side has a valid update file, the missing patch should be redownloaded to the system. During the download process the file will pass the vintage test and be copied to the standby processor. Validation tests will then be run on both machines. On the next restart, the patch will be applied to memory. This procedure is less disruptive to the customer if the unpatched processor is the standby at the time of the restart.

enable administered-connection

This command restarts scheduled and periodic maintenance for a single administered connection or all administered connections.

SYNOPSIS

enable administered-connection [ac number | all]

PERMISSIONS

The following default logins may execute this command: inads, init, system technician, cust, rcust, mis.

EXAMPLES

enable administered-connection all
enable administered-connection 1
enable administered-connection 128

DESCRIPTION

The enable administered connection command causes scheduled and periodic maintenance to function normally for all or single administered connection(s). This command can be used to track the maintenance processing of administered connections without interference from other maintenance processing. This commands restarts the processing of in-line errors for all or the selected administered connection.

Defaults

None.

Parameters

ac number	The number of the administered connection being enabled.
all	IF "all" is entered then all administered connections are enabled.

Help Messages

If the user presses HELP after entering "enable administered-connection", the following message will be displayed:

```
Enter assigned administered connection number(1-128) or 'all'
```

Error Messages

If the administered connection number entered is not "all" and is non numeric, the following message is displayed:

```
Identifier invalid
```

If the administered connection number entered is not within the valid range of connections, the following message is displayed:

```
Entry out of range
```

If the connection number entered is not administered, the following message is displayed:

```
Identifier not assigned
```

If the administered connection number entered is already enabled, the following message is displayed:

```
Administered connection already enabled
```

If the software data cannot be sent to the SAT, the following message will be displayed:

```
Error encountered, can't complete request
```

If the command entered is in conflict with another currently executing command, then a message is displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear and then resubmit
```

OUTPUT

After the user has entered the command and the command is successful, the following message appears at the bottom of the screen:

```
Command successfully completed
```

FEATURE INTERACTIONS

None.

enable mst

This command will allow the user to enable the trace buffer.

SYNOPSIS

enable mst

PERMISSIONS

The following default logins may execute this command: inads, init.

EXAMPLES

enable mst

DESCRIPTION

The enable mst command will enable the message trace. The trace will then be controlled according to the parameters on the "change mst" screen. If executed while the trace is enabled, it will have no effect and will indicate that it worked.

Defaults

None.

Parameters

None.

Help Messages

If the user presses HELP after entering "enable mst", the following message will be displayed:

```
Entry is not required
```

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

OUTPUT

After the user has entered the command the following message appears at the bottom of the screen:

```
Command successfully completed
```

FEATURE INTERACTIONS

None.

enable synchronization-switch

This command re-enables automatic clock switching.

SYNOPSIS

enable synchronization-switch

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

enable synchronization-switch

DESCRIPTION

The enable synchronization-switch command puts the automatic clock switching capability of the maintenance subsystem back into a normal state. Clock refers to the oscillator on a tone/clock or DS1 interface.

The synchronization subsystem provides error free digital communication between the switch and other PBXs, COs, or customer premise equipment. The subsystem is made up of system components involved in synchronization: TDM bus clock, DS1 trunk board, maintenance and administration software resident in the SPE.

Defaults

No defaults.

Parameters

None.

Help Messages

If the system technician presses help after entering "enable synchronization-switch" the following message will be displayed:

```
Entry is not required
```

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

If the enable synchronization-switch command is successful, the following message will be displayed on the SAT:

```
Command successfully completed
```

If the enable synchronization-switch command is unsuccessful, the following message will be displayed on the SAT:

```
Error encountered, can't complete request
```

If the enable command is run and synchronization-switch is currently enabled, the following message will be displayed on the SAT:

```
Synchronization-switch already enabled
```

FEATURE INTERACTIONS

None.

enable test-number

This command enables a previously disabled test number.

SYNOPSIS

enable test-number number

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

enable test-number 102

DESCRIPTION

This command will re-enable the specified test number that was previously disabled. This will cause that the test number be allowed to run on the next request by maintenance or the technician.

Defaults

No defaults.

Parameters

number	This is the specific test number to re-enable.

Help Messages

If the system technician presses help after entering "enable test-number" the following message will be displayed:

```
Enter test number
```

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy
```

OUTPUT

If the enable test-number command is successful, the following message will be displayed on the SAT:

```
Command successfully completed
```

If the enable test-number command is unsuccessful, the following message will be displayed on the SAT:

```
Error encountered, cannot complete request
```

FEATURE INTERACTIONS

The display disabled-tests command gives a list of all disabled tests.

format card-mem

This command formats the active processor Flash Read-Only Memory.

SYNOPSIS

format card-mem [translation] [announcements] [coredump] [firmware]

PERMISSIONS

The following default logins may execute this command: browse, system technician, cust, inads, init.

EXAMPLES

format card-mem translation
format card-mem announcements
format card-mem coredump
format card-mem firmware

DESCRIPTION

The maintenance command, “format card-mem” will erase and format the memory card for translations announcements, coredump, and firmware.

Defaults

No defaults.

Parameters

translation	If specified, this parameter will erase and format the memory card for translations only.
announcemen ts	If specified, this parameter erase and format the memory card for translations and announcements.
coredump	If specified, this parameter will erase and format the memory card for translations, announcements and coredump
firmware	If specified, this parameter erase and format the memory card for translations, announcements and firmware

Help Messages

If the system technician presses help after entering "format card-mem" the following message will be displayed:

```
Enter ‘translation’ or ‘announcements’ or ‘coredump’ or ‘firmware’
    ‘translation’ option formats for translation only
  ‘announcements’ option formats for translation and announcements
       ‘coredump’ option formats for translation, announcements, and code-dump
       ‘firmware’ option formats for translation, announcements, and firmware
Or press CANCEL to cancel the command
```

Error Messages

If the format memory [translation] [announcements] [coredump] [firmware] maintenance command is executed and errors occur, one of the following error messages will be displayed:

- `Memory card is not inserted in the system`
- `Cannot turn on 12 volt power supply`
- `Memory card is write-protected`
- `Unknown type of memory card`
- `Could not write to memory card`
- `Could not erase memory card`
- `Memory card too large for operation requested`
- `Memory card too small for operation requested`
- `Error encountered, memory card unusable`

OUTPUT

For the following output example the command "format card-mem" was entered.

```
                          FORMAT FLASH MEMORY CARD

Processor  Command Completion Status

  SPE-A    SUCCESS

------------------------------------------------------------------------------
Command successfully completed
------------------------------------------------------------------------------
Command: format card-mem translation
```

FEATURE INTERACTIONS

None

get vector

This command displays the conditions and the Switch Processing Element (SPE) associated with a core dump of memory to tape or memory card.

SYNOPSIS

get vector *long print*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

get vector
get vector print
get vector long
get vector long print

DESCRIPTION

The get vector command displays the vector and the Switch Processing Element (SPE) used for a core dump of memory to tape or memory card. The dump occurs on the tape or disk of the previously active SPE (or the SPE previously specified using the "set vector" command in systems with duplicated SPEs).

The vector is cleared when a system restart of the proper level is performed regardless of whether the core is actually dumped.

Defaults

No defaults.

Parameters

long	This causes timestamps for the core dump to be printed. If SPEs are duplicated, timestamps are printed for both SPEs (or a message stating why the timestamp cannot be printed is displayed).
print	This causes the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses help after entering "get vector" the following message will be displayed:

```
['long'], ['print']
```

Error Messages

If a list configuration command is still executing while the "get vector" command is entered, the following message will be displayed:

```
Still clearing previously canceled command; please try later
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, the following message is displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, the following message is displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Core Dump Vector	The condition(s) which cause(s) a core dump to a tape drive or memory card are represented by a hexadecimal value. The hexadecimal value is a bit map of the four reset conditions which cause the dump. These conditions from least to most significant bit are: warm start, cold 2 restart, cold 1 restart, and reboot. A core dump vector of 0 signifies that the vector is cleared or not set.

Vector-Condition Mapping

value	warm-start	cold-2	cold-1	reboot
0	n	n	n	n
1	y	n	n	n
2	n	y	n	n
3	y	y	n	n
4	n	n	y	n
5	y	n	y	n
6	n	y	y	n
7	y	y	y	n
8	n	n	n	y
9	y	n	n	y
a	n	y	n	y
b	y	y	n	y
c	n	n	y	y
d	y	n	y	y
e	n	y	y	y
f	y	y	y	y

Set Vector Command Option	The user specified SPE prior to the core dump. For simplex SPE systems this field will always be "spe-active" unless the vector is cleared or not set. For duplex SPE systems the field will be either "spe-active" or "spe-standby" unless the vector is cleared or not set. If the vector is cleared or not set in either a duplex or simplex SPE system, this field will display blanks.
Core Dump Time	The time that the core dump was taken. This field displays timestamps for both "SPE_A" and "SPE_B." If the system has a simplex SPE, a timestamp will be displayed for "SPE_A" (or the active SPE) and "non duplicated SPE" will be displayed for "SPE_B." If the core dump cannot be accessed a message of "can't access" will be displayed for the corresponding SPE (e.g. in a High or Critical Reliability System where SPE B is not refreshed, "SPE_B" displays "can't access" instead of a timestamp). If the MSS device storing the core dump timestamp is busy for any reason a "device busy" message is displayed.

For the following output example, the command get vector was entered on a duplex SPE system after a core dump occurred when the vector bit was set. Assume SPE B was the active processor prior to the core dump, but SPE A is the current active processor.

```
get vector

                          GET RESULTS

   Core Dump Vector           Set Vector Command Option
       0                      spe-active

   Core Dump Time
   SPE_A
   SPE_B

 Command successfully completed
```

FEATURE INTERACTIONS

None.

list configuration

list configuration hardware-group [print | schedule]

NOTE:
The **list configuration software-version** command is discussed separately under its own heading.

Hardware configuration reports list, for each circuit pack in the group specified, the type, code, suffix, and vintage of the requested circuit packs as installed in the switch, and all ports assigned to the circuit pack.

Parameters

Enter one of the following hardware groups.

- **carriers all**— Specifies the display of all circuit packs administered and/or physically inserted in port, switch node and control carriers on the entire system.
- **board** *UUCSS*— Specifies the display of all assigned ports on the circuit pack specified by cabinet, carrier and slot.
- **carrier** *c*— Specifies the display of all circuit packs and assigned ports on a specified carrier.
- **control**— Specifies the display of all circuit packs located in the control complex.
- **ds1**— Specifies the display of all the DS1 (TN722, TN767 and TN464) circuit packs administered and/or physically inserted in port carriers on the entire system.
- **port-network pn#**— Specifies the display of all circuit packs located in a specified port network. **List cabinet** gives the port network number(s) associated with a particular cabinet. Circuit packs on switch node carriers are not displayed when the port-network qualifier is entered. To display SN circuit packs, use the **all**, **carrier** or **board** qualifiers.
- **stations**—Specifies the display of all circuit packs that can be assigned stations (including DS1 circuit packs for remote stations). All assigned ports are displayed.
- **trunks**—Specifies the display of all circuit packs that can be used for administering trunks. All assigned ports are displayed.

Examples

list configuration carrier 2c schedule
list configuration port-network 5
list configuration stations print

Output

Assigned Ports:

- **Board Number**— The functional name of the circuit pack.
- **Code**— The TN or UN code and suffix of the circuit packs are displayed.
- **Vintage 00000000-065535 KKKKKK**— The vintage number of the circuit pack.
- **no board**— The circuit pack is administered but not physically installed.
- **conflict**— The circuit pack administered to the slot differs from the circuit pack that is physically installed.
- **no link**— The T1 link is down to a DS1 circuit pack.

Field definitions:

- **Signaling**—This field is displayed only when "list configuration ds1" option is selected. The contents of the field are the same as the signaling mode administered for the ds1 circuit pack (via add/change ds1 command) or "none" if the circuit pack is not administered.
- **Name**— This field is displayed only when "list configuration ds1" option is selected. The contents of the field are the same as the name administered for the ds1 circuit pack (via add/change ds1 command) or "blank" if the circuit pack is not administered.
- **CSU MOD**— This field is displayed only when "list configuration ds1" option is selected. The field contains the identification number of the Integrated CSU module present on the ds1 circuit pack (TN767E or later / TN464F or later) or "none". If the circuit pack is a TN464E or TN767D, "unknown" will be displayed. If the circuit pack is a TN464D or TN767C or earlier suffix DS1 board, then "n/a" will be displayed.

Assigned Ports

Each port on the circuit pack is represented by a position corresponding to its circuit number in ascending order from left to right. The assigned ports are not displayed for "list configuration ds1". Two rows are required for circuit packs with more then 8 ports. The position displays one of the following values depending on its administered status:

- **01-16**— The circuit number of an assigned port.
- **u**— The port corresponding to this position exists but is unassigned.
- **t**— The port is not currently assigned and is supported by the Terminal Translation Initialization feature. Ports in this state can be activated by the TTI association sequence.

Each port on a TN556 ISDN-BRI circuit pack can have two BRI endpoints. BRI ports are displayed once when assigned only one endpoint and twice when fully configured with two endpoints.

The following display shows a typical result when **list configuration all** is entered.

```
   list configuration all                                       Page   1

                            SYSTEM CONFIGURATION

list config software-version

list configuration software-version [memory-resident | long]
[print | schedule]

This command displays

- Software version numbers and compatibility indexes of the software load modules stored in system memory (RAM) and on the Mass Storage System devices (tape).
- The dates and times when translation and announcement data were last saved to the MSS.
- Information about any software update files that have been applied to the system. See "Software Upgrade" in Chapter 5, 'Routine Maintenance Procedures" for an explanation of software versions and compatibility indexes.

Parameters

long	Specifies display of data for both SPEs in a high or critical reliability If not used, only data for the active SPE is shown.
memory-resident	Specifies display of RAM-resident files only. Fields for tape data will contain `n/a`

Output

If the tape or memory card contains a core dump file, fields for tape or memory card data display `coredump`. When a core dump is present, all other files on the device are marked invalid.

If the tape or memory card cannot be read at the time the command is entered, the relevant fields display `no tape or memory card`. (This does not indicate that the system does not recognize the presence of the device.)

Fields in the SPE-B column are blank for standard reliability systems. On high and critical reliability systems, only fields for the active SPE are displayed unless the **long** option is specified.

Tape Second Copy Fields (286 only)

Many of the files on tape are duplicated: a second copy of the file is stored on the same device. The Second Copy fields indicate whether the two copies are consistent using the following entries:

Good	The second copy is considered usable. The time stamp and/or vintage of the second copy matches the first, and its status bits mark it as a good file.
Inconsistent	The time stamp or vintage of the file is inconsistent with the first copy, or the status bits mark it as a bad file. Follow normal escalation procedures.
Inaccessible	The second copy of the file could not be accessed. Media failure is the most probable cause for this. Follow normal escalation procedures.

UPDATE FILE Section

The top half of page 1 of the form displays information pertaining to software field-update files (‘‘patches’’).

Creation (GMT) Tape and (GMT) Disk	When the update file was originally created, in Greenwich Mean Time (GMT). Note that this is *not* the time at which the update file was written to the MSS device.
Old-Version Tape and Disk	The software version for which the update was created.
Old-Identifier Tape and Disk	Which previous update file this update file expected to find stored in the MSS when it was applied.
New-Identifier Tape and Disk	Uniquely identifies the current update file.

SOFTWARE VERSION Section

This section at the bottom of page 1 of the output form displays information related to the current software-load module stored in memory and in the MSS.

Memory Resident	Version number of the RAM-resident load module.
Tape Resident (286 only)	Version number of the tape-resident load module.

Mem Card Resident (386 only)	Version of memory card resident load module. If a memory card is not installed, this field will display “no card”.
Update-identifier (Patch Identifier)	This uniquely identifies the update file, if any, that has been applied to memory.
Update-state (Patch State)	The status of the software field-update (‘‘patch’’) file id is displayed.

TRANSLATION DATE Section

This section displays information related to the translation files as stored in memory and the MSS.

Memory Resident	Date and time marked on the tape or disk when translation data was last read from the MSS into memory. This is stored in SPE memory and is not modified by changes to translation data. A save translation will update this date. If "Date invalid" is displayed, the timestamp does not contain the expected information.
Tape Resident (286 only)	The last date and time that translation data was saved to tape. This date is read from tape and appears blank if the tape is not installed.
Mem Card Resident (386 only)	The last date and time that translation data was saved to the memory card. This date is read from the memory card at command execution. If a memory card is not installed, this field will display “no card”.

PI FW VERSION Section

This section displays information related to the Processor Interface (PI) circuit pack firmware. Information is displayed for the PI circuit pack resident copy as well as the corresponding tape file..

PI 1 Resident	The version of firmware in the first PI circuit pack in the control carrier.
PI 2 Resident	The version of firmware in the second PI circuit pack in the control carrier.
Tape Resident (286 only)	The version of PI firmware residing on the tape. This field is left blank if there is no tape in the tape drive.
Flash Resident (386 only)	The version of PI firmware residing on the system flash memory.

ANNOUNCEMENT DATE Section

This section displays information related to the announcement files. Information is displayed for the memory resident copy as well as the corresponding MSS file.

Tape Resident (286 only)	The last date and time that announcement data was saved to tape. This date is read from the tape at command execution.
Mem Card Resident (386 only)	The last date and time that announcement data was saved to the memory card. If the memory card is not installed, this field will display "no card"..

PKT-CTRL FW VERSION Section

This section displays information related to the Packet Control firmware. Information is displayed for the Packet Control circuit pack resident copy as well as the corresponding tape file..

Pkt-ctrl Resident	The version of firmware in the Packet Control circuit pack.
Tape Resident (286 only)	The version of the Packet Control circuit pack residing on the tape. This field is left blank if there is no tape in the tape drive.
Flash Resident (386 only)	The version of the Packet Control circuit pack residing on the system flash memory.

Some things to note when using the **list configuration software-version** command are:

1. For simplex systems, the fields under column "SPE_B are always blank and the optional **Long** qualifier is not part of the command line.
2. For a High or Critical Reliability System, the fields under the column of the standby SPE are blank if the optional **long** modifier is not given.
3. If the tape or memory card contains a core dump file system, fields for the tape or memory card will contain ***coredump***. This is because in a coredump file system all files other than the ***coredump*** file are marked as invalid.
4. If for any reason, MSS can not be read when the command is issued the string **no tape** or **none** for no memory card will be placed in the appropriate fields on the screen. This does not mean that the system thinks there is no tape, only that the software was unable to read the appropriate information when requested.
5. If the command is issued using the ***memory-resident*** option, the fields on the form associated with the tape will contain the string **n/a**.

6. When the status of the update field is displayed, the following strings will be used (For more information refer to step 3 of this list):

none in memory	No update has been applied to memory.
immediate partially applied	An error condition that is valid only when an update that is in the process of being applied fails. Check the validity of the update file that was sent, and then check the hardware error log for tape errors, and follow standard maintenance procedures.
all immediate applied deferred pending	A valid update file was received by the switch, and all the immediate sub-patches were applied. This state indicates that there are deferred sub-patches in the update file, and a system reset of the proper level has not occurred since the update file was received.
deferred partially applied	An error condition that is valid only when a update that is in the process of being applied fails. Check the validity of the update file that was sent, and then check the hardware error log for tape errors, and follow standard maintenance procedures.
entirely applied to memory	The update associated with the memory-resident identifier has been completely applied to memory.

The following display shows a typical result when **list configuration software-version** is entered on a 386 system.

```

     Tape Resident: 8.3
     Disk Resident: 8.3
```

This command displays all the MOs that have been maintenance disabled in the system.

SYNOPSIS

list disabled-MOs [print **|** schedule]

PERMISSIONS

The following default logins may execute this command: inads, init.

EXAMPLES

list disabled-MOs
list disabled-MOs print
list disabled-MOs schedule

DESCRIPTION

This command will display a list of the specific MOs that have been disabled with the disable MO, disable MO-all, or disable all commands.

Defaults

No defaults.

Parameters

print	This will cause the report to be printed if a printer is linked to the SAT.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses help after entering "list disabled-MOs" the following message will be displayed:

```
['print' or 'schedule']
```

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy, try again later
```

OUTPUT

Maintenance Name	The type of maintenance object or group of maintenance objects that have been disabled. "ALL" is also valid.
Location	The physical location of the maintenance object that has been disabled. This field displays blanks if all maintenance objects have been disabled (disable all) or all MOs of a specific type have been disabled (disable MO-all).
Status	Whether the maintenance object or group of maintenance objects is "Enabled" or "Disabled."

```
list disabled-MOs

          DISABLED MAINTENANCE OBJECT INFORMATION

        Maintenance Name   Location    Status
        ALL                            Enabled
        DIG-LINE           02A1203     Disabled

 Command successfully completed
```

FEATURE INTERACTIONS

None.

list history

This command generates a log listing of the most recent "data affecting" administration and maintenance commands.

SYNOPSIS

list history [print | schedule]

PERMISSIONS

The following logins may execute this command: browse, system technician, cust, inads, init, nms.

EXAMPLES

list history
list history print
list history schedule

DESCRIPTION

The list history command generates a log listing of the most recent "data affecting" administration and maintenance commands successfully completed.

Data commands are those administration and maintenance commands that change the data state associated with any object and qualifier in the system. Administration data commands affect translation data while maintenance data commands affect state information. For example, "change station" would be classed as a data command, whereas "display station" would not.

All information in the transaction log is saved on tape as translation data when the "save translation" command is performed (LIFO order). When the switch COLD I starts or reboots, the saved translation, and thus the transaction log, will be loaded from tape. In this way, the translation data and the data in the transaction log will remain compatible.

Defaults

None.

Parameters

print	This will cause the report to be printed if a printer is linked to the SAT.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [2] for more details.

Help Messages

If the system technician presses HELP after entering "list history", the following message is displayed:

```
['print' or 'schedule']
```

Error Messages

None.

OUTPUT

Date	The date the command was issued. Format "mm/dd" where "mm" is the month and "dd" is the day.
Time	The time the command was issued. Format "hh:mm" where "hh" is the hour and "mm" is the minute.
Port	The port field indicates the port type to which the user was connected when the command was issued.

Port Number	Board	List History Display
0 - 30	EPN Maintenance Board Port	MAINT
31 - 40	System Access Port	SYS-PORT
41	Maintenance Board Port	SYSAM-LCL
42	Remote Maintenance Board Port	SYSAM-RMT

Login	The login of the user performing the data command; for example "system technician."
Actn	The first word (verb) of the command, specifying the operation to be performed. This field is truncated after four characters to allow enough space for objects and qualifiers. Four characters is enough to uniquely identify each action.
Object	The second phrase of the command specifying the particular thing being acted upon by the command. Note: Where the object is multiple words in length, only the first word will be displayed in the object field. All succeeding words will be treated as qualifiers. This field is truncated after twelve characters to allow enough space for qualifiers. Twelve characters is enough to uniquely identify each object.
Qualifier	One or more qualifiers which specify the characteristics of the action/object pair. This field is truncated after 31 characters to keep information for a command on a single line.

For the following example, the command that was entered is "list history."

```
list history                          Page   1   SPE A

                               HISTORY

         press CANCEL to quit --  press NEXT PAGE to continue
```

SYSTEM 85 R3 AND SYSTEM 75 R1 RELEASE DIFFERENCES

None.

FEATURE INTERACTIONS

The translation log is written to tape as translation data when the save translation command is executed.

Translation data is time stamped when saved on tape. This time stamp is noted when translation is loaded from tape and included in all recent change history reports.

When a user requests a recent change history report, there could be other users concurrently issuing data commands and altering the contents of the transaction log. Therefore, if the user pages the entire way through the report, the oldest entries in the transaction log may have been overwritten by data commands issued by these other users. Should this occur, the final entries of the report will show the data commands which have been issued by these other users since the recent change history report was originally requested.

Use of the maintenance command "set time" to alter the system clock could make it look as if the recent change history report is not in true LIFO order.

A maximum of 250 commands are stored in the transaction log.

list isdn-testcall

This command displays the ISDN-PRI trunks in use for ISDN-PRI test calls.

SYNOPSIS

list isdn-testcall [schedule **|** print]

PERMISSIONS

The following logins may execute this command: system technician, inads, init.

EXAMPLES

list isdn-testcall
list isdn-testcall print
list isdn-testcall schedule

DESCRIPTION

The list isdn-testcall command lists all of the ISDN-PRI trunks that are currently in use for ISDN-PRI test calls in the system. This command is useful to determine which trunk is in use for an outgoing ISDN-PRI test call.

Defaults

No defaults.

Parameters

schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.
print	This parameter will cause the output to be printed by a printer at the SAT.

Help Messages

If the system technician presses help after entering "list isdn-testcall" the following message will be displayed:

```
['print' or 'schedule']
```

Error Messages

If the software data cannot be sent to the SAT, the following message will be displayed:

```
Error encountered, can't complete request.
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy
```

OUTPUT

B-Channel	This field displays the trunk in use for the ISDN-PRI test call (trunk group number/ member number).
Start Time	The time the test call started (DD/HH:MM).
Duration	The expected duration of the test call.
M/T Port	The TN771 Maintenance/Test circuit pack's digital port address(cabinet/carrier/slot/circuit) in use for the outgoing asynchronous ISDN-PRI test call.

```
list isdn-testcall

               ISDN-PRI TESTCALLS

list marked-ports

This command lists all the ports that have been marked unusable.

SYNOPSIS

list marked-ports [print | schedule]

PERMISSIONS

The following default logins may execute this command: bcms, browse, system technician, cust, inads, init, rcust.

EXAMPLES

list marked-ports
list marked-ports print
list marked-ports schedule

DESCRIPTION

The list marked-ports command displays all of the ports that have been marked unusable via the mark port command. For more information on the mark port command, refer to the "mark port" command description in this chapter.

A maximum of fifteen marked ports are displayed per page.

Defaults

No defaults.

Parameters

print	If specified, this parameter will cause the information displayed by this command to be sent to the printer attached to the terminal as well as to the screen.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses help after entering "list marked-ports" the following message will be displayed:

```
['print' or 'schedule']
```

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy, try again later
```

OUTPUT

Port	The port address (cabinet-carrier-slot-circuit) of the marked port.
Board-Type	The type of circuit pack containing the marked port. If this circuit pack information is no longer available because the circuit pack was removed after the port was marked, the Board-Type field will be blank.

For the following output example, the command entered was "list marked-ports."

```
list marked-ports

             MARKED-PORT INFORMATION
     Port     Board-Type
     1C0101   DIG-BD
     1C0601
     1C0702   DIG-BD

 Command successfully completed
```

FEATURE INTERACTIONS

None.

list measurements

This command lists reports summarizing measurements associated with DS1 board. **The list measurements command has many more options than those that are documented here. Only those options dealing with DS1 board are documented below.**

SYNOPSIS

list measurements ds1 [log **|** summary] ds1_location [print **|** schedule]

PERMISSIONS

The following logins may execute this command: browse, system technician, cust, inads, init, nms, bcms, rcust.

EXAMPLES

list measurements ds1 log 2a18
list measurements ds1 summary 2a18 print
list measurements ds1 summary 2a18 schedule

DESCRIPTION

The "list measurements ds1" command provides performance measurements on a DS-1 link. The "ds1 summary" option provides a summary report while the "ds1 log" option provides a detailed report.

The performance measurements of a DS-1 link indicate the quality of the DS-1 physical interface between the system and a far end system.

Defaults

None.

Parameters

ds1_location	The physical location of a DS1 circuit pack entered as cabinet-carrier-slot.
print	This will cause the report to be printed if a printer is linked to the MGR1 terminal.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [2] for more details.

Help Messages

If the system technician presses HELP after entering "list measurements ds1", the following list of options is displayed:

```
log      summary
```

If the system technician presses HELP after entering "list measurements ds1 log" or "list measurements ds1 summary", the following message is displayed:

```
Enter board location: [cabinet(1-3)];carrier(A-E);slot(00-20),
                    ['print' or 'schedule']
```

Error Messages

If the user enters an invalid format for a board location when entering a "list measurements ds1 log" or "list measurements ds1 summary" command, the following error message is displayed:

```
"entered value" Invalid slot address for DS1 board
```

If the user enters a board location that is not a DS1 board location or the location of an unadministered DS1 when entering a "list measurements ds1 log" or "list measurements ds1 summary" command, the following error message is displayed:

```
DS1 board has not been administered
```

If the user enters anything other than "log" or "summary" following "list measurements ds1", the following error message is displayed:

```
"entered value" is an invalid entry; please press HELP
```

If the system time has not been set correctly, after entering "list measurements ds1 log ds1_location" or "list measurements ds1 summary ds1_location" the following error message is displayed:

```
Cannot get time from system clock
```

OUTPUT

The following field descriptions pertain to the summary reports accessed by the "list measurements ds1 summary" command.

Counted Since:	The start time and date when the associated measurement counters were cleared or the DS1 circuit pack was administered.
Number of Seconds Elapsed Into Current 15-min Interval:	The number of seconds from the beginning of the current 15-minute interval. This field has a value from 0 to 900.
Total of Valid 15-min Intervals in Past 24-hr Period:	The total number of 15-minute intervals in the past 24-hour period that contain valid data. This field has a value from 0 to 96.
Category	The four categories correspond to four measurement error counters. The four categories are "Errored Seconds," "Bursty Err Secs," "Severely Err Secs," and "Failed Seconds". The meanings of each category follow: ■ The value of the errored seconds counter for the specified 15-minute interval. This field has a value from 0 to 900 or N/A if the data for the 15-minute interval is invalid. ■ The value of the bursty errored seconds counter for the specified 15-minute interval. This field has a value from 0 to 900 or N/A if the data for the 15-minute interval is invalid. ■ The value of the severely errored seconds counter for the specified 15-minute interval. This field has a value from 0 to 900 or N/A if the data for the 15-minute interval is invalid. ■ The value of the failed seconds counter for the specified 15-minute interval. This field has a value from 0 to 900 or N/A if the data for the 15-minute interval is invalid.

Worst_ 15-Min_ Interval	The date(Date), end time(Time), and error count (Count; from 0 to 900 in increments of four) of the 15-minute interval in the previous 24-hour period that contains the maximum value for each of the four error categories (errored seconds, bursty errored seconds, severely errored seconds, and failed seconds).
Total of 24-Hour Count	The sum of all valid 15-minute counts for the previous 24-hour period for each of the four error categories. This field has a value from 0 to 65535.
Current 15-Minute Interval	The error count for the current (incomplete) 15-minute interval for each of the four error categories. This field has a value from 0 to 899 or N/A if the data for the current 15-minute interval is invalid.

The following field descriptions pertain to the detailed reports accessed by the "list measurements ds1 log" command.

Counted Since:	The start time and date when the associated measurement counters were cleared or the DS1 circuit pack was administered.
DATE	The date of the 15-minute interval.
TIME	The time of the 15-minute interval.
ERRORED SECONDS	The value of the errored seconds counter for the specified 15-minute interval. This field has a value from 0 to 900 or N/A if the data for the 15-minute interval is invalid.
BURSTY ERR SECS	The value of the bursty errored seconds counter for the specified 15-minute interval. This field has a value from 0 to 900 or N/A if the data for the 15-minute interval is invalid.
SEVERELY ERR SECS	The value of the severely errored seconds counter for the specified 15-minute interval. This field has a value from 0 to 900 or N/A if the data for the 15-minute interval is invalid.
FAILED SECONDS	The value of the failed seconds counter for the specified 15-minute interval. This field has a value from 0 to 900 or N/A if the data for the 15-minute interval is invalid.

VALID INTERVAL — This field indicates whether the data for the specified 15-minute interval is valid. Data is considered valid when a count for that 15-minute interval. If the field has a value of 'y', the data for the four error categories is valid; otherwise, the data is invalid. Data is considered valid when a count for that 15-minute interval is retrieved and none of the following invalid conditions occur. Data is invalid if a system warm start or a system cold start occurred during the interval, if the DS1 circuit pack was not inserted during the interval, if the system time was changed during the interval, or if the system was too busy to respond to a poll request for the interval.

The following output examples show all of the four different DS1 reports.

```
list measurements ds1 summary 2a19                     SPE A

 Switch Name:                  Date: 1:25 pm  THU APR 16, 1992

FEATURE INTERACTIONS

None.

list mst

This command will allow the user to display messages in the MST buffer.

SYNOPSIS

list mst *from message number count number [continuous | LIFO | FIFO] auto-page*

[schedule | print]

PERMISSIONS

The following logins may execute this command: inads, init.

EXAMPLES

list mst continuous
list mst continuous auto-page
list mst LIFO
list mst from 222 count 7

DESCRIPTION

This command is used to display the messages in the trace buffer. It can be used when the trace is disabled or active, but if active, older messages may be sporadically omitted if wraparound is selected and the message rate is high. This command can be used repeatedly without destroying the integrity of the buffer.

Defaults

The default for the command is to display all messages in FIFO order, i.e., until the displayed message momentarily catches up with the newest message, and not "auto-page".

Parameters

from message number	The message number to start the display may be entered. If the message number specified is not in the buffer, then that will be indicated on the display, and no additional messages will be displayed. If this clause is omitted, then the messages will be displayed starting with the oldest in the buffer for FIFO and for "continuous". For LIFO, the display will start with the newest message in the buffer.
continuous	The display will be updated as new messages enter the trace buffer. The messages will be displayed in FIFO order. This option is most useful in conjunction with "auto-page". The list continuous command will terminate only when canceled by the user.
count	The count of messages to display may be used to limit the trace
LIFO	The messages will be displayed with the current newest message first.
FIFO	The messages will be displayed in the order received.
auto-page	The screen will automatically page when full. When used in combination with "continuous" this provides a nice way to "watch" the trace as messages arrive.
schedule	This parameter will allow access to the system printer feature. The "continuous" option may not be combined with this option.
print	This parameter will cause the output to be printed by a printer at the SAT.

Help Messages

If the user presses HELP after entering "list mst" the following message will be displayed:

```
Enter [ ’from’ 0-32767 ] [ ’count’ 1-9998 ]
   [ ’fifo’ or ’lifo’ or ’continuous’ ]
 [ ’auto-page’ ] [ ’print’ or ’schedule’ ]
```

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
’login id’:’command’ has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The responses will be displayed on a message by message basis with one or more lines of data displayed for each message traced.

Number	The sequence number for the message.
Date/Time	The Date/Time.
Type	MST message type, ex. 60 == ISDN uplink, 62 == ISDN downlink, 6C == ISDN level 2 primitive.
Message	Message text in hexadecimal (ISDN or X.25).

For the following output example, assume that the command that was entered was "list mst", and that timestamps were enabled via the "change mst" command.

```
list mst
                  MST DATA

 Number  Date/Time    Type  Message
   1   12/21/90
       14:30:21.220  62  00 00 74 17 08 02 00 11 05 04 03 80 90 a2 18
                         03 a1 83 86 70 01 80 96 28 0d 73 74 61 74 69

 Command Successfully Completed
```

INTERPRETATION OF OUTPUT

Summary of MST Message Types

Table 10-5. Summary of MST Message Types

Message Type Encode	Description
0x10	Vector Trace message
0x11	Vector Event message
0x21	IMT proc_errs
0x22	IMT crec
0x23	IMT miscellaneous hooks (dbug)
0x30	CCMS uplink message
0x31	CCMS downlink message
0x32	Packet uplink message
0x33	Packet downlink message
0x40	IMT internal-message trace for call_p, conn_m, grp_m, serv_d, suser_m
0x50	ASAI level 2 primitive uplink
0x51	ASAI level 2 primitive downlink
0x52	ASAI maintenance uplink
0x53	ASAI maintenance downlink
0x54	ASAI unrecognized uplink
0x55	ASAI unrecognized downlink
0x56	ASAI association uplink
0x57	ASAI association downlink
0x58	ASAI error uplink
0x60	ISDNPRI uplink
0x62	ISDNPRI downlink
0x64	ISDNBRI uplink
0x66	ISDNBRI downlink

Continued on next page

Table 10-5. Summary of MST Message Types — *Continued*

Message Type Encode	Description
0x68	ISDNBRI level 2 primitive uplink
0x6A	ISDNBRI level 2 primitive downlink
0x6C	ISDNPRI level 2 primitive uplink
0x6D	ISDNPRI level 2 primitive downlink
0x6E	ISDNPRI unrecognized message
0x6F	ISDNBRI unrecognized message
0x71	GAP marker
0x72	Time changed while trace enabled
0xA0	X.25 Outgoing application data message
0xA1	X.25 Incoming application data message
0xA2	X.25 Application error message
0xB0	X.25 Outgoing session layer control message
0xB1	X.25 Incoming session layer control message
0xCF	X.25 Message confirmation
0xD0	X.25 Outgoing processor channel control message
0xD1	X.25 Incoming processor channel control message
0xD2	X.25 Link control message
0xD3	X.25 Link status message
0xE2	X.25 Session Timer Expirations
0xF0	X.25 Error Message (Outgoing Message Lost)
0xF1	X.25 Unrecognized Messages
0xF2	X.25 Error Message (DIP ICOM Record Aborted) (R2 Only)
0xF9	Snapper instrumentation message
0xFA	Snapper continuation message (for large msgs)

Detailed description of Messages**

Note that the X.25 messages discussed below really follow the BX.25 Message Protocol.

** The R2 message set will be defined in the document, OSS Interface Requirement for the Definity Generic 2.2 ISDN-PRI/DCIU Message Sequence Tracer, COMPAS ID 7459DR.

The terminology Message[n] used below refers to the byte at offset n in the message being displayed.

MST message types contain a version number. Whenever the structure of the MST message changes, the version field in the MST buffer will be changed. Version 1 (default) displays a blank in the version field which is immediately after the MST message type field. Subsequent versions display the version number after the MST message type field and are connected with a '-'. For example: Version 2 of the X.25 Application error/notification message has added the text of the pm state table stimulus which was ignored.

Version 1 of MST message type 0xA2 would appear on the 'list mst' output:

Number	Date/Time	Type	Message
1	11:41:22:425	A2	17 10

Version 2of MST message type 0xA2 would appear on the 'list mst' output:

Number	Date/Time	Type	Message
90	12:41:14:112	A2-02	17 10 21 03 32 05 01 80

The following applies for the descriptions below:

— default version number is 1 (blank).

— MST messages which have more than one version will have the layouts for each version included.

— MST messages without a label will be in G3iV1.1-286 and G3iV2-386.

— Anything labeled R3 will also be in G3iV1.1-286 and G3iV2-386.

— Anything labeled R1 will also be in G3iV1.1-286, G3iV2-386, and G3sV2.

— Anything labeled D92 will only be in G3iV1.1-286, G3iV2-386, and G3sV2.

Vector Trace (G3 Only)

Message type:

0x10

Message format:

Message[1-4]	= call identifier (CID) (defined in $BASEPJ/hdrs/capro.h)
Message[5-6]	= vector number (defined in $BASEPJ/hdrs/dpm_calls.h)
Message[7]	= step number (defined in $BASEPJ/hdrs/callr.h)
Message[8]	= step type (defined in $BASEPJ/hdrs/dpm_calls.h)
Message[9]	= step state (defined in $BASEPJ/hdrs/dpm_calls.h)
Message[10-12]	= VDN
Message[13]	= port network number
Message[14]	= endpoint number
Message[15]	= angel number
Message[16]	= circuit number
Message[17-20]	= trunk number
Message[21+]	= auxiliary data (based on step type)

Vector Event Trace (D92 Only)

Message type:

0x11

Message format:

Message[1-4]	= cid (defined in $BASEPJ/hdrs/capro.h)
Message[5-6]	= event
Message[7+]	= auxiliary data (based on event)

Events are defined in $BASEPJ/hdrs/evnt_defs.h. Events based on the call_p will have the following auxiliary data:

Message[7-8]	= vector number
Message[9-10]	= step number

Events based on the grp_m will have the following auxiliary data:

Message[7-10]	= hunt group number

IMT (D92)

The messages described in this section cannot be controlled directly through any of the MST screens. They are enabled/disabled through TCM but their output goes to the MST buffer. See [IMT] for details on these messages.

A read-only field in the "change mst" screen, "Other Tracing?", alerts the user that one or more of these types of messages is enabled.

0x21 - IMT proc_errs

Message format:

Message[1-4]	= process number(lname)
Message[5-8]	= sequence number (defined in *.p/hdrs/main_err.h, for example: $BASEPJ/gmtce.ss/hmm.p/hdrs/main_err.h)
Message[9-12]	= data 1
Message[13-17]	= data 2

0x22 - IMT crec

Message format:

Message[1+]	= call record (defined as CALLR typedef in $BASEPJ/hdrs/callr.h)

0x23 - MT_IMT (miscellaneous IMT hooks)

This message type is for miscellaneous IMT hooks. The only sub-type currently available is for a debug button (dbut). The button number is provided in the debug button MST message so that more than one button can be administered (through IMT) to convey different meanings. For example, depression of button N could signify the start of the problem symptoms, while depression of button N + X could signify the end of the problem symptoms. Note that the button number being logged represents the position of a button on a particular set type, and will be different depending on set type and module type (feature, coverage, display, ...), etc. The mapping of the button number stored in the IMT_BUT_DEBUG MST message to a position on the set is not trivial, however, the debug buttons can be administered through TCM, debug button filtering enabled through TCM and

MST enabled using the 'enable mst' command and the resultant messages sent to MST when each button is depressed can be examined for the button data and noted.

Message format:

Message[1]	= 0x01 (debug button sub-type, IMT_BUT_DEBUG)
Message[2-3]	= button number
Message[4-7]	= user id

0x40 - internal message tracing of call_p, conn_m, grp_m, serv_d, suser_m

Message formats: conn_m, grp_m, and suser_m:

Message[1-4]	= user identifier
Message[5-6]	= hook identifier (defined in $BASEPJ/hdrs/mstencode.h)
Message[7+]	= standard message (depends on hook type)

serv_d (map-type messages):

Message[1-4]	= user identifier
Message[5-6]	= hook identifier (defined in $BASEPJ/hdrs/mstencode.h)
Message[7]	= STIM type
Message[8-11]	= service identifier
Message[12]	= port network number
Message[13]	= endpoint number
Message[14]	= angel number
Message[15]	= circuit number
Message[16+]	= message

serv_d (other serv_d messages):

Message[1-4]	= user identifier
Message[5-6]	= hook identifier (defined in $BASEPJ/hdrs/mstencode.h)
Message[7]	= STIM type
Message[8-11]	= service identifier

Message[12-13]	= interpreted STIM
Message[14-17]	= aux data 0
Message[18-21]	= aux data 1
Message[22-25]	= aux data 2
Message[26-29]	= aux data 3
Message[30]	= hwtype field
Message[31]	= hwdata field

call_p:

Message[1-4]	= call identifier
Message[5-6]	= hook identifier (defined in $BASEPJ/hdrs/mstencode.h)
Message[7]	= supervisor
Message[8]	= digit prep
Message[9+]	= message

CCMS (D92)

Message types:

0x30 uplink
0x31 downlink

Message format:

Message[1]	= port network number
Message[2]	= endpoint number
Message[3]	= angel number
Message[4]	= circuit number
Message[5-6]	= hook identifier (defined in $BASEPJ/hdrs/mstencode.h)
Message[7]	= message length
Message[8]	= angel id
Message[9+]	= standard CCMS message

Packet (D92)

Message type:

0x32 uplink

Message format:

Message[1-4]	= user identifier
Message[5-6]	= hook identifier (defined in $BASEPJ/hdrs/mstencode.h)
Message[7-10]	= link identifier
Message[11-12]	= message type (defined in $BASEPJ/hdrs/pcd_calls.h)
Message[13+]	= standard packet message

Message type:

0x33 downlink

Message format:

Message[1]	= port network number
Message[2]	= endpoint number
Message[3]	= angel number
Message[4]	= circuit number
Message[5-6]	= hook identifier (defined in $BASEPJ/hdrs/mstencode.h)
Message[7-10]	= link identifier
Message[11+]	= standard packet message

ASAI

ASAI messages listed on the MST screen consist of a 4 octet header and a variable length body. The header contains the ASAI port address encoded with 8 hexadecimal digits. This same encoding is also used for BRI and PRI.

In message types other than 50 and 51 (Level 2 Primitives), following the port address is a one octet field called the qualifier. The meaning of the qualifier varies according to the type (as specified by the MST encode) of ASAI message traced. The body which is a real ASAI message (except for Level 2 Primitives) follows the qualifier.

When the display is administered for abbreviated format, the body contains only the initial part of the ASAI message (all information in beginning of message up to and including the Q.931 IE tag) plus the cause IE (if present).

0x50 - ASAI level 2 uplink primitive

Message[1]	= Port Network Number of ASAI port
Message[2]	= reserved
Message[3]	= Carrier Address of ASAI port
Message[4]	= Port number of ASAI port
Message[5]	= SAPI
Message[6]	= TEI

R1:

Message[7,8]	= Link ID
Message[9]	= Uplink encode 0x01 - ASAI Link State 0x02 - TEI Management Message 0x03 - XID Message
Message[10]	= R1/R3 Link States: 0x00 - the link has gone down 0x01 - the link has come up 0x02 - the link id has changed 0x03 - the link has gone hyperactive 0x04 - the link has recovered 0x05 - the audit recovery stim 0x06 - the link has been reset 0x07 - link state hyper (too many SABMEs) disconnect 0x08 - broadcast link audit
	= R1/R3 TEI Management Message 0x01 - Identity request 0x05 - Identity Check Response 0x07 - Identity Verify Request
	= R1/R3 XID Messages 0x01 - XID Request 0x02 - XID Response

R3:

Message[7-10] = Link ID

Message[11] = Uplink encode
0x01 - ASAI Link State
0x02 - TEI Management Message
0x03 - XID Message

Message[12] = ASAI Link State:
0x00 - the link has gone down
0x01 - the link has come up
0x02 - the link id has changed
0x03 - the link has gone hyperactive
0x04 - the link has recovered
0x05 - the audit recovery stim
0x06 - the link has been reset
0x07 - link state hyper (too many SABMEs) disconnect
0x08 - broadcast link audit

= TEI Management Message
0x01 - Identity request
0x05 - Identity Check Response
0x07 - Identity Verify Request

= XID Messages
0x01 - XID Request
0x02 - XID Response

0x51 - ASAI level 2 downlink primitive

Message[1] = Port Network Number of ASAI port

Message[2] = Reserved

Message[3] = Carrier Address of ASAI port

Message[4] = Port number of ASAI port

Message[5] = SAPI

Message[6] = TEI

R1:

Message[7,8] = Link ID

NOTE:
The Link ID has no meaning for the link establish request, therefore the Link ID field will contain 0xff 0x.ff

Message[9] = Downlink encode
0x01 - ASAI Link Events
0x02 - TEI Management Message
0x03 - XID Message

Message[10] = ASAI Link Events:
0x02 - link release request
0x0f - link establish request sent to and received by the lower level

= TEI Management Message
0x02 - Identity Assigned
0x04 - Identity Check Request
0x06 - Identity Remove

= XID Messages
0x01 - XID Request
0x02 - XID Response

Message[11] = 0xCA - Cancel Byte

NOTE:
The cancel byte will only be present if the message was built, but could not be sent.

R3:

Message[7-10] = Link ID

NOTE:
The Link ID has no meaning for the link establish request, therefore the Link ID field will contain 0xff 0xff 0xff 0x.ff

Message[11]	= Downlink encode 0x01 - ASAI Link Events 0x02 - TEI Management Message 0x03 - XID Message
Message[12]	= ASAI Link Events: 0x02 - link release request 0x0f - link establish request sent to and received by the lower level
	= TEI Management Message 0x02 - Identity Assigned 0x04 - Identity Check Request 0x06 - Identity Remove
	= XID Messages 0x01 - XID Request 0x02 - XID Response
Message[13]	= 0xCA - Cancel Byte

NOTE:
The cancel byte will only be present if the message was built, but could not be sent.

0x52 - ASAI maintenance uplink

Message[1] = Port Network Number of ASAI port
Message[2] = Reserved
Message[3] = Carrier Address of ASAI port
Message[4] = Port number of ASAI port
Message[5] = 0
Message[6+] = standard or abbreviated ASAI message format

0x53 - ASAI maintenance downlink

Message[1] = Port Network Number of ASAI port
Message[2] = Reserved
Message[3] = Carrier Address of ASAI port
Message[4] = Port number of ASAI 3 ort
Message[5] = 0
Message[6+] = standard or abbreviated ASAI message format

0x54 - ASAI unrecognized uplink

Message[1] = Port Network Number of ASAI port
Message[2] = Reserved
Message[3] = Carrier Address of ASAI port
Message[4] = Port number of ASAI port
Message[5] = failure cause

Failure causes

0x2a (42.) - Overload Controls in Effect
0x32 (50.) - Requested Feature Not Administered
0x45 (69.) - Requested Feature Not Implemented
0x51 (81.) - Invalid CRV
0x5f (95.) - Invalid Message
0x60 (96.) - Mandatory Information Element Missing
0x61 (97.) - Message Non-Existent/Not Implemented
0x63 (99.) - Information Element non-existent
0x64 (100.) - Invalid Information Element Contents
0x6f (111.) - Protocol Error

Message[6+] = standard or abbreviated ASAI message format

NOTE:
An unrecognized message displayed in abbreviated format may be missing information (such as cause) because the message was not able to be parsed.

0x55 - ASAI unrecognized downlink

Message[1] = Port Network Number of ASAI port

Message[2] = Reserved

Message[3] = Carrier Address of ASAI port

Message[4] = Port number of ASAI port

Message[5] = failure reason

Failure reasons

1 - link flow controlled
2 - internal software error - see software error log
3 - packet interface problem - see error log

Message[6+] = standard or abbreviated ASAI message format

0x56 - ASAI association uplink

Message[1] = Port Network Number of ASAI port

Message[2] = Reserved

Message[3] = Carrier Address of ASAI port

Message[4] = Port number of ASAI port

Message[5] = association type

Association Type

0 - unknown
1 - call control
2 - domain control
3 - notification

4 - adjunct routing
5 - set value
6 - value query
7 - request feature

Message[6+] = standard or abbreviated ASAI message format

0x57 - ASAI Association downlink

Message[1] = Port Network Number of ASAI port

Message[2] = Reserved

Message[3] = Carrier Address of ASAI port

Message[4] = Port number of ASAI port

Message[5] = association type

Message[6+] = standard or abbreviated ASAI message format

0x58 - ASAI error uplink

Message[1] = Port Network Number of ASAI port

Message[2] = Reserved

Message[3] = Carrier Address of ASAI port

Message[4] = Port number of ASAI port

Message[5] = failure cause

Failure causes

1 - 127 are code standard zero cause values
128 - 255 are code standard three cause values (+ 128)

Message[6+] = standard or abbreviated ASAI message format

ISDN

0x60 - ISDN PRI uplink

Message[1]	= Port Network Number of D-channel port
Message[2]	= Reserved
Message[3]	= Carrier Address of D-channel port
Message[4]	= Port number of D-channel port
Message[5+]	= standard ISDNPRI format

NOTE:
In abbreviated format, the header of the Q.931 message, the cause IE (if present) and the channel id Information Element (IE) (if present) are the only IEs present.

0x62 - ISDN PRI downlink

Message[1]	= Port Network Number of D-channel port
Message[2]	= Reserved
Message[3]	= Carrier Address of D-channel port
Message[4]	= Port number of D-channel port
Message[5+]	= standard ISDNPRI format

NOTE:
In abbreviated format, the header of the Q.931 message, the cause IE (if present) and the channel id IE (if present) are the only IEs present.

0x64 - ISDN BRI uplink

Message[1]	= Port Network Number of BRI port
Message[2]	= Reserved
Message[3]	= Carrier Address of BRI port
Message[4]	= Port number of BRI port
Message[5]	= SAPI
Message[6]	= TEI

R1:

Message[7,8]	= Link ID
Message[9+]	= standard ISDNBRI format

R3:

Message[7-10]	= Link ID
Message[11+]	= standard ISDNBRI format

NOTE:
In abbreviated format, the header of the Q.931 message, the cause IE (if present) and the channel id Information Element (IE) (if present) are the only IEs present.

0x66 - ISDN BRI downlink

Message[1] = Port Network Number of BRI port
Message[2] = Reserved
Message[3] = Carrier Address of BRI port
Message[4] = Port number of BRI port
Message[5] = SAPI
Message[6] = TEI

R1:

Message[7,8] = Link ID
Message[9+] = standard ISDNBRI format

R3:

Message[7-10] = Link ID
Message[11+] = standard ISDNBRI format

NOTE:
In abbreviated format, the header of the Q.931 message, the cause IE (if present) and the channel id IE (if present) are the only IEs present.

An additional cancel byte (0xCA) may be present after the standard ISDNBRI formatted message if the message was not sent. The cancel byte will not be appended if the abbreviated format is selected.

0x68 - ISDN BRI level 2 uplink primitive

Message[1] = Port Network Number of BRI port
Message[2] = Reserved
Message[3] = Carrier Address of BRI port
Message[4] = Port number of BRI port
Message[5] = SAPI
Message[6] = TEI

R1:

Message[7,8] = Link ID
Message[9] = Uplink encode
0x01 - BRI Link State
0x02 - TEI Management Message
0x03 - XID Message

Message[10] = R1/R3 Link States:
0x00 - the link has gone down
0x01 - the link has come up
0x02 - the link id has changed
0x03 - the link has gone hyperactive
0x04 - the link has recovered
0x05 - the audit recovery stim
0x06 - the link has been reset
0x07 - link state hyper (too many SABMEs) disconnect
0x08 - broadcast link audit

= R1/R3 TEI Management Message
0x01 - Identity request
0x05 - Identity Check Response
0x07 - Identity Verify Request

= R1/R3 XID Messages
0x01 - XID Request
0x02 - XID Response

R3:

Message[7-10] = Link ID

Message[11] = Uplink encode
0x01 - BRI Link State
0x02 - TEI Management Message
0x03 - XID Message

Message[12] = BRI Link State:
0x00 - the link has gone down
0x01 - the link has come up
0x02 - the link id has changed
0x03 - the link has gone hyperactive
0x04 - the link has recovered
0x05 - the audit recovery stim
0x06 - the link has been reset
0x07 - link state hyper (too many SABMEs)
disconnect
0x08 - broadcast link audit

= TEI Management Message
0x01 - Identity request
0x05 - Identity Check Response
0x07 - Identity Verify Request

= XID Messages
0x01 - XID Request
0x02 - XID Response

0x6A - ISDN BRI level 2 downlink primitive

Message[1] = Port Network Number of BRI port

Message[2] = Reserved

Message[3] = Carrier Address of BRI port

Message[4] = Port number of BRI port

Message[5] = SAPI

Message[6] = TEI

R1:

Message[7,8] = Link ID

NOTE:
The Link ID has no meaning for the link establish request, therefore the Link ID field will contain 0xff 0xff

Message[9]	= Downlink encode 0x01 - BRI Link Events 0x02 - TEI Management Message 0x03 - XID Message
Message[10]	= BRI Link Events: 0x02 - link release request 0x0f - link establish request sent to and received by the lower level
	= TEI Management Message 0x02 - Identity Assigned 0x04 - Identity Check Request 0x06 - Identity Remove
	= XID Messages 0x01 - XID Request 0x02 - XID Response
Message[11]	= 0xCA - Cancel Byte

NOTE:
The cancel byte will only be present if the message was built, but could not be sent.

R3:

Message[7-10]	= Link ID

NOTE:
The Link ID has no meaning for the link establish request, therefore the Link ID field will contain 0xff 0xff 0xff 0x.ff

Message[11] = Downlink encode
0x01 - BRI Link Events
0x02 - TEI Management Message
0x03 - XID Message

Message[12] = BRI Link Events:
0x02 - link release request
0x0f - link establish request sent to and received by the lower level

= TEI Management Message
0x02 - Identity Assigned
0x04 - Identity Check Request
0x06 - Identity Remove

= XID Messages
0x01 - XID Request
0x02 - XID Response

Message[13] = 0xCA - Cancel Byte

NOTE:
The cancel byte will only be present if the message was built, but could not be sent.

0x6C - ISDN PRI level 2 uplink primitive

Message[1] = Port Network Number of D-channel port

Message[2] = Reserved

Message[3] = Carrier Address of D-channel port

Message[4] = Port number of D-channel port

Message[5] = change type

R1/R3 change types:
0x01 - session up notification

0x02 - Session down notification
0x6D - ISDN PRI level 2 downlink primitive (not implemented)

Message[1]	= Port Network Number of D-channel port
Message[2]	= Reserved
Message[3]	= Carrier Address of D-channel port
Message[4]	= Port number of D-channel port
Message[5]	= change type

R1/R3 change types:
0x01 - link establish request
0x02 - link release request

0x6E - ISDN PRI Unrecognized Messages

Message[1]	= Port Network Number of D-channel port
Message[2]	= Reserved
Message[3]	= Carrier Address of D-channel port
Message[4]	= Port number of D-channel port
Message[5]	= type of failure

Types of failure:
0x01 - outgoing ISDNPRI
0x02 - incoming ISDNPRI

Message[6+]	= standard ISDN format

0x6F - ISDN BRI Unrecognized Messages

Message[1] = Port Network Number of BRI port

Message[2] = Reserved

Message[3] = Carrier Address of BRI port

Message[4] = Port number of BRI port

Message[5] = SAPI

Message[6] = TEI

R1:

Message[7,8] = Link ID

Message[9] = type of failure

Types of failure:

0x01 - outgoing ISDN
0x02 - incoming ISDN

Message[10+] = standard ISDNBRI format

R3:

Message[7-10] = Link ID

Message[11] = type of failure

Types of failure:

0x01 - outgoing ISDN
0x02 - incoming ISDN

NOTE:
In abbreviated format, the header of the Q.931 message, the cause IE (if present) and the channel id IE (if present) are the only IEs present.

An additional cancel byte (0xCA) may be present after the standard ISDNBRI formatted message if the message was not sent. The cancel byte will not be appended if the abbreviated format is selected.

General

0x71 - GAP marker

Message[1] = GAP reason
Message[2] = GAP count (since last clear - high byte)
Message[3] = GAP count (since last clear - low byte)

GAP reasons:

0x01 - disabled, disable mst command executed
0x02 - disabled, mst timer expired
0x03 - disabled, buffer full on no-wrap
0x04 - disabled, restart occurred
0x05 - disabled, by stop trigger or count
0x06 - disabled, audit error
0x07 - not disabled, stopped by stop trigger or count

0x72 - Time changed while trace enabled

Message[1] = 0x00
Message[2] = timestamp indication

timestamp indication:

0x00 - MST timestamp is old time
0x01 - MST timestamp is new time

X.25 Application Data

The processor channel number is the R1/R3 term, and R2 calls it the port number. The processor channel number is equal to the Application port number in R1. In R3, the processor channel admin screen should be inspected to determine the mapping.

0xA0 - X.25 outgoing application message

Message[1]	= processor channel number
Message[2]	= sequence number
Message[3]	= buffer id
Message[4]	= 0x00
Message[5+]	= application message[1]

1 Application messages will contain the session layer data headers and the data.

In abbreviated mode, the application message is not saved.

0xA1 - X.25 incoming application message

Message[1]	= processor channel number
Message[2]	= sequence number
Message[3+]	= application message

In abbreviated mode, the application message is not saved.

Application Control

0xA2 - X.25 application error or notification

NOTE:
The 'X.25 application error message' category contains notifications as well as errors.

0xA2, 0xF0 and 0xF2 messages will be turned on by responding 'y' to the 'Application Errors?' field.

Version 1:

Message[1]	= processor channel number
Message[2]	= application error/notification

Version 2:

Message[1]	= processor channel number
Message[2]	= application error/notification
Message[3+]	= pm stimulus ignored (For message[2] == 0x10 only)

Errors/Notifications:

R1/R3:

0x01 - no outgoing buffer available
0x05 - pvc session down
0x06 - pvc session up
0x07 - pvc session connect
0x08 - pvc session restart
0x09 - message buffer overload uplink
0x0A - message buffer overload downlink
0x0B - message buffer exhaustion
0x0C - max # of outgoing msgs allowed
0x0D - bad msg type in message buffer routine
0x0E - no message buffers available
0x0F - message buffer pointer error
0x10 - pm state table stimulus ignored
0x11 - bad session connect message

Session Layer Control

NOTE:
The session layer header is considered part of the session layer message.

0xB0 - X.25 outgoing session layer control message

Message[1]	= processor channel number
Message[2]	= session layer message type
Message[3]	= buffer id
Message[4]	= 0
Message[5+]	= session layer message

session layer message type:

0x00 - session connect
0x01 - session accept
0x02 - session reject
0x03 - session disconnect
0x04 - reserved
0x05 - reserved
0x06 - resynch
0x07 - reserved
0x08 - resynch acknowledge

In abbreviated mode, the session layer message is not saved.

0xB1 - X.25 incoming session layer control message

Message[1]	= processor channel number
Message[2]	= session message type
Message[3+]	= session message

session message type:

0x00 - session connect
0x01 - session accept
0x02 - session reject
0x03 - session disconnect
0x04 - reserved
0x05 - reserved
0x06 - resynch
0x07 - reserved
0x08 - reserved

In abbreviated mode, the session layer message is not saved.

0xCF - message confirmation

This confirmation is X.25 far end confirmation.

Message[1]	= processor channel number
Message[2]	= internal buffer id
Message[3]	= count of outgoing buffers confirmed

Processor Channel Control

0xD0 - outgoing control message

Message[1] = processor channel number

Message[2] = message event

Message events for R1:

0x00 - Request Reset of Logical Channel
0x05 - Ack. Reset of Logical Channel
0x06 - Flow Control Uplink
0x07 - Release Uplink Flow Control
0x0A - Flow Control Downlink
0x0B - Release Downlink Flow Control

Message events for R3:

0x00 - Request Reset of Logical Channel
0x08 - Connect Processor Channel
0x09 - Disconnect Processor Channel
0xD1 - X.25 incoming control message

Message[1] = processor channel number

Message[2] = message event

R1 Message events:

0x01 - Performed Requested Reset of Logical Channel
0x06 - Resetting Logical Channel
0x0A - Level 3 Restart[1]

R3 Message events:

0x01 - Performed Requested Reset of Logical Channel
0x06 - Resetting Logical Channel
0x08 - processor channel connected
0x09 - processor channel disconnected

1. If this event occurs, one restart for each logical channel will be written into the MST trace.

Link Control

0xD2 - link control

Message[1] = interface link number

Message[2] = message event

R1 Message events:

0x00 - Busy Out Link
0x01 - Release Busied Out Link
0x0A - Level 3 Restarting

R3 Message events:

0x00 - Stop Link
0x01 - Start Link
0x0A - Level 3 Restarting

0xD3 - link status (R3 Only)

Message[1] = interface link number

Message[2] = message event

R3 Message events:

0x02 - Session Down
0x03 - Session Up

Session Sanity

0xE2 - X.25 Session Timer Expirations

Message[1] = processor channel number

Message[2] = timer

Timers:

0x00 - ST2(session connect)
0x01 - ST3(retransmission)

Message[3] = countdown from A1

0x02 - ST4(resynchronization)

No count

0x03 - ABT1(abort session 1)

Message[3] = protocol machine state where timeout occurred

0x04 - ABT2(abort session 2)

Message[3] = protocol machine state where timeout occurred

0x05 - State Timer

Message[3] = protocol machine state where timeout occurred

0x06 - Message Timer

Message[3] not used

Protocol Machine States:

BAD_STATE	0x00 /* 0 is very common, don't use as a state */
PT_UNALLOC	0x01 /* port is un-allocated */
QUIESCENT	0x02 /* quiescent - allocated but not used */
ENTER_wSA	0x03 /* entering wSA - reset issued, not ABT/CON */
W_ACCEPT	0x04 /* Waiting for Session Accept*/
DATA_XFER	0x05 /* Data Transfer State*/
DATA_RESYNC	0x06 /* Resynchronization state */
PRI_ALLOC	0x07 /* pri port allocated but not yet used */
PRI_CONN	0x08 /* pri port connected */
HIGH_STATE	0x08 /* Highest value a port state can be*/

X.25 Errors

0xF0 - X.25 Error Message (Outgoing Message Lost)

Note that 0xA2, 0xF0 and 0xF2 messages will be turned on by responding ’y’ to the ’Application Errors?’ field.

Version 1:

Message[1]	= processor channel number
Message[2]	= sequence number
Message[3+]	= message

Version 2:

Message[1]	= processor channel number
Message[2]	= sequence number
Message[3]	= reason code
Message[4+]	= message

Reason Codes:

```
0x00   /* message lost */
       /* 1 reserved */
0x02   /* message ignored, sequence number is within window but less
        * than expected
        */
0x03   /* message ignored, bad sequence number */
0x04   /* message ignored, other port has sent a disconnect message */
0x05   /* message ignored, send request is rejected*/
0x06   /* message ignored, from ig_l3 */
0x07   /* message ignored, from l3_err */
0x08   /* sequence number is within window but less
        * than expected (resync)
        */
0x09   /* bad sequence number (resync) */
```

In abbreviated mode, the application message is not saved.

0xF1 - Unrecognized X.25 Messages

Message[1]	= processor channel number
Message[2]	= Failure type
Message[3+]	= session message

Failure types:

0x00 - Reserved
0x01 - Unknown session layer message type
0x02 - unrecognized control message

0xF2 - BX.25 Error Message (DIP ICOM Record Aborted)

R2 only

FEATURE INTERACTIONS

See documentation on the system printer feature.

list testcalls

This command generates an Automatic Transmission Measurement System (ATMS) measurement report.

SYNOPSIS

list testcalls detail *[grp group number to-grp group number mem member number to-mem member number | port location] [result result identifier | not-result result identifier] count count number [print | schedule]*

list testcalls summary *grp group number to-grp group number count count number [print | schedule]*

PERMISSIONS

The following logins may execute this command: browse, system technician, cust, inads, init, nms.

EXAMPLES

list testcalls detail
list testcalls detail print
list testcalls detail grp 78
list testcalls detail grp 78 result marg count 3 schedule
list testcalls detail grp 78 to-grp 80
list testcalls detail grp 78 to-grp 80 mem 1 print
list testcalls detail grp 78 to-grp 80 mem 1 not-result pass
list testcalls detail grp 78 to-grp 80 mem 1 count 2 schedule
list testcalls detail grp 78 to-grp 80 mem 1 to-mem 5
list testcalls detail grp 78 to-grp 80 mem 1 to-mem 5 count 3 print
list testcalls detail grp 78 to-grp 80 mem 1 to-mem 5 count 3 result pass
list testcalls detail mem 1 count 3 result pass
list testcalls detail to-grp 78 to-mem 4 count 3 result pass
list testcalls detail to-mem 3 result pass
list testcalls detail port 1c1504
list testcalls detail port 1c1504 count 5 schedule
list testcalls detail port 1c1504 count 5 not-result marg print
list testcalls summary
list testcalls summary grp 78
list testcalls summary grp 78 print
list testcalls summary grp 78 count 5
list testcalls summary grp 78 count 5 schedule
list testcalls summary grp 78 to-grp 80
list testcalls summary grp 78 to-grp 80 count 3
list testcalls summary to-grp 78
list testcalls summary to-grp 78 count 7 schedule

DESCRIPTION

The list testcalls command is used to examine ATMS trunk measurements. The ATMS is a feature which allows the voice and data trunk facilities to be measured for satisfactory transmission performance. The performance of the trunks are evaluated according to measurements produced by a series of analog tests and are compared against user defined threshold values. The list testcalls command is a reporting mechanism designed to display the measurements produced by these tests.

The measurement report contains data on trunk signal loss, noise, singing return loss, and echo return loss. The purpose of the report is to provide measurement data to help determine the quality of trunk lines.

The measurements are produced by a set of analog trunk tests. The tests are initiated by a maintenance demand test or by a set of scheduled tests. The largest portion of these measurements are generated through scheduled testing during system quiet hours (hours where the traffic volume is low). Each trunk test performed by the system stores the results in a database. The trunk measurements in this database reflect the state of each trunk at the time of its last test.

Defaults

None.

Parameters

detail	This option specifies that a detailed measurement report is displayed (See example of the screen).
summary	This option specifies that a summary measurement report is displayed (See example of the screen).
grp group number	This option is used to specify that measurements for a specific trunk group are displayed. When used with the "to-grp" option, this option is the starting trunk group in a range of user specified trunk groups.
to-grp group number	This option is used to specify that measurements for all trunk groups from 1 to the specified "to-grp" trunk group are displayed. When used with the "grp" option, this option is the ending trunk group in a range of user specified trunk groups.

mem member number	This option is used to specify that measurements for a specific trunk group member are displayed. When used with the "to-mem" option, this option is the starting trunk group member in a range of user specified trunk group members.
to-mem member number	This option is used to specify that measurements for all trunk group members from 1 to the specified "to-mem" trunk group member are displayed. When used with the "mem" option, this option is the ending trunk group member in a range of user specified trunk group members.
port location	This option is used to specify that measurements for a specific trunk circuit (port) are displayed.
result result identifier	This option is used to filter out all measurement results that do not match the user specified result (i.e. only measurement results that match the user specified result are displayed). Examples of results are pass, marg, fail, etc.
not-result result identifier	This option is used to filter out all measurement results that do match the user specified result (i.e. only measurement results that do not match the user specified result are displayed). Examples of results are pass, marg, fail, etc.
count count number	This option is used to specify (limit) the number of records displayed.
print	This will cause the report to be printed if a printer is linked to the SAT.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "list testcalls", the following message is displayed:

```
Please enter one of the following object command words:
           detail          summary
     Or press CANCEL to cancel the command
```

If the system technician presses HELP after entering "list testcalls detail", the following message is displayed:

```
Enter [['grp' x],['to-grp' x],['mem' x],['to-mem' x] or ['port' x]],
[['result' x] or ['not-result' x]],['count' x],['print' or 'schedule']
```

If the system technician presses HELP after entering "list testcalls summary", the following message is displayed:

```
Enter [['grp' x],['to-grp' x],[['count' x],
['print'] or ['schedule']
```

Error Messages

If there are no records in the measurements database, the following message is displayed:

```
No data in the system to list
```

If an invalid identifier is entered, the following message is displayed:

```
"identifier" is an invalid entry; please press HELP
```

If an invalid count identifier is entered, the following message is displayed:

```
"identifier" is an invalid identifier; press RETURN to execute modified
command
```

If an invalid port location or unadministered port location is entered, the following message is displayed:

```
"identifier" Identifier invalid
```

If the user entered trunk group number or the trunk group member number is not within a valid range, the following message is displayed:

```
Entry out of range
```

If the user entered trunk group number or the trunk group member number is not administered, or the user entered result is not found, the following message is displayed:

```
No records match the specified query options
```

DETAIL REPORT OUTPUT

Group	The trunk group number selected.
Type	The trunk group type.
Vendor	The vendor of this trunk group.
TTL Type	The kind of test line for this trunk group.
Threshold Values	The list of marginal and unacceptable threshold values defined on the trunk group form.
	The following fields appear on the lower section of the form. Many of the column headings contain the abbreviations "FE" for far end and "NE" for near end. These abbreviations define which end took the measurements.
Trk Mem	The trunk member within the trunk group.
Test Date	The month and day this trunk was tested.
Test Time	The time of day this trunk was tested.
Tst Rslt	This field describes the results of the trunk transmission test.
1004Hz-loss Min	Far-to-near and near-to-far measurements of 1004-Hz loss from low-level tone.
1004Hz-loss Max	Far-to-near and near-to-far measurements of 1004-Hz loss at 0 dBm.
Loss dev at 404Hz	Transmission tests at low frequency. These tests measure a maximum positive and negative deviation of +9 and -9 dB from the 1004-Hz loss measurements.
Loss dev at 2804Hz	Transmission tests at high frequency. These tests measure a maximum positive and negative deviation of +9 and -9 dB from the 1004-Hz loss measurements.
C-msg Noise	Maximum noise interference (in dBrnC: decibels above reference noise, which is B(EQ)10 sup -12E(EQ) watts) terminating on a voice terminal within the voice-band frequency range (500 to 2500 Hz) between 15 and 55 dBrnC.
C-ntch Noise	Maximum signal-dependent noise interference on a line between 34 and 74 dBrnC.

SRL-LO	Singing return loss from 0 to 40 dB between the sum of the circuit (repeater) gains and the sum of the circuit losses. SRL-LO occurs most often in the frequency range of 200 to 500 Hz.
SRL-HI	Singing return loss from 0 to 40 dB between the sum of the circuit (repeater) gains on a circuit and the sum of the circuit losses. SRL-HI occurs most often in the frequency range of 2500 to 3200 Hz.
ERL	Echo return loss from 0 to 40 dB between the level of signal strength transmitted and the level of signal strength reflected. ERL occurs most often in the frequency range of 500 to 2500 Hz.

For the following example, the command that was entered is "list testcalls detail grp 80."

```
list testcalls detail grp 80                  Page   1   SPE A

SUMMARY REPORT OUTPUT

Trk Grp Num	The trunk group number which is being summarized. Only outgoing or two-way analog trunks will be listed.
Num Of Trks	The total number of members per trunk group.
Last Test Date	The date of the oldest measurement in the trunk group.
Last Test Time	The time of the oldest measurement in the trunk group.
Trunks Passed Transm Test	The number of trunks that have passed the trunk transmission tests.
Trunks Failed Marginal Threshld	The number of trunks that failed a marginal threshold, but not an unacceptable threshold according to the threshold values defined on the trunk group form.
Trunks Failed Unaccept Threshld	This is taken from the unacceptable threshold administered on the Trunk group form.
Trks In-Use	The number of trunks that were in-use at the time of testing.
Trks Not Test	The number of trunks that were not tested due to error conditions.
Busied Out Trunks	The number of trunks that were busied out at the time. This could be due to hardware problems, incorrect threshold values, etc.

For the following example, the command that was entered is "list testcalls summary grp 80."

```
list testcalls summary grp 80                       SPE A

 Command successfully completed
```

SYSTEM 85 R3 AND SYSTEM 75 R1 RELEASE DIFFERENCES

None.

FEATURE INTERACTIONS

The ATMS feature must be turned "on" before the "list testcalls" command can be accessed. The "change system-parameters customer-options" form is used to turn "on" the ATMS feature.

These "list testcalls" reports interact with the trunk threshold values defined on the trunk group form. The marginal values defined on that form will be used to highlight measurements on the SAT report which are out of tolerance. The unacceptable values will be used to identify (by blinking) the trunk members on the SAT report which are unusable. These mechanisms will help a user to quickly identify out of tolerance or unusable trunks. The determination of the trunk threshold values or marginal values are done at the time of the list command, not at the test execution time.

Trunk transmission measurements must have been collected in order for the reports to be of any use. Test calls must be conducted to cause the collection of this data. System initialization or recovery will clear all transmission test data. ATMS measurements are stored only in memory and are not backed up onto a mass storage device. If for any reason the switch loses its current memory contents, the measurements will be lost. Trunks which have no transmission test data appear on the report as a blank line after the trunk member number.

mark port

This command marks a port as unusable.

SYNOPSIS

mark port location

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

mark port 1c0208
mark port 2a1001

DESCRIPTION

The mark port command is used to mark a faulty port as defective to prevent the use of the port in other administrative operations (for example, adding a data-module or station). Ports on any type of circuit pack may be marked except for circuit packs that are administered automatically (for example, Tone Detector, Tone Generator, Announcement, Speech Synthesizer, Call Classifier and Maintenance/Test circuit packs) when the circuit pack is installed. When the mark port command is entered, the specified port is marked. If the port can be administered manually, and if the port is not assigned, then the port is marked as faulty. The port can be restored to service by using the clear port command. All marked ports can be displayed in a list format via the list marked-ports command. All marked port information is saved as part of translations.

Defaults

No defaults.

Parameters

location	A "location" represents the physical position of the port to be marked and is entered as "UUcSSpp" where "UU" represents the cabinet number, "c" represents the carrier, "SS" represents the slot position, and "pp" represents the circuit (port). A single digit cabinet (1 - 3) may be entered with or without a leading zero (0).

Help Messages

If the system technician presses help after entering "mark port" the following message will be displayed:

```
Enter 7 character port number
```

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy, try again later
```

OUTPUT

If the mark port command is successful the following message will be displayed on the SAT:

```
Command successfully completed
```

FEATURE INTERACTIONS

None.

monitor bcms

This command displays real-time status reports for agents and splits summarizing BCMS (basic call management systems).

SYNOPSIS

monitor bcms [split *split number* | system *system number* | skill *skill number*]

PERMISSIONS

The following default logins may execute this command: init, inads, system technician, cust, rcust, bcms, browse.

EXAMPLES

monitor bcms split 1
monitor bcms system 1 5 7 8 9
monitor bcms system 1-15
monitor bcms skill 1

DESCRIPTION

The monitor bcms command displays output for agents and splits summarizing the bcms condition. This on-line status report is automatically updated every 30 seconds (or by pressing the UPDATE key) until the command is canceled by pressing the CANCEL key. Three display options are available: skill, split, and system.

Defaults

No defaults.

Parameters

split	This specifies that the command display status information for a specified split number (an ACD hunt group).
split number	The split's identity to the switch and BCMS; an ACD hunt group number (split number). This parameter is entered only when the "split" parameter is entered.
system	This specifies that the command display split queue status as well as cumulative split information for all the BCMS measured splits.

system number	ACD hunt group numbers (split numbers) separated by spaces and/or split number ranges separated by a hyphen ("-").
skill	This specifies that the command display status information for a specified skill number.
skill number	The skill's identity to the switch and BCMS; an ACD hunt group number (skill number). This parameter is entered only when the "skill" parameter is entered.

Help Messages

If the system technician presses HELP after entering "monitor bcms", the following object command word choices will be displayed:

```
Please enter one of the following object command words:
          skill         split          system
         Or press CANCEL to cancel the command
```

If the system technician presses HELP after entering "monitor bcms system" the following message will be displayed:

```
Enter [measured split numbers separated by one space
and/or split range in the format xx-xx], ['print']
       Or press CANCEL to cancel the command
```

If the system technician presses HELP after entering command "monitor bcms split" or "monitor bcms skill" the following message will be displayed:

```
Enter a measured split or skill number(1-99), ['print']
         Or press CANCEL to cancel the command
```

Error Messages

If the split or skill number entered is non numeric, not administered, or invalid in any other way, the following message is displayed:

```
Invalid split number
```

If the split or skill number entered is not measured by BCMS or only measured externally, the following message is displayed:

```
Split is not measured by Basic Call Management System (BCMS)
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The following output fields are for the "monitor bcms system" command

Date:	The current date and time which is updated every 30 seconds or when the UPDATE key is pressed.
SPLIT	The name of the split being reported, if no name is administered then the split extension is displayed in the form "EXTxxxxx". Splits are displayed in split number order. This field is translation data.
CALLS WAIT	The number of calls currently waiting in this split's queue. If any of these calls are Direct Agent Calls, the field will be preceded by an asterisk. This field is real-time status data.
OLDEST CALL	The amount of time that the oldest call has waited in queue. This field is real-time status data.
AVG ANSW SPEED	The average speed of answer for this split during the current period. This includes time in queue and time ringing at the agent's voice terminal. Calls that intraflow (calls that overflow from one ACD split to another split) will not have queue time from previous splits included in the average. The calculation is Total Answer Time/Total Automatic Call Distribution (ACD) Calls. This field is measurement data and includes only those calls that have completed (terminated).
AVAIL AGENT	The number of agents in this split currently available to receive an Automatic Call Distribution (ACD) call from this split. This field is real-time status data.
# ABAND	The number of calls that have abandoned during the current period. This field is measurement data.
AVG ABAND TIME	The average time abandoned calls waited in queue before abandoning during the current period. The calculation is Total Abandon Time/Total Calls Abandoned. This field is measurement data and includes only those calls that have completed (terminated).

# ACD	The number of Automatic Call Distribution (ACD) calls handled by this split during the current period. This includes calls that intraflow into the split. This field is measurement data.
AVG TALK	The average talk time for Automatic Call Distribution (ACD) calls handled by this split during the current period. This does not include ring time at the agents' voice terminal. The calculation is Total ACD Talk Time/Number of ACD Calls. This field is measurement data and includes only those calls that have completed (terminated).
AVG AFTER CALL	The average After Call Work (ACW) time for Automatic Call Distribution (ACD) calls handled by this split during the current period. ACD calls with no ACW time are included in the average. Time spent on direct incoming or outgoing calls while in ACW will not be included in the average. The calculation is (Total ACW Time - Total ACW Incoming Time - Total ACW Outgoing Time)/Total ACD Calls. This field is measurement data and includes only those calls that have completed (terminated).

The following display was produced by entering the "monitor bcms system" command.

```
monitor bcms system                               Page   1 of   1

                          BCMS SYSTEM STATUS

                       Date:   14:02 THU OCT 17 1991

                          AVG                         AVG                     AVG
          CALLS  OLDEST   ANSW  AVAIL   #      ABAND    #    AVG    AFTER
SPLIT      WAIT   CALL   SPEED  AGENT  ABAND    TIME   ACD   TALK    CALL
Service       3   1:03     :45    0      3       :30    20    2:30   1:25
Sales         5    :33     :15    0     11       :45    36    1:32    :35
```

The following output fields are for the "monitor bcms split" command:

Split:	The number of the split requested. This field is translation data.
Split Name:	The name of the split requested. If no name exists the split extension is displayed in the form "EXT xxxxx". This field is translation data.
Date:	The current date and time which is updated every 30 seconds or when the UPDATE key is pressed.
Calls Waiting:	The number of calls currently waiting in this split's queue. If any of these calls are Direct Agent Calls, the field will be preceded by an asterisk. This field is real-time status data.
Oldest Call:	The time in minutes:seconds that the current oldest call has waited in this split's queue. This field is real-time status data.
Staffed	The number of agents currently logged into this split. This field is real-time status data.
Avail	The number of agents currently available to receive an Automatic Call Distribution (ACD) call in this split. Agents are in either the Auto-in or Manual-in work modes and are not currently on a call. If the agent is on another split's call or in After Call Work (ACW) for another split, this agent is not considered available and will not be recorded here. This field is real-time status data.
ACD	The number of agents in this split currently on an Automatic Call Distribution (ACD) call for this split. This includes ACD calls that are being handled by this split that arrive as coverage from another split. This field also includes outbound calls (Outgoing Call Manager) that are distributed through the ACD. Note that if an agent puts an ACD call on hold, but does not enter another state (for example, the agent does not enter the AVAIL state), the agent will still be seen as in the ACD state. This field is real-time status data.
ACW	The number of agents in this split currently in After Call Work (ACW) for this split. This field is real-time status data.

AUX	The number of agents in this split currently in AUX work for this split. If an agent is on another split's call or in After Call Work (ACW) for another split, this agent is not considered in AUX work and will not be recorded here. This field is real-time status data.
Extn	The number of agents in this split currently on non-ACD (Automatic Call Distribution) calls, either incoming or outgoing directly to or from their extensions. If the agents are also in After Call Work (ACW) or AUX they will be recorded as Extn rather than ACW or AUX. This field is real-time status data.
OtherSplit	The number of agents in this split on another split's call or in After Call Work (ACW) for another split. Only used if agents belong to multiple splits. This field is real-time status data.
AGENT	The name of the agent associated with the extension. If no name exists this field will be left blank. This field is translation data.
EXT	The extension of the agent. This field is translation data.
STATE	The current state of the agent for this split. This possible states are Avail, ACD, ACW, AUX, Extn In, Extn Out, OtherSplit, and Unstaff. If an agent is staffed, the agent must also be in one of the above states. This field is real-time status data.
TIME	The clock time that the agent entered the current state in hours:minutes. This field is real-time status data.
ACD CALLS	The number of Automatic Call Distribution (ACD) calls (inbound and outbound), that the agent has completed for this split during the current period (half hour or hour). The maximum number of calls is 255, and if this maximum is exceeded, 255 is displayed. This field is measurement data.
EXTN IN CALLS	The number of non-ACD (Automatic Call Distribution) calls that the agent has received (incoming) and completed during the current period. The maximum number of calls is 255, and if this maximum is exceeded, 255 is displayed. This field is measurement data.
EXTN OUT CALLS	The number of non-ACD (Automatic Call Distribution) calls that the agent has made (outgoing) and completed during the current period. The maximum number of calls is 255, and if this maximum is exceeded, 255 is displayed. This field is measurement data.

The following display was produced by entering "monitor bcms split 1".

```
monitor bcms split 1                   Page   1 of   1   SPE A

            BCMS SPLIT (AGENT) STATUS

```

FEATURE INTERACTIONS

None.

monitor health

This command displays one screen page of output summarizing the overall condition of the system.

SYNOPSIS

monitor health

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, init, nms, browse.

EXAMPLES

monitor health

DESCRIPTION

The monitor health command displays the current system alarm summary, maintenance busy summary, user summary, critical system status, and cabinet status, all of which is updated every minute.

The user is logged off of the system after this command is terminated.

Defaults

No defaults.

Parameters

None.

Help Messages

If the system technician presses HELP after entering "monitor health" the following message will be displayed:

```
Entry is not required
```

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Major	The number of logged major alarms is displayed as a number ranging from 0 to 200. Up to 200 major alarms can be reported in the alarm log; therefore, this is the maximum which can be displayed.
Minor	The number of logged minor alarms is displayed as a number ranging from 0 to 200. Up to 200 minor alarms can be reported in the alarm log; therefore, this is the maximum which can be displayed.
Warning	The number of warnings logged in the alarm file is displayed as a value between 0 and 200, which is the maximum number of warnings permitted.
Trunks	The number of maintenance busied out trunks is shown.
Stations	The number of maintenance busied out stations is displayed.
Others	The combined number of maintenance busied out objects excluding trunks and stations is displayed.
Static	Static indicates the proportion of the CPU which is currently dedicated to high priority items (e.g. the operating system). This percentage is rounded to the nearest integer, therefore a percentage of 0 means that the occupancy is less than one half of a percent (e.g. an occupancy of 89.6% would be displayed as 90%).
SM	SM indicates the proportion of the CPU which is currently dedicated to system management or periodic and scheduled maintenance. Therefore, if there is a large amount of periodic or scheduled maintenance testing being performed, this occupancy percentage can be high without affecting service. This percentage is rounded to the nearest integer, therefore a percentage of 0 means that the occupancy is less than one half of a percent (e.g. an occupancy of 89.6% would be displayed as 90%).

CP	CP indicates the proportion of the CPU which is currently dedicated to call processing. This occupancy has priority over SM and IDLE occupancy categories and if needed, will take processor time away from these occupancy categories. This percentage is rounded to the nearest integer, therefore a percentage of 0 means that the occupancy is less than one half of a percent (e.g. an occupancy of 89.6% would be displayed as 90%).
Idle	Idle indicates the proportion of the CPU which is currently available for use. This percentage is rounded to the nearest integer, therefore a percentage of 0 means that the occupancy is less than one half of a percent (e.g. an occupancy of 89.6% would be displayed as 90%).
Active SPE	A or B is displayed to indicate the currently active processor complex. When the active processor complex is locked on-line via lock switching on DUPINT, the "lock" option will be displayed; otherwise, "auto" will be shown.
Duplicated?	The duplication status of the SPE component is indicated. "y" indicates duplication and "n" indicates no duplication.
SPE Power	The current source of power for the processor complex is indicated. The normal state is "commercial". When commercial power is not available, battery backup is in use and will be indicated by "backup".
Time Source	The current timing source is displayed. The display values for this field vary according to the timing source selected. If the site has administered the optional Stratum-3 hardware, "external" will be displayed under normal operating conditions and "internal" will be displayed when an internal source, such as a tone clock, is used. Primary and secondary timing sources must be administered when using the Stratum-4 option. "primary" is displayed when the primary administered source is in use, and "secondary" is displayed when the administered secondary source is in use. When neither the primary or secondary sources are in use, "local" will be displayed.
# Logins	The number of current users is displayed.
Cab	The assigned cabinet number, ranging from 1 to the highest cabinet number in the system, is displayed on the screen.

Emerg Trans	The current setting of the emergency transfer switch on the maintenance board is indicated for each cabinet. Five options are available: auto-on ("auto+" or "a+"), auto-off ("auto-" or "a-"), "on", "off", and "n.a.". Normally, the "auto+" or "auto-" option is enabled. In this state, emergency transfer will be activated automatically upon cabinet failure (The "+" indicates that emergency transfer is currently activated, while the "-" indicates that emergency transfer is currently not activated). When "on" is displayed, emergency transfer is automatically activated. The "off" option shows that the cabinet is prevented from activating emergency transfer. In a system equipped with duplicated SPEs, the switch settings for both processors of the PPN (cabinet 1) will be displayed. In this case, "auto+" will be abbreviated "a+", "auto-" will be abbreviated "a-", and "off" will be abbreviated as "of". "on" will not be changed. If "n.a." is displayed, the emergency transfer switch setting is not available.
Mj	The individual number of major alarms associated with the cabinet is indicated. An asterisk is used to fill the field when the number exceeds 99.
Mn	The individual number of minor alarms associated with the cabinet is indicated. An asterisk is used to fill the field when the number exceeds 99.
Wn	The individual number of associated with the cabinet is indicated. An asterisk is used to fill the field when the number exceeds 99.
PNC	Current Port Network Connectivity (PNC) status for each of the port networks within a cabinet is displayed. When multiple port networks exist within a cabinet, Carriers A, B, and C are listed first and separated from Carriers D and E by a slash (e.g. up/up). PNC status of a port network is determined on the basis of availability of the Expansion Archangel Link (EAL). An "up" denotes that the EAL is available. When the EAL is not available, then a "dn" (down) is displayed.
Time of Day	The current time of day acquired from the system is displayed.

The following display was produced by entering "monitor system health".

```
status health

FEATURE INTERACTIONS

In a High or Critical Reliability System, if the standby SPE Emergency Transfer Select Switch is changed and handshake is down, the displayed Emerg Trans field will be incorrect until handshake comes up again.

The user is logged off of the system when the monitor health command is terminated.

monitor security-violations

This command provides an audit trail of security infractions

SYNOPSIS

monitor security-violations *print*

PERMISSIONS

The following default logins may execute this command: init, inads, system technician, cust, rcust, bcms, browse.

EXAMPLES

monitor security-violations
monitor security-violations print

DESCRIPTION

The monitor security-violations command displays information about failed attempts to access the system. The time of the violation, the login entered, and the port accessed during the failed login attempt are logged. Also, the trunk group number, member, and extension will be logged for remote access violations. Remote and local invalid access attempts are logged with a total of 16 entries maintained for each access type. This on-line status report is automatically updated every 30 seconds until the command is canceled by pressing the CANCEL key.

Defaults

No defaults.

Parameters

print   This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses HELP after entering "monitor security-violations", the following message is displayed:

```
['print']
```

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The following output fields are for the "monitor security-violations" command

SYSTEM MANAGEMENT VIOLATIONS

Date:	The current date and time.
Date	The date of the logged security violation given as MM/DD where MM is the month and DD is the day of the invalid access attempt.
Time	The time of the logged security violation given as HH:MM where HH is the hour and MM is the minute of the invalid access attempt.
Login	This is the login ID that was entered as part of the login violation attempt.
Port	This is the type of port from which the login violation was attempted. The following is a table of the valid port types:

Port Type	Description
MGR1	This represents a connection to one of the system SAT ports. This can be accomplished either by a hard-wired EIA connection or by a dial-up connection.

Ext	The extension assigned to the data module the failed "logging in" session was attempted on. If a data module was not used as, for example, in the case of dedicated EIA connections, then this field will be blank.

REMOTE ACCESS VIOLATIONS

Date	The date of the logged security violation given as MM/DD where MM is the month and DD is the day of the invalid access attempt.
Time	The time of the logged security violation given as HH:MM where HH is the hour and MM is the minute of the invalid access attempt.
TG No.	The trunk group number associated with the trunk from which the remote access attempt terminated (remote access violations only).
Mbr	The trunk group member number associated with the trunk from which the remote access attempt terminated (remote access violations only).
Ext	The extension used to interface with the remote access feature (remote access violations only).

The following display was produced by entering "monitor security-violations".

```
monitor security-violations                        SPE A

                     SECURITY VIOLATIONS STATUS

FEATURE INTERACTIONS

None.

monitor system

This command with the view1 or view2 option displays one screen page of output summarizing the overall condition of the system. With the connection option, the command displays the real-time status for time slots and buses. Additionally, there are other miscellaneous parameters displayed that show call rates, intervals, etc.

SYNOPSIS

monitor system [view1 | view2 | conn [pnn *pnn number 1 pnn number 2 pnn number 3*]]

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, init, nms, browse.

EXAMPLES

monitor system view1
monitor system view2
monitor system conn
monitor system conn pnn 1 5 7

DESCRIPTION

The monitor system view1 and view2 commands display a page of output summarizing the condition of the system. This on-line status report is automatically updated until the command is canceled by pressing the CANCEL key. Two display options are available: view1 and view2.

The current overall system status is available with either of the view options. "View1" displays attendant, maintenance, and traffic status. Attendant and maintenance status are updated every minute and traffic status is updated on an hourly basis. When the command is canceled, the technician will be automatically logged off for security reasons. The "view2" report contains everything the "view1" report does, except the hunt group measurements are omitted from the traffic status portion of the "view2" report. These forms contain simplified high-level information from which a basic picture of the system’s health can be drawn. The monitor system conn command displays output that shows the status of connections in the connection manager process. Data is collected frequently in the connection manager for certain key information items. It is from this database that this report is drawn. This on-line status report is automatically updated every minute (or by pressing the UPDATE key) until the command is canceled by pressing the CANCEL key. Pressing the CANCEL keys forces a logout of the current login id.

There is one option to the command line entry, monitor system conn. That parameter is *pnn*. On the *gaz target*, there are only 3 possible pnns. On the *mips target*, however, up to 22 pnn can be administered. The command line parameter *pnn* is used to indicate which 3 pnns the user wishes to see.

Defaults

No defaults.

Parameters

view1	This specifies a form that will include the attendant status, the maintenance status, the last hour's measurement of trunk groups, hunt groups, and the attendant group, and finally, the time of day.
view2	This specifies a form that will display a subset of the view1 form entries. This form will include all of the view1 form except the last hour's hunt group measurements.
conn	This option will bring up the connection monitor output for key information.
entering no options	Omitting the "pnn # # #" argument on the command line will cause the default configuration of Pnn's 1, 2 and 3 to be displayed.
pnn # # #	Entering "pnn # # #", where "#" is replaced by a pnn number from 1 to 3, will cause data for the specified pnns to be displayed.

entering no options	Omitting the "pnn # # #" argument on the command line will cause the default configuration of Pnn's 1, 2 and 3 to be displayed.
pnn # # #	Entering "pnn # # #", where "#" is replaced by a pnn number from 1 to 3, will cause data for the specified pnns to be displayed.

Help Messages

If the system technician presses HELP after entering "monitor system", the following object command word choices will be displayed:

```
conn        view1       view2
              scr
```

If the system technician presses HELP after entering "monitor system conn" the following message will be displayed:

```
Enter 3 port network numbers(xx-xx) ['pnn' x x x]
```

Error Messages

If the pnn number entered is non numeric, not administered, or invalid in any other way, one of following messages will be displayed:

```
Object command word omitted; please press HELP
"xx" is an invalid identifier; press RETURN to execute modified command
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The following output fields are for the "monitor system view1" and "monitor system view2" commands.

Console #	A list of console numbers that are either activated or deactivated.
Activated:	The attendant console is in service. An attendant console is considered activated if its handset/headset is plugged in, it is not busied out, and the system is in day service and the console is a day or day/night or principle console, or the system is in night service and the console is a night or day/night console.
Deactivated:	The attendant console is not in service. The attendant console is considered deactivated if it does not meet the previous activated conditions.
# of alarms for trunks	The total number of existing minor and major alarms on trunk ports.
# of alarms for other resources	The total number of existing minor and major alarms on all maintainable objects in the system except trunks and stations.

First OSS number has been informed?	Have all the alarms been reported and acknowledged by the first OSS telephone number. If the "Alarm Origination" is not enable or there are no active alarm, the field will be "n".
Measurement Hour	The starting time of the period for which the measurement was taken. For example, if the measurement hour is shown as 1800, it means the traffic status data displayed is for the time period from 6 PM to 7 PM (The measurement is taken on an hourly basis).
Grp no	A number between 1 and the maximum trunk group number or maximum hunt group number in the system.
Grp dir	Group direction: incoming, outgoing or two way.
Calls qued	Total calls that arrived and were placed in the queue for trunk groups.
Calls aban	Total calls that were abandoned by the caller.
%Out blkg:	The ratio of outgoing calls that are not carried (due to overload conditions) on a trunk group to the outgoing calls offered.
% Time ATB:	The percentage of time within the polling interval that all trunks in the trunk group were unavailable for use.
Time of day	The current time of day acquired from the system.

For the following output example, the command monitor system view1 was entered.

```
monitor system view1
                 ATTENDANT STATUS                  MAINTENANCE STATUS

                   Console no.                     # of alarms for trunks: 4
  Activated: 1 2 3 4 5 6                         # of alarms for stations: 2
                                                # of alarms for other res: 1
Deactivated: 7 8                       First OSS number has been informed? n

                               TRAFFIC STATUS
                             Measurement Hour: 1800
            Trunk Group Measurement                Hunt groups Measurement
(4 grps with highest %time ATB)          (4 grps with highest # of qued calls)
    Grp no: 78                                  Grp no: 16
   Grp dir:                                 Calls qued: 2
Calls qued: 1                               Calls aban: 1
 %Out blkg:                                       Attendant Group Measurement
 %Time ATB:                                 Calls qued: 1     Calls aban: 0

                                                    16:06 WED MAR 6 1996
                 - press CANCEL to quit -
```

For the following output example, the command monitor system view2 was entered.

```
monitor system view2
                 ATTENDANT STATUS                  MAINTENANCE STATUS

                   Console no.                     # of alarms for trunks: 4
  Activated: 1 2 3 4 5 6                         # of alarms for stations: 2
                                                # of alarms for other res: 1
Deactivated: 7 8                       First OSS number has been informed? n

                 - press CANCEL to quit -
```

OUTPUT

The following output fields are for the "monitor system conn" command.

Time Slot Status	There are 4 numbers associated with the time slot status for each specified pnn; for each of the two buses (0 and 1) there is a maintenance and a normal state. The first row is the pnn, the second specifies the bus while the third specifies the bus's state while the last column represents the number of idle counts. These fields represent real-time status data.
Bus Status	For the bus status fields, there are two numbers associated with each of the two buses for each pnn. Shown are the pnn number; the bus associated with it, i.e., 0 or 1; and the state of the bus, i.e., "avail" or "unavail". These fields represent real-time status data.
Callrate	The callrate field represents the call rate being experienced currently on the switch. This is a counter which is bumped each time a call attempt is made. This field represents real-time status data.

Interval	This field is related to the above field in that it represents the interval being applied with which the call rate is applicable. It is normally set to a 36 second time period. This field represents a constant status data.
Max_callrate	This field represents the maximum call rate which has been hit during the time since the last hour has passed. If, for example, at 20 minutes past 12:00 this command is executed, this field will represent the maximum call rate obtained during the past 20 minutes. This field represents real-time status data.
Next_hour	This field will contain a value of 0 or 1 depending upon if the measurements being taken are for this hour or the next. It is related to the previous field in that the maximum call rate is reflected for this hour. When this flag is set, then statistics begin to accumulate for the next hour and shortly thereafter, the maximum call rate will become zero and accumulations will begin anew.
tot_ts_req	This field holds the total time slots in use during the time period elapsed since the top of the last hour. Data is internally collected every 100 seconds. When the timer fires and the data collection occurs, a check is made as to how many time slots are currently in use. That's where the total comes from. There are three numbers displayed for this field on the form; one for each of the pnns requested. This field represents real-time status data.
ts_denied	This field holds the total time slots requests that were denied during the time period elapsed since the top of the last hour. Data is internally collected every 100 seconds. There are three numbers displayed for this field on the form; one for each of the pnns requested. This field represents real-time status data.
tot_fts_req	This field represents the total fiber time slots that have been requested. This field is incremented each time a fiber time slots that have been allocated since the last top of the hour measurements polling. There are three values shown on the form; one for each of the requested pnns. This field represents real-time status data.
ts_count	This field indicates how many time slots are in use during the last 100 second poling period. An internal timer causing polling to occur every 100 seconds. The value in this field represents the requests for time slots during that 100 second interim. There are three numbers displayed for this field on the form; one for each of the pnns requested. This field represents real-time status data.

ts_total	This field gets it's value from the time slots count field discussed above every 100 seconds. It represents the total number of time slots requested since the top of the last hour and is real-time status data.
fts_count	This field indicates how many fiber time slots are in use during the last 100 second poling period. An internal timer causing polling to occur every 100 seconds. The value in this field represents the requests for fiber time slots during that 100 second interim. There are three numbers displayed for this field on the form; one for each of the pnns requested. This field represents real-time status data.
fts_total	This field indicates the total number of fiber time slots. This field gets it's value from the fiber time slots count field discussed above every 100 seconds. It represents the total number of fiber time slots requested since the top of the last hour and is real-time status data.
Requests-TN748 TTRs	The total number of touch tone receivers requested is reflected in this field. It is a running count of currently active requests. It is decremented when a tone receiver is freed and incremented when they are requested. Note that this field applies strictly to the TN748 board. This field represents real-time status data.
Requests-TN748 CPTRs	The total number of call progress tone receivers requested is reflected in this field. It is a running count of currently active requests. It is decremented when a call progress tone receiver is freed and incremented when they are requested. Note that this field applies strictly to the TN748 board. This field represents real-time status data.
Requests-TN744 CPTRs	The total number of call progress tone receivers requested is reflected in this field. It is a running count of currently active requests. It is decremented when a call progress tone receiver is freed and incremented when they are requested. Note that this field applies strictly to the TN744 board. This field represents real-time status data.
Requests-TN744 TTRs	The total number of touch tone receivers requested is reflected in this field. It is a running count of currently active requests. It is decremented when a tone receiver is freed and incremented when they are requested. Note that this field applies strictly to the TN744 board. This field represents real-time status data.
Requests-TN744 MFC	The total number of multi-frequency receivers requested is reflected in this field. It is a running count of currently active requests. It is decremented when a multi-frequency receiver is freed and incremented when they are requested. Note that this field applies strictly to the TN744 board. This field represents real-time status data.

The following display was produced by entering "monitor system conn".

```
       Time Slot Status                  Bus Status

FEATURE INTERACTIONS

None.

monitor traffic

This command monitors the traffic load for trunk or hunt groups.

SYNOPSIS

monitor traffic [trunk-groups *number* | hunt-groups]

PERMISSIONS

The following default logins may execute this command: init, inads, system technician, cust, rcust, bcms, browse.

EXAMPLES

monitor traffic trunk-groups
monitor traffic trunk-groups 4
monitor traffic hunt-groups

DESCRIPTION

The monitor traffic command gives an instant picture of the load on various trunk and hunt groups in terms of number of calls waiting to be serviced, and the time the oldest call in the group has been awaiting service.

Defaults

No defaults.

Parameters

trunk-groups	The trunk group report displays the number of calls in the queue waiting to be serviced, for each trunk group. The number of the members in the group and the number of members which are active on calls in the group are also displayed for comparative analysis. Only the administered trunk groups are displayed, up to a maximum of 60 groups. The user may specify the starting trunk group. For example, if the user entered 5, then the trunks displayed would be from group 5 and up, 1-4 would not be displayed.
hunt-groups	The hunt-group report has a similar format as the trunk-group report. In addition to the trunk-group information, this report displays the time the oldest call has been waiting in the queue for each hunt group. The data on the screen is updated every minute, only the fields whose values have changed are refreshed. All the hunt groups, whether administered or not, are displayed. The hunt groups that are not administered have blank values.

Help Messages

If the system technician presses HELP after entering "monitor traffic", the following object command word choices will be displayed:

```
hunt-groups         trunk-groups
```

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

#	Group number for the trunk or hunt group.
S	The size (number of members administered) of each trunk or hunt group.
A	The number of members in a group that are active on a call. This does not include members which have been busied out.

Q The length of the queue administered for a group.

W The number of calls waiting in the group queue to be serviced.

LCIQ The longest call in queue (LCIQ) indicates the time in seconds the oldest call in the hunt group queue has been waiting to be serviced.

For the following output example, the command "monitor traffic hunt-groups" was entered.

```
monitor traffic hunt-groups

                 HUNT GROUP STATUS   22:49 SAT DEC 31 1988
      #   S   A   Q   W   LCIQ       #   S  A   Q   W  LCIQ

 (#: Group;  S: Grp Size;  A: Active Members;  Q: Q Length;  W: Calls Waiting)

 (LCIQ: Longest Call In Queue in seconds)
```

For the following output example, the command monitor traffic trunk-groups was entered.

```
monitor traffic trunk-groups

                 TRUNK GROUP STATUS   22:49 SAT DEC 311988
   #  S  A  Q  W  #  S  A  Q  W  #  S  A  Q  W  #  S  A  Q  W
   1  15 10 0  0
   2  22 21 10 10
   9  31 12 20 0
   65 5  5  10 8
   99 12 0  0  0

 (#: Group;  S: Grp Size;  A: Active Members;  Q: Q Length;  W: Calls Waiting)
```

FEATURE INTERACTIONS

None.

monitor trunk

This command monitors the status of an individual trunk group member.

SYNOPSIS

monitor trunk group*/member*

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, rcust, bcms, init, browse.

EXAMPLES

monitor trunk 78
monitor trunk 80/
monitor trunk 78/1
monitor trunk 80/2

DESCRIPTION

The monitor trunk command displays internal software state information for diagnosis. This command can help locate facilities to which the trunk is communicating.

If a trunk group number is entered without a member number, with or without the "/", it is assumed to be the member 1. If a trunk group number and member number are both entered, status for the specified member is displayed.

Defaults

The member number defaults to 1 if a group is specified without a member.

Parameters

group	The group number is an administered number associated with each trunk group. The valid range is 1 - 99. If a group number is entered without a member number, member number defaults to 1.
member	The member number is an administered number identifying a particular member within a trunk group. The valid range is 1 - 99. If a member number is entered, status for that member is displayed.

Help Messages

If the system technician presses HELP after entering "monitor trunk", the following message is displayed:

```
Enter assigned trunk group(1-99) or [group/member(1-99)]
```

Error Messages

If the format of the trunk identifier is incorrect, the following error message is displayed:

```
Format invalid
```

If the trunk identifier is not in the valid range, the following error message is displayed:

```
Trunk or trunk group invalid
```

If the trunk group member is not administered, the following message is displayed:

```
Group member not assigned
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message is displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Trunk Group/Member	The trunk group number and group member number. Valid identifiers are 1-99/1-99.
Port	The port location (cabinet-carrier-slot-circuit) of the trunk.
Signaling Group ID	If the trunk is of type ISDN, then this field contains the number of the ISDN Signaling Group to which this group belongs. Otherwise, this field is blank.
Connected Ports	Port locations (cabinet-carrier-slot-circuit) connected to the trunk.

Service State	Whether the trunk is in service or out of service. One of the following states is displayed: in-service/active, in-service/idle, out-of-service, out-of-service-NE (Near End), out-of-service-FE (Far End), maint-NE/active, maint-FE/active, maint-NE/idle, maint-FE/idle, pending-in-service, pending-maint, or disconnected. NE (Near End) and FE (Far End) refer to which "end" of the trunk has placed the facility in the state that it is in.
Maintenance Busy	Whether there is any maintenance testing being performed upon the trunk.
CA-TSC State	The state of the temporary signaling connection. A temporary signaling connection is a connection set up to pass call information over PRI signaling links.

For the following output example, the command that was entered is "monitor trunk 78/1".

```
monitor trunk 78/1

                              TRUNK STATUS

 Trunk Group/Member: 078/001           Service State: in-service/idle
              Port: 01C1505        Maintenance Busy? no
 Signaling Group ID:                       CA-TSC State:
    Connected Ports:
```

FEATURE INTERACTIONS

None.

recycle carrier

This command recycles power on a carrier.

SYNOPSIS

recycle carrier location

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

recycle carrier c
recycle carrier 01c
recycle carrier 2b
recycle carrier 3d

DESCRIPTION

The recycle carrier command recycles power on a specific carrier. When a power unit is replaced in a carrier, this command must be entered to recycle the power on that carrier. **The processor carrier and its duplicate if present as well as any EPN control carrier or an SCC carrier cannot be recycled. If a port carrier is recycled, service is interrupted for that port carrier. If a carrier containing an active EI is recycled, communications with that cabinet will be disrupted. If a carrier containing an active tone-clock board is recycled, all ports in port network will have service disrupted.** For more details on recycling and trouble shooting power units, refer to "Troubleshooting Control Carrier Power Units" in Chapter 5, "Routine Maintenance Procedures".

Defaults

The default cabinet is cabinet 1. There is no default carrier.

Parameters

location	The location designates the physical location of the desired carrier. The location consists of the cabinet number and a carrier letter. The cabinet number is one or two digits from 1 to 3 with leading zeros allowed. Cabinet 1 is the PPN with 2-3 referring to some optional EPN cabinet. The carrier letter may be "b" through "e". The "b" carrier may not be specified for SPE duplex PPNs.

Help Messages

If the system technician presses HELP after entering "recycle carrier" on a simplex SPE system, the following message will be displayed:

```
Enter [cabinet(1-3)];carrier(B-E)
```

If the system technician presses HELP after entering "recycle carrier" on a duplex SPE system, the following message will be displayed:

```
For cabinet 1 enter [cabinet(1)];carrier(C-E)
For cabinet 2-3 enter cabinet (2-3);carrier(B-E)
```

Error Messages

If no location is entered, the following message will be displayed:

```
Identifier command word(s) omitted; please press help
```

If a location greater than three characters is entered, the following message will be displayed:

```
Entry invalid
```

If the location entered is longer than 3 characters or less than 1 character the following will be displayed:

```
Invalid carrier specified
```

If the cabinet and carrier specified are in an EPN that is not available, the following message will be displayed:

```
EPN is not available
```

If a cabinet number of "1" or "01" is entered and the carrier specified is "A" or "B" in an SPE duplex system, the carrier specified is "A" in a SPE simplex system or if the "A" carrier is specified with a cabinet other than "1" or "01, or an SCC carrier location is given," the following message will be displayed:

```
Cannot recycle control carriers or XE carriers
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
login id':'command' has a command conflict
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	The port address (cabinet-carrier) of the maintenance object that is being tested. For this maintenance object, only the cabinet and carrier values are displayed.
Maintenance Name	The maintenance name will always be CARR-POW.
Alt. Name	Not applicable.
Test Number	The test number will always be 126.
Test Result	An indicator as to whether the test passed, failed, or was aborted.
Error Code	Further detail about the results of the test.

For the following output example, the command recycle carrier c was entered.

```
recycle carrier c

                           TEST RESULTS

  Port    Maintenance Name  Alt. Name Test No. Result       Error Code
  01C     CARR-POW                     126      PASS

Command successfully completed
```

FEATURE INTERACTIONS

The 'a' carrier can never have its power recycled. When the 'b' carrier of the PPN contains SPE duplication hardware, the 'b' carrier similarly is not available for power recycling.

If a port carrier is recycled, service is interrupted for that port carrier. If a carrier containing an active EI is recycled, communications with that cabinet will be disrupted. If a carrier containing an active tone-clock board is recycled, all ports port network will have service disrupted.

Occasionally, circuit packs show red LEDs and "NO BOARD" when a list configuration command is issued after a carrier is recycled. The test tdm command can be used to accelerate retirement of these problems.

refresh spe-standby

This command refreshes the memory of the standby SPE in a High or Critical Reliability System.

SYNOPSIS

refresh spe-standby

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

refresh spe-standby

DESCRIPTION

The refresh spe-standby command is used to immediately put the Standby SPE into Standby Mode. The command conducts the same activities regardless of whether the Standby SPE is already in Standby or Maintenance Mode. When this command is issued, any Standby SPE maintenance activity that is currently is progress is preempted, the Standby SPE Processor is held reset, and the Standby SPE's DRAM memory is refreshed (that is, all of Active SPE DRAM memory is shadowed to the Standby SPE memory). The refresh is necessary because while the Standby SPE is in Maintenance Mode, memory shadowing is disabled. When the Standby SPE is returned to Standby Mode, its memory must be brought up-to-date with Active SPE memory.

Because of its power to preempt Standby SPE maintenance activities, the refresh spe-standby command should be used judiciously. If the Standby SPE is in Maintenance Mode when the refresh spe-standby command is issued, the maintenance activity that is being conducted by the Standby SPE is immediately terminated with the following potential side-effects:

- Testing of the Standby SPE components that are the target of the maintenance activity may not have completed. Depending on the maintenance activity and the point at which it is terminated, tests that detect faults and/or lack of faults on those Standby SPE components may not have had the opportunity to run. Accordingly, alarms are not raised or retired on the components.

- If the maintenance activity is scheduled and if the refresh spe-standby command is issued before a scheduled translation save is performed, the translation save is not done and the translations data on the Active and Standby SPE mass storage devices do not reflect the changes made since the last translation save.

Defaults

No defaults.

Parameters

None.

Help Messages

If the system technician presses HELP after entering "refresh spe-standby," the following message will be displayed:

```
Entry is not required
```

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

OUTPUT

If the refresh command is successful, the following message will be displayed on the SAT:

```
Command successfully completed
```

If the refresh command is unsuccessful, the following message will be displayed on the SAT:

```
 Refresh not successful;
use 'display errors' to check for STBY-SPE errors
```

If the active SPE is held reset via the SPE select switches, then the following will be displayed:

```
 Could only hold Standby SPE reset because
Active SPE is locked via SPE select switches
```

If the standby is currently entering maintenance mode, then the following will be displayed:

```
 Cannot interrupt Standby SPE while entering
maintenance mode; please try later
```

If the standby is busy with another task, then the following will be displayed:

```
 Standby SPE not available; for information use "status
system"
```

If the standby is in the process of doing a software upgrade, then the following will be displayed:

```
 Standby SPE upgrade in progress, command denied
```

FEATURE INTERACTIONS

The refresh command is not allowed while the standby SPE is being brought out of standby mode into maintenance mode. Once fully in maintenance mode, however, the command can be executed.

release access-endpoint

This command will release a specified access endpoint.

SYNOPSIS

release access-endpoint extension

PERMISSIONS

The following default logins may execute this command: system technician, inads, init, nms.

EXAMPLES

release access-endpoint 25012
release access-endpoint 77868

DESCRIPTION

The release access endpoint command will remove all ports associated with the specified access endpoint from a maintenance busy state. Periodic and scheduled tests will resume on the released ports. Maintenance will do background initialization testing on the released ports. For details of the test sequence, refer to [3].

Defaults

No defaults.

Parameters

extension	An extension number associated with the desired access endpoint. The number of digits in an extension is determined by the dial-plan.

Help Messages

If the user presses HELP after entering "release access-endpoint," the following message is displayed:

```
Enter assigned extension
```

Error Messages

If the format for the extension is incorrect, the following error message will be displayed:

```
Extension invalid
```

If the EPN on which the access endpoint resides is not accessible, the following message will be displayed:

```
EPN is not available
```

If the extension is not administered, the following message will be displayed:

```
Extension not assigned
```

If the object associated with the specified extension is not an access endpoint, the following message will be displayed:

```
Extension assigned to object other than access-endpoint
```

If the board that contains the access endpoint is not inserted in the system, the following message will be displayed:

```
Board not inserted
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then
resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being released.
Maintenance Name	The type of maintenance object that is being released. For wideband access endpoint the maintenance name for each port is "WAE-PORT." For single port access endpoint the maintenance name is "TIE-DS1."
Alt. Name	The alternate way of identifying the maintenance object. This field contains the extension number of the access endpoint.
Result	An indicator as to whether the object is successfully released. The possible values are: PASS, FAIL and ABORT.
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be in the "Busyout/Release Commands" section of this chapter.

For the following output example, the command "release access-endpoint 22502" was entered. Assume that the access endpoint ports for extension 22502 are in cabinet 1, carrier C, slot 11, circuit 1 to 6.

```
release access-endpoint 22502          page 1 of 1

                    COMMAND RESULTS

 Port  Maintenance Name Alt. Name  Result   Error Code
 01C1101  WAE-PORT    22502    PASS
 01C1102  WAE-PORT    22502    PASS
 01C1103  WAE-PORT    22502    PASS
 01C1104  WAE-PORT    22502    PASS
 01C1105  WAE-PORT    22502    PASS
 01C1106  WAE-PORT    22502    PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

None.

release board

This command will release each maintenance object on the specified board.

SYNOPSIS

release board location

PERMISSIONS

The following default logins may execute this command: system technician, inads, init, nms.

EXAMPLES

release board 01c11
release board 02c15

DESCRIPTION

The release board command will put every administered maintenance object on the circuit pack at the specified location into operation. Some tests are done on the object to make sure that it can be used.

Defaults

No defaults.

Parameters

location	A "location" represents the physical position of the board to be busied out or released and is entered as "UUcSS" where "UU" represents the cabinet number (1-3), "c" represents the carrier, and "SS" represents the slot position.

Help Messages

If the system technician presses HELP after entering "release board," the following message will be displayed:

```
Enter 5 character board number
```

Error Messages

If the format of the board location is incorrect, the following error message will be displayed:

```
Port/Board invalid
```

If the EPN on which the board resides is not available, the following message will be displayed:

```
EPN is not available
```

If a board is not inserted in the specified location, the following message will be displayed:

```
Board not assigned
```

If the specified board does not have any maintenance objects associated with it, the following message will be displayed:

```
No MO in this board
```

If the specified board is a EI board and it is part of the active link, the following message will be displayed:

```
Illegal Command for active object; use 'set' to switch to
standby
```

If a reset is attempted on an invalid board in the service slot, the following message is displayed:

```
Board invalid
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then
resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	The port address (cabinet-carrier-slot) of the maintenance object that is being released.
Maintenance Name	The type of maintenance object that is being released.
Alt. Name	The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number.
Result	The result of the release -"PASS," "ABORT," "FAIL."
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be in the "Busyout/Release Commands" section of this chapter.

For the following output example, assume that the board in cabinet 1, carrier c, slot 7 is an analog board with three ports administered. The command that was entered is "release board 1c07."

```
release board 01C07

                    COMMAND RESULTS

Port   Maintenance Name  Alt. Name  Result  Error Code
01C07     ANL-BD                    PASS
01C0702   ANL-LINE                  PASS
01C0701   ANL-LINE        51001     PASS
01C0703   ANL-LINE                  PASS

Command successfully completed
```

FEATURE INTERACTIONS

None.

release cdr-link

This command will release a maintenance object associated with the specified call detail recording (cdr)-link.

SYNOPSIS

release cdr-link link-id

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

release cdr-link primary
release cdr-link secondary

DESCRIPTION

The release cdr-link command will remove the maintenance object associated with a specified call detail recording (cdr)-link from a maintenance busy state.

A link is made up of several components. It involves a far end data module, a simulated data channel on a PKTINT board, a manager that initiates and maintains the link, and a controller/protocol that services the link. A controller/protocol is usually a transient process that exists for as long as the link is up. A link is considered up if a physical connection is established. A link can be considered to be up while no useful work can be performed over it, in this case the link is insane and should be torn down. These links provide asynchronous data connections from the switch to peripherals.

For information on what a CDR link is and does, see the second paragraph in the "DESCRIPTION" section of the "status cdr-link" manual pages.

Defaults

No defaults.

Parameters

link-id The link identifier is either "primary" or "secondary."

Help Messages

If the system technician presses HELP after entering "release cdr-link," the following message will be displayed:

```
Enter 'primary' or 'secondary'
```

Error Messages

If the cdr-link is not administered, then the following message will be displayed:

```
Link not administered
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then
resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	Not applicable. Will always be blank.
Maintenance Name	The type of maintenance object that is being released. If releasing the primary cdr-link the maintenance object will be PRI-CDR, else if releasing the secondary cdr-link the maintenance object will be SEC-CDR.
Alt. Name	Not applicable. Will always be blank.
Result	The result of the release - "PASS," "ABORT," "FAIL."
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be found in the "Busyout/Release Commands" section of this chapter.

For the following output example, assume that the command that was entered is "release cdr-link primary."

```
release cdr-link primary

                     COMMAND RESULTS

 Port  Maintenance Name  Alt. Name  Result   Error Code
          PRI-CDR                    PASS

Command successfully completed
```

FEATURE INTERACTIONS

None.

release data-module

This command will release a system technician-specified data module or data channel.

SYNOPSIS

release data-module extension

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, init, nms.

EXAMPLES

release data-module 310

DESCRIPTION

The release data module command will put the specified data module (or data channel) into service. Some tests are executed on the hardware to verify that the equipment is functioning.

Defaults

No defaults.

Parameters

extension	An extension number associated with the desired data module or data channel. The number of digits in an extension is determined by a dial-plan.

Help Messages

If the system technician presses HELP after entering "release data-module," the following message will be displayed:

```
Enter assigned extension
```

Error Messages

If the length or format of the extension is incorrect, the following error message will be displayed:

```
Extension invalid
```

If the specified extension is not administered, then the following message will be displayed:

```
Extension not assigned
```

If the specified extension is not a data module or a data channel, then the following message will be displayed:

```
Extension exists but assigned to a different object
```

If the EPN that contains the data module port is not available, the following message will be displayed:

```
EPN is not available
```

If the board containing the data module port is part of the SCI link, the following message will be displayed:

```
Cannot busyout/release part of SCI link
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
’login id’:’command’ has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then
resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out or released, or the number of the data channel.
Maintenance Name	The type of maintenance object that is being busied out or released.
Alt. Name	The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number.
Result	An indicator as to whether the object was successfully busied out or released.
Error Code	A numerical description of why the command failed.

For the following output example, assume that the command that was entered is "release data-module 300."

```
release data-module 310

                         COMMAND RESULTS

Port   Maintenance Name  Alt. Name   Result   Error Code
01C1103    DIG-LINE                  PASS

Command successfully completed
```

SYSTEM 85 R3 AND SYSTEM 75 R1 RELEASE DIFFERENCES

None.

FEATURE INTERACTIONS

None.

release journal-printer

This command will release a maintenance object associated with the system technician specified pms-log or wakeup-log.

SYNOPSIS

release journal-printer [pms-log | wakeup-log]

PERMISSIONS

The following default logins may execute this command: system technician, inads, init, nms.

EXAMPLES

release journal-printer pms-log
release journal-printer wakeup-log

DESCRIPTION

The release journal-printer command will put the maintenance object associated with a specified pms-log or wakeup-log link into service. Some tests are executed on the hardware to verify that the equipment is functioning.

For general information on journal printer links, see the second paragraph in the "DESCRIPTION" section of the "busyout pms-link" manual pages.

For information on what a journal printer is and does, see the second paragraph in the "DESCRIPTION" section of the "status journal-link" manual pages.

Defaults

None.

Parameters

wakeup-log	This will release the link to the wakeup logging facility. In the output the port name for this object is 0.
pms-log	This will release the link to the pms printer. In the output the port name for the pms link is 1.

Help Messages

If the system technician presses HELP after entering "release journal-printer," the following object command word choices will be displayed:

```
pms-log     wakeup-log
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then
resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out or released. In this case, the physical object port address will be a 0 for wakeup log and a 1 for the pms log.
Maintenance Name	The type of maintenance object that is being busied out or released.
Alt. Name	Not applicable.
Result	An indicator as to whether the object was successfully busied out or released.
Error Code	A numerical description of why the command failed.

For the following output example, assume that the command that was entered is "release journal-printer wakeup-log."

```
release journal-printer wakeup-log

                         COMMAND RESULTS

Port   Maintenance Name   Alt. Name   Result   Error Code
 0         JRNL-LINK                  PASS

Command successfully completed
```

FEATURE INTERACTIONS

The maintenance of a particular component on a link will sometimes interfere with the maintenance of the link itself. Maintenance can put a link component in a busy state causing link set-up to fail. Frequent attempts at re-setup of a link may delay the recover of a faulty component, due to the maintenance test of a component only taking place when the component is idle. Therefore, the technician needs to be able to disable the attempted re-setup of a link. The busyout command is used to do this, and will not cause the link to be torn down. If the link is already down, the busyout command will stop periodic re-setup trys on the link.

release link

This command will release the system technician specified link.

SYNOPSIS

release link link-id

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

release link 1
release link 8

DESCRIPTION

The release link command will put the maintenance objects associated with a specified link into service. Some tests are executed on the hardware to verify that the equipment is functioning.

Defaults

None.

Parameters

link-id	The link-id is a number associated with each link between 1-8. Link 1 through 4 reside on Processor Interface circuit pack "1a1" or "1b1" and 5 through 8 reside on Processor Interface circuit pack "1a2" or "1b2."

Help Messages

If the system technician presses HELP after entering "release link," the following message will be displayed:

```
Enter 1 character link number
```

Error Messages

If the link identifier is not valid, the following error message is displayed:

```
Link out of range, please press HELP
```

If the link is not administered, the following error message is displayed:

```
Link not administered or not enabled
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message is displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out or released. With this command the Port address represents the link-id.
Maintenance Name	The type of maintenance object that is being released.
Alt. Name	Not applicable.
Result	"PASS," "ABORT," "FAIL."
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be found in the "Busyout/Release Commands" section of this chapter.

For the following output example, assume that the command that was entered is "release link 1."

```
release link 1

                        COMMAND RESULTS

Port   Maintenance Name  Alt. Name  Result  Error Code
01C0301    PI-LINK                  PASS

Command successfully completed
```

FEATURE INTERACTIONS

None.

release mis

This command will release a specified management information system.

SYNOPSIS

release mis

PERMISSIONS

The following default logins may execute this command: system technician, inads, init, cust, rcust.

EXAMPLES

release mis

DESCRIPTION

The release mis command will put a management information system into service. Some tests are executed on the hardware to verify that the equipment is functioning.

Defaults

None.

Parameters

None.

Help Messages

If the system technician presses HELP after entering "release mis" the following message will be displayed:

```
Entry is not required
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
 Command resources busy; Press CANCEL to clear, and then
resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	Not applicable.
Maintenance Name	The type of maintenance object that is being released. MIS for this command.
Alt. Name	Not applicable.
Result	The result of the release -"PASS," "ABORT," "FAIL."
Error Code	A numerical description of why the command failed or was aborted. 1011 - already released

For the following output example, assume that the command that was entered is "release mis."

```
release mis

                       COMMAND RESULTS

Port   Maintenance Name   Alt. Name   Result   Error Code
               MIS                    PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

None.

release modem-pool

This command will allow all members of a modem pool group to be released.

SYNOPSIS

release modem-pool group/*member*

PERMISSIONS

The following default logins may execute this command: init, inads, system technician.

EXAMPLES

release modem-pool 1
release modem-pool 4/3

DESCRIPTION

The release modem-pool command will remove the specified modem pool group or group member from the maintenance busy state. A single group member can be released by specifying the group number, a "/," and the member number. All members in a modem pool group can be released by specifying the modem pool group number only.

Defaults

None.

Parameters

group number	The group number is assigned from administration. The group number may be any administered group from 1-5.
member number	The member number is assigned from administration. A member is a pair of analog and digital line ports (or two pair for the Integrated modem-pool case). The member number may be any administered group member from 1-32.

Help Messages

If the system technician presses HELP after entering "release modem-pool" the following message will be displayed:

```
Enter assigned group number between 1-5
Or press CANCEL to cancel the command
```

Error Messages

If the "release modem-pool" command is entered from a login for which the command is not valid, then the following message will be displayed:

```
"release" is an invalid entry; please press HELP
```

If the group or member numbers entered are not in a valid format, the following message will be displayed:

```
Identifier invalid
```

If the group number entered is not within the range of groups or the member number is not within the member range, then the following message will be displayed:

```
Boards not assigned
```

If the specific group or member are not administered, then the following message will be displayed:

```
Group not assigned, or group assigned but with no member
```

If a software fault is encountered while the command is executing, the following message will be displayed:

```
Error encountered, can’t complete request
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
’login id’:’command’ has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then
resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

When each modem pool member has been busied out, the following information will be displayed:

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object which is being busied out.
Maintenance Name	The type of maintenance object that is being busied out or released. This is always MODEM-PT.
Alt. Name	This field is not applicable to this command.
Result	The result of the release -"PASS," "ABORT," "FAIL."
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be in the "Busyout/Release Commands" section of this chapter.

In the following output example, the command "release modem-pool 1" was entered.

```
release modem-pool 1              SPE B

                        COMMAND RESULTS

Port      Maintenance Name   Alt. Name  Result   Error Code

01C0701      MODEM-PT                   PASS
01C0703      MODEM-PT                   PASS

Command successfully completed
```

FEATURE INTERACTIONS

None.

release packet-control

This command will release the specified packet-control.

SYNOPSIS

release packet-control *location*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init

EXAMPLES

release packet-control 1A
release packet-control 1B

DESCRIPTION

The release packet-control command will put the packet-control circuit pack in-service, and reestablish each point-to-point signaling link that is terminated on this packet-control. This command is the complement to the busyout packet-control command which puts the packet-control in a out-of-service state and tears down all point-to-point signaling links terminated on this packet-control.

Defaults

For simplex systems, the location is optional and defaults to cabinet 1, carrier A. For duplex systems, the cabinet default is again cabinet 1, but there is no default for the carrier.

Parameters

location	The location only applies to duplicated configurations. If the configuration is a simplex, the location parameter is not used and thus is not valid. For duplicated configurations, a "location" represents the carrier that the packet-control resides on in the system. Valid locations are either 1A or 1B.

Help Messages

If the system technician presses HELP after entering "release packet-control," the following message is displayed:

```
Enter Packet Control location: [cabinet(1)];carrier(A-B)
```

Error Messages

If this command is entered for a packet-control that resides on the stand-by control complex of a High or Critical Reliability System, the following message is displayed:

```
Command only applies to the active Packet Control
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy; Press CANCEL to clear, and then
resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	This field represents the Cabinet-Carrier in which the Packet-Control resides.
Maintenance Name	The type of maintenance object that is being released which is always PKT-CTRL.
Alt. Name	This field is not used in this output display.
Result	An indicator as to whether the object was successfully released ("PASS," "FAIL," or "ABORT").
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be in the "Busyout/Release Commands" section of this chapter.

For the following output example, the command release packet-control 1A was entered.

```
release packet-control 1A

                      COMMAND RESULTS

Port  Maintenance Name   Alt. Name   Result   Error Code

 1A       PKT-CTRL                   PASS

Command successfully completed
```

FEATURE INTERACTIONS

In a High or Critical Reliability System, an attempt to release the packet-control that resides in the standby control complex will be disallowed.

When the packet-control in the active control complex is released from a previously busied-out state, all connectivity across the Packet Bus will be reestablished. Thus, all ISDN-BRI point-to-point signaling links that had been established via the packet-control prior to the execution of a busyout packet-control command will be reestablished by the release packet-control command.

release pms-link

This command will release a specified property management system link.

SYNOPSIS

release pms-link

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

release pms-link

DESCRIPTION

The release pms-link command will remove all maintenance objects associated with a property management system link from the maintenance busy state.

A link is made up of several components. It involves a far end data module, a simulated data channel on a NETCON board, a manager that initiates and maintains the link, and a controller/protocol that services the link. A controller/protocol is usually a transient process that exists for as long as the link is up. A link is considered up if a physical connection is established. A link can be considered to be up while no useful work can be performed over it, in this case the link is insane and should be torn down. These links provide asynchronous data connections from the switch to peripherals.

For information on what a PMS is and does, see the second paragraph in the "DESCRIPTION" section of the "status pms-link" manual pages.

Defaults

None.

Parameters

None.

Help Messages

If the system technician presses HELP after entering "release pms-link" the following message will be displayed:

```
Entry is not required
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then
resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	With this maintenance object the port field is left blank.
Maintenance Name	The type of maintenance object that is being released (always PMS-LINK).
Alt. Name	Not applicable.
Result	The result of the release -"PASS," "ABORT," "FAIL."
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be in the "Busyout/Release Commands" section of this chapter.

For the following output example, assume that the command that was entered is "release pms-link."

```
release pms-link

                       COMMAND RESULTS

Port   Maintenance Name    Alt. Name   Result    Error Code
          PMS-LINK                     PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

The maintenance of a particular component on a link will sometimes interfere with the maintenance of the link itself. Maintenance can put a link component in a busy state causing link set-up to fail. Frequent attempts at re-setup of a link may delay the recover of a faulty component, due to the maintenance test of a component only taking place when the component is idle. Therefore, the technician needs to be able to disable the attempted re-setup of a link. The busyout command is used to do this, and will not cause the link to be torn down. If the link is already down, the busyout command will stop periodic re-setup trys on the link.

release port

This command will release a specified port on a circuit pack.

SYNOPSIS

release port location

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

release port 01c1101
release port 02c1501

DESCRIPTION

The release port command will remove the specified port on a circuit pack from a maintenance busy state.

Defaults

No defaults.

Parameters

location	A "location" represents the physical position of the port to be released and is entered as "UUcSSpp" where "UU" represents the cabinet number (1-3), "c" represents the carrier, "SS" represents the slot position, and "pp" represents the circuit (port).

Help Messages

If the system technician presses HELP after entering "release port," the following message will be displayed:

```
Enter 7 character port number
```

Error Messages

If the format of the port location is incorrect, the following error message will be displayed:

```
Port/Board invalid
```

If the EPN on which the port resides is unavailable, the following message will be displayed:

```
EPN is not available
```

If the board on which the port resides is not administered, the following error message will be displayed:

```
Port not assigned
```

If the board on which the port resides is part of the SCI link, the following error message will be displayed:

```
Cannot busyout/release part of SCI link
```

If the port is translated within a Wideband Access Endpoint, the following error message will be displayed:

```
 Port within wideband access endpt;
Use busyout access-endpoint <ext> instead
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being released.
Maintenance Name	The type of maintenance object that is being released.
Alt. Name	The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number.
Result	The result of the release -"PASS," "ABORT," "FAIL,"
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be in the "Busyout/Release Commands" section of this chapter.

For the following output example, assume that the port in cabinet 1, carrier c, slot 7, circuit 1 is an analog port. The command that was entered is "release port 1c0701."

```
release port 01C0701

                          COMMAND RESULTS

   Port   Maintenance Name   Alt. Name   Result   Error Code
 01C0701     ANL-LINE                     PASS

Command successfully completed
```

FEATURE INTERACTIONS

None.

release pri-endpoint

This command will release a specified PRI endpoint.

SYNOPSIS

release pri-endpoint extension

PERMISSIONS

The following default logins may execute this command: system technician, inads, init, nms.

EXAMPLES

release pri-endpoint 25012
release pri-endpoint 77868

DESCRIPTION

The release PRI endpoint command will remove all PRI endpoint ports (B-channels) associated with the specified PRI endpoint from a maintenance busy state. Periodic and scheduled tests will resume on the released ports. The switch will attempt to negotiate with the far-end PRI terminal adapter to put each PRI endpoint port (B-channel) into in-service state. Maintenance will do background initialization testing on the released ports. For details of the test sequence, refer to [3].

Defaults

No defaults.

Parameters

extension	An extension number associated with the desired PRI endpoint. The number of digits in an extension is determined by the dial-plan.

Help Messages

If the user presses HELP after entering "release pri-endpoint," the following message is displayed:

```
Enter assigned extension
```

Error Messages

If the format for the extension is incorrect, the following error message will be displayed:

```
Extension invalid
```

If the EPN on which the PRI endpoint resides is not accessible, the following message will be displayed:

```
EPN is not available
```

If the extension is not administered, the following message will be displayed:

```
Extension not assigned
```

If the object associated with the specified extension is not a PRI endpoint, the following message will be displayed:

```
Extension assigned to object other than pri-endpoint
```

If the board that contains the PRI endpoint is not inserted in the system, the following message will be displayed:

```
Board not inserted
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
’login id’:’command’ has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being released.
Maintenance Name	The type of maintenance object that is being released. The name for PRI endpoint port is "PE-BCHL."
Alt. Name	The alternate way of identifying the maintenance object. This field contains the extension number of the PRI endpoint.
Result	An indicator as to whether the object is successfully released. The possible values are: PASS, FAIL and ABORT.
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be in the "Busyout/Release Commands" section of this chapter.

For the following output example, the command "release pri-endpoint 22501" was entered. Assume that the PRI endpoint ports for extension 22501 are in cabinet 1, carrier B, slot 20, circuit 1 to 6.

```
release pri-endpoint 22501            page 1 of 1

                          COMMAND RESULTS

 Port      Maintenance Name Alt. Name  Result   Error Code
 01B2001        PE-BCHL       22501     PASS
 01B2002        PE-BCHL       22501     PASS
 01B2003        PE-BCHL       22501     PASS
 01B2004        PE-BCHL       22501     PASS
 01B2005        PE-BCHL       22501     PASS
 01B2006        PE-BCHL       22501     PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

None.

release sp-link

This command will release the system printer link.

SYNOPSIS

release sp-link

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

release sp-link

DESCRIPTION

The release sp-link command will return the busied out system printer link to operation and resolve all active alarms for the system printer link.

The system printer link is a link from the switch to an external printer over which jobs can be printed. This link is created by administering the system printer extension and setting up a call to the system printer.

Defaults

No defaults.

Parameters

None.

Help Messages

If the system technician presses HELP after entering "release sp-link," the following is displayed:

```
Entry is not required
```

Error Messages

If the system printer link is not administered, the following message is displayed:

```
Link not administered or not enabled
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy; Press CANCEL to clear, and then
resubmit
```

If all of the available maintenance resources are currently in use, then the following message is displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being busied out. For this maintenance object, blanks are displayed.
Maintenance Name	The type of maintenance object that is being busied out.
Alt. Name	The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number.
Result	An indicator as to whether the object was successfully busied out.
Error Code	A numerical description of why the command failed.

For the following output example the command entered was "release sp-link."

```
release sp-link               SPE A

                      COMMAND RESULTS

Port   Maintenance Name   Alt. Name   Result   Error Code
            SYS-PRNT                   PASS

Command Successfully Completed
```

SYSTEM 85 R3 AND SYSTEM 75 R1 RELEASE DIFFERENCES

None.

FEATURE INTERACTIONS

None.

release spe-standby

This command allows the technician to release the standby Switch Processing Element (SPE).

SYNOPSIS

release spe-standby

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

release spe-standby

DESCRIPTION

The release spe-standby command removes the busyout status of the standby SPE. Memory shadowing will be restored, a memory refresh of the standby SPE will occur and 1 minute later the equivalent of scheduled standby SPE maintenance will be performed which will return the standby SPE's Fault Severity Level to the appropriate value.

Release of the standby SPE will be allowed if communication to the standby is down.

Defaults

No defaults.

Parameters

None.

Help Messages

If the system technician presses HELP after entering "release spe-standby" the following message will be displayed:

```
Entry is not required
```

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

OUTPUT

Port	The port address will display the cabinet and carrier location of the standby SPE. The standby SPE port address will always be 01A or 01B.
Maintenance Name	"STBY-SPE" for the standby SPE maintenance object.
Alt. Name	Always blank for this command.
Result	The result of the release -"PASS," "ABORT," "FAIL,"
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be in the "Busyout/Release Commands" section of this chapter.

For the following output example, assume that the standby SPE is located in carrier "B." The command that was entered is "release spe-standby."

```
release spe-standby              SPE A

                         COMMAND RESULTS

Port  Maintenance Name    Alt. Name    Result    Error Code
01B       STBY-SPE                     PASS

Command successfully completed
```

FEATURE INTERACTIONS

When the standby SPE is released a memory refresh is performed which may take several minutes to complete. The standby Fault Severity Level will be lowered to its appropriate level when a release is requested. One minute later, the equivalent of scheduled standby SPE maintenance will be performed, after which a spontaneous SPE interchange could occur, depending of the Fault Severity Level of the two SPE's.

If the standby SPE is in poor health, memory shadowing can not be enabled or communication to the standby is impossible, a release of the standby SPE will still be successful.

release station

This command will release a specified station.

SYNOPSIS

release station extension

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, init.

EXAMPLES

release station 10020
release station 32770

DESCRIPTION

The release station command will remove the specified administered voice terminal extension (station) from a maintenance busy state.

Defaults

No defaults.

Parameters

extension	An extension number associated with the desired voice terminal. The number of digits in an extension is determined by a dial-plan.

Help Messages

If the system technician presses HELP after entering "release station," the following message will be displayed:

```
Enter extension for an assigned station
```

Error Messages

If the format of the extension is incorrect, the following error message will be displayed:

```
Extension invalid
```

If the specified extension is not administered, then the following message will be displayed:

```
Extension not assigned
```

If the specified extension does not belong to a station or attendant console, the following message will be displayed:

```
Extension exists but assigned to a different object
```

If the station port resides on an EPN that is unavailable, the following message will be displayed:

```
EPN is not available
```

If the station port resides on a board that is not inserted in the system, the following message will be displayed:

```
Board not assigned
```

If the station port resides on a board that is part of the SCI link, the following message will be displayed:

```
Cannot busyout/release part of SCI link
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being released.
Maintenance Name	The type of maintenance object that is being released.
Alt. Name	The alternate means of identifying the maintenance object. This field contains the extension when the object is a station.
Result	The result of the release -"PASS," "ABORT," "FAIL."
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be in the "Busyout/Release Commands" section of this chapter.

For the following output example, assume that the command that was entered is "release station 1002."

```
release station 1002

                         COMMAND RESULTS

 Port      Maintenance Name   Alt. Name   Result   Error Code
 01C1102       DIG-LINE                   PASS

Command successfully completed
```

FEATURE INTERACTIONS

None.

release tdm

This command will release a TDM bus on the PPN or any EPN.

SYNOPSIS

release tdm port-network pn number bus bus

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

release tdm port-network 1 bus a
release tdm port-network 1 bus b

DESCRIPTION

The release tdm command will remove the specified tdm bus from a maintenance busy state.

Defaults

No defaults.

pn number	The PN number specifies the Port Network number of the TDM bus to be released.
bus	The TDM bus ("a" or "b") specifies which half of the TDM bus is desired. Each 512 time slot TDM bus is configured as two duplicate 256 time slot buses. This division allows for duplication of control channels and dedicated tone time slots. The default control bus (carrying the control channel) is the "a" bus, while the default tone bus (carrying dedicated tones) is the "b" bus. A port network number (1 - 3) may be entered with or without a leading zero (0).

Help Messages

If the system technician presses HELP after entering "release tdm," the following message will be displayed:

```
Enter ’port-network’, port network number (1-3),
 ’bus’, bus (’a’ or ’b’)
```

Error Messages

If the technician enters "bus" before "port-network," the following message will be displayed:

```
'bus' is an invalid identifier; please press HELP
```

If the technician does not enter all digits for the port-network number, the following message will be displayed:

```
Entry must be all digits
```

If the technician enters a bus other than A or B, the following message will be displayed:

```
Identifier invalid
```

If the technician enters a TDM bus identifier with a Port Network number that is not administered, the following message will be displayed:

```
Port Network number not assigned
```

If the port network on which the desired TDM bus resides is unavailable, the following message will be displayed:

```
EPN is not available
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	The port network number (preceded by "PN") and the bus ("A" or "B") associated with the TDM bus.
Maintenance Name	TDM-BUS is the maintenance object being released.
Alt. Name	Not applicable.
Result	The result of the release -"PASS," "ABORT," "FAIL,"
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be in the "Busyout/Release Commands" section of this chapter.

For the following output example, assume that the command that was entered is "release tdm port-network 1 bus a."

```
release tdm port-network 1 bus a

                        COMMAND RESULTS

Port     Maintenance Name   Alt. Name   Result    Error Code
PN 01A       TDM-BUS                    PASS

Command successfully completed
```

FEATURE INTERACTIONS

If a bus is busied out, no calls will be torn down. However, no new calls will be set up on the busied out bus.

Dedicated tone time slots must be moved to another bus (the other half of the duplicated bus) before a busyout of a particular bus will be allowed.

release tone-clock

This command will release a tone/clock circuit pack.

SYNOPSIS

release tone-clock location

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

release tone-clock c

DESCRIPTION

The release tone-clock command will remove the specified tone/clock from a maintenance busy state.

Defaults

The cabinet number will default to 1 (one).

Parameters

location	A "location" represents the physical position of the tone/clock to be released and is entered as "UUc" where "UU" represents the cabinet number, and "c" represents the carrier. A single digit cabinet number (1 - 3) may be entered with or without a leading zero (0).

Help Messages

If the system technician presses HELP after entering "release tone-clock," the following message will be displayed:

```
Enter tone/clock location:
[cabinet(1-3)];(carrier(A-E))
```

Error Messages

If an identifier greater than 3 (three) characters is entered, or the cabinet entered is not a digit (number), the following message will be displayed:

```
Identifier invalid
```

If the carrier entered is invalid, the following message will be displayed:

```
Invalid carrier specified
```

If the cabinet entered is not within the valid range of cabinets or the cabinet is not administered, the following message will be displayed:

```
Cabinet number not assigned
```

If there is no tone/clock board at the specified location, one of the following messages will be displayed:

```
Board not inserted
Board not assigned
```

If the specified cabinet carrier location is that of a switch node, the following message will be displayed:

```
Switch Node carrier specified;
invalid command for SN carrier
```

If the cabinet carrier location entered is that of an EPN that is not available, the following message will be displayed:

```
EPN is not available
```

If the tone/clock is not busied out and the specified action is release, the following message will be displayed:

```
Object is not busied out; can't release
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	The tone clock circuit pack maintenance object will only display the cabinet and carrier of the desired tone/clock board.
Maintenance Name	The type of maintenance object that is being released is TONE-PT, TDM-CLK and TONE-BD.
Alt. Name	Not applicable.
Result	The result of the release -"PASS," "ABORT," "FAIL."
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be in the "Busyout/Release Commands" section of this chapter.

For the following output example, assume that the command that was entered is "release tone-clock 1a."

```
release tone-clock 1a

                          COMMAND RESULTS

Port   Maintenance Name   Alt. Name   Result   Error Code
01A         TONE-PT                    PASS
01A         TDM-CLK                    PASS
01A         TONE-BD                    PASS

Command successfully completed
```

FEATURE INTERACTIONS

None.

release trunk

This command will release a specified trunk group or trunk group member.

SYNOPSIS

release trunk group/*member*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

release trunk 78
release trunk 78/1

DESCRIPTION

The release trunk command will remove the specified trunk group or trunk group member from a maintenance busy state. A single group member can be released by specifying the group number, a "/," and the member number. All members in a trunk group can be released by specifying the trunk group number only.

Defaults

No defaults.

Parameters

group	The group number is an administered number associated with each trunk group. The valid range is 1 - 99.
member	The member number is an administered number identifying a particular trunk within a trunk group. The valid range is 1 - 99.

Help Messages

If the system technician presses HELP after entering "release trunk," the following message will be displayed:

```
Enter assigned trunk group number [or group/member]
```

Error Messages

If the format of the identifier is invalid, the following message will be displayed:

```
Format invalid
```

If the range of the trunk group is incorrect, the following error message will be displayed:

```
Trunk or trunk group invalid
```

If the specified trunk group is not administered or has no members, the following message will be displayed:

```
Group not assigned,
or group assigned but with no member
```

If the specified member is not administered, the following message will be displayed:

```
Group member not assigned
```

If the specified trunk group is part of the SCI link, the following message will be displayed:

```
Cannot busyout/release part of SCI link
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being released.
Maintenance Name	The type of maintenance object that is being released.
Alt. Name	The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number.
Result	The result of the release - "PASS," "ABORT," "FAIL."
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes can be found in the "Busyout/Release Commands" section of this chapter.

For the following output example, assume that the command that was entered is "release trunk 78/1."

```
release trunk 78/1

                           COMMAND RESULTS

 Port     Maintenance Name    Alt. Name   Result    Error Code
 01C1505        CO_TRK           78/01     PASS

Command successfully completed
```

FEATURE INTERACTIONS

None.

reset board

This command will reset the specified board.

SYNOPSIS

reset board location *repeat number*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init, nms.

EXAMPLES

reset board 01c11
reset board c08
reset board 03d12 r 3

DESCRIPTION

The reset board command will perform a soft (i.e. software) reset of every administered port on the port circuit pack at the specified location. All ports must be busied out before the port circuit pack is reset. The most efficient way of doing this is to perform a busyout of the board before resetting it.

WARNING:
This command is service disrupting and may cause extraneous alarms.

Defaults

The carrier and repeat number default to 1.

Parameters

location	A "location" represents the physical position of the port board to be reset and is entered as "UUcSS" where "UU" represents the cabinet number (1 - 3), "c" represents the carrier, and "SS" represents the slot position.
number	The "number" specifies how many times each board reset is to be repeated. "Number" may be any integer between 1 and 100.

Help Messages

If the system technician presses HELP after entering "reset board," the following message will be displayed:

```
Enter board location, [’repeat’ (1-100)]
```

Error Messages

If the format of the board location is incorrect, the following error message will be displayed:

```
Port/Board invalid
```

If the EPN on which the specified board is not available, the following message will be displayed:

```
EPN is not available
```

If a board is not inserted in the specified location, then the following message will be displayed:

```
Board not assigned
```

If the specified board is active, the following message will be displayed:

```
Illegal command for active object;
use ’set’ to switch to standby
```

If a reset is attempted on an invalid board in the service slot, the following message is displayed:

```
Board invalid
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
’login id’:’command’ has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	The port address (cabinet-carrier-slot) of the maintenance object that is being reset.
Maintenance Name	The type of maintenance object being reset.
Alt. Name	The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number.
Result	The result of the reset -"PASS," "ABORT," "FAIL."
Error Code	A system-generated number that tells why the reset failed or aborted. A detailed list of the codes can be in the "Reset Commands" section of this chapter.

For the following output example, assume that the board in port network 1, carrier c, slot 7 is an analog board with three ports administered. The command that was entered is "reset board 1c07."

```
reset board 1C07

                              TEST RESULTS

 Port    Maintenance Name    Alt. Name Test No. Result    Error Code
 01C07        ANL-BD                      53     PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

None.

reset interface

This command will reset the processor interface board (PI).

SYNOPSIS

reset interface location

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

reset interface 01a1
reset interface a2
reset interface 01b1
reset interface 01b2

DESCRIPTION

This command resets the Processor Interface circuit pack, causes its associated software to be read from tape, applications processes to be restarted, permanent switched calls to be re-established, and each enabled link to be setup. If the interface cannot be established, a Major alarm i s raised on the interface and all enabled links are taken out-of-service. When the Message Server Adjunct (MSA), Distributed Communications System (DCS), Audio Information Exchange (AUDIX), or Call Management System (CMS) is first administered and the form submitted, the link for these applications and the submittal of the form restart the interface. Before the Processor Interface circuit pack is replaced, the switch must be powered down and then restarted (unless the system is equipped with High or Critical Reliability).

When resolving troubles, also see the **status interface, status link,** and **status processor-channel** commands to determine where the trouble is located before performing a **reset interfaces** because link traffic is interrupted.

WARNING:
The interface command interrupts operation of the AP, DCS, AUDIX, CMS or ISDN-PRI.

Defaults

No defaults.

Parameters

location	The location (cabinet-carrier-position) of the processor interface (PI board). The position determines which processor interface circuit pack will be cleared. A position of 1 is the first processor interface in the carrier, while a position of 2 is the second processor interface in the carrier.

Help Messages

If the system technician presses HELP after entering "reset interface," the following message will be displayed:

```
Enter identifier: [cabinet(1)];carrier(A-B);position(1-2)
```

Error Messages

If the specified carrier is not the active PE, the following message will be displayed:

```
Command must be executed from active SPE
```

If the technician-entered cabinet and carrier is invalid for a PPN, the following message will be displayed:

```
Invalid port-network specified
```

If the technician-entered carrier is not a valid carrier, the following message will be displayed:

```
Invalid carrier specified
```

If the technician-entered carrier is not active, the following error message will be entered:

```
Board invalid
```

If the specified carrier/position processor interface circuit pack is not inserted, but the specified carrier is active, the following error message will be displayed:

```
Processor Interface (TN765)
not started or is being started
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If the standby is entering maintenance mode when this command is executed, then the following message is displayed:

```
Cannot interrupt Standby SPE while entering
maintenance mode; please try later
```

If the standby SPE is not refreshed when this command is executed, then the following message is displayed:

```
Standby SPE memory not refreshed; use the
"refresh spe-standby" command.
```

If the standby SPE is not refreshed and the active SPE is hard selected via the SPE select switches when this command is executed, then the following message is displayed:

```
Active SPE locked via select switches;
Standby SPE memory not refreshed
```

If the standby SPE is busy with another task, then the following message is displayed:

```
Standby SPE busy with another task;
for information use "status system 1"
```

If the standby SPE is not available when this command is executed, then the following message is displayed:

```
Standby SPE not available;
for information use "status system 1"
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

If the reset interface command is successful, the following message will be displayed on the SAT:

```
Command successfully completed
```

If the reset interface command is unsuccessful, the following message will be displayed:

```
Error encountered, can’t complete request
```

FEATURE INTERACTIONS

None.

reset maintenance

This command will reset the EPN maintenance circuit pack in any Expansion Port Network cabinet.

SYNOPSIS

reset maintenance location

PERMISSIONS

The following logins may execute this command: system technician, inads, init.

EXAMPLES

reset maintenance 02
reset maintenance 2
reset maintenance 3a

DESCRIPTION

The reset maintenance command performs a reset on a technician specified EPN maintenance circuit pack. Specifying cabinets 2 or 3 resets the EPN maintenance circuit pack in the 'a' carrier of the specified cabinet.

This command is destructive and will drop a SAT terminal session on the EPN maintenance circuit pack being reset. If this command is run from a EPN maintenance SAT terminal, the results of the reset will not be displayed.

Defaults

None.

Parameters

location	The location designates the physical position of the desired EPN maintenance circuit pack. The location consists of a cabinet number and carrier letter. The cabinet number is one digit, 2 through 3 with a leading zero allowed. The carrier is always "a" if entered.

Help Messages

If the system technician presses HELP after entering "reset maintenance" the following message will be displayed:

```
Enter cabinet([0]2-[0]3);[carrier(A)]
```

Error Messages

On any system, if the cabinet entered is non numeric or not within a valid range, the following message will be displayed:

```
Cabinet number out of range; Enter 2 - 3
```

For any system, if the length of the user entered parameter exceeds three (3), or is in any other way invalid, the following message will be displayed:

```
Entry invalid
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

OUTPUT

Port	The port address (cabinet-carrier-slot) of the maintenance object that is being reset.
Maintenance Name	"MAINT" for the EPN maintenance circuit pack.
Alt. Name	Always blank for this command.
Result	The result of the reset -"PASS," "ABORT," "FAIL."
Test No.	The test number for this command will always be 306.
Error Code	A system-generated number that tells why the reset failed or aborted. A detailed list of the codes can be in the "Reset Commands" section of this chapter.

For the following output example, assume that the command that was entered is "reset maintenance 02a."

```
reset maintenance 02A

                              TEST RESULTS

Port   Maintenance Name  Alt. Name  Test No.  Result  Error Code
02A           MAINT                    306      PASS

Command successfully completed
```

FEATURE INTERACTIONS

Running the command from the EPNSAT, will cause the SAT to be dropped before the reset results can be displayed. In this case, the user should examine the error and alarm logs for "MAINT" entries to determine if the reset failed.

reset spe-standby

This command will reset the standby Switch Processing Element (SPE) to a defined level.

SYNOPSIS

reset spe-standby level

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

reset spe-standby 1
reset spe-standby 2
reset spe-standby 3
reset spe-standby 4
reset spe-standby 5

DESCRIPTION

The reset spe-standby command will reset the standby Switch Processing Element (SPE) to a system technician defined level. Resetting the standby SPE means bringing that SPE out of standby mode into maintenance mode with the defined restart level. This command is only for a High or Critical Reliability System.

Defaults

None.

Parameters

level — The reset levels are entered numerically with a range of 1 - 5, the levels are as follows:

Level	Recovery
1	Warm Restart
2	Cold-2
3	Cold-1
4	Reboot
5	Extended Reboot

Help Messages

If the system technician presses HELP after entering "reset spe-standby" on a duplex SPE system, the following message will be displayed:

```
Enter standby SPE recovery level ’1’(WARM), ’2’(COLDII),
’3’(COLDI), ’4’(REBOOT) or ’5’(EXT REBOOT)
```

Error Messages

If the specified level is invalid (not 1-5), the following message will be displayed:

```
System reset level invalid
```

If the standby SPE is not refreshed and the SPE Select switches are selecting the active SPE, the following message will be displayed:

```
Active SPE locked via select switches;
Standby SPE memory not refreshed
```

If the standby SPE is not refreshed; the following message will be displayed:

```
Standby SPE memory not refreshed; use the
"refresh spe-standby" command
```

OUTPUT

If the reset command is successful, the following message will be displayed:

```
Command successfully completed
```

If the reset command is unsuccessful, the following error message will be displayed:

```
Standby SPE failed to reset with requested level;
check for STBY-SPE errors
```

If the standby is in the process of doing a software upgrade, then the following will be displayed:

```
Standby SPE upgrade in progress, command denied
```

FEATURE INTERACTIONS

The reset spe-standby command will invoke standby SPE initialization as if low level maintenance had done it. This means that the reset level requested will never be escalated by software. The reset level requested by the technician will always be the level that is performed.

If the standby SPE contains a software memory card (386 systems) or a tape (286 systems) and the requested restart level is 4 or 5, then the standby SPE will reload system software before rebooting.

reset system

This command will reset the Switch Processing Element (SPE) to a defined level, or switch control to the standby SPE.

SYNOPSIS

reset system [level **|** interchange]*health-override*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

reset system 1
reset system 2
reset system 3
reset system 4
reset system 5
reset system interchange
reset system interchange health-override

DESCRIPTION

The reset system command will reset a Switch Processing Element (SPE) to a system technician defined level. This command is increasingly destructive as the reset level increases.

The command can also be used to switch control from the currently active SPE to the standby SPE in a High or Critical Reliability System through a HOT (planned) restart interchange. **Once a planned interchange has been started it cannot be aborted by pressing the CANCEL key.** If a "reset system interchange" command is rejected because the Fault Severity Level of the standby SPE is higher than that of the active SPE, the "health-override" option can be specified to try to force a HOT interchange.

The reset system interchange command does not disrupt in-progress calls. However, it drops links to local and remote administration terminals and also drops and re-establishes connections on the Network Control Circuit Pack data channels. This includes CDR and PMS links. No new calls can be made during the interchange, but stable calls are not affected.

When a system restart occurs with the corresponding vector bit set, a core dump is written to tape (286 systems) or memory card (386 systems, only if the memory card is the special core dump card), the vector is cleared, and the requested restart is performed.

All successful reset system commands will log the user off.

Defaults

None.

Parameters

llevel — The reset levels are entered numerically with a range of 1 - 5, the levels are as follows, and the approximate times are listed for each appropriate level and system configuration:

Level	Recovery	SMALL 386 Flash	MEDIUM 386 Flash	286 Intel
1	Warm Restart			1:00
2	Cold-2			4:00
3	Cold-1			8:00
4	Reboot			13:00
5	Extended Reboot			14:00

interchange — Control of the system passes to the standby SPE as the active SPE becomes the standby SPE and the standby SPE becomes the active SPE. The optional "health-override" qualifier can be entered to force an interchange even if the Fault Severity Level of the standby SPE would normally cause the maintenance software to abort the interchange. The Fault Severity Level of an SPE is determined by the alarmed components in that SPE. Each component is given a severity level, and the single worst alarm (severity) for a SPE defines Fault Severity Level for the SPE. The table below lists the maintenance objects, their alarms, severities and the restart level of the interchange that affect a SPE's Fault Severity Level.

Maintenance Object	Alarm Level	On/Off Board	Fault Severity Level	Restart Level
STBY-SPE	WARNING	OFF	120	None
MEM-BD	MAJOR or MINOR	ON	110	Hot or Warm
MEMORY	MAJOR or MINOR	ON	110	Hot or Warm
STBY-SPE	MAJOR	ON	100	None
PROCR	MAJOR	ON	70	Hot or Warm
SW-CTL	MAJOR	ON	65	Cold 2
TAPE	MAJOR	OFF	65	Cold 1
MEM-CARD	MAJOR	OFF	65	Cold 1
12V-PWR	MIN	ON	65	Hot
DUPINT	MAJOR	ON	61	Hot
CARR-POW	MAJOR	ON	61	Cold 2
SHDW-CIR	MAJOR	ON or OFF	60	Warm
SHDW-LINK	MAJOR	ON	60	Warm
SW-CTL	MINOR	ON	40	Hot
PR-MAINT	MINOR	ON	30	Hot
PI-BD	MAJOR or MINOR	ON	20	Hot
PKT-CTRL	MAJOR	ON or OFF	20	Hot
PKT-CTRL	MINOR	ON or OFF	15	Hot
PI-PT	MAJOR	ON	15	Hot
DATA-CHL	MINOR	ON	15	Hot
DATA-CON	MINOR	ON	15	Hot
DATA-BD	MINOR	ON	15	Hot
TAPE	MINOR	ON or OFF	10	Hot
MEM-CARD	MINOR	ON or OFF	10	Hot
PR-MAINT	MINOR	OFF	8	Hot

A "reset system interchange" command will abort for the following reasons:

- If the standby SPE is down
- If the active SPE is locked active
- If communication to the standby SPE is not possible
- If memory shadowing to the standby SPE is not functioning
- If the standby SPE is not fully refreshed
- If the standby SPE is busied out

health-override — If a HOT restart interchange fails because the Fault Severity Level of the standby SPE is higher than that of the active SPE, the "health-override" option can be specified to try to force a switch to occur. If the switch occurs, this option causes the new active SPE Fault Severity Level to be raised as much as possible in hopes that a software initiated HOT SPE interchange switch back to the original active SPE will not occur. This artificial raising of the active Fault Severity Level will last for one hour at which time the Fault Severity Level of both SPEs will return to their normal values based on the alarms listed in the table above.

Help Messages

If the system technician presses HELP after entering "reset system" on a simplex SPE system, the following message will be displayed:

```
Enter system recovery level ’1’(WARM), ’2’(COLDII),
’3’(COLDI), ’4’(REBOOT), or ’5’(EXT REBOOT)
```

If the system technician presses HELP after entering "reset system" on a duplex

SPE system, the following message will be displayed:

```
Enter system recovery level ’1’(WARM), ’2’(COLDII),
’3’(COLDI), ’4’(REBOOT),  or ’5’(EXT REBOOT)
 or ’interchange [’health-override’]’
```

Error Messages

If the CANCEL key is pressed after the command has been started, the following message is displayed:

```
This command may not be canceled
```

If the system reset level is not numeric or "interchange," the following message will be displayed:

```
System reset level invalid
```

If the "health-override" option is specified with any level of 1 - 5, the following message will be displayed:

```
The 'health-override' option is only used
with the 'interchange' level
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If this command is issued while an **upgrade software** command is active the following message will be displayed:

```
Standby SPE upgrade in progress, command denied
```

OUTPUT

If the reset command, including the "reset system interchange," is successful the user will be logged off.

If the "reset system interchange" command is not successful one of the following are displayed:

If the "interchange" option is specified and the active SPE is locked active, the following message will be displayed:

```
Unable to interchange because the
active SPE is locked active
```

If the "interchange" option is specified and only the Fault Severity Level of the standby SPE is preventing the interchange, the following message will be displayed:

```
Unable to interchange due to alarms on the standby SPE;
Use 'health-override' option
```

If the "interchange" option is specified and the standby SPE is busied out, the following message will be displayed:

```
Unable to interchange; standby SPE is busied out
```

If the reset interchange command cannot be performed for any other reason, the following message will be displayed on the SAT:

```
Cannot perform SPE interchange;
for information use 'status system'
```

FEATURE INTERACTIONS

The reset command will invoke system initialization as if low level maintenance had done it. This means that the reset level requested will never be escalated by software. The reset level requested by the technician will always be the level that is performed.

It should be noted that there are two hardware switches associated with the active and standby SPEs. These hardware switches override any demand maintenance activities that the system technician requests. If the active SPE is locked active with these hardware switches, an interchange will not take place until the active is unlocked using the same hardware switches.

A successful SPE interchange will always logoff the PPNSAT terminal.

Any level of restart will null out the effect of the health-override option.

restore announcements

This command copies announcement data from the specified MSS device (tape or Card-Mem) to the announcement board.

SYNOPSIS

restore announcements *[print | schedule]*

PERMISSIONS

The following default logins may execute this command: system technician, cust, rcust, inads, init.

EXAMPLES

restore announcements

DESCRIPTION

The restore announcements command copies announcement data from the active MSS device to the announcement board.

Defaults

In a tape based system, the announcement data is copied from the active processor's tape to the announcement board. In a Card-Mem based system, the announcement data is copied from the active processor's Card-Mem to the announcement board.

Parameters

print	In addition to displaying the output of the restore announcement command on the Manager I terminal, print the result of the restore announcement command on the printer.
scheduled	Schedule the execution of the restore announcement command at a specific time.

Help Messages

If the system technician presses HELP after entering "restore announcements," the following message is displayed:

```
Enter ['print' or 'schedule']
```

Error Messages

If the announcement data module cannot be accessed (upload/download port is active), the following message is displayed:

```
Announcement data module not available
```

If the announcement data module has been taken out of service, the following message is displayed:

```
Announcement data module out of service
```

If one or more of the announcement ports are in use, the following message is displayed:

```
Announcement port in use; please try later
```

If the announcement data module is not administered, the following message is displayed:

```
Required announcement data module not administered
```

If the announcement data module is not administered or is currently in use, the following message is displayed:

```
Required data module not administered or unavailable
```

If there is no announcement board in the system, the following message is displayed:

```
Integrated announcement board not present
```

If the NETCON data module is not administered or out of service the following message is displayed:

```
Required NETCON data module not
administered or out-of-service
```

If the NETCON data module is busy the following message is displayed:

```
Required NETCON data module unavailable
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

OUTPUT

Processor	This field displays the processor on which the MSS device resides that was used to copy announcement data.
Command Completion Status	This field specifies whether the command completed successfully. Valid values are:
Error Code	This is a numerical description of whether the announcement file is successfully restored to the announcement board. A value of "0" means that the restore was successful. A value of "1" denotes that the restore failed.

For the following output example, the command entered is "restore announcements" on a simplex SPE system.

```
restore announcements         Page  1 of  1  SPE A

                 RESTORE ANNOUNCEMENTS

Processor  Command Completion Status         Error Code
SPE-A      Success                                0
```

FEATURE INTERACTIONS

WARNING:
Use of the manager I is blocked for other activities until the command completes, which can take up to 45 minutes

The command is denied if no announcement data module and no NETCON data module has been administered.

The command is denied if the announcement data module port is out of service or active (e.g. performing an announcement playback).

The command is denied if a user is in an integrated announcements session.

The command is denied if the board is currently being uploaded or downloaded. A user cannot save or restore announcement after the restore announcements command has started.

The command aborts if copying from tape and no tape is in the tape drive.

The restore announcements command will not be allowed if the MSS is in use. The MSS may be in use by either another user or by maintenance.

In case of a failure, it is the user's responsibility to make sure the announcement file is completely copied to the announcement board. If an error is the result of a hardware or firmware failure, the MSS software will log a hardware error with maintenance.

The restore announcements command will not be allowed if no announcement file has been saved on the MSS or a corrupted announcement file is on the MSS.

In case of a failure, it is the user's responsibility to make sure the announcement file is completely copied to the announcement board, although the system will continually attempt to download the board in 10 minute intervals until a download is successful, announcements are recorded, or a download is initiated from the SAT. The user should take appropriate action based on the error message returned. If the error is the result of a hardware or firmware failure, the MSS software will log a hardware error with maintenance. Maintenance software will invoke tests to diagnose and attempt to correct the problem. If maintenance software fails to correct the problem, an alarm is raised and the system technician should take appropriate action.

In the case where the system crashes and/or there is a spontaneous processor interchange, the restore operation will fail. In this case, there will not be a valid announcement file on the announcement board. The command should be restarted on the newly active processor to copy the announcements from the active processor's MSS device to the announcement board. Until the announcements are successfully and completely copied to the announcement board, calls will not be connected to any announcements on the ANN board.

When the announcement board is plugged in or reset, maintenance will perform a series of tests, including a DRAM Checksum test. The test will fail due to the power loss to the board, resulting in automatic downloading of the announcement file.

resume hardware-group

A "test hardware-group" command which had been canceled can be resumed by the user with this command. The reactivated hardware-group command will start testing where it previously left off.

SYNOPSIS

resume hardware-group

PERMISSIONS

The following logins may execute this command: inads, init.

EXAMPLES

resume hardware-group

DESCRIPTION

A system technician, in the course of the execution of a "test hardware-group" command, may find the need to halt the testing, either temporarily or permanently. A "test hardware-group" command executing in the background can be canceled with the "cancel hardware-group" command. A "test hardware-group" command executing in the foreground can be canceled by pressing the 'cancel' key on the SAT or by entering the "cancel hardware-group" command from another SAT. The "resume hardware-group" command provides the technician the ability to resume the previous "test hardware-group" command from where it was canceled. This ability to resume a canceled "test hardware-group" command is lost if another "test hardware-group" command is entered.

The state of a canceled "test hardware-group" command will appear on the "status hardware-group" screen as 'canceled'. The state of a resumed "test hardware-group" command will appear on the "status hardware-group" screen as 'active'.

Defaults

None.

Parameters

None.

Help Messages

If the system technician presses HELP after entering "resume hardware-group," the following message will be displayed:

```
Entry is not required
```

Error Messages

If there is no "test hardware-group" command to be resumed, i.e, no "test hardware-group" command was previously canceled, or some system recovery had occurred and no "test hardware-group" command had since been entered and subsequently canceled, then the following message will be displayed:

```
Command aborted - no hardware-group
test available to resume
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If the previously entered hardware-group command used the "all-ports" option the following message will be displayed:

```
Resume disallowed with 'all-ports'
option in original command
```

If the previously entered hardware-group command used the "SPE-interchange" option the following message will be displayed:

```
Resume disallowed with 'SPE-interchange'
option in original command
```

OUTPUT

If a "test hardware-group" command is successfully resumed as a consequence of the "resume hardware-group" command and the previous "test hardware-group" was executing in the background, then the following response will be displayed:

```
Hardware-group command successfully
resumed in background
```

If a "test hardware-group" command is successfully resumed as a consequence of the "resume hardware-group" command and the previous "test hardware-group" was executing in the foreground, then the test results will start being displayed on the SAT.

FEATURE INTERACTIONS

Cancel hardware-group

When a "test hardware-group" command is canceled, the test command is put in an inactive state. This state can be displayed using the "status hardware-group" screen and will show up as 'canceled'.

When the "resume hardware-group" command is entered to resume a previously canceled "test hardware-group" command, the state of the test command will be changed to 'active' on the "status hardware-group" screen.

save announcements

This command copies announcement data from the announcement board to the MSS. (tape or Card-Mem)

SYNOPSIS

save announcements *[spe-active | spe-standby]*

PERMISSIONS

The following default logins may execute this command: system technician, cust, rcust, inads, init.

EXAMPLES

save announcements
save announcements spe-active
save announcements spe-standby

DESCRIPTION

The save announcements command copies announcement data from the announcement board to the MSS. In a 286 based system, the tape is the storage device for the system. In a 386 based system, the Card-Mem is the storage device for the system. By default, announcement data is written to the MSS device in a simplex processor (SPE) system, or to both MSS devices in a High or Critical Reliability System. Also, the save announcements command can be directed to write to the MSS device on either of the processors, in a High or Critical Reliability System.

This command is only allowed if there is an integrated announcement board in the system. The save announcement command is denied if no announcement data module has been administered and no NETCON data module has been administered.

Simplex

There are no options for the save announcement in a simplex system. The save announcement command will save the announcement file to the MSS device.

Duplex

If no options are specified, the system saves the announcement to both processors' MSS devices.

Parameters

spe-active	This option forces the system to write the announcement data to the specified device in the currently active processor.
spe-standby	This forces the system to write the announcement data to the specified device in the standby processor.

Help Messages

If the system technician presses HELP after entering "save announcements" on a simplex SPE system the following message is displayed:

```
Entry is not required
```

If the system technician presses HELP after entering "save announcements" on a duplex SPE system the following message is displayed:

```
Enter ['spe-active' or 'spe-standby']
```

Error Messages

If the announcement data module cannot be accessed (upload/download port is active), the following message is displayed:

```
Announcement data module not available
```

If the announcement data module is out of service, the following message is displayed:

```
Announcement data module out of service
```

If one or more of the announcement ports are in use, the following message is displayed:

```
Announcement port in use; please try later
```

If there are no announcements on the announcement board, the following message is displayed:

```
No announcements on board
```

If the announcement data module is not administered, the following message is displayed:

```
Required announcement data module not administered
```

If the announcement data module is not administered or is currently in use, the following message is displayed:

```
Required data module not administered or unavailable
```

If there is no announcement board in the system, the following message is displayed:

```
Integrated announcement board not present
```

If the standby processor times out, the following message is displayed:

```
Command timed out on standby processor
```

If an inconsistency between the NETCON data module and the announcement data module exists (e.g. both data modules using the same COR) the following message is displayed:

```
System error, please try later
```

If the NETCON data module is not administered or out of service the following message is displayed:

```
Required NETCON data module not
administered or out-of-service
```

If the NETCON data module is busy the following message is displayed:

```
Required NETCON data module unavailable
```

If the time of day is not set, the following message is displayed:

```
Please set the time of day before proceeding
```

If the standby SPE is inaccessible, the following message is displayed:

```
Cannot access the standby SPE at this time
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
’login id’:’command’ has a command conflict
```

OUTPUT

Processor	This field displays the processor(s) that had the announcement data written to its/their device(s). Valid values are "SPE-A" and "SPE-B."
Command Completion Status	This field specifies whether the command completed successfully. Valid values are:
Error Code	A value of "0" specifies that the save was successful. A value of "2" specifies that the save failed.

For the following output example, the command entered is "save announcements" on a simplex SPE system.

```
save announcements           Page  1 of  1  SPE A

                      SAVE ANNOUNCEMENTS

Processor  Command Completion Status         Error Code
SPE-A      Success                                0
```

FEATURE INTERACTIONS

WARNING:
Use of the manager I is blocked for other activities until the command completes, which can take up to 45 minutes.

The command is denied if no announcement data module and no NETCON data module has been administered.

The command is denied if the announcement data module port is out of service or active (e.g. performing an announcement playback).

The command is denied if no announcements are on the board or a user is in an integrated announcements session.

The command is denied if the board is currently being uploaded or downloaded. A user cannot record an integrated announcement after the save announcements command has started although 15 channels are still available for announcement playback (one is reserved for uploading and downloading).

The command aborts if saving to the tape and no tape is in the tape drive or the tape is write-protected. The command also abort if no NETCON data module is available.

The save announcements command will not be allowed if the MSS is in use. The MSS may be in use by either another user or by maintenance.

If the user requests that announcements be saved to the standby processor, the standby processor must be in service and shadowing must be enabled.

When MSS devices on both processors in a High or Critical Reliability System are specified, the save announcements operation will save announcement data from the announcement board to the active MSS device, then to the standby MSS device. The status of each save operation is reported to the user separately. If one of the save operations fail, the save operation to the other device continues. The goal is to save the new announcement data on some MSS device so that it is not lost totally; this will cause the announcement data to be inconsistent between these MSS devices.

In case of a failure, it is the user's responsibility to make the announcement files on the two MSS devices consistent. The files may become inconsistent due to hardware failures or spontaneous processor interchanges. If announcement files are inconsistent due to failure on the hardware used during the save announcements command, the user should take appropriate action based on the error message returned. Maintenance software monitoring this hardware will log a hardware error with maintenance. Maintenance software will invoke tests to diagnose and attempt to correct the problem. If maintenance software fails to correct the problem, an alarm is raised and the system technician should take appropriate action.

The save announcements command writes two time-stamped identical copies of announcement data to the selected device(s). The time stamp for both copies will be the same, i.e. the time of writing to the first copy. Each copy contains a timestamp and the state of the copy (i.e., "good" or "bad").

If a good copy of the announcement file is not available, then the restore announcements operation can not be executed until the save announcements command is successfully completed. The announcements on the board are still accessible and usable.

save translation

This command allows the user to save the in-memory translation data to the tape (286 processor) or memory card (386 processor) device.

SYNOPSIS

save translation *[spe-active | spe-standby]*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init, cust.

EXAMPLES

save translation
save translation spe-active
save translation spe-standby

DESCRIPTION

All translation data is dept in memory during system operation. This means that all data would be lost if the switch went down. The save translation operation will allow the user to save to tape or memory card the in-memory translation data. This operation may be done as part of scheduled maintenance and/or on demand by the customer/system technician.

Simplex

The default is to save translation to the tape/memory-card on SPE_A.

Duplex

The default is to save translation to the tape/memory-card on both SPE-A and SPE-B.

Parameters

spe-active	This identifies that the save translation should be done on the active processor's MSS device.
spe-standby	This identifies that the save translation should be done on the standby processor's MSS device.

Help Messages

If the system technician presses HELP after entering "save translation" the following message will be displayed:

```
Enter ['spe-active' or 'spe-standby']
```

Error Messages

If there is another tape activity currently running on the system, then the following message will be displayed:

```
A tape command is active;
this command is not allowed at this time
```

If the user chooses that save be done on the standby processor, and the standby processor is inaccessible, then the following message will be displayed:

```
Cannot access the standby SPE at this time
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

OUTPUT

The responses will be displayed on an SPE basis with one line of data displayed for each SPE.

Processor	This identifies the processor carrier that was translation data was saved to. (i.e. SPE-A, or SPE-B).
Command Completion Status	This may display a variety of messages, to identify the success or failure of the command on the given processor:

For the following output example, assume that the command, save translation is done on a duplex system.

```
save translation

                         SAVE TRANSLATION

Processor   Command Completion Status         Error Code
SPE-A       Success                                0
SPE-B       Success                                0

Command Successfully Completed
```

FEATURE INTERACTIONS

The save translation cannot be performed if translation data is being changed by an administration command.

set expansion-link

This command sets the Expansion-Interface Link between the PPN and an EPN or between two EPNs to a specific Interface Link circuit pack between PPN and EPN.

SYNOPSIS

set expansion-link link-identifier

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

set expansion-link 02a01
set expansion-link 3a02

DESCRIPTION

This command sets the Expansion-Interface Link between the PPN and an EPN or between two EPNs to a specific Interface Link circuit pack between PPN and EPN.

Note: This command can corrupt any active data links between the PPN and an EPN or between two EPNs.

Defaults

No defaults.

Parameters

link-identifier	The circuit pack address of the designated Standby Expansion Interface circuit pack (identified as 1A01, 1A02, 1B01, 1B02, 2A01, 2A02, 2B03, 3A01, 3A02, 3AB02 or 3B03).

Help Messages

If the system technician presses HELP after entering "set expansion-interface," the following message will be displayed:

```
Enter board location:
```

```
[cabinet(1-3)];carrier(A-E);slot(0-20)
```

Error Messages

If the format of the specified expansion interface circuit pack is invalid, the following message will be displayed:

```
Port/Board invalid
```

If the link associated with the entered EI location is already active, the following message will be displayed:

```
EXP-INTF is already on active link
```

If the specified expansion interface is not configured in the system, the following message will be displayed:

```
Board not assigned
```

If the specified expansion interface is already the active link, the following message will be displayed:

```
EXP-INTF is already on active link
```

If the specified expansion interface is unable to become active, the following message will be displayed:

```
Standby EXP-INTF Link is unable to take over
```

If there are no maintenance objects for the specified board, the following message will be displayed:

```
No MO in this board
```

If the specified board is not an expansion interface board, the following message will be displayed:

```
Address is not a valid Expansion Interface Board
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The following message indicates that the command completed successfully:

```
Command successfully completed
```

The following message indicates that the command was aborted:

```
Command aborted; please try later
```

The following message indicates that the command failed:

```
Error encountered, can’t complete request
Command failed
```

FEATURE INTERACTIONS

None.

set options

This command allows the user to administer whether certain alarms are reported to INADS or whether they are downgraded to a minor alarm, warning alarm, or no alarm.

SYNOPSIS

set options

PERMISSIONS

The following default logins may execute this command: inads, init.

EXAMPLES

set options

DESCRIPTION

This special command enables the technician (that is, remote user with INADS permission) to select which types of maintenance categories report alarms automatically and which types require the customer to call in. Judicious use of this command can reduce the number of ineffective alarms to the TSC. For the **set options** command to be effective, the default settings specified in this section should always be used. These settings are not intended to be changed on a per-system basis. Special circumstances (for example, special studies) may require temporary changes under the guidance of Tiers 3 and 4.

NOTE: Alarms can't be upgraded.

Defaults

Initially, the alarm reporting options for On-board Trunk Alarms (Alarm Group 1), both Major and Minor, and Minor, and the Memory Card Capacity Alarm are set to "yes" (y); all others are set to "warning" (w). All trunk groups are associated with alarm severity group 1 by default.

Parameters

None.

Help Messages

If the user presses HELP after entering "set options," the following message is displayed:

```
Entry is not required
```

Error Messages

If the command entered is in conflict with another currently executing command, then a message is displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message is displayed:

```
All maintenance resources busy; try again later
```

FORM INPUT

After entering the command "set options," the user is presented with the following form.

```
set options                                          Page 1 of  8

                      ALARM REPORTING OPTIONS

                                            Major  Minor
                   On-board Station Alarms:  w     w
                  Off-board Station Alarms:  w     w
     On-board Trunk Alarms (Alarm Group 1):  y     y
    Off-board Trunk Alarms (Alarm Group 1):  w     w
     On-board Trunk Alarms (Alarm Group 2):  w     w
    Off-board Trunk Alarms (Alarm Group 2):  w     w
     On-board Trunk Alarms (Alarm Group 3):  w     w
    Off-board Trunk Alarms (Alarm Group 3):  w     w
     On-board Trunk Alarms (Alarm Group 4):  w     w
    Off-board Trunk Alarms (Alarm Group 4):  w     w
                    On-boar Adjunct Alarms:  w     w
                          Off-board Alarms:  w     w
                      Off-board DS1 Alarms:  w     w
                  Off-board PI-LINK Alarms:  w     w
                  Off-board Alarms (Other):  w     w
               Memory Card Capacity Alarms:        y
```

```
set options                                            Page  2 of  8

                          TRUNK GROUP ALARM OPTIONS
                               (Alarm Group)

01: 1  11: 1  21: 1  31: 1  41: 1  51: 1  61: 1  71: 1  81: 1  91: 1
02: 1  12: 1  22: 1  32: 1  42: 1  52: 1  62: 1  72: 1  82: 1  92: 1
03: 1  13: 1  23: 1  33: 1  43: 1  53: 1  63: 1  73: 1  83: 1  93: 1
04: 1  14: 1  24: 1  34: 1  44: 1  54: 1  64: 1  74: 1  84: 1  94: 1
05: 1  15: 1  25: 1  35: 1  45: 1  55: 1  65: 1  75: 1  85: 1  95: 1
06: 1  16: 1  26: 1  36: 1  46: 1  56: 1  66: 1  76: 1  86: 1  96: 1
07: 1  17: 1  27: 1  37: 1  47: 1  57: 1  67: 1  77: 1  87: 1  97: 1
08: 1  18: 1  28: 1  38: 1  48: 1  58: 1  68: 1  78: 1  88: 1  98: 1
09: 1  19: 1  29: 1  39: 1  49: 1  59: 1  69: 1  79: 1  89: 1  99: 1
10: 1  20: 1  30: 1  40: 1  50: 1  60: 1  70: 1  80: 1  90: 1
```

NOTE:
The remaining Trunk Group information is shown on the next 6 pages and is not documented in this Manual.

On the first page of the Alarm Reporting Options Form, the user selects the alarm severity options for station alarms, the four trunk alarm severity groups, the adjunct alarms, off-board DS1 alarms, and PI-LINK alarms, memory card translation capacity alarms, and other off-board alarms. On the second page, known as the Alarm Reporting Options Form, the user assigns an alarm severity group to each trunk group. This feature enables the technician to reduce the level of alarms reported for on-board or off-board trouble conditions.

The following alarm options are available:

- Minor

  Alarms are raised as maintenance testing discovers them but the severity of the alarm is downgraded to a minor. Alarmed resources that would have normally been taken out of service are still taken out of service. LEDs on the port board and maintenance board follow the normal Minor alarm LED strategy and there is a call to the receiving OSS.

- Warning

  Alarms are raised as maintenance testing discovers them, but the severity of the alarm is downgraded to a warning. The advantage to the technician here is that the Alarm Log can still be used to pinpoint trunk or station problems reported by the customer. Alarmed resources that would normally have been taken out-of-service are still taken out-of-service. Alarm LEDs light on the port circuit pack and Maintenance circuit pack as before, but no attendant LEDs or stations reporting alarms are affected. There is no call to INADS.

- Report

  This option treats the alarms in the same way as the warning category with one exception: alarms are reported to INADS using a special WARNING category. When an alarm of this type is received, INADS logs the occurrence and either creates a trouble ticket or closes it immediately. The retry strategy for a call of this type is similar to normal Major or Minor alarm reports. However, the acknowledgment LED on the attendant console or alarm reporting station does not reflect the status of the call.

- Yes

  Alarms are raised in the normal manner. There is no filtering of alarm data.

- No

  Alarms raised on a trunk, station, or adjunct in this category are dropped. Error information is provided as before, but there is no trace of an alarm. There is no LED activity and no call to INADS. Because resources are taken out-of-service without any record, this option is recommended only when other options do not provide the desired result.

The alarm options can be administered only on a system-wide basis for the following alarm categories:

- Major on-board station alarms
- Minor on-board station alarms
- Major off-board station alarms
- Minor off-board station alarms

Four alarm severity groups are provided for trunk alarms. You can administer the alarm options for the categories listed below in each alarm severity group. However, in G1, the alarm options can be administered only on a system-wide basis for the following categories:

- Major on-board trunk alarms
- Minor on-board trunk alarms
- Major off-board trunk alarms
- Minor off-board trunk alarms

For Adjuncts, an alarm severity option is assigned to each of the following categories:

- Major on-board adjunct alarms
- Major off-board adjunct alarms
- Minor on-board adjunct alarms
- Minor of-board adjunct alarms

You can also administer the options on a system-wide basis for Minor off-board DS1 Interface circuit pack alarms and for the Minor off-board Memory Card Capacity Alarm.

Alarm reporting options information in the Alarm Reporting Options Form is considered translation data and, thus, is preserved through all levels of restart.

This feature affects the alarming of the MOs listed below. Neither the trunk nor the station category applies to alarms raised on the common portion of the circuit pack.

In all cases, if the option associated with the alarm type is set to "n," the alarm report is dropped. All error information about the alarm is intact, but there is no record of an alarm and no LEDs light on the port circuit pack, the Maintenance circuit pack, the attendant console, or alarm reporting station to indicate a problem.

If the option is set to "warning" or "report," port circuit pack LEDs and LEDs on the Maintenance circuit pack are affected the same as normal warning alarms.

The default parameters are as follows:

- Downgrade all station, trunk (except on-board trunk alarms), and Minor DS1-BD alarms to warning alarms.
- On-board Major and Minor trunk alarms, and the Memory Card Capacity alarm should continue to raise alarms and report to INADS.

Station MOs Affected By This Command

NOTE:
Although alarms on these MOs may appear as warnings, the alarms should be investigated with user-reported problems.

- Analog Lines (ANL-LINE, ANL-NE-L, ANL-16-L)
- Digital Lines (DIG-LINE)
- Hybrid Lines (HYB-LINE)
- MET Lines (MET-LINE)
- ISDN-BRI Lines (BRI-PORT, BRI-SET)

Trunk maintenance is characterized by an escalation of a Minor alarm to a Major alarm if more than 75 percent of the members of the trunk group are alarmed. If the option for the trunk category is set to "warning," "minor," "report," or "no," this no longer happens. Maintenance removes an individual trunk member out-of-service according to the normal criteria used for Major and Minor alarms.

Trunk MOs Affected By This Command:

NOTE:
Although alarms on these MOs may appear as warnings, the alarms should be investigated with user-reported problems.

- Auxiliary Trunks (AUX-TRK)
- Central Office Trunks (CO-TRK)
- Direct Inward Dialing Trunks (DID-TRK)
- Direct Inward and Outward Dial Trunks (DIOD-TRK)[G1.2SE only]
- DS1 Central Office Trunks (CO-DS1)
- DS1 Direct Inward Dialing Trunks (DID-DS1)
- DS1 Tie Trunks (TIE-DS1)
- ISDN Trunks (ISDN-TRK)
- Tie Trunks (TIE-TRK)

Circuit Pack MOs Affected By This Command

NOTE:
Although alarms on these MOs may appear as warnings, the alarms should be investigated with user-reported problems.

NOTE:
Trunks that are not members of Trunk Groups, (e.g. PCOLs) are downgraded according to the alarm severity of group one.

- DS1 Interface Circuit Pack (DS1-BD)

Adjunct-Related MOs Affected By This Command

NOTE:
Although alarms on these MOs may appear as warnings, the alarms should be investigated with user-reported problems.

- ASAI Adjunct (ASAI-ADJ)
- AT&T Adjunct Port (ATT-PORT)
- Ethernet ASAI Port (LGATE-PT)
- Ethernet ASAI Adjunct (LGATE-AJ)
- Ethernet AT&T Port (ATTE-PT)
- Ethernet AT&T Adjunct (ATTE_AJ)
- ISDN-BRI Ports connected to Adjuncts (ABRI-PORT)

Although adjuncts are administered as stations, the administration of alarm severity for the station alarm group does not affect the alarm severity levels of the adjuncts. Similarly, the administration of alarm severity for the adjunct alarm group does not affect the alarm severity levels for other types of stations.

PI-Link and associated Link MOs affected by this Command:

NOTE:
Although alarms on these MOs may appear as warnings, the alarms should be investigated with user-related problems.

- See Processor Interface Link ["PI-LINK (Processor Interface Link)"] for other associated Link Maintenance Objects.

Memory Card MOs Affected by This Command

NOTE:
While this option does not downgrade the CAP-MEM alarm by default, changes to this options may result in alarms being downgraded to warning. This alarm is raised when the memory card translation capacity is over 98% full and is intended to alert Services to inform the customer of a possible need to upgrade to a larger flash card.

- Memory Card Capacity (CAP-MEM)

Other MOs Affected by This Command

NOTE:
Although alarms on these MOs may appear as warnings, the alarms should be investigated with user-related problems.

- EPN Maintenance Circuit Pack (MAINT)
- Expansion Interface (EXP-INTF)
- ISDN-PRI Signaling Group (ISN-SGR)
- Journal Printer (JNL-PRNT)
- PMS Link (PMS-LINK)
- PMS log printer (PMS-LOG)
- Primary CDR Link (PRI-CDR)
- Secondary CDR Link (SEC-CDR)
- SPE Select Switches (SPE-SELEC)
- Synchronization (SYNC)
- System Communication Interface (PI-SCI)
- System Printer (SYS-PRNT)

- TDM Clock (TDM-CLK)
- Tone Generator Circuit Pack (TONE-BD)

Field Help

Since all fields on the first page may have the same values, then pressing HELP in any field on the first page presents the following field help message:

```
m(inor) n(o) r(eport) w(arning) y(es)
```

The following is a description of the values:

m(inor)	Downgrade the major alarm to a minor alarm and report the alarm to INADS.
n(o)	Do not log the alarm or report it to INADS.
r(eport)	Downgrade the alarm to a warning and report the warning to INADS.
w(arning)	Downgrade the alarm to a warning, log it but do not report the alarm to INADS.
y(es)	Log and report the alarm to INADS.

All fields on page 2 may have the same values. Pressing HELP in any field on page 2 gives the following field help message:

```
Enter alarm group number: 1 to 4
```

The alarm group number is a way of distinguishing four different groups of alarms. These alarm groups allow the user to specify that alarms in different groups are handled differently from those in other groups.

Field Error Messages

All of the fields on the first page allow the same values. Only one error message is printed for all first page fields. If the value is not one of the listed characters (m,n,r,w,or y) then the following message is displayed:

```
"X" is an invalid entry; please press HELP key
```

All of the fields on page 2 allow the same values. If the value in one of these fields is not numeric, the following message is displayed:

```
Entry must be all digits
```

All of the fields on pages page 2 allow the same values. If the value in one of these fields is a digit other than 1, 2, 3, or 4, the following message is displayed:

```
Entry out of range
```

OUTPUT

After the user has entered in the changes to the options and pressed SUBMIT, the following message appears at the bottom of the screen:

```
Command successfully completed
```

FEATURE INTERACTIONS

None.

set signaling-group

This command sets the secondary D-channel within the specified group to be the primary D-channel.

SYNOPSIS

set signaling-group group identifier

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

set signaling-group 1
set signaling-group 2

DESCRIPTION

The set signaling-group command sets the secondary D-channel in the specified signaling group to be the primary D-channel. The primary D-channel then becomes the secondary D-channel.

A signaling group is a collection of B-channels signaled for by a designated single D-channel or set of D-channels over an ISDN-PRI.

Defaults

None.

Parameters

group identifier	The signaling group identifier is an administered number associated with each signaling group.

Help Messages

If the system technician presses HELP after entering "set signaling-group," the following is displayed:

```
Enter group identifier
```

Error Messages

If the specified group identifier is non numeric or out of range, the following message is displayed:

```
Signaling group invalid
```

If the specified group identifier is not administered, the following message is displayed:

```
No signaling group assigned
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message is displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

If the set signaling-group command is successful, the following message will be displayed on the SAT:

```
Command successfully completed
```

If the set signaling-group command is unsuccessful, the following message will be displayed:

```
Error encountered, can’t complete request
```

FEATURE INTERACTIONS

None.

set synchronization

This command will set the DS1 trunk or tone/clock circuit pack that is to supply an on-line reference for synchronization.

SYNOPSIS

set synchronization location

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

set synchronization 01c08
set synchronization 02a01
set synchronization 01a
set synchronization 02c

DESCRIPTION

The set synchronization command will set the DS1 trunk or active tone/clock circuit pack that will supply a reference for synchronization. The set command will work only after synchronization has been disabled via the "disable synchronization" command. Any administered DS1 trunk or active tone/clock may be entered with the set command. The DS1 or tone/clock will remain as the synchronization reference until the set command is run with another board or until the "enable synchronization" command is run.

After the "enable synchronization" command is run, an administered primary or secondary synchronization source will be used as the synchronization reference. If no primary or secondary source is administered, then synchronization will use an active tone/clock board as the synchronization reference after synchronization has been enabled.

The synchronization subsystem provides error free digital communication between the switch and other PBXs, COs, or customer premise equipment. The subsystem is made up of system components involved in synchronization: TDM bus clock, DS1 trunk board, maintenance and administration software resident in the SPE.

Defaults

No defaults.

Parameters

location	A "location" represents the physical position of the board (DS1 trunk or active tone/clock) that will supply a reference for synchronization. The location of a DS1 trunk is entered as "UUcSS" where "UU" represents the cabinet number, "c" represents the carrier, and "SS" represents the slot position. The location of a tone/clock is entered as "UUc" where "UU represents the cabinet number, and "c" represents the carrier. The location of a tone/clock may also be entered as "UUcSS" where "UU represents the cabinet number, "c" represents the carrier, and "SS" represents the slot position. A cabinet number (1 - 3) may be entered with or without a leading zero (0).

Help Messages

If the system technician presses HELP after entering "set synchronization," the following message will be displayed:

```
Enter DS1 board location or Tone-Clock location:
[(cabinet (1-3)]; carrier (A-E))
```

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

Can not set synchronization to standby tone clock circuit pack.

```
Cannot set synchronization to standby tone/clock board.
```

OUTPUT

The following message indicates that the command completed successfully:

```
Command successfully completed
```

The following message indicates that the command was unsuccessful, due to synchronization not being disabled:

```
Must disable synchronization-switch first
```

The following message indicates that the command was unsuccessful, due to the board not being inserted:

```
Board not inserted
```

The following message indicates that the command was unsuccessful, due to an invalid board being specified (not a DS1 trunk or tone/clock):

```
Port/Board invalid
```

The following message indicates that the command was unsuccessful, due to reasons other than the ones listed above:

```
Error encountered, can’t complete request
```

FEATURE INTERACTIONS

None.

set tdm

This command will set which TDM bus has the control channel and dedicated tones on it.

SYNOPSIS

set tdm port-network pn number bus bus *override*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

set tdm port-network 2 bus a
set tdm port-network 2 bus b override

DESCRIPTION

The set tdm command will set which TDM bus on a port network has the control channel and dedicated tones on it.

Defaults

No defaults.

Parameters

pn number	The PN number specifies the Port Network number of the TDM bus to be set.
bus	The TDM bus ("a" or "b") specifies which half of the TDM bus is desired. Each 512 time slot TDM bus is configured as two duplicate 256 time slot buses. This division allows for duplication of control channels and dedicated tone time slots. The default control bus (carrying the control channel) is the "a" bus, while the default tone bus (carrying dedicated tones) is the "b" bus. A port network number (1 - 3) may be entered with or without a leading zero (0).
override	This qualifier is optional, it will force the setting of a bus which is out of service or a bus whose dedicated tone time slots are in use.

Help Messages

If the system technician presses HELP after entering "set tdm," the following message will be displayed:

```
Enter ’port-network’, port network number (1-3),
’bus’, bus (’a’ or ’b’); [’override’]
```

Error Messages

If the technician enters "bus" before "port-network," the following message will be displayed:

```
’bus’ is an invalid identifier; please press HELP
```

If the technician does not enter all digits for the port-network number, the following message will be displayed:

```
Entry must be all digits
```

If the technician enters a bus other than A or B, the following message will be displayed:

```
Identifier invalid
```

If the technician enters a Port Network number that is not administered, the following message will be displayed:

```
Port Network number not assigned
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
’login id’:’command’ has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The following message indicates that the command completed successfully:

```
Command successfully completed
```

The following message indicates that the command was unsuccessful, due to the tdm bus being busied out:

```
Must release tdm bus first
```

The following message indicates that the command was unsuccessful, due to the health of the tdm bus:

```
Tdm bus is out-of-service; use ’override’
option to force ’set’ command
```

The following message indicates that the command was unsuccessful, due to the dedicated tone time slots being used:

```
Dedicated tone time slots in use; use ’override’
option to force ’set’ command
```

The following message indicates that the command was unsuccessful, due to a tone/clock (TN768) board not being available:

```
Cannot set tdm bus or tone/clock boards;
need a TN768 board
```

The following message indicates that the command was unsuccessful, due to the expansion port network (EPN) not being available:

```
EPN is not available
```

The following message indicates that the command was unsuccessful, due to the link to the expansion port network (EPN) not being available:

```
EXP-INTF not available; please try later
```

FEATURE INTERACTIONS

In the rare event that all time slots on a particular bus are being used, and the dedicated tone time slots are on the other half of the bus, the time slots reserved for tones on the bus that has no other time slots available will be used for new calls. If the technician then performs a "set" command to the bus that has calls up on the dedicated tone time slots, these calls will be dropped.

set time

This command will allow the system technician to set the time of day clock on the switch.

SYNOPSIS

set time

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, rcust, bcms, init, browse.

EXAMPLES

set time

DESCRIPTION

The set time command will present the system technician with a form that contains the current time of day on the switch. The system technician may then edit and submit the form in order to change the time of day. The set time command allows the system technician to change the day of the week, the day of the month, the month, year, hour, and minute. The second field will be reset to zero (0) whenever the time on the clock is altered, but cannot be modified by the technician. The day of the week will be entered as a text string and will be translated to an integer for internal storage.

If no change is made to any field when the command is entered, there will be no update of the clock when the form is submitted. If the command is entered and the form is unchanged, the time will not be reset to the time displayed on the screen, but will remain the same as the current system clock time.

Defaults

If the system clock has never been set, a default time is used.

Parameters

None.

Help Messages

If the system technician presses HELP after entering "set time," the following message will be displayed:

```
Entry is not required
```

Error Messages

If the system encounters an error in getting the current time of day, then the following message will be displayed:

```
Error encountered, cannot complete request
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

FORM INPUT

After entering the command "set time," the system technician will be presented with the following form. The current time, or default time will be placed in the fields.

Day of the Week:	The day of the week that will be used by the time of day clock on the switch. Valid entries are Monday through Sunday. The timer will maintain the value of the day of the week, incrementing it every twenty-four (24) hours, and resetting it at the seventh day.
Day of the Month:	The day of the month that will be used by the system time of day clock. 1-31 are valid entries. A check for leap year is also made, February can have 29 days in 1984, but only 28 in the year 1990.
Month:	The month that will be used by the system time of day clock. Any of the twelve months are valid entries.

Year:	The year that will be used by the time of day clock on the switch. 1970-2999 are valid entries for the year field. The year must be saved as translation data and passed to the kernel whenever kernel memory is corrupted (system reboot or cold I restart) or the data is changed.
Hour:	The hour that will be used by the system for the time of day clock. 0-23 are valid hours that can be entered into this field.
Minute:	The minute that will be used by the time of day clock on the system. 0-59 are valid entries for the minute field.
Second:	The second that will be used by the time of day clock on the system. This field is restricted, and can't be set to a specific value by the technician. This field is set to zero when the time of day clock is set.

```
set time                                            Page 1 of 1

                          DATE AND TIME

  DATE
    Day of the Week: _________  Month: _________
   Day of the Month: __          Year: ____

  TIME
          Hour: __     Second:
        Minute: __
```

Field Help

Following are the help messages that the system technician will see upon tabbing to the specified field and pressing the HELP key.

Day of the Week:	A list of the days of the week will be presented on the bottom line. The help is longer than 80 characters, consequently, the "(MORE)" message will appear. In order to get the continuation of the list, the system technician needs to type another help key. The list of key words is: Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday.
Day of the Month:	"Enter current day 1-31."
Month:	A list of the months of the year will be presented on the bottom line. The help is longer than 80 characters, consequently, the "(MORE)" message will appear. In order to get the continuation of the list, the system technician needs to select the HELP key. The list of key words is: January, February, March, April, May, June, July, August, September, October, November, December.
Year:	"Enter current year"
Hour:	"Enter number between 0-23"
Minute:	"Enter number between 0-59"
Second:	This field is restricted and consequently the system technician cannot tab to or change this value.

Field Error Messages

Following are the error messages that will be displayed on the bottom of the screen. The messages are displayed when the system technician tabs out of a field and the validation routines are executed.

Day of the Week:	""xxxxxx" is an invalid entry; please press HELP"
Day of the Month:	"Day invalid"
Month:	""xxxx" is an invalid entry; please press HELP"
Year:	"Year invalid"
Hour:	"Hour invalid"
Minute:	"Minute invalid"

OUTPUT

After the system technician has entered in the corrections to the time and pressed the submit key (ENTER), then the following message appears at the bottom of the screen:

```
Command successfully completed
```

FEATURE INTERACTIONS

The date and time are generally available to all software via a system primitive.

set tone-clock

This command will set which tone/clock is active in a port network.

SYNOPSIS

set tone-clock location *override*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

set tone-clock 01b
set tone-clock 1b
set tone-clock 01b override
set tone-clock a

DESCRIPTION

The set tone-clock command will set which tone/clock is active in a port network. This command is only for cases where the tone/clock circuit pack is duplicated in a port network.

The default active tone clock in each port network should be set back to active after any use of the "set tone-clock" command. The tone-clock duplication strategy assumes that the active is always in use if it is healthy. If it is not in use, a single failure can result in unnecessary service outage. Schedule maintenance tone-clock switch option does not set the tone-clock back to the default active if it wasn't active at the beginning of the test.

Defaults

The cabinet number defaults to one (1) if it is not specified.

Parameters

location	A "location" represents the physical position of the tone/clock to be tested and is entered as "UUc" where "UU" represents the cabinet number (1-3), and "c" represents the carrier. The "b" carriers only contain tone-clock circuit packs when the system is equipped with High or Critical Reliability.
override	This qualifier is optional. If used, it will force the set command into effect regardless of the health of the tone/clock circuit pack.

Help Messages

If the system technician presses HELP after entering "set tone-clock," the following message will be displayed:

```
Enter tone/clock location:
[cabinet(1-3)];(carrier(A-E)) ['override']
```

Error Messages

If an identifier greater than 3 (three) characters is entered, or the cabinet entered is not a digit (number), the following message will be displayed:

```
Identifier invalid
```

If the carrier entered is invalid, the following message will be displayed:

```
Invalid carrier specified
```

If the cabinet entered is not within the valid range of cabinets or the cabinet is not administered, the following message will be displayed:

```
Cabinet number not assigned
```

If there is no tone/clock board at the specified location, one of the following messages will be displayed:

```
Board not inserted
Board not assigned
```

If the specified cabinet carrier location is that of a switch node, the following message will be displayed:

```
Switch Node carrier specified;
invalid command for SN carrier
```

If the cabinet carrier location entered is that of an EPN that is not available, the following message will be displayed:

```
EPN is not available
```

If the board is not a TN768 tone/clock board, the following error message will be displayed:

```
Cannot set tdm bus or tone/clock boards;
need a TN768 board
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The following message indicates that the command completed successfully:

```
Command successfully completed
```

If the tone/clock selected is out of service, the following message will be displayed:

```
Tone/clock board is out-of-service;
use 'override' option to force 'set' command
```

The following message indicates that the command was unsuccessful, due to the tone/clock being busied out:

```
Must release tone/clock board first
```

The following message indicates that the command was unsuccessful, due to the epn in which the tone/clock resides not being available:

```
EPN is not available
```

The following message indicates that the command was unsuccessful, due to the link to the EPN in which the tone/clock resides:

```
EXP-INTF not available; please try later
```

The following message indicate that the command was unsuccessful, due to the standby system clock:

```
Unable to activate the standby
```

```
System Clocks; please try later
```

The following message indicates that the command was unsuccessful, due to the standby system tones:

```
Unable to activate the standby
System Tones; please try later
```

FEATURE INTERACTIONS

None.

set vector

This command will set the conditions that cause a core dump of memory to tape or a core dump memory card.

SYNOPSIS

set vector condition *[spe-standby | spe-active | spe-maint]*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

SIMPLEX SYSTEM EXAMPLES:
set vector f
set vector 9
DUPLEX SYSTEM EXAMPLES:
set vector f spe-standby
set vector f spe-active
set vector f spe-maint
set vector 9

DESCRIPTION

The set vector command specifies what level of restart must occur before a core dump occurs. The memory copy (core dump) is placed on the primary Mass Storage System (a tape in a tape system and a core dump memory card in a memory card system) device so that it may be examined at a later date. The set vector command allows the technician to tailor what level of restarts will cause memory to be copied to the primary Mass Storage System device.

NOTE:
An extended reboot will never be requested by software.

To force a core dump to occur immediately by user demand in a simplex or duplex system, the appropriate bit should be set using this command, then a "reset system" should be done at a level that will force a core dump corresponding to the set vector bit.

When a system restart occurs in a simplex Switch Processing Element (SPE) system with the corresponding vector bit set, the core dump is written to secondary storage (the primary MSS device). Once the core dump is written, the vector is cleared and the restart is performed. **This command is always service disruptive in a simplex system.**

When a system restart occurs on the active SPE in a High or Critical Reliability System with the corresponding vector bit set, and the "spe-active" option was selected when the vector bit was set, the active SPE will perform a core dump. **Service will be disrupted while the active SPE is performing the requested core dump.**

When a system restart occurs on the active SPE in a High or Critical Reliability System with the corresponding vector bit set, and the "spe-standby" option was selected when the vector bit was set, the standby SPE will perform a core dump after the standby SPE has refreshed its memory.

When a system restart occurs on the active SPE in a High or Critical Reliability System with the corresponding vector bit set, and the "spe-maint" option was selected when the vector bit was set, the standby SPE will perform a core dump without refreshing its memory first.

In all cases after a core dump has been performed, the vector will be cleared.

Defaults

In a High or Critical Reliability System, the default option is "spe-standby."

Parameters

condition	The condition(s) which cause(s) a core dump represented by a hexadecimal value. The hexadecimal value represents the bit map of the four reset conditions which cause the dump. These conditions from least to most significant bit are: WARM start, COLDII restart, COLDI restart, and REBOOT. To set more than one condition, the logical OR of the bits needed is used to determine the hexadecimal character. Setting a vector to a condition of 0 actually clears the vector, and the vector is not considered set.

Vector-Condition Mapping

value	WARM	COLDII	COLDI	REBOOT
0	n	n	n	n
1	y	n	n	n
2	n	y	n	n
3	y	y	n	n
4	n	n	y	n
5	y	n	y	n
6	n	y	y	n
7	y	y	y	n
8	n	n	n	y
9	y	n	n	y
a	n	y	n	y
b	y	y	n	y
c	n	n	y	y
d	y	n	y	y
e	n	y	y	y
f	y	y	y	y

spe-standby — This option is only specified for a High or Critical Reliability System and is the default option. It specifies that if a restart occurs on the active SPE and the corresponding vector bit is set, a core dump will be taken on the standby SPE after the standby SPE has performed a refresh of memory.

spe-active — This option is only specified for a High or Critical Reliability System. It specifies that if a restart occurs on the active SPE and the corresponding vector bit is set, a core dump will be taken on the active SPE. This option is the default in simplex SPE systems (no options are specified in a simplex SPE system, but spe-active is always assumed). **This option is service disrupting.**

spe-maint	This option is only specified for a High or Critical Reliability System. It specifies that if a restart occurs on the active SPE and the corresponding vector bit is set, a core dump will be taken on the standby SPE without the standby SPE performing a refresh of memory.

Help Messages

If the system technician presses HELP after entering "set vector" on a simplex system, the following message will be displayed:

286:

```
Enter a tape dump vector value: (0-F)

The tape dump vector value is a hex value representing restart levels
 A hex value of '1' causes tape dumps to be taken on WARM restarts
 A hex value of '2' causes tape dumps to be taken on COLDII restarts
 A hex value of '4' causes tape dumps to be taken on COLDI restarts
 A hex value of '8' causes tape dumps to be taken on REBOOT restarts

All other hex values represent a combination of restart levels.
 The combination is determined by adding the hex values of the individual
 restarts together (e.g. a hex value of '3' causes tape dumps to
 be taken on WARM and COLDII restarts, a hex value of 'F' causes tape
 dumps to be taken on WARM, COLDII, COLDI, and REBOOT restarts, etc.)
```

386:

```
Enter a memory dump vector value: (0-F)

The memory dump vector value is a hex value representing restart levels
 A hex value of '1' causes memory dumps to be taken on WARM restarts
 A hex value of '2' causes memory dumps to be taken on COLDII restarts
 A hex value of '4' causes memory dumps to be taken on COLDI restarts
 A hex value of '8' causes memory dumps to be taken on REBOOT restarts

All other hex values represent a combination of restart levels.
 The combination is determined by adding the hex values of the individual
 restarts together (e.g. a hex value of '3' causes memory dumps to
 be taken on WARM and COLDII restarts, a hex value of 'F' causes memory
 dumps to be taken on WARM, COLDII, COLDI, and REBOOT restarts, etc.)
```

If the system technician presses HELP after entering "set vector" on a duplex system, the following message will be displayed:

286:

```
Enter a tape dump vector value: (0-F),
  ['spe-active', 'spe-standby', 'spe-maint']

The tape dump vector value is a hex value representing restart levels
  A hex value of '1' causes tape dumps to be taken on WARM restarts
  A hex value of '2' causes tape dumps to be taken on COLDII restarts
  A hex value of '4' causes tape dumps to be taken on COLDI restarts
  A hex value of '8' causes tape dumps to be taken on REBOOT restarts

All other hex values represent a combination of restart levels.
  The combination is determined by adding the hex values of the individual
  restarts together (e.g. a hex value of '3' causes tape dumps to
  be taken on WARM and COLDII restarts, a hex value of 'F' causes tape
  dumps to be taken on WARM, COLDII, COLDI, and REBOOT restarts, etc.)
```

386:

```
Enter a memory dump vector value: (0-F),
  ['spe-active', 'spe-standby', 'spe-maint']

The memory dump vector value is a hex value representing restart levels
  A hex value of '1' causes memory dumps to be taken on WARM restarts
  A hex value of '2' causes memory dumps to be taken on COLDII restarts
  A hex value of '4' causes memory dumps to be taken on COLDI restarts
  A hex value of '8' causes memory dumps to be taken on REBOOT restarts

All other hex values represent a combination of restart levels.
  The combination is determined by adding the hex values of the individual
  restarts together (e.g. a hex value of '3' causes memory dumps to
  be taken on WARM and COLDII restarts, a hex value of 'F' causes memory
  dumps to be taken on WARM, COLDII, COLDI, and REBOOT restarts, etc.)
```

Error Messages

If the format of the condition (dump vector value) is invalid, the following message will be displayed:

`Entry invalid; please press HELP`

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

`'login id':'command' has a command conflict`

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

`Command resources busy; Press CANCEL to clear, and then resubmit`

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The following message indicates that the command completed successfully:

```
Command successfully completed
```

The following message indicates that the command failed:

```
Command failed
Error encountered, can't complete request FEATURE
INTERACTIONS
```

In a simplex SPE system, service will be disrupted while a core dump is being written to the primary Mass Storage System device. In addition, service will continue to be disrupted until the software is restarted at an appropriate level. These "disruption" times will vary depending upon the particular switch configuration.

If a core dump already exists on the file system (tape or memory card) subsequent core dumps will overwrite the existing core dump.

If the Mass Storage System is not accessible, a core dump can not be executed.

The vector will be cleared when a system restart of the proper level is performed regardless of whether the core is actually dumped.

If handshake is down in a High or Critical Reliability System and one of the "spe-active," "spe-standby," or "spe-maint" options is selected, the active vector will be set, but the standby vector will not be cleared. This could lead to two different vectors on the active and standby SPEs. Therefore, the "set vector" command should be reissued after handshake is up on the standby SPE.

If handshake is up in a High or Critical Reliability System, the active vector will be set and the standby vector will be cleared, or vice versa depending on the option that is selected.

status access-endpoint

This command displays the status of an access endpoint.

SYNOPSIS

status access-endpoint extension *print*

PERMISSIONS

The following default logins may execute this command: system technician, cust, inads, init, nms, browse.

EXAMPLES

status access-endpoint 25012
status access-endpoint 77868
status access-endpoint 66078 print

DESCRIPTION

The status access-endpoint command displays internal software state information for diagnosis. This command can help locate facilities with which an Access Endpoint is communicating.

Defaults

No defaults.

Parameters

extension	The extension number of the access endpoint to be displayed. The number of digits in an extension is determined by the dial-plan.
print	This will cause the report to be printed if a printer is connected to the SAT.

Help Messages

If the user presses HELP after entering "status access-endpoint," the following message is displayed:

```
Enter assigned extension, ['print']
```

Error Messages

If the format for the extension is incorrect, the following error message will be displayed:

```
Extension invalid
```

If the extension is not administered, the following message will be displayed:

```
Extension not assigned
```

If the object associated with the specified extension is not an access endpoint, the following message will be displayed:

```
Extension assigned to object
other than access-endpoint
```

If the board that contains the access endpoint is not inserted in the system, the following message will be displayed:

```
Board not inserted
```

If the EPN on which the access endpoint resides is not accessible, the following message will be displayed:

```
EPN is not available
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Extension	The extension of the access endpoint to be displayed.
(Starting) Port	Port locations (cabinet-carrier-slot-circuit) of the access endpoint. For wideband access endpoint, the location shown is that of the starting port.
Communication Type	The valid voice and data communication type that the access endpoint is administered. The options are: 56k-data, 64k-data, voice-grade-data, and wideband.
Width	For communication types of 56k-data, 64k-data, and voice-grade-data, the width value is 1. For communication type of wideband, this field displays the number of DS0s that makes up the access endpoint.
Service State	Whether the access endpoint is in-service or out-of-service. One of the following states is displayed: in-service/active, in-service/idle, and out-of-service.
Connected Ports	Port location connected to the access endpoint (cabinet-carrier-slot-circuit) for an active call. For wideband access endpoint connection, all ports connected to the wideband access endpoint are listed.

For the following output example, the command "status access-endpoint 22502" was entered. Assume that the access endpoint ports for extension 22502 are in cabinet 1, carrier C, slot 11, circuit 1 to 6. The access endpoint is connected on an active call to ports 7 to 12 of board in location 1B19 (cabinet 1, carrier B, slot 19). This means port 01C1101 is connected to 01B1907, port 01C1102 is connected to 01B1908, port 01C1103 is connected to 01B1909, and so on.

```
status access-endpoint 22502               page 1 of 1

      ACCESS-ENDPOINT STATUS

             Extension: 22502
      (Starting) Port: 01C1101
    Communication Type: wideband
                 Width: 6

         Service State: in-service/active

       Connected Ports: 01B1907 01B1908 01B1909
                        01B1910 01B1911 01B1912

Command Successfully Completed
```

FEATURE INTERACTIONS

None.

status administered-connection

This commands displays the operational status of an administered connection.

SYNOPSIS

status administered-connection ac number *print*

PERMISSIONS

The following default logins may execute this command: rcust, cust, inads, init, system technician, browse, bcms.

EXAMPLES

status administered-connection 1
status administered-connection 50
status administered-connection 128 print

DESCRIPTION

An administered connection provides the ability to automatically establish an end-to-end connection between two access/data endpoints.

Parameters

ac number	The number assigned to an administered connection.
print	This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses HELP after entering "status administered-connection," the following message will be displayed:

```
Enter assigned administered connection number(1-128),
['print']
```

Error Messages

If the user entered administered-connection number is in the wrong format, the following error message is displayed:

```
Identifier invalid
```

If the user entered administered-connection number is out of range (not between 1 and 128), the following error message is displayed:

```
Entry out of range
```

If the user entered administered-connection number is not administered, the following error message is displayed:

```
Identifier not assigned
```

If the software data cannot be sent to the SAT, the following message is displayed:

```
Error encountered can’t complete request
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then
resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Connection Number:	The number assigned to the administered connection.
Enabled?	Whether the administered connection is enabled ("y" or "n").
Originator:	The extension of the originating access/data endpoint.
Destination:	The destination address to be used in the routing of the administered connection.
Connection State:	The current status of the administered connection. Valid values are "connected," "restored," "failed," "waiting to retry," "attempting to restore," "attempting to connect," "not scheduled," and "disabled."
Failure Cause:	The cause of the state of the administered connection (that is, why the state is reported as attempting to connect, attempting to restore, or having failed to restore). If the administered connection was due to be active but is not connected, then this field shows the most recent reason for failure.
Number of Retries:	The number of consecutive failed establishment attempts.
Auto Restorable?	When an administered connection is in the connected state, this field indicated whether or not auto restoration is attempted when failure occurs.

For the following output example, the command status administered-connection 3 was entered.

```
status administered-connection 3                page 1 of 1

                 ADMINISTERED-CONNECTION STATUS

   Connection Number:
             Enabled?
          Originator:
         Destination:
    Connection State:
       Failure Cause:
   Number of Retries:
     Auto Restorable?
```

FEATURE INTERACTIONS

status attendant

This command displays the status of the attendant console.

SYNOPSIS

status attendant console number *print*

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, rcust, init, bcms, browse.

EXAMPLES

status attendant 1
status attendant 2
status attendant 2 print

DESCRIPTION

The status attendant command displays internal software state information for diagnosis. This command can help locate facilities to which the attendant console is communicating.

Defaults

No defaults.

Parameters

console number	The console number is a unique number assigned to a specific attendant (i.e. 1 - 16).
print	This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses HELP after entering "status attendant," the following message will be displayed:

```
Enter assigned console(1-16), ['print']
```

Error Messages

If the entered console number is not a valid number from 1 through 16 the following message will be displayed:

```
Console number invalid
```

If the console number is not administered, the following error message will be displayed:

```
Console number not assigned
```

If a software fault is encountered while the command is executing, the following message will be displayed:

```
Error encountered, can't complete request
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then
resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Console Number	The specific number assigned to the attendant (1-16).
Port	The port location of the attendant (cabinet-carrier-slot-circuit).
Service State	In-service/idle, in-service/active, out of service, or disconnected.
Usage State	Idle or active.
Maintenance Busy State	Whether maintenance is testing the object.
Connected Ports	Port locations to which the attendant is communicating (cabinet-carrier-slot-circuit).

For the following output example, the command that was entered is "status attendant 1."

```
status attendant 1

       ATTENDANT STATUS

Console Number: 1            Service State: in-service/night service
          Port: 01C1106   Maintenance Busy? no
Connected Ports:

Command successfully completed
```

FEATURE INTERACTIONS

None.

status audits

This command will display the status of all of the Data Relation Audits that have detected a problem or that have aborted.

SYNOPSIS

status audits [peak-hour **|** cumulative] *[print | schedule]*

PERMISSIONS

The following default logins may execute this command: inads, init.

EXAMPLES

status audits cumulative
status audits cumulative print
status audits cumulative schedule
status audits peak-hour
status audits peak-hour print
status audits peak-hour schedule

DESCRIPTION

This command is used to display the results of the execution of the Data Relation Audits that are built into the switch. Data Relation Audits are used to check for inconsistencies between selected data items in the switch, to report any inconsistencies found and to take corrective action if possible. Data Relation Audits are useful during the development and testing phases of a project to help uncover software errors as well as in the field to help the switch recover from data corruption before that corruption causes an interruption in service.

This command displays the date and time of the beginning of the interval requested, the number of times that the full sequence of audits was executed (audit cycles), and status information about each audit that detected a problem or aborted during the specified interval. The status information contains the name of the audit, the number of times that the audit ran and corrected an error, the number of times that the audit ran and detected an error that it could not correct, the number of times that the audit ran and aborted for some reason, the date and time of the first problem detected by the audit (only for cumulative) and the time of the most recent error detected by the audit (only for cumulative).

The audit data is available since the last reboot or since the last execution of the "clear audits cumulative" command, and for the peak hour since the last reboot or since the last execution of the "clear audits peak-hour" or "clear audits cumulative" command. **Note: This data is not cleared on single process**

restarts, warm starts, cold 2 restarts, cold 1 restarts, or processor interchanges.

Audits can be executed directly using the "test MO" command (e.g. *test MO l 8192 p 512 t 0* will execute the Station Connections Audit, the audit lnames and numbers (pnames) are included in the Table Of Audits at the end of this main page). When the "test MO" command is used to execute an audit, the results of the audit are displayed on the terminal screen. In general, errors discovered as the result of a demand test are not logged in the error logs. To be consistent with other error logging and to avoid confusion, errors that are discovered as the result of a demand test executing an audit are not included in the data displayed by this command.

The screen does not automatically update, and is a reflection of the system at the time the request was made. More audits may have been run while the information is being displayed. These updates will not be reflected until the next execution of the command.

Defaults

None

Parameters

cumulative	This option will display the data collected since the last reboot or since the last execution of the "clear audits cumulative" command.
peak-hour	This option will display the data for the peak hour since the last reboot, or since the last execution of the "clear audits cumulative" or "clear audits peak-hour" command. The peak hour is determined by summing, for all audits, the number of times that the audit found and fixed a problem, the number of times that the audit found a problem that it could not fix and the number of times the audit aborted. The data for the hour with the highest number is displayed as the peak hour's data. If two peaks of the same size occur, the most recent is displayed.
print	If specified, this parameter will cause the information displayed by this command to be sent to the printer attached to the terminal as well as to the screen.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [3] for more details.

Help Messages

If the technician presses HELP after entering "status audits," the following message will be displayed:

```
cumulative  peak-hour
```

Error Messages

If the "print" option is specified and there is no printer attached to the terminal or if the printer is off line, then the following message will be displayed:

```
Printer failed
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The audit information will be displayed with one line of data displayed for each audit that has detected an error or aborted. The data for audits that have not detected any errors or aborted is not displayed since all of the numbers would be zero anyway. The output will be sorted in descending order based on the sum of the values in the "# Cycles Fixed Data," "# Cycles Could Not Fix Data" and "# Cycles Audit Aborted" fields for each audit.

Start Date	This field shows the date and time of the beginning of the interval being displayed. For "cumulative" it will be the date and time of the last reboot or of the last execution of the "clear audits cumulative" command. For "peak-hour" it will be the date and time of the beginning of the peak hour since the last reboot or since the last execution of a "clear audits cumulative" or "clear audits peak-hour" command.
# of Audit Cycles Completed	The switch executes the audits in a set order, one after another. When all of the audits have been executed, the switch starts over with the first one in the sequence. An audit cycle is one execution of all audits in the sequence of audits executed by the switch. This field shows how many audit cycles were completed in the specified interval. The number ranges from 0 to 999999, if it exceeds 999999 the string "******" will be displayed to indicate overflow. **NOTE:** Since this field shows the number of audit cycles completed, it is possible that the individual audit values, described below, could be larger than this value if the switch is part way through another audit cycle. Also, some audits are executed as part of scheduled maintenance instead of in the normal audit sequence, the Audit Cycles number does not apply to these audits.
Audit Name	This field shows the name of the audit that detected an error or aborted. There are a few audits that are not run in the normal sequence of audits. Instead, they are executed as part of scheduled maintenance. Those audits will be included in the reports but will be marked with "(SCH)" following the audit name.

# Cycles Fixed Data	This field shows the number of times that the audit ran, in the specified interval, and found a problem that it was able to fix. The number ranges from 0 to 65534, if it exceeds 65534 the string "*****" will be displayed to indicate overflow.
# Cycles Could Not Fix Data	This field shows the number of times that the audit ran, in the specified interval, and found a problem that it was not able to fix. The switch data being audited is left in an inconsistent state when this happens. The number ranges from 0 to 65534, if it exceeds 65534 the string "*****" will be displayed to indicate overflow.
# Cycles Audit Aborted	This field shows the number of times that the audit ran, in the specified interval, and aborted due to an internal error. The number ranges from 0 to 65534, if it exceeds 65534 the string "*****" will be displayed to indicate overflow.
First Error	This field shows the date and time that the audit first detected any of the three types of problems (i.e. fixed data, could not fix data, audit aborted) since the last execution of the "clear audits cumulative" command. The format used is: two digit month number followed by "/" followed by the two digit day of the month followed by "/" followed by the two digit hour in 24 hour time followed by ":" followed by the two digit minute (e.g. 03/27/14:31 for 2:31 pm, March 27th). **This field appears only on the "status audits cumulative" display.**
Most Recent Error	This field shows the date and time that the audit last detected any of the three types of problems. The format used is: two digit month number followed by "/" followed by the two digit day of the month followed by "/" followed by the two digit hour in 24 hour time followed by ":" followed by the two digit minute (e.g. 03/27/14:31 for 2:31 pm, March 27th). **This field appears only on the "status audits cumulative" display.**

The following are a sample outputs of the "status audits" command.

```
status audits cumulative

 Command successfully completed
```

FEATURE INTERACTIONS

The data displayed by "status audits cumulative" and "status audits peak-hour" can be affected by the "clear audits" command. The "clear audits cumulative" command clears the data collected to date and resets the start time kept for that data and also clears the peak hour's data. The "clear audits peak-hour" command clears the data kept for the peak hour so that a new peak hour can be established.

When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. Refer to the Report Scheduler and System Printer feature specification [3] for details about the scheduling form.

TABLE OF AUDITS

The following table shows the names of the audits that are run as part of time available maintenance, the audit number (pname) and a short description of each audit. These audits are executed using lname MO_DR_AUDIT (8192). These audits may be executed using the *test MO* command with lname 8192, pname "audit number," and test number 0 (for example, *test MO l 8192 p 607 t 0* will execute the AC state audit).

Audit Name	Audit Number	Description
AC-ISG	607	AC state audit
ADJUSR	595	Adjunct user record audit
ADMTRM	559	Administration terminal audit
ANUR-A	589	Announcement user record audit
AN-ADM	574	Announcement group administration audit
AN-CALLS	572	Announcement group calls audit
AN-QUE	577	Announcement group queue audit
AQSA	545	ACB queue slot allocation audit
ASLINK	606	ASAI link status audit
ASYLED	605	ASAI yellow LED audit
ATACT	558	Attendant active audit
ATAV	557	Attendant availability audit
ATDRCNT	576	Attendant resource count audit
AT-ADM	529	Attendant group administration audit

SUR-FREE	625	Station User Record Free List Audit

status bri-port

This command displays the current states of the specified ISDN-BRI port.

SYNOPSIS

status bri-port location *print*

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, init, nms, browse.

EXAMPLES

status bri-port 1c0701
status bri-port 1c0701 print

DESCRIPTION

The status bri-port command displays the service state, maintenance state and layer 1 state of an ISDN-BRI port. Also displayed on this form is information on the point-to-point signaling links transported over the port.

Defaults

None.

Parameters

location	A "location" represents the physical position of the port to be busied out and is entered as "UUcSSpp" where "UU" represents the cabinet number (1-3), "c" represents the carrier, "SS" represents the slot position, and "pp" represents the circuit (port).
print	This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses HELP after entering "status bri," the following is displayed:

```
Enter an isdn-bri port location, ['print']
```

Error Messages

If the format of the port location is incorrect, the following message is displayed:

```
Port/Board invalid
```

If the port location entered is not between 5 and 7 characters long, the following message is displayed:

```
Port invalid
```

If the port is not administered, the following message is displayed:

```
Port not assigned
```

If the board associated with the entered port location is not inserted, the following message is displayed:

```
Board not inserted
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message is displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port:	This field specifies the physical address of the ISDN-BRI port.
Service State:	This field specifies whether the ISDN-BRI port is "in-service" or "out-of-service."
Maintenance Busy?:	This field specifies whether there is any maintenance testing being performed upon the ISDN-BRI port ("yes" or "no").
Layer 1 State:	This field contains the layer 1 (physical) state of the BRI on the port. Valid states are "activated," "pend-activation," and "deactivated." ■ The "activated" state means layer 1 frames are being passed between the port and BRI endpoints. ■ The "pend-activation" state specifies that the port has been placed in-service, the layer 1 interface device has been turned on, layer 1 frames are being sent to the BRI endpoints connected to this port, but the BRI endpoints are not responding. ■ The "deactivated" state means that the layer 1 interface device on the BRI has been turned off due to the port going out-of-service.
TEI Value	The Terminal Endpoint Identifier(TEI) is a layer 2 addressing parameter used by the switch to pass information over the point-to-point signaling link to and from BRI endpoints. Each point-to-point signaling link has a TEI associated with it. This field displays the value of this addressing parameter. This value is in the range from 0 to 127.

Layer2 State:	This field contains the point-to-point signaling link layer 2 state. Valid states are "un-assigned," "assigned," "established," "l3-established" or "hyperactive."

- The states of "un-assigned" means the link is in the TEI-UNASSIGN state at Layer 2.
- The "assigned" state specifies the link is currently in the AWAIT_EST (Await Establish) state at layer 2. If the BRI endpoint supports TEI allocation procedures, this state means that those procedures have been successfully executed and a TEI has been assigned to the endpoint by the switch.
- The state of "established" signifies that the link is in the MF_EST_NORM (Multi-Frame Established Normal) state at layer 2. This state means that the switch has successfully started the link and is now capable of exchanging layer 3 frames with the endpoint. If the endpoint does not support SPID initialization procedures, the extension of the endpoint associated with the link is also displayed. This is the normal state for the link in the point-to-point wiring configuration.
- A state of "13-established" shows that the link is in the MF_EST_NORM state at layer 2 and SPID initialization procedures have been completed successfully. The extension of the endpoint associated with the link is also displayed. This is the normal state for the link in the multi-point wiring configuration.
- The state of "hyperactive" means that traffic on this link has gone over threshold. The link has been suspended and deemed hyperactive.

Endpt Extension	This field displays the extension of the voice/data endpoint associated with the link only if the link is in the "established" (point-to-point configuration) or "l3-established" (multipoint configuration) layer 2 states, otherwise this field is blank.
Endpt SPID	This field displays the SPID administered on the voice/data endpoint associated with the link. Note that this information is displayed only if the link is in either the "established" (point-to-point configuration) or the "13-established" (multipoint configuration) layer 2 state. Otherwise this field is blank.

Service SPID	This field displays an indication as to whether the link is associated with the Service SPID. If the link is associated with the Service SPID this field contains a "yes" and the endpoint extension field is blank, otherwise this field is blank. Service SPID is a feature used by service technicians to check building wiring between the switch and the BRI endpoint.

For the following output example, the command status bri-port 1c1701 was entered.

```
status bri-port 1c1701                Page 1 of  1  SPE A

                          STATUS BRI-PORT

             Port: 01C1701
    Service State: in-service
Maintenance Busy?: no
    Layer 1 State: activated

     TEI Value  Layer2 State   Endpt Extension   Endpt SPID   Service SPID?

Link1   64      13-established      1010            1010

Link2

Link3
```

STATUS INTERPRETATION SECTION

The meaning of the information on the status bri-port form is as follows.

Table 10-6. Status BRI-Port Command Interpretation

Endpoint Types	TEI Range	Layer 2 State	Voice Extension	Service SPID	Description / Recommendation
ASAI, BRI	0-126	Assigned	blank	blank	Transitory state for BRI endpoints and ASAI adjuncts. Link establishment is being attempted by the switch. 1. Check the endpoint and wiring by following the SPID Facility Test Procedure described in the BRI-SET (ISDN-BRI Set/ASAI Adjunct) Maintenance documentation. 2. Verify the repair by executing the **status bri-port PCSSpp** command. Determine that the L2 state of the signaling link is L3-Established for ASAI adjuncts and BRI endpoints supporting MIM (management information messages) initialization and Established for fixed TEIBRI endpoints and automatic TEIBRI endpoints not supporting MIM initialization. Otherwise, proceed to Step 3. **NOTE:** A MIM is a level-3 message that conveys management and maintenance information between a communications system and a BRI terminal. 3. Escalate the problem to the next tier.

Continued on next page

Table 10-6. Status BRI-Port Command Interpretation — *Continued*

Endpoint Types	TEI Range	Layer 2 State	Voice Extension	Service SPID	Description / Recommendation
ASAI	0-63	Established	blank	blank	Transitory state for ASAI adjuncts. ASAI signaling is connected at Layer 2. Layer 3 Restart procedure has not completed between switch and adjunct. 1. Check the adjunct by following the recommended repair procedures of the manufacturer. 2. Verify the repair by executing the **status bri-port PCSSpp** command. Determine that the L2 state of the signaling link is L3-Established. Otherwise, go to Step 3. 3. Escalate the problem to the next tier.
BRI	0-126	Established	ext	blank	Normal state for non-MIM initializing, fixed and automatic TEIBRI endpoints.

Continued on next page

Table 10-6. Status BRI-Port Command Interpretation — *Continued*

Endpoint Types	TEI Range	Layer 2 State	Voice Extension	Service SPID	Description / Recommendation
BRI, ASAI	64-126	Established	blank	blank	Transitory state for automatic TEIBRI endpoints which support MIM initialization. 1. Verify that SPID administration on the switch and endpoint are consistent. Verify the repair by executing the **status bri-port PCSSpp** command. Determine that the L2 state of the signaling link is L3-Established. Otherwise, proceed to Step 2. 2. Try replacing the endpoint. Verify the repair by executing the **status bri-port PCSSpp** command. Determine that the L2 state of the signaling link is L3-Established. Otherwise, proceed to Step 3. 3. Escalate the problem to the next tier.
BRI	64-126	L3-Established	ext	blank	Normal state for automatic TEIBRI endpoints supporting MIM initialization.
BRI, ASAI	64-126	L3-Established	blank	yes	SPID Facility Test is being conducted on the port by system technician. Link is not associated with a BRI endpoint on the port. See description of SPID Facility Test Procedures described in the BRI-SET (ISDN-BRI Set/ASAI Adjunct) Maintenance documentation.

Continued on next page

Table 10-6. Status BRI-Port Command Interpretation — *Continued*

Endpoint Types	TEI Range	Layer 2 State	Voice Extension	Service SPID	Description / Recommendation
BRI	64-126	L3-Established	ext	yes	SPID Facility Test is being conducted on the port by system technician. Link is associated with an endpoint on the port. See description of SPID Facility Test Procedures described in the BRI-SET (ISDN-BRI Set/ASAI Adjunct) Maintenance documentation.
BRI	0-126	L3-Established	blank	blank	Invalid SPID assigned to link. 1. Change the SPID value in the BRI endpoint to match the SPID administered to the BRI endpoint on the port. Verify the repair by executing the **status bri-port PCSSpp** command. Determine that the L2 state of the BRI endpoint is L3-Established. Otherwise, go to Step 2. 2. Escalate the problem to the next tier.

Continued on next page

Table 10-6. Status BRI-Port Command Interpretation — *Continued*

Endpoint Types	TEI Range	Layer 2 State	Voice Extension	Service SPID	Description / Recommendation
BRI *(cont'd)*	0-126	L3-Assigned	ext	blank	Transitory state for BRI endpoints which support MIM initialization. 3. Wait for five seconds and repeat the command. If the state has not changed, continue with Step 2. 4. Make sure SPID administration on the switch and endpoint are consistent. Verify the repair by executing the **status bri-port PCSSpp** command. Determine that the L2 state of the signaling link is L3-Established. Otherwise, go to Step 3. 5. Try replacing the endpoint. Verify the repair by executing the **status bri-port PCSSpp** command. Determine that the L2 state of the signaling link is L3-Established. Otherwise, go to Step 4. 6. Escalate the problem to the next tier.

Continued on next page

Table 10-6. Status BRI-Port Command Interpretation — *Continued*

Endpoint Types	TEI Range	Layer 2 State	Voice Extension	Service SPID	Description / Recommendation
BRI *(cont'd)*	0-126	L3-Assigned	ext	yes	Transitory state for BRI endpoints which support MIM initialization when SPID Facility Test was used to initialize the station. 7. Wait for five seconds and repeat the command. If the state has not changed, continue with Step 2. 8. Make sure SPID administration on the switch and endpoints are consistent. Verify the repair by executing the **status bri-port PCSSpp** command. Determine that the L2 state of the signaling link is L3-Established. Otherwise, go to Step 3. 9. Try replacing the endpoint. Verify the repair by executing the **status bri-port PCSSpp** command. Determine that the L2 state of the signaling link is L3-Established. Otherwise, go to Step 4. 10. Escalate the problem to the next tier.
ASAI	0-126	Hyperactive	ignore	ignore	Link has sent too many messages per unit time.

Continued on next page

Table 10-6. Status BRI-Port Command Interpretation — *Continued*

Endpoint Types	TEI Range	Layer 2 State	Voice Extension	Service SPID	Description / Recommendation
BRI					Signaling has been suspended. System timeouts in 60 seconds and attempts to place the link in service again. If a link remains in this state while there is no activity at the BRI endpoint: 1. Make sure SPID administration on the switch and endpoints are consistent. Verify the repair by executing the **status bri-port PCSSpp** command. Determine that the L2 state of the signaling link is L3-Established. Otherwise, go to Step 2. 2. Try replacing the endpoint. Verify the repair by executing the **status bri-port PCSSpp** command. Determine that the L2 state of the signaling link is L3-Established. Otherwise, go to Step 3. 3) Escalate the problem to the next tier.
ASAI	0-126	L3-Restarting	ext		The switch has sent a Restart message to the adjunct but has not yet received a Restart Acknowledgment message from the adjunct.
ASAI	0-126	L3-Restarted	ext		After receiving a Restart Acknowledgment message, the switch has sent a Heartbeat message to the adjunct and is waiting for a response.
ASAI	0-126	L3-Established	ext		Normal state for ASAI adjunct.

FEATURE INTERACTIONS

None.

status card-mem

This command views the status of the memory card located at the specified SPE.

SYNOPSIS

status card-mem location print

PERMISSIONS

The following default logins may execute this command: cust, init, inads, system technician, nms, rcust, browse, and bcms.

EXAMPLES

status card-mem
status card-mem A
status card-mem b print

DESCRIPTION

Memory card is a portable and compact memory card containing a bank of flash EPROM chips. The non-volatile memory card can be erased and randomly programmed with user’s data. In 386 systems [G3iV2-386, G3sV2, G3vsV2], the memory card replaces the traditional tape system as a mass storage for saving translation, announcements, and core dump. The system software is stored in the "flash" section of main memory and the memory card used for saving translations doesn’t contain a copy of the system software as the tape does. During the system reboot or a system power down condition, the in-core system maintenance hardware error logs are temporarily saved in the memory card before the system goes down and then the error logs file is read back when the system is restarted. The Hard Patch feature also uses the memory card as a temporary storage when LMM applies a patched file to the system software.

The "status card-mem" command can show the following information of a memory card located at either active SPE or standby SPE:

- Is a valid memory card in place?
- Is the memory card write-protected?
- What is the capacity of the inserted memory card?
- What kind of system configuration - small or medium?
- What is the number of pulses counted in the last erase operation?

- What is the percentage of translation storage space used?
- What are the names of files stored in the memory card, and what is date and time (if available) when it was saved?

Defaults

None.

Parameters

location	This parameter indicates the carrier location where the memory card resides in a High or Critical Reliability System. This field is not required in a simplex switch configuration. In a duplex switch configuration, this field is required and it can be either "A" for control carrier A in Processor Port Network (PPN) or "B" for control carrier B in PPN.
print	Print the status on the printer attached to the SAT.

Help Messages

If the system technician presses HELP after entering "status card-mem," the following message is displayed for a duplex system:

```
Enter [cabinet(1)];carrier(A-B), ['print']
['print']
```

Error Messages

If the carrier entered is invalid, the following message will be displayed:

```
"entered value" is an invalid identifier;
press RETURN to execute modified command
```

If the NETCON board is not TN777B, then the following message will be displayed:

```
Must install TN777B circuit pack
```

If the system is insane, the following message will be displayed:

```
Error encountered, can't complete request
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If the standby is entering maintenance mode when this command is executed, then the following message is displayed:

```
Cannot interrupt Standby SPE while entering
maintenance mode; please try later
```

If the standby SPE is not refreshed when this command is executed, then the following message is displayed:

```
Standby SPE memory not refreshed;
use the "refresh spe-standby" command.
```

If the standby SPE is not refreshed and the active SPE is hard selected via the SPE select switches when this command is executed, then the following message is displayed:

```
Active SPE locked via select switches;
Standby SPE memory not refreshed
```

If the standby SPE is busy with another task, then the following message is displayed:

```
Standby SPE busy with another task;
for information use "status system 1"
```

If the standby SPE is not available when this command is executed, then the following message is displayed:

```
Standby SPE not available;
for information use "status system 1"
```

OUTPUT

Location	This field indicates the physical location (carrier) of the memory card. In a simplex system, the "Location" always has the value "01A" for carrier A of Processor Port Network. In a High or Critical Reliability System, either "01A" or "01B" can be displayed.
System Size	The "System Size" field reflects the system configuration - **Small** [G3sV2] or **Medium** [G3iV2-386]. This information will be useful for catching errors such as inserting wrong size of memory card into the system.
Capacity	The "Capacity" field shows the capacity of the inserted memory card and the series number of the memory card. This field has a 3-digit format for the size of memory card and the 1-digit format for the series number. Three different capacities of memory cards are used in DEFINITY D92 system. The file contents of each type of memory card are described in the following table.

Capacity of Memory Card

Card Size	User	Customer File Names
1 Mb	Small w/o Announcements	translation
4 Mb	Medium w/o Announcements	translation
4 Mb	Small and Medium with Announcements	translation announcements
10 Mb	Maintenance (core dump)	translation announcements core_ dump
10 Mb	System Upgrade	system_software

Status	The possible values for the "Status" field are: **"inserted"**a valid memory card is in the memory card slot **"no card"**no memory card is inserted or the inserted memory card has a bad connection **"unformatted"**the inserted memory card is unformatted or can not be recognized by the switch Only when the status is "**inserted**," the switch can perform I/O operation to the memory card
Write-Protection	The "Write-Protection" field has a value "**on**" when the write-protection toggle on the memory card is turned on. Otherwise, the field is "**off**." If the "Write-Protection" field is "**on**," then the switch can not store any file to the memory card.
Number of Erase Pulses	This field contains the number of pulses counted in the last erase operation on a Series 1 type of memory card. This field is blank for Series 2 type of memory card due to the different algorithm of erase operation between two series.
Translation Storage Space Used (%)	Indicates the percentage of reserved storage space for storing translation file in the memory card that has been used for saving the translation into the memory card.

NOTE:
This percentage is valid only for the specific memory card used in the *most recent* save translation operation (which is implemented via the **save translation** command or via the scheduled maintenance with save translation enabled). If the memory card is replaced with another card, or if no save translation is performed on the new memory card, the percentage does **not** indicate the translation storage space used in the new card. Therefore, in such a case, the percentage can be ignored.

File Name	Each formatted memory card has reserved a fixed space in the card for each file. The starting address and size of each reserved slot is pre-determined according to the capacity of the memory card. The file name as defined in Table "Capacity of Memory Card" is shown in this field.
Data Present	The "Data Present" field is "y" when the file contains valid data. Otherwise, the "Data Present" field has a value of "n."
Date Time	This field shows the date and time when the file was saved into the memory card. For the "Software Upgrade" type of memory card, this field contains the system software release number instead of the time stamp. Due to the restriction of "core dump" file format, the year information is not available in the date/time string.

For the following output example, the command "status card-mem" was entered.

```
status card-mem

                        MEMORY CARD STATUS

     Location: 01A               Write Protection: off
       Status: inserted             Capacity (MB): 4 Series 1
  System Size: Medium      Number of Erase Pulses: 78
             Translation Storage Space Used (%): 21

   File Name    Data Present    Date     Time
   translation       y         2/17/91   9:00
   announcements     y         2/15/91  20:30

Command successfully completed
```

FEATURE INTERACTIONS

If the Announcement feature is not available in the system features configuration, then the "Data Present" field is always "n" for the "announcements" file. The Announcement feature requires a memory card with a minimum capacity of 4 MB. If the memory card is less than 4 MB, then the Announcements can not be saved in the memory card.

The Core Dump feature requires a 10 MB memory card for saving the core dump. If the memory card has a capacity less than 10 MB, then the core dump operation will fail.

status cdr-link

This command displays the status of the call detail recording (CDR) links.

SYNOPSIS

status cdr-link *print*

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, rcust, bcms, init, nms, browse.

EXAMPLES

status cdr-link
status cdr-link print

DESCRIPTION

The status cdr-link command displays the status of call detail recording (CDR) links. Whether the link is up or down will be displayed. If a link is down, the number of times the switch has tried to set up the link will be shown.

The call detail recording (CDR) link is the physical link connecting the SPE to a recording device (for example, printer) for sending CDR call records. A CDR link is composed of a data channel on the NETCON board or EIA port on the processor circuit pack, a digital port and a data module. There can be up to two CDR links in the system.

Defaults

No defaults.

Parameters

print	This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses HELP after entering "status cdr-link", the following message will be displayed:

```
['print']
```

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Link State	Up, down, or extension not administered will be displayed. *Up* means the link is up and the application can use the link. This is the normal state of operation. *Down* means the link is physically down. *Extension not administered* means you need to administer the *system cdr feature* form.
Number of Retries	The number of times the switch has tried to set up the link.
Maintenance Busy	Whether the maintenance object has been busied out or not. Will be set to either *yes* or *no*.

The following is an example of the fields contained on the output form.

```
status cdr-link

                       CDR LINK STATUS

         Primary                   Secondary
       Link State: up              extension not administered
Number of Retries: 0
 Maintenance Busy? no
```

FEATURE INTERACTIONS

None.

status data-module

This command displays the status of a data-module.

SYNOPSIS

status data-module extension *print*

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, rcust, bcms, init, browse.

EXAMPLES

status data-module 30000
status data-module 32770
status data-module 32770 print

DESCRIPTION

The status data-module command displays internal software state information for diagnosis. This command can help locate facilities to which the data module is communicating.

Defaults

No defaults.

Parameters

extension	The extension of the data module to be displayed. The number of digits in an extension is determined by a dial-plan.
print	This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses HELP after entering "status data-module", the following message will be displayed:

```
Enter assigned extension, ['print']
```

Error Messages

If the format of the extension is incorrect, the following error message will be displayed:

```
Extension invalid
```

If the extension is not administered, the following message will be displayed:

```
Extension not assigned
```

If the object associated with the extension is not a data module, the following message will be displayed:

```
Extension exists but assigned to a different object
```

If software fails to complete the command, one of the following messages will be displayed:

```
No tests for this MO
EPN is not available
Board not assigned
Port not assigned
Error encountered, can't complete request
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Data Ext/Sta Ext for Stn DM	The data module extension number. The DTDM is an exception: the connected station extension will be shown instead.
Port/Channel Number	The port location of the data module (cabinet-carrier-slot-circuit). If the data module specified is a data channel, the channel number will be shown instead.
Service State	This entry displays the status of the data module; valid states are: — In-service/idle — The data module is present but not in use. — In-service/active — The data module is present and is in use. — Out-of-service — The data module has been removed from service — Disconnected — The data module no longer appears to be present
CF Destination Ext	This entry displays the call forwarding destination, if any, of the station.
Maintenance Busy?	Whether maintenance is testing the object, "yes" or "no".
Connected Ports	Port locations to which the data module is connected (cabinet-carrier-slot-circuit).

For the following output example, the command that was entered is "status data-module 301".

```
status data-module 301

                          DATA-MODULE STATUS

Data Ext/Stn Ext for Stn DM: 301        Service State: out-of-service
        Port/Channel Number: 01C1103    Maintenance Busy? no
         CF Destination Ext:
            Connected Ports:
```

FEATURE INTERACTIONS

None.

status hardware-group

This command displays the status of the hardware group maintenance test.

SYNOPSIS

status hardware-group *print*

PERMISSIONS

The following default logins may execute this command: bcms, browse, system technician, inads, cust, init, rcust.

EXAMPLES

status hardware-group
status hardware-group print

DESCRIPTION

Summary information on the active or last hardware group tests will be displayed. This display includes the number and percentage of maintenance objects tested, the percentage of tests passed, failed, and aborted, the time elapsed since initiating the hardware group test, the specific hardware group test command (see "test hardware-group" command) initiated, and the state (active/canceled/complete) of the hardware-group test.

Defaults

No defaults.

Parameters

print This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses HELP after entering "status hardware-group", the following message will be displayed:

['print']

OUTPUT

Hardware Group Command State:	The state of a hardware-group command: "active" - if testing is in progress, "canceled" - if testing has been canceled, "complete" - if the command has completed and there is no testing going on.
Number of MOs Tested:	The number of MOs in the specified group (refer to test hardware-group command) that have had been tested by the current hardware-group command. This includes all MOs that were either actually tested or were aborted due to resource contention.
Total Number of MOs to be Tested:	The total number of MOs in the group that was specified in the "test hardware-group" command.
Percent Complete:	A ratio of the number of MOs completed and the total number of MOs to test in the command.
Elapsed Test Time:	The duration of the hardware-group test. If a test was canceled and then restarted this time excludes the cancel period. If the hardware-group command has finished it will indicate the length of time it took to complete the command. The time is displayed in the HH:MM:SS format where HH is hours, MM is minutes, and SS is seconds.
Repetition Number	The number of iterations that have been completed corresponding to the 'repeat' or the 'continuously' option.
Percentage of Tests Passed:	The percentage of tests that passed.
Percentage of Tests Failed:	The percentage of tests that failed.
Percentage of Tests Aborted:	The percentage of tests that were aborted.
Command:	The hardware-group action object and qualifiers that were entered.
Test sequence:	This will display either short or long.

Test repetition:	This will display either continuously or the keyword repeat along with the repeat value entered.
Output options:	This will display the selections that were chosen on the input form: auto-page, background, or failures.
Hardware options:	This will display the selections that were chosen on the input form: all-ports, or SPE-interchange.

For the following output example, the command "status hardware-group" was entered.

```
status hardware-group                        page 1 of 1

                  HARDWARE GROUP STATUS

          Hardware Group Command State:   active
                  Number of MOs Tested:   11070
      Total Number of MOs to be Tested:   12300
                      Percent Complete:      90%
        Elapsed Test Time (hr:min:sec): 0:15:30
                     Repetition Number:       1
            Percentage of Tests Passed:      82%
            Percentage of Tests Failed:      11%
           Percentage of Tests Aborted:       7%

              ENTERED HARDWARE GROUP COMMAND

         Command: test hardware-group system
   Test sequence: short
 Test repetition: repeat 3
  Output Options: failures
Hardware Options: SPE-interchange
```

FEATURE INTERACTIONS

None.

status health

This command displays the status of the overall health of the system.

SYNOPSIS

status health *print*

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, init, nms, browse.

EXAMPLES

status health
status health print

DESCRIPTION

The status health command displays the current system alarm summary, maintenance busy summary, user summary, critical system status, and cabinet status. This is the same page that is displayed when "monitor health" is entered, except with the "status health" command the output page is not updated periodically.

Defaults

None.

Parameters

print This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses HELP after entering "status health", the following object command word choices will be displayed:

```
['print']
```

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Major	The number of logged major alarms is displayed as a number ranging from 0 to 200. Up to 200 major alarms can be reported in the alarm log; therefore, this is the maximum which can be displayed.
Minor	The number of logged minor alarms is displayed as a number ranging from 0 to 200. Up to 200 minor alarms can be reported in the alarm log; therefore, this is the maximum which can be displayed.
Warning	The number of warnings logged in the alarm file is displayed as a value between 0 and 200, which is the maximum number of warnings permitted.
Trunks	The number of maintenance busied out trunks is shown.
Stations	The number of maintenance busied out stations is displayed.
Others	The combined number of maintenance busied out objects excluding trunks and stations is displayed.
Static	Static indicates the proportion of the CPU which is currently dedicated to high priority items (for example, the operating system). This percentage is rounded to the nearest integer, therefore a percentage of 0 means that the occupancy is less than one half of a percent (for example, an occupancy of 89.6% would be displayed as 90%).
SM	SM indicates the proportion of the CPU which is currently dedicated to system management or periodic and scheduled maintenance. Therefore, if there is a large amount of periodic or scheduled maintenance testing being performed, this occupancy percentage can be high without affecting service. This percentage is rounded to the nearest integer, therefore a percentage of 0 means that the occupancy is less than one half of a percent (for example, an occupancy of 89.6% would be displayed as 90%).

CP	CP indicates the proportion of the CPU which is currently dedicated to call processing. This occupancy has priority over SM and IDLE occupancy categories and if needed, will take processor time away from these occupancy categories. This percentage is rounded to the nearest integer, therefore a percentage of 0 means that the occupancy is less than one half of a percent (for example, an occupancy of 89.6% would be displayed as 90%).
Idle	Idle indicates the proportion of the CPU which is currently available for use. This percentage is rounded to the nearest integer, therefore a percentage of 0 means that the occupancy is less than one half of a percent (for example, an occupancy of 89.6% would be displayed as 90%).
Active SPE	A or B is displayed to indicate the currently active processor complex. When the active processor complex is locked on-line via lock switching on DUPINT, the "lock" option will be displayed; otherwise, "auto" will be shown.
Duplicated?	The duplication status of the SPE component is indicated. "y" indicates duplication and "n" indicates no duplication.
SPE Power	The current source of power for the processor complex is indicated. The normal state is "commercial". When commercial power is not available, battery backup is in use and will be indicated by "backup".
Time Source	The current timing source is displayed. The display values for this field vary according to the timing source selected. If the site has administered the optional Stratum-3 hardware, "external" will be displayed under normal operating conditions and "internal" will be displayed when an internal source, such as a tone clock, is used. Primary and secondary timing sources must be administered when using the Stratum-4 option. "primary" is displayed when the primary administered source is in use, and "secondary" is displayed when the administered secondary source is in use. When neither the primary or secondary sources are in use, "local" will be displayed.
# Logins	The number of current users is displayed.
Cab	The assigned cabinet number, ranging from 1 to the highest cabinet number in the system, is displayed on the screen.

Emerg Trans	The current setting of the emergency transfer switch on the maintenance board is indicated for each cabinet. Five options are available: auto-on ("auto+" or "a+"), auto-off ("auto-" or "a-"), "on", "off", and "n.a.". Normally, the "auto+" or "auto-" option is enabled. In this state, emergency transfer will be activated automatically upon cabinet failure (The "+" indicates that emergency transfer is currently activated, while the "-" indicates that emergency transfer is currently not activated). When "on" is displayed, emergency transfer is automatically activated. The "off" option shows that the cabinet is prevented from activating emergency transfer. In a system equipped with duplicated SPEs, the switch settings for both processors of the PPN (cabinet 1) will be displayed. In this case, "auto+" will be abbreviated "a+", "auto-" will be abbreviated "a-", and "off" will be abbreviated as "of". "on" will not be changed. If "n.a." is displayed, the emergency transfer switch setting is not available.
Mj	The individual number of major alarms associated with the cabinet is indicated. An asterisk is used to fill the field when the number exceeds 99.
Mn	The individual number of minor alarms associated with the cabinet is indicated. An asterisk is used to fill the field when the number exceeds 99.
Wn	The individual number of associated with the cabinet is indicated. An asterisk is used to fill the field when the number exceeds 99.
PNC	Current Port Network Connectivity (PNC) status for each of the port networks within a cabinet is displayed. When multiple port networks exist within a cabinet, Carriers A, B, and C are listed first and separated from Carriers D and E by a slash (for example, up/up). PNC status of a port network is determined on the basis of availability of the Expansion Archangel Link (EAL). An "up" denotes that the EAL is available. When the EAL is not available, then a "dn" (down) is displayed.
Time of Day	The current time of day acquired from the system is displayed.

For the following output example, the command "status health" was entered.

```
status health

SPE: A/Auto    B/functional             OCC:  ST:  9%   Cp: 25%  Sm: 10%  Idl:66%
PNC: A-PNC/Auto B-PNC/functional   ALARM:Maj:  0   Min: 2  Wrn:  9
Pwr: Comm   Sync:local   Logins:4   BUSYOUTS:Trk:  0   Stn:  0   Oth:  0
Cab  EmTr  Mj  Mn  Wn  PNC  Cab  EmTr  Mj  Mn  PNC  Cab EmTr  Mj  Mn  Wn  PNC
1    off   0|  7|  0   up
2    off   0|  0|  4   up
3    nia   0|  2|  0   up
                            -Press CANCEL to quit -   9:33 THU APR 16 :1993
```

FEATURE INTERACTIONS

In a High or Critical Reliability System, if the standby SPE Emergency Transfer Select Switch is changed and handshake is down, the displayed Emerg Trans field will be incorrect until handshake comes up again.

status interface

This command displays the current value of a number of counters maintained by the processor interface (PI). The information displayed by this command is only useful to development environment.

SYNOPSIS

status interface location *print*

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, init, browse, bcms, rcust.

EXAMPLES

status interface a1
status interface 01a2
status interface 01b1
status interface b2
status interface b2 print

DESCRIPTION

The status interface command displays the current value of a number of counters maintained by the PI, which is a front end processor implementing the packet layer and link layer of the BX.25 protocol and the integrated services digital network (ISDN) procedure-D protocol.

Defaults

The cabinet number defaults to one (1) if it is not specified.

Parameters

location	The location (cabinet-carrier-position) of the processor interface (PI board). A position of 1 is the first processor interface in the carrier, while a position of 2 is the second processor interface in the carrier.
print	This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses HELP after entering "status interface", the following message will be displayed:

```
Enter location: [cabinet(1)], carrier (A-B),
          position(1-2); ['print']
```

Error Messages

If the specified carrier is not the active PE, the following message will be displayed:

```
Port invalid
```

If the technician-entered cabinet and carrier is invalid for a PPN, the following message will be displayed:

```
Entry is bad
```

If the technician-entered carrier is not a valid carrier, the following message will be displayed:

```
Invalid carrier specified
```

If the technician-entered carrier is not active, the following error message will be entered:

```
Board invalid
```

If the specified carrier/position processor interface circuit pack is not inserted, but the specified carrier is active, the following error message will be displayed:

```
Processor Interface (TN765) not
  started or is being started
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Base Level Occupancy (Low)

Base Level Occupancy (High)

Primary Queue Audit Error

Secondary Queue Audit Error

Translation Audit Error

Protocol Timer Audit Error

Hardware Sanity Timeout

Hardware Resource Error

Hardware Overload Error

The following is an example of the fields contained on the output form.

```
status interface a1

                 PROCESSOR INTERFACE STATUS

       Base Level Occupancy(low): 10
      Base Level Occupancy(high): 25
       Primary Queue Audit Error: 4
     Secondary Queue Audit Error: 10
         Translation Audit Error: 12
      Protocol Timer Audit Error: 0
         Hardware Sanity Timeout: 1
         Hardware Resource Error: 12
         Hardware Overload Error: 8
```

FEATURE INTERACTIONS

None.

status isdn-testcall

This command displays the operational status (progress) of an outgoing ISDN-PRI test call.

SYNOPSIS

status isdn-testcall group number*/member number print*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init

EXAMPLES

status isdn-testcall 80/1
status isdn-testcall 78/1 print

DESCRIPTION

The status isdn-testcall command displays the progress of an outgoing ISDN-PRI test call. The tested ISDN-PRI B-channel port number, bit error rate, number of bits transmitted, block error rate, number of blocks transmitted, start time, duration specified, duration of test call and reason of termination are displayed on the status form.

Defaults

None.

Parameters

group number	The group number is an administered number associated with each trunk group.
member number	The member number is an administered number identifying a particular trunk within a trunk group.
print	This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses HELP after entering "status isdn-testcall", the following is displayed:

```
Enter group #/member # ['print']
```

Error Messages

If the specified format of the trunk location is incorrect, the following message is displayed:

```
Format invalid
```

If the specified trunk group or member range is invalid, the following message is displayed:

```
Trunk or trunk group invalid
```

If a trunk group and member is not specified, the following message is displayed:

```
Must specify group/member pair
```

\If the specified trunk group is not administered or has no members administered, the following message is displayed:

```
Group not assigned,
or group assigned but with no member
```

If the specified trunk group member is not administered, the following message is displayed:

```
Group member not assigned
```

If a test call is currently not in progress when the command is entered, the following message is displayed:

```
Test Call not in progress
```

If the specified trunk is not an ISDN-PRI trunk, the following message is displayed:

```
Invalid non ISDN-PRI trunk specified
```

If the software data cannot be sent to the SAT, the following message is displayed:

```
Error encountered, can't complete request
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message is displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	This field specifies the physical address (cabinet/carrier/slot/circuit) of the ISDN-PRI B-channel.
Bit Error Rate	The measured bit error count according to the comparison of the sent and received bit pattern. The number is displayed in scientific notation (one significant digit and an exponent).
Number of Bits	The number of bits generated. The number is displayed in scientific notation (one significant digit and an exponent).
Block error Rate	The measured block error count according to the comparison of the sent and received bit pattern. The number is displayed in scientific notation (one significant digit and an exponent).
Number of Blocks	The number of blocks generated. The number is displayed in scientific notation (one significant digit and an exponent).
Start Time	The time the test call started (dd/hh:mm).
Duration Specified	The duration specified in minutes for how long the test call should run. Valid durations are 1-120 (minutes) or blank (to indicate the default amount of 10 seconds was used to run the test).
Duration of Test	The duration specified in minutes for how long the test call has been running. A blank indicates that the default amount of time was used to run the test.

Reason of Termination

The reason of termination indicates why the test call has terminated. Valid reasons of termination are "finished," "canceled," "overflow," "no bits," "transmission," "internal fail," "data corrupt," "call dropped," "call rejected," and "in progress." A termination reason of "finished" means the test finished in the specified time. A termination reason of "canceled" means the test call has been canceled with the "clear isdn-testcall" command. A reason of "overflow" denotes that the bits transmitted have overflowed buffer allocation. A reason of "no bits" means that no bits have been received because the ISDN-PRI test call circuit connection is bad. A reason of "transmission" means there has been a data transmission interruption, probably caused from a power hit. A termination reason of "call dropped" indicates that the call dropped due to abnormal termination, or it couldn't cut-through to the other side. A termination reason of "call rejected" means the originating call was not set up properly. A termination reason of "internal fail" specifies that there is an internal error on the Maintenance/Test circuit pack. A reason of "in progress" means the test is still running and a reason of "data corrupt" is used for any other error condition.

For the following output example, the command status idsn-testcall 80/1 was entered.

```
status isdn-testcall 80/1                  Page 1 of   1   SPE A

                           ISDN TESTCALL STATUS

         Bit   Number Block Number           Duration          Reason
         Error Of     Error Of     Start     Duration  Of      Of
Port     Rate  Bits   Rate  Blocks Time      Specified Test    Termination

1B1401   0EE0  4EE7   0EE0  6EE2   25/12:36 120       100     in progress
```

FEATURE INTERACTIONS

If the bit error rate or block error rate is greater than zero, the ISDN-PRI trunk "may" be in a troubled state. Based on the statistical information displayed on the terminal, it can be decided to take the ISDN trunk out of service. This is subjective data because the ISDN trunk may be used for data or voice. If the trunk is used for data and the rates are high, the trunk should be taken out of service. If the trunk is used for voice, the trunk may not have to be taken out of service. Also, high rates may be due to some type of power hit on the line.

status journal-link

This command displays the status of a wakeup-log or a pms-log printer link.

SYNOPSIS

status journal-link [wakeup-log | pms-log] *print*

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, rcust, bcms, init, browse.

EXAMPLES

status journal-link wakeup-log
status journal-link pms-log
status journal-link pms-log print

DESCRIPTION

The status journal-link command displays the status of a wakeup-log or a pms-log printer link. Either command will display whether the link is up or down. If the link is down, the number of times the switch has tried to set up the link will be shown.

A journal printer is used to document the automatic wake-up events, emergency access to attendant events, and housekeeping events when the property management system is not functional. A journal printer may also generate reports of the automatic wake-up events and the emergency access events at a scheduled time. If system configuration includes two printers, one will be for the housekeeping events only and the second will be used for automatic wake-up events and emergency access events only.

For general information on journal printer links, see the second paragraph in the "DESCRIPTION" section of the "busyout journal-printer" manual pages.

Defaults

No defaults.

Parameters

wakeup-log	The printer which handles the automatic wakeup and emergency access to attendant events and scheduled reports.
pms-log	The printer which handles the pms down events.
print	This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses HELP after entering "status journal-link", the following object command word choices will be displayed:

```
pms-log      wakeup-log
```

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Link State	Up, down, or extension not administered will be displayed. A wakeup-log or a pms-log link is considered administered only if an extension is given in the System Parameters Hospitality form.
Maintenance Busy	Whether there is any maintenance testing being performed upon the link.

The following is an example of the fields contained on the output form.

```
status journal-link wakeup-log

                      JOURNAL LINK STATUS

       Link State: up
 Maintenance Busy? no
```

FEATURE INTERACTIONS

None.

status link

This command displays the status of an Processor Interface (PI) link.

SYNOPSIS

status link link number *print*

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, rcust, init, bcms, browse.

EXAMPLES

status link 1
status link 8
status link 4 print

DESCRIPTION

The status link command displays the operational status associated with a specified processor interface link.

Defaults

No defaults.

Parameters

link number	A link number (1-8) associated with a specific link.
print	This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses HELP after entering "status link", the following message will be displayed:

```
Enter 1 character link number ['print']
```

Error Messages

If the specified link number is invalid, the following message is displayed:

```
Link out of range, please press HELP
```

If the specified link number is not administered, the following message is displayed:

```
Link not administered
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message is displayed:

```
All maintenance resources busy; try again later
```

DEFINITIONS

Link	A synchronous connection between the Definity system and an adjunct or another switch. The link consists of three protocol levels. The entire link is identified by a link number which is specified on the "change communications-interface links" form.
Level 1	Physical connection of a port on a Processor Interface board to hardware which serves the same purpose on the adjunct or switch (for example, a PI board on G3iV1.1-286 or G3iV2-386, or an SCP board on Audix). There can be several components between these two endpoints (e.g., modems, DS1 facilities, cables, etc.).
Level 2	The logical protocol that allows data communication between these two endpoints. BX.25 specifies that this is the LAPB (Link Access Protocol on the B-channel) protocol. Frames are sent at level 2. Establishment of the protocol requires one end to send a SABM (Set Asynchronous Balanced Mode) frame and the other to respond with a UA (User Acknowledgment) frame. Both sides send SABMs until they receive a UA at which time level 2 is up and the Link Status field indicates "restarting". This should be a temporary condition, because the link is unusable until level 3 comes up, and that occurs immediately.

Level 3	The logical protocol that allows multiplexing of many channels onto one level 2 link. BX.25 specifies that this will be the X.25 data phase protocol. Packets are sent at level 3 and are included in level 2 frames. This protocol is established after level 2 is established by one end sending a Restart packet, and the other end sending a Restart Confirm packet.
Processor channel	The connection of an application running inside the SPE to a particular channel on a particular link. Processor channels are identified by a number associated with an entry on the "change communication-interface processor-channel" form. There the link number and level channel number on that link are specified as well as the application (for example, dcs) that uses that processor channel are specified.

OUTPUT

Link Number	The Processor Interface link number (1-8).
Link Status	The state of the link, valid states are: — in-service — PI link is currently up and providing service. — maintenance busy — The PI link has been busied out by system technician. — disconnected — The PI link is currently down. Check the Hardware Error Log for more information on why the link is not in-service.
Destination	A character string identifying the link destination type. The valid types are: "ISDN-LNK", "ISDN-TRK", "TIE-DS1", "PDMODULE", "TDMODULE", and " EIA LINK".
Dest Status	The status of the link destination. Valid states are: "in-service", "in-service/idle", "in-service/active", and "out-of-service", "manual OOS", "standby", "awaiting call", "disconnected", "out-of-service-NE", and "out-of-service-FE".
Port	The destination port, this port is logically connected to the Processor Interface.
Destination Information Field	One of the following will be present depending on the type of link destination. — Sig Grp — The signaling group number, valid for "ISDN-LNK". — Trk/Mem — The trunk group/member, valid for "ISDN-TRK" and "TIE-DS1". — Ext — The data module extension, valid for "PDMODULE" and "TDMODULE".

The following fields represent values of counters read from the Packet Interface board. These counters are not initialized on board insertion. It is therefore recommended that "clear link" command be issued and the counters are read after a period of time (15 min) to get a reliable readout.

Hardware Device Check (receive)	This timeout counter is incremented when there is a 40 to 80 second period during which no link traffic is received. This condition probably indicates that the link is down on the far end system. The SABM (Set Asynchronous Balance Mode) count is probably increasing also.
Hardware Device Check (transmit)	This timeout counter is incremented when there is a 40 to 80 second period during which no link traffic is transmitted. This condition indicates possible PI faults. The link is down and the SABM count is increasing. If the link is down at both the near end and the far end, then this counter will increment along with the Hardware Device Check (receive) counter.
Far-End MOOS Count	The number of times that the switch tries to restart the link and the Far-End responds with the link status "manual-out- of-service." This condition only occurs on ISDN-PRI Nonfacility Associated Signaling (NFAS) with D-channel backup. When this occurs, contact the Network and ask them to release the link.
Far-End FRMR	This value is informational only and no action is necessary. It is one of eight counters that tell the history from the last "clear link" command of why the link went down. In this case, the link went down because the switch received an FRMR frame from the Far-End.
Far-End DISC	This value is informational only and no action is necessary. It is one of eight counters that tell the history from the last "clear link" command of why the link went down. In this case, the link went down because the switch received a DISConnect frame from the Far-End.

Timeout	This value is informational only and no action is necessary. It is one of eight counters that tell the history from the last "clear link" command of why the link went down. In this case, the link went down because of a Layer 2 timer expiration on the PI circuit pack.
Software Initiated Link Down	This value is informational only and no action is necessary. It is one of eight counters that tell the history from the last "clear link" command of why the link went down. In this case, the switch software restarted the link. Look at other PI-LINK errors to determine the cause.
Level 2 I-frames retransmitted	This is a count of the number of frames that have been retransmitted in LAPD (Link Access Procedure D) or X.25 layer 2. In general, this is a measure of link quality. This count, which could indicate a very noisy link or synchronization problem, will increment normally if a Hot Start PEI is done locally.
Level 2 Reset (SABM)	This is the number of X.25 SABMs or LAPD SABMs that have been transmitted. Since SABMs are used to establish links, every time this count is incremented a link establishment attempt has failed. If the link is currently in-service and the count is non-zero after having been previously cleared by the "clear link link-no" command, then this condition indicates that the link has gone down in that interval. Check the Hardware Error Log for additional information.
Invalid Frame Count	This is the number of invalid frames that have been received. This count is a measure of the link quality and could indicate a very noisy link or a synchronization problem. This might increment normally if a Hot Start PEI is done locally. If an administration error exists, this counter could be incrementing along with the Level 2 Reset counter. This counter may be incremented by message retransmissions.
Far-End SABM(E)/DM	This value is informational only and no action is necessary. It is one of eight counters that tell the history from the last "clear link" command of why the link went down. In this case, the link went down because the switch received a SABM from the Far-End.

Protocol Error Detected	This value is informational only and no action is necessary. It is one of eight counters that tell the history from the last "clear link" command of why the link went down. In this case, the link went down because the PI circuit pack detected a Layer 2 protocol error in its communications with the Far-End of the link.
Local Busy Out	This value is informational only and no action is necessary. It is one of eight counters that tell the history from the last "clear link" command of why the link went down. In this case, the link when down because the switch software made the link local busy. The link is made "maintenance busy" as part of the D-channel Back Up protocol or when the link is "busied out" via the System Access Terminal (SAT).
Firmware Initiated Link Down	This value is informational only and no action is necessary. It is one of eight counters that tell the history from the last "clear link" command of why the link went down. In this case, the PI firmware initiated the link down. Please consult SCI-BD or PROTOCOL errors to determine the cause.
LOCAL/REMOTE PROCESSOR CHANNELS	Local/remote processor channel pairs. Each pair consists of a processor channel on the local machine and a processor channel on the remote machine that are connected in the communication session. **NOTE:** For "ISDN-LNK" links, this is no correlation between the local and remote processor channels. Therefore, only the local processor channel is shown (the remote processor channel is blank).

The following are examples of the fields contained on the output form. The command entered, for each example, was "status link 1." Each example shown is for a different type of link connection.

```
status link 1

FEATURE INTERACTIONS

None.

status logins

This command will list the status all of the users that are currently logged into the system.

SYNOPSIS

status logins *print*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init, rcust, bcms, browse, cust.

EXAMPLES

status logins
status logins print

DESCRIPTION

This command will display information about all of the users that are currently logged into the system. This information will contain their login names, location of physical access, and their currently executing command.

The screen does not automatically update, and is a reflection of the system at the time the request was made. Users may have logged off, or on, or the command may have finished executing while the information is being displayed. These updates will not be reflected until the next execution of the command.

Defaults

None.

Parameters

print This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the technician presses HELP after entering "status logins" the following message will be displayed:

```
['print']
```

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The login information will be displayed with one line of data displayed for each user.

Login Id — This field shows the login id of the user that is currently logged into the system. The value of "LOGIN" means that the terminal is connected to that port and the login prompt is displayed, but no user is currently logged on. An asterisk in the login id field identifies your login.

Type — This identifies the type of connection that is associated with the login session. Following are the values for this field:

Login Type	Description
NET	This represents a dialed-in connection via a Netcon data channel.
EPN	This represents a connection to the SAT port of an EPN maintenance board. This is accomplished via a hard-wired connection to that port.
MGR1	This signals a physical connection to the local SAT port on the active processor carrier. This port is accessed via a hard-wired connection.
INADS	This represents a connection to the remote SAT port on the active processor carrier. This port is normally accessed via a dial-in connection.
SYS-PTR	This identifies that the system printer is active in the system. The login will be the id of the user who requested the print job, and the active command will be the command used for the print.

Location	This identifies the physical location where the user or printer is connected into the switch. For the types of MGR1 and INADS, this value will be the processor board location. For the EPN type, this will be the EPN maintenance board location. For the NET type this will be the physical location of the terminal port where the customer's SAT is connected. For a BRI NET connection the BRI endpoint is the last 3 digits, and for the SYS-PTR type this is the physical location of the printer port.
Aux	This field give additional location information. For the types of MGR1 and INADS, this field will contain the port network number of the processor board (that is, 1). For the EPN type, this field will contain the port network number of the EPN maintenance board. For the NET and SYS-PTR types, this field will contain the Netcon data channel number (1-4).
Active Command	This field displays the currently executing command, entered by the user logged into the system at the specified location. If the user has no command currently executing, then the field is empty.

The following is a sample output of a "status logins" command.

```
status logins

                     USER LOGIN INFORMATION

 Login               Type    Location   Aux   Active Command
*system technician  MGR1     01A        1     stat logins
 cust               NET      01c1101001 1     add station next
 inads              INADS    01A        1
 LOGIN              EPN      02A        3
 system technician  SYS-PTR  01c1102    2     list stations

Command Successfully Completed
```

FEATURE INTERACTIONS

The command will take a snapshot of the commands that the users on the system are currently executing. Because of timing, the command could be terminated by the time this command finishes displaying the list (i.e., the active command may not be accurate).

status mst

This command will allow the user to display the trigger and buffer status of the mst.

SYNOPSIS

status mst

PERMISSIONS

The following default logins may execute this command: inads, init.

EXAMPLES

status mst

DESCRIPTION

The status mst command will present the user with the form that contains the current status for the mst triggers and buffers.

Parameters

None.

Help Messages

If the user presses HELP after entering "status mst", the following message will be displayed:

```
Entry is not required
```

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

FORM OUTPUT

After entering the command "status mst", the user will be presented with the following form. The current settings will be placed in the fields.

```
                          MST STATUS

          Trace Status: enabled
    Start Trigger Status: triggered
     Stop Trigger Status: not triggered
      Pending Stop Count: 5
       Enable Trace Time: 1/21/90 10:30
     Disable Trace Time : 3/31/90 10:30

 Percent of Current Wrap: 100
        Wraparound Count: 2
    Oldest Message Number: 3345
    Newest Message Number: 3923
      Completed Snapshots: 0
```

trace status	Can be "enabled", "disabled by command", "disabled by timer", "disabled by buffer full", "disabled by stop trigger or count" or "disabled by restart".
trigger status	Can be "none", "not triggered", "triggered".
Pending stop count	This field will have a value in it whenever it is actually being used. The value will indicate the number of messages to be collected before stopping the trace.
Enable trace time	The time the trace was enabled.
Disable trace time	The time the trace was disabled or will be disabled by the run time limit.
Percent of current wrap	The percentage of the buffer that has been written since the last wraparound.
Wraparound count	The number of times that the buffer has wrapped around. This will initially be 0.

Oldest message number	The sequence number of the oldest message in the trace.
Newest message number	The sequence number of the newest message in the trace.
Completed snapshots	The number of complete snapshots that have been collected.

FEATURE INTERACTIONS

None.

status packet-control

This command displays the status of the specified packet-control.

SYNOPSIS

status packet-control *location*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init, nms

EXAMPLES

status packet-control 1A
status packet-control 1B

DESCRIPTION

The status packet-control command will display the service state of the specified packet-control, and link statistics for links that are terminated on this packet-control. The service state can be either in-service or out-of-service. The link statistics describe the connectivity picture for links terminated by this packet-control. The total number of links is the number of links that have been administered or translated. The number of established links is the number of links that have transitioned from a translated (tie-assigned) state to a state of normal operation (Multi-Frame Established Normal state). Proper handshaking is required for links to be in the established state.

Defaults

For simplex systems, the location is optional and defaults to cabinet 1, carrier A. For duplex systems, the cabinet default is again cabinet 1, but there is no default for the carrier.

Parameters

location	The location only applies to duplicated configurations. If the configuration is a simplex, the location parameter is not used and thus is not valid. For duplicated configurations, a "location" represents the carrier that the packet-control resides on in the system. Valid locations are either 1A or 1B.

Help Messages

If the system technician presses HELP after entering "status packet-control", the following message is displayed:

```
Enter Packet Control location:
[cabinet(1)];carrier(A-B)
```

Error Messages

If this command is entered for a packet-control that resides on the stand-by control complex of a High or Critical Reliability System, the following message is displayed:

```
Command only applies to the active Packet Control
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Service State: This field describes the service state of the packet-control. Valid service states are "in-service" and "out-of-service". In-service means that the packet-control is providing service. Out-of-service means that the packet-control is not providing service. Typical reasons for the out-of-service state are:

- The packet-control is busied out.
- The packet-control has failed.

Total No. of links: The total number of links that require establishment for normal operation. Point-to-point signaling links are an example of links that require establishment. There is usually one point-to-point signaling link per endpoint with packet-bus connectivity (for example, ISDN-BRI endpoints).

No. of links that are established: The number of links that are established out of the total number of links. Ideally, all point-to-point signaling links are in the established state and thus, the number of established links will be equal to the total number of links.

For the following output example, the command status packet-control 1A was entered.

```
status packet-control 1A

                     PACKET CONTROL STATUS

                     Service State: in-service
                Total No. of links: 10
No. of links that are established: 10

Command successfully completed
```

STATUS INTERPRETATION SECTION

The "Total No. of Links" minus the "No. of link that are established" equals the number of links which are down. Links that are down do not necessarily imply that there is a Packet Control circuit pack failure. A link goes down if there is a failure on any of the components through which it passes. These components include the Packet Control circuit pack, the Packet Bus, the Expansion Interface circuit pack, the BRI circuit pack, and the endpoint itself. By knowing which components can cause a link terminating on the Packet Control circuit pack to go down, and by having a rough idea of how many links go through each component, it is possible to determine which components are the most likely candidates to have failed.

For example, when all of the links are down (that is, no links are established) it is likely that there is a failure with a component through which all of the links pass. All links always pass through the Packet Control circuit pack and the PPN Packet Bus. Thus, these two components are likely to have failed. If all of the packet endpoints are in one EPN, then that EPN's Packet Bus is also a likely to have failed. It is unlikely that the failure is with an individual BRI circuit pack, since that would only affect links passing through that one circuit pack (unless there is only one BRI circuit pack in the system, in which case that circuit pack may very possibly have failed).

Conversely, if only a few links are down, then it is not likely that the fault is with the Packet Control circuit pack or the PPN Packet Bus, since a fault on either of these would normally affect all links equally. In this case, the fault is more likely to be on an individual BRI circuit pack or endpoint.

CAUTION:

The purpose of the information described above is to provide general information about the causes of link failures. This information should be used in conjunction with the procedures found throughout this manual, and not as a replacement for those procedures.

FEATURE INTERACTIONS

In a High or Critical Reliability System, an attempt to get the status of the packet-control that resides in the standby processor complex will not be allowed.

status periodic-scheduled

This command displays the status of periodic and scheduled maintenance testing performed by the system.

SYNOPSIS

status periodic-scheduled *print*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

status periodic-scheduled
status periodic-scheduled print

DESCRIPTION

The status periodic-scheduled command displays summary information on active scheduled and periodic testing. Periodic tests are run every hour, while scheduled tests are run every 24 hours. Scheduled tests can have their starting and stopping times administered. For periodic maintenance, the completion percentage for all resources will be displayed for the current cycle of testing as well as the previous cycle of testing. For scheduled maintenance, the completion percentage of all resources will be displayed for the last 24 hour testing cycle.

Defaults

No defaults.

Parameters

print   This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses HELP after entering "status period-scheduled", the following message will be displayed:

```
['print']
```

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit.
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later.
```

OUTPUT

Pre - SCHEDULED MAINTENANCE	During scheduled maintenance, a delay of about 1 to 15 minutes can be observed prior to the testing of System Critical Resources. During this period maintenance is switching those duplicated resources administered on the **system-parameters maintenance** screen. Pre-scheduled maintenance also includes the time the standby SPE is being tested in a system with the duplication option.
System Critical Percentage Complete:	The ratio of the number of System Critical MOs tested to the number of System Critical MOs left to test. This number is displayed for the current testing period as well as the previous testing period. System critical resources are considered imperative to test, and are tested first (for example, Processor).
Shared Percentage Complete:	The ratio of the number of Shared MOs tested to the number of Shared MOs left to test. This number is displayed for the current testing period as well as the previous testing period. Shared resources are resources that are used by more than one user, and are tested after system critical resources (for example, Trunks).
Single User Percentage Complete:	The ratio of the number of Single User MOs tested to the number of Single User MOs left to test. This number is displayed for the current testing period as well as the previous testing period. Single User resources are resources that are used by a single user only, and are tested after shared resources (for example, Voice Stations).

Start Time of Current or Previous Cycle:	For both periodic and scheduled maintenance if any of the three levels of MOs are active, then the time the System Critical MOs started for this current cycle is shown. If, however, none of the MO levels are currently being tested, then the start time for previous completed cycle is shown.

For the following output example, the command "status periodic-scheduled" was entered.

```
status periodic-scheduled                                  SPE B

               MO            Current  Current  Previous Cycle  Rate of
              Type           Cycle %   Cycle     Duration     Completed
                             Complete  Active?  (hr:min:sec)   Cycles
PERIODIC      System Critical  100%      n        00:00:45     1.0/hr
MAINTENANCE   Shared Resource  100%      n        00:00:43     1.0/hr
                  Single User    0%      n        00:00:01     1.0/hr
                        Total                     00:01:29

   Start Time of Current or Previous Cycle: 11/19/13:34:56

  Pre - SCHEDULED MAINTENANCE            n        00:00:01

SCHEDULED     System Critical   16%      y        00:00:44     1.0/day
MAINTENANCE   Shared Resource  100%      n        00:03:16     1.0/day
                  Single User  100%      n        00:00:00     1.0/day
                        Total                     00:04:00

   Start Time of Current or Previous Cycle: 11/19/13:42:08
```

FEATURE INTERACTIONS

None.

status pms-link

This command displays the status of the property management system interface link.

SYNOPSIS

status pms-link *print*

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, init, browse.

EXAMPLES

status pms-link
status pms-link print

DESCRIPTION

The status pms-link command displays the status of the property management system interface link. If the link is up, whether or not a data base swap is taking place between the switch and PMS, will be shown. If the link is down, the number of times the switch has tried to set up the link will be shown.

A property management system (PMS) is a stand alone computer system which can be integrated with the switch to enhance the service capability for a hotel/motel.

For general information on PMS links, see the second paragraph in the "DESCRIPTION" section of the "busyout pms-link" manual pages.

Defaults

No defaults.

Parameters

print	This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses HELP after entering "status pms-link", the following message will be displayed:

```
['print']
```

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Physical Link State	Up, down, or extension not administered will be displayed. The PMS link is considered administered only if an extension is given in the System Hospitality form.
Protocol State	"up", "down", or blank if not administered.
Number of Retries	Number of times the switch has tried to set up the link. Only displayed when the link is down. The Largest number that can be displayed is 999.
Maintenance Busy	"yes", or "no" (that is, system technician has or has not busied out the link). Blank if PMS link not administered.

The following is an example of the fields contained on the output form.

```
status pms-link

                      PMS LINK STATUS

    Physical Link State: down
         Protocol State: down
      Number of Retries: 3
       Maintenance Busy? no
```

FEATURE INTERACTIONS

None.

status pri-endpoint

This command displays the status of a PRI endpoint.

SYNOPSIS

status pri-endpoint extension *print*

PERMISSIONS

The following default logins may execute this command: system technician, cust, inads, init, nms, browse.

EXAMPLES

status pri-endpoint 25012
status pri-endpoint 77868
status pri-endpoint 66078 print

DESCRIPTION

The status pri-endpoint command displays internal software state information for diagnosis. This command can help locate facilities with which a PRI endpoint is communicating. Status information for each of the B-channels making up the PRI endpoint are displayed in addition to some overall PRI endpoint information.

Defaults

No defaults.

Parameters

extension	The extension number of the PRI endpoint to be displayed. The number of digits in an extension is determined by the dial-plan.
print	This will cause the report to be printed if a printer is connected to the SAT.

Help Messages

If the user presses HELP after entering "status pri-endpoint", the following message is displayed:

```
Enter assigned extension, ['print']
```

Error Messages

If the format for the extension is incorrect, the following error message will be displayed:

```
Extension invalid
```

If the extension is not administered, the following message will be displayed:

```
Extension not assigned
```

If the object associated with the specified extension is not a PRI endpoint, the following message will be displayed:

```
Extension assigned to object other than pri-endpoint
```

If the board that contains the PRI endpoint is not inserted in the system, the following message will be displayed:

```
Board not inserted
```

If the EPN on which the PRI endpoint resides is not accessible, the following message will be displayed:

```
EPN is not available
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Extension	The extension of the PRI endpoint.
Width	Administered number of B-channels associated with the specified PRI endpoint.
Signaling Group ID	The ID number of the signaling group which handles the signaling for the ports in the specified PRI endpoint.
Originating Auto Restoration	Administered option for the auto restore feature which restores calls originated from this PRI endpoint in the case of network failure. Displayed values for this field are "y" for the restoration option enabled and "n" for the restoration option disabled.

B-Channels Active	The number of B-channels active on a call.
B-Channels Idle	The number of B-channels that are in the in-service/idle state.
Port	Port locations (cabinet-carrier-slot-circuit) for each of the B-channels that makes up the PRI endpoint.
Service State	This field shows whether each of the B-channels is in-service or out-of-service. One of the following states is displayed: in-service/active, in-service/idle, out-of-service-NE, out-of-service-FE, maint-NE/active, maint-FE/active, maint-NE/idle, and maint-FE/idle. NE (Near End) and FE (Far End) refer to which "end" of the B-channel has placed the facility in the state that it is in. NE refers to the switch and FE refers to the PRI terminal adapter (or any device that terminates the D-channel signaling on the facility).
Test In Progress	Whether there is any maintenance testing being performed on the port.
Connected Port	This field lists the connected port location (cabinet-carrier-slot-circuit) for each of the B-channels active on a call.

For the following output example, the command "status pri-endpoint 22501" was entered. Assume that the PRI endpoint ports for extension 22501 are in cabinet 1, carrier B, slot 20, circuit 1 to 6. The ports 1 to 3 of the specified PRI endpoint are connected on an active call to ports 13 to 15 of board in location 1B19 (cabinet 1, carrier B, slot 19). Ports 4 and 5 of the specified PRI endpoint are idle. Port 6 of the specified PRI endpoint is out of service and background maintenance testing is being performed on the port.

Note that a PRI endpoint can initiate and receive a call on any one or more of the B-channels making up the PRI endpoint.

```
status pri-endpoint 22501                              page 1 of 1

                       PRI-ENDPOINT STATUS

                    Extension: 22501              Width: 6
           Signaling Group ID: 3       B-Channels Active: 3
 Originating Auto Restoration? n         B-Channels Idle: 2

  Port     Service State       Test In Progress  Connected Port
  01B2001  in-service/active          n          01B1913
  01B2002  in-service/active          n          01B1914
  01B2003  in-service/active          n          01B1915
  01B2004  in-service/idle            n
  01B2005  in-service/idle            n
  01B2006  out-of-service-NE          y

Command Successfully Completed
```

Note that the line listing of each B-channel's status may continue on to the next page. The user is prompted to hit <NxtPg> key to continue the display.

FEATURE INTERACTIONS

None.

status processor-channel

status processor-channel - This command displays the status of a processor channel.

SYNOPSIS

status processor-channel channel number *print*

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, init, browse, bcms, rcust.

EXAMPLES

status processor-channel 1
status processor-channel 10
status processor-channel 64
status processor-channel 64 print

DESCRIPTION

The status processor-channel command displays the status of the technician specified processor channel and the values of its various counters. A processor channel is one 64 logical channels associated with an SCI link. Each processor channel terminates in the switch processing element with a session.

Defaults

No defaults.

Parameters

channel number	The processor channel number (1-64).
print	This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses HELP after entering "status processor-channel", the following message will be displayed:

```
Enter a processor-channel number 1-64 ['print']
```

Error Messages

If the technician-entered channel number is invalid, the following message will be displayed:

```
Channel invalid
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Channel Number	The processor channel number 1-64.
Channel Status	The state that the channel is in: 1-10 (Channel status 9 and 10 pertain to ISDN-PRI channels). The following describes the various channel states: 1. Channel is not administered. 2. Channel is administered but not used. 3. Channel is in a state entering "wait session accept" (WSA). 4. Channel is in a state waiting for a "session accept" message from the far end. 5. Channel is waiting for action. 6. Channel is in data transfer state (channel is up and running). 7. Channel is in resynchronization state. 8. Channel is waiting for acknowledge of disconnect message. 9. ISDN-PRI Channel is currently down. 10. ISDN-PRI Channel is in the data transfer state (that is, channel is up and running).
Reset Count	The number of times that the reset has been issued for this channel.

Message Buffer Number	The number of message buffers that are currently used for the communication on this channel.
Link Number	The physical SCI link (i.e. 1-8) associated with the channel.
Retransmission Count	The number of times that message retransmission has occurred.

The following is an example of the fields contained on the output form.

```
status processor-channels 1

                     PROCESSOR CHANNEL STATUS

        Channel Number: 1
        Channel Status: 6: In data transfer state
           Reset Count: 3
 Message Buffer Number: 1
           Link Number: 4
  Retransmission Count: 5
```

FEATURE INTERACTIONS

None.

status signaling-group

status signaling-group - This command displays the operational status of the specified ISDN-PRI signaling group.

SYNOPSIS

status signaling-group group identifier *print*

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, init, browse.

EXAMPLES

status signaling-group 1
status signaling-group 2 print

DESCRIPTION

The status signaling-group command displays the state, type, port location, and state of the Primary and Secondary D-channels within the group.

A signaling group is a collection of B-channels signaled for by a designated single D-channel or set of D-channels over an ISDN-PRI.

Defaults

None.

Parameters

group identifier	The signaling group identifier is an administered number associated with each signaling group (1-8).
print	This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses HELP after entering "status signaling-group", the following is displayed:

```
Enter group identifier (1-8) ['print']
```

Error Messages

If the specified group identifier is non numeric or out of range, the following message is displayed:

```
Signaling group invalid
```

If the specified group identifier is not administered, the following message is displayed:

```
No signaling group assigned
```

If the software data cannot be sent to the SAT, the following message is displayed:

```
Error encountered, can't complete request
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message is displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Group ID: The numerical ID of the signaling group. Valid identifiers are 1-8.

Type: The signaling group can be either "facility associated signaling" or "non-facility associated signaling." In the "facility associated signaling" type all members are on a single DS-1 facility. Facility associated signaling groups support only the simplex D-channel configuration. In the "non-facility associated signaling" type members can be carried by multiple DS-1 facilities. The DS-1 facility is identified across the ISDN-PRI using an explicit facility identifier. In a simplex configuration one D-channel is used to signal for B-channel members, while in a duplex configuration two D-channels are used to signal for B-channel members (one channel is active and the other is used as a backup to the active channel).

Group State:	The signaling group state can be either "in-service" or "out-of-service." The group is "in-service" when one of the D-channels signaling for the group is in service. The group is "out-of-service" when neither D-channel in the group is in service. NOTE: If there is no D-channel backup and the primary D-channel is out-of-service, then the signaling group is in an "out-of-service" state.
Link:	The link transporting the D-channel.
Port:	The physical address of the port transporting either the primary or secondary D-channel.
Level 3 State:	The state of the primary or secondary D-channels. The state can be "in-service," "standby," "wait," "maintenance busy," "manual-out-of-service," "out-of-service," or "no-link."

in-service:A D-channel is "in-service" when it is in the multiple-frame-established state at layer 2 carrying normal call-control signaling at layer 3.

standby:A D-channel is "standby" when it is in the multiple-frame-established state at layer 2, and not carrying any layer 3 call-control messages on logical link 0,0.

wait:A D-channel is in a "wait" state when an attempt has been made by one side of the interface to establish layer 3 peer communications as part of the process of going to the "in-service" state. This state is transitional in nature. As ISDN SERVICE message is sent over the interface, When the far end of the interface responds with a SERVICE ACKnowledge message the D-channel is placed in the "in-service" state.

maintenance-busy:A D-channel is "maintenance-busy" when it is not in the multiple-frame-established state at layer 2. This state is entered automatically when an active D-channel is declared failed. A D-channel which has been placed in the "maintenance-busy" state may be place in the "out-of-service" state without system technician intervention.

manual-out-of-service:A D-channel is "manual-out-of-service" when system technician intervention has caused it to be placed in the TEI-assigned state at layer 2. System Technician intervention is required to retrieve a D-channel from this state.

out-of-service:A D-channel is "out-of-service" when it is in the TEI-assigned state at layer 2, but is periodically requested by layer 3 to attempt to establish the link.

no-link:No link is administered for the D-channel.

For the following output example, the command status signaling-group 1 was entered.

```
status signaling-group 1                  Page 1 of   1   SPE A

                     STATUS SIGNALING-GROUP

      Group ID: 1
          Type: facility associated signaling
   Group State: in-service

                     Primary D-Channel

 Link: 1    Port: 01C1924  Level 3 State: in-service

                    Secondary D-Channel

 Link:    Port:      Level 3 State:
```

FEATURE INTERACTIONS

None.

status sp-link

This command displays the operational attributes of the system printer link.

SYNOPSIS

status sp-link *print*

PERMISSIONS

The following default logins may execute this command: system technician, cust, rcust, bcms, inads, init, browse.

EXAMPLES

status sp-link
status sp-link print

DESCRIPTION

The status sp-link command displays a page of output summarizing the operational status of the system printer link. The link state, number of retries, and whether the link is maintenance busy is displayed.

Defaults

None.

Parameters

print   This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses HELP after entering "status sp-link", the following message will be displayed:

```
['print']
```

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Link State:	This field displays the operational mode of the link. A state of "up,""down," or "extension not administered" is displayed. A state of "up" means that the link is administered and a call is setup between the switch and the system printer. A state of "down" means that the link is administered, but a call is not setup between the switch and the system printer. A state of "extension not administered" means that the link is not administered (no system printer extension has been administered).
Number of Retries:	This field is displayed only if the "Link State:" is "down." The field displays the number of times the switch has tried to set up the link since a request to set up the link has been received. The largest number that can be displayed is "999". If more than "999" retries have occurred, "999" is still displayed.
Maintenance Busy?	This field displays whether any maintenance testing is being performed on the system printer link. Values of "yes" and "no" are displayed if the system printer link is administered (the system printer extension is administered). Blanks are displayed if the system printer link is not administered.

For the following output example, the command status sp-link was entered.

```
status sp-link                                SPE A

                     SYSTEM PRINTER LINK STATUS

        Link State: up
 Number of Retries:
  Maintenance Busy? no
```

FEATURE INTERACTIONS

None.

status station

status station - This command displays the status of a station.

SYNOPSIS

status station extension *print*

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, init, browse.

EXAMPLES

status station 10020
status station 83277
status station 83277 print

DESCRIPTION

The status station command displays internal software state information for diagnosis. This command can help locate facilities to which the station is communicating.

Defaults

No defaults.

Parameters

extension	The extension of the station to be displayed. The number of digits in an extension is determined by a dial-plan.
print	This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses HELP after entering "status station", the following message will be displayed:

```
Enter assigned extension, [’print’]
```

Error Messages

If the extension format is incorrect, the following message will be displayed:

```
Extension invalid
```

If the extension is not administered, the following message will be displayed:

```
Extension not assigned
```

If the object associated with the extension is not a station or an attendant console, the following message will be displayed:

```
Extension exists but assigned to a different object
```

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Type	The administered station type.
Extension	The extension of the station or attendant to be displayed.
Port	The port location of the station (cabinet-carrier-slot-circuit).
Call Park	Whether the station has a call parked ("yes" or "no").
Ring Cut Off Activated	Whether ring cut off is activated ("yes" or "no").
CF Destination Ext	The call forwarding destination extension, if any.
Message Waiting	Whether there is a message waiting for the station. "AP-SPE", "AUDIX", "PMS" or blank if no messages are waiting.
Connected Ports	Port locations of the facilities to which the station is connected (cabinet-carrier-slot-circuit).
Agent Logged In	Displays (underneath it) the hunt groups (up to 3) that the agent is logged into.

On ACD Call?	Whether the agent is on an ACD call currently ("yes" or "no").
Work Mode	Work mode of each hunt group that an agent is logged into.
Service State	In service/on-hook, in service/off-hook, out of service, or disconnected.
Maintenance Busy State	Whether maintenance is testing the object ("yes" or "no").
SAC Activated	Whether send all calls is activated ("yes" or "no").
User Cntrl Restr	One or two of the following: "none", "total", "stat-stat", "outward" or "terminate".
Group Cntrl Restr	One or two of the following: "none", "total", "stat-stat", "outward" or "terminate".
AWU Call at	What time an automatic wakeup call is scheduled.
User DND	Status of the do not disturb feature.
Group DND	Status of the group do not disturb feature.
Room Status	Whether a room is occupied or not ("non-guest room", "vacant" or "occupied").

For the following output example, the command that was entered is "status station 1002".

```
status station 1002

                       GENERAL STATUS

             Type: 7405D          Service State: in-service/on-hook
        Extension: 1002        Maintenance Busy? no
             Port: 01C0702        SAC Activated? no
      Call Parked? no          User Cntrl Restr: none
  Ring Cut Off Act? no        Group Cntrl Restr: none
CF Destination Ext:
   Message Waiting:
   Connected Ports:

      ACD STATUS            HOSPITALITY STATUS

  Agent Logged In   Work Mode          AWU Call At:
                                          User DND: not activated
                                         Group DND: not activated
                                       Room Status: non-guest room
     On ACD Call? no
```

FEATURE INTERACTIONS

None.

status synchronization

This command displays the current status of synchronization.

SYNOPSIS

status synchronization *print*

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, init, browse.

EXAMPLES

status synchronization
status synchronization print

DESCRIPTION

The status synchronization command displays the location of the DS1 or tone-clock circuit pack that is used for an on-line synchronization reference.

The synchronization subsystem provides error free digital communication between the switch and other PBXs, COs, or customer premise equipment. The subsystem is made up of system components involved in synchronization: TDM bus clock, DS1 trunk board, maintenance and administration software resident in the SPE.

Defaults

No defaults.

Parameters

print This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses HELP after entering "status synchronization", the following message will be displayed:

```
['print']
```

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Stratum Level	This is the synchronization stratum level, either a "3" or "4."
Maintenance Name:	Either "TONE-BD," "DS1-BD," or "STRAT-3."
Physical Location	The board location of the selected DS1 or tone-clock circuit pack. This includes the cabinet-carrier-slot for a DS1 or the cabinet-carrier for a tone-clock.
Switching Capability	Whether the on-line reference for synchronization can be switched. "Enabled" and "Disabled" are used to describe the current capacity for reference switching.
Excessive Reference Switching	This field gives a high level description of how many times the synchronization reference has been switched. If excessive reference switching is taking place (sync error 1793 is at threshold) this field displays "Yes," otherwise "No" is displayed.

For the following output example, the command that was entered is "status synchronization".

```
status synchronization

                         SYNCHRONIZATION STATUS

                Stratum Level:4
             Maintenance Name: TONE-BD   Physical Location: 01A
         Switching Capability: Enabled
Excessive Reference Switching: No
```

FEATURE INTERACTIONS

None.

status system

This command displays the status, mode, and operational attributes of the SPE(s), TDM and Packet busses, tone-clock circuit pack(s), expansion interface links (exp-links), and emergency transfer switch of a single cabinets or all cabinets in the system. For more information about SPE(s) see Chapter 8, "SPE Duplication".

SYNOPSIS

status system cabinet

PERMISSIONS

The following logins may execute this command: bcms, browse, system technician, cust, inads, init, rcust.

EXAMPLES

status system 1st-cabinet
status system 2nd-cabinet
status system 3rd-cabinet
status system all-cabinets

DESCRIPTION

status system - This command displays the status, mode, and operational attributes of the SPE(s), TDM and Packet busses, tone-clock circuit pack(s), expansion interface links (exp-links), and emergency transfer switch of a single cabinets or all cabinets in the system.

Defaults

No defaults.

Parameters

cabinet — The cabinet specifies for which cabinet to display status. "**1st-cabinet**" always refers to the PPN, "**2nd-cabinet**" refers to the 1st EPN, and "**3rd-cabinet**" refers to the 2nd EPN. The status for one cabinet is displayed on one page of output. If "**all-cabinets**" are specified, then the user gets a 3 page output, one for each cabinet in the system. The status displayed for a cabinet is always related to that cabinet except in the case of status for EPNs and the SPE attributes. SPE attributes always refer to PPN status regardless of which cabinet is being displayed.

Help Messages

If the system technician presses HELP after entering "status system", the following message will be displayed:

```
Please enter one of the following object command words:
                    1st-cabinet
                    2nd-cabinet
                    3rd-cabinet
                   all-cabinets
```

If the system technician presses HELP after entering "status system cabinet", where "cabinet" is one of the object described above, the following message will be displayed:

```
['print']
```

Error Messages

None

OUTPUT

CAUTION:
The purpose of this command is to provide general information about the cabinet status. This information may not display correctly when the cabinet is in a transient period. In this case, wait for 1 minute and enter the command again.

SPE — The identifier of the Switch Process Element (SPE). Valid identifiers are **1A** or **1B**.

MODE — The modes of an SPE are different for simplex systems versus those for systems with the duplication option.

1. **SIMPLEX SPE MODES**
   - **active** The **1A**SPE in a simplex system is always the **active** SPE.
   - **<blank>** The **1B**SPE in a simplex system always displays **<blank>** indicating there is no 1B SPE.
2. **DUPLEX SPE MODES**

   The modes for the active and standby SPE in a system with the duplication option are different.
3. **DUPLEX ACTIVE SPE MODES**
   - **active** This SPE is performing its designed functions for the system as the active SPE.
   - **active/override-on** This SPE is performing its designed functions for the system as the active SPE, however, this SPE is active because it was forced active via a **reset system interchange health-override** command.
   - **selected** This SPE is the "active" SPE and is performing its designed functions for the system, however, the SPE select switches will **not** allow this SPE to become the standby SPE.
4. **DUPLEX STANDBY SPE MODES**

   The modes of the standby SPE can be classified into one of the following four areas: **Standby Mode**, **Busyout Modes**, **Maintenance Modes** and **Down Modes**.
5. **STANDBY MODE**
   - **standby** This SPE is held reset, its memory is being shadowed from the active SPE, and is ready to take over the functions being performed by the active SPE.
6. **BUSYOUT MODES**

   Busyout modes occur when the standby SPE has been busied out via the **busyout spe-standby** command. The active SPE could be either **active** or **selected** when the standby SPE is in one of the **Busyout** modes.
   - **busyout/idle** This standby SPE has been busied out and no maintenance activity is currently taking place. The active SPE could be either **active** or **selected**.
   - **busyout/entering** This standby SPE has been busied out and is currently in the process restarting the switch software on this SPE. As soon as the switch software on this SPE finishes its initialization, the standby SPE will be ready to perform SAT requested maintenance functions on the standby SPE and the mode will change.
   - **busyout/testing** This standby SPE has been busied out, however the switch software on this SPE has been restarted and is currently in the process of executing a SAT demanded **test** command.

- **busyout/not-refreshed** This standby SPE has been busied out, however the **busyout spe-standby** command was executed at a time when the standby memory was not refreshed. The standby SPE will not be able to perform any maintenance or SAT requested activities until a successful **refresh spe-standby** command is executed.
- **busyout/list-config** This standby SPE has been busied out, however the switch software on this SPE has been restarted and is currently in the process of executing a SAT demanded **list configuration** command.
- **busyout/status** This standby SPE has been busied out, however the switch software on this SPE has been restarted and is currently in the process of executing a SAT demanded **status card-mem** command.

7. **MAINTENANCE MODES**

Maintenance modes occur when the standby SPE is taken out of **standby** mode to perform a maintenance or SAT requested function. Unlike the **busyout** and **down** modes, being in **maintenance** mode implies this SPE can be returned to **standby** mode when the requested activity is completed assuming there are no faults in the standby SPE complex. The active SPE could be either **active** or **selected** when the standby SPE is in one of the **Maintenance** modes.

- **maint/init** The standby SPE is in maintenance mode because the system has restarted within the last 10 minutes. During this 10 minute interval, the standby SPE is not placed into standby mode just in case a core dump is being written to the tape or memory card on the standby SPE.
- **maint/idle** This standby SPE is in maintenance mode, however no maintenance activity is currently taking place. The active SPE could be either **active** or **selected**.
- **maint/entering** This standby SPE is currently in the process of restarting the switch software on this SPE. As soon as the switch software on this SPE finishes its initialization, the standby SPE will be ready to perform SAT requested maintenance function and the mode will change.
- **maint/testing** This standby SPE is in maintenance mode executing a SAT demanded **test** command.
- **maint/not-refreshed** This standby SPE is in maintenance mode executing a destructive background maintenance test that has temporarily left the standby memory not refreshed. Once the current test has completed a refresh of the standby SPE will be performed by background maintenance and the mode will change.
- **maint/not-tested** This standby SPE is in maintenance mode because previously the active SPE had been selected with the SPE select switches and since the active was unselected the standby

has not been tested to ensure the standby can enter standby mode. Once the standby is tested successfully, the standby will go back to standby mode.

- **maint/list-config** This standby SPE is in maintenance mode and is currently in the process of executing a SAT demanded **list configuration** command.
- **maint/save~trans** This standby SPE is in maintenance mode and is currently in the process of executing a SAT demanded **save translation** command.
- **maint/save~announce** This standby SPE is in maintenance mode and is currently in the process of executing a SAT demanded **save announcement** command.
- **maint/status** This standby SPE is in maintenance mode and is currently in the process of executing a SAT demanded **status card-mem** command.
- **maint/patching** This standby SPE is in maintenance mode and is currently in the process of applying a software patch to the standby SPE memory (386 systems) or writing the patch to tape (286 systems).
- **maint/periodic** This standby SPE is in maintenance mode and is currently in the process of performing periodic background maintenance. Periodic background maintenance is performed on the standby SPE every two hours if some component of the standby SPE is currently alarmed.
- **maint/scheduled** This standby SPE is in maintenance mode and is currently in the process of performing daily scheduled background maintenance.
- **maint/analysis** This standby SPE is in maintenance mode and is currently in the process of performing background maintenance testing in response to a reported trouble by some component in the active or standby SPE complex that relates to the standby SPE.
- **maint/upgrade** This standby SPE is in maintenance mode and is currently in the process of performing software upgrade.

8. **DOWN MODES**

The standby SPE is placed in **down** mode when a fault occurs in the standby SPE complex that would prevent that SPE from performing system functions. **Down** mode is always associated with **STBY-SPE** alarms and errors. The active SPE could be either **active** or **selected** when the standby SPE is in one of the **Down** modes.

- **down/bad_upgrade** This standby SPE is in down mode because a software upgrade attempt failed. The standby SPE will stay in down mode until a successful software upgrade is performed.

- **down/idle** This standby SPE is in down mode, however, no maintenance activity is currently taking place. The active SPE could be either **active** or **selected**.
- **down/entering** This standby SPE is in down mode, but is currently in the process of trying to restart the switch software on this SPE. As soon as the switch software on this SPE finishes its initialization, the standby SPE will be ready to perform background or SAT requested maintenance activity.
- **down/mismatch_soft** This standby SPE is in down mode because the vintage of software in flash memory of the standby SPE does not match the vintage of the software in the active SPE. The standby SPE will stay in down mode until a successful software upgrade is performed to fix the software mismatch.
- **down/testing** This standby SPE is in down mode attempting to execute a SAT demanded **test** command.
- **down/not-refreshed** This standby SPE is in down mode executing a destructive background maintenance test that has temporarily left the standby memory not refreshed. Once the current test has completed a refresh of the standby SPE will be attempted by background maintenance and the mode will change.
- **down/analysis** This standby SPE is in down mode and is currently in the process of performing background maintenance testing in an effort to determine if the problem has been corrected.

SELECT SWITCH The position of the SPE select switch on the Duplication Interface circuit pack is displayed in the SPE related information section. The switch can be in one of three positions:

— **auto**

The switch is in the position.

— **spe-a**

The switch is in the left position.

— **spe-b**

The switch is in the right position.

— **<blank>**

Always appears for the 1A and 1B SPE in a simplex system. In a system with High or Critical Reliability, a **"blank"** implies a hardware problem with the Duplication Interface circuit pack.

PE ALARMS - MAJOR

The number of Major alarms associated with the SPE complex that affect the fault severity level of this SPE is shown. If the system is simplex system, then the 1B SPE always shows blank.

SPE ALARMS - MINOR

The number of Minor alarms associated with the SPE complex that affect the fault severity level of this SPE is shown. If the system is simplex system, then the 1B SPE always shows blank.

TONE/CLOCK

The location of the tone-clock circuit pack. Valid locations are **1A**, **1B**, **2A**, **2B**, **3A** and **3B**.

SERVICE STATE

The operational state of the Tone-Clock circuit pack. The possible states are as follows:

— **in**

The Tone-Clock is installed in the system and is in-service.

— **out**

The Tone-Clock has failed certain maintenance tests and has been removed from service.

— **<blank>**

If the system is not duplicated, then there is no B carrier Tone-Clock and this field displays **"blank"**.

SYSTEM CLOCK — This field shows which Tone-Clock circuit pack supplies the system clock for the cabinet being displayed.

— **active**

This Tone-Clock is active and is supplying the system clock for this cabinet.

— **standby**

This Tone-Clock is standby and is ready to supply the system clock for this cabinet if the active clock fails.

— **down**

This Tone-Clock has failed some maintenance activity and can not supply the system clock for this cabinet.

— **unavail**

If the system has an EPN that is currently down, then **unavail** is displayed for the Tone-Clock.

— **<blank>**

If the system is Simplex, then the 1B Tone-Clock for the PPN will display a blank. If the system does not have an EPN, then both the 1A and 1B Tone-Clock for this EPN will display a blank.

SYSTEM TONE	This field shows which Tone-Clock circuit pack supplies the system tones for the cabinet being displayed. — **active** This Tone-Clock is active and is supplying the system tones for this cabinet. — **standby** This Tone-Clock is standby and is ready to supply the system tones for this cabinet if the active clock fails. — **down** This Tone-Clock has failed some maintenance activity and can not supply the system tones for this cabinet. — **unavail** If the system has an EPN that is currently down, then **unavail** is displayed for the Tone-Clock. — **<blank>** If the system is Simplex, then the 1B Tone-Clock for the PPN will display a blank. If the system does not have an EPN, then both the 1A and 1B Tone-Clock for this EPN will display a blank.
TDM	The TDM Bus identifier. Valid identifiers are **1A**, **1B**, **2A**, **2B**, **3A** and **3B**.
SERVICE STATE	The operational state of the TDM Bus circuit pack. The possible states are as follows: — **in** The TDM Bus is installed in the system and is in-service. — **out** The TDM Bus has failed certain maintenance tests and has been removed from service.
CONTROL CHANNEL	Indicates whether the control channel is on this TDM Bus. Either **y**(es) or **n**(o) is displayed.
DEDICATED TONES	Indicates whether the dedicated tones are on this TDM Bus. Either **y**(es), **n**(o) is displayed.

PKT	The Packet Bus identifier, which is the same as the cabinet number. Valid Packet Buses are **1**, **2** and **3**. If the system is running on a X75XE cabinet all the PKT fields will be blank and the following will be displayed instead: **S75XE does not support Packet** Refer to Packet Bus Maintenance descriptions for more information.
SERVICE STATE	The operational state of the Packet Buses. Possible states are: — **in** The Packet Bus is in-service and operating normally. — **out** The Packet Bus has failed certain maintenance tests and has been removed from service. — **reconfig** The Maintenance/Test circuit pack has swapped one or more signal leads because of lead faults detected during testing (High or Critical Reliability System only). — **open lds** The Maintenance/Test circuit pack can not correct all of the Packet Bus faults. There are open leads, but the Packet Bus is still at least partly functional (on a High or Critical Reliability System only). — **unavail** If the system has an EPN that is currently down, then **unavail** is displayed for the Packet Bus. — **<blank>** If the system does not have the Packet Bus feature, a blank is displayed.
BUS ALARMS-MAJOR	This **y**(es) or **n**(o) field shows whether Major alarms exist for packet bus components.
BUS ALARMS-MINOR	This **y**(es) or **n**(o) field shows whether Minor alarms exist for packet bus components.

BUS FAULTS	This field indicates the number of faulty bus leads, where a fault is defined as either shorted to another lead, stuck at some value or an open lead. This field may take on any integer between 0 and 24. The system displays a blank if the Maintenance/Test circuit pack is not present, if the Packet Bus port of the Maintenance/Test circuit pack has been taken out-of-service or if the system does not have the Packet Bus feature.
OPEN BUS LEADS	This field indicates the number of bus leads which tests indicate have an open circuit between the Maintenance/Test circuit pack and bus terminator. Bus leads test open as a result of physical damage to the backplane or its connectors OR because a bus terminator is missing. This field may contain values between 0 and 24. The system displays a blank if the Maintenance/Test circuit pack is not present or has been take out-of-service, if the Packet Bus port of the Maintenance/Test circuit pack has been take out-of-service or if the system does not have the Packet Bus feature.
EMERGENCY TRANSFER	The location of the Processor or EPN Maintenance circuit pack containing the Emergency Transfer Select Switch is displayed. Valid locations are **1A** and **1B** for the PPN, and **2A** or **3A** for the EPNs.

SELECT SWITCH The position of the Emergency Transfer Switch on the Processor(s) or the EPN maintenance circuit pack and the state of Emergency Transfer in the cabinet are displayed as follows:

— **on**

The switch is in the right position. If this is a Simplex PPN or an EPN, then designated analog phones in this cabinet are cut through to CO trunk lines. The switch should only be in this state in an emergency situation. In a High or Critical Reliability System, the Emergency Transfer Switches on both SPEs in the PPN must be in the **on** position before Emergency Transfer is invoked for the PPN.

— **off**

The switch is in the left position and regardless of Simplex or Duplex, PPN or EPN, Emergency Transfer is off and can not be invoked by the system software. The switch should only be in this state when a service technician is on sight.

— **auto-on**

The switch is in the or auto position, however, because of a serious system fault, system software has invoked Emergency Transfer.

— **auto-off**

The switch is in the or auto position and because the system has no serious faults, system software has **not** invoked Emergency Transfer.

— **unavail**

If the system has an EPN that is currently down, then **unavail** is displayed for the Emergency Transfer.

— **<blank>**

If the system is Simplex, then the 1B Emergency Transfer indication for the PPN will display a blank. If the system does not have an EPN, then both the 1A and 1B Emergency Transfer indications for the EPN will display a blank.

EXP-LINK

An identifier of the Expansion Links that originate from this cabinet showing the locations of the two Expansion Interface circuit packs that make up the link. If the Expansion Link does not exist in the system then a **-** is displayed.

The following are valid Expansion Link identifiers for the PPN or Cabinet 1:

"**1A01-2A01**", "**1B01-2B02**", "**1A02-3A01**", "**1B02-3B02**"

The following are valid Expansion Link identifiers for the first EPN or Cabinet 2:

"**1A01-2A01**", "**1B01-2B02**", "**2A02-3A02**", "**2B03-3B03**"

The following are valid Expansion Link identifiers for the second EPN or Cabinet 3:

"**1A02-3A01**", "**1B02-3B02**", "**2A02-3A02**", "**2B03-3B03**"

SERVICE STATE

The operational state of the Expansion Interface Link. The possible states are as follows:

— **in**

The Expansion Interface Link is installed in the system and is in-service.

— **out**

The Expansion Interface Link has failed certain maintenance tests and has been removed from service.

— **<blank>**

The Expansion Interface Link does not exist in the system.

MODE

— **active**

The Expansion Interface Link is in-service and is providing the active connectivity between the two cabinets.

— **standby**

The Expansion Interface Link is in-service and is ready to provide connectivity between the two cabinets should the active link fail.

— **down**

The Expansion Interface Link is out-of-service and can not provide connectivity between the two cabinets.

— **<blank>**

The Expansion Interface Link does not exist in the system.

CABINET TYPE — Indicates the type of physical cabinet containing this cabinet.

- **MCC-**

  A Medium Carrier Cabinet capable of supporting up to 5 carriers. A MCC in an PPN can run a 286 or a 386 Processor. A MCC can run as either simplex or duplex as a PPN.

- **SCC**

  A Single Carrier Cabinet capable of supporting up to 4 carriers. A SCC in an PPN can run a 286 or a 386 Processor. A SCC can run as either simplex or duplex as a PPN.

- **EMCC-**

  A Enhanced Medium Carrier Cabinet capable of supporting up to 5 carriers. A EMCC can only be a PPN cabinet and always runs a 386 Processor. A EMCC can run as either simplex or duplex as a PPN.

- **ESCC-**

  A Enhanced Medium Carrier Cabinet capable of supporting up to 4 carriers. A ESCC can only be a PPN cabinet and always runs a 386 Processor. A ESCC can run as either simplex or duplex as a PPN.

- **MICRO**

  A Mirco or Wall Mounted cabinet always exists alone as an A carrier in the PPN and always runs a 386 Processor. A MICRO cabinet can be only used in simplex systems.

- **S75XE**

  A S75XE cabinet is a System 75 R1V3 PPN cabinet modified to run as the A carrier in the PPN and always runs a 386 Processor. A S75XE cabinet can be only used in simplex systems.

The following is an example of the fields contained on the output form.

```
status system all-cabinets                 Page  1 of  3   SPE B

                        SYSTEM STATUS CABINET 1

                           SELECT  SPE ALARMS    TONE/  SERVICE SYSTEM  SYSTEM

```

FEATURE INTERACTIONS

None.

status trunk

This command displays the status of an individual trunk group member or all of the members in a particular group.

SYNOPSIS

status trunk group*/member print*

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, rcust, bcms, init, browse.

EXAMPLES

status trunk 78
status trunk 80
status trunk 78/1
status trunk 80/2
status trunk 80/2 print

DESCRIPTION

The status trunk command displays internal software state information for diagnosis. This command can help locate facilities to which the trunk is communicating.

If a trunk group number is entered without a member number, a list showing the status for each member in the specified group is displayed. If a trunk group number and member number are both entered, only status for the specified member is displayed.

Defaults

None.

Parameters

group	The group number is an administered number associated with each trunk group. The valid range is 1 - 99. If a group number is entered without a member number, a list showing the status of each member in the group is displayed.
member	The member number is an administered number identifying a particular member within a trunk group. The valid range is 1 - 99. If a member number is entered, status for that member only is displayed.
print	This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses HELP after entering "status trunk", the following message is displayed:

```
Enter assigned trunk group(1-99)
or [group/member(1-99)], [‘print‘]
```

Error Messages

If the format of the trunk identifier is incorrect, the following error message is displayed:

```
Format invalid
```

If the trunk identifier is not in the valid range, the following error message is displayed:

```
Trunk or trunk group invalid
```

If the trunk group is not administered or has no members, the following message is displayed:

```
Group not assigned, or group assigned
but with no member
```

If the trunk group member is not administered, the following message is displayed:

```
Group member not assigned
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message is displayed:

```
All maintenance resources busy; try again later
```

MEMBER OUTPUT

The following is output when a user enters a trunk group and member:

Trunk Group/Member	The trunk group number and group member number. Valid identifiers are 1-99/1-99.
Port	The port location (cabinet-carrier-slot-circuit) of the trunk.
Signaling Group ID	If the trunk is of type ISDN, then this field contains the number of the ISDN Signaling Group to which this group belongs. Otherwise, this field is blank.
Connected Ports	Port locations (cabinet-carrier-slot-circuit) connected to the trunk.
Service State	Whether the trunk is in service or out of service. One of the following states is displayed: in-service/active, in-service/idle, out-of-service, out-of-service-NE (Near End), out-of-service-FE (Far End), maint-NE/active, maint-FE/active, maint-NE/idle, maint-FE/idle, pending-in-service, pending-maint, or disconnected. NE (Near End) and FE (Far End) refer to which "end" of the trunk has placed the facility in the state that it is in.
Maintenance Busy	Whether there is any maintenance testing being performed upon the trunk.
CA-TSC State	The state of the temporary signaling connection. A temporary signaling connection is a connection set up to pass call information over PRI signaling links.

For the following output example, the command that was entered is "status trunk 78/1".

```
status trunk 78/1

                           TRUNK STATUS

Trunk Group/Member: 078/001            Service State: in-service/idle
              Port: 01C1505         Maintenance Busy? no
Signaling Group ID:                     CA-TSC State:
   Connected Ports:
```

GROUP OUTPUT

The following is output when a user enters only a trunk group:

Member	The trunk group number and group member number. Valid identifiers are 1-99/1-99.
Port	The port location (cabinet-carrier-slot-circuit) of the trunk.
Service State	Whether the trunk is in service or out of service. One of the following states is displayed: in-service/active, in-service/idle, out-of-service, out-of-service-NE (Near End), out-of-service-FE (Far End), maint-NE/active, maint-FE/active, maint-NE/idle, maint-FE/idle, pending-in-service, pending-maint, or disconnected. NE (Near End) and FE (Far End) refer to which "end" of the trunk has placed the facility in the state that it is in.
Mtce Busy	Whether there is any maintenance testing being performed upon the trunk.
Connected Ports	Port locations (cabinet-carrier-slot-circuit) connected to the trunk.

For the following output example, the command that was entered is "status trunk 78".

```
status trunk 78

                       TRUNK GROUP STATUS

Member   Port    Service State    Mtce Connected Ports
                                  Busy
078/001  01C1505 in-service/idle  no
078/002  01C1506 in-service/idle  no
```

FEATURE INTERACTIONS

None.

status tsc-administered

This command displays the operational status of Temporary Signaling Connections (TSCs) for a signaling group.

SYNOPSIS

status tsc-administered signaling group #/*tsc index print*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

status tsc-administered 1
status tsc-administered 1/1
status tsc-administered 1/2 print

DESCRIPTION

The status tsc-administered command displays the operational status of TSC's administered for an administered signaling group. The status represents the state of the TSC according to switched services.

Defaults

None.

Parameters

signaling group #	An administered number associated with each signaling group.
tsc index	A number associated with each TSC in a signaling group.
print	This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses HELP after entering "status tsc-administered" the following message will be displayed:

```
Enter sig group # (1-8) /tsc index # (1-64),
                  ['print']
```

Error Messages

If the format for the specified signaling group or the signaling group and TSC is incorrect, the following message is displayed:

```
Format invalid
```

If the specified signaling group number is out of range, the following message is displayed:

```
Signaling group invalid
```

If the specified signaling group is not administered, the following message is displayed:

```
No signaling group assigned
```

If the specified signaling group has no TSC assigned or the specified TSC is unadministered, the following message is displayed:

```
No TSC assigned
```

If the specified TSC number is out of range, the following message is displayed:

```
Tsc index invalid
```

If the software data cannot be sent to the SAT, the following message is displayed:

```
Error encountered, can't complete request
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

TSC Index	The administered TSC index (1-64).
TSC State	The state of the administered TSC. A state of "inactive" means that the administered TSC is not functioning (i.e. D-channel out-of-service, or disabled, etc.). A state of "active" indicates that the administered TSC is up and user information can be exchanged end-to-end. A state of "pending-inactive" shows that the TSC is being released. A state of "pending-active" means that the TSC is about to come up.
Establish	This field refers to the switch responsible for the origination of the administered TSC. A state of "as-needed" shows that the TSC is established on an as needed basis. A state of "permanent" shows that the TSC is permanently established.
Enabled	Indicates if the administered TSC's have been enabled ("yes" or "no").
Congested	This field indicates the administered TSC congestion history (i.e. whether the network can handle the receipt of USER INFORMATION messages for the administered TSC). A "yes" in this field indicates that the administered TSC is congested. A "no" indicates that the administered TSC is not congested. A "clear" in this field denotes the administered TSC congestion was cleared during its' active period.

For the following output example, the command that was entered was "status tsc-administered 1/1".

```
status tsc-administered 1/1

         ADMINISTERED NON-CALL-ASSOCIATED TSC STATUS

TSC      TSC
Index    State        Establish   Enabled   Congested
1        inactive     as-needed   yes       no
```

FEATURE INTERACTIONS

None.

status tti

This command displays the status of the TTI (Terminal Translation Initialization) background maintenance task.

SYNOPSIS

status tti *print*

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust init, nms, browse.

EXAMPLES

status tt
status tti print

DESCRIPTION

The status tti command displays the status (active/not active) of the tti background maintenance task and if it is active, then it will display whether tti ports are being generated or removed, the number of tti-supported boards that have processed, and the number of tti-supported boards that have not yet been processed. The display also includes the elapsed time since the background maintenance task started.

Defaults

No defaults.

Parameters

print This will cause the report to be printed if a printer is linked to the SAT.

Help Messages

If the system technician presses HELP after entering "status tti", the following message will be displayed:

```
['print']
```

Error Messages

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit.
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later.
```

OUTPUT

TTI Background Task State:	The state of the tti background maintenance task: generating tti ports, removing tti ports, suspended, not active, completed - all ports translated, completed - some ports not translated. If the last execution of the background task completed normally, then "completed - all ports translated" is displayed here. If the task completed due to resource exhaustion with some ports left untranslated, then "completed - some ports not translated" is displayed in this field.
TTI State:	The tti state field contains "off" if the TTI feature is not enabled for the system or if it is enabled then it contains what kind of tti ports are being generated or removed: voice, data.
# of Boards Completed:	The number of TTI-supported boards that have had been processed by the background maintenance task. A "completed" board has either had all its unadministered ports translated as TTI ports or its TTI ports have been removed and are now unadministered ports. This depends on whether the TTI background task is generating or removing tti ports.

# of Boards Left to Process:	The number of TTI-supported boards that have not yet been processed by the background maintenance task.
Percent Complete:	A ratio of the of number of boards completed and the number of boards left to process.
Elapsed Time since Task Started:	The amount of time that has elapsed since the TTI background task was started. If the task is "not active", then this field will blank. If the task is "completed" it will indicate the length of time it took to complete the task. If the task is "suspended", then it will display the elapsed time at the point the task was suspended. The time is displayed in the HH:MM format where HH is hours and MM is minutes.

For the following output example, the command "status tti" was entered.

```
status tti                            Page 1 of 1

                             TTI STATUS

        TTI Background Task State:  generating tti ports
                        TTI State:  voice
            # of Boards Completed:  30
      # of Boards Left to Process:  120
                 Percent Complete:  25
  Elapsed Time since Task Started:  0:15
```

FEATURE INTERACTIONS

The TTI Background maintenance task is activated by enabling the TTI system parameter on the system-parameters features administration form.

test access-endpoint

This command will perform hardware diagnostic tests on all port circuits that are associated with the specified access endpoint extension.

SYNOPSIS

test access-endpoint extension *[short | long] repeat number schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init, nms.

EXAMPLES

test access-endpoint 25012
test access-endpoint 45002 sh
test access-endpoint 45892 l
test access-endpoint 24389 sh r 4
test access-endpoint 34899 l r 6
test access-endpoint 34912 l r 5 schedule
test access-endpoint 93483 r 2
test access-endpoint 10022 c
test access-endpoint 92349 schedule

DESCRIPTION

The test access-endpoint command performs hardware diagnostic tests on all port circuits that are associated with the specified access endpoint.

Defaults

The default for the command is short with repeat number of 1.

Parameters

extension	The extension of the access endpoint to be tested. The number of digits in an extension is determined by the dial-plan.
short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of nondestructive diagnostic tests.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the user presses HELP after entering "test access-endpoint", the following message is displayed:

```
Enter extension number, ['long' or 'short'],
     ['repeat' (1-100)], ['schedule']
```

Error Messages

If the format for the extension is incorrect, the following error message will be displayed:

```
Extension invalid
```

If the EPN on which the access endpoint resides is not accessible, the following message will be displayed:

```
EPN is not available
```

If the extension is not administered, the following message will be displayed:

```
Extension not assigned
```

If the object associated with the specified extension is not an access endpoint, the following message will be displayed:

```
Extension assigned to object
other than access-endpoint
```

If the board that contains the access endpoint is not inserted in the system, the following message will be displayed:

```
Board not inserted
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The responses will be displayed on a port-by-port and test-by-test basis with one line of data displayed for each test result.

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.
Maintenance Name	The type of maintenance object that is being tested. For wideband access endpoint the maintenance name for each port is "WAE-PORT". For single port access endpoint the maintenance name is "TIE-DS1".
Alt. Name	The alternate way of identifying the maintenance object. This field contains the extension number of the access endpoint.
Test No	The actual test that is being executed.
Result	The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED."
Error Code	A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

For the following output example, the command "test access-endpoint 22502" was entered. Assume that the access endpoint ports for extension 22502 are in cabinet 1, carrier C, slot 11, circuit 1 to 6.

```
test access-endpoint 22502 short                   page 1 of 1

                             TEST RESULTS

  Port      Maintenance Name  Alt. Name Test No. Result      Error Code
  01C1101   WAE-PORT          22502       36     PASS
  01C1102   WAE-PORT          22502       36     PASS
  01C1103   WAE-PORT          22502       36     PASS
  01C1104   WAE-PORT          22502       36     PASS
  01C1105   WAE-PORT          22502       36     PASS
  01C1106   WAE-PORT          22502       36     PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

None.

test alarms

This command tests the hardware associated with selected alarms

SYNOPSIS

test alarms *auto-page failures step [short | long][repeat number | clear]*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init, nms.

EXAMPLES

test alarms
test alarms step failures
test alarms long clear auto-page
test alarms long failures

DESCRIPTION

This command allows the technician to automatically test all of the hardware that is associated with the active alarms in the alarm log. This command provides a query form to help the user narrow the selection of alarmed objects. Once the form is filled out, the user presses "ENTER" and the hardware associated with the selected alarm log entries is tested. The results will be displayed in standard test output and status information will be displayed on the message line as the command progresses.

Several alarms may be logged against a single maintenance object, each alarm representing a different problem. Even if there are multiple entries in the alarm log for a single object, the test alarms command will only test each physical object once.

Defaults

The default options for this command are: short, repeat of 1.

Parameters

auto-page	This option provides the ability to continue testing and displaying test results, by providing a new screen every time the SAT screen is filled with test results. The screen does not scroll to accommodate new results; instead a new screen is provided after the current screen fills up. If the auto-page option is not specified, the SAT screen will not be refreshed once it is filled with test results and testing will stop until the user enters the "PAGE" key to continue or the "CANCEL" key to halt the testing.
failures	This requests that only the failures be displayed on the screen. All passes will not be displayed on the output screen. Hardware failures as well as aborts, conflicts and EPN-down failures will be displayed.
step	This option will allow the user to step to the next or previous alarm and not have the current alarm tested. When this option is specified, the user is presented with the alarm information and prompted for a keypress. The user may enter CANCEL to abort the command, ENTER to test the currently displayed alarm, NEXT ALARM (function key) to move to the next alarm, PREV ALARM (function key) to move to the previous alarm without testing the currently displayed alarm. If this option is given, then the NEXT ALARM (function key) or PREV ALARM (function key) may be pressed at any time during the command (even during test results). If the NEXT ALARM or PREV ALARM is pressed during a test, the test is aborted, testing of the current alarm stops, and the next alarm or previous alarm is displayed. If the first alarms is displayed, and the PREV ALARM is pressed, then the last alarm is displayed. Also, if the last alarm is currently displayed, and the NEXT ALARM is requested, then the first alarm will be shown. **NOTE:** When this option is given the only way to terminate this command is to press CANCEL.
short	This will cause the command to execute a series of nondestructive diagnostic tests.

long	This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm is cleared or a single test in the sequence fails. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.

WARNING:

Executing a clear with short option, may not clear all alarms even if all tests pass.

WARNING:

Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.

Help Messages

If the technician presses HELP after entering "test alarms" the following message will be displayed:

```
Enter ['auto-page'], ['failures'], ['step'],
['short' or 'long'], ['repeat' (1-100) or 'clear']
```

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

QUERY FORM INPUT

After entering the command "test alarms", the system technician will be presented with an options form for alarm selection.

```
test alarms repeat 1

            HARDWARE TEST ALARM QUERY

    The following options control which alarms will be tested.

    ALARM TYPES
          Major? y_     Minor? y_    Warning? y_

        REPORT PERIOD
         Interval: m_  From: __/__/__:__  To: __/__/__:__

    EQUIPMENT TYPE ( Choose only one, if any, of the following )
                         Cabinet: __
                    Port Network: __
                    Board Number: ____
                            Port: ______
                        Category: ________
                       Extension: _____
            Trunk ( group/member ): __/__
```

Alarm Types	The type of alarm to be tested is specified by placing a ’y’ or ’n’ in the alarm type fields. The technician can choose a combination of active alarms: major, minor, and/or warning.
Interval	Test alarms for records for the last hour (h), last day (d), last week (w) or all (a). The default is all.
From	Test alarm associated with records from the time specified by mm/dd/hh/mm, where mm month, dd is the day, hh is the hour and mm is the minute. If no "from" date is entered, then no checking is done. This will give the user all the alarms active since a month prior to the current time.
To	Test alarms associated with records to the time specified by mm/dd/hh/mm, where mm is the month, dd is the day, hh is the hour and mm is the minute. If no "to" date is entered, any alarm which is active after the from date will be selected.

Equipment Type

The technician can choose between five different equipment types. If there is no input to any of these fields, the system will default to all the equipment. The user can select one of the following fields:

- Cabinet: This allows the technician to test all alarms associated with a particular cabinet. Alarms for a cabinet are referenced by a number ranging from 1 to 3 which is assigned during cabinet administration.
- Port Network: This allows the technician to test all alarms associated with a particular port network. Alarms for a port network are referenced by a number ranging from 1 to 3.
- Board Number: This allows the technician to choose all alarms associated with a particular circuit pack for testing. Alarms for a circuit pack are referenced by circuit pack location (cabinet-carrier-slot). If the cabinet number is omitted, the system will default to 1.
- Port: This allows the technician to choose all alarms associated with a particular port on a circuit pack for testing. Alarms for a port circuit are referenced by port location (cabinet-carrier-slot-circuit). If the cabinet number is omitted, the system will default to 1.
- Category: Alarms for a particular equipment category.
- Extension: Alarms associated with an extension number.
- Trunk (group/member): The technician can choose to test all alarms associated with a particular trunk group or trunk group member. The group identifier should be entered to test all alarms associated with a trunk group (XX/__). The group identifier and member identifier should both be entered to test all alarms associated with a specific trunk group member (XX/XX).

Field Help

Following are the help messages that the system technician will see upon tabbing to the specified field and pressing the HELP key.

Major?	"n(o) y(es)"
Minor?	"n(o) y(es)"
Warning?	"n(o) y(es)"
Interval:	"m(onth), h(our), d(ay), w(eek), a(ll)"
From month	"Enter month between 1-12"
From (day)	"Enter day between 0-31"
From (hour)	"Enter hour between 0-23"
From (minute)	"Enter minute between 0-59"
To (month)	"Enter month between 1-12"
To (day)	"Enter day between 0-31"
To (hour)	"Enter hour between 0-23"
To (minute)	"Enter minute between 0-59"
Cabinet:	"Enter cabinet number (1-3)"
Port Network:	"Enter port network number (1-3)"
Board Number:	"Enter 4 character board number; [cabinet(1-3)]:carrier(A-E):slot(0-21)"
Port:	"Enter port number; [cabinet(1-3)]:carrier(A-E):slot(0-21):circuit(1-24)"
Category:	"adm-conn, announce, bri/asai, card-mem, cdr, data-mod, detector, dup-spe, environ, ext-intf, ext-dev, generatr, inads-link, infc, maint, mbus, memory, misc, mnt-test, modem, netcon, pkt, pkt_ctrl, quick-st, pms/jrnl, procr, s-syn, stabd, stacrk, stations, sys-prnt, tape, tdm, tone, trkbd, trkcrk, trunks and wideband" (For a table describing the category entries in greater detail, see the "display errors" command.)
Extension:	"Enter assigned extension, or blank"
Trunk (group)	"Enter group number between 1-99"
Trunk (member)	"Enter group member between 1-99, or blank"

Field Error Messages

Following are the error messages that will be displayed on the screen. The messages are displayed when the system technician tabs out of a field and the validation routines are executed. In the following messages, an "x" represents the character that was entered by the user.

Major?	""x" is an invalid entry; please press HELP"
Minor?	""x" is an invalid entry; please press HELP"
Warning?	""x" is an invalid entry; please press HELP"
Interval:	""x" is an invalid entry; please press HELP key"
From (month)	"Entry must be all digits"
From (day)	"Entry must be all digits"
	"Day invalid"
From (hour)	"Entry must be all digits"
	"Hour invalid"
From (minute)	"Entry must be all digits"
	"Minute invalid"
To (month)	"Entry must be all digits"
To (day)	"Entry must be all digits"
	"Day invalid"
To (hour)	"Entry must be all digits"
	"Hour invalid"
To (minute)	"Entry must be all digits"
	"Minute invalid"
Cabinet:	"Invalid entry"
Port Network:	"Port Network invalid"
Board Number:	"Invalid entry"
Port:	"Port invalid"
Category:	""xxxxxxxx" is an invalid entry; please press HELP"

Extension:	"Entry must be all digits"
	"Extension not assigned"
Trunk (group)	"Entry must be all digits"
	"Group not assigned, or group assigned but with no member"
Trunk (member)	"Entry must be all digits"
	"Number invalid""
	"Group member not assigned"
	"Trunk or trunk group invalid"

OUTPUT

The responses, with normal output, will be displayed on a test-by-test basis with one line of data displayed for each test result. With the failures option only the tests that have failed will be displayed.

The following output fields are for the ALARM ENTRY section:

Port	The location of the alarmed object (cabinet-carrier-slot-circuit). This is the same identifier as used by the alarm log.
Maintenance Name	The logical name of the maintenance object which has been alarmed.
On Board	Whether the fault detected is on the associated circuit pack, or an off board element connected to the circuit pack.
Alt Name	Terminal extension numbers or trunk group numbers.
Alarm Type	Major, Minor, or Warning. This is an indicator to the seriousness of the alarm raised.
Service State	RDY (ready for service), OUT (out of service), or IN (in service). This is the current service state of the station and trunk ports shown.
Ack	The columns under the “1” and “2” headings denote if the alarm has been acknowledged by the first and second OSS telephone numbers, respectively.
Date Alarmed	Day, hour, and minute of alarm.
Alarm Count	This field contains the count of the current alarm entry verses the total number of alarms to be tested.

The following fields are displayed for the test results:

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.
Maintenance Name	The type of maintenance object that is being tested.
Alt. Name	The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number.
Test No	The actual test that is being executed.
Result	An indicator as to whether the test failed, passed, aborted or no hardware was available (no board). If this field has conflict, this means that another user was testing this hardware. If this field has epn-down it means that the epn is inaccessible at this time.
Error Code	A numerical description of why the test failed or was aborted.

When errors are encountered preparing a particular object to be tested (not inserted, contention, etc.) the an error message will be displayed. This error message will be displayed in the TEST RESULTS data.

For the following output example, assume that only one alarm was in the alarm log and it is on the board in cabinet 1, carrier c, slot 7. The command that was entered was "test alarms" and the query form was left empty by just pressing "ENTER"

.

```
test alarms                                                                Page   1

                                 ALARM ENTRY
Port       Maintenance On   Alt     Alarm   Svc    Ack?  Date         Alarm
           Name        Brd? Name    Type    State  1 2   Alarmed      Count

01C03     UDS1-BD                     139      NO BOARD
01C03     UDS1-BD                     140      NO BOARD
01C03     UDS1-BD                     141      NO BOARD
01C03     UDS1-BD                     142      NO BOARD
01C03     UDS1-BD                     143      NO BOARD
01C03     UDS1-BD                     144      NO BOARD
01C03     UDS1-BD                     145      NO BOARD
01C03     UDS1-BD                     146      NO BOARD
Testing completed for this object.

                press CANCEL to quit --  press NEXT PAGE to continue
```

FEATURE INTERACTIONS

With the enhancement of multiple maintenance users, there may be a possibility of two users attempting to test the same physical hardware (for example, one via the test alarms command and another through the test board command). If this command should attempt to test a board that is currently being tested by another user, a error message is displayed.

test analog-testcall

This command will place an analog test call on a trunk or a group of trunks.

SYNOPSIS

test analog-testcall [trunk group number*/member number* **|** port location **|** board location] *[full | supervision | no-selftest | no-return-loss | no-st-or-rl][repeat number] schedule*

PERMISSIONS

The following logins may execute this command: system technician, inads, cust, init.

EXAMPLES

test analog-testcall trunk 78 f
test analog-testcall trunk 78 f schedule
test analog-testcall trunk 80/1 s r 2
test analog-testcall trunk 80/1 s r 2 schedule
test analog-testcall trunk 78/2 no-selftest r 10
test analog-testcall trunk 78/2 no-selftest r 10 schedule
test analog-testcall trunk 78 r 4
test analog-testcall trunk 78 r 4 schedule

te an t 80 schedule

DESCRIPTION

The test analog-testcall command performs facility diagnostic tests on an entire trunk group, an individual trunk group member, an individual trunk port or on all trunks on a board, depending on the options entered by the technician. The type of test call, the far end test line number and the various other test call related parameters must be administered on the trunk group form before executing the command. presses HELP

Normally the user should only invoke the full or supervision test. The other options are provided primarily for testing when setting up an ATMS schedule.

Defaults

The default for the command is full with the repeat of 1.

Parameters

group number	The group number is an administered number associated with each trunk group.
member number	The member number is an administered number identifying a particular trunk within a trunk group. If a group number is entered, and no member number is given, then all trunks in the group will be tested.
location	A "location" represents the physical position of the board or port to be tested and is entered as "UUcSSpp" where "UU" represents the cabinet number, "c" represents the carrier, "SS" represents the slot position, and "pp" represents the circuit. A cabinet number (1 - 3) may be entered. The "pp" should be omitted for a board location.
full	This will execute the most comprehensive test call available using the administered test set type.
supervision	This will cause the system to execute a supervision only test call. It will take about 10 seconds and will only confirm the presence of the test set at the far end.
no-selftest	This will execute the "full" test, but will skip any self test sequences. This saves about 20 seconds on the type 105 transmission test and will not have any effect on type 100 transmission tests or on type 102 transmission tests.
no-return-loss	This will execute the "full" test, but will skip any return loss sequences. This saves about 20 seconds on the type 105 transmission test and will not have any effect on type 100 transmission tests or type 102 transmission tests.
no-st-or-rl	This will execute the "full" test, but will skip all self test and return loss sequences. This saves about 40 seconds on the type 105 transmission test and will not have any effect on type 100 transmission tests or type 102 transmission tests.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.

schedule — When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test analog-testcall" a message showing the following keywords is displayed:

```
trunk  board    port
```

If the system technician presses HELP after entering "test analog-testcall trunk," the following message will be displayed:

```
Enter group number or group number/member number,
   ['full' or 'supervision' or   'no-selftest'
     or 'no-return-loss' or 'no-st-or-rl'],
         ['repeat 1-100'], ['schedule']
```

If the system technician presses HELP after entering "test analog-testcall port" the following message will be displayed:

```
Enter trunk port number ['full' or 'supervision'
      or 'no-selftest' or'no-return-loss'
or 'no-st-or-rl'], ['repeat 1-100'], ['schedule']
```

If the system technician presses HELP after entering "test analog-testcall board" the following message will be displayed:

```
Enter trunk board number, ['full' or 'supervision'
      or 'no-selftest' or 'no-return-loss'
or 'no-st-or-rl'], ['repeat 1-100'], ['schedule']
```

Error Messages

If the format for the trunk location is incorrect, the following error message would be displayed:

```
Format invalid
```

If the trunk group or member range is invalid, the following message will be displayed:

```
Trunk or trunk group invalid
```

If the board is not inserted, the following message will be displayed:

```
Board not inserted
```

If the specified board does not have any maintenance objects associated with it, the following message will be displayed:

```
No MO in this board
```

If the EPN on which the board resides is not available, the following message will be displayed:

```
EPN is not available
```

If there is a software communication problem, the following message will be displayed:

```
Error encountered, can’t complete request
```

If the trunk group is not administered, the following message will be displayed:

```
Group not assigned, or group
assigned but with no member
```

If the trunk group member is not administered, the following message will be displayed:

```
Group member not assigned
```

If no tests can be found for the associated MO, the following message is displayed:

```
No tests for this MO
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
’login id’:’command’ has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

If the format for the board or port location is incorrect, the following error message will be displayed:

```
Port/Board invalid
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.
Maintenance Name	The type of maintenance object that is being tested.
Alt. Name	The alternate means of identifying the maintenance object. This field contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number.
Test No.	The actual test that is being executed.
Result	The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."
Error Code	A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO (for example, CO_TRK Transmission Tests (#844-849).

For the following output example, assume that the command that was entered was "test analog-testcall trunk 78".

```
test analog-testcall trunk 78

                           TEST RESULTS

  Port      Maintenance Name  Alt. Name Test No. Result       Error Code
  01C1505   CO-TRK             78/1     845      PASS
  01C1507   CO-TRK             78/2     845      PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

Additional data is available after running a test. See the list measurements test-calls command for details on how to access the additional data.

If the trunk is in use by call processing the test will abort.

If the trunk is in use by maintenance, the test will queue and will run when the current maintenance activity finishes.

test board

This command will perform a set of hardware diagnostic tests on the specified circuit pack. The tests will vary according to the type of pack and short or long request.

SYNOPSIS

test board location *[short | long][repeat number | clear] schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init, nms.

EXAMPLES

test board 01c11 l
test board 01c11 l schedule
test board 02e15 sh r 2
test board 01c08
test board 02d12 r 4
test board 02d12 c

DESCRIPTION

The test board command will validate that the board exists at the specified location. Based on the logical type (e.g., Analog, Digital, Hybrid, etc.) of board a series of tests will be executed. Each individual test will exercise diagnostics on the board and then return results of the test along with any possible error codes.

Some of the tests can be disabled by administering forms on the administration terminal.

Defaults

The default for the command is short with the repeat of 1.

Parameters

location	A "location" represents the physical position of the board to be tested. For R3 Standard cabinets a location is entered as "UUcSS" where "UU" represents the cabinet number, "c" represents the carrier, and "SS" represents the slot position. A single digit cabinet (1 - 9) may be entered with or without a leading zero (0).
short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.

WARNING:

Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.

schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test board" the following message will be displayed:

```
Enter board location, ['long' or 'short'],
['repeat' (1-100) or 'clear'], ['schedule']
```

Error Messages

If the format for the board location is incorrect, the following error message will be displayed:

```
Port/Board invalid
```

If the EPN in which the specified board resides is not available, the following message will be displayed:

```
EPN is not available
```

If the specified board is not configured in the system, the following message will be displayed:

```
Board not assigned
```

If the request for all maintenance objects associated with the board fails, the following message will be displayed:

```
No MO in this board
```

If no tests can be found for the associated MO, the following message will be displayed:

```
No tests for this MO
```

If the specified board is a Switch Node Interface (SNI) board which resides on the active Port Network Connectivity (assuming PNC is duplicated) and a long test has been specified, the following message will be displayed:

```
Must busyout specified object first
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.
Maintenance Name	The type of maintenance object that is being tested.
Alt. Name	The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number.
Test No	The actual test that is being executed.
Result	The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

For the following output example, assume that the board in cabinet 1, carrier c, slot 7 is an analog board with three ports administered. The command that was entered was "test board 1c07".

```
test board 01C07 short

                           TEST RESULTS

  Port      Maintenance Name  Alt. Name Test No. Result        Error Code
  01C07     ANL-BD                      51       PASS
  01C07     ANL-BD                      52       PASS
  01C0703   ANL-LINE                    35       PASS
  01C0703   ANL-LINE                    48       PASS
  01C0703   ANL-LINE                    36       PASS
  01C0701   ANL-LINE                    35       PASS
  01C0701   ANL-LINE                    48       PASS
  01C0701   ANL-LINE                    36       PASS
  01C0702   ANL-LINE                    35       PASS
  01C0702   ANL-LINE                    48       PASS
  01C0702   ANL-LINE                    36       PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

Destructive long tests on a Switch Node Interface (SNI) board will not be allowed unless the board has been busied out.

test card-mem

This command will initiate a test sequence on the specified memory card.

SYNOPSIS

test card-mem location *[short | long] [repeat number | clear] schedule*

PERMISSIONS

The following default logins may execute this command: init, inads, system technician.

EXAMPLES

test card-mem
test card-mem a l
test card-mem b sh r 2
test card-mem a sch
test card-mem a c

DESCRIPTION

The "test card-mem" command executes a sequence of tests on the memory card in the specified switch processor element. The test sequences in order for both "long" and "short" versions are described in the following table:

TEST	Included In Short?	Included In Long?
12 Volt Power Supply Test (#701)	Yes	Yes
Memory Card Insertion Test (#695)	Yes	Yes
Memory Card Format and Read Test (#696)	Yes	Yes
Memory Card Match Test (#697)	Yes	Yes
Memory Card Write-Protected Test (#698)	Yes	Yes
Memory Card Directory Recovery Test (#699)	Yes	Yes
Memory Card Translation Data Integrity Test (#694)	No	Yes
Memory Card Erase/Write/Read Test (#693)	No	Yes
Memory Card Capacity Test (#1014)	No	Yes
Flash Data Consistency Test (#421)	No	Yes

The tests in the sequence can verify the sanity of the memory card device, the basic read/erase/write operations to the memory card, the integrity of the translation data stored in the memory card, the function of 12 volt power supply in TN777B NETCON circuit pack used for memory card erase/write operations, the translation capacity of the memory card, and the consistency of data stored in both memory cards in a High or Critical Reliability System. This command can help system technician to trouble-shoot the hardware errors related to maintenance objects such as "CARD-MEM", "12V-PWR", CAP-MEM, and "FL-DATA" logged in the system hardware error log. The details of test results and the repair procedures for recovery are described in Maintenance Service Document associated with each maintenance object.

If the switch is a simplex system, then the "Flash Data Consistency Test" is not executed.

Defaults

The defaults for this test command are "short" with a repeat number of "1". The location of carrier where the memory card resides must be specified in the command line for a High or Critical Reliability System.

Parameters

location	This parameter indicates the carrier location where the memory card resides in a High or Critical Reliability System (i.e. "a" or "b"). In a duplicated switch configuration, it can be either "a", "A", "b", or "B".
short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.

WARNING:

Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.

schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test card-mem", the following message is displayed for a simplex switch configuration:

```
Enter ['long' or 'short'], ['repeat' (1-100)
          or 'clear'], ['schedule']
```

For a duplex switch configuration, the following message will be displayed:

```
Enter [cabinet(1)];carrier(A-B), ['long' or 'short'],
    ['repeat' (1-100) or 'clear'], ['schedule']
```

Error Messages

If the SPE is not active, the following message will be displayed:

```
Command must be executed from active SPE
```

If the carrier entered is invalid, the following message will be displayed:

```
"entered value" is an invalid identifier;
press RETURN to execute modified command
```

If the switch system is a 386 system [G3iV2-386, G3sV2, G3vsV2], and the NETCON board is not TN777B, then the following message will be displayed:

```
Must install TN777B circuit pack
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If the standby is entering maintenance mode when this command is executed, then the following message is displayed:

```
Cannot interrupt Standby SPE while entering
    maintenance mode; please try later
```

If the standby SPE is not refreshed when this command is executed, then the following message is displayed:

```
Standby SPE memory not refreshed;
use the "refresh spe-standby" command.
```

If the standby SPE is not refreshed and the active SPE is hard selected via the SPE select switches when this command is executed, then the following message is displayed:

```
Active SPE locked via select switches;
   Standby SPE memory not refreshed
```

If the standby SPE is busy with another task, then the following message is displayed

```
Standby SPE busy with another task;
for information use "status system 1"
```

If the standby SPE is not available when this command is executed, then the following message is displayed:

```
Standby SPE not available;
for information use "status system 1"
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested. This object is always associated with cabinet 1. The carrier is "A" for the control carrier A in a simplex system, and it can be either "A" or "B" for the control carriers A and B in a duplex system. The slot and circuit fields of port address for the maintenance objects, 12V-PWR, CAP-MEM, and CARD-MEM, are always blank. The port address for maintenance object "FL-DATA" is blank.
Maintenance Name	The type of maintenance object that is being tested - "CARD-MEM" for the memory card; "12V-PWR" for 12 volt power supply in TN777B NETCON board; "CAP-MEM" for memory card capacity; and "FL-DATA" for the data consistency stored in memory cards in a duplicated switch.
Test No	The actual test that is being executed.
Result	An indicator such as PASS for test passed, FAIL for test failed, ABORT for test was aborted.
Error Code	A system-generated number that tells why the individual test failed or was aborted. A detailed list of the codes according to "Test No." is provided for each maintenance object.

For the following output example, the command "test card-mem" was entered.

```
test card-mem a long                                   SPE A

                  TEST RESULTS

  Port    Maintenance Name  Alt. Name Test No. Result      Error Code
  01A     12V-PWR                      701      PASS
  01A     CARD-MEM                     695      PASS
  01A     CARD-MEM                     696      PASS
  01A     CARD-MEM                     697      PASS
  01A     CARD-MEM                     698      PASS
  01A     CARD-MEM                     699      PASS
  01A     CARD-MEM                     694      PASS
  01A     CARD-MEM                     693      PASS
  01A     CAP-MEM                     1014      PASS
          FL-DATA                      421      PASS

Command successfully completed
```

FEATURE INTERACTIONS

The "test card-mem long" command will invoke the Memory Card Erase/Write/Read Test. This means that the "save translation" and "save announcement" commands will be rejected while a write-to-memory-card operation is active.

The "test card-mem long" command will also invoke the Memory Card Capacity Test which will check if the memory card is more than 98% full or not. This test will also be invoked after a "save translation" command.

In a High or Critical Reliability System, running "test card-mem" command for a memory card in the standby SPE means that the standby SPE is put into the maintenance mode and no SPE interchange is allowed through the "reset system interchange" command or scheduled SPE interchange.

test cdr-link

This command will perform a set of tests on a call detail recording (cdr)-link.

SYNOPSIS

test cdr-link [primary | secondary]*[short | long][repeat number | clear]* *schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

test cdr-link primary l
test cdr-link secondary sh r 2
test cdr-link primary
test cdr-link secondary
test cdr-link secondary c
test cdr-link primary schedule

DESCRIPTION

The test cdr-link command will validate that the call detail recording (cdr)-link has been administered and exists in the PBX. Each individual test will exercise diagnostics on the link and then return results of the test along with any possible error codes.

For information on what a CDR link is and does, see the second paragraph in the "DESCRIPTION" section of the "status cdr-link" manual pages.

Defaults

The default for the command is short with the repeat of 1.

Parameters

link-id	A "Link-id" is either "primary" or "secondary".
short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test cdr-link" the following message will be displayed:

```
Enter 'primary' or  'secondary'
```

If the system technician presses HELP after entering "test cdr-link primary" or "test cdr-link secondary" the following message will be displayed:

```
Enter ['long' or 'short'],
['repeat' (1-100) or 'clear'], ['schedule']
```

Error Messages

If the link is not administered, the following error message will be displayed:

```
Link not administered or not enabled
```

If no tests can be found for the link, the following message will be displayed:

```
No tests for this MO
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	Not applicable. Will always be blank.
Maintenance Name	The type of maintenance object that is being tested. If testing primary cdr-link the maintenance object will be PRI-CDR, else if testing secondary cdr-link the maintenance object will be SEC-CDR.
Alt. Name	Not applicable. Will always be blank.
Test No	The actual test that is being executed.
Result	The result of the individual test - "PASS", "ABORT", "FAIL", "DISABLED".
Error Code	A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

For the following output example, assume that the command that was entered was "test cdr-link primary".

```
test cdr-link primary short

                         TEST RESULTS

  Port    Maintenance Name  Alt. Name Test No. Result       Error Code
          PRI-CDR                     215      PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

None.

test customer-alarm

This command allows the technician to test the leads for a customer-provided alarming device on the Processor and EPN maintenance circuit packs.

SYNOPSIS

test customer-alarm location *[short | long][repeat number | clear] schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

test customer-alarm
test customer-alarm schedule
test customer-alarm 02 r 2
test customer-alarm 01b r 25
test customer-alarm 01b r 25 schedule
test customer-alarm 2a
test customer-alarm 2a sh
test customer-alarm 01b l schedule
test customer-alarm 3 c

DESCRIPTION

The test customer-alarm command performs hardware diagnostic tests on the leads of the Processor and EPN maintenance circuit packs. These are used for customer provided alarms by closing the appropriate relay for one minute. Failure is verified by the technician checking the customer alarm attached to the circuit pack that was specified.

Defaults

The default cabinet is cabinet 1. The default carrier is carrier "a" except for SPE duplex system PPNs. In this case the carrier has no default and either "a" or "b" must be entered. The default for the remaining parameter is a repeat of 1.

Parameters

location	The location designates the physical position of the desired customer-alarm circuit pack. The location consists of a cabinet number and carrier letter. The cabinet number is one or two digits from 1 to 3 with leading zeros allowed. Cabinet 1 is the PPN with 2-3 referring to some optional EPN. The carrier is either "a" or "b" for cabinet 1 for SPE duplex systems. For SPE simplex systems, when selecting cabinet 1, the carrier must be "a" if entered. For cabinets 2-3, the carrier must be "a" if entered.
short	This will cause test number 115 to run.
long	This will cause test number 115 to run and is the same as the short sequence.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The clear option forces a clear of all alarms if no errors are encountered during testing.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test customer-alarm" on a simplex SPE system, the following message will be displayed:

```
Enter [cabinet(1-3)],['long' or 'short'],
['repeat'(1-100) or 'clear'], ['schedule']
```

If the system technician presses HELP after entering "test customer-alarm" on a duplex SPE system the following message will be displayed:

```
For cabinet 1 enter [cabinet(1)];
carrier (A-B),['long' or 'short'],
['repeat'(1-100) or 'clear'], ['schedule']
For cabinet 2-3 enter cabinet(2-3),['long' or 'short'],
['repeat'(1-100) or 'clear'], ['schedule']
```

Error Messages

If the location identifier entered is not valid, the following message will be displayed:

```
Command aborted; please try later
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

OUTPUT

Port	The port address (cabinet-carrier-slot) of the maintenance object that is being reset.
Maintenance Name	The maintenance name will always be CUST-ALM.
Alt. Name	Not applicable.
Test No.	The test number will always be 115.
Result	The result of the individual test -"PASS," "ABORT," "FAIL."
Error Code	A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

For the following output example, assume that the command that was entered is "test customer-alarm 02a".

```
test customer-alarm 02A

                              TEST RESULTS

  Port    Maintenance Name  Alt. Name Test No. Result       Error Code
  02A     CUST-ALM                    115      PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

None.

test data-module

This command allows the technician to test a data module or a data channel.

SYNOPSIS

test data-module extension *[short | long][repeat number | clear] schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, init, nms.

EXAMPLES

test data-module 30000 l
test data-module 30000
test data-module 32000 sh r 2
test data-module 33000 l r 25
test data-module 33000 l r 25 schedule
test data-module 30000 c

DESCRIPTION

The test data-module command performs hardware diagnostic tests on a data module or a data channel. Test results are determined by the interface to the digital switch-data line port, digital line port, or network control data channel.

Defaults

The default for the command is short with the repeat of 1.

Parameters

extension	The extension associated with the data module or data channel to be tested. The number of digits in an extension is determined by a dial-plan.
short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.

WARNING:

WARNING: Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.

schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test data-module" the following message will be displayed:

```
  Enter extension, ['long' or 'short'],
['repeat' (1-100) or 'clear'], ['schedule']
```

Error Messages

If the extension format is invalid, the following error message would be displayed:

```
Extension invalid
```

If the extension is not administered, the following message will be displayed:

```
Extension not assigned
```

If the object associated with the specified extension is not a data module or a data channel, the following message will be displayed:

```
Extension exists but assigned to a different object
```

If the EPN that contains the data module port is not accessible, the following message will be displayed:

```
EPN is not available
```

If the board that contains the data port is not configured in the system, the following message will be displayed:

```
Board not assigned
```

If no tests can be found for the current MO, the following message will be displayed:

```
No tests for this MO
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.
Maintenance Name	The type of maintenance object that is being tested.
Alt. Name	The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number.
Test No	The actual test that is being executed.
Result	An indicator as to whether the test failed, passed, aborted or no hardware was available (no board).
Error Code	A numerical description of why the test failed or was aborted.

For the following output example, the command entered was "test data-module 300".

```
test data-module 300

                              TEST RESULTS

  Port      Maintenance Name  Alt. Name Test No. Result       Error Code
  01C1103   PDMODULE                        17     PASS

Command successfully completed
```

test ds1-loop

test ds1-loop - For TN464F or TN767E or later suffix DS1 Interface circuit packs, this command is used for loopback and one-way span testing of the DS1 span.

SYNOPSIS

test ds1-loop location [cpe-loopback-jack-test-begin [number-of-bits bit-pattern] | far-csu-loopback-test-begin | one-way-span-test-begin | end-loopback/span-test | inject-single-bit-error | ds1/csu-loopback-tests]

PERMISSIONS

Logins with the following service levels may execute this command: system technician, inads, init, super-user, or logins with Maintain Switch Circuit Packs permissions enabled.

EXAMPLES

test ds1-loop 01c08
test ds1-loop 1-3c03 cpe-loopback-jack
test ds1-loop 1-3c03 cpe
test ds1-loop 10c03 end
test ds1-loop 02d12 fa
test ds1-loop 02d12 inj

DESCRIPTION

The test ds1-loop command will validate that the board exists at the specified location, that the board is a TN464F or TN767E or later suffix DS1 Interface board, and that the G3 Version of the switch software is V3 or later. Based on the command parameter, a long-duration loopback/span test or series of short-duration loopback tests will be executed.

Long-duration loopback tests execute for an extended period of time until the system technician terminates it. Short-duration loopback tests return the result of the test to the screen when finished executing. The "list measurements ds1 summary" command should be used to monitor the status of a long-duration loopback/span test.

Defaults

The default for the command is ds1/csu-loopback-tests.

Parameters

location	A "location" represents the physical position of the board to be tested. For G3V3 Standard cabinets a location is entered as "UUcSS" where "UU" represents the cabinet number, "c" represents the carrier, and "SS" represents the slot position. A single digit cabinet (1-3) may be entered with or without a leading zero (0).
cpe-loopback-jack-test-begin	For TN464F or TN767E or later suffix DS1 boards, this will cause a long-duration loopback test to be setup through the Customer Premises Equipment (CPE) Loopback Jack. The command allows the user to specify a loop-up code for the CPE loopback jack if it differs from the default of 0x47F. This loop-up code is entered by specifying the number of bits in the loop-up code as well as the actual bit-pattern (in hexadecimal). The test will abort if the board has not been taken out of service via the "busyout" command.
far-csu-loopback-test-begin	For TN464F or TN767E or later suffix DS1 boards, this will cause a long-duration loopback test to be setup through the far-end Channel Service Unit (CSU). The test will abort if the board has not been taken out of service via the "busyout" command.
one-way-span-test-begin	For TN464F or TN767E or later suffix DS1 boards, this will begin execution of a long-duration one-way span test. The test will abort if the board has not been taken out of service via the "busyout" command.
end-loopback/span-test	For TN464F or TN767E or later suffix DS1 boards, this parameter terminates long-duration one-way span and loopback testing.
inject-single-bit-error	For TN464F or TN767E or later suffix DS1 boards, this parameter causes a single bit error to be sent within an active framed 3-in-24 test pattern used in long-duration loopback and span testing.
ds1/csu-loopback-tests	For TN464F or TN767E or later suffix DS1 boards, this parameter will execute the following loopback tests: DS1 Board LoopBack, CSU Module Equipment LoopBack, and CSU Module Repeater LoopBack. These tests are performed sequentially for a short duration each, and individual PASS/FAIL/ABORT test results are reported following each test.

Help Messages

If the system technician presses HELP after entering "test ds1-loop" the following message will be displayed:

```
Enter DS1 board location,
['cpe-loopback-jack-test-begin [number-of-bits bit-pattern]' or
'far-csu-loopback-test-begin' or 'one-way-span-test-begin' or
'end-loopback/span-test' or 'inject-single-bit-error' or
'ds1/csu-loopback-tests']
```

Error Messages

If the format for the board location is incorrect, the following error message will be displayed:

```
Port/Board invalid
```

If the EPN in which the specified board resides is not available, the following message will be displayed:

```
EPN is not available
```

If the specified board is not inserted in the system, the following message will be displayed:

```
Board not inserted
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

If the "test ds1-loop" command is executed and the "G3 Version" field on the "system-parameters customer-options" form is not V3 or later, then the following message will be displayed:

```
G3 Version must be V3 or later
```

If the "test ds1-loop" command is executed on a circuit pack other than TN464F or TN767E or later DS1 board, then the following message will be displayed:

```
Command valid for TN464F or TN767E or
later release DS1 circuit packs
```

If the "inject-single-bit-error" parameter is selected, but no CPE Loopback Jack, far-end CSU, or one-way span test is active on the DS1 circuit pack, then the following message will be displayed:

```
Parameter valid only if a loopback/span test is active on the DS1
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.
Maintenance Name	The type of maintenance object that is being tested.
Alt. Name	The alternate means of identifying the maintenance object.
Test No	The actual test that is being executed.
Result	The result of the individual test - "PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD".
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

For the following output example, assume that the board in cabinet 1, carrier c, slot 7 is a TN767E DS1 board. The command that was entered was "test ds1-loop 1c07."

```
test ds1-loop 01C07 ds1/csu-loopback-tests

                                TEST RESULTS

  Port      Maintenance Name  Alt. Name Test No. Result       Error Code
  01C07     DS1-BD                      1209     PASS
  01C07     DS1-BD                      1210     PASS
  01C07     DS1-BD                      1211     PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

Loopback or span tests will not be allowed on DS1 boards unless the board has been busied out.

Only one of the CPE Loopback Jack, far-end CSU, one-way span, or DS1/CSU loopback tests may be active at any given time on a DS1 span.

test duplication-interface

This command will test the indicated duplication-interface board.

SYNOPSIS

test duplication-interface location *[short | long][repeat number | clear] schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

test duplication-interface a
test duplication-interface b sh
test duplication-interface a l r 25
test duplication-interface 1b l r 25 schedule
test duplication-interface 1a l c

DESCRIPTION

The test duplication-interface command performs hardware diagnostic tests on the indicated duplication interface circuit pack. Testing is under control of the active SPE. The SHDW-CIR, SPE-SELECT and DUPINT maintenance objects are tested using this command. The SHDW-CIR maintenance object is associated with that portion of the duplication interface circuit pack that handles memory shadowing from the active to the standby SPE. The SPE-SELECT maintenance objects is associated with the SPE Select switch located on the front of the circuit pack. The DUPINT maintenance object is associated with the duplication interface circuit packs other functions which include SPE to SPE communication, SAT connection and environmental maintenance leads.

Defaults

Defaults for the parameters are short with a repeat of 1.

Parameters

location	The location designates the SPE location of the desired duplication interface circuit pack; either "1a", "1b" "a" or "b".
short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. The long version includes a destructive test for this command.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test duplication-interface," the following message is displayed:

```
Enter [network(1);carrier(A-B) ['long' or 'short'],
     ['repeat' (1-100) or 'clear'], ['schedule']
```

Error Messages

For any system, if a user entered parameter is not among those listed in the "Parameters" section, the following message is displayed:

```
Entry invalid
```

If an invalid port network is specified, the following message is displayed:

```
Invalid port-network specified
```

If an invalid carrier is specified, the following message is displayed:

```
Invalid carrier specified
```

If the standby is entering maintenance mode when this command is executed, then the following message is displayed:

```
Cannot interrupt Standby SPE while entering
maintenance mode; please try later
```

If the standby SPE is not refreshed when this command is executed, then the following message is displayed:

```
Standby SPE memory not refreshed;
use the "refresh spe-standby" command.
```

If the standby SPE is not refreshed and the active SPE is hard selected via the SPE select switches when this command is executed, then the following message is displayed:

```
Active SPE locked via select switches;
Standby SPE memory not refreshed
```

If the standby SPE is busy with another task, then the following message is displayed:

```
Standby SPE busy with another task;
for information use "status system 1"
```

If the standby SPE is not available when this command is executed, then the following message is displayed:

```
Standby SPE not available;
for information use "status system 1"
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	The port address (cabinet-carrier) will always be 01A or 01B.
Maintenance Name	The maintenance name will always be SHDW-CIR, SPE-SELE, or DUPINT.
Alt. Name	Not applicable.
Test No.	The actual test that is being executed.
Result	The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED."
Error Code	A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

For the following output example, assume that the command that was entered was "test duplication-interface 1A" while "A" was the active carrier in an SPE duplex system.

```
test duplication-interface a long                      SPE A

                                TEST RESULTS

  Port    Maintenance Name  Alt. Name Test No. Result      Error Code
  1A      SHDW-CIR                    285      PASS
  1A      SHDW-CIR                    283      PASS
  1A      SHDW-CIR                    284      PASS
  1A      SPE-SELE                    278      PASS
  1A      DUPINT                      315      PASS
  1A      DUPINT                      275      PASS
  1A      DUPINT                      276      PASS
  1A      DUPINT                      280      PASS
  1A      DUPINT                      271      PASS
  1A      DUPINT                      277      PASS
  1A      DUPINT                      272      PASS
  1A      DUPINT                      274      PASS
  1A      DUPINT                      273      PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

Failures of the duplication-interface may prevent SPE switching.

Test EDA-External-Device-Alrm

test eda-external-device-alrm all | physical location [repeat number | clear][schedule]

This test will perform hardware diagnostic tests on an individual external-device-alarm port or on all external-device-alarm ports.

The **test eda-external-device-alrm** command performs a hardware diagnostic test on all administered external device alarms if all is entered. If an administered external device alarm port is entered, the test external-device-alarm command performs a hardware diagnostic test on that port. The test PASSES if the external device is not reporting an external device alarm and FAILS if the external device is reporting an external device alarm. If the technician specifies the port it must be administered as an external device alarm port on a maintenance board or on an analog line port carrier board.

Defaults

The default for this command is a repeat of 1.

Parameters

physical location	In addition to entering the word "physical" the system technician must specify the physical location. For an administered external device alarm analog line port, a "physical location" represents the physical position of the port to be tested and is entered as "**UUcSSpp**" where "**UU**" represents the cabinet number (1-MAX_CABS), "**c**" represents the carrier, "**SS**" represents the slot position, and "**pp**" represents the circuit. Since the "maintenance board" alarm connections connect to control carrier boards that are in unnumbered slots, the standard port format cannot be used to designate these alarm connections. The special ports **UUmajor** and **UUminor** are used designate the major or minor maintenance board alarm connection for cabinet **UU**. **NOTE:** The major/minor designation specifies the pair of wires, not the alarm level associated with the connection (*i.e.* the "major" port can be administered as a major, minor or warning alarm and the "minor" port can be administered as a major, minor or warning alarm). The "all" location is used to test all administered external device alarm ports on analog line boards and maintenance boards.
repeat number	The "number" specifies how many times the “test physical location” is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specifications [1] for more details.

Examples

test eda-external-device-alrm all
test eda-external-device-alrm all schedule
test eda-external-device-alrm physical 1major r 10
test eda-external-device-alrm physical 2c1101 c

Output

For the following output example the command that was entered was "**test external-device-alarm all**":

```
test eda-external-device-alrm all

                             TEST RESULTS

  Port      Maintenance Name  Alt. Name Test No. Result           Error Code

  03major   EXT-DEV            CMS1      120      PASS
  03A2102   EXT_DEV            CMS2      120      FAIL
  01major   EXT-DEV            UPS1      120      PASS
  01minor   EXT-DEV            UPS1      120      PASS
  01c1201   EXT-DEV            UPS1      120      PASS
  03A2101   EXT_DEV            CC temp   120      PASS
  01c1202   EXT-DEV            Audix1    120      PASS
  03minor   EXT-DEV            Audix2    120      FAIL
  04major   EXT-DEV            unknown   120      FAIL

Command successfully completed
```

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Field definitions:

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.
Maintenance Name	The type of maintenance object that is being tested.
Alt. Name	The alternate means of identifying the maintenance object. This is an administered more descriptive name of the external device alarm
Test No	The actual test that is being executed.
Result	The result of the individual test -"PASS", "ABORT", "FAIL", "NO BOARD", "DISABLED", "EXTRA BD".
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

test environment

This command will test the environment monitoring and control capabilities including emergency transfer in any cabinet.

SYNOPSIS

test environment location *[short | long][repeat number | clear] schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

test environment
test environment schedule
test environment 1 sh
test environment 1 l r 25
test environment 01 l r 25
test environment 01 l r 25 schedule
test environment 2 l c
test environment 3 c

DESCRIPTION

The test environment command performs hardware diagnostic tests of the environment monitoring and control, and emergency transfer functions of a technician specified cabinet. This command will test both Processor Port Network (PPN) cabinets and Expansion Port Network (EPN) cabinets. Circuit packs involved are the Processor circuit pack (PPN simplex systems), the Duplication Interface circuit pack (PPN duplex systems) and EPN Maintenance circuit packs. The tone/clock circuit pack is involved in tests of the ring generator.

There are 8 Maintenance Objects involved in this testing. DC-POWER tests power availability, battery charging and temperature functions in SCC cabinets only. EMG-XFER tests emergency transfer status, and EXT-DEV tests external (i.e. AUDIX) alarm status for both the SCC and MCC cabinet systems. POWER tests battery backup, AC-POWER tests AC power availability, CARR_POW tests carrier DC power availability, CABINET tests air flow and temperature, RING_GEN tests ringing voltage are tested in MCC cabinets only.

Note that the long test of CARR_POW includes a power recycle test for non-Processor Element (SPE) carriers and is destructive. There is one instance of CARR_POW for each carrier in the cabinet.

NOTE:
The processor carrier and its duplicate if present as well as any EPN control carrier or an SCC carrier will not be recycled. All port carriers are recycled, and service is interrupted for each port carrier. If a carrier containing an active EI is recycled, communications with that cabinet will be disrupted. If a carrier containing an active tone-clock board is recycled, all ports in the cabinet or port network will have service disrupted.

Defaults

The default cabinet is cabinet 1. Defaults for the remaining parameters are short with a repeat of 1.

Parameters

location	The location the cabinet number. The cabinet number is one or two digits from 1 to 3 with leading zeros allowed. Cabinet 1 is the PPN with 2-3 referring to some optional EPN.
short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. This includes both destructive and nondestructive tests for this command.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test environment," the following message will be displayed:

```
Enter [cabinet(1-3)],['long' or 'short'],
['repeat'(1-100) or 'clear'],['schedule']
```

Error Messages

If the entered cabinet location is greater than two characters or otherwise invalid, the following error message is displayed:

```
Identifier invalid
```

If the indicated EPN is not available, the following message is displayed:

```
EPN is not available
```

If the command entered is in conflict with another currently executing command, then a message is displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	The port address (cabinet-carrier) of the maintenance object that is being tested. For all but the CARR-POW maintenance object, only the cabinet value is displayed. For the CARR-POW maintenance object, both the cabinet and carrier values are displayed.
Maintenance Name	The type of maintenance object that is being tested.
Alt. Name	Not applicable.
Test No.	The actual test that is being executed.
Result	The result of the individual test -"PASS," "ABORT," "FAIL," "DISABLED."
Error Code	A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

For the following output example, assume that the command that was entered was "test environment 1" to test a MCCPPN cabinet.

```
test environment 1

                            TEST RESULTS

  Port    Maintenance Name  Alt. Name Test No. Result       Error Code
  01      POWER                           5      PASS
  01      AC-POWER                       79      PASS
  01A     CARR-POW                      127      PASS
  01B     CARR-POW                      127      PASS
  01C     CARR-POW                      127      PASS
  01D     CARR-POW                      127      PASS
  01E     CARR-POW                      127      PASS
  01      EMG-XFER                      124      PASS
  01      CABINET                       122      PASS
  01      EXT-DEV                       120      PASS
  01      RING-GEN                      118      PASS

Command Successfully Completed
```

For the following output example, assume that the command that was entered was "test environment 2" where cabinet 2 is an SCC cabinet.

```
test environment 2

                             TEST RESULTS

  Port    Maintenance Name  Alt. Name Test No. Result       Error Code
  02      DC-POWER                       5      PASS
  02      EMG-XFER                     124      PASS
  02      EXT-DEV                      120      PASS
  02      RING-GEN                     117      PASS
  02      RING-GEN                     118      PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

The long test will recycle power in some specified cabinet on non-SPE and maintenance board carriers and is destructive. Specifically, the 'a' carrier of PPNs and EPNs does not have power recycled. In PPNs containing duplicated SPEs the 'b' carrier also does not have power recycled.

All port carriers are recycled, and service is interrupted for each port carrier. If a carrier containing an active EI is recycled, communications with that cabinet will be disrupted. If a carrier containing an active tone-clock board is recycled, all ports in the cabinet or port network will have service disrupted.

test hardware-group

This command allows a user to perform a set of hardware diagnostic tests on the whole system, a carrier, cabinet, spe, or board. The tests will vary according to the configuration of the system and the specified command options.

SYNOPSIS

test hardware-group [system | carrier carrier location |

cabinet cabinet location | board board location | spe]

[print | schedule]

PERMISSIONS

The following logins may execute this command: inads, init.

EXAMPLES

test hardware-group system
test hardware-group system print
test hardware-group carrier 1a
test hardware-group carrier 1a schedule
test hardware-group cabinet 2
test hardware-group board 01c07
test hardware-group board 01c07 schedule
test hardware-group spe
test hardware-group spe print
test hardware-group spe schedule

DESCRIPTION

The "test hardware-group" command will run a series of tests on all the hardware on the entire system, an individual carrier, cabinet, spe, or board. The tests will vary depending on options chosen and board types. Each individual test will exercise diagnostics on all the hardware in the specified hardware group and return results of the test along with any possible error codes. Concurrent testing is done to enhance performance, therefore, test results are displayed on the SAT in the order they are received. Consequently, test results of one maintenance object may be intermixed with test results of other maintenance objects.

Because the tests in the "test hardware-group" command are not destructive, the tests performed on a particular maintenance object with either the 'short' or the 'long' option of the "test hardware-group" command may not be the same as the corresponding demand tests.

A hardware-group command executing in the foreground may be aborted by either pressing the ’cancel’ key on the SAT or by entering the "cancel hardware-group" command on a different SAT.

However, if the system technician wishes to cancel a "test hardware-group" command running in the background the "cancel hardware-group" command needs to be entered on any SAT.

A canceled "test hardware-group" command can be resumed at the point it left off by entering the "resume hardware-group" command on the SAT. Restarts are not allowed for "test hardware-group" commands entered with either the "all-ports" option or the "spe-interchange" option.

Defaults

The default for the command is short with a repeat of 1.

Parameters

carrier location	A ’carrier location’ represents the carrier to be tested and is entered as UUC format where ’UU’ is a valid cabinet number (1-3) and the ’C’ represents any value between A-E. The type of carrier may be port, or processor. In the case of a port carrier, all universal port and tone-clock boards (see reference 4) and its affiliated MOs residing in the specified carrier are tested. For a processor carrier, all SPE complex and tone-clock boards and its affiliated MOs are tested.
cabinet location	A ’cabinet location’ represents the cabinet to be tested. It can be any value between 1-3. All PN and PNC related MOs plus cabinet specific MOs, including maintenance boards and environment (ring generator, battery, power, emergency transfer, external alarms, fans, and temperature) will be tested if they reside in the specified ’cabinet location’.

board location	A 'board location' represents the physical location of the board and is entered as 'UUCSS' format, where 'UU' is a valid cabinet number (1-3), 'C' is a carrier number between A-E, and 'SS' is the slot position. All MOs on the specified 'board location' including ports will be tested.
print	This will cause the report to be printed if a printer is linked to the SAT.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [5] for more details.

Help Messages

If the system technician presses HELP after entering "test hardware-group" the following message will be displayed:

```
board  cabinet  carrier  spe  system
```

If the system technician presses HELP after entering "test hardware-group board" the following message will be displayed:

```
Enter board location: [cabinet (1-3);
     carrier (A-E);slot(00-20)]
```

If the system technician presses HELP after entering "test hardware-group cabinet" the following message will be displayed:

```
Enter cabinet (1-3)
```

If the system technician presses HELP after entering "test hardware-group carrier" the following message will be displayed:

```
Enter carrier location:
['cabinet'(1-3)]; carrier (A-E)
```

If the system technician presses HELP after entering "test hardware-group system" the following message will be displayed:

```
Entry is not required
```

If the system technician presses HELP after entering "test hardware-group spe" the following message will be displayed:

```
Entry is not required
```

Error Messages

If there is another "test hardware-group" active the following message will be displayed:

```
Command aborted - another hardware-group
        test already in progress
```

If an "add station" command is entered for a non-customer translated port at the same time as it is being tested because of the "test hardware-group" command with the ’all-ports’ option the request to "add station" will fail and the following message will be displayed:

```
Object in use; please try later
```

If an invalid physical location is specified with the "test hardware-group board" command the following message will be displayed:

```
Board invalid
```

If an unassigned board is specified with the "test hardware-group board" command the following message will be displayed:

```
Board not assigned
```

If an invalid carrier is specified with the "test hardware-group carrier" command the following message will be displayed:

```
Invalid carrier specified
```

If an invalid cabinet is specified with the "test hardware-group cabinet" command the following message will be displayed:

```
Invalid cabinet specified
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
’login id’:’command’ has a command conflict
```

FORM INPUT

Once the user has entered the desired action (test hardware-group) and the object (board, carrier, etc.), then the user is presented with an options form.

Test sequence	This allows the user to specify whether the short (nondestructive) or the long (more comprehensive and still nondestructive) test sequence should be exercised.
Test Repetition	This allows the user to enter either ’repeat’ with a corresponding repeat value (between 1 and 99) or ’continuously’. The repeat option will cause each test to be executed the number of times specified on each physical object. The continuously option, on the other hand, will cause all tests on all the hardware specified to be executed until the CANCEL key is hit or the ’cancel hardware-group’ command is run.
count:	This field allows the technician to enter a repeat value between 1 and 99. If the ’test sequence’ field is set to continuously, then this field is removed from the screen. When the ’test sequence’ field is set to repeat, then this field is added to the screen.
Auto-page?	This option provides the ability to continue testing and display of test results by providing a new screen every time the SAT screen is filled with test results. The screen does not scroll to accommodate new results; instead a new screen is provided after the current screen fills up. This option is not allowed if the ’background’ option has been chosen. If the ’auto-page’ option is not specified, the SAT screen will not be refreshed once it is filled with test results and testing will stop until the user enters the ’page’ key to continue or ’cancel’ key to halt the testing.

Background? This option provides the ability to run the command in the background thus freeing up the SAT. The error results will be tabulated in the error log but no results will be displayed on the terminal.

This option may not be used if the ’continuously’ option or the ’auto-page’ option is specified.

Failures? This option will select only failing test results to be displayed on the test results screen. Test results which pass or abort are not displayed. The ’failures’ option has no effect if entered with the ’background’ option.

All-ports? The ’all-ports’ option will allow testing of all customer translated line and trunk ports and also a set of line and trunk ports without customer translations. Untranslated ports for the following board types will be tested:

Table 10-7. Test of ‘all ports’ option for the following boards:

Board Number	Description
TN413	Digital Line
TN417	Auxiliary Trunk
TN429	Direct Inward/Outward Dialing Trunk
TN436	Direct Inward Dialing Trunk
TN437	Tie Trunk
TN438	Central Office Trunk
TN439	Tie Trunk
TN447	Central Office Trunk
TN458	Tie Trunk
TN459	Direct Inward Dialing Trunk
TN464C	Universal DS1
TN465	Central Office Trunk
TN467	8 port Analog line
TN468	16 port Analog line
TN479	16 port Analog line

Continued on next page

Table 10-7. Test of 'all ports' option for the following boards: — *Continued*

Board Number	Description
TN497	Tie Trunk
TN556	ISDNBRI Line
TN722B	DS1 Tie Trunk
TN726B	Data Line
TN735	MET Line
TN742	8 port Analog Line
TN746	16 port Analog Line
TN747B	Central Office Trunk
TN753	Direct-Inward-Dial Trunk
TN754	Digital Line
TN760C	Tie Trunk
TN762B	Hybrid Line
TN763C	Auxiliary Trunk
TN767	DS1 Interface
TN769	Analog Line with Message Waiting
TN784	Digital Line
TN785	16 port Analog Line
TN2135	Italian 16 Port Analog Line
TN2136	Digital Line
TN2138	International Central Office Trunk
TN2139	Direct Inward Dialing Trunk
TN2140	Tie Trunk
TN2144	Analog Line
TN2146	Direct Inward Dialing Trunk
TN2147	Central Office Trunk
TN2149	Analog Line
TN2180	16 port Analog line

SPE-interchange?	The 'spe-interchange' option will allow for the planned interchange of duplicated SPEs and subsequent testing of both the active and standby SPEs.

```
test hardware-group system                       Page 1 of 1

           TEST HARDWARE-GROUP SELECTIONS

      Select the desired options for the specified test.
            Test sequence: short
          Test repetition: repeat          count: 1

       OUTPUT OPTIONS:                HARDWARE OPTIONS:
        Auto-page? n               All-ports? n
       Background? n         SPE-interchange? n
         Failures? n
```

Field Help

Following are the help message that the system technician will see upon tabbing to the specified field and pressing the HELP key.

Test sequence	Enter short or long
Test Repetition	Enter repeat or continuously
count:	Enter repeat number between 1-99
Auto-page?	n(o) y(es)
Background?	n(o) y(es)
Failures?	n(o) y(es)
All-ports?	n(o) y(es)
SPE-interchange?	n(o) y(es)

Field Error Message

Following are the error message that will be displayed on the screen. The message are displayed when the system technician tabs out of a field and the validation routines are executed. In the following messages, an "x" represents what was entered by the user.

Test sequence	"x" is an invalid entry, please press HELP
Test Repetition	"x" is an invalid entry, please press HELP
	"x" The background option cannot be chosen with continuous testing
count:	Entry must be all digits
	Entry out of range
Auto-page?	"x" is an invalid entry, please press HELP
	"x" The auto-page and background options may not both be activated
Background?	"x" is an invalid entry, please press HELP
	"x" The background option cannot be chosen with continuous testing
	"x" The auto-page and background options may not both be activated
Failures?	"x" is an invalid entry, please press HELP
All-ports?	"x" is an invalid entry, please press HELP
SPE-interchange?	"x" is an invalid entry, please press HELP

OUTPUT

If the ’background’ option was chosen then the following message is displayed:

```
Command started in background mode
```

Progress information will be displayed on the SAT screen for a "test hardware-group" command run in the foreground. While testing is in progress, a running count of MOs tested, the total number of MOs to be tested, and the current pass number will be displayed on the screen ().

If the all-ports option is entered the following message will be displayed before testing has begun:

```
Preparing unadministered ports for testing
```

If the "failures" option was selected and no tests fail the following message will be displayed:

```
No failing test results available
```

If no tests are available for the MOs in the specified hardware group the following message is displayed:

```
No tests available for MOs in the
    specified hardware group
```

If the spe-interchange option was selected and the command was run from a non-PPNSAT the following message is displayed while the interchange takes place:

```
SPE interchange in progress, please wait
```

If the spe-interchange option was selected and the command was run from the PPNSAT, the interchange will be the last operation to run and then the SAT will be logged off as part of the interchange.

If an interchange cannot be performed the following message is displayed:

```
Cannot perform SPE interchange,
for information use ’status spe’
```

The responses to a "test hardware-group" command run in the foreground will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that has been tested.
Maintenance Name	The type of maintenance object that has been tested.
Alt. Name	The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number.

Test No.	The actual test that has been executed.
Result	An indicator as to whether the test failed, passed or was aborted. Sometimes a maintenance object cannot be tested and one of the following test results will be displayed: NO BOARD The board is administered but not inserted. EXTRA BD The wrong type of board is inserted in this slot. DISABLED This maintenance object has been disabled, either through a demand maintenance command ("disable MO") or by an internal maintenance action. SKIPPED This maintenance object is busy with other maintenance activity. Hardware-group maintenance will **not** preempt other types of testing, not even background maintenance.
Error Code	A numerical description of why the test failed or was aborted.

For the following output example, assume that the board in port network 1, carrier c, slot 7 is an analog board with three ports administered. The command that was entered was "test hardware-group system" and a repeat with count of 3 was chosen.

```
test hardware-group system

                                TEST RESULTS

  Port      Maintenance Name  Alt. Name Test No. Result       Error Code
  01C07     ANL-BD                      51       PASS
  01C07     ANL-BD                      52       PASS
  01C0703   ANL-LINE                    35       PASS
  01C0702   ANL-LINE                    35       PASS
  01C0703   ANL-LINE                    48       PASS
  01C0701   ANL-LINE                    35       PASS
  01C0702   ANL-LINE                    48       PASS
  01C0703   ANL-LINE                    36       PASS
  01C0702   ANL-LINE                    36       PASS
  01C0701   ANL-LINE                    48       PASS
  01C0701   ANL-LINE                    36       PASS

Testing system, 11070 of 12300 (90%) MOs tested for repetition 1
```

For the following output example, the command that was entered was "test hardware-group system" and the background option was chosen.

```
test hardware-group system

Command started in background mode
```

FEATURE INTERACTIONS

Test hardware-group

Only one "test hardware-group" command can be active at any given time.

TTI

If the "test hardware-group" command is issued with the ’all-ports’ option when the TTI background task is active, some unadministered ports may not be tested. In addition, active alarms on line ports may be cleared by this task. The "status tti" command may be used to determine the state of the TTI background task.

Add Station

If a "add station" command is entered for an untranslated port at the same time as it is being tested because of the "test hardware-group" command with the ’all-ports’ option, the request to "add station" will fail and the following message will be displayed:

```
Object in use; please try later
```

Trunk Administration

If an attempt is made to add an unadministered trunk port to a trunk group at the same time as it is being tested because of the "test hardware-group" command with the ’all-ports’ option, the request will fail and the following message will be displayed:

```
Object in use; please try later
```

Save Translation

If the "test hardware-group" command is issued with the ’all-ports’ option when a translation save operation is active, some unadministered ports may not be tested. All other hardware will be tested normally.

Hardware Alarms

When a hardware error is detected by the "test hardware-group" command the hardware goes through the standard escalation strategy. Alarms will be raised on hardware that manifest 'hard' errors. This alarming strategy is the same, regardless of whether the ports are translated or not.

System Interaction

The performance of "test hardware-group" is affected by call processing traffic, administration activity, choice of the 'short' or 'long' option, whether the 'all-ports' option was chosen, whether the 'spe-interchange' option was chosen, and other demand maintenance activity.

Scheduled and Periodic maintenance

When a "test hardware-group" command is entered, all activity related to scheduled background maintenance, periodic background maintenance, and data audits is suspended for the duration of the execution of the "test hardware-group" command. When a "test hardware-group" command is canceled or when the "test hardware-group" command completes, all suspended periodic, scheduled, and data audits background maintenance activity will be restarted where it left off.

test inads-link

This command will perform hardware diagnostic tests from the inads port that is accessible through the maintenance board to an OSS telephone number.

SYNOPSIS

test inads-link [1 | 2]

PERMISSIONS

The following default logins may execute this command: system technician, inads, init, nms.

EXAMPLES

test inads-link
test inads-link 1
test inads-link 2

DESCRIPTION

The test inads-link command attempts to make a call over the inads port on the maintenance board to verify the INADS alarm notification process. By default, the link to the first OSS telephone number is tested. If there is an alarm pending to be reported or the call is in progress or up, then the test will be aborted. If the alarm origination to the OSS telephone number to be tested is disabled, the test generates an informative error and the test continues. The test will wait 2 minutes before executing to allow the remote maintenance technician to logoff freeing the line. The line must be free so the system can place a call to INADS. A local SAT user entering the "test inads-link" command need not log off for the system to place a call to INADS, but the two minute delay still exists.

Once the call is answered by INADS, the system will send a message with a test alarm type. INADS acknowledges receipt of the message and creates a trouble ticket. The trouble ticket will be closed immediately and have a "INADS LINK TEST" message entered in the description field. If an alarm is raised while the test call is up, the system will not send an alarm message over the existing link. The normal retry mechanism will be followed, which means an attempt to make a call to INADS to report the error will take place seven (7) minutes later. An INADS trouble ticket will be created only if the connection is successfully established, and a message is sent to the system acknowledging that INADS received the system message.

The "Maintain Process Circuit Packs" field must be set to yes on the inads and technician permission forms. This will provide permissions to execute the "test inads-link" command. The field can be changed by executing a "change permission login" command.

There will be no alarms raised on the system as a result of the "test inads-link" command. Attendant alarm and acknowledgment lamp states will not be changed as a result of the command. The test will not be run during periodic or scheduled maintenance.

Defaults

The test will default to test the link to the first OSS telephone number.

Parameter

1	This option will cause testing of the link to the first OSS telephone number.
2	This option will cause testing of the link to the second OSS telephone number.

Help Messages

If the system technician presses HELP after entering "test inads-link" the following message will be displayed:

['1' or '2']

Or press CANCEL to cancel the command

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

If the test passed then the following message will be displayed:

```
Command successfully completed
```

If the test failed, because the link was up or because there was an active alarm that the switch needs to report or there was a problem with the call, the following message will be displayed:

```
Command failed
```

NOTE: An entry is made in the error log describing why the inads-link test failed.

SYSTEM 85 R3 AND SYSTEM 75 R1 RELEASE DIFFERENCES

None.

FEATURE INTERACTIONS

None.

test interface

This command will test a processor interface board.

SYNOPSIS

test interface location *[short | long][repeat number | clear] schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init, nms.

EXAMPLES

test interface 01a1 l
test interface 01b2 s r 2
test interface 01b2 s r 2 schedule
test interface b1 l r 25
test interface a2

DESCRIPTION

The test interface command performs hardware diagnostic tests on the technician specified processor interface circuit pack. In addition to testing the PI board, the tests will examine the protocol and link interface that is transmitted over the board.

Defaults

The default for the command is short with the repeat of 1.

Parameters

location	The location (cabinet-carrier-position) of the processor interface. The position determines which processor interface circuit pack will be cleared. A position of 1 is the first processor interface in the carrier, while a position of 2 is the second processor interface in the carrier.
short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.

repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence

WARNING:
Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.

schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test interface" the following message will be displayed:

```
Enter [cabinet(1)];carrier(A-B), pos(1-2),
  ['long' or 'short'], ['repeat' (1-100)
        or 'clear'], ['schedule']
```

Error Messages

If the specified carrier is not the active PE, the following message will be displayed:

```
Command must be executed from active SPE
```

If the technician-entered cabinet and carrier is invalid for a PPN, the following message will be displayed:

```
Invalid port-network specified
```

If the technician-entered carrier is not a valid carrier, the following message will be displayed:

```
Invalid carrier specified
```

If the technician-entered carrier is not active, the following error message will be entered:

```
Board invalid
```

If the specified carrier/position processor interface circuit pack is not inserted, but the specified carrier is active, the following error message will be displayed:

```
No such MO's lname/pname
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If the standby is entering maintenance mode when this command is executed, then the following message is displayed:

```
Cannot interrupt Standby SPE while entering
maintenance mode; please try later
```

If the standby SPE is not refreshed when this command is executed, then the following message is displayed:

```
Standby SPE memory not refreshed;
use the "refresh spe-standby" command.
```

If the standby SPE is not refreshed and the active SPE is hard selected via the SPE select switches when this command is executed, then the following message is displayed:

```
Active SPE locked via select switches;
Standby SPE memory not refreshed
```

If the standby SPE is busy with another task, then the following message is displayed:

```
Standby SPE busy with another task;
for information use "status system 1"
```

If the standby SPE is not available when this command is executed, then the following message is displayed:

```
Standby SPE not available;
for information use "status system 1"
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	The port address (cabinet-carrier-slot) of the maintenance object that is being tested. With this particular maintenance object, the port address represents the carrier associated with the particular processor interface board.
Maintenance Name	The type of maintenance object that is being tested.
Alt. Name	Not applicable.
Test No	The actual test that is being executed.
Result	The result of the individual test - "PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

For the following output example, assume that the command that was entered was "test interface a1".

```
test interface a1

                              TEST RESULTS

  Port    Maintenance Name  Alt. Name Test No. Result      Error Code
  01A1    PI-SCI                      231      PASS
  01A1    PI-BD                       52       PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

None.

test isdn-testcall

This command starts an outgoing ISDN-PRI test call.

SYNOPSIS

test isdn-testcall group number*/member number minutes minute number schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

test isdn-testcall 80/1
test isdn-testcall 80/1 schedule
test isdn-testcall 78/2 minutes 10
test isdn-testcall 78/3 minutes 100 schedule

DESCRIPTION

The test isdn-testcall command starts an outgoing ISDN-PRI test call in the asynchronous method. The trunk to originate the ISDN-PRI test call from is specified. If the test results are "PASS" the test call is started. A test result of "ABORT" means that a resource wasn't available (i.e. B-channel, Maintenance/Test circuit pack). A test result of "FAIL" denotes that the outgoing ISDN-PRI test call was not established.

Defaults

The duration of the test call defaults to 8.4 or 9.6 seconds.

Parameters

group number	The group number is an administered number associated with each trunk group.
member number	The member number is an administered number identifying a particular trunk within a trunk group.
minute number	The duration of the test call specified in minutes (1-120).
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test isdn-testcall" the following message will be displayed:

```
Enter group #/member # ['minutes' (1-120)],
                ['schedule']
```

Error Messages

If the specified format of the trunk location is incorrect, the following message is displayed:

```
Format invalid
```

If the specified trunk group or member range is invalid, the following message is displayed:

```
Trunk or trunk group invalid
```

If a trunk group and member is not specified, the following message is displayed:

```
Must specify group/member pair
```

If the specified trunk group is not administered or has no members administered, the following message is displayed:

```
Group not assigned, or group assigned
         but with no member
```

If the specified trunk group member is not administered, the following message is displayed:

```
Group member not assigned
```

If the specified trunk is not an ISDN-PRI trunk, the following message is displayed:

```
Invalid non ISDN-PRI trunk specified
```

If no tests can be found for the associated MO, the following message is displayed:

```
No tests for this MO
```

If an ISDN-PRI test call has already been started, the following message is displayed:

```
There is a test call already in progress
```

If the software data cannot be sent to the SAT, the following message is displayed:

```
Error encountered, can’t complete request
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
’login id’:’command’ has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.
Maintenance Name	The type of maintenance object that is being tested.
Alt. Name	The alternate means of identifying the maintenance object. This field contains the trunk object xxx/yyy, where xxx is the trunk group number and yyy is the member number.

Test No	The actual test that is being executed.
Result	The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."
Error Code	A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO [for example, see "ISDN-TRK (DS1 ISDN Trunk)" section error code description Test Number 258].

For the following output example the command entered was "test isdn-testcall 80/1".

```
test isdn-testcall 77/1                             SPE A

                        TEST RESULTS

  Port      Maintenance Name  Alt. Name Test No. Result       Error Code
  01B1501   ISDN-TRK          077/001   258      PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

Additional data is available after running the test. See the status isdn-testcall command for details on how to access the additional data.

Only one ISDN trunk can be tested per port network at a time. Once testing is completed, another ISDN trunk can be tested in that port network.

The maximum number of asynchronous outgoing test calls running, depends on the number of Maintenance/Test circuit packs in the system.

test journal-printer

This command will perform tests on the journal printer links.

SYNOPSIS

test journal-printer [pms-log | wakeup-log] *[short | long][repeat number | clear] schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

test journal-printer pms-log l
test journal-printer pms-log l schedule
test journal-printer wakeup-log r 2
test journal-printer wakeup-log r 2 schedule
test journ pm r 3
test journ pm r 3 schedule

DESCRIPTION

The test journal-printer command will perform hardware diagnostics on the link between the switch and one of the technician specified journal printer links. There are two types of journal printer links (pms-log wakeup-log).

For general information on journal printer links, see the second paragraph in the "DESCRIPTION" section of the "busyout pms-link" manual pages.

For information on what a journal printer is and does, see the second paragraph in the "DESCRIPTION" section of the "status journal-link" manual pages.

Defaults

The default for the command is short with the repeat of 1.

Parameters

pms-log	This will test the link to the pms logging printer. The maintenance name for the pms-log printer, displayed on the test results form on output, is PMS-PRNT.
wakeup-log	This will test the link to the wakeup logging printer. The maintenance name for the wakeup-log printer, displayed on the test results form on output, is JNL-PRNT.
short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test journal-printer", the following object command word choices will be displayed:

```
pms-log    wakeup-log
```

Error Messages

If the link is not administered, the following error message will be displayed:

```
Link not administered or not enabled
```

If no tests can be found for the link, the following message will be displayed:

```
No tests for this MO
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	Not applicable. Will always be blank.
Maintenance Name	The type of maintenance object that is being tested. If testing the pms-log printer link the maintenance name will be PMS-PRNT, else if testing the wakeup-log printer link the maintenance name will be JNL-PRNT.
Alt. Name	Not applicable. Will always be blank.
Test No	The actual test that is being executed.
Result	The result of the individual test - "PASS", "ABORT", "FAIL", "DISABLED".
Error Code	A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

For the following output example, assume that the command that was entered was "test journal-printer pms-log".

```
test journal-printer pms-log short

                              TEST RESULTS

  Port    Maintenance Name  Alt. Name Test No. Result       Error Code
          JRNL-LINK                   215      PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

The maintenance of a particular component on a link will sometimes interfere with the maintenance of the link itself. Maintenance can put a link component in a busy state causing link set-up to fail. Frequent attempts at re-setup of a link may delay the recovery of a faulty component, due to the maintenance test of a component only taking place when the component is idle. Therefore, the technician needs to be able to disable the attempted re-setup of a link. The busyout command is used to do this, and will cause the link to be torn down. If the link is already down, the busyout command will stop periodic re-setup trys on the link.

test led

This command will perform a test on all the LEDs in a specified cabinet. The test consists of turning all the LEDs on all circuit packs on and then off.

SYNOPSIS

test led *[all | cabinet number] [short | long] repeat number*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

test led
test led all r 2
test led cabinet 1
test led c 1
test led 1 long

DESCRIPTION

The test led command will validate that the specified cabinet exists. Once the range of circuit packs is determined, the test LED command will turn on all LEDs on the circuit packs contained in each carrier until all affected carriers are lit. Once all the LEDs are on there will be a 2 second pause and then all the LEDs will be turned off in the same order as they were lit. Once all of the repeat cycles are completed, all affected LEDs will be restored to the current status.

On a duplex PPN, only the long option will test the leds in the standby SPE. When executing the test led long command, the standby Processor, Memory and Packet Control circuit pack LEDs can take up to 20 seconds to light.

The following LEDs are NOT lighted by the test led command:

- SPE Select LEDs on the Duplication Interface Circuit Packs.
- Power Unit LEDs.
- The yellow (amber) LED on the tape drive.

Defaults

The default for the command is "all" with a repeat of 1 and short in a duplex system.

Parameters

all	All LEDs in all carriers will be tested.
cabinet number	The number of the cabinet that will be tested. Each carrier in the cabinet will complete testing before the next carrier is started.
short	In a simplex system the short and long option are identical and will turn on and off all leds in the specified port network. In a duplex system, the short option will NOT affect the leds in the standby SPE carrier in the PPN.
long	In a simplex system the short and long option are identical and will turn on and off all leds in the specified port network. In a duplex system, the long option will affect the leds in the standby SPE carrier in the PPN.
repeat number	The "number" specifies how many times each test is repeated. "Number" may be any integer between 1 and 100.

Help Messages

If the system technician presses HELP after entering "test led" the following message will be displayed:

```
Enter ['all' or 'cabinet' (1-3)],
['long' or 'short' ], ['repeat' (1-100)]
```

Error Messages

If there is an error in the input to the command, where "x" is the invalid input, the following message will be displayed:

```
"x" is an invalid identifier;
press RETURN to execute modified command
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

OUTPUT

If the command is successful, the following message will be displayed:

```
Command successfully completed
```

FEATURE INTERACTIONS

None.

test link

This command will perform a set of hardware diagnostic tests on the specified link.

SYNOPSIS

test link link-id *[short | long][repeat number | clear] schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

test link 1
test link 1 schedule
test link 3 l
test link 2 sh
test link 2 r 2
test link 2 l c

DESCRIPTION

The test link command will validate that the link specified is administered. Then the tests for a link will be executed on the specified link. The results of the test along with any possible error codes are displayed.

Defaults

The default for the command is short with the repeat of 1.

Parameters

link-id	A link number between 1-8 that identifies the link to be tested. The link number is assigned via the communication-interface links form.
short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.

repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.

WARNING:

Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.

schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test link" the following message will be displayed:

```
Enter link number(1-8), ['long' or 'short'],
  ['repeat' (1-100) or 'clear'], ['schedule']
```

Error Messages

If the link number is not within the valid range, then the following error message is displayed:

```
Link out of range, please press HELP
```

If the link has not been administered, then the following message is displayed:

```
Link not administered or not enabled
```

If there are no tests for the current MO, the following message is displayed:

```
No tests for this MO
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message is displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	Port address on the Processor Interface board associated with the link-id being tested.
Maintenance Name	The type of maintenance object that is being tested.
Alt. Name	Not applicable.
Test No	The actual test that is being executed.
Result	The result of the individual test - "PASS", "ABORT", "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."
Error Code	A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

Following is an sample output for the command "test link 1 long".

```
test link 1 long

                             TEST RESULTS

  Port      Maintenance Name  Alt. Name Test No. Result       Error Code
  01AXX01   PI-LINK                     182      PASS
  01AXX01   PI-LINK                     183      PASS
  01AXX01   PI-LINK                     234      PASS
  01AXX01   PI-LINK                     233      PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

None.

test maintenance

This command will test the EPN maintenance circuit pack in any Expansion Port Network control carrier.

SYNOPSIS

test maintenance location *[short | long][repeat number | clear] schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

test maintenance 2
test maintenance 3 schedule
test maintenance 2 sh
test maintenance 2 l c

DESCRIPTION

The test maintenance command performs hardware diagnostic tests on a technician specified maintenance circuit pack. Specifying cabinets 2 through 3 will allow testing of any connected EPN maintenance circuit packs.

For the EPN maintenance circuit pack, the SAT interface, EI link, reset and sanity functions are tested. The long test resets the EPN maintenance circuit pack causing the EPNSAT link to be dropped and is destructive.

Defaults

The default for the parameters are short with a repeat of 1.

Parameters

location	The location designates the physical position of the desired maintenance circuit pack. The location consists of a cabinet number and carrier letter. The cabinet number is one or two digits from 2 to 3 with leading zeros allowed.
short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. This includes both destructive and nondestructive tests for this command.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test maintenance", the following message will be displayed:

```
Enter [cabinet(2-3)];carrier(A)],
['long' or 'short'],   ['repeat'(1-100)
or 'clear'], ['schedule']
```

Error Messages

For any system, if the entered value is invalid, the following message will be displayed:

```
Identifier invalid
```

If the port network specified is not available, the following message will be displayed:

```
EPN is not available
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	The port address (cabinet-carrier) of the maintenance object that is being tested. For this maintenance object, only the cabinet and carrier values are displayed.
Maintenance Name	The maintenance name will always be MAINT.
Alt. Name	Not applicable.
Test No.	The actual test that is being executed.
Result	The result of the individual test -"PASS," "ABORT," "FAIL," "DISABLED."
Error Code	A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

For the following output example, assume that the command that was entered was "test maintenance 2".

```
test maintenance 2

                              TEST RESULTS

  Port    Maintenance Name  Alt. Name Test No. Result       Error Code
  02A     MAINT                       106      PASS
  02A     MAINT                       229      PASS
  02A     MAINT                       303      PASS
  02A     MAINT                       337      PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

The long test on EPN maintenance circuit packs will cause the EPNSAT link to be dropped. The reset test is the last test and drops this link.

test memory

This command will test memory circuit packs.

SYNOPSIS

test memory location *[short | long][repeat number | clear] schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init, nms.

EXAMPLES

test memory
test memory a
test memory a schedule
test memory 1a2
test memory b1 sh
test memory b l r 25
test memory a l c

DESCRIPTION

This command performs hardware diagnostic tests on any one memory circuit packs or on all memory circuit packs in the technician specified carrier. Neither the short nor the long test is destructive when testing memory.

Defaults

The cabinet default is always cabinet 1. For SPE simplex systems, the default carrier is the "a" carrier. For SPE duplex systems, there is no default carrier. The defaults for the remaining parameters are short with a repeat of 1.

Parameters

location	The location designates the physical position of the desired memory circuit pack. The location consists of a cabinet number and carrier letter. The cabinet number is always optional and must be a "1" or a "01" if entered. The carrier must be either "a" or "b" for SPE duplex systems. For SPE simplex systems, the carrier must be "a" if entered.
short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. The long version does not include any destructive tests for this command.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test memory" on a simplex SPE system the following message will be displayed:

```
      Enter [cabinet(1)];carrier(A),
['long' or 'short'],   ['repeat' (1-100)
        or 'clear'], ['schedule']
```

If the system technician presses HELP after entering "test disk" on a duplex SPE system the following message will be displayed:

```
Enter [cabinet(1)];carrier(A-B),
['long' or 'short'],   ['repeat' (1-100)
or 'clear'], ['schedule']
```

Error Messages

For SPE duplex systems, if no carrier is entered on the command line, the following message will be displayed:

```
A carrier must be specified for duplex systems
```

For any system, if the length of the user entered parameter exceeds five (5), the following message will be displayed:

```
Entry invalid
```

On any system, if any cabinet other than "1" or "01" is specified, the following message will be displayed:

```
Only cabinet '1' may be specified for this command
```

If a carrier is entered which is not valid for the current system configuration (for example, anything other than "A" or "B" for SPE duplex and anything other than the 'a' carrier for SPE simplex), the following message will be displayed:

```
Carrier out of range;
Enter 'a' if SPE simplex, 'a' or 'b' if SPE duplex
```

If the standby SPE was specified, and it does not respond, the following message will be displayed:

```
Standby SPE not available;
for information use 'status system'
```

If an invalid position number is entered, the following message will be displayed:

```
Board position is invalid
```

If a non administered circuit pack location is entered, the following message will be displayed:

```
Memory Board not assigned
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	The port address (cabinet-carrier) of the maintenance object that is being tested.
Maintenance Name	The type of maintenance object that is being tested will be MEM-BD for 286 systems and MEMORY for 386 systems.
Alt. Name	Not applicable.
Test No.	The actual test that is being executed.
Result	The result of the individual test -"PASS," "ABORT," "FAIL".
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

For the following output example, assume that the command that was entered was "test memory 1b".

```
test memory 1b

                          TEST RESULTS

  Port    Maintenance Name  Alt. Name Test No. Result       Error Code
  01B     MEM-BD                      87       PASS
  01B     MEM-BD                      631      PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

None.

test modem-pool

This command will perform hardware diagnostic tests on the specified modem pool group or an individual member of a specified group.

SYNOPSIS

test modem-pool group*/member [short | long] repeat number schedule*

PERMISSIONS

The following default logins may execute this command: init, inads, system technician.

EXAMPLES

test modem-pool 1
test modem-pool 1 schedule
test modem-pool 1/3 l r 2
test modem-pool 1/3 l r 2 schedule
test modem-pool 2 r 2
test modem-pool 2 l

DESCRIPTION

The "test modem-pool" command performs hardware diagnostic tests on all of the members that are in a modem-pool group or, on a single member if the optional member number is supplied.

If the member number is supplied, what is tested depends on the type of modem-pool group, Combined or Integrated. A Combined modem-pool group consists of pairs of Analog and Digital Line ports. One pair of Analog and Digital Line ports used for modem-pooling is called a conversion resource. An Integrated group, on the other hand, consists of modem-pool circuit packs each of which contains two conversion resources. Therefore, when a member number is specified for a Combined modem-pool group, one conversion resource is tested and when a member number is specified for an Integrated modem-pool group, two conversion resources are tested.

Defaults

The default for the command is short with a repeat number of 1.

Parameters

group number	The group number is assigned from administration. The group number may be any administered group from 1-5.
member number	The member number is assigned from administration. A member is a pair of analog and digital line ports (or two pair for the Integrated modem-pool case). The member number may be any administered group member from 1-32.
short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.
repeat number	This number specifies how many times each test in the sequence is to be repeated. The number may be any integer between 1 and 100. For example, if number = 2, then each test in the sequence is executed twice.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test modem-pool" the following message will be displayed:

```
Enter group #(1-5) or group #/member #,
['long' or 'short'], ['repeat' (1-100)],
['schedule'] or press CANCEL to cancel the command
```

Error Messages

If the "test modem-pool" command is entered from a login for which the command is not valid, then the following message will be displayed:

```
"test" is an invalid entry; please press HELP
```

If the group or member numbers entered are not digits, then the following message will be displayed:

```
Identifier invalid
```

If the group number or member number entered is not within the valid range of groups or members, the following message will be displayed:

```
Boards not assigned
```

If the group is not administered or is administered but with no members, the following message will be displayed:

```
Group not assigned, or group
assigned but with no member
```

If the a member is assigned, but the port is does not exist in the system, then the following message is displayed:

```
Port not assigned
```

If there are no tests found for the maintenance object, the following message will be displayed:

```
No tests for this MO
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.
Maintenance Name	The type of maintenance object that is being tested. This is always MODEM-PT.
Alt. Name	This field is not applicable to this command.

Test No	The actual test that is being executed.
Result	The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

In the following output example, the command "test modem-pool 1/3" was entered.

```
test modem-pool 1/3 short                         SPE B

                              TEST RESULTS

  Port      Maintenance Name  Alt. Name Test No. Result       Error Code
  01C0701   MODEM-PT                  98       PASS
  01C0701   MODEM-PT                  99       PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

None.

test network-control

This command will test a network control board.

SYNOPSIS

test network-control location *[short | long][repeat number | clear] schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

test network-control
test network-control a l
test network-control b sh r 2
test network-control b l r 25
test network-control a
test network-control a c

DESCRIPTION

The test network-control command performs hardware diagnostic tests on a technician specified network control circuit pack.

Defaults

The default for the command is cabinet 1, carrier a, short with a repeat of 1.

Parameters

location	The location designates the desired network control board carrier in a High or Critical Reliability System (i.e. "a" or "b").
short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.

WARNING:

Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.

schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test network-control" the following message will be displayed for a simplex switch configuration:

```
Enter ['long' or 'short'], ['repeat' (1-100)
        or 'clear'], ['schedule']
```

For a duplex switch configuration, the following message will be displayed:

```
Enter [cabinet(1)];carrier(A-B),
['long' or 'short'], ['repeat' (1-100)
or 'clear'], ['schedule']
```

Error Messages

If the SPE is not active, the following message will be displayed:

```
Command must be executed from active SPE
```

If the carrier entered is invalid, the following message will be displayed:

```
"entered value" is an invalid identifier;
press RETURN to execute modified command
```

If the switch system is a 386 system [G3iV2-386, G3sV2, G3vsV2], and the NETCON board is not TN777B, then the following message will be displayed:

```
Must install TN777B circuit pack
```

If the entered standby carrier cannot be retrieved, the following message will be displayed:

```
Error encountered, can't complete request
```

If there aren't any tests found for this MO, the following message will be displayed:

```
No tests for this MO
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

If the standby is entering maintenance mode when this command is executed, then the following message is displayed:

```
Cannot interrupt Standby SPE while entering
maintenance mode; please try later
```

If the standby SPE is not refreshed when this command is executed, then the following message is displayed:

```
Standby SPE memory not refreshed;
use the "refresh spe-standby" command.
```

If the standby SPE is not refreshed and the active SPE is hard selected via the SPE select switches when this command is executed, then the following message is displayed:

```
Active SPE locked via select switches;
Standby SPE memory not refreshed
```

If the standby SPE is busy with another task, then the following message is displayed:

```
Standby SPE busy with another task;
for information use "status system 1"
```

If the standby SPE is not available when this command is executed, then the following message is displayed:

```
Standby SPE not available;
for information use "status system 1"
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested. This object is always associated with cabinet 1. For maintenance objects: DATA-BD, SW-CTL, 12V-PWR, CARD-MEM, the slot and circuit fields of port address are blank. The administered data channel maintenance object, DATA-CHL, uses the "XX" as the slot address and has a circuit number between 01 and 04. The carrier field has a value "A" for the control carrier A in a simplex system, and "A" or "B" for control carriers A and B in a duplex system.
Maintenance Name	The type of maintenance object that is being tested. The maintenance objects are: DATA-BD for Network Control board, SW-CTL for Switch Control Arch-angel, DATA-CHL for administered data channel, 12V-PWR for 12 volt power supply unit on Network Control board, CARD-MEM for flash memory card on Network Control board. 12V-PWR and CARD-MEM are shown only when the Network Control board is TN777B in 386 systems [G3iV2-386, G3sV2, G3vsV2].
Alt. Name	This field contains the extension number of the DATA-CHL if administered. For other maintenance objects, this field is not applicable and left empty.
Test No	The actual test that is being executed.
Result	An indicator such as "PASS" for test passed, "FAIL" for test failed, "ABORT" for test was aborted, "NO BOARD" for no Network Control Board was inserted.
Error Code	A system-generated number that tells why the individual test failed or was aborted. A detailed list of the codes according to "Test No." is provided for each maintenance object.

For the following output example, assume that the entered command was "test network-control a".

```
test network-control a

                              TEST RESULTS

  Port      Maintenance Name  Alt. Name Test No. Result      Error Code
  01A       DATA-BD                     52       PASS
  01AXX01   DATA-CHL          4001      109      PASS
  01AXX01   DATA-CHL          4001      110      PASS
  01AXX01   DATA-CHL          4001      111      PASS
  01A       SW-CTL                      95       PASS
  01A       SW-CTL                      92       PASS
  01A       SW-CTL                      94       PASS
  01A       SW-CTL                      324      PASS
  01A       12V-PWR                     701      PASS
  01A       CARD-MEM                    695      PASS
  01A       CARD-MEM                    696      PASS
  01A       CARD-MEM                    697      PASS
  01A       CARD-MEM                    698      PASS
  01A       CARD-MEM                    699      PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

None.

test packet-control

This command will test the specified packet-control.

SYNOPSIS

test packet-control *location [short | long][repeat (1-100) | clear] [schedule]*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init, nms

EXAMPLES

test packet-control
test packet-control A
test packet-control B
test packet-control 1A
test packet-control 1B
test packet-control a short
test packet-control a s repeat 5
test packet-control b s r 5
test packet-control b long clear
test packet-control b l r 25

DESCRIPTION

The test packet-control command performs hardware diagnostic tests on a technician specified packet-control circuit pack.

Defaults

For simplex systems, the location is optional and defaults to cabinet 1, carrier A. For duplex systems, the cabinet default is again cabinet 1, but there is no default for the carrier.

Parameters

location	The location only applies to duplicated configurations. If the configuration is a simplex, the location parameter is not used and thus is not valid. For duplicated configurations, a "location" represents the carrier that the packet-control resides on in the system. Valid locations are either 1A or 1B.
short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. The long version does not include any destructive tests for this command.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if on exists against the packet-control) is cleared or a single test in the sequence fails. If no alarms are registered against the packet-control the test sequence will be run only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms related to tests in the short sequence.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test packet-control", the following message is displayed:

```
Enter [cabinet(1)]; carrier (A-B),
['long' or 'short'], ['repeat' (1-100)
or 'clear'], ['schedule']
```

Error Messages

If this command is executed on the standby SPE and this SPE is busy at the moment, the following will be displayed:

```
Standby SPE busy;
See status system for more details
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

Port	This field represents the Cabinet-Carrier in which the Packet-Control resides.
Maintenance Name	The type of maintenance object that is being busied out.
Alt. Name	This field is not used in this output display.
Test No.	This field lists the test run on the packet-control.
Result	An indicator as to whether the object was successfully busied out ("PASS", "FAIL", "ABORT", "NO BOARD", "DISABLED", "EXTRA BD").
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the coeds according to "Test No." is provided for each MO.

For the following output example, the command test packet-control 1B long was entered. Note that carrier B is the active carrier in these example outputs.

```
test packet-control 1B l

                              TEST RESULTS

 Port    Maintenance Name  Alt. Name Test No.  Result      Error Code

 01B     PKT-CTRL                     583      PASS
 01B     PKT-CTRL                     584      PASS
 01B     PKT-CTRL                     585      PASS

Command successfully completed
```

For the following output example, the command test packet-control 1B was entered. Note that carrier B is the active carrier in these example outputs.

```
test packet-control 1B

                             TEST RESULTS

 Port    Maintenance Name  Alt. Name Test No.  Result      Error Code
 01B     PKT-CTRL                      585      PASS

Command successfully completed
```

For the following output example, the command test packet-control 1A was entered. Note that carrier A is the standby carrier in these example outputs.

```
test packet-control 1A

                             TEST RESULTS

 Port    Maintenance Name  Alt. Name Test No.  Result     Error Code
 01A     PKT-CTRL                   586        PASS
 01A     PKT-CTRL                   583        PASS
 01A     PKT-CTRL                   585        PASS

Command successfully completed
```

FEATURE INTERACTIONS

The reset packet-control test (586) does not run on the active packet-control. This test is part of the standby packet-control test sequence as illustrated in the OUTPUT section of this manual page.

test pkt

This command will test the Packet bus on the specified PPN or EPN.

SYNOPSIS

test pkt port-network pn number *[short | long][repeat number | clear] schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

test pkt port-network 1 l
test pkt port-network 2 sh r 2
test pkt port-network 2 sh schedule
test pkt port-network 1 l r 25
test pkt port-network 2
test pkt port-network 1 c

DESCRIPTION

The test pkt runs a series of diagnostic packet bus tests that return results of the test along with possible error codes to the user.

Defaults

The default for this command is short with a repeat of 1.

Parameters

pn number	The individual Packet bus to be tested is entered as "NN" where "NN" represents the port network number of the port network to have its Packet bus tested. A port network number (1-3) may be entered.
short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.

WARNING:

Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.

schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test pkt" the following message will be displayed:

```
Enter ’port-network’, port network number (1-3),
     [’long’ or ’short’], [’repeat’ (1-100)
            or ’clear’], [’schedule’]
```

Error Messages

If the technician does not enter all digits for the port-network number, the following message will be displayed:

```
Entry must be all digits
```

If the port network on which the desired Packet bus resides is unavailable, the following message will be displayed:

```
EPN is not available
```

For any system, if the length of the user entered parameter "port network" exceeds 3 the following message will be displayed:

```
Entry invalid
```

If the packet bus is not activated the following message will be displayed:

```
Packet Bus is not activated,
check system-parameters maintenance form
```

If no tests can be found for the associated MO, the following message is displayed:

```
No tests for this MO
```

If the software data cannot be sent to the SAT, the following message is displayed:

```
Error encountered, can’t complete request
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
’login id’:’command’ has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	A port network number is displayed (1-3).
Maintenance Name	The type of maintenance object that is being tested.
Alt. Name	Not applicable.
Test No	The actual test that is being executed.
Result	The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."
Error Code	A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO [for example, see MO section on "PKT-BUS (Packet Bus)"].

For the following output example, assume that the command that was entered was "test pkt port-network 1".

```
test pkt port-network 1

                 TEST RESULTS

  Port    Maintenance Name  Alt. Name Test No. Result       Error Code
  PN 01   PKT-BUS                     571      PASS
  PN 01   PKT-BUS                     572      PASS
  PN 01   PKT-BUS                     573      PASS

Command successfully completed
```

test pms-link

This command will test a property management system link.

SYNOPSIS

test pms-link *[short | long][repeat number | clear] schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

test pms-link sh r 5
test pms-link l
test pms-link
test pms-link c
test pms-link c sch

DESCRIPTION

The test pms-link command will perform the specified property management system link tests on the specified pms link, by checking to see if the link is accessible and then performing a reset on the link. The above scenario is for the long test only.

For general information on PMS links, see the second paragraph in the "DESCRIPTION" section of the "busyout pms-link" manual pages.

For information on what a PMS is and does, see the second paragraph in the "DESCRIPTION" section of the "status pms-link" manual pages.

Defaults

The default for the command is short with the repeat of 1.

Parameters

short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test pms-link" the following message will be displayed:

```
Enter ['long' or 'short'],
['repeat' (1-100) or 'clear'], ['schedule']
```

Error Messages

If the link is not administered, the following error message will be displayed:

```
Link not administered or not enabled
```

If no tests can be found for the link, the following message will be displayed:

```
No tests for this MO
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	With this object the port field is blank.
Maintenance Name	The type of maintenance object that is being tested (always PMS-LINK).
Alt. Name	Not applicable.
Test No	The actual test that is being executed.
Result	The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

For the following output example, assume that the command that was entered was "test pms-link l".

```
test pms-link long

                              TEST RESULTS

  Port    Maintenance Name  Alt. Name Test No. Result       Error Code
          PMS-LINK                    214      PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

The maintenance of a particular component on a link will sometimes interfere with the maintenance of the link itself. Maintenance can put a link component in a busy state causing link set-up to fail. Frequent attempts at re-setup of a link may delay the recover of a faulty component, due to the maintenance test of a component only taking place when the component is idle. Therefore, the technician needs to be able to disable the attempted re-setup of a link. The busyout command is used to do this, and will cause the link to be torn down. If the link is already down, the busyout command will stop periodic re-setup trys on the link.

test port

This command will perform hardware diagnostic tests on an individual port circuit.

SYNOPSIS

test port location *[short | long][repeat number | clear] schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

test port 01c1101 l
test port 01c1101 l schedule
test port 02e1502 sh r 2
test port 02d1201 r 4
test port 01c1101 c

DESCRIPTION

The test port command performs hardware diagnostic tests on an individual port circuit. In most cases, tests will be performed on hardware that is connected to the port. The technician must specify the port on the port carrier board which the tests are to be performed on.

Defaults

The default for the command is short with the repeat of 1.

Parameters

location	A "location" represents the physical position of the port to be tested and is entered as "UUcSSpp" where "UU" represents the cabinet number (1-3), "c" represents the carrier, "SS" represents the slot position, and "pp" represents the circuit.
short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence. **WARNING:** *Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.*
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test port" the following message will be displayed:

```
Enter port location, ['long' or 'short'],
['repeat' (1-100) or 'clear'], ['schedule']
```

Error Messages

If the format for the port location is incorrect, the following error message will be displayed:

```
Port/Board invalid
```

If the EPN on which the port resides is not accessible, the following message will be displayed:

```
EPN is not available
```

If the board on which the port resides is not configured in the system, the following message will be displayed:

```
Port not assigned
```

If there are no tests found for this maintenance object, the following message will be displayed:

```
No tests for this MO
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.
Maintenance Name	The type of maintenance object that is being tested.
Alt. Name	The alternate means of identifying the maintenance object. This field contains the extension when the object is a station, and it contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number.
Test No	The actual test that is being executed.
Result	The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

For the following output example, assume that the port in cabinet 1, carrier c, slot 7, circuit 1 is an analog port. The command that was entered was "test port 1c0701".

```
test port 01c0701 short

                 TEST RESULTS

  Port      Maintenance Name  Alt. Name Test No. Result       Error Code
  01C0701   ANL-LINE                    35       PASS
  01C0701   ANL-LINE                    48       PASS
  01C0701   ANL-LINE                    36       PASS

Command Successfully Completed
```

test pri-endpoint

This command will perform hardware diagnostic tests on all port circuits (B-channels) that are associated with the PRI endpoint extension.

SYNOPSIS

test pri-endpoint extension *[short | long] repeat number schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init, nms.

EXAMPLES

test pri-endpoint 25012
test pri-endpoint 45002 sh
test pri-endpoint 45892 l
test pri-endpoint 24389 sh r 4
test pri-endpoint 34899 l r 6
test pri-endpoint 34912 l r 5 schedule
test pri-endpoint 93483 r 2
test pri-endpoint 10022 c
test pri-endpoint 92349 schedule

DESCRIPTION

The test pri-endpoint command performs hardware diagnostic tests on all port circuits (B-channels) that are associated with the specified PRI endpoint.

Defaults

The default for the command is short with repeat number of 1.

Parameters

extension	The extension of the PRI endpoint to be tested. The number of digits in an extension is determined by the dial-plan.
short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of nondestructive diagnostic tests.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the user presses HELP after entering "test pri-endpoint", the following message is displayed:

```
Enter extension number, ['long' or 'short'],
      ['repeat' (1-100)], ['schedule']
```

Error Messages

If the format for the extension is incorrect, the following error message will be displayed:

```
Extension invalid
```

If the EPN on which the PRI endpoint resides is not accessible, the following message will be displayed:

```
EPN is not available
```

If the extension is not administered, the following message will be displayed:

```
Extension not assigned
```

If the object associated with the specified extension is not a PRI endpoint, the following message will be displayed:

```
Extension assigned to object other than pri-endpoint
```

If the board that contains the PRI endpoint is not inserted in the system, the following message will be displayed:

```
Board not inserted
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The responses will be displayed on a port-by-port and test-by-test basis with one line of data displayed for each test result.

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.
Maintenance Name	The type of maintenance object that is being tested. The name for PRI endpoint port is "PE-BCHL".
Alt. Name	The alternate way of identifying the maintenance object. This field contains the specified extension number of the PRI endpoint.
Test No	The actual test that is being executed.
Result	The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED."
Error Code	A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

For the following output example, the command "test pri-endpoint 22501" was entered. Assume that the PRI endpoint ports for extension 22501 are in cabinet 1, carrier B, slot 20, circuit 1 to 3.

```
test pri-endpoint 22501 short                    page 1 of 1

                            TEST RESULTS

  Port      Maintenance Name  Alt. Name Test No. Result      Error Code
  01B2001   PE-BCHL           22501     36       PASS
  01B2001   PE-BCHL           22501     255      PASS
  01B2001   PE-BCHL           22501     256      PASS
  01B2001   PE-BCHL           22501     257      PASS
  01B2002   PE-BCHL           22501     36       PASS
  01B2002   PE-BCHL           22501     255      PASS
  01B2002   PE-BCHL           22501     256      PASS
  01B2002   PE-BCHL           22501     257      PASS
  01B2003   PE-BCHL           22501     36       PASS
  01B2003   PE-BCHL           22501     255      PASS
  01B2003   PE-BCHL           22501     256      PASS
  01B2003   PE-BCHL           22501     257      PASS

Command Successfully Completed
```

test processor

This command will test the processor circuit pack.

SYNOPSIS

test processor location *[short | long] clear schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

test processor
test processor schedule
test processor a
test processor 1a
test processor b sh
test processor a l c

DESCRIPTION

The test processor command performs hardware diagnostic tests on a technician specified processor circuit pack.

Defaults

For SPE simplex systems, the location is optional and defaults to cabinet 1, carrier "a". For SPE duplex systems, the cabinet default is again cabinet 1 but there is no default for the carrier. Defaults for the remaining parameters are short with a repeat of 1.

Parameters

location	The location designates the physical position of the desired processor. The location consists of a cabinet number and carrier letter. The cabinet number is always optional and must be a "1" or a "01" if entered. The carrier is an optional "a" for SPE simplex systems but is required for SPE duplex systems and must be either "a" or "b" in this case.
short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. The long version does not include any destructive tests for this command.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test processor" on a simplex SPE system the following message will be displayed:

286:

```
Enter ['long' or 'short'], ['clear'], ['schedule']
```

386:

```
Enter ['long' or 'short'],
['repeat'(1-100) or 'clear'], ['schedule']
```

If the system technician presses HELP after entering "test processor" on a duplex SPE system the following message will be displayed:

286:

```
Enter [cabinet(1)];carrier(A-B),
      ['long' or 'short'],
    ['clear'], ['schedule']
```

386:

```
Enter [cabinet(1)];carrier(A-B),
      ['long' or 'short'],
['repeat'(1-100) or 'clear'], ['schedule']
```

Error Messages

For SPE duplex systems, if no carrier is entered on the command line, the following message will be displayed:

```
A carrier must be specified for duplex systems
```

For any system, if the length of the user entered parameter exceeds three (3), the following message will be displayed:

```
Entry invalid
```

On any system, if any cabinet other than "1" or "01" is specified, the following message will be displayed:

```
Only cabinet '1' may be specified for this command
```

If a carrier is entered which is not valid for the current system configuration (for example, anything other than "A" or "B" for SPE duplex and anything other than the 'a' carrier for SPE simplex), the following message will be displayed:

```
Carrier out of range;
Enter 'a' if SPE simplex, 'a' or 'b' if SPE duplex
```

If the standby SPE was specified, and it does not respond, the following message will be displayed:

```
Standby SPE not available;
for information use 'status system'
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	The port address (cabinet-carrier) of the maintenance object that is being tested.
Maintenance Name	The type of maintenance object that is being tested will be PROCR, PR-MAINT and MEMORY (MEMORY will be displayed only for the 386 processor).
Alt. Name	Not applicable.
Test No.	The actual test that is being executed.
Result	The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD".
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

For the following output example, assume that the command that was entered was "test processor a" for a 286 processor.

```
test processor a                               SPE B

                         TEST RESULTS

  Port    Maintenance Name  Alt. Name Test No. Result      Error Code
  01A     PROCR                       77       PASS
  01A     PROCR                       80       PASS
  01A     PROCR                       82       PASS
  01A     PR-MAINT                    102      ABORT       1018
  01A     PR-MAINT                    103      ABORT       1018
  01A     PR-MAINT                    106      PASS
  01A     PR-MAINT                    228      PASS
  01A     PR-MAINT                    229      ABORT       1018

Command successfully completed
```

"test processor a" for a 386 processor.

```
test processor a                               SPE B

                          TEST RESULTS

  Port    Maintenance Name  Alt. Name Test No. Result      Error Code
  01A     PROCR                           77      PASS
  01A     PROCR                           80      PASS
  01A     PROCR                           82      PASS
  01A     PR-MAINT                       102      ABORT       1018
  01A     PR-MAINT                       103      ABORT       1018
  01A     PR-MAINT                       106      PASS
  01A     PR-MAINT                       228      PASS
  01A     PR-MAINT                       229      ABORT       1018
  01A     MEMORY                          87      PASS
  01A     MEMORY                         631      PASS

Command successfully completed

test shadow-link

This command allows the technician to test the shadow link.

SYNOPSIS

test shadow-link *[short | long][repeat number | clear] schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

test shadow-link l
test shadow-link sh r 2
test shadow-link sh r 2 schedule
test shadow-link c

DESCRIPTION

The test shadow-link command performs hardware diagnostics for the shadow link between the two duplication-interface circuit packs. This command works only with a High or Critical Reliability System. Refer to Chapter 8, "Reliability Systems: A Maintenance Aid" for more details.

Defaults

The default for the command is short with the repeat of 1.

Parameters

short	The short and long test sequence both execute only test #318.
long	The short and long test sequence both execute only test #318.

repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test shadow-link" the following message will be displayed:

```
Enter ['long' or 'short'],
['repeat' (1-100) or 'clear'], ['schedule']
```

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If the standby is entering maintenance mode when this command is executed, then the following message is displayed:

```
Cannot interrupt Standby SPE while entering
maintenance mode; please try later
```

If the standby SPE is not refreshed when this command is executed, then the following message is displayed:

```
Standby SPE memory not refreshed;
use the "refresh spe-standby" command.
```

If the standby SPE is not refreshed and the active SPE is hard selected via the SPE select switches when this command is executed, then the following message is displayed:

```
Active SPE locked via select switches;
   Standby SPE memory not refreshed
```

If the standby SPE is busy with another task, then the following message is displayed

```
Standby SPE busy with another task;
for information use "status system 1"
```

If the standby SPE is not available when this command is executed, then the following message is displayed:

```
Standby SPE not available;
for information use "status system 1"
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	The port address will always be blank for this command.
Maintenance Name	The maintenance name will always be SHDW-LNK for this command.
Alt. Name	Not applicable.
Test No	The test number will always be 318 for this command.
Result	The result of the individual test -"PASS," "ABORT," "FAIL," "DISABLED,".
Error Code	A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

For the following output example, assume that the command that was entered was "test shadow-link"

```
test shadow-link

                              TEST RESULTS

  Port    Maintenance Name  Alt. Name Test No. Result       Error Code
          SHDW-LNK                    318      PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

None.

test signaling-group

This command performs a set of hardware diagnostic tests on the specified signaling group. The tests vary according to whether a short or long option is specified.

SYNOPSIS

test signaling-group group identifier *[short | long][repeat number | clear] schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

test signaling-group 1
test signaling-group 1 repeat 10
test signaling-group 2 short
test signaling-group 4 long
test signaling-group 4 long clear
test signaling-group 2 schedule

DESCRIPTION

The test signaling-group validates that the specified signaling group is administered and runs a series of diagnostic tests that return results of the test along with possible error codes to the user.

A signaling group is a collection of B-channels signaled for by a designated single D-channel or set of D-channels over an ISDN-PRI.

Defaults

The default for the command is short with the repeat of 1.

Parameters

group identifier	The signaling group identifier is an administered number associated with each signaling group (1-8).
short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.

WARNING:
Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.

schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test signaling-group", the following is displayed:

```
Enter group identifier (1-8), ['long' or 'short'],
    ['repeat' (1-100) or 'clear'], ['schedule']
```

Error Messages

If the specified group identifier is non numeric or out of range, the following message is displayed:

```
Signaling group invalid
```

If the specified group identifier is not administered, the following message is displayed:

```
No signaling group assigned
```

If no tests can be found for the associated MO, the following message is displayed:

```
No tests for this MO
```

If the software data cannot be sent to the SAT, the following message is displayed:

```
Error encountered, can't complete request
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message is displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	The signaling group number (1-8) of the signaling group that is being tested.
Maintenance Name	The type of maintenance object that is being tested.
Alt. Name	Not Applicable.
Test No	The actual test that is being executed.
Result	The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."
Error Code	A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO [for example, see MO section on "ISDN-SGR (ISDN-PRI Signaling Group)"].

For the following output example, assume that the command "test signaling-group 1" was entered.

```
test signaling-group 1                           SPE A

                           TEST RESULTS

  Port    Maintenance Name  Alt. Name Test No. Result       Error Code
  1       ISDN-SGR                    636      PASS
  1       ISDN-SGR                    639      PASS
  1       ISDN-SGR                    637      PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

Additional data is available after running a test. See the status signaling-group command for details on how to access the additional data.

test sp-link

This command performs a set of hardware diagnostic tests on the system printer link (if one exists). The tests vary according to whether a short or long option is specified.

SYNOPSIS

test sp-link *[short | long] schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

test sp-link
test sp-link sh
test sp-link l
test sp-link schedule
test sp-link sh sch

DESCRIPTION

The test sp-link command validates that the system printer link is administered and runs a series of diagnostic tests that return results of the test along with possible error codes to the user.

The system printer link is a link from the switch to an external printer over which jobs can be printed. This link is created by administering the system printer extension and setting up a call to the system printer.

Defaults

The default for the command is short.

Parameters

short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test sp-link", the following is displayed:

```
Enter ['long' or 'short'], ['schedule']
```

Error Messages

If the system printer link is not administered, the following message is displayed:

```
Link not administered or not enabled
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message is displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message is displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	Not applicable. Will always be blank.
Maintenance Name	The type of maintenance object that is being tested. This will always be "SYS-PRNT".
Alt. Name	Not applicable. Will always be blank.

Test No	The actual test that is being executed.
Result	The result of the individual test - "PASS", "ABORT", "FAIL", "NO BOARD", "DISABLED", "EXTRA BD".
Error Code	A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

For the following output example the command entered was "test sp-link".

```
test sp-link                                  SPE A

                             TEST RESULTS

  Port    Maintenance Name  Alt. Name Test No. Result       Error Code
          SYS-PRNT                    215      PASS
          SYS-PRNT                    213      PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

None.

test spe-standby

This command allows the technician to test the standby Switch Processing Element.

SYNOPSIS

test spe-standby *[short | long][repeat number | clear]*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

test spe-standby long
test spe-standby l
test spe-standby s r 2
test spe-standby c

DESCRIPTION

The test spe-standby command performs hardware diagnostic tests on the standby Switch Processing Element (SPE) in a duplex SPE system. This command tests all MOs in the standby MO. The STBY-SPE MO itself does not have any defined tests. Instead tests are run on the following MOs when the **test spe-standby** command is run. Refer to the sections for these MOs for more details. This command is only for a High or Critical Reliability System. This command will run the following tests on the standby SPE:

1. MEM-BD (286 systems)
2. MEMORY (386 systems)
3. SHDW-LNK
4. SHDW-CIR
5. SPE_SELEC
6. DUPINT
7. DATA-BD
8. DATA-CHL
9. SW-CTL
10. PROCR
11. PR-MAINT

12. 12V-PWR (386 systems only)
13. CARD-MEM (386 systems only)
14. FL-DATA (386 systems only)
15. TAPE (286 systems only)
16. TAPE-DATA (286 systems only)
17. PI-BD
18. PI-PT
19. PKT-CTRL

Defaults

The defaults for this command are short with a repeat of 1.

Parameters

short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.

Help Messages

If the system technician presses HELP after entering "test spe-standby" the following message will be displayed:

```
Enter ['long' or 'short'],
['repeat' (1-100) or 'clear'], ['schedule']
```

Error Messages

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If the standby is entering maintenance mode when this command is executed, then the following message is displayed:

```
Cannot interrupt Standby SPE while entering
    maintenance mode; please try later
```

If the standby SPE is not refreshed when this command is executed, then the following message is displayed:

```
Standby SPE memory not refreshed;
use the "refresh spe-standby" command.
```

If the standby SPE is not refreshed and the active SPE is hard selected via the SPE select switches when this command is executed, then the following message is displayed:

```
Active SPE locked via select switches;
   Standby SPE memory not refreshed
```

If the standby SPE is busy with another task, then the following message is displayed:

```
Standby SPE busy with another task;
for information use "status system 1"
```

If the standby SPE is not available when this command is executed, then the following message is displayed:

```
Standby SPE not available;
for information use "status system 1"
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested. This maintenance object will display the cabinet and carrier location of the standby SPE only.
Maintenance Name	The type of maintenance object that is being tested.
Alt. Name	The alternate means of identifying the maintenance object. This field contains the extension when the object is a data module.

Test No	The actual test that is being executed.
Result	The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED,".
Error Code	A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

For the following output example, assume that the standby SPE is located in carrier B and the command entered is "test spe-standby".

```
test spe-standby                               SPE A

                            TEST RESULTS

Port    Maintenance Name Alt. Name Test No. Result       Error Code
01B     SHDW-CIR                   285                   PASS
01B     SHDW-CIR                   284                   PASS
01B     SPE-SELECT                 278                   PASS
01B     DUPINT                     315                   PASS
 .        .                         .                      .
 .        .                         .                      .
 .        .                         .                      .

Command Successfully Completed
```

FEATURE INTERACTIONS

The testing of the standby SPE maintenance object makes the standby SPE unavailable to take over for the active SPE.

test station

This command performs hardware diagnostic tests on an individual port circuit that is associated with the extension.

SYNOPSIS

test station extension *[short | long][repeat number | clear] schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, init, nms.

EXAMPLES

test station 81709 l
test station 85136 s r 2
test station 85036 l r 25
test station 85036 l r 25 schedule
test station 84297 r 4
test station 81709 c

DESCRIPTION

The test station command performs hardware diagnostic tests on an individual port circuit assigned to that extension. Tests will be performed on the hardware that is connected to the port. The technician must specify the extension and a translation is automatically done to the physical port location.

Defaults

The default for the command is short with the repeat of 1.

Parameters

extension	The extension of the station to test. The number of digits in an extension is determined by a dial-plan.
short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.

WARNING:

Since the "clear long" options clear all counters if tests pass, it is possible for firmware counters to be cleared even when a problem exists. In some cases customer service might degrade since calls may be routed over defective equipment.

schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test station" the following message will be displayed:

```
 Enter extension, ['long' or 'short'],
['repeat' (1-100) or 'clear'], ['schedule']
```

Error Messages

If the format for the extension is incorrect, the following error message will be displayed:

```
Extension invalid
```

If the EPN on which the port resides is not accessible, the following message will be displayed:

```
EPN is not available
```

If the extension is not administered, the following message will be displayed:

```
Extension not assigned
```

If the object associated with the specified extension is not a station, the following message will be displayed:

```
Extension exists but assigned to a different object
```

If the board that contains the port is not inserted in the system, the following message will be displayed:

```
Board not assigned
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
’login id’:’command’ has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.
Maintenance Name	The type of maintenance object that is being tested.
Alt. Name	The alternate means of identifying the maintenance object. This field contains the extension when the object is a station.

Test No	The actual test that is being executed.
Result	The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

For the following output example, assume that the port in cabinet 1, carrier c, slot 7, circuit 1 is an analog port and extension 81902 is connected to that port. The command that was entered was "test station 81902".

```
test station 81902 short

                            TEST RESULTS

  Port      Maintenance Name  Alt. Name Test No. Result       Error Code
  01C0701   ANL-LINE                    35       PASS
  01C0701   ANL-LINE                    48       PASS
  01C0701   ANL-LINE                    36       PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

None.

test synchronization

This command will update all the boards involved with synchronization.

SYNOPSIS

test synchronization *[short | long] [repeat number | clear] schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

test synchronization r 3
test synchronization sh r 1
test synchronization sh r 1 schedule
test synchronization l

DESCRIPTION

The test synchronization command will make sure that the proper sources are being used for timing synchronization and will update the boards with the correct synchronization parameters. The tone-clocks, DS1s, and EIs are all sent down-link messages to place them in the correct synchronization configuration given the current on-line synchronization reference.

The synchronization subsystem provides error free digital communication between the switch and other PBXs, COs, or customer premise equipment. The subsystem is made up of system components involved in synchronization: TDM bus clock, DS1 trunk board, maintenance and administration software resident in the SPE.

Defaults

The default for this command is short with a repeat of 1.

Parameters

short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. This will involve both destructive and nondestructive tests. For the synchronization maintenance object, the same nondestructive test is run for both the short and long tests: test 417. If stratum-3 synchronization is administered, an additional nondestructive test (649) is also run.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against synchronization maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against synchronization maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test synchronization", the following message will be displayed:

```
Enter ['long' or 'short'], ['repeat' (1-100)
        or 'clear'], ['schedule']
```

Error Messages

If there are no tests found for synchronization maintenance object, the following message will be displayed:

```
No tests for this MO
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	Not applicable.
Maintenance Name	The maintenance object being tested is Synchronization.
Alt. Name	Not applicable.
Test No.	The actual test that is being executed.
Result	The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

The command that was entered was "test synchronization short".

```
test synchronization short

                            TEST RESULTS

  Port    Maintenance Name  Alt. Name Test No. Result       Error Code
          SYNC                        417      PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

None.

test tape

This command tests the tape.

SYNOPSIS

test tape location *[short | long][repeat number | clear] schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

test tape
test tape schedule
test tape a
test tape 1a
test tape b sh
test tape b l r 25
test tape 01b l r 25
test tape 01b l r 25 schedule
test tape a l c

DESCRIPTION

The test tape command will perform a series of tests on the tape circuit pack and tape cartridge. The tape cartridge is rewound and only a specific portion of the tape cartridge is used in the test for actual reads and writes. Tapes used for core dumps have an incompatible file system and shouldn’t be used with this command.

Defaults

For SPE simplex systems, the location is optional and defaults to cabinet 1, carrier "a". For SPE duplex systems, the cabinet default is again cabinet 1 but there is no default for the carrier. Defaults for the remaining parameters are short with a repeat of 1.

Parameters

location	The location designates the physical position of the desired tape. The location consists of a cabinet number and carrier letter. The cabinet number is always optional and must be a "1" or a "01" if entered. The carrier is an optional "a" for SPE simplex systems but is required for SPE duplex systems and must be either "a" or "b" in this case.
short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. The long version does not include any destructive tests with this command.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against tape) is cleared or a single test in the sequence fails. If no alarms are registered against tape then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test tape" on a simplex SPE system, the following message will be displayed:

```
Enter [cabinet(1);carrier(A)],['long' or 'short'],
     ['repeat'(1-100) or 'clear'], ['schedule']
```

If the system technician presses HELP after entering "test tape" on a duplex SPE system the following message will be displayed:

```
Enter [cabinet(1)];carrier(A-B),['long' or 'short'],
     ['repeat' (1-100) or 'clear'], ['schedule']
```

For SPE simplex systems, the carrier is optional and should be the ’a’ carrier if entered. For SPE duplex systems, the carrier is required and must be either ’a’ or ’b’.

Error Messages

For SPE duplex systems, if no carrier is entered on the command line, the following message will be displayed:

```
A carrier must be specified for duplex systems
```

For any system, if the length of the user entered parameter exceeds three (3), the following message will be displayed:

```
Entry invalid
```

On any system, if any cabinet other than "1" or "01" is specified, the following message will be displayed:

```
Invalid port-network specified.
```

If a carrier is entered which is not valid for the current system configuration (for example, anything other than "A" or "B" for SPE duplex and anything other than the ’a’ carrier for SPE simplex), the following message will be displayed:

```
Invalid port-network specified.
```

If the standby SPE was specified, and it does not respond, the following message will be displayed:

```
Standby SPE not available; for information use ’status spe’
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
’login id’:’command’ has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	For the tape maintenance object, only the cabinet and carrier values are displayed.
Maintenance Name	The maintenance object being tested is TAPE.
Alt. Name	Not applicable.
Test No.	The actual test that is being executed.
Result	The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

For the following output example, assume that the command that was entered was "test tape".

```
test tape

                            TEST RESULTS

  Port    Maintenance Name  Alt. Name Test No. Result       Error Code
  01A     TAPE                        230      PASS
  01A     TAPE                         66      PASS
  01A     TAPE                         69      PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

This command will abort if any other tape operation has already begun.

Failure of the tape test may result in the tape being placed in an out-of-service state. In this state, access to the tape by all system software except maintenance software is blocked.

Tapes used for core dumps have an incompatible file systems and can’t be used for this command.

test tdm

This command tests all the time slots on a bus associated with a PPN or an EPN.

SYNOPSIS

test tdm port-network pn number *[short | long][repeat number | clear][schedule]*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

test tdm port-network 1 l
test tdm port-network 2 sh r 2
test tdm port-network 2 sh sch
test tdm port-network 1 l r 25
test tdm port-network 2
test tdm port-network 1 c

DESCRIPTION

The test tdm command performs hardware diagnostic tests on the time slots of the desired bus.

Defaults

The default for this command is short with a repeat of 1.

Parameters

pn number	The individual TDM bus to be tested is entered as "NN" where "NN" represents the port network number of the port network to have its TDM bus tested. Both halves ("a" and "b") of the TDM bus will be tested. A port network number (1 - 3) may be entered with or without a leading zero (0).
short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the TDM-BUS maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the TDM-BUS maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test tdm" the following message will be displayed:

```
Enter 'port-network', port network number (1-3),
['long' or 'short'], ['repeat' (1-100) or 'clear'], ['schedule']
```

Error Messages

If the technician does not enter all digits for the port-network number, the following message will be displayed:

```
Entry must be all digits
```

If the technician enters a Port Network number that is not administered, the following message will be displayed:

```
Port Network number not assigned
```

If the port network on which the desired TDM bus resides is unavailable, the following message will be displayed:

```
EPN is not available
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	For TDM-BUS maintenance object the port network number and the bus (A or B) is displayed.
Maintenance Name	The maintenance object being tested is TDM-BUS.
Alt. Name	Not applicable.
Test No	The actual test that is being executed.
Result	The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

For the following output example, assume that the command that was entered was "test tdm port-network 1".

```
test tdm port-network 1

                            TEST RESULTS

  Port    Maintenance Name  Alt. Name Test No. Result       Error Code
  PN 01A  TDM-BUS                     294      PASS
  PN 01A  TDM-BUS                     296      PASS
  PN 01A  TDM-BUS                     297      PASS
  PN 01B  TDM-BUS                     294      PASS
  PN 01B  TDM-BUS                     296      PASS
  PN 01B  TDM-BUS                     297      PASS

Command Successfully Completed

test tone-clock

This command will test a tone/clock board.

SYNOPSIS

test tone-clock location *[short | long][repeat number | clear] schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

test tone-clock 01a l
test tone-clock 01b l schedule

DESCRIPTION

The test tone/clock command performs hardware diagnostic tests on a technician specified tone/clock circuit pack.

Defaults

The default for the command is short with a repeat of 1.

Parameters

location	A "location" represents the physical position of the tone/clock to be tested and is entered as "UUc" where "UU" represents the cabinet number, and "c" represents the carrier. A cabinet number (1 - 3) may be entered with or without a leading zero (0).
short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the tone clock circuit pack) is cleared or a single test in the sequence fails. If no alarms are registered against the tone clock circuit pack then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test tone-clock" the following message will be displayed:

```
Enter [[cabinet(1-3)];carr(A-B)],['long' or 'short'],
      ['repeat' (1-100) or 'clear'], ['schedule']
```

Error Messages

If an identifier greater than 3 (three) characters is entered, or the cabinet entered is not a digit (number), the following message will be displayed:

```
Identifier invalid
```

If the carrier entered is invalid, the following message will be displayed:

```
Invalid carrier specified
```

If the cabinet entered is not within the valid range of cabinets or the cabinet is not administered, the following message will be displayed:

```
Cabinet number not assigned
```

If there is no tone/clock board at the specified location, one of the following messages will be displayed:

```
Board not inserted
Board not assigned
```

If the specified cabinet carrier location is that of a switch node, the following message will be displayed:

```
Switch Node carrier specified; invalid command for SN carrier
```

If the cabinet carrier location entered is that of an EPN that is not available, the following message will be displayed:

```
EPN is not available
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy; Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	The tone clock circuit pack maintenance object will only display the cabinet-carrier location.
Maintenance Name	The maintenance objects being tested is TONE-BD, TONE-PT and TDM-CLK.
Alt. Name	Not applicable.

Test No	The actual test that is being executed.
Result	The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

For the following output example, assume that the command that was entered was "test tone-clock 1a".

```
test tone-clock 1a

                           TEST RESULTS

  Port    Maintenance Name  Alt. Name Test No. Result       Error Code
  01A     TONE-BD                     46       PASS
  01A     TONE-BD                     52       PASS
  01A     TONE-PT                     40       PASS
  01A     TONE-PT                     41       PASS
  01A     TDM-CLK                     148      PASS
  01A     TDM-CLK                     149      PASS
  01A     TDM-CLK                     150      PASS
  01A     TDM-CLK                     151      PASS
  01A     TDM-CLK                     574      PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

test trunk

This command will test an entire trunk group or a specific trunk group member.

SYNOPSIS

test trunk group number*/member number [short | long][repeat number | clear] schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, cust, init.

EXAMPLES

test trunk 78 l
test trunk 80/1 sh r 2
test trunk 78/2 l r 25
test trunk 78/2 l r 25 schedule
test trunk 80
test trunk 80 schedule
test trunk 78 r 4
test trunk 78 c

DESCRIPTION

The test trunk command performs hardware diagnostic tests on an entire trunk group or an individual trunk group member, depending on the options entered by the technician.

Defaults

The default for the command is short with the repeat of 1.

Parameters

group number	The group number is an administered number associated with each trunk group (1-99).
member number	The member number is an administered number identifying a particular trunk within a trunk group (1-99).
short	This will cause the command to execute a series of nondestructive diagnostic tests.
long	This will execute a more comprehensive and longer version of the diagnostic tests. This may involve both destructive and nondestructive tests.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
clear	This option causes the test sequence (short or long) to repeat until the alarm (if one exists against the maintenance object) is cleared or a single test in the sequence fails. If no alarms are registered against the maintenance object then the test sequence will be exercised only once. The long clear option forces a clear of all alarms if no errors are encountered during testing. The short clear option only clears alarms pertinent to tests in the short sequence.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test trunk" the following message will be displayed:

```
Enter group # or group #/member #, ['long' or 'short'],
     ['repeat' (1-100) or 'clear'], ['schedule']
```

Error Messages

If the format for the trunk location is incorrect, the following error message would be displayed:

```
Format invalid
```

If the trunk group or member range is invalid, the following message will be displayed:

```
Trunk or trunk group invalid
```

If a software fault is encountered while the command is executing, the following message will be displayed:

```
Error encountered, can't complete request
```

If the trunk group is not administered, the following message will be displayed:

```
Group not assigned, or group assigned but with no member
```

If the trunk group member is not administered, the following message will be displayed:

```
Group member not assigned
```

If there are no tests found for this maintenance object, the following message will be displayed:

```
No tests for this MO
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	The port address (cabinet-carrier-slot-circuit) of the maintenance object that is being tested.
Maintenance Name	The type of maintenance object that is being tested.
Alt. Name	The alternate means of identifying the maintenance object. This field contains xxx/yyy when the object is a trunk, where xxx is the trunk group number and yyy is the member number. It contains P/xxx when the object is a private CO line, where xxx is the private CO line group number.
Test No	The actual test that is being executed.
Result	The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED."
Error Code	A system-generated number that tells why the release failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO.

For the following output example, assume that the command that was entered was "test trunk 78".

```
test trunk 78

                            TEST RESULTS

  Port      Maintenance Name  Alt. Name Test No. Result       Error Code
  01C1505   CO-TRK            078/001   3        PASS
  01C1505   CO-TRK            078/001   36       PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

test tsc-administered

This command performs switched services request to run a heartbeat test on any type of administered Temporary Signaling Connection (TSC).

SYNOPSIS

test tsc-administered signaling group number/*tsc index repeat number schedule*

PERMISSIONS

The following default logins may execute this command: system technician, inads, init.

EXAMPLES

test tsc-administered 1
test tsc-administered 1/1 repeat 2
test tsc-administered 1/2 schedule

DESCRIPTION

The test tsc-administered command runs a switched services request to run the TSC heartbeat test is for administered Temporary Signaling Connection's (TSCs) on a signaling group.

Defaults

The default for the command is a repeat of 1.

Parameters

signaling group number	An administered number associated with each signaling group (1-8).
tsc index	A number associated with each TSC in a signaling group.
repeat number	The "number" specifies how many times each test in the sequence is to be repeated. "Number" may be any integer between 1 and 100.
schedule	When the "schedule" option is specified, the command is validated and then a scheduling form is displayed to allow the technician to schedule execution of the command. The command is then placed in the command queue and is executed at the specified time. The information displayed by the command is sent to the system printer instead of the screen. Refer to the Report Scheduler and System Printer feature specification [1] for more details.

Help Messages

If the system technician presses HELP after entering "test tsc-administered" the following message will be displayed:

```
Enter group # (1-8) or group #, [/tsc index (1-64)],
          ['repeat' (1-100)], ['schedule']
```

Error Messages

If the format for the specified signaling group or the signaling group and TSC is incorrect, the following message is displayed:

```
Format invalid
```

If the specified signaling group number is out of range, the following message is displayed:

```
Signaling group invalid
```

If the specified signaling group is not administered, the following message is displayed:

```
No signaling group assigned
```

If the specified signaling group has no TSC assigned or the specified TSC is unadministered, the following message is displayed:

```
No TSC assigned
```

If the specified TSC number is out of range, the following message is displayed:

```
Tsc index invalid
```

If the software data cannot be sent to the SAT, the following message is displayed:

```
Error encountered, can't complete request
```

If no tests can be found for the associated MO, the following message is displayed:

```
No tests for this MO
```

If the command entered is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

If during the execution of a command a resource problem occurs that requires the user to restart the command, then the following message will be displayed:

```
Command resources busy;
Press CANCEL to clear, and then resubmit
```

If all of the available maintenance resources are currently in use, then the following message will be displayed:

```
All maintenance resources busy; try again later
```

OUTPUT

The responses will be displayed on a test-by-test basis with one line of data displayed for each test result.

Port	The port address of the administered temporary signaling connection that is being tested (signaling group no/tsc index).
Maintenance Name	The type of maintenance object that is being tested.
Alt. Name	Not applicable.
Test No	The actual test that is being executed.
Result	The result of the individual test -"PASS," "ABORT," "FAIL," "NO BOARD," "DISABLED," "EXTRA BD."
Error Code	A system-generated number that tells why the test failed or aborted. A detailed list of the codes according to "Test No." is provided for each MO (for example, see MO section "TSC-ADM (Administered Temporary Signaling Connections)").

For the following output example, the command that was entered was "test tsc-administered 1/1".

```
test tsc-administered 1/1

                             TEST RESULTS

  Port    Maintenance Name  Alt. Name Test No. Result       Error Code
  1/1     TSC-ADM                     604      PASS

Command Successfully Completed
```

FEATURE INTERACTIONS

Additional data is available after running the test. See the status tsc-administered command for details on how to access the additional data.

upgrade software

This command allows the software text image, the flash component of the LMM firmware (386 only), the MTP firmware (386 only), the Packet Control (PACCON) and the Processor Interface (PI) firmwares to be upgraded. Save translation must be done before this command.

NOTE:
For more information about software upgrades prior to DEFINITY DCS Release 5 see "Software Upgrade" in Chapter 5, "Routine Maintenance Procedures". For upgrading a Release 5 System see "Software Upgrade" in Chapter 5, "Routine Maintenance Procedures".

SYNOPSIS

Simplex/Duplex[1]

upgrade software

PERMISSIONS

The following logins may execute this command: system technician, inads, init.

EXAMPLES

Simplex/Duplex

upgrade software

DESCRIPTION

Simplex

386 Only

The command verifies that a software card-mem is present and then, if present, proceeds to reprogram the flash memory and perform a level-4 restart. During the restart of the system, the system technician is prompted to replace the software card-mem with the translation card-mem. Service is provided upon completion of the system restart. Service down time is between 5 to 12 minutes.

1. In this context, *simplex* is equivalent to the *stand reliability option*
In this context, *duplex* is equivalent to the high reliability option or *critical reliability option*.

286 Only

This command invokes a level-4 restart on the system. As the core image is read from the tape with the new software, the system is upgraded to the new software. Service is provided upon completion of the system restart. Service down time is between 10 to 20 minutes.

Duplex

386 Only

The command verifies that a software card-mem is present in the standby SPE, programs the flash memory, resets the standby SPE, and prompt the system technician to replace the software card-mem with the translation card-mem as in the simplex case. An interchange of SPE's is performed upon completion of a successful standby upgrade. At the same time, the old active SPE is upgraded automatically with the new software through similar swapping of card-mems. The service disruption is between 1 to 4 minutes, which is less disruptive than the simplex case.

286 Only

This command invokes a level-4 restart on the standby SPE which reads in the core image from the tape containing the new software. Upon successful completion of the restart, an SPE-interchange occurs. The standby SPE becomes the active SPE and performs a level-2 restart. The new standby SPE is upgraded when the new active SPE enables memory shadowing 10 minutes after the upgrade. The service disruption is between 5 to 10 minutes, which is less disruptive than the simplex case.

Defaults

None.

Parameters

None.

Help Messages

If the system technician presses HELP after entering "upgrade software," the following message is displayed:

```
Entry is not required
```

386 Only

If no card-mem is loaded into the system, the following message will be displayed:

```
Software card-mem is not inserted in the system
```

If a wrong card-mem is loaded into the system, the following message will be displayed:

```
Incorrect card-mem loaded; insert software card-mem
```

If the directory information on the software card-mem is corrupted or the card-mem is not formatted properly, the following message will be displayed:

```
Software card-mem not readable; try another card-mem
```

286 Only

If the cancel key is depressed when the command is executed in a duplex system, the following message will be displayed:

```
This command may not be canceled
```

Both 386 and 286

If this command is in conflict with another currently executing command, then a message will be displayed showing the login id of the conflicting user and the conflicting command. The message is as follows:

```
'login id':'command' has a command conflict
```

386 Only

If the checksum on the software card-mem is bad, the following message will be displayed:

```
Bad checksum on software card-mem; try another card-mem
```

If the software upgrade failed in the standby SPE, the following message will be displayed:

```
No response on upgrade status from standby SPE, command failed
```

If the software card-mem in the standby SPE is not replaced with a translation card-mem within 2 minutes, the following message will be displayed:

```
No translation card-mem inserted
in the standby SPE, command aborted
```

If the flash text checksum failed after the standby upgrade, the following message will be displayed:

```
Standby SPE text checksum failed, command aborted
```

If the software card-mem is not inserted in the active SPE within 2 minutes after the prompting string: "REPLACE TRANSLATION CARD-MEM ON <active carrier> WITH SOFTWARE CARD-MEM," the command has to be retried again and the following message will be displayed:

```
No software card-mem inserted in active SPE; command aborted
```

If the SPE-select switches are thrown to prevent the SPE-interchange during a software upgrade, the following message is displayed:

```
SPE select switches thrown; upgrade complete only on standby
```

Both 386 and 286

If the standby SPE is not in the standby mode and is busy running tests, the following message will be displayed:

```
Standby SPE busy with another task;
for information use 'status system'
```

If the standby SPE has not completed initialization, the following message will be displayed:

```
Standby SPE memory not refreshed; Use 'refresh spe-standby'
```

If the active SPE cannot communicate with the standby SPE after the standby SPE is properly upgraded, the following message will be displayed:

```
Upgrade failed; no communication with
  standby after new software booted
```

If the SPE-interchange failed and the new software cannot be run in the active SPE, the following message is displayed:

```
Software upgrade failed, could not perform an interchange
```

OUTPUT

386 Only

The following is the output of a successful simplex upgrade upon entering the "upgrade software" command:

```
 INITIATING SOFTWARE UPGRADE
 MEM-CARD CHECKSUMPASSED
REPROGRAMMING MTPPASSED
ERASING MEMORYPASSED
REPROGRAMMING SPEPASSED
FLASH TEXT CHECKSUM       PASSED
 UPGRADE COMPLETE
 <beep>
 REPLACE SOFTWARE MEM-CARD WITH TRANSLATION MEM-CARD
 <beep>
```

Explanations and error recoveries to the above steps are as follows:

INITIATING SOFTWARE UPGRADE:	This indicates that the system is proceeding to do a software upgrade.
MEM-CARD CHECKSUM:	If the card-mem checksum fails, the system will reboot without performing an upgrade. Retry the command with another software card-mem.
REPROGRAMMING MTP:	If the MTP programming fails, the Manager I will not be functional anymore. So the rest of the upgrade (if it occurs) will not be visible. Nor will the MTP be present to monitor the health of the 386. The only recovery procedure is to power down and power up the system since the presence of a software card-mem will cause a software upgrade.
ERASING MEMORY:	The rest of the memory is being erased.
REPROGRAMMING SPE:	This shows the status of the reprogramming. A total of 7 Mbytes has to be reprogrammed. If the reprogramming fails in the midst of upgrade, it will take the system into *SPE-down* mode. In this mode, the system technician can only reset the system or display alarms. The system should be reset, and another upgrade attempt will be done due to the detection of a software card-mem in the system.
FLASH TEXT CHECKSUM:	If the checksum fails, the software may or may not be healthy. But it will try to run for as long as it can until further system reset due to escalation or system technician intervention.
REPLACE SOFTWARE MEM-CARD WITH TRANSLATION MEM-CARD:	The system technician is prompted by a beep and this text string on the Manager I to replace the software card-mem with the translation card-mem. The system will boot without translation if the replacement is not done within 2 minutes. The only way to recover from this is to replace the card-mem and issue a *reset system 3* to read in the translations again.
UPGRADE COMPLETE:	This indicates that the software upgrade is completed.

286 Only

The following is displayed when the "upgrade software" command is entered:

```
LMM VERSION 7.2.0
ROM CHECKSUM TEST ( = DF22)       PASSED
DUAL PORT RAM TEST                PASSED
SOFT INT TEST                     PASSED
NMI TEST                          PASSED
READ_WRITE MEMORY                 PASSED
MEMORY BOARD 1 DATA BIT TEST      PASSED
MEMORY BOARD 1 CHECK BIT TEST     PASSED
MEMORY BOARD 1 MEE SING BIT TEST  PASSED
MEMORY BOARD 1 MEE DOUB BIT TEST  PASSED
MEMORY BOARD 2 DATA BIT TEST      PASSED
MEMORY BOARD 2 CHECK BIT TEST     PASSED
MEMORY BOARD 2 MEE SING BIT TEST  PASSED
MEMORY BOARD 2 MEE DOUB BIT TEST  PASSED
MEMORY FUNCTIONAL TEST            PASSED
TAPE DIAGNOSTIC                   PASSED
READING TAPE IMAGE                PASSED
RAM CHECKSUM TEST ( = A545)       PASSED
RAM CHECKSUM DATA ( = A4C0)       PASSED
RESET 4 (REBOOT) PERFORMED
```

Duplex:

The following is the output of a successful duplex upgrade upon entering the "upgrade software" command (assume that carrier A is active):

```
TN786 CLMM Release 1.9.0
INITIATING SOFTWARE UPGRADE
MEM-CARD CHECKSUM           PASSED
REPROGRAMMING MTP           PASSED
REPROGRAMMING SPE           PASSED
FLASH TEXT CHECKSUM         PASSED
REPLACE SOFTWARE MEM-CARD ON B WITH TRANSLATION MEM-CARD
UPGRADE COMPLETE
REPLACE TRANSLATION MEM-CARD ON A WITH SOFTWARE MEM-CARD
TN786 CLMM Release 1.9.0
INITIATING SOFTWARE UPGRADE
MEM-CARD CHECKSUM           PASSED
REPROGRAMMING MTP           PASSED
REPROGRAMMING SPE           PASSED
FLASH TEXT CHECKSUM         PASSED
REPLACE SOFTWARE MEM-CARD ON A WITH TRANSLATION MEM-CARD
UPGRADE COMPLETE
```

NOTE:
Carrier A is assumed to be active.

Explanations and error recoveries to the above steps are as follows:

INITIATING SOFTWARE UPGRADE:	This indicates that the system is proceeding to do a software upgrade.

REPROGRAMMING MTP:	If the standby MTP programming fails, Manager I screen updates will be gone even though upgrade may continue. The active SPE will finally reset the screen (about 15 minutes) and the upgrade is considered failed.
ERASING MEMORY:	The rest of the standby memory is being erased.
REPROGRAMMING SPE:	This shows the status of the reprogramming. A total of 7 Mbytes has to be reprogrammed. If the reprogramming fails in the midst of upgrade, it will take the standby SPE into *SPE-down* mode. The display of the failed upgrade will remain until the active SPE resets the screen again (takes about 15 minutes). The upgrade attempt has to be retry.
FLASH TEXT CHECKSUM:	If the standby checksum fails, the standby SPE will run unpredictably. The active SPE will eventually take over the Manager I screen (about 15 minutes) and the upgrade is failed.
REPLACE SOFTWARE MEM-CARD ON B WITH TRANSLATION MEM-CARD:	The system technician is prompted by a beep and this text string on the Manager I to replace the standby software card-mem with the translation card-mem. If the card-mem is not replaced within 2 minutes, the standby SPE will go into SPE-down mode. Retry command again.
REPLACE TRANSLATION MEM-CARD ON A WITH SOFTWARE MEM-CARD:	The system technician is prompted by a beep and this text string on the Manager I to replace the translation card-mem with the software card-mem on the active SPE. If this step is not done, the SPE-interchange will not happen. A major alarm will be raise against the standby SPE as it has different software now.
REPLACE SOFTWARE MEM-CARD ON A WITH TRANSLATION MEM-CARD:	The system prompts the system technician to replace the software card-mem with the translation card-mem in the new standby SPE. Failure to replace the card-mem will cause the standby to boot up with no translation, but the active's translation will be shadowed over when shadowing is enabled.
UPGRADE COMPLETE:	The upgrade for the new standby SPE is completed.

286 Only

No output is displayed when the standby SPE is upgraded. The following output is displayed when the level-2 SPE-interchange occurs:

```
READ_WRITE MEMORY              PASSED
RAM CHECKSUM TEXT ( = A545)    PASSED
ROM CHECKSUM TEST ( = DF22)    PASSED
DUAL PORT RAM TEST             PASSED
SOFT INT TEST                  PASSED
NMI TEST                       PASSED
RESET 2 (COLD_2) PERFORMED
```

FEATURE INTERACTIONS

System Restarts

An upgrade will cause a system restart. Simplex systems will result in a level-4 restart. Duplex system will undergo a level-2 SPE-interchange after the standby is upgraded through a level-4 restart.

Initcauses

Executing "display initcauses" will show that software upgrade and the level of system reset being done.

Multi-user Contention

When this command is executing, all other maintenance commands will be blocked. Exceptions to these are most of the status or display type commands. All administrations commands are not blocked. It is the user's responsibility to make sure that no new translations are added between the last save translation operation and the completion of the *upgrade software* command.

Recent Change History Log

The *upgrade software* command will not be logged for both simplex and duplex systems. This is due to the clearing of memory during the level 4 reset.

Periodic and Scheduled Maintenance

Periodic and scheduled maintenance will be suspended while the upgrade command is executing.

Error and Alarm Log

Error and alarm logs before the software upgrade will be lost.

Demand Busyout Objects

Maintenance objects that have been demand busyout will be released when the processor reboots or interchanges during the software upgrade. If the command is cancelled before the actual reboot or interchange starts, then all demand busyout objects status will be preserved.

Standby SPE Maintenance

Data consistency alarms will be generated if the software in the active and standby are not consistent.

Disabled Objects

All disabled objects retain their "disabled" status after a software upgrade according to status recorded in the last successful *save translation* command.

Remote Software Upgrade

In a tape-base system, after the system technician has gone on-site to replace the tapes, the upgrade can be performed later remotely. This is not possible in a flash system.

Delayed/Automatic Upgrade

In a tape-based system, it is possible to install in the new tapes and have the system do an upgrade the next time the system does a *reset system 4*. This is not possible in the flash system.

Maintenance Object Repair Procedures

11

General

Trouble-clearing is based on the type of indication received, system-alarmed troubles, or user-reported troubles. When viewing the Alarm Log, all major alarms are displayed first, minor alarms are displayed second, and warning alarms are displayed last. Each level of alarm is displayed by importance of functional area. The first alarmed entry should be resolved first because it may be affecting the rest of the alarmed entries.

Sometimes system-alarmed and user-reported troubles exist at the same time. The alarmed troubles should always be cleared first, if possible. This often clears the user-reported faults without additional maintenance.

Port Troubles

Failures in trunk and station circuit packs in the port carriers and in the port slots of the control carrier(s) are the easiest to repair. Failures are usually independent and can be cleared by replacing the circuit pack with the red alarm LED or on-board alarm in the Error Log. It is desirable to wait until the amber (busy) LED is off before removing the pack, if possible. However, during moderate to heavy system activity, at least one station or trunk is usually busy.

There is an alternative to replacing a port circuit pack that has only one (or a few) failed port(s). The voice terminal or trunk assigned to the failed port can be moved to a good port on the same or another port pack. If this is done, the wiring must also be changed at the cross-connect field (see *DEFINITY Communications System Generic 1 and Generic 3i Wiring*, 555-204-111, for cross-connect field wiring information). This method should be done only to improve the system temporarily until a new circuit pack is obtained.

This is an administrative rather than a maintenance procedure and should be done by the System Manager. The new port must be compatible with the trunk or voice terminal. System records should be updated to identify the defective port so that it is not used again. Packs with more than two or three defective ports should *always* be replaced.

Common Control Troubles

The circuit packs in the SPE(s) of the control carrier(s) A (and B) are more difficult to repair. For systems not equipped with High or Critical Reliability, the system must be powered down before any of these packs are replaced. After the suspect circuit pack has been replaced, the system is powered up (rebooted). For High or Critical Reliability Systems, refer to Chapter 8, "Reliability Systems: A Maintenance Aid".

Another factor increasing the difficulty of trouble-clearing in the SPE is the high degree of interaction among the circuit packs. Multiple alarms and off-board alarms are more likely to occur in common control troubles than in port troubles. Use of the Alarm Log and the List of Alarms is often necessary when clearing problems.

For more detailed information on repairing Common Control circuit packs, refer to the "XXX-BD (Common Port Circuit Pack)" maintenance procedure near the end of this chapter.

Voice Terminal and Trunk Troubles

If the system isolates a fault to a voice terminal or if a user complaint indicates a voice terminal problem, the trouble must be isolated to the voice terminal itself or to the wiring between the cabinet and the voice terminal. Tests for checking wiring and voice terminal performance can be generated at the administration terminal and at designated voice terminals.

WARNING:
A visual inspection of voice terminal wiring, particularly the mounting cord, is always advisable in case of voice terminal trouble reports. A dead voice terminal can be the result of a loose mounting cord. Voice terminal trouble can also occur when wiring is crushed or severed by furniture or traffic.

Trunk problems, reported by alarms or by users, can be evaluated through tests from voice terminals or the administration terminal. If trunk troubles appear to be outside the system, the responsible common carrier should be asked to make the repairs.

Error Generation/Tracking

Errors may be detected by periodic maintenance tests run on an MO or by using the MO (for example, placing a phone call or saving translations). These errors are reported to the maintenance subsystem and logged in the Error Log which then causes initial testing to begin on the MO.

All types of errors logged against an MO are kept in a maintenance record for that MO. This record is created when the first error is reported and remains active until maintenance determines that the problem no longer exists. A counter is kept for each type of error, and each time the error recurs the associated counter is increased.

Each error and test counter is assigned a threshold value. Accelerated testing begins when the counter becomes "Active." In general, alarms are raised only by test failures; in-line errors, in most cases, do not raise alarms. An alarm is not resolved until **all** tests have passed and all alarming counters go to 0. Also, the maintenance record is active until all counters are reduced to 0.

Error/Alarm Resolution

The same tests that run automatically are also available to the technician, and the results of these system technician-demanded tests affect the error counters in the same way. Thus, if an alarm is raised by a transient problem that is no longer active, the alarm can be resolved quickly running the appropriate tests the correct number of times.

Maintenance Object Test/Repair Procedures

The rest of this chapter contains information required for accurate interpretation of the Alarm Log, efficient maintenance testing, and speedy repair of alarmed MOs. The following details are provided for each MO, if applicable:

- Release number that MO description applies to (includes Domestic or International releases; for example, "International G1.2SE")
- Alarm level(s)
- Hardware error(s) associated with the MO
- The associated test that caused the error(s)
- Test sequences
- Test description(s)
- Error code description(s)
- Recommended maintenance procedures

NOTE:
Some test commands may trigger test sequences for more than one MO.

For your convenience, the MOs have been arranged alphabetically by their Alarm Log names. The only exception is XXX-BD which is a set of common tests used by certain circuit packs that share the generic hardware that interfaces with the TDM Bus. The circuit packs included in the XXX-BD category are listed in the beginning of the "XXX-BD (Common Port Circuit Pack)" Maintenance documentation section.

12V-PWR (12 Volt Power Supply)

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run	Full Name of MO
12V-PWR	MINOR	test card-mem sh	12 Volt Power Supply
12V-PWR	WARNING	test card-mem sh	12 Volt Power Supply

The 12 Volt Power Supply unit in the TN777B NETCON circuit pack is required for programming flash memory devices in circuit packs such as the TN786B or TN790 Processor circuit pack and the removable memory card inserted into the TN777B NETCON circuit pack. During the erase and write operations of a flash memory or of a memory card, the 12 volt power supply must be turned on under the instruction of software. For the read-only operation of a flash memory or of a memory card, the 12 volt power supply is not required. The maintenance strategy for the 12 volt power supply is to ensure that the power supply is functional as designed.

If the 12 volt power supply cannot be turned on, all the erase and write operations to a flash device fail. Features such as "save translation," "save announcements," "system upgrade," "hard patching," and "core dump" always fail in this case.

Hardware Error Log Entries and Test to Clear Values

12 Volt Power Supply Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test card-mem
1(a)	Any	12 Volt Power Supply Test (#701)	MINOR	ON	test card-mem
257(b)	Any	12 Volt Power Supply Test (#701)	WARNING	ON	test card-mem

1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

a. Software cannot turn on the 12 volt power supply to provide 12 volt power to the flash memory or to the memory card.

b. Software can turn on the 12 volt power supply, and 12 volt power is available. However, the software cannot turn the power supply off after operations are completed. The 12 volt power remains on. This error does not affect the normal operations involved in accessing the memory or the memory card.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table that follows when you are inspecting errors in the system. By clearing error codes associated with the *12 Volt Power Supply Test* for example, you may also clear errors generated from other tests in the testing sequence. The 12 Volt Power Supply Test can be initiated via either the **test card-mem** command or the **test network-control** command.

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND[1]
12 Volt Power Supply Test (#701)	X	X		ND
Memory Card Insertion Test (#695) (a)	X	X		ND
Memory Card Format and Read Test (#696) (a)	X	X		ND
Memory Card Match Test (#697) (a)	X	X		ND
Memory Card Write-Protected Test (#698) (a)	X	X		ND
Memory Card Directory Recovery Test (#699) (a)	X	X		ND
Memory Card Translation Data Integrity Test (#694) (a)		X		ND
Memory Card Erase/Write/Read Test (#693) (a)		X		ND

1 D = Destructive; ND = Nondestructive

Notes:

a. Refer to "CARD-MEM (Memory Card)" Maintenance documentation for a description of this test.

12 Volt Power Supply Test (#701)

This test is a nondestructive test. The purpose of the test is to diagnose the 12 volt power supply unit in the TN777B NETCON circuit pack. No erase and write-to-memory operations are started or verified during the test. The contents of flash memory and of the memory card should not be changed.

The test turns on the power supply, and it verifies that 12 volt power appears by reading the control register in the TN777B NETCON circuit pack. After the power supply is turned on, the maintenance software waits for three seconds before verifying the appearance of 12 volt power. After the 12 volt power supply can be turned on and verified, the test turns the power supply off and then verifies that the power is off. The control register in the TN777B NETCON circuit pack is read again for the verification.

If, while this test is running, an application attempts to erase or write a flash memory or a memory card, this test remains active, and the application is barred.

Table 11-1. 12 Volt Power Supply Test

Error Code	Test Result	Description/ Recommendation
1192	ABORT	12 volt power supply is being used by other applications or by maintenance. 1. The 12 volt power supply is in use. Retry the **test card-mem** command after the maintenance operation application is completed.
2106 2114	ABORT	Internal System Error. 1. Retry the command at one minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
2108	ABORT	The NETCON circuit pack is not a TN777B circuit pack. 1. Follow the Standard Repair Procedures for replacing the NETCON circuit pack with the TN777B circuit pack. 2. Re-enter the **test card-mem** command.

Continued on next page

Table 11-1. 12 Volt Power Supply Test — *Continued*

Error Code	Test Result	Description/ Recommendation
109	FAIL	The 12 volt power supply unit in the TN777B NETCON circuit pack cannot be turned on by the software. 1. Retry the **test card-mem** command one more time to verify the operation of the 12 volt power supply in the TN777B NETCON circuit pack. 2. If the failure indicated by Error Code 109 persists, the TN777B NETCON circuit pack must be replaced with a new circuit pack. Follow the standard procedure for replacing the NETCON circuit pack from the SPE control carrier. 3. After the new TN777B circuit pack is inserted, enter the **test card-mem** command to verify the operations of the 12 volt power supply in the TN777B NETCON circuit pack. The alarm is resolved after the test passes twice. 4. If the failure persists even after a new NETCON circuit pack is inserted, escalate the problem.
110	FAIL	The 12 volt power supply unit in the TN777B NETCON circuit pack cannot be turned off by the software. 1. Retry the **test card-mem** command one more time to verify the operation of the 12 volt power supply in the TN777B NETCON circuit pack. 2. If the failure indicated by Error Code 110 persists, the TN777B NETCON circuit pack should be scheduled for replacement during the next regular maintenance visit. This failure does not cause any service disruption.
	PASS	The 12 volt power supply unit in the TN777B NETCON circuit pack is functioning correctly.

ABRI-PORT (ASAI ISDN-BRI Port)

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run[1]	Full Name of MO
ABRI-PORT[2]	MAJOR(b)	test port PCSSpp l	ASAI ISDN-BRI Port
ABRI-PORT	MINOR	test port PCSSpp l	ASAI ISDN-BRI Port

1 Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (01, 02, ..., etc.); and pp is the 2-digit port number (for example, 01).

2 The alarm level for ABRI ports may be administered using the **set options** command. The alarm level can be set independently for Off-Board and On-Board alarms to MAJOR for all ABRI ports in the system.

Refer to "BRI-PORT (ISDN-BRI Port), ABRI-PORT (ASAI ISDN-BRI Port)" Maintenance documentation for repair procedures.

AC-POWER (AC Power) for AC-Powered Systems

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run[1]	Full Name of MO
AC-POWER	WARNING	test environment P	AC Power

1 Where P is an appropriate port network number determined via the PORT field from the Alarm or Error Log.

DEFINITY Generic 1 offers two basic cabinet type configurations: (1) the multicarrier cabinet system and (2) the single-carrier cabinet system. Both cabinet system configurations may be powered by either an external AC or DC power source.

NOTE:
For environment maintenance, PPN or EPN cabinet configuration aspects in a High or Critical Reliabilty system are irrelevant.

The environment maintenance strategy to be used depends on both the cabinet configuration and the type of powering. Therefore, refer to the following list to find the appropriate section(s).

- For a single-carrier cabinet system, refer to the DC-POWER (DC Power) Maintenance documentation for environment maintenance strategy.
- For a multicarrier cabinet system using an external AC power source, refer to one or more of the following Maintenance documentation sections: "AC-POWER (AC Power) for AC-Powered Systems", "CARR-POW (Carrier Port Power Unit) for AC-Powered Systems", or "POWER (Battery & Battery Charger) for AC-Powered Systems".
- For a multicarrier cabinet system using an external DC power source, refer to one or more of the following Maintenance documentation sections: "AC-POWER (AC Power) for DC-Powered Systems", "CARR-POW (Carrier Port Power Unit) for DC-Powered Systems", or "POWER (Battery & Battery Charger) for DC-Powered Systems".

The AC Power MO represents the AC power provided to the switch from a wall outlet in a multicarrier cabinet system. The AC power comes from the wall outlet, through the Power Distribution Unit (PDU), and is then distributed to the various Carrier Port Power Units. The Battery Charger monitors AC power via fuse F5. Figure 11-1 illustrates the relation of fuse F5 to the rest of the system (Figure 11-1 also shows other environment maintenance-related items that can be ignored for this section on AC Power). Figure 11-2 illustrates the fuse arrangement in a Small Cabinet (from a System 75 R1V3 upgrade). In a Small Cabinet, fuse F3 plays the role fuse F5 plays in the multicarrier cabinet system. Figure 11-3 shows the position of the fuses on the PDU and describes how to replace a fuse. When the switch loses power (for example, a power outage in the building), a Major alarm is logged against AC Power and the system goes on battery backup, which is known as Nominal Power Holdover (NPH). If power is restored before the NPH time expires, the alarm is resolved. Each multicarrier cabinet port network has separate batteries for NPH. The nominal power holdover provided is as follows:

- In a multicarrier cabinet PPN in a system without High or Critical Reliability, the battery supplies 10 seconds of power to the PPN cabinet and then an additional 10 minutes of power to just the control carrier in the PPN. The administration terminal is logged off. In this case, the system software does the timing.
- In a multicarrier cabinet PPN in a High or Critical Reliability system, the battery supplies five seconds of power to the PPN cabinet and then an additional five minutes of power to just the two control carriers in the PPN. In this case, the system software does the timing.
- In an EPN, the battery supplies 15 seconds of power to the EPN cabinet and no partial holdover. In this case, the EPN Maintenance circuit pack does the timing.

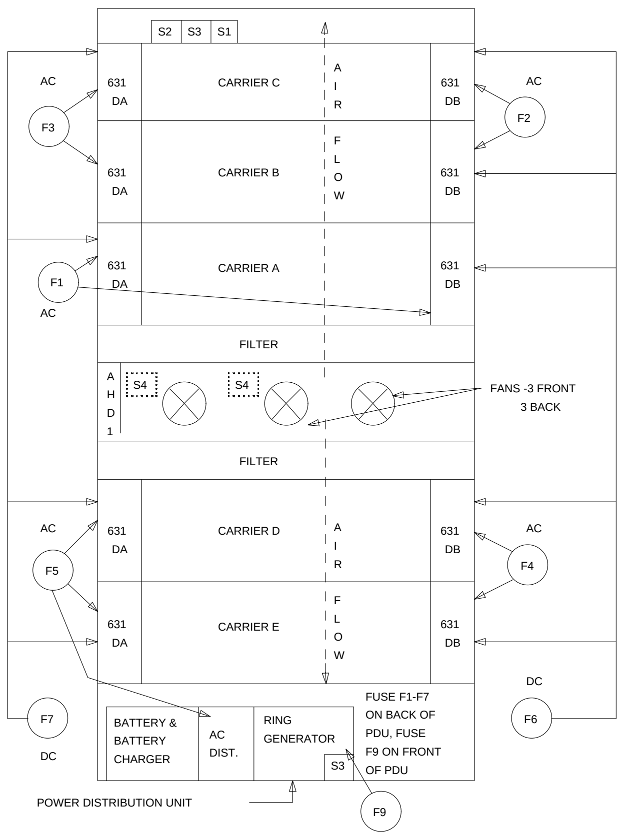

Figure 11-1. Multicarrier Cabinet Environment Components (AC-POWER)

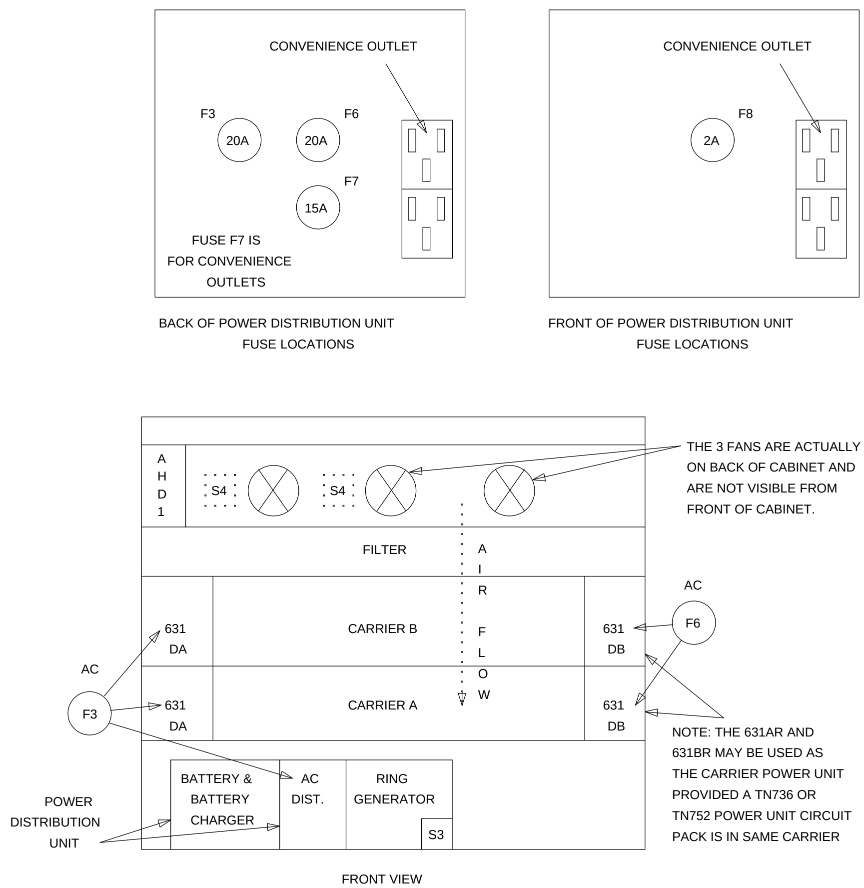

Figure 11-2. Small Cabinet Environment Components (AC-POWER)

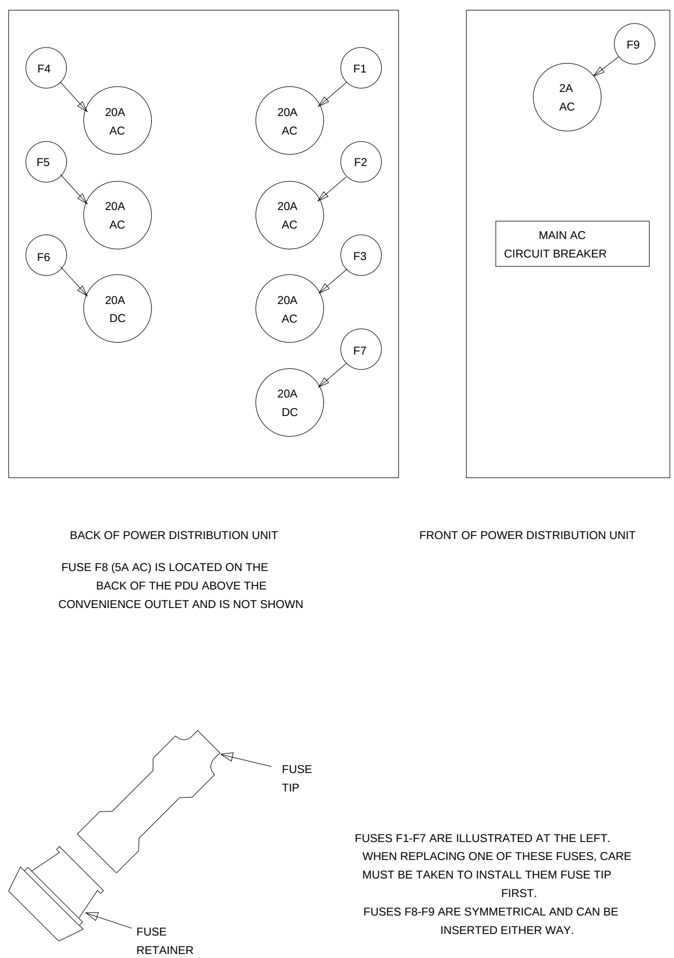

Figure 11-3. Multicarrier Cabinet Fuse Location and Replacement

Hardware Error Log Entries and Test to Clear Values

AC Power Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test environment P sh r 1
513	Any	AC Power Query Test (#78)	WARNING	OFF	test environment P sh r 1

1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence.

Refer to the appropriate test description and follow the recommended procedures.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following table when inspecting errors in the system. By clearing error codes associated with the *AC Power Query Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Battery & Battery Charger Query Test (#5) (a)	X	X	ND
AC Power Query Test (#78)	X	X	ND
Power Unit Query Test (carrier E) (#127) (b)	X	X	ND
Power Unit Query Test (carrier D) (#127) (b)	X	X	ND
Power Unit Query Test (carrier A) (#127) (b)	X	X	ND
Power Unit Query Test (carrier B) (#127) (b)	X	X	ND
Power Unit Query Test (carrier C) (#127) (b)	X	X	ND
Emergency Transfer Query Test (#124) (c)	X	X	ND
Cabinet Temperature Query Test (#122) (d)	X	X	ND
External Alarm Lead Query Test (#120) (e)	X	X	ND
Analog Ring Generator Initialization Test (#117) (f)	X	X	ND
Analog Ring Generator Query Test (#118) (f)	X	X	ND

1 D = Destructive; ND = Nondestructive

Notes:

a. Refer to "POWER (Battery & Battery Charger) for AC-Powered Systems" Maintenance documentation for a description of this test.

b. Refer to "CARR-POW (Carrier Port Power Unit) for AC-Powered Systems" Maintenance documentation for a description of this test.

c. Refer to "EMG-XFER (Emergency Transfer)" Maintenance documentation for a description of this test.

d. Refer to "CABINET (Cabinet Sensors)" Maintenance documentation for a description of this test.

e. Refer to "EXT-DEV ADMIN? N (External Device Alarm)" or "EXT-DEV ADMIN? Y (External Device Alarm)" Maintenance documentation for a description of this test.

f. Refer to "RING-GEN (Analog Ring Generator)" Maintenance documentation for a description of this test.

NOTE:
This test only shows up in the test sequence if there is a TN768 or TN780 Tone-Clock circuit pack in the port network being tested.

AC Power Query Test (#78)

This test queries the Maintenance/Tape Processor in a PPN in a system without High or Critical Reliability, the Duplication Interface circuit pack in a High or Critical Reliability system PPN, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system for the status of AC power to the switch.

Table 11-2. TEST #78 AC Power Query Test

Error Code	Test Result	Description / Recommendation
1000	ABORT	System resources required to run this test are not available. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
2000	ABORT	Response to the test request was not received within the allowable time period. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to ABORT with Error Code 2000, check for system powering problems with the A carrier (PPN or EPN). Look for and resolve all CARR-POW alarms in a multicarrier cabinet system or DC-POWER alarms in a single-carrier cabinet system. Then, repeat the test. 3. If the test continues to ABORT with a 2000 Error Code, check for and resolve all DUPINT (Duplication Interface) errors in a High or Critical Reliability system PPN, PR-MAINT (Maintenance/Tape Processor) errors in a standard PPN, or MAINT (EPN Maintenance circuit pack) errors in an EPN. Then, repeat the test. 4. If the test continues to ABORT with a 2000 Error Code, then escalate the problem.
2029	ABORT	Internal System Error. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-2. TEST #78 AC Power Query Test — *Continued*

Error Code	Test Result	Description / Recommendation
1	FAIL	**NOTE:** For a Global AC MCC (J58890CH) use the procedures outlined in step 2. The switch is currently without AC power. **WARNING:** *Turn off power to the 397C Battery Chrger before removing Fuse F5.* 1. Check for AC at the wall outlet. a. If there is no AC power at the wall outlet, then the problem is not with the system itself. Power must be restored to the wall outlet. b. If there is AC power at the wall outlet, then there could be a problem with the Battery or Battery chargers. Resolve all alarms logged against POWER (Battery & Battery Charger), and rerun the test. If the test still fails, the fuse F5 may have blown (See the above WARNING before removing Fuse F5). Replace fuse F5 (see Figure 11-3), and rerun the test. If the test still fails, then the PR-MAINT (Maintenance/Tape Processor) in a PPN in a system without High or Critical Reliability, the DUPINT (Duplication Interface) circuit pack in a High or Critical Reliability system PPN, or the EPN MAINT (Maintenance) circuit pack in an EPN multicarrier cabinet system may be incorrectly reporting the problem. Resolve all

Continued on next page

Table 11-2. TEST #78 AC Power Query Test — *Continued*

Error Code	Test Result	Description / Recommendation
1 *(cont'd.)*	FAIL	c. alarms against these MOs, and rerun the test. There are failures that can occur on the Maintenance/Tape Processor, Duplication Interface, and EPN Maintenance circuit pack that **are not** detected by the respective maintenance, but that cause many, if not all, environment tests to fail. If many environment tests are failing, the suspect circuit pack, depending on the system configuration, should be replaced and the test rerun. If the test still fails, then escalate the problem. 2. Procedures for a Global MCC (J58890CH): a. For a nominal holdover system if there is no AC power at the wall outlet, then the problem is not with the system itself. Power must be restored to the wall outlet. For a Extended Power System follow normal escalation procedures b. If there is AC power at the wall outlet, then there could be a problem with the Rectifiers (RM850), Battery Interface Unit, or battery. Resolve all alarms logged against the POWER Maintenance Object, and rerun the test. If the test still fails, the BIU may be defective. Check to see if the BOD alarm LED is "on", on the BIU. If the BOD LED is "on" replace the Battery Interface Unit (BIU). If the BOD LED is "off" and the BOK LED is "on" then the SYSAM or the EPN Maintenance circuit pack may be incorrectly reporting the problem. Resolve all alarms against these Maintenance Objects and rerun the test. c. If the test still fails, then follow normal escalation procedures

Continued on next page

Table 11-2. TEST #78 AC Power Query Test — *Continued*

Error Code	Test Result	Description / Recommendation
100	FAIL	The switch is currently without AC power, and AC Power maintenance is in the middle of timing the NPH interval. 1. Follow the repair steps outlined above for Error Code 1.
	PASS	The PR-MAINT (Maintenance/Tape Processor) in a PPN in a system without High or Critical Reliability, the DUPINT (Duplication Interface) circuit pack in a High or Critical Reliability system PPN, or the EPN MAINT (Maintenance) circuit pack in an EPN multicarrier cabinet system has reported that the switch has AC power. If there is no AC power at the wall outlet, then look for and resolve all alarms against the appropriate MO listed.

AC-POWER (AC Power) for DC-Powered Systems

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run[1]	Full Name of MO
AC-POWER	WARNING	test environment P	AC Power

1 Where P is an appropriate port network number determined via the PORT field from the Alarm or Error Log.

DEFINITY Generic 1 offers two basic cabinet type configurations: (1) the multicarrier cabinet system and (2) the single-carrier cabinet system. Both cabinet system configurations may be powered by either an external AC or DC power source.

NOTE:
For environment maintenance, the PPN or EPN cabinet configuration aspects in a High or Critical Reliability system are irrelevant.

The environment maintenance strategy to be used depends on both the cabinet configuration and the type of powering. Therefore, refer to the following list to find the appropriate section(s).

- For a single-carrier cabinet system, refer to the "DC-POWER (Single-Carrier Cabinet Power)" Maintenance documentation for environment maintenance strategy.
- For a multicarrier cabinet system using an external AC power source, refer to one or more of the following Maintenance documentation sections: "AC-POWER (AC Power) for AC-Powered Systems", "CARR-POW (Carrier Port Power Unit) for AC-Powered Systems", or "POWER (Battery & Battery Charger) for AC-Powered Systems".
- For a multicarrier cabinet system using an external DC power source, refer to one or more of the following Maintenance documentation sections: "AC-POWER (AC Power) for AC-Powered Systems", "CARR-POW (Carrier Port Power Unit) for AC-Powered Systems", or "POWER (Battery & Battery Charger) for AC-Powered Systems".

In a DC-powered multicarrier cabinet system, the AC-POWER maintenance object still exists, but serves no functional purpose. Because the system cannot determine the type of powering provided, all AC-POWER tests should always either pass or abort.

Hardware Error Log Entries and Test to Clear Values

AC Power Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test environment P sh r 1
513	Any	AC Power Query Test (#78)	WARNING	OFF	test environment P sh r 1

1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following table when inspecting errors in the system. By clearing error codes associated with the *AC Power Query Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Battery & Battery Charger Query Test (#5) (a)	X	X	ND
AC Power Query Test (#78)	X	X	ND
Power Unit Query Test (carrier E) (#127) (b)	X	X	ND
Power Unit Query Test (carrier D) (#127) (b)	X	X	ND
Power Unit Query Test (carrier A) (#127) (b)	X	X	ND
Power Unit Query Test (carrier B) (#127) (b)	X	X	ND
Power Unit Query Test (carrier C) (#127) (b)	X	X	ND
Emergency Transfer Query Test (#124) (c)	X	X	ND
Cabinet Temperature Query Test (#122) (d)	X	X	ND
External Alarm Lead Query Test (#120) (e)	X	X	ND
Analog Ring Generator Initialization Test (#117) (f)	X	X	ND
Analog Ring Generator Query Test (#118) (f)	X	X	ND

1 D = Destructive; ND = Nondestructive

Notes:

a. Refer to "POWER (Battery & Battery Charger) for AC-Powered Systems" Maintenance documentation for a description of this test.

b. Refer to "CARR-POW (Carrier Port Power Unit) for AC-Powered Systems" Maintenance documentation for a description of this test.

c. Refer to "EMG-XFER (Emergency Transfer)" Maintenance documentation for a description of this test.
d. Refer to "CABINET (Cabinet Sensors)" Maintenance documentation for a description of this test.
e. Refer to "EXT-DEV ADMIN? N (External Device Alarm)" or "EXT-DEV ADMIN? Y (External Device Alarm)" Maintenance documentation for a description of this test.
f. Refer to "RING-GEN (Analog Ring Generator)" Maintenance documentation for a description of this test.

AC Power Query Test (#78)

This test queries the Maintenance/Tape Processor in a PPN in a system without High or Critical Reliability, the Duplication Interface circuit pack in a High or Critical Reliability system PPN, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system for the status of AC power to the switch. In a DC-powered system, this test should never fail.

Table 11-3. TEST #78 AC Power Query Test

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available.
2000	ABORT	Response to the test request was not received within the allowable time period.
2029	ABORT	Internal System Error. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
any	FAIL	The Maintenance/Tape Processor in a PPN in a system without High or Critical Reliability, the Duplication Interface circuit pack in a High or Critical Reliability system PPN, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system is incorrectly reporting a problem with AC power. If this test fails, the problem is with the circuit pack and not with AC-POWER. The suspect circuit pack, depending on the system configuration, should be replaced and the test rerun. If the test still fails, then follow normal escalation procedures.
	PASS	All that can be inferred is that the PR-MAINT (Maintenance/Tape Processor) in a PPN in a system without High or Critical Reliability, the DUPINT (Duplication Interface) circuit pack in a High or Critical Reliability system PPN, or the EPN MAINT (Maintenance) circuit pack in an EPN multicarrier cabinet system is working properly.

ADM-CONN (Administered Connection)

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run[1]	Full Name of MO
ADM-CONN	MAJOR	status administered-connection N	Administered Connection
ADM-CONN	MINOR	status administered-connection N	Administered Connection
ADM-CONN	WARNING	status administered-connection N	Administered Connection

1 Where N is an appropriate Administered Connection number determined via the PORT field from the Alarm or Error Log.

An Administered Connection (ADM-CONN) provides an end-to-end connection between two access endpoints or data-modules. This connection is automatically established whenever the Administered Connection is administered and the Administered Connection is due to be active. An error is logged whenever an Administered Connection cannot be established, either initially, on retry, fast retry, redial, or auto restoration, or whenever an established Administered Connection fails (including an Administered Connection that is subsequently reestablished via fast retry, redial, or auto restoration). An alarm is logged whenever an Administered Connection cannot initially be established or fails and cannot be reestablished. An administrable alarming strategy is supported on a per Administered Connection basis. An alarm is raised for an Administered Connection when either the number of consecutive failed attempts to establish the Administered Connection reaches the alarm threshold or it can be determined that a failed attempt to establish was due to an administered error (see note d). The alarm raised ("major," "minor," "warning," or "none") is specified in the "Alarm Type" field of the Administered Connection Administration Form.

Hardware Error Log Entries and Test to Clear Values

Table 11-4. Administered Connection Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0 (a)(b)(c)(k)	Any	None	Any	OFF	None
1 (a)(b)(c)(d)(e)	Any	None	Any	OFF	None
2 (a)(b)(c)(f)	Any	None	Any	OFF	None

95 (a)(b)(c)(q)	Any	None	Any	OFF	None
96 (a)(b)(c)(q)	Any	None	Any	OFF	None
97 (a)(b)(c)(q)	Any	None	Any	OFF	None
98 (a)(b)(c)(q)	Any	None	Any	OFF	None
99 (a)(b)(c)(q)	Any	None	Any	OFF	None
100 (a)(b)(c)(q)	Any	None	Any	OFF	None
102 (a)(b)(c)(i)	Any	None	Any	OFF	None
111 (a)(b)(c)(q)	Any	None	Any	OFF	None
127 (a)(b)(c)(g)	Any	None	Any	OFF	None

a. These errors have no specific test associated with them. Refer to Notes b through s for an explanation and appropriate action.

b. These errors are valid only for Administered Connection established over ISDN facilities; only error 127 is valid for Administered Connection established over non-ISDN facilities (or between two endpoints on the same switch).

- Aux Data 1—Administered Connection establishment failed
- Aux Data 2—Active Administered Connection failed; attempting reestablishment via auto restoration
- Aux Data 3—Auto restoration failed
- Aux Data 4—Active Administered Connection failed; attempting reestablishment via fast retry
- Aux Data 5—Fast retry failed

c. **These errors are typically associated with administrative problems and are not expected to be of a temporary nature. Therefore, the Administered Connection is not retried and the failure is alarmed immediately (that is, the alarm threshold specified by the customer is ignored).**

d. The address of the destination endpoint is: an unassigned number (1); has an invalid number format (28); or is restricted form terminating calls ("Access Denied") [due to COR (Class of Restriction)]. Verify that the destination address is correct and that the destination endpoint is administered. **The destination endpoint is not administered on the switch where this error is logged.**

e. A request has been made to use a transit network or common carrier that cannot be accessed. Check the routing pattern used by this Administered Connection and verify that the inter-exchange carrier specified is correct.

f. The exact failure cause is unknown or has been mapped to one of these values. If this is not a temporary condition, try reversing the direction of the Administered Connection (that is, originate the Administered Connection from the destination switch). This may yield another failure cause; if not, and if this condition persists, follow normal escalation procedures.

g. The destination endpoint is not available. Check the status of the destination endpoint (for example, by using the **status access-endpoint** or **status data-module** command) and verify that the endpoint is not busy or otherwise unavailable (for example, out-of-service). **The status for the destination endpoint is not available on the switch where this error is logged.**

h. This switch sent an ISDN message to another switch, which either did not respond (18) or did not respond within the allotted time (102). This could be due to link failure or congestion or outage at the other switch. If this is not a temporary condition, follow normal escalation procedures.

i. The address of the destination endpoint has changed. Verify that the new address is correct and change the Administered Connection accordingly. **The destination endpoint is not administered on the switch where this error is logged.**

j. If this is not a temporary condition, follow normal escalation procedures.

k. These errors indicate that a resource (for example, a circuit or bearer capability) required by the Administered Connection is not presently available. If this is not a temporary condition, follow normal escalation procedures.

l. A network failure (38) or temporary failure (41) has occurred. Error Log entries for other maintenance objects (for example, DS1-BD or ISDN-LNK) may indicate a local problem. If not, and if this condition persists, follow normal escalation procedures.

m. A request to use a network service has been denied because the service has not been purchased. Check the routing pattern used by this Administered Connection and verify that the service type is correct. If the service type appears correct, check with the customer or network provider or both to determine what services have been purchased by the customer.

n. These errors indicate that outgoing calls may be barred on the originating switch (52) or that incoming calls may be barred on the destination switch (54). To restore an Administered Connection failure, issue the **status administered connection** command for current Administered Connection state (observe the retry count). If the Administered Connection state is "failed," then verify and correct the Administered Connection Administration Form.

o. The requested bearer capability (65), channel type (66), or facility (69) is not implemented or is unknown to the network. Check the address of the destination endpoint and the routing pattern used by this Administered Connection, and verify that they are correct and available. If no problem is found, follow normal escalation procedures.

p. These errors indicate that an ISDN protocol error has occurred. If this is not a temporary condition, follow normal escalation procedures.

q. If this is not a temporary condition, follow normal escalation procedures.

r. The destination endpoint (or some intermediate facility) is not compatible with the originating endpoint. Check the BCC fields of the routing pattern used by this Administered Connection. Also, check whether or not the originating and destination endpoints are compatible (for example, the originating access endpoint is voice-grade data, and the destination access endpoint is 64k data).

ADX16D-B (16 Port AUDIX Digital Circuit Pack)

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run[1]	Full Name of MO
ADX16D-B	MINOR	test board UUCSS sh	AUDIX Circuit Pack
ADX16D-B	WARNING	test board UUCSS sh	AUDIX Circuit Pack

1 Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.); and pp is the 2-digit port number (for example, 01).

The ADX16D-B maintenance object represents a TN566/TN2169 Definity AUDIX circuit pack combination (sometimes called Embedded AUDIX) operating in 16 port mode digital (DP). For circuit-pack-level problems, see XXX-BD. Port-level maintenance is covered by ADX16D-P.

On G3rV1 systems, the TN566/TN2169 combination operating in control-link mode appear to the system as a TN746 Analog Line circuit pack with vintage greater than 50. The maintenance strategy for ports on the TN566 operating in control-link mode is described in ADXCL-PT.

DEFINITY AUDIX consists of two circuit packs that occupy 5 slots on a port carrier. The tests described in this manual apply only to switch-side maintenance which tests circuit pack components related to the TDM bus interface. The AUDIX system has an extensive maintenance strategy of its own that is described in *DEFINITY AUDIX System Maintenance*, 585-300-110.

ADX16D -P (16-Port AUDIX Digital PORT)

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run[1]	Full Name of MO
ADX16D-P	MIN	test port PCSSpp l	AUDIX 16-Port Digital
ADX16D-P	WRN	test port PCSSpp sh	AUDIX 16-Port Digital

1 Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.); and pp is the 2-digit port number (for example, 01).

When a call is not answered, it is transferred to AUDIX, which answers the call.

DEFINITY AUDIX is a full-service voice messaging system that allows both system users and outside callers to write, edit, send, and forward voice messages to other users. It resides on two circuit packs, the TN566 Multifunction Board (MFB) and the TN2169 (ALM) Alarm Board.

In 16-port digital port (DP) mode the TN566 circuit pack supports up to 16 voice ports, each port is equipped with a primary and secondary information channel. When a call to a station with an AUDIX login is not answered, AUDIX answers the call using one of the available voice ports.

The maintenance strategy for ports on the TN566 operating in control-link mode is described in ADXCL-PT. On G3r V1 systems, TN566/TN2169 DEFINITY AUDIX circuit packs operating in control-link mode appear to the system as a TN746 Analog Line circuit pack with vintage greater than 50.

The tests described in this manual apply only to switch-side maintenance which tests circuit pack components related to the TDM bus interface. The AUDIX system has an extensive maintenance strategy of its own that is described in *DEFINITY AUDIX System Maintenance*, 585-300-110.

Due to its width, the TN566 circuit pack occupies a total of five adjacent slots. When used in a Gs and G3i, it occupies the slot on the backplane into which the MFB plugs: the three slots to the immediate left and one slot to the immediate right. When used in a G3vs, the TN566 occupies the slot on the backplane into which the MFB plugs, and three additional slots to the left.

CAUTION:
*DEFINITY AUDIX unlike some AUDIX systems is **not** an adjunct. Always shut down the AUDIX system before:*

- *Removing a TN566 or TN2169 DEFINITY AUDIX circuit pack.*
- *Recycle power to a carrier or cabinet containing DEFINITY AUDIX circuit packs.*
- *Remove power to a carrier or cabinet containing DEFINITY AUDIX circuit packs*

Shutting Down DEFINITY AUDIX

Always shut down the AUDIX system before removing the TN566/TN2169 or removing or recycling power to it.

1. When AUDIX is shut down, the LCD display on the faceplate will display `E_SHUT`, `M_SHUT` or `386_DEAD`.
2. If one of the above is not displayed, press the `BOOT/SHUTDOWN` button on the AUDIX faceplate and wait for `M_SHUT` to be displayed steadily. (The display will flash while the disk spins down).
3. You can now safely remove (or recycle power to) the AUDIX circuit packs.
4. To restart AUDIX from the `SHUT` service state, press the `BOOT/SHUTDOWN` button.

Hardware Error Log Entries and Test to Clear Values

16-Port AUDIX Analog Line Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test port UUCSSpp sh r 1
1 (a)	40987	None	WRN	OFF	
1 (b)	1 to 20	None	WRN	OFF	
15 (c)	Any	None			
18 (d)	0	busyout port UUCSSpp	WRN	OFF	release port UUCSSpp

2049		NPE Crosstalk Test (#9)	MIN/WRN[2]	ON	test port UUCSSpp 1 r 3
2305 (j)	40967	None			
3840 (k)	40965	None			
3840 (l)	41029	None			

1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

2 Minor alarms on this MO may be downgraded to Warning alarms based on the values used in the **set options** command.

Notes:

a. The user may experience a noisy port or link. This is a off-board problem that is detected by the port circuit. If this problem exists, replace the circuit pack (see the precaution at the beginning of this section). Once this problem is resolved, the alarm will be retired after a predetermined amount of time.

b. At least 15 off-board problems have been detected with the link to the voice port. When an error with the link is detected, an on-board counter is incremented.

   The user could experience a noisy port or link. This is an off-board problem that is detected by the port circuit. If this problem exists, replace the circuit pack (see precaution at the beginning of this section). Once the problem is resolved, the alarm is retired after a predetermined amount of time.

c. This is a internal type error that occurs when an audit request fails.

d. The port is busied-out by command. Use the **release port UUCSSpp** command to release the port.

e. The circuit pack in administered but not installed. The alarm will clear when a circuit pack is inserted into the assigned slot.

f. The circuit pack has been insane for more than 21 minutes. To clear the error, reinsert or replace the circuit pack (see the precaution at the beginning of this section).

g. Something is interfering with transmitting to the voice port. This is usually an on-board problem and can be ignored if no user complaints are received.

h. AUDIX is not available to the switch, possibly due to a busyout on the AUDIX system. To check out the AUDIX system, use the *DEFINITY AUDIX System Maintenance (AT&T 858-300-110)* document.

i. An in-line maintenance error has generated an off-board warning due to a problem with the link to a voice port. This problem can be ignored if no user complaints are received. If the problem persists, replace the circuit pack (see precaution at the beginning of this section). Once the circuit pack is replaced, the alarm will be retired after a certain period of time.

j. The link between the voice port and the circuit pack has been successfully reset. No craft action is required.

k. No voice ports are connected to the DEFINITY AUDIX circuit pack. No maintenance action is required.

l. The message buffer in the circuit pack is full.

NO-OP Tests

The maintenance strategy for DEFINITY AUDIX emulates the one for DIG-LINE. The tests listed below apply only to DIG-LINE and not to DEFINITY AUDIX and are referred to as *NO-OP* tests. NO-OP tests always return PASS. Users should ignore these tests.

- Electronic Power Feed Test (#11)
- Station Lamp Updates Test (#16)
- Station (Digital) Audits Test (#17)
- Digital Terminal Remote Loop Around Test (#1201)

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following table when inspecting errors in the system. By clearing error codes associated with the *Battery Feed Test,* for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Voice and Control Channel Loop Around Test (#13)		X	ND
NPE Crosstalk Test (#9)		X	ND

1 D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#9)

One or more Network Processing Elements (NPEs) reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain and provides conference functions on a per-port basis. The NPE Crosstalk Test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is usually only part of a port's Long Test Sequence and takes about 20 to 30 seconds to complete. Crosstalk testing is performed on both the primary information channel (voice) and on the secondary information channel (data) associated with each DEFINITY AUDIX port. If this test fails on either channel, the voice port is taken out-of-service.

Table 11-5. TEST #9 NPE Crosstalk Test

Error Code	Test Result	Description/ Recommendation
1	ABORT	During testing of the primary information channel, system resources may not have been available. Also, the port may have been busy during the test 1. Check the port status. Use the **display port UUCSSpp** command to determine the voice port extension of the port. Use the **status station** command to determine the service state of the port. If the service state of the port indicates that the port is unavailable for the test, wait until the port is idle and retry the test. 2. If the port status is idle, retry the command at one-minute intervals a maximum of five times. 3. If the test continues to abort, escalate the problem.
2	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-5. TEST #9 NPE Crosstalk Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the **display port PCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. If the port status is idle, retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1001	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to "TDM-BUS (TDM Bus)" Maintenance documentation to diagnose any active TDM-BUS errors. 1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-5. TEST #9 NPE Crosstalk Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. 1. Look for TTR-LEV errors in the Error Log. If present, refer to "TTR-LEV (TTR Level)" Maintenance documentation. 2. Look for TONE-PT errors in the Error Log. If present, refer to "TONE-PT (Tone Generator)" Maintenance documentation. 3. If neither condition exists, retry the test at one-minute intervals a maximum of five times. 4. If the test continues to abort, escalate the problem.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. Use the **display port PCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort and the port is not in use, escalate the problem.
1020	ABORT	Test disabled via background testing. Use the **status station** command to determine when the voice port is available for testing.
2000	ABORT	Response to the test request was not received within the allowable time period. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort and the port is not in use, escalate the problem.

Continued on next page

Table 11-5. TEST #9 NPE Crosstalk Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1, 2	FAIL	The Network Processing Element (NPE) of the tested port was found to be transmitting in error. This causes noisy and unreliable connections. Failure code 1 indicates that the Crosstalk test failed on the primary channel. Failure code 2 indicates that the Crosstalk test failed on the secondary channel. 1. Replace the circuit pack (see precaution at the beginning of this section).
1	ABORT	During testing of the primary information channel, system resources may not have been available. Also, the port may have been busy during the test. 1. Check the port status. Use the **display port UUCSSpp** command to determine the voice port extension of the port. Use the **status station** command to determine the service state of the port. If the service state of the port indicates that the port is unavailable for the test, wait until the port is idle and retry the test. 2. If the port status is idle, retry the command at one-minute intervals a maximum of five times. 3. If the test continues to abort, escalate the problem.

Voice and Control Channel Local Loop Test (#13)

This test checks the information and control channels between the Switch Processing Element (SPE) and the DENFINTY AUDIX port circuit. The SPE sends a message to loop around both the information and control channels for the port. The primary information (voice) channel loop back test is run first. This test is run by sending a digital count on the Tone-Clock circuit pack on the primary information channel time slot and receiving the same digital count with a general purpose Tone Detector.

The Control Channel Loop Around Test is performed while the primary information channel is still looped back. This test sends four different transparent patterns to the on-board microprocessor which loops them back. A data integrity test is made by checking the loop back pattern to the original pattern.

The Loop Around Test for the secondary information channel is then performed using the same process as the primary channel.

After the above tests are completed a Conference test is implemented for the primary information channel. This test is the same as Conference Test #6.

Only one value (Pass, Fail, or Abort) is generated as a result of the four tests. If any test fails or aborts, the sequence is stopped.

Table 11-6. TEST #13 Conference Circuit Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal System Error. 1. Retry the command at one minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the **display port UUCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. If the port status is idle, then retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1001	ABORT	The system resources required to run this test are not available. 1. If the port status is idle, then retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to "TDM-BUS (TDM Bus)" Maintenance documentation to diagnose any active TDM-BUS errors. 1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-6. TEST #13 Conference Circuit Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. 1. Look for TTR-LEV errors in the Error Log. If present, refer to "TTR-LEV (TTR Level)" Maintenance documentation. 2. Look for TONE-PT errors in the Error Log. If present, refer to "TONE-PT (Tone Generator)" Maintenance documentation. 3. If neither condition exists, retry the test at one-minute intervals a maximum of five times. 4. If the test continues to abort, escalate the problem.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. Use the **display port UUCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort and the port is not in use, escalate the problem.

Continued on next page

Table 11-6. TEST #13 Conference Circuit Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-6. TEST #13 Conference Circuit Test — *Continued*

Error Code	Test Result	Description/ Recommendation
7	FAIL	Conference Test failed on the primary channel. In some cases users may not notice a disruption in service. In extreme cases, the conference feature may not work at all.
14	FAIL	The primary voice channel is not transmitting properly. User impact may range from no noticeable effect to loss of use of the port.
15	FAIL	The control channel between the processor and the DEFINITY AUDIX circuit pack is not transmitting properly. User impact may range from no noticeable effect to loss of use of this port. This failure could also be disruptive to other use.
16	FAIL	The secondary voice channel is not transmitting properly. User impact may range from no noticeable effect to loss of use of the port.
None	FAIL	The test failed for reasons external to the DEFINITY AUDIX circuit pack. 1. Run circuit pack tests to check the Tone Generator circuit pack and the Tone Detector circuit pack by using the **test board UUCSS s** command. 2. Resolve any problems that are detected on the Tone Generator circuit pack, and the Tone Detector circuit pack. 3. If the Tone Generator circuit pack and the Tone Detector circuit pack are functioning properly, and if the test still fails, replace the DEFINITY AUDIX circuit pack (see the precautions at the beginning of this section).
	PASS	Voice and Control Channel Local test passed. All channels are transmitting properly. 1. To be sure that this is not an intermittent problem, repeat the test up to 10 times to see if it will continues to pass. 2. If complaints still exist, examine the connections.

ADXCL-BD (AUDIX Control Link Circuit Pack)

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run[1]	Full Name of MO
ADXCL-BD	MIN	test board PCSS sh	AUDIX Control Link Circuit Pack
ADXCL-BD	WRN	test board PCSS sh	AUDIX Control Link Circuit Pack

1 Where P is the port network number (1 for PPN and 2 or [G1.2, G3iV1.1-286, G3iV2-386] 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.).

The maintenance strategy for DEFINITY AUDIX Analog or Control Link emulates the one for ANL-16-L. The few tests that apply only to ANL-16-L and not to DEFINITY AUDIX Control Link are listed below and are referred to as *NO-OP* tests. NO-OP tests always return PASS. Users should ignore this test.

- Neon Test (#220)

Refer to "XXX-BD (Common Port Circuit Pack)" Maintenance documentation for circuit pack level errors. See also "ADXCL-PT (16-Port AUDIX Analog Line/Control Link Mode)" Maintenance documentation for related port information.

NOTE:
For information on removing DEFINITY AUDIX Control Link circuit packs, refer to *DEFINITY AUDIX Maintenance, 585-300-110*. For information on installing DEFINITY AUDIX Control Link circuit packs, refer to *DEFINITY AUDIX System R2.0 Installation, 555-300-111*.

ADXCL-PT (16-Port AUDIX Analog Line/Control Link Mode)

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run[1]	Full Name of MO
ADXCL-PT	MIN	test port PCSSpp l	16-Port AUDIX Analog Line/Control Link
ADXCL-PT	WRN	test port PCSSpp sh release station <ext>	16-Port AUDIX Analog Line/Control Link

1 Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.); and pp is the 2-digit port number (for example, 01).

When a call is not answered, it is transferred to AUDIX, which answers the call.

The DEFINITY AUDIX circuit pack is a port circuit pack that allows both system users and outside callers to write, edit, send, and forward voice messages to other users. This circuit pack can be administered to up to sixteen analog voice ports. Each of the sixteen ports can support one DEFINITY AUDIX voice port. Whenever AUDIX answers a call, it uses one of the available voice ports.

The circuit pack resides on the TN566 Multifunction Board (MFB).[1]

Due to its width, the TN566 circuit pack actually consumes a total of five adjacent slots: the slot on the backplane into which the MFB plugs, the three slots to the immediate left, and one slot to the immediate right.

NOTE:
DEFINITY AUDIX is **not** an adjunct.

Failures of the common ringing application circuitry are reported as part of the Common Port Circuit Pack errors (see errors 1281 and 1537 in the XXX-BD (Common Port Circuit Pack) Maintenance documentation).

1. In some earlier systems, DEFINITY AUDIX appears to the system as a TN746B 16-Port Analog Line circuit pack. In these systems, you need to check the vintage number and suffix of the circuit pack to determine if a TN746B circuit pack is really a DEFINITY AUDIX. For TN746B circuit pack, *if the vintage is greater than or equal to 50*, the circuit pack is actually DEFINITY AUDIX. Otherwise, the circuit pack is normal TN746B 16-Port Analog Line circuit pack.

Hardware Error Log Entries and Test to Clear Values

16-Port AUDIX Analog Line Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test port PCSSpp sh r 1
1 (a)	40977	None			
18	0	busyout station <extension>	WRN	ON	release station <extension>
23(b)	0	None	WRN	OFF	
130(c)		None	WRN	ON	test port PCSSpp sh
257(d)	40973	None			
513(e)	Any	None			
1025(f)		Loop Around Test (#161)	MIN/WRN[2]	ON	test port PCSSpp l r 2
1281		Conference Test (#7)	MIN/WRN[2]	ON	test port PCSSpp l r 2
1537		NPE Crosstalk Test (#6)	MIN/WRN[2]	ON	test port PCSSpp l r 2

1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

2 Minor alarms on this MO may be downgraded to Warning alarms based on the values used in the **set options** command.

Notes:

a. This is an in-line error and can only be resolved over time. This indicates that no terminal equipment was present when ringing was attempted. Execute the short **test port PCSSpp** command.

b. The circuit pack has been logically administered but not physically installed. The alarm will be cleared when the circuit pack is installed.

c. This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.

d. This is an in-line error and can only be resolved over time. This error indicates that ringing voltage is absent. If only one Analog circuit pack in the system has this problem, then replace the circuit pack. If only Analog circuit packs on a particular carrier have this error, then the ringing generator may not be connected to this carrier. If Analog circuit packs on many carriers have this error, then it is probably a problem with the ringing generator.

e. AUDIX is not available. Check the AUDIX system.

f. TDM BUS is out of Service.

NO-OP Tests

The maintenance strategy for DEFINITY AUDIX Analog or Control Link emulates the one for ANL-16-L. The few tests that apply only to ANL-16-L and not to DEFINITY AUDIX Control Link are listed below and are referred to as *NO-OP* tests. NO-OP tests always return PASS. Users should ignore these tests.

- Battery Feed Test (#35)
- Audits and Updates Test (#36)
- Station Present Test (#48)

NOTE:
Tests 36 and 48 ABORT when AUDIX is not running.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following table when inspecting errors in the system. By clearing error codes associated with the *Battery Feed Test,* for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Loop Around Test (#161)		X	ND
Conference Test (#7)		X	ND
NPE Crosstalk Test (#6)		X	ND

1 D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

One or more Network Processing Elements (NPEs) reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The NPE Crosstalk Test verifies that this port’s NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is usually only part of a port's Long Test Sequence and takes about 20 to 30 seconds to complete.

Table 11-7. TEST #6 NPE Crosstalk Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the **display port PCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. If the port status is idle, retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1001	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-7. TEST #6 NPE Crosstalk Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to "TDM-BUS (TDM Bus)" Maintenance documentation to diagnose any active TDM-BUS errors. 1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. 1. Look for TTR-LEV errors in the Error Log. If present, refer to "TTR-LEV (TTR Level)" Maintenance documentation. 2. Look for TONE-PT errors in the Error Log. If present, refer to "TONE-PT (Tone Generator)" Maintenance documentation. 3. If neither condition exists, retry the test at one-minute intervals a maximum of five times. 4. If the test continues to abort, escalate the problem.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. Use the **display port PCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort and the port is not in use, escalate the problem.

Continued on next page

Table 11-7. TEST #6 NPE Crosstalk Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1005	ABORT	This condition indicates that the test is not applicable when the analog port is used in a combined modem pool. This error can be ignored.
1018	ABORT	Test disabled via administration. 1. To enable the test for the particular analog station being tested, enter the **change station <extension>** command and change the "Test?" field on the Station Form from "n" to "y."
2000	ABORT	Response to the test request was not received within the allowable time period.
2012	ABORT	System could not respond to this request.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
Any	FAIL	The NPE of the tested port was found to be transmitting in error. This causes noisy and unreliable connections. 1. Replace the circuit pack.
	PASS	The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.

Conference Circuit Test (#7)

One or more NPEs reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The Conference Circuit Test verifies that the NPE channel for the port being tested can correctly perform the conferencing function. The NPE is instructed to listen to several different tones and conference the tones together. The resulting signal is then measured by a Tone Detector port. If the level of the tone is within a certain range, the test passes.

Table 11-8. TEST #7 Conference Circuit Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the **display port PCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. If the port status is idle, then retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-8. TEST #7 Conference Circuit Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. Use the **display port PCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort and the port is not in use, escalate the problem.
1018	ABORT	Test disabled via administration. This only applies to analog stations. 1. To enable the test for the particular analog station being tested, enter the **change station <extension>** command and change the "Test?" field on the Station Form from "n" to "y."
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
Any	FAIL	The NPE of the tested port did not conference the tones correctly. This causes noisy and unreliable connections. 1. Replace the circuit pack.
	PASS	The port can correctly conference multiple connections. User-reported troubles on this port should be investigated by using other port tests and by examining station, trunk, or external wiring.

Loop Around Test (#161)

Each Analog port consists of:

- an NPE for port connectivity and gain, and conferencing functionality

This test is designed to check the on-board transmission capabilities of the NPE on the analog port. A Tone Detector and a Tone Generator talk and listen on the same pair of time slots as the Analog Port. The Analog Port is then instructed to go into loop around mode (see the following below). The test passes if the signal measured by the Tone Detector is within acceptable limits. For the TN566, the gain has been artificially reduced to be within the tolerances required by the switch TONE LEVEL MEASUREMENTS.

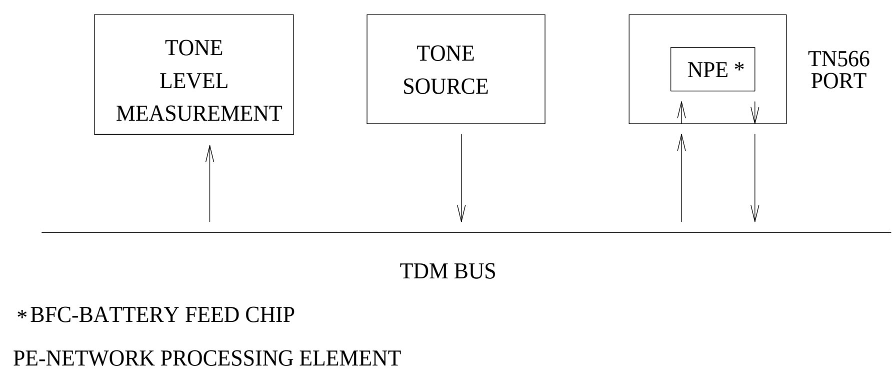

Figure 11-4. Analog Loop Around Test

Table 11-9. TEST #161 Loop Around Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the **display port PCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. If the port status is idle, then retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to "TDM-BUS (TDM Bus)" Maintenance documentation to diagnose any active TDM-BUS errors. 1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Table 11-9. TEST #161 Loop Around Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
	FAIL	The reflective Loop Around Test failed. This causes noisy or unreliable connections or other users calling this port may hear an echo. 1. Replace the circuit pack.
	PASS	The port is able to provide an analog transmission path to the station equipment. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.

ADXDP-BD (AUDIX Digital Circuit Pack)

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run[1]	Full Name of MO
ADXDP-BD	MIN	test board PCSS sh	AUDIX Digital Circuit Pack
ADXDP-BD	WRN	test board PCSS sh	AUDIX Digital Circuit Pack

1 Where P is the port network number (1 for PPN and 2 or [G1.2, G3iV1.1-286, G3iV2-386] 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.).

Refer to "XXX-BD (Common Port Circuit Pack)" Maintenance documentation for circuit pack level errors. See also "ADXDP-PT (AUDIX Digital Port)" Maintenance documentation for related port information.

NOTE:
For information on removing DEFINITY AUDIX Digital circuit packs, refer to *DEFINITY AUDIX Maintenance, 585-300-110*. For information on installing DEFINITY AUDIX Digital circuit packs, refer to *DEFINITY AUDIX System R2.0 Installation, 555-300-111*.

ADXDP-PT (AUDIX Digital Port)

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run[1]	Full Name of MO
ADXDP-PT	MIN	test port PCSSpp l	AUDIX Digital Port
ADXDP-PT	WRN	test port PCSSpp sh	AUDIX Digital Port

1 Where P is the port network number (1 for PPN and 2 or [G1.2,G3iV1.1-286, G3iV2-386] 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.); and pp is the 2-digit port number (for example, 01).

When a call is not answered, it is transferred to AUDIX, which answers the call.

The DEFINITY AUDIX circuit pack is a port circuit pack that allows both system users and outside callers to write, edit, send, and forward voice messages to other users. This circuit pack can be administered to up to eight voice ports in increments of two. The pack can support eight ports, with two logical information channels (primary information channel and secondary information channel) on each port. Each of the eight ports can support one DEFINITY AUDIX voice port. Whenever AUDIX answers a call, it uses one of the available voice ports.

The circuit pack resides on the TN566 Multifunction circuit pack (MFB).[2]

Due to its width, the TN566 circuit pack actually consumes a total of five adjacent slots: the slot on the backplane into which the MFB plugs, the three slots to the immediate left, and one slot to the immediate right.

NOTE:
DEFINITY AUDIX is **not** an adjunct.

Failures of the common ringing application circuitry are reported as part of the Common Port Circuit Pack errors (see error 1793 in the XXX-BD (Common Port Circuit Pack) Maintenance documentation).

2. In some earlier systems, DEFINITY AUDIX appears to the system as a TN746B 16-Port Analog Line circuit pack. In these systems, you need to check the vintage number and suffix of the circuit pack to determine if a TN746B circuit pack is really a DEFINITY AUDIX. For TN746B circuit pack, *if the vintage is greater than or equal to 50*, the circuit pack is actually DEFINITY AUDIX. Otherwise, the circuit pack is normal TN746B 16-Port Analog Line circuit pack.

Hardware Error Log Entries and Test to Clear Values

1793		Voice & Ctrl. Local Loop	MIN/WRN[2]	ON	test port PCSSpp l r 3
		Test (#13)			
2049		NPE Crosstalk Test (#9)	MIN/WRN[2]	ON	test port PCSSpp l r 3
2305 (j)	40967	None			
3840 (k)	40965	None			
3840 (l)	41029	None			

1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

2 Minor alarms on this MO may be downgraded to Warning alarms based on the values used in the **set options** command.

Notes:

a. The user may experience a noisy port or link. This is an off-board problem that is detected by the port circuit. If this problem exists, replace the circuit pack. Once the problem is resolved, the alarm is retired after a predetermined amount of time.

b. At least 15 off-board problems have been detected with the link to the voice port. When an error with the link is detected, an on-board counter is incremented.

The user could experience a noisy port or link. This is an off-board problem that is detected by the port circuit. If this problem exists, replace the circuit pack. Once the problem is resolved, the alarm is retired after a predetermined amount of time.

c. This is an internal type error that occurs when an audit request fails.

d. The port in question is busied out by maintenance personnel. Make sure that the port is released from busyout via the **release port PCSSpp** command.

e. The circuit pack has been logically administered but not physically installed. The alarm will be cleared when the circuit pack is installed.

f. The circuit pack has been removed or has been insane for more than 21 minutes. To clear the error, reinsert or replace the AUDIX circuit pack.

g. There are problems transmitting to the voice port. This is usually an on-board problem, and it can be ignored if no user complaints are received.

h. AUDIX is not available. Check the AUDIX system. For Aux Data 0, tests 11, 16, and 17 fail with no error code.

i. An in-line maintenance error has generated an off-board warning due to some problem with the link to the voice port. This can be ignored if no user complaints are received. If the problem persists, replace the circuit pack. Once the problem is resolved, the alarm is retired after a pre-determined amount of time.

j. The link between the circuit pack and the voice port is successfully reset. No system technician action is necessary.

k. No voice port is connected to the DEFINITY AUDIX circuit pack. No maintenance action is required.

l. The message buffer in the circuit pack is full.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when you are inspecting errors in the system. By clearing error codes associated with the *Voice and Control Channel Local Loop Around Test,* for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Voice and Control Channel Local Loop Around Test (#13)		X	ND
NPE Crosstalk Test (#9)		X	ND

1 D = Destructive; ND = Nondestructive

NO-OP Tests

The Maintenance Strategy for DEFINITY AUDIX emulates the one for DIG-LINE. The few tests that apply only to DIG-LINE and not to DEFINITY AUDIX are listed in the following table, and they are referred to as "NO-OP". NO-OP tests always return PASS, and users should ignore these tests.

NO-OP Tests for ADXDP-PT
Electronic Power Feed Test (#11)
Station Lamp Updates Test (#16)
Station (Digital) Audits Test (#17)

NOTE:
Tests 16 and 17 ABORT when AUDIX is not present.

NPE Crosstalk Test (#9)

One or more Network Processing Elements (NPEs) reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and it provides conferencing functions on a per-port basis. The NPE Crosstalk Test verifies that this port's NPE channel talks on the selected time slot and that it never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is part of a port's Long Test Sequence, and it takes about 20 to 30 seconds to complete. Crosstalk testing is performed on both the primary information channel (voice) and on the secondary information channel (data) associated with each DEFINITY AUDIX port. If this test fails on either channel, the voice port is taken out-of-service.

Table 11-10. TEST #9 NPE Crosstalk Test

Error Code	Test Result	Description/ Recommendation
1	ABORT	During testing of the primary information channel, system resources may not have been available. Also, the port may have been busy during the test. 1. Check the port status. Use the **display port PCSSpp** command to determine the voice port extension of the port. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, the port is unavailable for this test. You must wait until the port is idle. 2. If the port status is idle, retry the command at one minute intervals a maximum of five times. 3. If the test continues to abort, escalate the problem.
2	ABORT	System resources may not have been available, or the port may have been busy during the test. 1. Check if port is being used. Retry the command after one minute. 2. If the test continues to abort after five attempts, escalate the problem.

Table 11-10. TEST #9 NPE Crosstalk Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available. The port may be in use. Use the **display port PCSSpp** command to determine the voice port extension of the port. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. If the port status is idle, retry the command at one minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1001	ABORT	System resources required to run this test are not available. 1. Retry the command at one minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions, or it may have time slots out-of-service due to TDM-BUS errors. Refer to "TDM-BUS (TDM Bus)" Maintenance to diagnose any active TDM-BUS errors. 1. If system has no TDM-BUS errors, and if it is not handling heavy traffic, repeat the test at one minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-10. TEST #9 NPE Crosstalk Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out-of-service. 1. Look for TTR-LEV errors in the Error Log. If present, refer to "TTR-LEV (TTR Level)" Maintenance documentation. 2. Look for TONE-PT errors in the Error Log. If present, refer to "TONE-PT (Tone Generator)" Maintenance documentation. 3. If neither condition exists, retry the command at one minute intervals a maximum of five times. 4. If the test continues to abort, escalate the problem.
1004	ABORT	The port was put in use during the test. The test has been aborted. 1. Use the **display port PCSSpp** command to determine the voice port extension of the port. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting.
1020	ABORT	Test disabled via background testing. Use the **status station** command to determine when the voice port is available for testing.
2000	ABORT	Response to the test request was not received within the allowable time period. 1. Retry the command at one minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-10. TEST #9 NPE Crosstalk Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1,2	FAIL	The Network Processing Element (NPE) of the tested port was found to be transmitting in error. This causes noisy and unreliable connections. Error Code 1 indicates that the Crosstalk test failed on the primary channel. Error Code 2 indicates that the Crosstalk test failed on the secondary channel. 1. Replace the pack.
	PASS	The port is using its allocated time slots correctly. 1. To be sure that this is not an intermittent problem, repeat this test up to a maximum of 10 times to make sure it continues to pass. 2. If complaints still exist, examine the connections.

Voice and Control Channel Local Loop Test (#13)

This test checks the information and control channels between the Switch Processing Element (SPE) and the DEFINITY AUDIX port circuit. The SPE sends a message to loop around both the information and control channels for the port. First, the primary information (voice) channel loop back test is run. The test is performed by sending a digital count from the Tone-Clock circuit pack on the primary information channel time slot and receiving the same digital count with a general purpose Tone Detector.

While the primary information channel is still looped around, the Control Channel Loop Around Test is performed. This test involves sending four different transparent patterns to the on-board microprocessor, receiving them back, and comparing them.

The Loop Around Test for the secondary information (data) channel is then performed. This test is the same as the primary information channel loop around test.

Next, a Conference Test is implemented for the primary information channel. This test is the same as Conference Test #6.

Only one value (Pass, Fail, or Abort) is generated as a result of the four tests run. If any test fails or aborts, the sequence is stopped.

Table 11-11. TEST #13 Voice and Control Channel Local Loop Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal System Error 1. Retry the command at one minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Table 11-11. TEST #13 Voice and Control Channel Local Loop Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present, or some Tone Detectors may be out-of-service. 1. Look for TTR-LEV errors in the Error Log. If present, refer to "TTR-LEV (TTR Level)" Maintenance documentation. 2. Look for TONE-PT errors in the Error Log. If present, refer to "TONE-PT (Tone Generator)" Maintenance documentation. 3. If neither condition exists, retry the command at one minute intervals a maximum of five times. 4. If the test continues to abort, escalate the problem.
1004	ABORT	The port was put in use during the test. The test has been aborted. Use the **display port PCSSpp** to determine the voice port extension of the port. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. Retry the command at one minute intervals a maximum of five times. 2. If the test continues to abort, and if the port is not in use, escalate the problem.
2000	ABORT	Response to the test request was not received within the allowable time period. 1. Retry the command at one minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-11. TEST #13 Voice and Control Channel Local Loop Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Rerun the test at one minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
7	FAIL	Conference Test failed on the primary channel. In some cases, users may not notice a disruption in service. In extreme cases, the conferencing feature may not work at all.
14	FAIL	The primary voice channel is not transmitting properly. User impact may range from noticing nothing to not being able to use this port.
15	FAIL	The control channel between the processor and DEFINITY AUDIX circuit pack is not transmitting properly. User impact may range from noticing nothing to being unable to use the port. Could also be disruptive to other users.
16	FAIL	The secondary voice channel is not transmitting properly. User impact may range from noticing nothing to not being able to use this port. 1. Run circuit pack tests to check the Tone Generator circuit pack and the Tone Detector circuit pack by using the **test board PCSS s** command. 2. Resolve any problems that are detected on the Tone Generator circuit pack or Tone Detector circuit pack. 3. If the Tone Generator and Tone Detector circuit packs are functioning properly, and if the test still fails, replace the DEFINITY AUDIX circuit pack.
	PASS	Voice and Control Channel Local Loop test passed. All channels are transmitting properly. 1. To be sure that this is not an intermittent problem, repeat this test up to a maximum of 10 times to make sure it continues to pass. 2. If complaints still exist, examine the connections.

NOTE:
For information on removing DEFINITY AUDIX circuit packs, refer to *DEFINITY AUDIX Maintenance,* 585-300-110. For information on installing DEFINITY AUDIX circuit packs, refer to *DEFINITY AUDIX System R1.0 Installation,* 555-300-111.

ALARM-PT (ALARM PORT)

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run[1]	Full Name of MO
ALARM-PT	MIN	test port UUCSSpp l	Alarm-Port
ALARM-PT	WRN	test port UUCSSpp sh	Alarm-Port

1 Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.); and pp is the 2-digit port number (for example, 01).

The Alarm Port Maintenance Object provides on-board maintenance for an analog line port that is administered as an external device alarm port. Tests are provided to verify the analog line port's ability to detect an external device alarm. The External Device Alarm (EXT-DEV) Maintenance Object is used for the off-board external device alarm.

ANL-16-L (16-Port Neon Analog Line)

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run[1]	Full Name of MO
ANL-16-L	MIN	test port PCSSpp l	16-Port Neon Analog Line
ANL-16-L	WRN	test port PCSSpp sh release station <ext>	16-Port Neon Analog Line

1 Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.); and pp is the 2-digit port number (for example, 01).

The following are 16-Port Analog Line circuit packs:

TN746	TN746B
TN468 [G3iV2-386]	TN749 [G3iV2-386]
TN468B [G3iV2-386]	TN2135 [G3iV2-386]
TN2144 [G3iV2-386]	TN2149 [G3iV2-386]

These circuit packs provide 16 ports for analog voice terminals. The TN746, TN468, and TN749 support only single-line, on-premises/in-building, analog voice terminals, and not off-premises stations, since these circuit packs are not equipped with lightning protection. The TN746B, TN2144, TN2149, and TN468B support both on-premises and off-premises (that is, out-of-building) analog voice terminals. The TN468, TN468B, TN479, TN2135, TN2144, and TN2149 do NOT support the neon message waiting feature.

Test #48 may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled via the **change station <extension>** command. However, on some releases of the software, this action disables Tests #6, #7, #161, and #35 as well as Test #48.

No maintenance of the terminal connected to the 16-Port Neon Analog Line circuit pack is performed, except to determine whether or not the terminal is connected. Failures of the neon message waiting lamp power and the common ringing application circuitry are reported as part of the Common Port Circuit Pack errors (see errors 1281 and 1793 in the XXX-BD (Common Port Circuit Pack) Maintenance documentation).

Hardware Error Log Entries and Test to Clear Values

16-Port Neon Analog Line Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test port PCSSpp sh r 1
1 (a)	40960 40977	none			
15 (b)	Any	Audits and Updates Test (#36)			
18	0	busyout station <extension>	WRN	ON	release station <extension>
130 (c)		None	WRN	ON	test port PCSSpp sh
257 (d)	40973	none			
513 (e)		Station Present Test (#48)	WRN	OFF	test port PCSSpp sh r 2
769		Battery Feed Test (#35)	MIN/WRN[2]	ON	test port PCSSpp sh r 2
1025		Loop Around Test (#161)	MIN/WRN[2]	ON	test port PCSSpp l r 2
1281		Conference Test (#7)	MIN/WRN[2]	ON	test port PCSSpp l r 2
1537		NPE Crosstalk Test (#6)	MIN/WRN[2]	ON	test port PCSSpp l r 2

1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

2 Minor alarms on this MO may be downgraded to Warning alarms based on the values used in the **set options** command.

Notes:

a. This is an in-line error and can only be resolved over time. This indicates that no terminal equipment was present when ringing was attempted. Execute the short **test port PCSSpp** command, and follow the procedure for the results of Test #48.

- 40960—indicates that too many simultaneous incoming ringing attempts were made on this board. Only four ports on a board may be ringing simultaneously. A fifth incoming call will cause an inline error from the board.

- 40977—indicates that no terminal equipment was connected when ringing was attempted. Run the short Test via the **test port PCSSpp** command, and follow the procedure for the results of Test #48.

b. This is a software audit error that does not indicate any hardware malfunction. Run Short Test Sequence and investigate associated errors (if any).

c. This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.

d. This is an in-line error and can only be resolved over time. This error indicates that ringing voltage is absent. If only one Analog circuit pack in the system has this problem, then replace the circuit pack. If only Analog circuit packs on a particular carrier have this error, then the ringing generator may not be connected to this carrier. If Analog circuit packs on many carriers have this error, then it is probably a problem with the ringing generator.

e. Test #48 may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled using the **change station <extension>** command. However, on some releases of the software, this action disables Tests #6, #7, #161, and #35 as well as Test #48.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following table when inspecting errors in the system. By clearing error codes associated with the *Battery Feed Test,* for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Battery Feed Test (#35)	X	X	ND
Station Present Test (#48)	X	X	ND
Loop Around Test (#161)		X	ND
Conference Test (#7)		X	ND
NPE Crosstalk Test (#6)		X	ND
Station Status and Translation Audits and Updates Test (#36)	X	X	ND

1 D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

One or more Network Processing Elements (NPEs) reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The NPE Crosstalk Test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is usually only part of a port's Long Test Sequence and takes about 20 to 30 seconds to complete.

Table 11-12. TEST #6 NPE Crosstalk Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the **display port PCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. If the port status is idle, retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1001	ABORT	System resources required to run this test are not available. This could be due to a failure to seize the port. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-12. TEST #6 NPE Crosstalk Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to "TDM-BUS (TDM Bus)" Maintenance documentation to diagnose any active TDM-BUS errors. 1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. 1. Look for TTR-LEV errors in the Error Log. If present, refer to "TTR-LEV (TTR Level)" Maintenance documentation. 2. Look for TONE-PT errors in the Error Log. If present, refer to "TTR-LEV (TTR Level)" Maintenance documentation. 3. If neither condition exists, retry the test at one-minute intervals a maximum of five times. 4. If the test continues to abort, escalate the problem.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. Use the **display port PCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort and the port is not in use, escalate the problem.

Continued on next page

Table 11-12. TEST #6 NPE Crosstalk Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1005	ABORT	The test was aborted due to a configuration problem. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or music on hold).
1018	ABORT	The test has been disabled via administration. The default for the 'Test' field on the 'Station' form is 'y'; thus, you may want to determine why this field has been set to 'n' on this station (this may be due to the ringing application test 48, which can be customer or terminal disturbing). 1. To enable the test for a particular station being tested, enter **change station extension** and set the 'Test?' field on the station from 'n' to 'y.'
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available. This could be due to a failure to seize the port. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-12. TEST #6 NPE Crosstalk Test — *Continued*

Error Code	Test Result	Description/ Recommendation
Any	FAIL	This test can fail due to on-board or off-board problems. Off-board problems of concern include EXP-INTF faults, TDM-BUS faults, and faults associated with the tone detectors/tone generators. Clear all off-board problems before replacing the board. Keep in mind that a TDM-BUS problem is usually the result of a faulty board connected to the backplane or bent pins on the backplane. 1. Look for EXP-INTF errors in the error log. If present, refer to the EXP-INTF Maintenance documentation. 2. Look for TDM-BUS errors in the error log. If present, refer to the TDM-BUS Maintenance documentation. 3. Look for TONE-BD and/or TONE-PT errors in the error log. If present, refer to the TONE-BD Maintenance documentation and the TONE-PT Maintenance documentation. 4. Test the board when the faults from steps 1, 2, and 3 are cleared. Replace the board only if the test fails.
	PASS	The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.

Continued on next page

Table 11-12. TEST #6 NPE Crosstalk Test — *Continued*

Error Code	Test Result	Description/ Recommendation
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Check to ensure that the board translations are correct. Use the **list config** command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, issue the **busyout board** command. 3. Issue the **reset board** command. 4. Issue the **release busy board** command. 5. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.

Conference Circuit Test (#7)

One or more NPEs reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The Conference Circuit Test verifies that the NPE channel for the port being tested can correctly perform the conferencing function. The NPE is instructed to listen to several different tones and conference the tones together. The resulting signal is then measured by a Tone Detector port. If the level of the tone is within a certain range, the test passes.

Table 11-13. TEST #7 Conference Circuit Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the **display port PCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. If the port status is idle, then retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

If this is not the case, dispatch to check to ensure that there is a valid board inserted.

Battery Feed Test (also called Port Diagnostic Test) (#35)

The battery feed chip provides power to the telephone equipment, signaling, rotary dial pulsing, transmission, and balance. This test checks the signaling and switchhook capabilities of the battery feed chip by terminating the port, applying battery, and by trying to detect a current.

NOTE:
For the TN746B 16-Port Neon Analog Line circuit pack, Test #35 always "passes." No actual testing is performed on the TN746B while the test is running. Test #35 operates in the normal manner for TN746.

Table 11-14. TEST #35 Battery Feed Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the **display port PCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. If the port status is idle, then retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-14. TEST #35 Battery Feed Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. Use the **display port PCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort and the port is not in use, escalate the problem.
1005	ABORT	The test was aborted due to a configuration problem. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or music on hold).
1018	ABORT	The test has been disabled via administration. The default for the 'Test' field on the 'Station' form is 'y'; thus, you may want to determine why this field has been set to 'n' on this station (this may be due to the ringing application test 48, which can be customer or terminal disturbing). 1. To enable the test for the particular analog station being tested, enter **change station extension** and set the 'Test?' field on the station from 'n' to 'y.'
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-14. TEST #35 Battery Feed Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	FAIL	The port's battery feed chip is unable to supply sufficient power to the terminal equipment. This could be a marginal test, and the terminal equipment may be operating satisfactorily. 1. Retry the test at 1-minute intervals for a maximum of 5 times. 2. If the test continues to fail, determine whether the customer is experiencing problems on this line. Replace the circuit pack only if the customer is experiencing problems.
	PASS	The port’s battery feed chip is able to provide power to the station equipment to detect on-/off-hook, but may not be able to supply power for touch-tones. If touch-tones are inoperative on this station, then replace the circuit pack because this port is inoperative. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Check to ensure that the board translations are correct. Use the **list config** command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, issue the **busyout board** command. 3. Issue the **reset board** command. 4. Issue the **release busy board** command. 5. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.

Station Status and Translation Audits and Updates Test (#36)

This test updates the Analog port's message lamp state (if it has one) and translations (such as station type, dial type, network connection) with information kept in the software. The software is updated with the switchhook state reported by the port processor. When the ringer is in the off state, this test also turns off the station's ringer to prevent constant ringing caused by defective hardware.

Table 11-15. TEST #36 Station Status and Translation Audits and Updates Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. Use the **display port PCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort and the port is not in use, escalate the problem.
1005	ABORT	The test was aborted due to a configuration problem. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or music on hold).

Continued on next page

Table 11-15. TEST #36 Station Status and Translation Audits and Updates Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1006	ABORT	This port has been busied out by command, or taken out-of-service by the failure of the NPE Crosstalk Test. 1. Look in the error log for error type 18 (port busied out) for this port. If this error is present, release the port with the **release station extension** command, and run the test again. 2. Look in the error log for error type 1025 (NPE crosstalk test failed) for this port. If this error is present, investigate the errors associated with the NPE Crosstalk Test 6. 3. Make sure that the terminal is connected and in service, and then retest. 4. If the test continues to abort, escalate the problem.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1	FAIL	This does not indicate a hardware problem. The switchhook audit failed. The other updates were not performed because of this failure. This may occur when the audit is performed at the same time that the terminal equipment goes off-hook. Use the **status station** command to determine when the port is available for testing. 1. When the port becomes available for testing, retry the command at one-minute intervals a maximum of five times. 2. If the test continues to fail, escalate the problem.

Continued on next page

Table 11-15. TEST #36 Station Status and Translation Audits and Updates Test — *Continued*

Error Code	Test Result	Description/ Recommendation
5	FAIL	This does not indicate a hardware problem. However, there may be an internal software error. The message waiting lamp update failed. The translation and ringer updates were not performed because of this failure.
7	FAIL	The translation update failed. This does not indicate a hardware problem. However, there may be an internal software error. The ringer update was not performed because of this failure.
8	FAIL	This does not indicate a hardware problem. However, there may be an internal software error. The ringer update failed. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to fail, escalate the problem.
	PASS	The software and the port processor have the same status. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Check to ensure that the board translations are correct. Use the **list config** command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, issue the **busyout board** command. 3. Issue the **reset board** command. 4. Issue the **release busy board** command. 5. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.

Station Present Test (also called Ringing Application Test) (#48)

This test provides a burst of ringing current to the terminal equipment and detects that current flows. This test ascertains whether terminal equipment is connected to the port.

This test may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled using the Tests field of the station administration screen form. However, on some releases of the software, this action disables Tests #6, #7, #161, and #35 as well as Test #48.

Table 11-16. TEST #48 Station Present Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the **display port PCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. If the port status is idle, then retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-16. TEST #48 Station Present Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. Use the **display port PCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort and the port is not in use, escalate the problem.
1005	ABORT	The test was aborted due to a configuration problem. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or music on hold).
1008	ABORT	Could not allocate a ringing circuit. Either all the ringing circuits are in use or the ringing generator is defective or it is not wired correctly. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, look for RING-GEN errors in the Error Log. If an ABORT 1008 occurs for this test on other circuit packs as well, then the ringing generator may be defective or is not wired correctly (see errors for RING-GEN). If it doesn't occur on other ports, then all four ring phases are in use.

Continued on next page

Table 11-16. TEST #48 Station Present Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1018	ABORT	The test has been disabled via administration. The default for the 'Test' field on the 'Station' form is 'y'; thus, you may want to determine why this field has been set to 'n' on this station (this may be due to the brief ringing disturbance that this test may cause). 1. To enable the test for the particular analog station being tested, enter **change station extension** and set the 'Test?' field on the station from 'n' to 'y.'
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
	FAIL	The terminal equipment is not connected to the circuit pack. Some terminal equipment such as modems may fail even when connected properly. 1. Remotely test the equipment. 2. If the test fails again, look for RING-GEN errors in the error log. If present, refer to the RING-GEN (analog ring generator) Maintenance documentation. 3. Check all of the wiring between the station equipment and the switch. Then, run the test again. 4. If the test still fails, the set may be defective. Check the set, and replace it, if necessary. 5. Some terminal equipment could fail even when it is connected properly. If this is the case, disable the test using the **change station extension** command (enter 'n' into the Test field). Note that this action also disables tests 6, 7, 161, and 35 on this port.

Continued on next page

Table 11-16. TEST #48 Station Present Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	PASS	The station is connected properly to the switch. This test may also pass if no terminal equipment is connected and the terminal is located very far from the switch. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Check to ensure that the board translations are correct. Use the **list config** command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, issue the **busyout board** command. 3. Issue the **reset board** command. 4. Issue the **release busy board** command. 5. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.

Loop Around Test (#161)

Each Analog port consists of:

- an NPE for port connectivity and gain, and conferencing functionality
- a code that converts the digital signals of the TDM Bus to analog signals
- a battery feed chip that provides power to the telephone set for signaling, dial pulsing, transmission, and balance

This test is designed to check the on-board transmission capabilities of the NPE, the codec, and the battery feed chip of the analog port. A Tone Detector and a Tone Generator talk and listen on the same pair of time slots as the Analog Port. The Analog Port is then instructed to go into loop around mode (see the following below). The test passes if the signal measured by the Tone Detector is within acceptable limits.

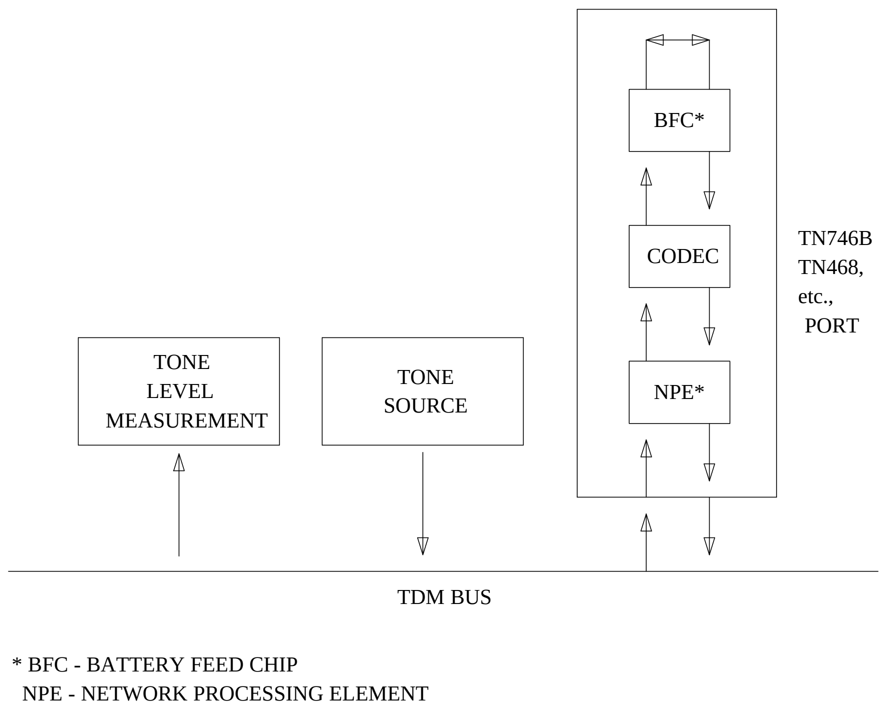

Figure 11-5. Analog Loop Around Test

Table 11-17. TEST #161 Loop Around Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the **display port PCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. If the port status is idle, then retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to "TDM-BUS (TDM Bus)" Maintenance documentation to diagnose any active TDM-BUS errors. 1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-17. TEST #161 Loop Around Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. 1. Look for TTR-LEV errors in the Error Log. If present, refer to the "TTR-LEV (TTR Level)" Maintenance documentation. 2. Look for TONE-PT errors in the Error Log. If present, refer to the "TONE-PT (Tone Generator)" Maintenance documentation. 3. If neither condition exists, retry the test at one-minute intervals a maximum of five times. 4. If the test continues to abort, escalate the problem.
1004	ABORT	The port was seized by a valid call during the test. The test has been aborted. Use the **display port PCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort and the port is not in use, escalate the problem.
1005	ABORT	The test is not run because the port is administered as either an External Alert or Announcement port.

Continued on next page

Table 11-17. TEST #161 Loop Around Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1018	ABORT	The test has been disabled via administration. The default for the 'Test' field on the 'Station' form is 'y'; thus, you may want to determine why this field has been set to 'n' on this station (this may be due to the ringing application test 48, which can be customer or terminal disturbing). 1. To enable the test for the particular analog station being tested, enter **change station extension** and set the ‘Test?’ field on the station from 'n' to 'y.'
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. This could be due to a failure to seize the port. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.
	FAIL	The reflective loop around test failed. This could cause noisy or unreliable connections, or users calling this port may hear an echo. The problem can also be off-board, as described below. 1. Since the test may be affected by a line seizure, repeat the test at 1-minute intervals for a maximum of 5 times. 2. Run circuit pack tests to check the tone generator circuit pack and the tone detector circuit pack by using the **test board UUCSS short** command. 3. Resolve any problems that are detected on the tone generator circuit pack or the tone detector circuit pack. 4. If the tone generator and tone detector circuit packs are functioning properly and the test still fails and a voice terminal is connected and wired properly, replace the analog line circuit pack.

Continued on next page

Table 11-17. TEST #161 Loop Around Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	PASS	The port is able to provide an analog transmission path to the station equipment. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, or by examining the station.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Check to ensure that the board translations are correct. Use the **list config** command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, issue the **busyout board** command. 3. Issue the **reset board** command. 4. Issue the **release busy board** command. 5. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.

ANL-BD (Analog Line Circuit Pack)

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run[1]	Full Name of MO
ANL-BD	MIN	test board PCSS sh	8-Port Analog Line Circuit Pack
ANL-BD	WRN	test board PCSS sh	8-Port Analog Line Circuit Pack
ANL-BD	MIN	test board PCSS sh	8-Port Neon Analog Line Circuit Pack
ANL-BD	WRN	test board PCSS sh	8-Port Neon Analog Line Circuit Pack
ANL-BD	MIN	test board PCSS sh	16-Port Neon Analog Line Circuit Pack
ANL-BD	WRN	test board PCSS sh	16-Port Neon Analog Line Circuit Pack

1 Where P is the port network number (1 for PPN and 2 or [G.1] 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.).

Refer to "XXX-BD (Common Port Circuit Pack)" Maintenance documentation for circuit pack level errors. See also "ANL-LINE (8-Port Analog Line), ANL-NE-L (8-Port Neon Analog Line)", and "ANL-16-L (16-Port Neon Analog Line)" Maintenance documentation for related line information.

ANL-LINE (8-Port Analog Line), ANL-NE-L (8-Port Neon Analog Line)

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run[1]	Full Name of MO
ANL-LINE	MIN	test port PCSSpp l	8-Port Analog Line
ANL-LINE	WRN	test port PCSSpp sh	8-Port Analog Line
ANL-NE-L	MIN	test port PCSSpp l	8-Port Neon Analog Line
ANL-NE-L	WRN	test port PCSSpp sh	8-Port Neon Analog Line

1 Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.); and pp is the 2-digit port number (for example, 01).

The 8-Port Analog Line circuit packs are:

TN742	TN431 [G3iV2-386]
TN769	TN443 [G3iV2-386]
TN712	TN467 [G3iV2-386]
	TN411 [G3iV2-386]

These circuit packs provide eight ports for single line on-premises or off-premises analog endpoints such as analog voice terminals, queue warning level lamps, recorded announcements, dictation machines, PagePac™ paging equipment, external alerting devices, modems, facsimile machines, and AUDIX voice ports. The TN769 supports a neon message waiting lamp. The other eight-port analog lines do not support the lamp.

Test #48 may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled using the Tests field of the station administration screen. However, on some releases of the software, this action disables Tests #6, #47, and #35 as well as Test #48. Test #47 may cause a false alarm when the port is connected to off-premises equipment, some non-voice terminal equipment, and some loop equipment. If this is the case, then the test should be disabled using the Tests field of the **change station <extension>** command.

No maintenance of the terminal connected to the 8-Port Analog Line circuit pack or 8-Port Neon Analog Line circuit pack is performed, except to determine whether or not the terminal is connected. Failures of the neon message waiting lamp power (for ANL-NE-L only) and the common ringing application circuitry are reported as part of the Common Port Circuit Pack errors (see errors 1281 and 1793 in the XXX-BD (Common Port Circuit Pack) Maintenance documentation).

Hardware Error Log Entries and Test to Clear Values

1025		NPE Crosstalk Test (#6)	MIN/WRN[2]	ON	test port PCSSpp l r 3
1281 (f)					
1793 (f)					

1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

2 Major or Minor alarms on this MO may be downgraded to Warning alarms based on the values used in the **set options** command.

Notes:

a. These are in-line errors and can only be resolved over time.

- 40960—indicates that too many simultaneous incoming ringing attempts were made on this board. Only four ports on a board may be ringing simultaneously. A fifth incoming call will cause an inline error from the board.

- 40975—indicates that the terminal equipment was on-hook when ring-tip was detected during ringing. This usually indicates a failure in the terminal equipment or the type of terminal has a low ringer impedance. Call the terminal equipment and verify that the terminal rings. If the terminal doesn't ring, then replace it. Otherwise, issue the **test port PCSSpp** command, and follow the procedure for Test #48.
- 40977—indicates that no terminal equipment was connected when ringing was attempted. Run the Short Test via the **test port PCSSpp** command, and follow the procedure for the results of Test #48.

b. This is a software audit error that does not indicate any hardware malfunction. Run Short Test Sequence and investigate errors (if any).

c. This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.

d. Test #48 may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled via the **change station <extension>** command. However, on some releases of the software, this disables Tests #6, #47, and #35 as well as Test #48.

e. Test #47 may cause a false alarm when the port is connected to off-premises equipment, some non-voice terminal equipment, and some loop equipment. If this causes a false alarm, then disable the test by changing the Tests field of the **change station** command to "no."

f. Refer to "XXX-BD (Common Port Circuit Pack)" Maintenance documentation.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Battery Feed Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Battery Feed Test (#35)	X	X	ND
Station Present Test (#48)	X	X	ND
NPE Crosstalk Test (#6)		X	ND
Loop Around and Conference Test (#47)		X	ND
Station Status and Translation Audits and Updates Test (#36)	X	X	ND

1 D = Destructive; ND = Nondestructive

NPE Crosstalk Test (#6)

One or more NPEs reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain, and provides conferencing functions on a per-port basis. The NPE Crosstalk Test verifies that this port's NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is usually only part of a port's Long Test Sequence and takes about 20 to 30 seconds to complete.

Table 11-18. TEST #6 NPE Crosstalk Test

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the **display port PCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. If the port status is idle, then retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1001	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to "TDM-BUS (TDM Bus)" Maintenance documentation to diagnose any active TDM-BUS errors. 1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Table 11-18. TEST #6 NPE Crosstalk Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. 1. Look for TTR-LEV errors in the Error Log. If present, refer to "TTR-LEV (TTR Level)" Maintenance documentation. 2. Look for TONE-PT errors in the Error Log. If present, refer to "TONE-PT (Tone Generator)" Maintenance documentation. 3. If neither condition exists, retry the test at one-minute intervals a maximum of five times. 4. If the test continues to abort, escalate the problem.
1004	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the **display port PCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort and the port is not in use, escalate the problem.

Continued on next page

Table 11-18. TEST #6 NPE Crosstalk Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1005	ABORT	The test was aborted due to a configuration problem. This code will result under either of the following conditions: 1. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or music on hold). 2. The circuit pack is one of the following: — TN742 vintages 13,14 and 15 — TN769 vintages 3,4 and 5
1018	ABORT	Test disabled via administration. The default for the 'Test' field on the 'Station' form is 'y'; thus, you may want to determine why this field has been set to 'n' on this station (this may be due to the ringing application test 48, which can be customer or terminal disturbing). 1. To enable the test for a particular station, enter **change station extension** and set the 'Test?' field on the 'Station Form' to 'y.'
1020	ABORT	The test did not run due to a previously existing error on the specific port or a more general circuit pack error. 1. Examine Error Log for existing errors against this port or the circuit pack and attempt to diagnose the previously existing error.

Continued on next page

Table 11-18. TEST #6 NPE Crosstalk Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available. Either a system allocation to get information about the port or to put the port into a service state failed or the attempt to put the port in connection with a tone source failed (this could be a tone-clock problem). The tone-clock and tone detectors could be having a communication problem, for example, the companding modes could be out of synchronization. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-18. TEST #6 NPE Crosstalk Test — *Continued*

Error Code	Test Result	Description/ Recommendation
Any	FAIL	This test can fail due to on-board or off-board problems. Off-board problems of concern include EXP-INTF faults, TDM-BUS faults, and faults associated with the tone detectors/tone generators. Clear all off-board problems before replacing the board. Keep in mind that a TDM-BUS problem is usually the result of a faulty board connected to the backplane or bent pins on the backplane. 1. Look for EXP-INTF errors in the error log. If present, refer to the EXP-INTF Maintenance documentation. 2. Look for TDM-BUS errors in the error log. If present, refer to the TDM-BUS Maintenance documentation. 3. Look for TONE-BD and/or TONE-PT errors in the error log. If present, refer to the TONE-BD Maintenance documentation and the TONE-PT Maintenance documentation. 4. Test the board when the faults from steps 1, 2, and 3 are cleared. Replace the board only if the test fails.
	PASS	The port is correctly using its allocated time slots. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, by examining the station, and by ensuring that the terminal is correctly translated as off-premises or on-premises. **NOTE:** This test always passes for Analog circuit packs TN712 prior to Vintage 14 and TN742 prior to Vintage 4.

Continued on next page

Table 11-18. TEST #6 NPE Crosstalk Test — *Continued*

Error Code	Test Result	Description/ Recommendation
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Check to ensure that the board translations are correct. Use the **list config** command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, issue the **busyout board** command. 3. Issue the **reset board** command. 4. Issue the **release busy board** command. 5. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.

Battery Feed Test (also called Port Diagnostic Test) (#35)

The battery feed chip provides power to the telephone equipment, signaling, rotary dial pulsing, transmission, and balance. This test checks the signaling and switchhook capabilities of the battery feed chip by terminating the port, applying battery, and trying to detect a current.

Table 11-19. TEST #35 Battery Feed Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the **display port PCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. If the port status is idle, then retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Table 11-19. TEST #35 Battery Feed Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available. Either a system allocation to get information about the port or to put the port into a service state failed or the attempt to put the port in connection with a tone source failed (this could be a tone-clock problem). The tone-clock and tone detectors could be having a communication problem, for example, the companding modes could be out of synchronization. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.
	FAIL	The port's battery feed chip is unable to supply sufficient power to the terminal equipment. This may occur when the test is performed at the same time that the terminal equipment goes off-hook. 1. Use **status station** to determine when the port is available for testing. When the port becomes available for testing, retry the command at 1-minute intervals a minimum of five times. 2. If the test continues to fail, determine whether the customer is experiencing problems on this line. Replace the circuit pack only if the customer is experiencing problems. 3. If the test continues to fail, escalate the problem.

Continued on next page

Table 11-19. TEST #35 Battery Feed Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	PASS	The port's battery feed chip is able to provide power to the station equipment to detect on-/off-hook. However, the battery feed chip may still be unable to provide power for touch-tones. If tones are heard when buttons are pressed, then the battery feed chip is functioning correctly; otherwise, replace the circuit pack because this port is defective. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, by examining the station, and by ensuring that the terminal is correctly translated as off-premises or on-premises. **NOTE:** This test always passes for TN712 Analog circuit packs prior to Vintage 14 and TN742 prior to Vintage 6.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Check to ensure that the board translations are correct. Use the **list config** command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, issue the **busyout board** command. 3. Issue the **reset board** command. 4. Issue the **release busy board** command. 5. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.

Station Status and Translation Audits and Updates Test (#36)

This test updates the analog port's message lamp state (if it has one) and translations (such as station type, dial type, network connection) with information kept in the software. The software is updated with the switchhook state reported by the port processor. When the ringer is in the off state, this test also turns off the station's ringer to prevent constant ringing caused by defective hardware.

Table 11-20. TEST #36 Station Status and Translation Audits and Updates Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test.
1004	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the **display port PCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort and the port is not in use, escalate the problem.
1005	ABORT	The test was aborted due to a configuration problem. This code will result under either of the following conditions: 1. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or music on hold). 2. The circuit pack is one of the following: — TN742 vintages 13,14 and 15 — TN769 vintages 3,4 and 5

Table 11-20. TEST #36 Station Status and Translation Audits and Updates Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1006	ABORT	This port has been busied out by command or taken out-of-service by the failure of the NPE Crosstalk Test. 1. Look in the Error Log for Error Type 18 (port busied out) for this port. If this error is present, then release the port with the **release station extension** command and run the test again. 2. Look in the Error Log for Error Type 1025 (NPE Crosstalk Test failed) for this port. If this error is present, then investigate the errors associated with the NPE Crosstalk Test (#6) first. 3. Make sure that the terminal is connected and in service, and then retest. 4. If the test continues to abort, escalate the problem.
	ABORT	Could not allocate the necessary system resources to run this test.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1	FAIL	This does not indicate a hardware problem. The switchhook audit failed, and the other updates were not performed because of this failure. This condition may occur when the audit is performed at the same time that the terminal equipment goes off-hook. Use the **status station** command to determine when the port is available for testing. 1. When the port becomes available for testing, retry the command at one-minute intervals a maximum of five times. 2. If the test continues to fail, escalate the problem.

Continued on next page

Table 11-20. TEST #36 Station Status and Translation Audits and Updates Test — *Continued*

Error Code	Test Result	Description/ Recommendation
5	FAIL	This does not indicate a hardware problem but may indicate an internal software error. The message waiting lamp update failed. The translation and ringer updates were not performed because of this failure.
7	FAIL	The translation update failed. The ringer update was not performed because of this failure. This does not indicate a hardware problem but may be an internal software error.
8	FAIL	This does not indicate a hardware problem but may be an internal software error. The ringer update failed. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to fail, escalate the problem.
	PASS	The software and the port processor have the same status. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, by examining the station, and by ensuring that the terminal is correctly translated as off-premises or on-premises. **NOTE:** This test always passes for TN712 Analog circuit packs prior to Vintage 14 and TN742 circuit packs prior to Vintage 6.

Table 11-20. TEST #36 Station Status and Translation Audits and Updates Test — *Continued*

Error Code	Test Result	Description/ Recommendation
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Check to ensure that the board translations are correct. Use the **list config** command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, issue the **busyout board** command. 3. Issue the **reset board** command. 4. Issue the **release busy board** command. 5. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.

Loop Around and Conference Test (#47)

Each Analog Port consists of:

- an NPE for port connectivity and gain, and conferencing functionality
- a code that converts the digital signals of the TDM Bus to analog signals
- a battery feed chip that provides power to the telephone set for signaling, dial pulsing, transmission, and balance.

This test is designed to check the on-board transmission capabilities of the NPE, the code, and the battery feed chip of the Analog Port. A Tone Detector and a Tone Generator talk and listen on the same pair of time slots as the Analog Port. The Analog Port is then instructed to go into loop around mode (see Figure 11-5). The test passes if the signal measured by the Tone Detector is within acceptable limits.

The Conference Circuit Test verifies that the NPE channel for the port being tested can correctly perform the conferencing function. As part of Test #47, the operation of the port conference circuits in the NPE for three and four parties is also tested. In addition, a test is run to measure noise. The NPE is instructed to listen to several different tones and conference the tones together. The resulting signal is then measured by a Tone Detector port. If the level of the tone is within a certain range, the test passes.

The noise test is performed by filtering out the tone, and then measuring inherent port noise.

NOTE:
This Loop Around Test is sensitive to the length of the loop, the equipment in the loop, or the equipment terminating the loop, such as off-premises stations. If this test is causing a false alarm, then disable the test by changing the Tests field to "no" using the **change station** command for this station.

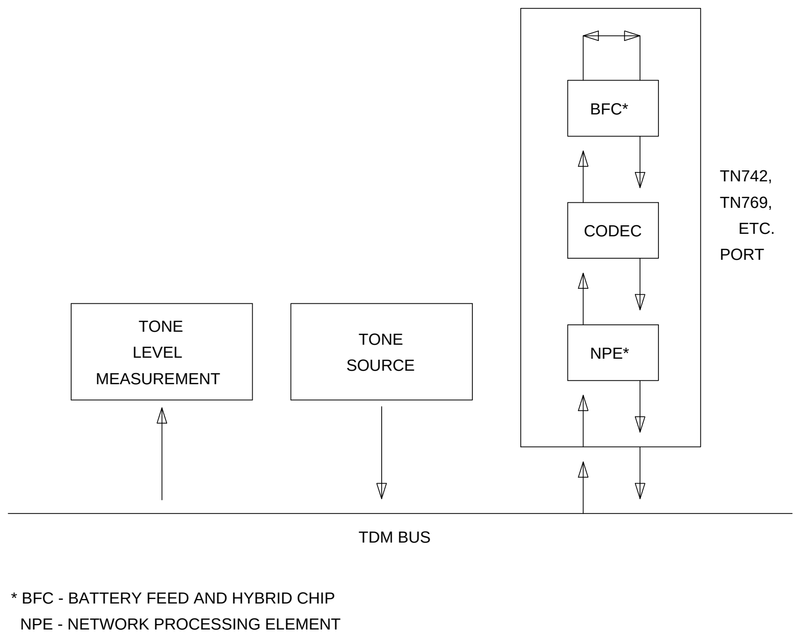

Figure 11-6. Analog Loop Around and Conference Test

Table 11-21. TEST #47 Loop Around and Conference Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Table 11-21. TEST #47 Loop Around and Conference Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1018	ABORT	Test disabled via administration. The default for the 'Test' field on the 'Station' form is 'y'; thus, you may want to determine why this field has been set to 'n' on this station (this may be due to the ringing application test 48, which can be customer or terminal disturbing). 1. To enable the test for a particular station, enter **change station** extension and set the ‘Test?’ field on the ‘Station Form’ to ‘y.’
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available. Either a system allocation to get information about the port or to put the port into a service state failed or the attempt to put the port in connection with a tone source failed (this could be a tone-clock problem). The tone-clock and tone detectors could be having a communication problem, for example, the companding modes could be out of synchronization. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-21. TEST #47 Loop Around and Conference Test — *Continued*

Error Code	Test Result	Description/ Recommendation
7	FAIL	The conference test or the noise test failed. This could cause noisy or unreliable connections, or users calling this port may hear an echo. The problem can also be off-board, as described below.
13		The reflective loop around with gain set to low and the 600-ohm balance failed. This will cause noisy or unreliable connections.
14		The reflective loop around test (with the gain set to high, using RC balance) failed. This could cause noisy or unreliable connections. The problem can also be off-board, as described below.
15		The nonreflective loop around test failed. This could cause noisy or unreliable connections, or users calling this port may hear an echo. The problem can also be off-board, as described below.
		More information continues on the next page.

Continued on next page

Table 11-21. TEST #47 Loop Around and Conference Test — *Continued*

Error Code	Test Result	Description/ Recommendation
7 13 14 15 *(cont'd.)*	FAIL *(cont'd.)*	1. Disconnect the terminal equipment from the circuit pack at the cross-connect and run the test again. 2. If the test fails again, replace the circuit pack and reconnect the terminal equipment. If the test passes the second time, then the test results were affected by the terminal equipment connected to the port; in this case, ignore the results of this test if all other tests pass or abort and the station is operating properly. Failure of test 47 does not cause an alarm. If there are failures of other tests, then investigate those errors. User reported troubles with this port should be investigated by using other port tests, by examining station wiring, and by examining the station to ensure that it is correctly translated as off-premises or on-premises. **NOTE:** If the loop around and conference circuit test fails for all ports on a circuit pack, a -5 volt power problem is indicated. If a TN736 or TN752 power unit circuit pack is present, either the 631DB AC power unit or the 676B DC power unit may be defective. (The 631DB power unit is used in a medium cabinet powered by an AC source. The 645B power unit is used in a medium cabinet powered by a DC power source.) The system may contain a TN736 or TN752 power unit circuit pack or a 631DB AC power unit, but not both types of power units. To investigate problems with a 631DB AC power unit, refer to the CARR-POW (carrier port power unit for AC-powered systems) Maintenance documentation. To investigate problems with a 645B DC power unit, refer to the CARR-POW (carrier port power unit for DC-powered systems) Maintenance documentation. If a red LED on TN736 or TN752 power unit circuit pack is on, replace the pack. If the test fails on more than 1 port, check for errors on the TONE-BD or the TONE-PT. If errors, take appropriate actions. When the tone errors are cleared, rerun the test.

Table 11-21. TEST #47 Loop Around and Conference Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	PASS	The port is able to provide an analog transmission path to the station equipment. User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, by examining the station, and by ensuring that the terminal is correctly translated as off-premises or on-premises. **NOTE:** This test always passes for TN712 Analog circuit packs prior to Vintage 14 and TN742 circuit packs prior to Vintage 6.
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Check to ensure that the board translations are correct. Use the **list config** command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, issue the **busyout board** command. 3. Issue the **reset board** command. 4. Issue the **release busy board** command. 5. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.

Station Present Test (also called Ringing Application Test) (#48)

This test provides a burst of ringing current to the terminal equipment and detects that current flows. This test is to ascertain whether or not terminal equipment is connected to the port.

This test may cause some terminal equipment to ring briefly during daily maintenance. If this ringing is disturbing the customer or the terminal equipment, it should be disabled using the Tests field of the station administration screen. However, on some releases of the software, this action disables Tests #6, #47, and #35 as well as Test #48.

Table 11-22. TEST #48 Station Present Test

Error Code	Test Result	Description/ Recommendation
	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1000	ABORT	System resources required to run this test were not available. The port may be busy with a valid call. Use the **display port PCSSpp** to determine the station’s extension. Enter **status station** extension to determine the service state of the port. If the port is in use, it will be unavailable for certain tests. Wait until the port is idle before retesting. 1. If the port is idle, retry the command at 1-minute intervals up to 5 times. 2. Check for phone left off-hook or for wiring problems. 3. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-22. TEST #48 Station Present Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1004	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the **display port PCSSpp** command to determine the station extension. Use the **status station** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) You must wait until the port is idle before retesting. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort and the port is not in use, escalate the problem.
1005	ABORT	The test was aborted due to a configuration problem. This code will result under either of the following conditions: 1. This test may not be applicable, or it may be disruptive to terminal equipment other than a voice terminal (for example, the modem pool member or music on hold). 2. The circuit pack is one of the following: — TN742 vintages 13,14 and 15 — TN769 vintages 3,4 and 5

Continued on next page

Table 11-22. TEST #48 Station Present Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1008	ABORT	Could not allocate a ringing circuit for one of the following reasons: ■ All the ringing circuits are in use, or ■ The ringing generator is defective, or ■ It is not wired correctly. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, look for RING-GEN errors in the Error Log. If an ABORT 1008 occurs for Test #48 on other circuit packs as well, then the ringing generator may be defective or not wired correctly. If it does not occur on other ports, then that circuit pack is currently using all four ringing phases.
1018	ABORT	The test was disabled via administration. The default for the 'Test' field on the 'Station' form is 'y'; thus, you may want to determine why this field has been set to 'n' on this station (this may be due to the ringing application test 48, which can be customer or terminal disturbing). 1. To enable the test for a particular station, enter **change station** extension and set the ‘Test?’ field on the ‘Station Form’ to ‘y.’
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	System resources required to run this test are not available. Either a system allocation to get information about the port or to put the port into a service state failed or the attempt to put the port in connection with a tone source failed (this could be a tone-clock problem). The tone-clock and tone detectors could be having a communication problem, for example, the companding modes could be out of synchronization. 1. Retry the command at 1-minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-22. TEST #48 Station Present Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	FAIL	The terminal equipment is not connected to the circuit pack or the ringing generator may have failed. 1. Remotely test the equipment. 2. If the test fails again, look for RING-GEN errors in the error log. If present, refer to the RING-GEN (analog ring generator) Maintenance documentation. 3. Check all of the wiring between the station equipment and the switch. Then, run the test again. 4. If the test still fails, the set may be defective. Check the set, and replace it, if necessary. 5. Some terminal equipment (such as a modem) could fail even when it is connected properly. If this is the case, disable the test using the **change station extension** command (enter 'n' into the 'Test' field). Note that this action also disables tests 6, 7, 161, and 35 on this port.
	PASS	The station is connected properly to the switch. This test may also pass if no terminal equipment is connected and the terminal is located far from the switch (that is, it is off-premises). User-reported troubles on this port should be investigated by using other port tests, by examining station wiring, by examining the station, and by ensuring that the terminal is correctly translated as off-premises or on-premises. **NOTE:** This test always passes for TN712 Analog circuit packs prior to Vintage 14 and TN742 circuit packs prior to Vintage 6.

Continued on next page

Table 11-22. TEST #48 Station Present Test — *Continued*

Error Code	Test Result	Description/ Recommendation
0	NO BOARD	The test could not relate the internal ID to the port (no board). This could be due to incorrect translations, no board is inserted, an incorrect board is inserted, or an insane board is inserted. 1. Check to ensure that the board translations are correct. Use the **list config** command, and resolve any problems that are found. 2. If the board was found to be correctly inserted in step 1, issue the **busyout board** command. 3. Issue the **reset board** command. 4. Issue the **release busy board** command. 5. Issue the **test board long** command. This should re-establish the linkage between the internal ID and the port. If this is not the case, dispatch to check to ensure that there is a valid board inserted.

ANN-BD (Announcement Circuit Pack)

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run[1]	Full Name of MO
ANN-BD	MINOR	test board PCSS l	Announcement Circuit Pack
ANN-BD	WRN	test board PCSS l	Announcement Circuit Pack

1 Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.).

The TN750 Announcement circuit pack is a service circuit which provides a DEFINITY Generic 3 customer with an integrated means for recording announcements that can be played back on demand by call processing as part of a calling feature (for example, announcements on hunt group calls). There are 16 Announcement Ports on the Announcement circuit pack. Each port can play any integrated announcement, independently of the other ports. In addition to the 16 Announcement Ports, the Announcement circuit pack also has one Data Line Circuit Port (port 17). The Data Line Circuit Port is used for uploading/downloading the announcement memory to/from the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2]. If there are any errors associated with port 17, refer to "DAT-LINE (Data Line)" Maintenance documentation. If there are any errors associated with any other port, refer to "ANN-PT (Announcement Port)" Maintenance documentation.

NOTE:
TN750C is required if your system will have multiple announcement boards. To use multiple announcement boards, you must have G3V4 software, and at least one TN750C (up to ten are allowed). Only one TN750A/B may be present in the system when a TN750C is used. The announcements from a TN750A/B can be saved and restored to a TN750C — but once the announcements are recorded onto a TN750C, they are not backward compatible with the TN750A/B.

The Announcement circuit pack has two processors on it. The first processor, or Angel, controls the circuit pack and communicates with the switch via the control channel on the TDM Bus. The second processor, or Speech Processor (SP), controls the speech memory and announcements. Digital speech is converted from its TDM Bus form to an internal storage form (for recording) and vice versa (for playbacks) by the 140AY device on the circuit pack, which has 16 channels (one for each Announcement Port).

General Notes

Here are a few **very important** general notes that apply to any problem on the Announcement circuit pack. The user should read this before attempting to work on the TN750 Announcement circuit pack or Announcement Ports, **especially if the circuit pack needs to be replaced.**

1. The Announcement circuit pack retains all integrated announcements *as long as the circuit pack has power*. For this reason, whenever there is a problem with either the Announcement circuit pack or an Announcement Port that may require the circuit pack to be reset, it is always best to try to reset the circuit pack via the **reset board PCSS** command first. If that does not work, replace the circuit pack. **Announcements are preserved through a software reset, but they are lost when the circuit pack is reseated.**
2. **If a customer has announcements on the Announcement circuit pack that cannot be rerecorded easily, then announcements must be saved on the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2] to ensure that they are not lost.** This should be done as soon as the announcements are recorded on the circuit pack (or whenever they are changed), assuming that the circuit pack is in proper working order (see Note).

   NOTE:
   Unlike translations, announcements are NEVER automatically saved to the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2].

3. The administration terminal **save announcements** command replaces the announcement file on the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2] the Announcement circuit pack speech memory. Care must be taken not to mistakenly enter this command and, as a result, destroy a valid file on the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2].
4. The **restore announcements** command replaces the Announcement circuit pack speech memory with the announcement file on the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2]. Care must be taken not to mistakenly enter this command, destroying valid speech memory (especially if the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2] does not have a valid announcement file on it).
5. Whenever the Announcement circuit pack is replaced, announcements must always be rerecorded or downloaded to the new circuit pack. Otherwise, call processing is not able to use the pack.
6. If announcement speech memory is corrupted, announcements should not be saved [that is, if the Announcement Checksum Test (#209) fails, or if the speech sounds corrupted on playback]. This can ruin a good announcement file on the system tape [G3iV1.1-286] or memory card

[G3sV2, G3iV2-386, G3vsV2] and potentially cause errors/alarms on any circuit pack to which the new file is downloaded. However, if the customer does not have a valid announcement file on the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2], announcements can be saved in an effort to try to retain some of them (all of the announcements recorded may not be corrupted).

7. Due to a hardware fault in the TN750 announcement board, the following sequence of events my cause the announcement file to become corrupted and unusable:
   - Fill the board with recorded announcements.
   - Delete the last few announcements recorded.
   - Re-record the announcements deleted.

   If the announcement file becomes corrupted, the only solution is to re-record all announcements. To do this, follow these steps:

   a. Remove the announcement board.
   b. Remove the tape cartridge from the tape drive. Do this so that announcements are not automatically restored from tape.
   c. Re-insert the announcement board.
   d. Re-record all announcements.
   e. Insert the tape cartridge in the tape drive.
   f. Issue the save announcements command to save all the announcements on the tape.

   This hardware fault is fixed in the TN750B announcement board. However, the TN750B board will not automatically correct an announcement file which has previously been corrupted by a TN750 board. The only way to correct an announcement file corrupted by the TN750 board is to follow the steps above.

Announcement Administration

A brief description of the integrated announcement administration is given here to aid in troubleshooting the Announcement circuit pack and its ports. In many cases, it is necessary to record, play back, and/or delete announcements to resolve an alarm. It may also be necessary to save and restore announcements as part of the maintenance procedures. For a complete description of integrated announcement administration, please refer to the following manuals:

1. *DEFINITY Communications System Generic 3 Implementation*, 555-230-653
2. *DEFINITY Communications System Generic 1 and Generic 3 System Management*, 555-230-500

3. *DEFINITY Communications System Generic 3 V2 Traffic Reports*, 555-230-511
4. *DEFINITY Communications System Generic 1 and Generic 3 Voice Terminal Operations*, 555-230-701

Announcement Session

Announcements can be recorded, played back, and deleted from an announcement session. A station's COS needs to include console permissions in order for that station to be able to enter an announcement session. To enter an announcement session, go off-hook on a station that has console permissions and enter the appropriate Feature Access Code (FAC), administered as Announcement access code on the FACs form. Dial tone should be returned at this point. Enter the extension of the announcement that needs to be recorded, deleted, or played back. Again, dial tone should be heard. To record an announcement, press station keypad digit 1, record after the tone, and hang up when done. To play back an announcement, press 2. To delete an announcement, press 3 (confirmation tone is given if the delete worked). Announcements can also be played back by simply calling the announcement extension associated with them.

Uploading/Downloading Announcements

Integrated announcements on the TN750 Announcement circuit pack can be uploaded to the system tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2] with the administration terminal **save announcements** command. Likewise, integrated announcements can be downloaded to the Announcement circuit pack with the **restore announcements** command. Both of these commands require a free data module of NETCON type to be administered, a data module of announcement type (on the Announcement circuit pack) to be administered, and a tape cartridge to be in the system's tape drive (must not be write-protected) or a memory card (must not be write-protected). These commands are useful in maintaining the customer's recorded announcements. Depending on system traffic, announcement uploads and/or downloads take between 30 and 45 minutes.

The system **automatically** tries to download the Announcement circuit pack five minutes after it is inserted. This automatic download procedure is aborted if:

1. An announcement is recorded within 10 minutes of circuit pack insertion.
2. An announcement download is invoked sooner with the administration terminal **restore announcements** command.
3. No announcement and/or NETCON data module is administered.
4. Either the announcement data module is busy or all the administered NETCON data modules are busy.

5. No tape [G3iV1.1-286] or memory card [G3sV2, G3iV2-386, G3vsV2] is in the system.
6. The tape or memory card in the system does not have a valid announcement file saved on it.

NOTE:
Unlike translations, there is no provision in the Generic 3 system for automatically saving announcements to the system tape or memory card.

Hardware Error Log Entries and Test to Clear Values

Table 11-23. Announcement Circuit Pack Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level (See WARNING message below)	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test board PCSS sh r 1
1(a)	0	Circuit pack removed or SAKI Test (#53)	MINOR	ON	
2(p)		None			
14(b)	1 to 64	Announcement Checksum Test (#209)			
18	0	busyout board PCSS	WARNING	OFF	release board PCSS
23(c)	0	None	WARNING	OFF

3840(n)	Any	None			
3999(o)	Any	None			

1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

WARNING:
All alarms are upgraded to MAJOR when the BASE Tone Generator is set to 12. (France).

Notes:

a. Error Type 1— This error indicates the circuit pack totally stopped functioning or it was physically removed from the system.

NOTE:
The alarm is logged about 11 minutes after the circuit pack has been removed and/or SAKI Test (#53) fails.

If the circuit pack is not in the system, insert a circuit pack (in the same slot as the error indicates) to resolve this error. Or, if the circuit pack is in the system and the red LED is on, follow the instructions for "Red (alarm)" in the "Control and Port Circuit Pack Status LEDs" section in Chapter 7, "LED Interpretation".

NOTE:
The alarm is logged about 11 minutes after the circuit pack has been removed and/or SAKI Test (#53) fails.

WARNING:
Reseating and/or replacing the circuit pack results in loss of integrated announcements. See "General Notes" near the beginning of this Maintenance procedure.

b. Error Type 14—Whenever the Announcement Checksum Test (#209) fails, this error is logged. The Aux Data indicates the number of the first defective announcement found. This number corresponds to the announcement numbers on the announcement form. The extension relating to the announcement can be determined by the **display announcement** command. This error only appears in the Error Log in conjunction with Error Type 2817. Follow the procedures for Error Type 2817 to troubleshoot Error Type 14.

c. Error Type 23—The circuit pack has been logically administered but not physically installed. The alarm is cleared when the circuit pack is installed.

d. Error Type 125—A wrong circuit pack is inserted in the slot where this circuit pack is logically administered. To resolve this problem, either remove the wrong circuit pack and insert the logically administered circuit pack OR use the **change circuit-pack** command to readminister this slot to match the circuit pack inserted.

e. Error Type 170—Announcement board is not allowed in slot A03 for a system with Enhanced SCC cabinet. The red led of announcement board is turned on and the error message "Announcement board is not allowed in slot A03" is shown on SAT when **test/busyout/release board A03** commands are entered. The announcement board must be removed and inserted into a different slot.

f. Error Type 217 and 267— Indicate that there is more than one TN750 Announcement circuit pack inserted in the system. Remove the alarmed circuit pack..

g. Error Type 257—This error indicates transient communication problems with this circuit pack. This error is not service-affecting and no action is required.

h. Error Type 513—This error, when reported with Aux Data in the range of 4352 to 4358, indicates the circuit pack has reported a hardware failure on the circuit pack. The circuit pack should be replaced.

WARNING:
Replacing the circuit pack results in loss of integrated announcements. See "General Notes" near the beginning of this Maintenance procedure.

i. Error Type 1025—This error is not service-affecting and no action is required.

j. Error Type 1281—The SP found a fault in the speech main memory (SMM) (that is, it found one or more faulty memory locations). Whenever this error is logged, error 2817 is also logged [see Note (k)], which causes the maintenance system to run the Announcement Checksum Test (#209) to determine if the bad memory location was being used by an announcement.

k. Error Type 1538—The hyperactive circuit pack is out-of-service and may exhibit one or more of the following symptoms:

   1. The tests run on the ports of this circuit pack are returning with a NO-BOARD.
   2. A busyout/release of the circuit pack has no effect on test results.
   3. A **list configuration** command shows that the circuit pack and ports are properly installed.

   The system tries to restore the circuit pack within 15 minutes. If the error recurs after 15 minutes, replace the circuit pack. (Refer to the "Handling Port Circuit Packs" section in Chapter 5, "Routine Maintenance Procedures".)

l. Error Type 2049 and 2817—These errors are logged in conjunction with Error Type 1281, Aux Data 17699. Since that error [see Note (j)] means that a defective speech memory location was found, the announcement checksum error is also logged. This causes the Announcement Checksum Test (#209) to run, which determines if the defective memory location has corrupted any recorded announcements. If the Checksum Test passes, the faulty memory location is currently not being used, and the SP marks the location as faulty to ensure that future announcements do not attempt to use it.

NOTE:
As memory locations are marked faulty, the amount of available memory decreases, which decreases the total amount of announcement time available on the circuit pack.

m. Error Type 2049—A transient error that does not cause an alarm can occasionally occur during a SPE, TDM BUS, or Tone Clock interchange. It is possible for a marginal Tone-Clock circuit pack to cause this error against the ANN-BD without alarming the TONE-BD. If this error occurs again, replacing the Tone-Clock circuit pack may clear up this error. See the FAIL case in the Clock Match Inquiry Test (#212).

n. Error Type 3840— This error is not service-affecting and no action is required.

o. Error type 3999— Indicates that the circuit pack sent a large number of control channel messages to the switch within a short period of time. If error type 1538 is also present, then the circuit pack was taken out-of-service due to hyperactivity. If error type 1538 is not present, then the circuit pack has not been taken out-of-service, but it has generated 50% of the messages necessary to be considered hyperactive. This may be completely normal during heavy traffic periods. However, if this error type is logged when the circuit pack is being lightly used, it may indicate a problem with the circuit pack or the equipment attached to it.

p. Error Type 2—Check the Class of Restriction (COR) administered for the Data Line extension assigned to the TN750 for uploading and downloading announcements. The extension can be found by using **list data-module**

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Control Channel Loop Around Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND[1]
Control Channel Loop Around Test (#52) (a)		X		ND
Angel-Speech Processor (SP) Handshake Test (#208)		X		ND
Clock Match Inquiry (#212)	X	X		ND
Super Frame Match Inquiry (#211)	X	X		ND
140AY Loop Around Test (#210)	X	X		ND
Announcement Checksum Test (#209)	X	X		ND
Network Processor Element (NPE) Audit Test (#50) (a)		X		ND
SAKI Test (#53) (a)			X	D

1 D = Destructive; ND = Nondestructive

a. For a complete description of these tests, refer to the "XXX-BD (Common Port Circuit Pack)" Maintenance documentation.

Angel-Speech Processor (SP) Handshake Test (#208)

This test checks the integrity of the communication link between the two processors on the Announcement circuit pack. Failure of this test indicates that the Speech Processor is insane and **results in the loss of all integrated announcements on the circuit pack.**

Table 11-24. TEST #208 Angel-Speech Processor (SP) Handshake Test

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period. If Error Type 1538 is present in the Error Log, follow the maintenance strategy recommended for this Error Type.
2100	ABORT	Could not allocate the necessary system resources to run this test.
	ABORT	Internal System Error. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-24. TEST #208 Angel-Speech Processor (SP) Handshake Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	FAIL	Test failed. Circuit pack cannot be used. **Announcement speech memory is cleared when this test fails. Therefore, when the problem has been resolved, announcements must be rerecorded or downloaded to the circuit pack.** Refer to "General Notes" near the beginning of this Maintenance documentation. 1. Reset the circuit pack via the **reset board PCSS** command and then run this test again. If the test continues to fail, replace the circuit pack and then run this test again. 2. If there are recurring alarms on this circuit pack caused by this test failing, replace the circuit pack **even if Step 1 works**. **WARNING:** *Replacing the circuit pack results in loss of integrated announcements. See "General Notes" near the beginning of this Maintenance documentation.*
	PASS	The communications link between the two processors on the Announcement circuit pack is functioning properly. User-reported troubles on this circuit pack should be investigated using other circuit pack and port tests. Refer to "ANN-PT (Announcement Port)" Maintenance documentation for a description of the port tests.

Announcement Checksum Test (#209)

Associated with every recorded announcement is a checksum. In this test, the SP checks a stored global checksum covering all recorded announcements against a calculated one and returns the results to the maintenance system. If the global checksum failed, maintenance requests the SP to check each individual announcement's checksum.

If the test fails, then it returns the total number of defective announcements found. In addition, associated with each failure is an error in the Error Log (Error Type 14). The Aux Data indicates the number of the first defective announcement found. This number corresponds to the announcement numbers on the announcement form. The extension relating to the announcement can be determined by the **display announcement** command.

Table 11-25. TEST #209 Announcement Checksum Test

Error Code	Test Result	Description/ Recommendation
0	ABORT	An error code of 0 indicates that the announcement file has been corrupted due to a hardware fault in the TN750 board. Follow step #7 under "General Notes" at the beginning of this section.
1023	ABORT	There are no announcements currently recorded on the circuit pack.

Continued on next page

Table 11-25. TEST #209 Announcement Checksum Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1024	ABORT	This abort code is given for the following reasons: 1. An announcement upload or download is in progress. 2. An announcement upload or download is requested when this test is running. 3. A record is in progress. 4. A record request comes in when this test is running. If an announcement upload or download is in progress, a **status data-module <announcement data extension>** command should show that the announcement data port is connected to a NETCON data channel, and [for G3iV1.1-286] the tape drive should be active or [for G3sV2, G3iV2-386, or G3vsV2] the "card-in-use" amber LED for the memory card is on (to determine the extension of the announcement data module, use the **list data-module** command). See Note (a) at end of table for more information. 1. Wait until the blocking event is finished, and then run this test again. An upload or download could take up to 45 minutes to complete, and a recording session is finished as soon as the station that was making the recording is placed on-hook. 2. If the test continues to abort, and a record or upload/download is not in progress, escalate the problem.

Continued on next page

Table 11-25. TEST #209 Announcement Checksum Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period. If Error Type 1538 is present in the Error Log, follow the maintenance strategy recommended for this Error Type.
2100	ABORT	Could not allocate the necessary system resources to run this test.
	ABORT	Internal System Error. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-25. TEST #209 Announcement Checksum Test — *Continued*

Error Code	Test Result	Description/ Recommendation
0-256	FAIL	Test failed. The error code indicates the total number of defective announcements that were found. When TEST #209 fails with error code 0, the Global Checksum failed on the board, but no individual Checksum failed. **NOTE:** Since the announcements are recorded digitally, it is possible for the Announcement Checksum Test to *fail* but still have all the announcements sound uncorrupted. When an individual announcement fails the Checksum Test, always listen to the announcement first before taking any action (an announcement can be played back by dialing the announcement extension associated with the announcement number). If the announcement sounds corrupted, then rerecord it or delete it. 1. Look in the Error Log to determine the number of the first defective announcement. Play back the announcement. If the announcement sounds defective, rerecord it or delete it. If the error code was greater than one (indicating that there is more than one defective announcement), run this test again and repeat this step. 2. If after deleting and rerecording all defective announcements, the checksum test still fails, reset the circuit pack using the **reset board PCSS** command and run this test again. 3. If the test still continues to fail, reseat the circuit pack and restore all announcements with an appropriate time estimate (for example, 40 minutes.) Then rerecord the lost announcements (that is, those recorded since the last save operation) and run this test again. 4. If the test still continues to fail, replace the circuit pack, and run this test again. **WARNING:** *Replacing the circuit pack results in loss of integrated announcements. See "General Notes" near the beginning of this Maintenance procedure.*

Continued on next page

Table 11-25. TEST #209 Announcement Checksum Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	PASS	All recorded announcements checksum correctly, indicating that the speech main memory is functioning properly. User-reported troubles on this circuit pack should be investigated using other circuit pack and port tests. Refer to "ANN-PT (Announcement Port)" Maintenance documentation for a description of the port tests.

Notes:

a. The Announcement circuit pack can exhibit a condition that does not allow recording.

   If the circuit pack gets locked into this state (this is an extremely rare condition), two of the Announcement Ports on the circuit pack will be unusable by software, one of which is the record port. Also, **save/restore announcements** will not work, since the record port looks busy to the circuit pack. Note that software does not have any way of knowing this, and attempts to use the ports.

   If the circuit pack is locked into this state, the following symptoms are observed:

   1. When attempting to record an announcement, users hear the proper record tone, but the announcement do not record (they do not know it until the announcement is played back).
   2. Performing a **test board long** when the circuit pack is in this state yield the following abort codes:
      - Ports 1 AND 9 abort Test #206 with code 1024
      - Ports 1 AND 9 abort Test #205 with code 2000
      - Board level Tests #209 and #210 abort with code 1024
   3. The **save/restore announcements** command times out with:

      Error encountered, can't complete request

The Announcement circuit pack lock-up can be cleared remotely by performing a soft reset to the circuit pack:

- **busyout board PCSS** (this command drops all calls in progress on the Announcement circuit pack)
- reset circuit pack using the **reset board PCSS** command
- release circuit pack using the **release board PCSS** command

140AY Loop Around Test (#210)

This test checks the integrity of the record channel on the Announcement circuit pack (Announcement Port 1). The main function of the 140AY device is to accept Pulse Code Modulation (PCM)/Adaptive Differential Pulse Code Modulation (ADPCM) samples and compress/expand the samples using ADPCM. This test connects a Tone Generator to one port (Announcement Port 1, the recording port), and a Tone Detector to another port (Announcement Port 9). A tone is generated by the Tone Generator on the first port and looped through the 140AY device to the second port. The Tone Detector then responds with a tone present/absent message. The 140AY Loop Around Test is repeated at three different speech compression rates.

Since this test involves sending a tone through two different ports, the Playback Speech Memory Array (PSMA) Test (#206) [see ANN-PT (Announcement Port) Maintenance documentation for a description of this test] is run on the two ports first to make sure that they are working properly.

Table 11-26. TEST #210 140AY Loop Around Test

Error Code	Test Result	Description/ Recommendation
1-3	ABORT	Response to the test request was not received within the allowable time period. The error code indicates at which speech compression rate the test aborted (one being the first rate tested, three being the last). 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
10	ABORT	The PSMA Test (#206) failed on Announcement Port 1.
90	ABORT	The PSMA Test (#206) failed on Announcement Port 9. 1. Refer to"ANN-PT (Announcement Port)" Maintenance documentation, Test #206.

Continued on next page

Table 11-26. TEST #210 140AY Loop Around Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available. This test needs Announcement Ports 1 and 9 to run. One of the ports may be in use on a valid call. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort and Ports 1 and 9 are not in use, escalate the problem.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to "TDM-BUS (TDM Bus)" Maintenance documentation to diagnose any active TDM-BUS errors. 1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat test at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. 1. Look for TTR-LEV errors in the Error Log. If present, refer to the "TTR-LEV (TTR Level)" Maintenance documentation. 2. Look for TONE-PT errors in the Error Log. If present, refer to the "TONE-PT (Tone Generator)" Maintenance documentation. 3. If neither condition exists, retry the test at one-minute intervals a maximum of five times. 4. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-26. TEST #210 140AY Loop Around Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1007	ABORT	The Announcement circuit pack thinks that Port 1 or Port 9 is busy. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, follow the Announcement Port maintenance procedures for Ports 1 and 9. 3. If the Announcement Ports pass all their tests, escalate the problem.
1024	ABORT	Announcement circuit pack blocked the test because an announcement download is in progress. If an announcement download is in progress, a **status data-module <announcement data extension>** command should show that the announcement data port is connected to a NETCON data channel, and [for G3iV1.1-286] the tape drive should be active or [for G3sV2, G3iV2-386, or G3vsV2] the "card-in-use" amber LED for the memory card should be on (to determine the extension of the announcement data module, use the **list data-module** command). See Note (a) at end of table for more information. 1. Wait until download is finished (can take up to 45 minutes), and then run the test again. 2. If the test continues to abort and there is no download in progress, escalate the problem.
2000	ABORT	Response to the test request was not received within the allowable time period. If Error Type 1538 is present in the Error Log, follow the maintenance strategy recommended for this error type. 1. Retry the command at one minute intervals a maximum of 5 times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-26. TEST #210 140AY Loop Around Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2007	ABORT	The Announcement circuit pack thinks that Port 1 or Port 9 is busy. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, follow the Announcement Port maintenance procedures for Ports 1 and 9. 3. If the Announcement ports pass all their tests, escalate the problem.
2100	ABORT	Could not allocate the necessary system resources to run this test.
	ABORT	Internal System Error. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1-3	FAIL	Test failed. The error code indicates at which speech compression rate the test actually failed (one being the first rate tested, three being the last). 1. Reset the circuit pack via the **reset board PCSS** command and then run this test again. If the test still fails, replace the circuit pack (see Warning) and run this test again. 2. If there are recurring alarms on this circuit pack caused by this test failing, replace the circuit pack even if Step 1 works (see Warning). ⚠ **WARNING:** *Replacing the circuit pack results in loss of integrated announcements. See "General Notes" near the beginning of this Maintenance procedure.*
	PASS	The record channel on the Announcement circuit pack is functioning properly. User-reported troubles on this circuit pack should be investigated using other circuit pack and port tests. Refer to "ANN-PT (Announcement Port)" Maintenance documentation for a description of the port tests.

Continued on next page

Notes:

a. The Announcement circuit pack can exhibit a condition that does not allow recording.

If the circuit pack gets locked into this state (this is an extremely rare condition), two of the Announcement Ports on the circuit pack will be unusable by software, one of which is the record port. Also, **save/restore announcements** will not work since the record port looks busy to the circuit pack. Note that software does not have any way of knowing this, and attempts to use the ports.

If the circuit pack is locked into this state, the following symptoms are observed:

1. When attempting to record an announcement, users hear the proper record tone, but the announcement does not record (they do not know it until the announcement is played back).
2. Performing a **test board long** when the circuit pack is in this state yields the following abort codes:
   - Ports 1 AND 9 abort Test #206 with code 1024
   - Ports 1 AND 9 abort Test #205 with code 2000
   - Board level Tests #209 and #210 abort with code 1024
3. The **save/restore announcements** command times out with:

   Error encountered, can't complete request

The Announcement circuit pack lock-up can be cleared remotely by performing a soft reset to the circuit pack:

- **busyout board PCSS** (this command drops all calls in progress on the Announcement circuit pack)
- reset circuit pack using the **reset board PCSS** command
- release circuit pack using the **release board PCSS** command

Super Frame Match Inquiry Test (#211)

The super frame is a means by which the SP synchronizes with the 140AY device on the Announcement circuit pack. If the super frame is not synchronized, the SP is not able to properly process record/playback requests. Both the SP and the hardware generate a super frame pulse. When these two pulses are out of synch, the SP sets a flag to indicate the mismatch. When this test is run, the state of this flag is returned.

Table 11-27. TEST #211 Super Frame Match Inquiry

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period. If Error Type 1538 is present in the Error Log, follow the maintenance strategy recommended for this Error Type.
2100	ABORT	Could not allocate the necessary system resources to run this test.
	ABORT	Internal System Error. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-27. TEST #211 Super Frame Match Inquiry — *Continued*

Error Code	Test Result	Description/ Recommendation
	FAIL	Test failed. Announcement playbacks should sound corrupted. 1. Reset the circuit pack via the **reset board PCSS** command and then run this test again. If the test continues to fail, replace the circuit pack (see Warning). 2. If there are recurring alarms on this circuit pack caused by this test failing, replace the circuit pack even if Step 1 works (see Warning). **WARNING:** *Replacing the circuit pack results in loss of integrated announcements. See "General Notes" near the beginning of this Maintenance procedure.*
	PASS	The SP can properly process record/playback requests. User-reported troubles on this circuit pack should be investigated using other circuit pack and port tests. Refer to "ANN-PT (Announcement Port)" Maintenance documentation for a description of the port tests.

Clock Match Inquiry Test (#212)

This test is supported to determine the state of the clock generation circuitry on the Announcement circuit pack. This circuitry is used for controlling various pieces of the hardware, like the 140AY device. It is also used to synchronize the Announcement circuit pack with the clock that is on the backplane.

Table 11-28. TEST #212 Clock Match Inquiry Test

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period. If Error Type 1538 is present in the Error Log, follow the maintenance strategy recommended for this Error Type.
2100	ABORT	Could not allocate the necessary system resources to run this test.
	ABORT	Internal System Error. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-28. TEST #212 Clock Match Inquiry Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	FAIL	Test failed. Announcements recorded or played back while the clock circuitry is not functioning properly sound distorted. The ANN-BD may be defective or the Active Tone-Clock circuit pack (TONE-BD) in the same Port Network as the ANN-BD may be marginal and is causing this test to fail. 1. Reset the circuit pack via the **reset board PCSS** command and then run this test again. If the test continues to fail, proceed to Step 2 or 3 as applicable. 2. If this is a High or Critical Reliability system, determine the Active TONE-BD in this Port Network via the **status system** command and make the Standby Tone-Clock circuit pack active via the **set tone-clock PCSS** command. Rerun the test. If the test passes, then replace the now Standby Tone-Clock circuit pack. If the test continues to fail, replace the ANN-BD circuit pack. **WARNING:** *Replacing the circuit pack results in loss of integrated announcements. See "General Notes" near the beginning of this Maintenance procedure.*

Continued on next page

Table 11-28. TEST #212 Clock Match Inquiry Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	FAIL *(cont'd.)*	3. If this is a Standard system (that is, not a High or Critical Reliability system), replace the ANN-BD. Rerun the test. If the test continues to fail, replace the Tone-Clock circuit pack located in the same Port Network as the ANN-BD. **WARNING:** *Replacing the Tone-Clock circuit pack causes a standard system PPN to perform a COLD 2 reset or an EPN to reset. See the "How to Replace a Tone-Clock Circuit Pack" section in the "TONE-BD (Tone-Clock Circuit Pack)" Maintenance documentation. Replacing the ANN-BD results in loss of integrated announcements. See "General Notes" near the beginning of this Maintenance procedure.* 4. If there are recurring alarms on this circuit pack caused by this test failing, replace the ANN-BD even if the previous steps were successful. **WARNING:** *Replacing the TONE-BD causes a standard system PPN to perform a COLD 2 reset or an EPN to reset. Replacing the ANN-BD results in loss of integrated announcements. See the "General Notes" section near the beginning of this Maintenance procedure.*
	PASS	Announcement record/playbacks should have clear sound quality. User-reported troubles on this circuit pack should be investigated using other circuit packs and port tests. Refer to "ANN-PT (Announcement Port)" Maintenance documentation for a description of the port tests.

ANN-PT (Announcement Port)

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run[1]	Full Name of MO
ANN-PT	MINOR	test port PCSSpp l	Announcement Port
ANN-PT	WRN	test port PCSSpp l	Announcement Port

1 Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (for example, A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (for example, 01, 02, ..., etc.).

The TN750 Announcement circuit pack is a service circuit pack that provides a customer with an integrated means for recording announcements that can be played back on demand by call processing as part of a calling feature (that is, announcements on hunt group calls). There are 16 Announcement Ports on the Announcement circuit pack. Each port can play any integrated announcement, independently of the other ports. In addition to the 16 Announcement Ports, the Announcement circuit pack also has one Data Line Circuit Port (Port 17). The Data Line Circuit Port is used for uploading/downloading the announcement memory to/from the system tape. If there are any errors associated with Port 17, refer to "DAT-LINE (Data Line)" Maintenance documentation. If there are any errors associated with the circuit pack, refer to "ANN-BD (Announcement Circuit Pack)" Maintenance documentation.

The Announcement circuit pack has two processors on it. The first processor, or Angel, controls the circuit pack, and communicates with the switch via the control channel on the TDM Bus. The second processor, or SP, controls the speech memory and announcements. Digital speech is converted from its TDM Bus form to an internal storage form (for recording) and vice versa (for playbacks) by the 140AY device on the circuit pack, which has 16 channels (one for each Announcement Port).

General Notes

Here are a few **very important** general notes that apply to any problem on the Announcement circuit pack. The user should read this before attempting to work on the TN750 Announcement circuit pack or Announcement Ports, **especially if the circuit pack needs to be replaced.**

1. The Announcement circuit pack retains all integrated announcements *as long as the circuit pack has power.* For this reason, whenever there is a problem with either the Announcement circuit pack or an Announcement Port that may require the circuit pack to be reset, it is always better to try to reset the circuit pack via the **reset board PCSS** command first and, if that

does not work, then try to reseat it. **Announcements are preserved through a software reset, but they are lost when the circuit pack is reseated.**

2. **If a customer has announcements on the Announcement circuit pack that cannot be re-recorded easily, then announcements must be saved on the system tape to ensure that they are not lost.** This should be done as soon as the announcements are recorded on the circuit pack (or whenever they are changed), assuming that the pack is in proper working order (see Note).

   This should be done as soon as the announcements are recorded on the circuit pack (or whenever they are changed), assuming that the pack is in proper working order (see Note).

   NOTE:
   Unlike translations, announcements are NEVER automatically saved to the system tape.

3. The administration terminal **save announcements** command replaces the announcement file on tape with the Announcement circuit pack speech memory. Care must be taken not to mistakenly enter this command, thereby destroying a valid file on tape.
4. The terminal **restore announcements** command replaces the Announcement circuit pack speech memory with the announcement file on the system tape. Care must be taken not to mistakenly enter this command, thereby destroying valid speech memory (especially if the system tape does not have a valid announcement file on it).
5. Whenever the Announcement circuit pack is replaced, announcements must always be re-recorded or downloaded to the new circuit pack. Otherwise, call processing is not able to use the circuit pack.
6. If announcement speech memory is corrupted, **announcements should not be saved**, that is, if the Announcement Checksum Test (#209) fails or if the speech sounds corrupted on playback. This can ruin a good announcement file on tape and potentially cause errors/alarms on any circuit pack to which the new file is downloaded. However, if the customer does not have a valid announcement file on tape, then announcements can be saved in an effort to try to retain some of them (all of the announcements recorded may not be corrupted).
7. Although Announcement Port 5 and Data Line Circuit Port 17 on the Announcement circuit pack are logically two separate ports, they are physically the same port. Therefore, if one of the ports is in use, the other one will be busy. Also, if Announcement Port 5 is out-of-service, the Data Line Circuit Port is taken out-of-service. However, if the Data Line Circuit Port is out-of-service, the Announcement Port remains in-service.

Announcement Administration

A brief description of the integrated announcement administration is given here to aid in the troubleshooting of the Announcement circuit pack and its ports. In many cases, it is necessary to record, play back, and/or delete announcements to resolve an alarm. It may also be necessary to save and restore announcements as part of the maintenance procedures. For a complete description of integrated announcement administration, please refer to the following manuals:

1. *DEFINITY Communications System Generic 3 Implementation*, 555-230-653
2. *DEFINITY Communications System Generic 1 and Generic 3 Voice Terminal Operations,* 555-230-701
3. *DEFINITY Communications System Generic 1 and Generic 3 System Management,* 555-230-500
4. *DEFINITY Communications System Generic 3 V2 Traffic Reports*, 555-230-511

Announcement Session

Announcements can be recorded, played back, and deleted from an announcement session. A station's COS needs to include console permissions in order for that station to be able to enter an announcement session. To enter an announcement session, go off-hook on a station that has console permissions and enter the appropriate FAC (administered as Announcement access code on the FACs form). Dial tone should be returned at this point. Enter the extension of the announcement that needs to be recorded, deleted or played back. Again, dial tone should be heard. To record an announcement, press station keypad digit 1, record after the tone, and hang up when done. To play back an announcement, press station keypad digit 2. To delete an announcement, press station keypad digit 3 (confirmation tone is given if the delete worked). Announcements can also be played back by simply calling the announcement extension associated with them.

Uploading/Downloading Announcements

Integrated announcements on the TN750 Announcement circuit pack can be uploaded to the system tape with the administration terminal **save announcements** commands. Similarly, integrated announcements can be downloaded to the Announcement circuit pack with the administration terminal **restore announcements** command. Both of these commands require a free data module of NETCON type to be administered, a data module of announcement type (on the Announcement circuit pack) to be administered, and a tape cartridge to be in the system's tape drive (must not be write-protected).

These commands are useful in maintaining the customer's recorded announcements. Depending on system traffic, announcement uploads/downloads take between 30 and 45 minutes.

The system **automatically** tries to download the Announcement circuit pack five minutes after it is inserted. This automatic download procedure is aborted if:

1. An announcement is recorded within 10 minutes of circuit pack insertion.
2. An announcement download is invoked sooner with the administration terminal **restore announcements** command.
3. There is no announcement and/or NETCON data module administered.
4. Either the announcement data module is busy or all the administered NETCON data modules are busy.
5. There is no tape in the system.
6. The tape in the system does not have a valid announcement file saved on it.

NOTE:
Unlike translations, there is no provision in the system for automatically saving announcements to the system tape.

Hardware Error Log Entries and Test to Clear Values

Announcement Port Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test port PCSSpp sh r 1
1		Playback Speech Memory Array (PSMA) Test (#206)	MINOR	ON	test port PCSSpp sh r 3
18	0	The port was busied out	WARNING	OFF	release port PCSSpp
130 (a)		None	WARNING	ON	test port PCSSpp sh
257		Channel Administration Memory Array (CAMA) Test (#205)	MINOR	ON	test port PCSSpp l r 3
	17667	In-line error			
5		140AY Channel Sanity Inquiry Test (#222)	MINOR	ON	test port PCSSpp sh r 3
	17684	In-line error			
769 (b)		None			

1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

a. This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, reinsert or replace the circuit pack.

b. This error is logged and the port is alarmed when an alarm is raised on the Announcement circuit pack because of a faulty condition with a common circuit pack resource. Any one of the following alarmed errors on the Announcement circuit pack causes this error to be logged against the Announcement Port: 1793, 2049, 2305, 2561. Follow the ANN-BD (Announcement Circuit Pack) Maintenance documentation to resolve these alarms. When the corresponding circuit pack alarm is cleared, this alarm clears.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Channel Administration Memory Array (CAMA) Test,* for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Channel Administration Memory Array (CAMA) Test (#205)		X	ND
Playback Speech Memory Array (PSMA) Test (#206)	X	X	ND
140AY Channel Sanity Inquiry Test (#222)	X	X	ND

1 D = Destructive; ND = Nondestructive

Channel Administration Memory Array (CAMA) Test (#205)

This test is a memory device that stores information used to control the 140AY device. The Angel asynchronously feeds the CAMA with the control information. During the CAMA test, the Angel writes patterns into the CAMA, reads them back, and verifies that they match. If the patterns do not match, the test fails. This test is run periodically by the switch maintenance and by the Announcement circuit pack in the background.

Table 11-29. TEST #205 Channel Administration Memory Array (CAMA) Test

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available. The port may be in use on a valid call. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, and the circuit pack is not in use, escalate the problem.
2000	ABORT	Response to the test request was not received within the allowable time period. See Note (a) at end of table for more information.
2100	ABORT	Could not allocate the necessary system resources to run this test.
	ABORT	Internal System Error. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-29. TEST #205 Channel Administration Memory Array (CAMA) Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	FAIL	Test failed. Announcements played back on this port may sound corrupted. 1. Reset the circuit pack via the **reset board PCSS** command and then run this test again. If the test continues to fail, replace the circuit pack (see Warning). 2. If there are recurring alarms on this port caused by this test failing, replace the circuit pack even if Step 1 works (see Warning). **WARNING:** *Replacing the circuit pack results in loss of integrated announcements. Refer to "General Notes" near the beginning of this Maintenance procedure.*
	PASS	This test verifies that the Angel processor can properly set up this port for playbacks. User-reported troubles on this circuit pack should be investigated using other port and circuit pack tests. (Refer to "ANN-BD (Announcement Circuit Pack)" Maintenance documentation for a description of the circuit pack tests.)

Notes:

a. The Announcement circuit pack can exhibit a condition that does not allow recording.

   If the circuit pack gets locked into this state (this is an extremely rare condition), two of the Announcement Ports on the circuit pack (one of which is the record port) will be unusable by software. Also, **save/restore announcements** will not work since the record port looks busy to the circuit pack. Note that software does not have any way of knowing this and attempts to use the ports.

   If the circuit pack is locked into this state, the following symptoms are observed:

1. When attempting to record an announcement, users hear the proper record tone, but the announcement does not record (they do not know it until the announcement is played back).
2. Performing a **test board long** when the circuit pack is in this state yields the following abort codes:
   - Ports 1 AND 9 abort Test #206 with code 1024
   - Ports 1 AND 9 abort Test #205 with code 2000
   - Board level Tests #209 and #210 abort with code 1024
3. The **save/restore announcements** command times out with:

   Error encountered, can't complete request

The Announcement circuit pack lock-up can be cleared remotely by performing a soft reset to the circuit pack:

- **busyout board PCSS** (this command drops all calls in progress on the Announcement circuit pack)
- reset circuit pack using the **reset board PCSS** command
- release circuit pack using the **release board PCSS** command

Playback Speech Memory Array (PSMA) Test (#206)

The PSMA test checks the integrity of a playback channel's interface to the speech memory and the TDM Bus. The SP has an internal buffer that contains a specific 256-byte sequence. During this test, the byte sequence is "played" through the 140AY device onto the TDM Bus. A General Purpose Tone Detector is used to confirm that the proper sequence was played. **This test is very important.** It is the only test that actually checks an Announcement Port's ability to play back an announcement on the TDM Bus. If the test fails, the Tone Detector returns the number of bytes that did not match the expected sequence. The larger the number, the more severe the problem with that port. If this test fails, announcements played over this port should sound corrupted.

It is the only test that actually checks an Announcement Port's ability to play back an announcement on the TDM Bus. If the test fails, the Tone Detector returns the number of bytes that did not match the expected sequence. The larger the number, the more severe the problem with that port. If this test fails, announcements played over this port should sound corrupted.

Table 11-30. TEST #206 Playback Speech Memory Array (PSMA) Test

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available. The port may be in use on a valid call. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort and the pack is not in use, escalate the problem.
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to "TDM-BUS (TDM Bus)" Maintenance documentation to diagnose any active TDM-BUS errors. 1. If system has no TDM-BUS errors and is not handling heavy traffic, repeat the test at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-30. TEST #206 Playback Speech Memory Array (PSMA) Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. 1. Look for TTR-LEV errors in the Error Log. If present, refer to "TTR-LEV (TTR Level)" Maintenance documentation. 2. Look for TONE-PT errors in the Error Log. If present, refer to "TONE-PT (Tone Generator)" Maintenance documentation. 3. If neither condition exists, retry the test at one-minute intervals a maximum of five times. 4. If the test continues to abort, escalate the problem.
1024	ABORT	Announcement circuit pack blocked the test because an announcement download is in progress. If an announcement download is in progress, a **status data-module <announcement data extension>** command should show that the announcement data port is connected to a NETCON data channel, and the tape drive should be active. (To determine the extension of the announcement data module, use the **list data-module** command.) See Note (a) at end of table for more information. 1. Wait until download is finished (could take a maximum of 45 minutes), and then run the test again. 2. If the test continues to abort and there is no download in progress, escalate the problem.
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test.

Continued on next page

Table 11-30. TEST #206 Playback Speech Memory Array (PSMA) Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	ABORT	Internal System Error. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1 to 254	FAIL	Test failed. The error code indicates the number of byte count errors found by the Tone Detector. 1. Reset the circuit pack via the **reset board PCSS** command and then run this test again. If the test continues to fail, replace the circuit pack (see Warning). 2. If there are recurring alarms on this port caused by this test failing, replace the circuit pack even if Step 1 works (see Warning). **WARNING:** *Replacing the circuit pack results in loss of integrated announcements. Refer to "General Notes" near the beginning of this Maintenance procedure.*

Continued on next page

Table 11-30. TEST #206 Playback Speech Memory Array (PSMA) Test — *Continued*

Error Code	Test Result	Description/ Recommendation
255	FAIL	Test failed. The Announcement Port and the Tone Detector never synchronized. Check for active GPTD-PT errors, and refer to "GPTD-PT [General Purpose Tone Detector Port (CPTR)]" Maintenance documentation to diagnose them first. 1. If there are no active GPTD-PT errors, reset the circuit pack via the **reset board PCSS** command and then run this test again. If the test continues to fail, replace the circuit pack (see Warning). 2. If there are recurring alarms on this port caused by this test failing, replace the circuit pack even if Step 1 works (see Warning). **WARNING:** *Replacing the circuit pack results in loss of integrated announcements. Refer to "General Notes" near the beginning of this Maintenance procedure.*
	PASS	This port can cleanly play announcements. User-reported troubles on this pack should be investigated using other port and circuit pack tests. Refer to "ANN-BD (Announcement Circuit Pack)" Maintenance documentation for a description of the circuit pack tests.

Notes:

a. The Announcement circuit pack can exhibit a condition that does not allow recording.

If the circuit pack gets locked into this state (this is an extremely rare condition), two of the Announcement Ports on the circuit pack (one of which is the record port) will be unusable by software. Also, **save/restore announcements** will not work, since the record port looks busy to the circuit pack. Note that software does not have any way of knowing this and attempts to use the ports.

If the circuit pack is locked into this state, the following symptoms are observed:

1. When attempting to record an announcement, users hear the proper record tone, but the announcement does not record (they do not know it until the announcement is played back).
2. Performing a **test board long** when the circuit pack is in this state yields the following abort codes:
   - Ports 1 and 9 abort Test #206 with code 1024
   - Ports 1 and 9 abort Test #205 with code 2000
   - Board level Tests #209 and #210 abort with code 1024
3. The **save/restore announcements** command times out with:

   Error encountered, can't complete request

The Announcement circuit pack lock-up can be cleared remotely by performing a soft reset to the circuit pack:

- **busyout board PCSS** (this command drops all calls in progress on the Announcement circuit pack)
- reset circuit pack using the **reset board PCSS** command
- release circuit pack using the **release board PCSS** command

140AY Channel Sanity Inquiry Test (#222)

The Angel keeps a sanity status bit for each of the 16 channels on the 140AY device. This test queries the Angel to determine the status for a particular channel. If a channel is insane, that implies that announcements cannot be played back on that channel.

Table 11-31. TEST #222 140AY Channel Sanity Inquiry Test

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period.
2100	ABORT	Could not allocate the necessary system resources to run this test.
	ABORT	Internal System Error. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
	FAIL	Test failed. Announcements cannot be played back over this port. 1. Reset the circuit pack via the **reset board PCSS** command and then run this test again. If the test continues to fail, replace the circuit pack (see Warning). 2. If there are recurring alarms on this port caused by this test failing, replace the circuit pack even if Step 1 works (see Warning). **WARNING:** *Replacing the circuit pack results in loss of integrated announcements. Refer to "General Notes" near the beginning of this Maintenance procedure.*
	PASS	Announcements can be played back over this port. User-reported troubles on this pack should be investigated using other port and circuit pack tests. Refer to the "ANN-BD (Announcement Circuit Pack)" Maintenance documentation for a description of the circuit pack tests.

ANNOUNCE (Announce)

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run	Full Name of MO
ANNOUNCE	none	none	ANNOUNCEMENT

The ANNOUNCE MO logs an error in the hardware error log if at least one of the following is true:

- The **save announcements** or **restore announcements** command does not complete successfully, or the
- System fails to restore announcements from the memory card [386 system] or tape [286 system] at boot time.

Figure 11-7 shows the connection of the Announcement Circuit Pack to the system. To save or restore announcements, an ANNOUNCEMENT Data Extension must be administered, and at least one DATA-CHL (Network Control Data Channel) must be in the in-service/idle state.

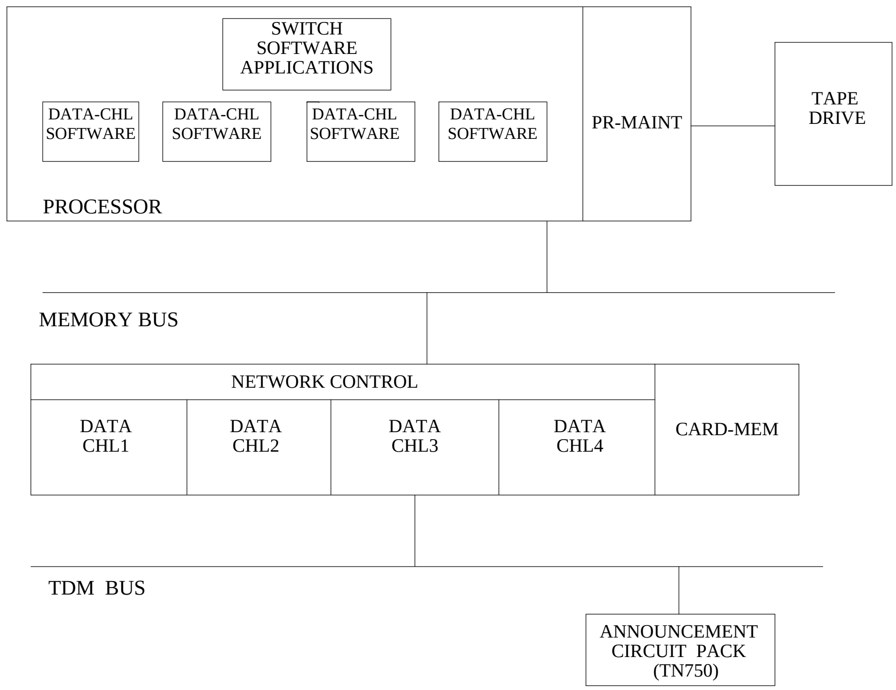

Figure 11-7. Connection of Announcement Circuit Pack to the System

Hardware Error Log Entries

ANNOUNCE Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
1(a)(f)	any	None			
257(b)(f)	any	None			
513(c)(f)	0	None			
769(d)(f)	0	None			
1025(e)(f)	any	None			

Notes:

a. Error occurred while saving announcements. (See Table 11-32 in the next section for an explanation of Aux Data and for recommended repair actions.)

b. Error occurred while saving announcements to the standby SPE. (See Table 11-32 in the next section for an explanation of Aux Data and for recommended repair actions.)

c. User pressed cancel while announcements were being saved by the active PE.

d. User pressed cancel while announcements were being saved by the standby PE.

e. Error occurred while restoring announcements. (See Table 11-32 in the next section for an explanation of Aux Data and for recommended repair actions.)

f. The port field for this error contained the active PE complex when the error occurred.

Aux Data Error Codes and Recommended Repair Procedures

Table 11-32. Aux Data Error Codes and Recommended Repair Procedures

Aux Data	Description/ Recommendation
9000 through 9031	CARD-MEM [386 systems] errors. Check and resolve CARD-MEM [386 systems] errors and alarms.
30001 through 30054	Tape [286 systems] errors. Check and resolve TAPE [286 systems] errors and alarms.
32001	Internal system error. 1. Check other ANNOUNCE errors and take corrective action. If there are no other ANNOUNCE errors, do the following: 2. Retry the command at two minute intervals a maximum of three times. 3. If the **save/restore announcements** command fails, escalate the problem.
32002	Announcement circuit pack is in use. 1. Retry the command at two minute intervals a maximum of three times. 2. If the **save/restore announcements** command fails, escalate the problem.
32003	Announcement port is in use. 1. Wait for all Announcement ports to become available. 2. Enter the **save/restore announcements** command.
32004	There are no announcements recorded on the Announcement Circuit Pack. The **save announcements** command is not allowed to prevent the destroying of the announcement file on tape [286 systems] or on the memory card [386 systems].

Continued on next page

Table 11-32. Aux Data Error Codes and Recommended Repair Procedures — *Continued*

Aux Data	Description/ Recommendation
32005	Integrated announcement circuit pack is not present. The Announcement Circuit Pack is not inserted, or it is defective. 1. Enter the **list config** command to check for the presence of the circuit pack in the system. 2. If the Announcement Circuit Pack is present, use the **test board PCSS** command to check the status of the Announcement Circuit Pack.
32006	Announcement Data Module not available. 1. Use the **status** command to check the status of the Announcement Data Module.
32007	Announcement Data Module out of service. 1. Use the **status** command to check the status of the Announcement Data Module.
32008	Announcement data is being saved or loaded. 1. Retry the command at two minute intervals a maximum of three times. 2. If the **save/restore announcements** command fails, escalate the problem.
32009	Required DATA-CHL is not administered or out of service. (A DATA-CHL is required to save or restore announcements.) 1. Add a DATA-CHL if none is administered. 2. If a DATA-CHL is administered, use the **status** command to check the status of all DATA-CHLs. At least one DATA-CHL should be in the in-service/idle state.
32010 32013	DATA-CHL is not administered, or it is unavailable. (A DATA-CHL is required to save or restore announcements.) 1. Add a DATA-CHL if none is administered. 2. If a DATA-CHL is administered, use the **status** command to check the status of all DATA-CHLs. At least one DATA-CHL should be in the in-service/idle state.
32012	Required Announcement Data Module is not administered. 1. Add an Announcement Data Module and repeat the command.

Continued on next page

Table 11-32. Aux Data Error Codes and Recommended Repair Procedures — *Continued*

Aux Data	Description/ Recommendation
32014	Command timed out on the standby processor [286 systems]. This could present problems. 1. Check the error and alarm logs for errors and alarms that are logged against the STBY-SPE (Standby SPE) [286 systems].
32015	Time of day not set. 1. Set the time of day, and reenter the **save/restore announcements** command.
32016	Internal System errors. Check for any other ANNOUNCE errors and take corrective action.If there are no other announcements errors, do the following: 1. Retry the command at two minute intervals a maximum of three times. 2. If the **save/restore announcements** command fails, escalate the problem.

ASAI-ADJ (Adjunct-Switch Application Interface) [G3iV1.1-286,G3iV2-386]

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run[1]	Full Name of MO
ASAI-ADJ	MAJ/MIN/WRN[1]	test station extension l	ASAI Adjunct

1 The alarm level for ASAI adjunct ports may be administered using the **set options** command. The alarm level can be set independently for Off-Board and On-Board alarms to WARNING, MINOR, or MAJOR for all ASAI adjunct ports in the system.

Refer to "BRI-SET, ASAI-ADJ, BRI-DAT" Maintenance documentation.

BRI-BD/LGATE-BD (ISDN-BRI Line Circuit Pack)

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run[1]	Full Name of MO
BRI-BD	MAJOR	test board PCSS l	ISDN-BRI Line Circuit Pack
BRI-BD	MINOR	test board PCSS l	ISDN-BRI Line Circuit Pack
BRI-BD	WARNING	test board PCSS sh	ISDN-BRI Line Circuit Pack
LGATE-BD	MAJOR	test board PCSS l	DEFINITY Lan Gateway
LGATE-BD	MINOR	test board PCSS l	DEFINITY Lan Gateway
LGATE-BD	WARNING	test board PCSS sh	DEFINITY Lan Gateway

1 Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (01, 02, ..., etc.).

NOTE:
Some of the information in this section is reserved for future use.

CAUTION:
A detailed flowchart for isolating and resolving Packet Bus faults is included in Chapter 9, "Packet Bus Fault Isolation and Correction". This flowchart, along with the other information presented in the chapter, can help in resolving problems that involve more than a single station or circuit pack. Whenever the repair procedures for this Maintenance Object refer to Packet Bus and/or Packet Control maintenance, be sure to reference Chapter 9, "Packet Bus Fault Isolation and Correction", in addition to the relevant MO documentation.

ISDN-BRI Line is a packet port circuit pack that provides access to ISDN-BRI endpoints. The ISDN-BRI Line circuit pack supports 12 ports, each of which provides access to ISDN stations. Voice and circuit-switched data from the ISDN stations are carried on the Time Division Multiplex (TDM) Bus. Signaling is carried over the Packet Bus.

LEDS

The ISDN-BRI Line circuit pack performs extensive initialization tests and lights both the red and green LEDS during the initialization testing. See Chapter 7, "LED Interpretation", for more details on circuit pack status LEDs.

Hardware Error Log Entries and Test to Clear Values

BRI-BD Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test board PCSS sh r 1
1(a)	Any	None	MINOR	ON

2306 (j)		LANBIC Receive Parity Error Counter Test (#595)			
3330 (k)	46083		MINOR	OFF	
3840 (l)	4096 to 4101				
3843 (m)	46097				
3999 (n)	Any	None			

1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

a. This error indicates the circuit pack totally stopped functioning or it was physically removed from the system.

> **NOTE:**
> The alarm is logged approximately 11 minutes after the circuit pack has been removed and/or SAKI Sanity Test (#53) fails.

If the circuit pack is not in the system, insert a circuit pack (in the same slot as the error indicates) to resolve this error. Or, if the circuit pack is in the system and the red LED is on, then follow the instructions for "Red (alarm)" in the "Control and Port Circuit Pack Status LEDs" section in Chapter 7, "LED Interpretation". (Also, refer to the "Handling Port Circuit Packs" section in Chapter 5, "Routine Maintenance Procedures".

b. This circuit pack has been busied out via the **busyout board PCSS** command.

c. Port(s) has(have) been administered on this circuit pack but the circuit pack is not physically present.

d. This error indicates transient communication problems between the switch and this circuit pack. Execute the **test board PCSS** command and refer to the repair procedures for the Control Channel Loop Around Test (#52).

e. An on-board hardware failure has been detected by the circuit pack.

The reported aux data values correspond to the following detected errors:

4352	External RAM error
4353	Internal RAM error
4355	ROM Checksum error
4357	Instruction set error

Reset the circuit pack by executing the **busyout board PCSS** and **reset board PCSS** commands. When it is reset, the circuit pack executes a set of tests to detect the presence of any of the above faults. The detection of one of these errors during initialization causes the circuit pack to lock-up and appear insane to the system. See the repair procedure in footnote (a) for error type 1.

f. This error is reported by the circuit pack when it detects a program logic error. While no action is required, this error may lead to errors of other types being reported against this circuit pack.

g. This error is reported by the circuit pack when it cannot update NPE memory and read it back. This error type can be ignored, but may lead to errors of other types being reported against this circuit pack.

h. A critical hardware failure has been detected on the circuit pack. Reset the circuit pack via the **busyout board PCSS** and **reset board PCSS** commands. If the Circuit Pack Restart Test (#594) passes, then the on-board circuitry is healthy. Retire the alarm via the **test board PCSS long clear** command. If the Circuit Pack Restart Test (#594) fails, replace the circuit pack.

   The reported error types correspond to the following detected errors:

1293	On-board auxiliary processor insane
1294	Internal memory access error

i. These error types are reported when the following errors are detected:

1537	Frame overrun at Packet Bus interface. This condition may be caused by an on-board fault or by faulty data received on one of the circuit pack's external ports. If any of the ports on this circuit pack are alarmed, refer to the repair procedures for those maintenance objects.
1538	Circuit packet is hyperactive; that is, it is flooding the switch with messages sent over the control channel. The circuit pack is taken out-of-service when a threshold number of these errors is reported to the switch. Clear the alarm via the following commands: **busyout board PCSS**, **reset board PCSS**, **test board PCSS long clear**, **release board PCSS**. If the error recurs within 10 minutes, then replace the circuit pack.

j. These errors indicate that the circuit pack is having problems transmitting data to the Packet Bus.

1793	Parity errors are detected when transmitting data to the Packet Bus.

1794	Overflow of Packet Bus transmit buffers has occurred.
1795	Circuit pack cannot find end of frame when transmitting to Packet Bus. Clear the alarm via the following commands: **busyout board PCSS**, **reset board PCSS**, **test board PCSS long clear**, **release board PCSS**. If the error recurs within 10 minutes, then replace the circuit pack.
2306	This error occurs when the circuit pack detects an error in a received frame from the packet bus. These errors are most likely caused by a packet bus problem, but may be due to a circuit pack fault.An invalid Link Access Procedure Data (LAPD) frame error occurs if the frame contains a bad Cyclical Redundancy Checking (CRC), is greater than the maximum length, or violates the link level protocol.When bus parity errors are reported, the LANBIC Receive Parity Error Counter Test (#595) should be performed to determine if the condition had cleared. Refer to the "PKT-BUS (Packet Bus)" Maintenance documentation to determine if the problem is isolated to this circuit pack or if the problem is caused by Packet Bus faults.

k. A critical failure has been detected in the Packet Bus interface of the circuit pack. This failure may be due to either a Packet Bus fault or an on-board fault. If the Packet Bus is alarmed, refer to the "PKT-BUS (Packet Bus)" section and Chapter 9, "Packet Bus Fault Isolation and Correction" for recommended repair procedures. The probability of this error being related to Packet bus problems increases with the number of ISDN-BRI circuit packs displaying this error.

   If the Packet Bus is not alarmed, reset the circuit pack via the **busyout board PCSS** and **reset board PCSS** commands. If the Circuit Pack Restart Test (#594) passes, then the on-board circuitry is healthy. Retire the alarm via the **test board PCSS long clear** command. If the Circuit Pack Restart Test (#594) fails, replace the circuit pack. If the problem persists after complying with the above instructions, then follow normal escalation procedures.

l. These errors are not service-affecting. No action is required. These errors are reported by the circuit pack when it receives a bad control channel message from the switch. The auxiliary data identifies the following error events:

4096	Bad major heading
4097	Bad port number
4098	Bad data

4099	Bad sub-qualifier
4100	State inconsistency
4101	Inconsistent downlink message

m. This error is not service-affecting. No action is required.

3843	Bad translation RAM detected, but call continues by using another translation location.

n. Error type 3999— Indicates that the circuit pack sent a large number of control channel messages to the switch within a short period of time. If error type 1538 is also present, then the circuit pack was taken out-of-service due to hyperactivity. If error type 1538 is not present, then the circuit pack has not been taken out-of-service, but it has generated 50% of the messages necessary to be considered hyperactive. This may be completely normal during heavy traffic periods. However, if this error type is logged when the circuit pack is being lightly used, it may indicate a problem with the circuit pack or the equipment attached to it.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following tables when inspecting errors in the system. By clearing error codes associated with the *Control Channel Loop Around Test,* for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Control Channel Loop-Around Test (#52)	X	X	ND
NPE Audit Test (#50)		X	ND
LANBIC Receive Parity Error Counter Test (#595)		X	ND

1 D = Destructive; ND = Nondestructive

NPE Audit Test (#50)

Refer to the repair procedure described in the"XXX-BD (Common Port Circuit Pack)" Maintenance documentation as NPE Audit Test (#50).

Control Channel Loop Around Test (#52)

Refer to the repair procedure described in the "XXX-BD (Common Port Circuit Pack)" Maintenance documentation as Control Channel Loop Around Test (#52).

SAKI Sanity Test (#53)

Refer to the repair procedure described in the "XXX-BD (Common Port Circuit Pack)" Maintenance documentation as SAKI Sanity Test (#53).

LANBIC Receive Parity Error Counter Test (#595)

This test is destructive.

The test reads and clears the LANBIC Receive Parity Error Counter on the circuit pack. This counter is incremented by the circuit pack when it detects a parity error in data received from the Packet Bus.

These errors may be indicative of a circuit pack problem, Packet Bus problem, or a problem with another circuit pack on the bus. This test is useful for verifying the repair of the problem.

Table 11-33. TEST #595 LANBIC Receive Parity Error Counter Test

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test was not received from the circuit pack within the allowable time period. 1. If the test aborts repeatedly a maximum of five times, reset the circuit pack via the **busyout board PCSS** and **reset board PCSS** commands. 2. If the test aborts again, replace the circuit pack.
2100	ABORT	Could not allocate the necessary system resources to run this test.
2012	ABORT	Internal System Error. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to fail, escalate the problem.

Continued on next page

Table 11-33. TEST #595 LANBIC Receive Parity Error Counter Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1-10	FAIL	The circuit pack is still detecting errors of this type. The error code indicates the value of the on-board error counter. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to fail, verify the validity of the Packet Bus. Run the Packet Bus maintenance test with the **test pkt P long** command. If any Packet Bus tests fail, refer to the"PKT-BUS (Packet Bus)" Maintenance documentation for recommended repair procedures. 3. If the Packet Bus test passes, check the validity of the circuit pack. Execute a test that involves data transmission onto the Packet Bus. For example, the BRI may use the connectivity tests of the port-level maintenance object (BRI-PORT) by executing the **test port PCSSpp** command. Refer to the repair procedures for the executed test if it fails. Otherwise, proceed to the next step. 4. Other circuit packs on the Packet Bus may be the cause of the parity error. Use the **display errors** command to check the Error Log for other circuit packs that are alarmed. If any alarms are present for the other circuit packs, retire those alarms also. Then, rerun the LANBIC Receive Parity Error Counter Test (#595) on this circuit pack.
	PASS	No errors detected by circuit pack.

BRI-DAT (ISDN-BRI)

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run	Full Name of MO
BRI-DAT	WARNING[1]	test data-module	ISDN-BRI Standalone Data Module

1 The alarm level for ASAI adjuncts may be administered using the **set options** command. The alarm level can be set independently for Off-Board and On-Board alarms to WARNING, MINOR, or MAJOR for all ASAI adjuncts in the system.

Refer to BRI-SET (ISDN-BRI Set) Maintenance documentation.

BRI-PORT (ISDN-BRI Port), ABRI-PORT (ASAI ISDN-BRI Port)

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run[1]	Full Name of MO
BRI-PORT	MINOR	test port PCSSpp l	ISDN-BRI Port
BRI-PORT	WARNING	test port PCSSpp sh	ISDN-BRI Port
ABRI-PORT	MAJOR[2,3]	test port PCSSpp l	ASAI ISDN-BRI Port
ABRI-PORT	WARNING[2,3]	test port PCSSpp l	ASAI ISDN-BRI Port
ATT-PORT	MAJOR[2, 3]	test port PCSSpp l	AT&T Adjunct ISDN-BRI Port
ATT-PORT	WARNING[2, 3]	test port PCSSpp l	AT&T Adjunct ISDN-BRI Port
LGATE-PORT	MAJOR[2, 3]	test port PCSSpp l	Ethernet ASAI Port
LGATE-PORT	WARNING[2, 3]	test port PCSSpp l	Ethernet ASAI Port
ATTE-PT	MAJOR[2, 3]	test port PCSSpp l	Ethernet AT&T Adjunct Port
ATTE-PT	WARNING[2, 3]	test port PCSSpp l	Ethernet AT&T Adjunct Port

1 Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (A, B, C, D, or E); and SS is the address of the slot in the carrier where the circuit pack is located (01, 02, ..., etc.); and pp is the 2-digit port number (for example, 01).

2 The alarm level for ASAI and AT&T adjunct ports may be administered using the **set options** command. The alarm level can be set independently for Off-Board and On-Board alarms to WARNING, MINOR, or MAJOR for all ASAI and AT&T adjunct ports in the system.

3 All alarming for an ASAI and AT&T adjunct and OFF-BOARD alarming for an ASAI or AT&T port is disabled if the ASAI or AT&T adjunct asks the switch to suspend maintenance. When this occurs, an error and a WARNING alarm is logged against the ASAI or AT&T adjunct. The Hardware Error and Alarm Logs should be checked to see if the adjunct has disabled alarming.

NOTE:
Some of the information in this section is reserved for future use.

CAUTION:
A detailed flowchart for isolating and resolving Packet Bus faults is included in Chapter 9, "Packet Bus Fault Isolation and Correction". This flowchart, along with the other information presented in the chapter, can help in resolving problems that involve more than a single station or circuit pack. Whenever the repair procedures for this Maintenance Object refer to Packet

Bus and/or Packet Control maintenance, be sure to reference Chapter 9, "Packet Bus Fault Isolation and Correction" in addition to the relevant MO documentation.

WARNING:

If a significant Packet Bus failure occurs, errors and alarms may not be logged as expected for BRI-PORT/ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT. Conditions under which this occurs are detailed in the "Maintenance of the Packet Bus" section of Chapter 9, "Packet Bus Fault Isolation and Correction".

The TN2208 LGATE MFB provides DEFINITY with the interface to Adjunct-Switch Application Interface (ASAI) and AT&T adjuncts (for example, CONVERSANT®. Voice System). The circuit pack contains 12 ports of line circuit interface (although only 8 are usable by the switch), each of which operates with two B-channels (referred to as B1 and B2 throughout this section) and one D-channel as specified in the AT&T ISDN-BRI Specification. In this context, the term "ISDN-BRI port" is used to refer collectively to ports on the TN2208 circuit pack which are connected to ASAI or AT&T adjuncts.

The TN556 and TN2198 ISDN-BRI Line circuit packs provide DEFINITY with the interface to ISDN-BRI end points, Adjunct-Switch Application Interface (ASAI) and AT&T adjuncts (for example, CONVERSANT®. Voice System). The circuit packs contain 12 ports of line circuit interface, each of which operates with two B-channels (referred to as B1 and B2 throughout this section) and one D-channel as specified in the AT&T ISDN-BRI Specification. In this context, the term "ISDN-BRI port" is used to refer collectively to ports on the TN556 an TN2198 circuit packs which are connected to either BRI endpoints or ASAI or AT&T adjuncts.

For BRI endpoints, each B-channel may support voice or circuit-switched data and may be circuit-switched simultaneously. The B-channels are not used on ports connected to ASAI or AT&T adjuncts. The D-channel is used for conveying signaling between the switch and a BRI endpoint(s) or ASAI or AT&T adjunct. Each ISDN-BRI D-channel is connected to the switch processor and the ISDN-BRI port through the Packet Control circuit pack and the Packet Bus.

ISDN-BRI endpoints are available in various configurations. All endpoints require the D-channel to convey signaling information to the switch. Only one B-channel is required for a voice-only set or a stand-alone data module (BRI-DAT). A voice and data-capable set requires both B-channels (one for voice and one for data). Therefore, each TN556 or TN2198 port can support either two voice-only sets, two stand-alone data modules (BRI-DAT), or one voice and data-capable set. Only a single ASAI or AT&T adjunct may be connected to an ISDN-BRI port. Multiple adjuncts per line are not supported.

Figure 11-8 illustrates the physical connection (solid line) between an ISDN-BRI Port and its associated ISDN-BRI set(s). Each physical connection allows for two

B-channels and one D-channel. Each ISDN-BRI circuit pack can support up to 12 of these *physical* connections to different voice and voice/data sets or ASAI or AT&T adjuncts. On a TN2198 each ISDN-BRI circuit pack can support up to 12 *physical* connections to a NT1, which, in turn, connects to 2 terminals.

This section covers the maintenance documentation for ISDN-BRI ports. Some of the results of maintenance testing of ISDN-BRI ports may be affected by the health of the ISDN-BRI Line circuit pack (BRI-BD), BRI endpoint (BRI-SET), or ASAI adjunct (ASAI-AJ/LGATE-AJ) or AT&T adjunct (ATT_AJ/ATTE-AJ). These interactions should be kept in mind when investigating the cause of ISDN-BRI port problems. For more information on the circuit pack and endpoints, refer to the BRI-BD (ISDN-BRI Line Circuit Pack) Maintenance documentation, the BRI-SET (ISDN-BRI Endpoint) Maintenance documentation, and ASAI-AJ (Adjunct-Switch Application Interface) Maintenance documentation, ATT-AJ (AT&T Adjunct) Maintenance documentation, LGATE-AJ (Ethernet Adjunct-Switch Application Interface) Maintenance documentation, and ATTE-AJ (Ethernet AT&T Adjunct) Maintenance documentation.

Continued on next page

1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description, and follow the recommended procedures.

2 Major and Minor alarms on this MO may be downgraded to Warning alarms based on the value used in the **set options** command.

Notes:

a. This error occurs when the Level 1 Status Inquiry fails or when the BRI circuit pack detects that Level 1 has been deactivated on the port. The aux data field contains one of the following values:

- blank - this indicates that the Level 1 Status Inquiry failed.
- 32773 - this is a message from the BRI-LINE circuit pack indicating Level 1 has been deactivated.

Refer to the repair procedures for Test #621.

b. This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, replace or reinsert the circuit pack.

c. This error occurs when the EPF Status Inquiry fails due to an overcurrent condition or when the BRI-LINE circuit pack detects that the EPF is in an over current condition. The aux data field contains one of the following values:

- blank - this indicates that the EPF Status Inquiry failed due to an overcurrent condition.
- 40988 - this indicates that the BRI-LINE circuit pack has detected an overcurrent condition and has turned the EPF off.

Execute the Short Test Sequence and see the repair procedures for Test #622.

d. This error indicates that the circuit pack is having problems transmitting data to the Packet Bus, thus affecting the conveyance of signaling information over the D-channel. With Aux Data 46222, this error occurs when the Packet Bus transmit buffers overflow. This condition probably indicates a hardware problem. The BRI-PORT Alarm Level for the error with Aux Data 46222 is "MIN/WRN," and the ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT Alarm Level is "MAJ/MIN/WNR." With Aux Data 0, this error occurs whenever the Packet Bus transmit FIFO buffers overflow. This condition can be caused by an on-board hardware problem as well as by problems on the Packet Bus that disrupt the BRI circuit pack's ability to transmit data onto the Packet Bus. Use troubleshooting procedures for both on-board hardware problems and potential off-board Packet Bus problems. See the "PKT-BUS (Packet Bus)" Maintenance section in this chapter as well as Chapter 9, "Packet Bus Fault Isolation and Correction" for more details on Packet Bus troubleshooting procedures. The BRI-PORT Alarm Level for the error with Aux Data 0 is "MINOR," and the ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT Alarm Level is "MAJOR."

e. This error occurs when the NPE Crosstalk Test (#617) fails. Run the Long Test Sequence, and pay particular attention to the results of Test #617.

f. This error occurs when broadcast signaling links associated with this port have too much link establishment related traffic. This could occur if an endpoint on this port is sending link establishment traffic on a port level broadcast link, or if there are Level 1 problems on the port. Check the error logs for Level 1 errors. If Level 1 problems exist, follow the repair procedures listed for test #621. Software will suspend activity to this port for 75 minutes when the port is alarmed due to this error (note that service suspension does not occur if the port is an ABRI-PORT/LGATE-PT/ATTE-PT/ATT-PORT). If this problem persists, replace the endpoint or endpoints associated with this port. If replacing the endpoints does not fix the problem, follow normal escalation procedures.

g. This error occurs when the port receives an invalid frame over the D-channel. When CRC errors exceed five within 15 minutes, the port is taken out of service for five seconds. If five more CRC errors are received within 15 minutes of the first set of five errors, the port is taken out of service for one minute. If five more CRC errors are received within 15 minutes of the last five, the port is taken out of service for 15 minutes.

   This error is most likely due to a problem with the wiring to the set or adjunct, interference on the wiring due to a noise source or no termination (an open circuit). It usually does not indicate a problem with the circuit pack.

   - Check the wiring to the endpoints or the adjunct.
   - If the problem persists, replace the endpoints or adjuncts, or escalate the problem.

h. This error occurs when the BRI Port Local TDM Loop Around Test (#619) fails. Run the Long Test Sequence, and pay particular attention to the results of Test #619.

   There are no Test to Clear Values for the following error types. The error types are simply provided as additional data that may prove useful while troubleshooting.

i. This error occurs when a Layer 1 Transmission error is detected for the port. Run the Long Test Sequence, and pay particular attention to the results of the Layer 1 Transmission Error Counter Test (#624).

j. A BRI port supports up to three Terminal Endpoint Identifiers (TEIs). This error occurs when the switch receives a request for a fourth TEI on a port. Check the number of endpoints administered for this port.

k. This error occurs when an SPID initialization request is made from an endpoint and the switch determines that the SPID value is invalid or is a duplicate of another SPID that is already initialized at Layer 3 on the port. Check the administration of the endpoints.

l. This error occurs when the circuit pack detects an overflow of its receive buffers. Run the Long Test Sequence, and pay particular attention to the results of the Receive First In First Out (FIFO) Overflow Error Counter Test (#625).

m. This error occurs when the BRI Port Local LAN Loop Around Test (#618) fails. Run the Long Test Sequence, and pay particular attention to the results of Test #618.

n. This error most likely occurs when the Terminal Endpoint Identifier (TEI) administered for the ASAI or AT&T endpoint does not match the TEI administered in the ASAI or AT&T adjunct. Check the switch administration of the TEI against that of the adjunct, and make sure that both are using the same TEI.

o. Indicates that sets on the port do not support Layer 3 initialization. Consult the Service Set documentation.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the following tables when inspecting errors in the system. By clearing error codes associated with the *NPE Crosstalk Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
NPE Crosstalk Test (#617)		X	D
BRI Port Local LAN Loop Around Test (#618)		X	D
BRI Port Local TDM Loop Around Test (#619)		X	D
Electronic Power Feed Restoral Test (#620)	X	X	ND
Level 1 Status Inquiry Test (#621)	X	X	ND
Electronic Power Feed Inquiry Test (#622)	X	X	ND
CRC Error Counter Test (#623)		X	ND
Layer 1 Transmission Error Counter Test (#624)		X	ND
Receive FIFO Overflow Error Counter Test (#625)		X	ND
Clear Error Counters (#270)	X	X	ND

1 D = Destructive; ND = Nondestructive

Note:

The NPE Crosstalk Test and the BRI Port Local TDM Loop Around Test are not executed for ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT.

NPE Crosstalk Test (#617)

This test is destructive.

One or more NPEs reside on each circuit pack with a TDM Bus interface. The NPE controls port connectivity and gain and provides conferencing functions on a per-port basis. The NPE Crosstalk Test verifies that this port’s NPE channel talks on the selected time slot and never crosses over to time slots reserved for other connections. If the NPE is not working correctly, one-way and noisy connections may be observed. This test is part of a port’s Long Test Sequence and takes approximately 20 to 30 seconds to complete. Crosstalk testing is performed on both B-channels (B1 and B2) associated with a BRI port. If this test fails on either channel, any endpoints connected to the port are taken out-of-service.

This test is not executed for ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT because the B-channels associated with the port are not used by ASAI or AT&T adjuncts.

Table 11-35. TEST #161 Loop Around Test

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available. The port may be busy with a valid call. Use the **display port PCSSpp** command to determine the station extension or trunk group/member number of the port. Use the **status bri-port PCSSpp** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) Wait until the port is idle before retesting. 1. If the port status is idle, then retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1004	ABORT	The port has been seized by a user for a valid call. Use the **status station** command for the station associated with this port and determine when the port is available for testing. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort and the port is not in use, escalate the problem.

Continued on next page

Table 11-35. TEST #161 Loop Around Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1005	ABORT	This test is not valid for this type of translation. Ports administered as "ASAI" or "ADJK" can not run this test, because the B channels associated with the port are not used by ASAI or AT&T Adjunct Links. This is a normal condition.
2012	ABORT	Internal System Error.
2100	ABORT	Could not allocate the necessary resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1, 2	FAIL	The NPE of the tested port was found to be transmitting in error. This causes noisy and unreliable connections. Error code 1 indicates that the NPE Crosstalk Test failed on Channel B1. Error code 2 indicates that the NPE Crosstalk Test failed on Channel B1. 1. Replace circuit pack.
	PASS	The port is correctly using its allocated time slots. 1. To be sure that this is not an intermittent problem, repeat this test a maximum of 10 times to make sure it continues to pass. 2. If complaints still exist, examine the station, connections, and wiring.

BRI Port Local LAN Loop Around Test (#618)

This test is destructive.

This test, which verifies the connectivity of a BRI port across the LAN Bus, executes only if the port is out-of-service. The test aborts if calls associated with the port are in-progress. Failures of this test indicate either on-board faults associated with the BRI-PORT hardware on the circuit pack or problems with the LAN Bus, which is used to form connectivity between the switch and the BRI-PORT.

The dotted lines in Figure 11-9 show how a Loop Around Test is performed across the Packet Bus for the D-channel.

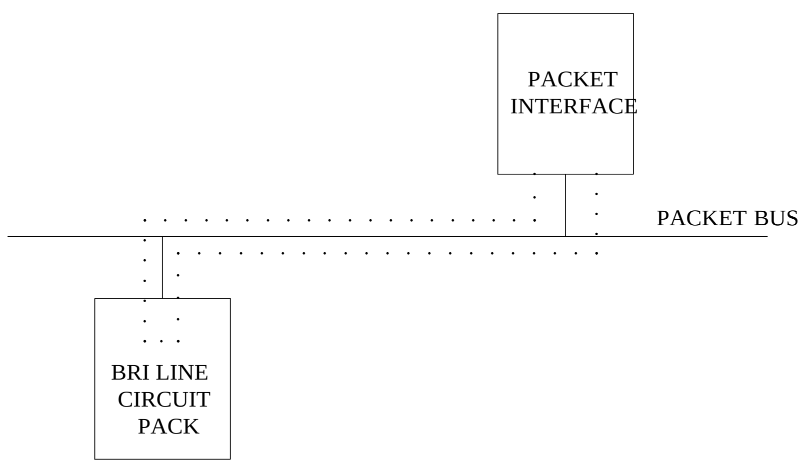

Figure 11-9. Path of the BRI Port Local LAN Loop Around

Table 11-36. TEST #618 BRI Port Local LAN Loop Around

Error Code	Test Result	Description/ Recommendation
1015	ABORT	The port is not in the out-of-service service state. 1. Display the BRI Port Status form via the **status bri-port PCSSpp** command to determine which stations or adjuncts are on this port. 2. Use the extension shown on this form in the **status station** command to determine if the station or adjunct is in use. 3. If it is in use, wait until it is idle, and then busyout the port (using the **busyout port PCSSpp** command) to place it in the out-of-service state and repeat this test. **WARNING:** *Since the "busyout" command is destructive, execution of this command prior to the port being idle causes all calls associated with BRI endpoints and all transactions associated with ASAI or AT&T adjuncts on the port to be torn down. Note that third party calls established by an ASAI or AT&T adjunct remain connected even though the port is taken out-of-service.*
1139	ABORT	The Packet Bus in the port network is out-of-service. 1. Follow the repair procedures for the Packet Bus. 2. After completing Step 1, execute the **test port long PCSSpp** command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.
1141	ABORT	The PKT-CTRL is out-of-service. 1. Follow the repair procedures for the PKT-CTRL. 2. After completing Step 1, execute the **test port long PCSSpp** command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.

Continued on next page

Table 11-36. TEST #618 BRI Port Local LAN Loop Around — *Continued*

Error Code	Test Result	Description/ Recommendation
1144	ABORT	The PPN Packet Bus is out-of-service. 1. Follow the repair procedures for the Packet Bus. 2. After completing Step 1, execute the **test port long PCSSpp** command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.
2012	ABORT	Internal System Error.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
	FAIL	The Loop Around Test has failed. 1. If the test fails repeatedly, attempt to reset the circuit pack if the other ports on the board are not in use. Reset the circuit pack by issuing the **busyout board PCSS** and the **reset board PCSS** commands. 2. If the test fails again, execute **test pkt P** on the G3MT terminal. If this fails, follow failure procedures in PKT-BUS section. 3. If tests executed in Step 2 pass, the problem is local to the BRI board. Replace the circuit pack.
	PASS	The BRI Port Local LAN Loop Around Test has passed.

BRI Port Local TDM Loop Around Test (#619)

This test is destructive.

This test verifies the connectivity of a BRI port across the TDM Bus. It aborts if calls associated with the port are in progress. Failure of this test indicates an on-board fault associated with the port hardware on the circuit pack.

This Loop Around Test runs a series of individual tests on the two B-channels (B1 and B2) associated with the port. It is a collection of the following:

- A Loop Around Test across the TDM Bus for B1.
- A Conference Circuit Test for B1.
- A Loop Around Test across the TDM Bus for B2.
- A Conference Circuit Test for B2.

The tests are run in the above order. If one fails, the remaining tests in the sequence are not executed. An error code is returned at that point.

This test is not executed for ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT because the B-channels associated with the port are not used by ASAI or AT&T adjuncts.

The dotted lines in Figure 11-10 show how a Loop Around Test is performed for the B-channels. The figure shows a terminal connected to a BRI line board using a TN556. If a TN2198 is used, the terminal would be connected to a NT1, and the NT1 to the BRI board.

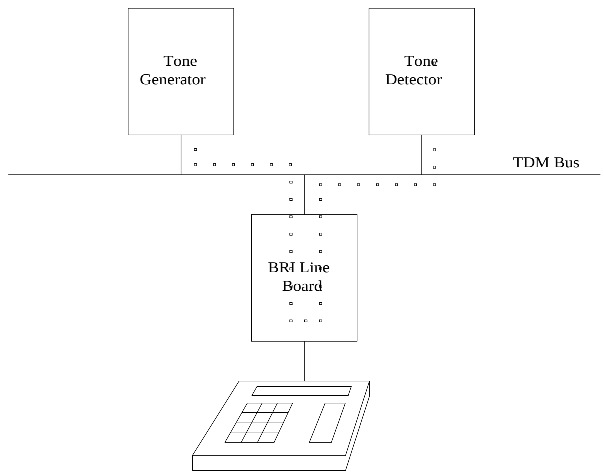

Figure 11-10. Path of the BRI Port Local TDM Loop Around

Table 11-37. TEST #619 BRI Port Local TDM Loop Around

Error Code	Test Result	Description/ Recommendation
1000	ABORT	The system resources required to run this test are not available. The port may be busy with a valid call. Use the **display port PCSSpp** command to determine the station extension or trunk group/member number of the port. Use the **status bri-port PCSSpp** command to determine the service state of the port. If the service state indicates that the port is in use, then the port is unavailable for certain tests. (Refer to the "Status Commands" section in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids", for a full description of all possible states.) Wait until the port is idle before retesting. 1. If the port is idle, then retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-37. TEST #619 BRI Port Local TDM Loop Around — *Continued*

Error Code	Test Result	Description/ Recommendation
1002	ABORT	The system could not allocate time slots for the test. The system may be under heavy traffic conditions or it may have time slots out-of-service due to TDM-BUS errors. Refer to TDM-BUS (TDM Bus) Maintenance documentation to diagnose any active TDM Bus errors. 1. If the system has no TDM-BUS errors and is not handling heavy traffic, repeat test at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1003	ABORT	The system could not allocate a tone receiver for the test. The system may be oversized for the number of Tone Detectors present or some Tone Detectors may be out-of-service. 1. Look for TTR-LEV errors in the Error Log. If present, refer to TTR-LEV (TTR Level) Maintenance documentation. 2. Look for TONE-PT errors in the Error Log. If present, refer to TONE-PT (Tone Generator) Maintenance documentation. 3. If neither condition exists, retry the test at one-minute intervals a maximum of five times. 4. If the test continues to abort, escalate the problem.
1004	ABORT	The port has been seized by a user for a valid call. Use the **status station** command for the station associated with this port and determine when the port is available for testing. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort and the port is not in use, escalate the problem.
1005	ABORT	This test is not valid for this type of translation. Ports administered as “ASAI” or “ADJK” can not run this test, because the B channels associated with the port are not used by ASAI or AT&T Adjunct Links. This is a normal condition.

Continued on next page

Table 11-37. TEST #619 BRI Port Local TDM Loop Around — *Continued*

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test was not received from the BRI-LINE circuit pack within the allowable time period. 1. If this result occurs repeatedly, attempt to reset the circuit pack if the other ports are not in use. Reset the circuit pack by issuing the **busyout board PCSS** and the **reset board PCSS** commands. 2. If this result occurs again, replace the circuit pack.

Continued on next page

Table 11-37. TEST #619 BRI Port Local TDM Loop Around — *Continued*

Error Code	Test Result	Description/ Recommendation
2012	ABORT	Internal System Error.
2100	ABORT	Could not allocate the necessary resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
2103	ABORT	The system could not make the conference connection for the test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1, 2	FAIL	As stated previously, this test runs a TDM Loop Around Test on each B-channel. This indicates that the loop around failed on one of the channels. Error Code 1 indicates that the TDM Loop Around Test failed on B1. Error Code 2 indicates that the TDM Loop Around Test failed on B2.
7, 8	FAIL	As stated previously, this test runs a Conference Circuit Test on each B-channel. A failure here indicates that one of these conference tests failed; Error Code 7 means that the test failed on B1; Error Code 8 means that the test failed on B2. 1. If the test fails repeatedly, attempt to reset the circuit pack if the other ports on the circuit pack are not in use. Reset the circuit pack by issuing the **busyout board PCSS** and the **reset board PCSS** commands. 2. If the test fails again, replace the circuit pack.
	PASS	The BRI Port Local TDM Loop Around Test has passed.

Electronic Power Feed Restoral Test (#620)

This test attempts to restore the Electronic Power Feed (EPF) on an ISDN-BRI port twice. In this test, the processor requests that the EPF be turned on for a given port. An attempt is made to turn on the power unit to the station or adjunct. If no current is being drawn by a station, this probably indicates that the station is not connected. No current being drawn by an adjunct is the normal condition. If an overcurrent condition is sensed (that is, too much current is being drawn), this condition may indicate a short in the wiring to the endpoint or adjunct. Depending on what condition is sensed, a message is returned stating that either the EPF was turned on successfully with no problems or that an overcurrent condition is sensed. This response is reported by the Electronic Power Feed Inquiry (#622), which follows in the testing sequence. EPF Restoral is attempted again by this test five seconds later. This test always passes for the TN2198 because it has no EPF. This test will always abort when run on the TN2208.

Table 11-38. TEST #620 Electronic Power Feed Restoral

Error Code	Test Result	Description / Recommendation
1005	ABORT	This test is not valid for this port type. The TN2208 does not have an electronic power feed, and the test will abort.
2012	ABORT	Internal System Error. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
	PASS	The EPF Test passed. The message to turn on the power feed to the station or the adjunct was successfully sent to the port. 1. Although this test should not return a fail result, after running this test, the Error Log should be checked for any entries with error type 257 to examine the real results of this test. 2. An error type of 257 in the Error Log indicates some problem with the power to the station or the adjunct. Check for a short in the wiring, a damaged jack, a defective voice terminal or adjunct, or an incorrect type of terminal.

Level 1 Status Inquiry Test (#621)

This test determines the state of the transmission facility of a BRI port at the physical layer (that is, Level 1). Level 1 can be in one of three possible states: Activated, Pending Activation, or Deactivated.

The Activated state is the correct state for an ISDN-BRI port. In this state the Level 1 interface can communicate with the BRI endpoint or ASAI or AT&T adjunct administered on this port. This test passes if the state of Level 1 (L1) is Activated. This test also passes if software has taken this port out of service. See the description of the Level 1 "Deactivated State" below for more details.

The Pending Activation state indicates a problem with the endpoints or adjunct, the wiring to the sets or adjunct, or the BRI-LINE circuit pack. When in this state, the Level 1 interface is either not receiving any L1 framing from the endpoint or adjunct (Endpoint Idle), or it is communicating with the endpoint or adjunct but cannot transition to the Activated state (Endpoint Active).

The Deactivated state indicates a problem with the BRI-LINE circuit pack. When in this state, the Level 1 interface is idle and is not trying to communicate with the BRI endpoints or adjunct. When an ISDN-BRI port is placed in the out-of-service state, Level 1 is also put into the Deactivated state. This could be due either to the system detecting a fault with the port or to a **busyout port PCSSpp** request.

Table 11-39. TEST #621 Level 1 Status Inquiry

Error Code	Test Result	Description/ Recommendation
1187	ABORT	The board, port or station may have been busied out by a technician. 1. Look in the Error Log for Error Type 18 (port busied out) for this port and BRI-BD (board busied out). If this error type is present for BRI-PORT only, then release the port via the **release port pp** command and run the test again. If the error is present for both BRI-BD and BRI-PORT, then release the board via the **release port PCSS** command and run the test again. **NOTE:** When you release a port, you release all ports associated with it. If certain ports still need to be busied out, use the **release port PCSSpp** command to busy them out. 2. Make sure the terminal is connected. 3. Retry the command at one-minute intervals a maximum of five times. 4. If the test continues to abort, escalate the problem.
2000	ABORT	Response to the test was not received from the circuit pack within the allowable time period. 1. If the test aborts repeatedly a maximum of five times, reset the circuit pack via the **busyout board PCSS** and **reset board PCSS** commands. 2. If the test aborts again, replace the circuit pack.
2012	ABORT	Internal System Error.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to fail, escalate the problem.

Continued on next page

Table 11-39. TEST #621 Level 1 Status Inquiry — *Continued*

Error Code	Test Result	Description/ Recommendation
1	FAIL	Received a status of Level 1 Pending Activation-Endpoint Idle which indicates a problem with the BRI endpoint or ASAI or AT&T adjunct, the wiring to the endpoint or adjunct, or the ISDN-BRI port. For the TN2198, received a status of Level 1 Pending Activation. U interface down, which indicates a problem with a connection between the switch and the NT1. **NOTE:** An NT1 is a 2- to 4-wire converter that is used to connect 4-wire AT&T terminals to a 2-wire TN2198 circuit pack. The NT1 also has status lamps to determine the health of the unit. 1. For the TN556 or TN2208, verify that an endpoint is connected to the port. If an endpoint is connected to the port, then proceed to step 2. For the TN2198 verify that the connections are good between the switch and the NT1. Verify that the NT1 has power. 2. As necessary, check and repair the wiring between the circuit pack and the endpoint or adjunct. If a TN2198 is used, the set must have been plugged in for at least 15 seconds before it will stabilize. Execute the **test port PCSSpp** command, and review the results of the Level 1 Status Inquiry Test to verify the repair. If this test is still failing, proceed to Step 3. 3. For BRI endpoints, replace the BRI endpoint(s) connected to the port or the NT1 if a TN2198 is used. For ASAI or AT&T adjuncts, follow the recommended repair procedures of the manufacturer for link communication problems. For the NT1, follow the manufacturers repair procedures. Then execute the **test port PCSSpp** command and review the results of the Level 1 Status Inquiry Test to verify repair. If this test is still failing, proceed to Step 4. 4. Escalate the problem to the next tier.

Continued on next page

Table 11-39. TEST #621 Level 1 Status Inquiry — *Continued*

Error Code	Test Result	Description/ Recommendation
2	FAIL	For the TN556 or TN2208, received a status of Level 1 Pending Activation-Endpoint Active which indicates a problem with the BRI endpoint or ASAI or AT&T adjunct, the wiring to the endpoint or adjunct, or the ISDN-BRI port. For the TN2198, received a status of Level 1 Pending Activation. U interface up S/T interface down, which indicates a problem with the NT1 or the wiring between the NT1 and the BRI endpoint (S/T interface). 1. As necessary, check and repair the wiring between the circuit pack and the endpoint or adjunct. Execute the **test port PCSSpp** command, and review the results of the Level 1 Status Inquiry test to verify the repair. If this test is still failing, proceed to Step 2. 2. For BRI endpoints, try replacing the BRI endpoint(s) connected to the port. For ASAI or AT&T adjuncts, follow the recommended repair procedures of the manufacturer for link communication problems. For the NT1, follow the recommended repair procedures of the manufacturer. Then execute the **test port PCSSpp** command, and review the results of the Level 1 Status Inquiry test to verify repair. If this test is still failing, proceed to Step 3. 3. Escalate the problem to the next tier.

Continued on next page

Table 11-39. TEST #621 Level 1 Status Inquiry — *Continued*

Error Code	Test Result	Description/ Recommendation
3	FAIL	Received a status of Level 1 Deactivated; the port is out-of-service. 1. Issue the **status bri-port PCSSpp** command to verify that the service state of the port is out-of-service. If the service state of the port is not out-of-service, escalate the problem to the next tier. Otherwise, proceed to Step 2. 2. If the port has been placed out-of-service via the **busyout port PCSSpp** command, try releasing the port by executing the **release port PCSSpp** command. Then issue the **test port long PCSSpp** command, and review the results of Level 1 Status Inquiry test. If this test is still failing, proceed to Step 3. 3. After executing the **test port long PCSSpp** command, review the results of all the tests. Follow the repair procedures for any tests that fail. Verify repair of the problem by executing the **test port PCSSpp** command and by determining that the Level 1 Status test passes. If the test continues to fail for this reason, proceed to Step 4. 4. Escalate the problem to the next tier.
4	FAIL	For the TN2198 only: Received a status of Level 1 Pending Activation, the NT1 has a loss of power indicating a problem with the NT1. 1. For the NT1 follow the manufacturers recommended repair procedures. 2. Execute the **test port PCSSpp** command, and review the results of the Level 1 Status Inquiry test to verify the repair. If the test is still failing proceed to Step 3. 3. Escalate the problem to the next tier.
	PASS	This test indicates that Level 1 is activated, or that software has taken the port out of service.

Electronic Power Feed Inquiry (#622)

This test queries the BRI-LINE circuit pack for the status of the Electronic Power Feed (EPF) supplied to a BRI endpoint or an ASAI or AT&T adjunct. If the EPF is on and no overcurrent condition exists, this test passes. All other states are not normal and indicate a problem with the endpoint or adjunct, the wiring to the endpoint or adjunct, or the BRI-LINE circuit pack. This test is not run on the TN2208 circuit pack or the TN2198 and will always return a pass for a TN2198. The TN2208 has no power feeds.

Table 11-40. TEST #622 Electronic Power Feed Inquiry

Error Code	Test Result	Description/ Recommendation
1005	ABORT	This test is not valid for this port type. Ports on the TN2208 cannot run this test because this board does not have an electronic power feed.
2000	ABORT	Response to the test was not received from the circuit pack within the allowable time period. 1. If the test aborts repeatedly a maximum of five times, reset the circuit pack via the **busyout board PCSS** and **reset board PCSS** commands. 2. If the test aborts again, replace the circuit pack.
2012	ABORT	Internal System Error.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-40. TEST #622 Electronic Power Feed Inquiry — *Continued*

Error Code	Test Result	Description/ Recommendation
1	FAIL	The BRI-LINE circuit pack reports that it has detected an overcurrent condition and has turned off the EPF. 1. As necessary, check and repair the wiring between the circuit pack and the endpoint or adjunct. Check the endpoints and replace one or both sets if the sets are drawing too much current. Execute the **test port PCSSpp** command and review the results of the EPF Inquiry Test to verify the repair. If this test is still failing, proceed to Step 2. 2. Execute the **test port PCSSpp** command, and review the results of the Level 1 Status Inquiry Test. If this test is also failing, then follow the repair procedure for the Level 1 Status Inquiry Test. Otherwise, escalate this problem to the next tier.
	PASS	The Electronic Power Feed Inquiry Test reports that the EPF is on.
2000	ABORT	Response to the test was not received from the circuit pack within the allowable time period. 1. If the test aborts repeatedly a maximum of five times, reset the circuit pack via the **busyout board PCSS** and **reset board PCSS** commands. 2. If the test aborts again, replace the circuit pack.
2012	ABORT	Internal System Error.

Layer 1 Transmission Error Counter Test (#624)

This test reads and clears the BRI port's Layer 1 Transmission error counter maintained on the BRI-LINE circuit pack. This counter is incremented by the circuit pack when it detects a Layer 1 transmission problem. The test passes if the value of the counter is 0 (that is, the error is cleared). If the counter is not zero, the test fails, and the value of the counter is displayed in the Error Code field.

This error is most likely due to a problem with the wiring or the endpoint or adjunct (verify that the wiring meets the configuration rules defined in *DEFINITY Communications System Generic 1 and Generic 3i Wiring*, 555-204-111). It does not indicate a problem with the ISDN-BRI circuit pack. This test is useful for verifying the repair of the problem.

Table 11-41. TEST #624 Layer 1 Transmission Error Counter Test

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test was not received from the circuit pack within the allowable time period. 1. If the test aborts repeatedly a maximum of five times, reset the circuit pack via the **busyout board PCSS** and **reset board PCSS** commands. 2. If the test aborts again, replace the circuit pack.

Continued on next page

Table 11-41. TEST #624 Layer 1 Transmission Error Counter Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2012	ABORT	Internal System Error.
2100	ABORT	Could not allocate necessary system resources to run test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to fail, escalate the problem.
value	FAIL	The BRI-LINE circuit pack is still detecting errors of this type. The Error Code field contains the value of this counter. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to fail, review the results of other tests in the Long Test Sequence. Pay particular attention to the results of the Level 1 Status Inquiry test. Follow repair procedures for any of the executed tests if they fail. Otherwise, go to the next step. 3. If the tests for the endpoints or adjunct pass and the Layer 1 Transmission Error Counter Test continues to fail, check the wiring to the endpoints or adjunct. If the wiring appears to be fine, escalate the problem.
	PASS	The Layer 1 Transmission error counter was read correctly and has a value of 0.

Receive FIFO Overflow Error Counter Test (#625)

This test reads and clears the BRI port's Receive FIFO Overflow error counter maintained on the BRI-LINE circuit pack. This counter is incremented by the circuit pack when it detects an overflow of its receive buffers. The test passes if the value of the counter is 0 (that is, the error is cleared). If the counter is non-zero, the test fails, and the value of the counter is displayed in the Error Code field.

This error can occur if signaling frames are being received from the Packet Bus at a rate sufficient to overflow the receive buffers on the circuit pack for a port OR if a hardware fault is causing the receive buffers not to be emptied properly by the circuit pack. This test is useful for verifying the repair of the problem.

Table 11-42. TEST #625 Receive FIFO Overflow Error Counter Test

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test was not received from the circuit pack within the allowable time period. 1. If the test aborts repeatedly a maximum of five times, reset the circuit pack via the **busyout board PCSS** and **reset board PCSS** commands. 2. If the test aborts again, replace the circuit pack.
2012	ABORT	Internal System Error.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to fail, escalate the problem.
value	FAIL	The BRI-LINE circuit pack is still detecting errors of this type. The Error Code field contains the value of this counter. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to fail, run the Long Test Sequence and pay particular attention to the Loop Around Tests (#618 and #619). See the repair procedures for the executed test if it fails. Otherwise, go to the next step. 3. Replace the circuit pack.

Continued on next page

Table 11-42. TEST #625 Receive FIFO Overflow Error Counter Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	PASS	The Receive FIFO Overflow error counter was read correctly and has a value of 0.

Clear Error Counters Test (#270)

This test is not an actual test in the strict sense of the word. There are various error counters associated with each BRI-PORT/ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT. This test clears those counters and triggers the auditing of Terminal Endpoint Identifier (TEI) values and layer 3 reinitialization. This test is used only to send messages to the BRI-PORT/ABRI-PORT/ATT-PORT/LGATE-PT/ATTE-PT and, therefore, should neither abort nor fail.

Table 11-43. TEST #270 Clear Error Counters

Error Code	Test Result	Description/ Recommendation
Any	ABORT	This test should never abort.
Any	FAIL	This test should never fail. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to fail, escalate the problem.
	PASS	The message to clear the error counters of the BRI-Port/ABRI-Port/ATT-PORT/LGATE-PT/ATTE-PT has been sent.

BRI-SET, ASAI-ADJ, BRI-DAT

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run[1]	Full Name of MO

BRI-DAT		test data-module	

1 Where P is the port network number (1 for PPN and 2 or 3 for EPN); C is the carrier designation (A, B, C, D, or E); SS is the address of the slot in the carrier where the circuit pack is located (01, 02, ..., etc.); and pp is the 2-digit port number (for example, 01). The alternate name field contains the extension of the endpoint. This field is used to distinguish between endpoints on the same port.

2 The alarm level for ASAI and AT&T adjuncts may be administered using the **set options** command. The alarm level can be set independently for Off-Board and On-Board alarms to WARNING, MINOR, or MAJOR for all ASAI and AT&T adjuncts in the system.

3 Alarming for an ASAI and AT&T adjuncts is disabled if the adjunct asks the switch to suspend maintenance. When this occurs, an error and a WARNING alarm are logged against the endpoint. Busying out and releasing the ASAI station or ADJLK station will clear the alarm.

CAUTION:

A detailed flowchart for isolating and resolving Packet Bus faults is included *in Chapter 9, "Packet Bus Fault Isolation and Correction". this flowchart, along with the other information presented in the chapter, can help in resolving problems that involve more than a single station or circuit pack. Whenever the repair procedures for this Maintenance Object refer to Packet Bus and/or Packet Control maintenance, be sure to reference Chapter 9, "Packet Bus Fault Isolation and Correction" in addition to the relevant MO documentation.*

WARNING:

If a significant Packet Bus failure occurs, errors and alarms may not be logged as expected for BRI-SET/BRI-DAT/ASAI-ADJ/ATT-ADJ/LGATE-AJ/ATTE-AJ. Conditions under which this occurs are detailed in the ""Maintenance of the Packet Bus" section of Chapter 9, "Packet Bus Fault Isolation and Correction".

The TN2208 ESAI MFB provides DEFINITY with an Ethernet interface to Adjunct-Switch Application Interface (ASAI) and AT&T adjuncts (for example, CONVERSANT® Voice System). This circuit pack contains 8 ports of line circuit interface, each of which operates with two B-channels (referred to as B1 and B2 throughout this section) and one D-channel as specified in the AT&T ISDN-BRI Specification. In this context, the term ``ISDN-BRI port'' is used to refer collectively to ports on the TN2208 MFB circuit pack which is connected to ASAI or AT&T adjuncts. The TN2208 ESAI MFB is handled by switch software as it is an ISDN BRI compatible board and all maintenance actions referring to ASAI and AT&T Adjunct Links in this section apply.

In G3iV1.1-286 and G3iV2-386, two types of ISDN-BRI endpoints may be connected to ISDN-BRI (ISDN Basic Rate Interface Line) TN556 and TN2198 circuit packs: ISDN-BRI station endpoints, ASAI (Adjunct-Switch Application Interface) and AT&T adjuncts (for example CONVERSANT® Voice System). These circuit packs contain 12 ports of line circuit interfaces, each of which operates at 192 kilobits per second (kbps) with two B-channels and one D-channel as specified in the AT&T ISDN-BRI specification (PUB 801-802-100). For BRI endpoints, each B-channel may support voice or circuit-switched data and may be circuit-switched simultaneously. The B-channels are not used by ASAI or AT&T adjuncts. The D-channel is used for conveying signaling between the switch and a BRI endpoint(s) or ASAI or AT&T adjuncts. Each ISDN-BRI D-channel is connected to the switch processor and the ISDN-BRI port through the PKT-CTRL (Packet Control) and the PKT-BUS (Packet Bus).

ISDN-BRI endpoints come in a number of configurations. All endpoints require the D-channel to convey signaling information to the switch. A voice-only set requires only one B-channel. A voice and data-capable set requires both B-channels (one for voice and one for data). Therefore, each TN556 port can support either two voice-only sets or one voice and data-capable set. Only a single ASAI or AT&T adjunct may be connected to an ISDN-BRI port. Multiple adjuncts per line are not supported.

Figure 11-11 illustrates the physical connection (solid line) between an ISDN-BRI Circuit Pack and a voice or voice/data set. Each physical connection allows for two B-channels, as stated above, plus one D-channel. Each ISDN-BRI circuit pack can support up to 12 of these PHYSICAL connections to different voice and voice/data sets or ASAI and AT&T adjuncts.

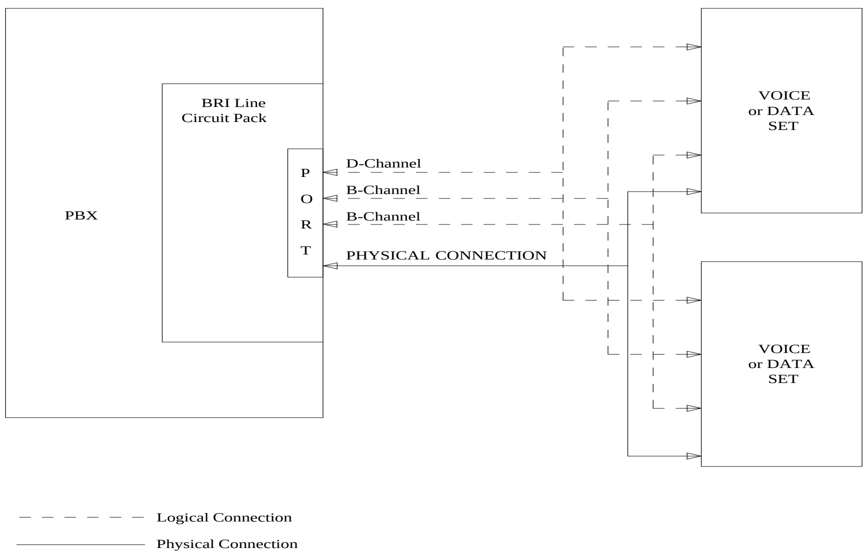

Figure 11-11. ISDN-BRI Set Interactions

This section contains the ISDN-BRI Set, ASAI Adjunct, and AT&T Adjunct Maintenance documentation. Some of the results of maintenance testing of the ISDN-BRI Set or the ASAI and AT&T Adjunct may be affected by the health of the ISDN-BRI circuit pack and Port. These interactions should be kept in mind when investigating the cause of ISDN-BRI Set problems.

Hardware Error Log Entries and Test to Clear Values

Table 11-44. BRI-SET/ASAI-ADJ Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level BRI-PORT	Alarm Level ABRI-PORT ATT-PORT LGATE-PORT ATTE-PT	On/ Off Board	Test to Clear Value

Table 11-44. BRI-SET/ASAI-ADJ Error Log Entries — *Continued*

Error Type	Aux Data	Associated Test	Alarm Level BRI-PORT	Alarm Level ABRI-PORT ATT-PORT LGATE-PORT ATTE-PT	On/ Off Board	Test to Clear Value
3073(j)	0	BRI Remote Loop Back (#627)	WARNING		OFF	test station ext l r 2 test data-module ext l r 2
3329(k)	Any	Signaling Link Status (626)	WARNING	MAJOR/ WARNING[2]	OFF	†
3584	0, 1	None				
3585-3839(i)	0	None				
3840-4095(m)(n)	0	None				

1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

2 Major alarms on this MO may be downgraded to Warning alarms based on the value used in the **set options** command.

Notes:

a. Errors of this type indicate violations of the ISDN-BRI signaling protocol; timers associated with certain Layer 3 messages have expired before a required response was received. In the following table, the aux data field indicates which timer has just expired. (For more information, refer to the AT&T ISDN-BRI Specification.)

Aux Data	Timer Type
2	First T303 (SETUP timer)
3	Second T303 (SETUP timer)
4	T305 (DISConnect timer)
5	First T308 (RELease timer)

Aux Data	Timer Type
6	Second T308 (RELease timer)
10	T316 (RESTart timer)
12	T309 (Layer 2 Failure timer)
16	TM100 (Management Information Message timer 1)
17	TM200 (Management Information Message timer 2)
102	TASAI (ASAI Routing Timer)

The switch sent a message to the endpoint which did not respond in the allotted time. This can happen occasionally due to failure of the point-to-point signaling link or because of a problem in the BRI endpoint or ASAI adjunct or AT&T adjunct. Execute the **test station extension sh** command and pay particular attention to the results of the BRI Layer 3 Query Test (#629). If this test fails, follow the repair procedure for Test #629.

b. This error type indicates that the circuit pack has been removed or has been insane for more than 11 minutes. To clear the error, replace or reinsert the circuit pack.

c. This error occurs when the endpoint does not respond to the service state query message sent to the adjunct or the endpoint. This error causes an alarm to be raised. The alarm is retired when the switch receives a response to the service state query to the endpoint or the adjunct.

For BRI endpoints, the Aux Data field for this error contains "0." When it occurs, execute the **test station extension sh** command and pay particular attention to the results of the BRI Layer 3 Query Test (#629). If this test fails, follow the repair procedure for Test #629.

When this error occurs for an ASAI or AT&T adjunct, the Aux Data field indicates the state of the ASAI link or AT&T link and whether an invalid response or no response was received to the query from the switch, as shown in the following table:

Aux Data	ASAI Link State	Error
102	13-restarting	No response to RESTART message
104	13-restarting	Invalid response to RESTART message
152	13-restarted	No response to Layer 3 query
154	13-restarted	Invalid response to Layer 3 query
202	13-established	No response to Layer 3 query
204	13-established	Invalid response to Layer 3 query

(See "Status BRI-Port" in Chapter 10, "Maintenance Commands and Trouble-Clearing Aids" for an explanation of the ASAI link states.)

For ASAI or AT&T adjuncts, the switch automatically queries the adjunct every two minutes (and therefore the Layer 3 Query Test is not executed for ASAI or AT&T adjuncts via a command issued from the G3MT terminal). While alarmed for this error, the switch momentarily (for five seconds) takes the associated port out-of-service every 15 minutes. This action is taken in an attempt to stimulate recovery actions to be taken by the adjunct.

When this error occurs for an ASAI or AT&T adjunct, the service technician should:

1. Execute the **test station extension** command, paying particular attention to any tests which fail, and perform the associated repair procedures for those tests.
2. Check the health of the adjunct by following the recommended repair procedures of the manufacturer of the adjunct if the preceding step does not resolve the problem.
3. The alarm condition persists and, if the above steps do not resolve the problem, follow normal escalation procedures.

d. This error and associated WARNING alarm are logged against an ASAI or AT&T endpoint when the adjunct has asked the switch to suspend Maintenance on the ASAI or AT&T endpoint. Busying out and releasing the ASAI station or ADJLK station will clear this alarm.

e. This error occurs when the endpoint sends more messages than the switch can handle. The switch suspends the reception of messages from the endpoint for a short period of time. There is no repair procedure for this error. If the condition persists, replace the endpoint.

f. This error occurs when the signaling link associated with a BRI endpoint has too much link establishment related traffic. This could occur if the signaling link is bouncing between assigned and established states. Software will suspend activity to this endpoint for 75 minutes when the endpoint is alarmed due to this problem (note that service suspension does not occur if the endpoint is an ASAI or AT&T adjunct). If this problem persists, replace the endpoint. If replacing the endpoint does not fix the problem, follow normal escalation procedures.

g. This error occurs when the ASAI-ADJ or ATT-ADJ or LGATE-AJ or ATTE-AJ message is not transmitted because the PKT-CTRL (Packet Control Circuit Pack) transmit buffers are exhausted. Frequent or persistent occurrence of these events may indicate a hardware problem or traffic overload on the PKT-CTRL, the signaling link, or the ASAI or AT&T adjunct. Attempt to resolve the problem by following the repair procedures for the PKT-CTRL. If these attempts fail, the problem should be escalated because re-engineering of the traffic on the PKT-CTRL, signaling link, or adjunct may be necessary.

h. This error occurs when the ASAI message is not transmitted because the transmit buffer for the ASAI link is full, causing the link to be flow controlled. Frequent or persistent occurrence of these events may indicate a hardware problem or traffic overload on the PKT-CTRL, the signaling link, or the ASAI or AT&T adjunct. Attempt to resolve the problem by following the repair procedures issued by the manufacturer of the adjunct. If these attempts fail, the problem should be escalated because re-engineering of the traffic on the PKT-CTRL, signaling link, or adjunct may be necessary.

i. This error indicates a problem with Layer 2 over the D-channel between the switch and the endpoint. When this error occurs, an alarm is raised against the station or adjunct. Execute the **test station extension short** command and pay particular attention to the results of the BRI XID Test (#628). If this test fails, follow the repair procedure for Test #628.

j. This error indicates a problem with the B-channel connection between the switch and the endpoint. When this error occurs, a warning alarm is raised against the endpoint. Execute the **test station extension l** command, and pay particular attention to the results of the BRI Remote Loop Back Test (#627). If this test fails, follow the repair procedure for Test #627.

k. This error occurs whenever the point-to-point signaling link to the endpoint goes down (except when it goes down because either the PKT-CTRL or the PKT-BUS has failed or has been busied out by system technician). When this error occurs, an alarm is raised against the endpoint or adjunct. Execute the **test station extension short** command and pay particular attention to the results of the Signaling Link Status Test (#626). If this test fails, follow the repair procedure for Test #626. The alarm is retired when the signaling link is reestablished to the endpoint or adjunct.

l. Certain ASAI protocol-specific cause codes are logged by switch software. The cause code can be determined from the following formula:

   If the error type is greater than 3712, then the ASAI cause code is equal to the error type minus 3712. This code was sent to the adjunct by the switch.

   If the error type is less than 3712, then the ASAI cause code is equal to the error type minus 3584. This code was sent to the switch by the adjunct.

   A description of the various ASAI cause values is contained in the Table 11-45. This table also contains recommended system technician actions associated with the cause value. Further information can also be found in the AT&T ASAI Specification (AT&T PUB 288-500-03). In addition, the Aux Data field of the Error Log entry contains additional diagnostic information.

Table 11-45. ASAI Cause Values

Code	Explanation	Recommendation
	SERVICE OR OPTION NOT AVAILABLE	
0	Unrecognized ASAIProtocol Operation	Requested ASAI protocol operation is not implemented by the switch or adjunct. Aux Data field of Error Log entry contains protocol identifier for unrecognized operation. 1. Consult switch and adjunct documentation to determine which set of operations is supported by the switch and the adjunct. Adjunct administration turning off operations not implemented by the switch may resolve the problem. 2. If Step 1 does not resolve the problem, escalate to the next tier.
40	Resources not available	No available internal resources to service switch or adjunct request. System transaction capacity for adjunct or switch is exceeded. 1. Re-engineering of adjunct services my be required. If problem persists, escalate problem to the next tier.
63	SERVICE OR OPTION NOT AVAILABLE	Requested ASAI capability or resource is not available on the switch or adjunct. More than one adjunct may be contending for the same switch resources. Potential administration mismatch between the resource domains administered on the switch and those administered on the adjunct. 1. Verify that no overlapping administration of switch resources (e.g., requesting notifications on a single domain by multiple adjuncts or multiple adjuncts attempting to control a single call) exists across all adjuncts connected to the switch. If overlaps exist, then readminister the adjuncts to guarantee that each adjunct is associated with a unique set of switch resources. 2. If Step 1 does not resolve the problem, escalate to the next tier.

Continued on next page

Table 11-45. ASAI Cause Values — *Continued*

Code	Explanation	Recommendation
	SERVICE OR OPTION NOT IMPLEMENTED	
79	SERVICE OR OPTION NOT IMPLEMENTED	Requested service or option (or combination of selected options) is not supported (implemented) in switch or the adjunct. 1. Consult switch and adjunct documentation to determine ASAI service and options supported by both switch and adjunct. Readministration of the switch-administered capabilities (see Customer Optional Feature Form) or those of the adjunct may be necessary to correct the problem. 2. If Step 1 does not provide the set of desired services due to deficient implementation, escalate the problem to the next tier.
	SWITCH ERROR CONDITIONS	
87	Internal switch audit	There is an inconsistency in switch data records. 1. There is no action needed since the switch has corrected the data inconsistency. 2. If a number of these errors continue to occur, then escalate to next tier.

m. Certain ISDN-BRI cause codes are logged by switch software. The cause code can be determined from the following formula:

   If the error type is greater than 3968, then the ISDN-BRI cause code is equal to the error type minus 3968. This code was sent to the endpoint by the switch.

   If the error type is less than 3968, then the ISDN-BRI cause code is equal to the error type minus 3840. This code was sent to the switch by the endpoint.

   A description of the various ISDN-BRI cause values is contained in Table 11-46. This table also contains recommended system technician actions associated with the cause value. Further information can also be found in the AT&T ISDN-BRI Specification (AT&T PUB 801-802-100). In addition, the Aux Data field of the Error Log entry contains additional diagnostic information.

n. Error 3847 indicates that sets on the port do not support level 3 initialization. Consult the Set Service documentation

o. For the Error 2567 indicates that the version of ASAI is not supported, check version of the software running on the ASAI or AT&T adjunct.

p. For Error 2568 indicates that the adjunct id is invalid, check the vender id or software running on the AT&T adjunct.

Table 11-46. ISDN-BRI Cause Values

Code	Explanation	Recommendation
	CHANNEL IN USE	
1		Requested channel is in use by another station on the BRI-PORT. (Not applicable for ASAI or AT&T adjuncts.) For BRI endpoints: 1. Try to originate a call to or from this port. 2. If the error persists, busy out and release the port. 3. If the problem still persists, replace stations on the port. 4. If the problem still persists, escalate to the next tier.

Continued on next page

Table 11-46. ISDN-BRI Cause Values — *Continued*

Code	Explanation	Recommendation
	SWITCH RESOURCES NOT AVAILABLE	
34	No circuit or channel available	A resource on the switch is unavailable for a call. For BRI endpoints: This cause value is not logged. For ASAI or AT&T Adjuncts: This condition means that there are no available trunks for an outgoing call request. 1. Verify that the adjunct is administered to support the trunk capabilities of the switch. 2. Investigate trunk group status by issuing **status trunk** commands from the SAT or by requesting a trunk group query or queries from the adjunct. 3. Perform trunk diagnostic procedures outlined in this manual. 4. If step 3 does not resolve the problem, escalate to the next tier.
42	Switch Equipment Congestion	Switch takes control to limit received traffic. For BRI endpoints: This cause value is not logged. For ASAI or AT&T Adjuncts: 1. See CallVisor protocol reference manual. 2. If step 1 does not resolve the problem, escalate to the next tier.
	SERVICE OR OPTION NOT AVAILABLE	

Continued on next page

Table 11-46. ISDN-BRI Cause Values — *Continued*

Code	Explanation	Recommendation
50	Requested Facility Not Subscribed	Requested facility is implemented, but not administered. Potential administration problem with endpoint or adjunct. For BRI endpoints: 1. Verify the switch administration of endpoint using either the **display station** or **display data-module** commands. 2. If Step 1 does not resolve the problem, refer to the endpoint's service manual and verify administration on the endpoint. 3. If Step 2 does not resolve the problem, escalate to the next tier. For ASAI adjuncts: 1. Display the Customer Optional Features Form (administration screen) on the switch to determine which ASAI capabilities are turned on in the switch. 2. Verify that the adjunct is administered to support the identical capabilities as the switch. If there is a mismatch in the administered capabilities, then readminister the switch and/or the adjunct to establish a consistent set of desired capabilities on both the switch and the adjunct. 3. If Step 2 does not resolve the problem, escalate to the next tier. For AT&T adjuncts: 1. Display the Customer Optional Features Form (administration screen) on the switch to determine if the AT&T adjunct is set enabled on in the switch. 2. If error type 2567 or 2568, verify the AT&T adjunct version, and readminister if needed. 3. If step 2 does not fix the problem, escalate to the next tier of support.

Continued on next page

Table 11-46. ISDN-BRI Cause Values — *Continued*

Code	Explanation	Recommendation
58	Bearer Capability Not Presently Available	Requested bearer capability is implemented, but not administered. No B-channel administered. See recommendation 50 above.
	SERVICE OR OPTION NOT IMPLEMENTED	
65	Bearer Service Not Implemented	Requested service not implemented in switch or endpoint.
69	Requested Facility Not Implemented	Requested service not supported in switch or endpoint. 1. Consult switch and endpoint documentation to determine service support. 2. If Step 1 does not resolve the problem, escalate to the next tier.
	ADJUNCT/SWITCH ERROR CONDITIONS	
81	Invalid CRV	An invalid CRV was sent by the adjunct. 1. This may indicate a CRV inconsistency between the switch and the adjunct. See the CallVisor protocol reference manual. 2. If step 1 does not resolve the problem, escalate to the next tier.

System Technician-Demanded Tests: Descriptions and Error Codes

When inspecting errors in the system and deciding which ones to address, always investigate errors associated with the circuit pack and port first. Clearing these error codes first may also clear errors generated against the endpoint. When all circuit pack and port errors have been cleared, and errors still exist against the endpoint, always investigate errors in the order they are presented in the table below. By clearing error codes associated with the *Signaling Link Status Test,* for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Signaling Link Status Test (#626)	X	X	ND
BRI XID Test (#628)	X	X	ND
BRI Layer 3 Query (#629)	X (a)	X (a)	ND
BRI Remote Loop Back (#627)		X (a)	ND
BRI Set Audits (#630)	X (a)	X (a)	ND
BRI Vendor ID Test (#631)		X (a)	ND
BRI Model/Vintage ID Test (#632)		X (a)	ND

1 D = Destructive; ND = Nondestructive

Note:

a. Will execute the **test port long PCSSpp** command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.

Signaling Link Status Test (#626)

This test determines the current status of the signaling link. This test passes if the link is "bound" to an endpoint and fails if the link is "not bound."

The definition of the term "bound" for a link depends upon the type of endpoint and may depend on the successful completion of procedures at both Layers 2 and 3 of the protocol. The definition of "bound" for each type of endpoint is as follows:

- **BRI endpoints administered for MIM (management information messages) initialization (multipoint):**

  NOTE:
  An MIM is a level 3 message that conveys management and maintenance information between a communications system and a BRI terminal.

  For endpoints of this type, the signaling link is "bound" when the link is connected at Layer 2 and the link has been associated with an endpoint, [that is, the endpoint has completed SPID initialization (L3 established)].

- **ASAI adjuncts and BRI endpoints not administered for MIM initialization (point-to-point):**

  For endpoints of this type, the signaling link is "bound" when the link is connected at Layer 2 (L2 established).

For all endpoint types, a signaling link becomes "unbound" when it is disconnected at Layer 2. For BRI endpoints supporting MIM initialization, a signaling link may also become "unbound" if a subsequent attempt to perform SPID initialization on a "bound" link fails, (that is, wrong SPID is entered into the endpoint by the user).

Table 11-47. TEST #626 Signaling Link Status Test

Error Code	Test Result	Description/ Recommendation
1139	ABORT	The Packet Bus in the port network is out-of-service. 1. Follow the repair procedures for the Packet Bus. 2. After completing Step 1, execute the **test port long PCSSpp** command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.

Continued on next page

Table 11-47. TEST #626 Signaling Link Status Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1141	ABORT	The PKT-CTRL is out-of-service. 1. Refer to PKT-CTRL (Packet Control Circuit Pack) Maintenance documentation. 2. If Step 1 does not resolve the problem, escalate to the next tier.
1144	ABORT	The PPN Packet Bus is out-of-service. 1. Follow the repair procedures for the Packet Bus in the PPN. 2. After completing Step 1, execute the **test port long PCSSpp** command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.

Continued on next page

Table 11-47. TEST #626 Signaling Link Status Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1187	ABORT	The circuit pack, port or station may have been busied out by a technician. 1. Look in the Error Log for Error Type 18 (busied out) for BRI-BD, BRI-PORT, or BRI-SET. 2. If this error type is present for BRI-SET only, then release the station via the **release station** command. a. If this error type is present for BRI-PORT and BRI-SET, then release the port via the **release port PCSSpp** command and run the test again. b. If the error is present for BRI-BD, BRI-PORT, and BRI-SET, then release the circuit pack via the **release port PCSSpp** command and run the test again. If the error is present for BRI-SET only, then release the circuit pack via the **release port PPCSS** command and run the test again. If the error is present for both BRI-BD and BRI-PORT, then release the circuit pack via the **release board PPCSS** command and run the test again. **NOTE:** When you release the circuit pack, you release all ports associated with it. If certain ports still need to be busied out, use the **release port PCSSpp** command to busy them out. 3. Make sure the terminal is connected. 4. Retry the command at one-minute intervals a maximum of five times. 5. If the test continues to abort, escalate the problem.
2012	ABORT	Internal System Error.

Continued on next page

Table 11-47. TEST #626 Signaling Link Status Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1113	FAIL	The signaling link is not "bound" to the adjunct or endpoint. For BRI endpoints supporting MIM initialization, this error indicates that the endpoint has not been bound to a signaling link (that is, SPID initialization has not been completed). Since the signaling link associated with the endpoint is not identified until SPID initialization completes, this error does not imply that the signaling link is connected or disconnected at Layer 2 nor does it provide the status of TEI assignment for the endpoint. For ASAI adjuncts and BRI endpoints not supporting MIM initialization, this error indicates that the link is disconnected at Layer 2. Since the signaling link associated with the endpoint has been identified via administration, the link is only "unbound" from the endpoint when it is disconnected. 1. Execute the **status bri-port PCSSpp** command and refer to the associated procedures for this command contained in the BRI-PORT (ISDN-BRI Port) Maintenance documentation. 2. If the test continues to fail, escalate the problem.
	PASS	The signaling link is connected at Layer 2 and "bound" to the BRI endpoint or ASAI adjunct.

Table 11-47. TEST #626 Signaling Link Status Test — *Continued*

Error Code	Test Result	Description/ Recommendation
1113	FAIL	The signaling link is not "bound" to the adjunct or endpoint. For BRI endpoints supporting MIM initialization, this error indicates that the endpoint has not been bound to a signaling link (that is, SPID initialization has not been completed). Since the signaling link associated with the endpoint is not identified until SPID initialization completes, this error does not imply that the signaling link is connected or disconnected at Layer 2 nor does it provide the status of TEI assignment for the endpoint. For ASAI adjuncts and BRI endpoints not supporting MIM initialization, this error indicates that the link is disconnected at Layer 2. Since the signaling link associated with the endpoint has been identified via administration, the link is only "unbound" from the endpoint when it is disconnected. 1. Execute the **status bri-port PCSSpp** command and refer to the associated procedures for this command contained in the BRI-PORT (ISDN-BRI Port) Maintenance documentation. 2. If the test continues to fail, escalate the problem.

BRI Remote Loop Back Test (#627)

This test checks the integrity of a circuit switched B-channel connection between the switch and the endpoint.

In this test, the endpoint is put in the "maintenance busy" state to prevent the switch from issuing calls to the endpoint during the test. An application message containing a loop back activate request for the appropriate B-channel is sent to the endpoint. The endpoint responds with a loop back activated response. Maintenance then sends data to the endpoint over the B-channel under test. Since the B-channel is looped back at the endpoint, maintenance should receive the data that it sent. If no data is detected, the test fails. An application message containing a loop back deactivate request is then sent to the endpoint to terminate the remote loop back test. The endpoint responds with an MIM message containing a loop back deactivate response. Maintenance then releases the endpoint so that it is available to terminate calls.

This test is not executed for ASAI adjuncts because adjuncts do not support MIMs upon which this test is based.

Table 11-48. TEST #627 BRI Remote Loop Back

Error Code	Test Result	Description/ Recommendation
1000	ABORT	Could not seize the endpoint or B-channels for test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1005	ABORT	The endpoint's MIMs Supported field is administered to "no." 1. Use the **change station extension** command to change parameter only if the endpoint documentation reflects support for ISDN-BRI Management and Maintenance Procedures.

Continued on next page

Table 11-48. TEST #627 BRI Remote Loop Back — *Continued*

Error Code	Test Result	Description/ Recommendation
1113	ABORT	The signaling link between the switch and the endpoint is down. 1. Use the **test port PCSSpp long** command to clear any errors which prevent establishment of the signaling link. 2. Examine the results of the Signaling Link Status Test (#626) which is run as part of this command. If this test aborts or fails, follow the repair procedure for Test #626. 3. If the XID Test continues to abort, escalate the problem.
1139	ABORT	The Packet Bus in the port network is out-of-service. 1. Follow the repair procedures for the Packet Bus. 2. After completing Step 1, execute the **test port long PCSSpp** command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.
1141	ABORT	The PKT-CTRL is out-of-service. 1. Refer to PKT-CTRL (Packet Control Circuit Pack) Maintenance documentation. 2. If Step 1 does not resolve the problem, escalate to the next tier.
1144	ABORT	The PPN Packet Bus is out-of-service. 1. Follow the repair procedures for the Packet Bus in the PPN. 2. After completing Step 1, execute the **test port long PCSSpp** command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.

Error Code	Test Result	Description/ Recommendation
1187	ABORT	The circuit pack, port or station may have been busied out by a technician. 1. Look in the Error Log for Error Type 18 (busied out) for BRI-BD, BRI-PORT, or BRI-SET. 2. If this error type is present for BRI-SET only, then release the station via the **release station** command. a. If this error type is present for BRI-PORT and BRI-SET, then release the port via **release port PCSSpp** command and run the test again. b. If the error is present for BRI-BD, BRI-PORT, and BRI-SET, then release the circuit pack via the **release port PCSSpp** command and run the test again. If the error is present for both BRI-BD and BRI-PORT, then release the circuit pack via the **release board PPCSS** command and run the test again. If the error is present for BRI-SET only, then release the circuit pack via the **release port PPCSS** command and run the test again. **NOTE:** When you release the circuit pack, you release all ports associated with it. If certain ports still need to be busied out, use the **release port PCSSpp** command to busy them out. 3. Make sure the terminal is connected. 4. Retry the command at one-minute intervals a maximum of five times. 5. If the test continues to abort, escalate the problem.
2012	ABORT	Internal System Error. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-48. TEST #627 BRI Remote Loop Back — *Continued*

Error Code	Test Result	Description/ Recommendation
2068	ABORT	The endpoint has rejected the switch sent application message. This indicates that the endpoint does not support the ISDN-BRI Management and Maintenance Procedure for Loop Back Testing. 1. Use the **change station extension** command and change the MIMs Supported field to "no."
2069	ABORT	The endpoint has returned an error response to the application message sent by the switch.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
2000	FAIL	No loop back activation or deactivation response is received from the endpoint. 1. Consult the endpoint documentation to determine if ISDN-BRI Management and Maintenance Procedures are supported. If not supported, use **change station extension** command to change the MIMs Supported? field to "no." Use the **busyout station extension** and **release station extension** commands to busyout and release the endpoint to resolve any endpoint alarms resulting from failure of this test. 2. If the endpoint supports these procedures and the test continues to fail, assume the endpoint is defective and replace it.

Continued on next page

Table 11-48. TEST #627 BRI Remote Loop Back — *Continued*

Error Code	Test Result	Description/ Recommendation
2071	FAIL	No data is detected on Channel B1 during loop back.
2072	FAIL	No data is detected on Channel B2 during loop back. 1. Replace the endpoint and repeat test. 2. If test continues to fail, check the wiring between the endpoint and the switch and repeat the test. 3. If test continues to fail, escalate the problem.
	PASS	The endpoint has responded to the switch activate and deactivate loop back application messages. Data has been detected on the looped back channels.
1000	ABORT	Could not seize the endpoint or B-channels for test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

BRI XID Test (#628)

This test checks the D-channel connection between the SPE and the endpoint or adjunct.

In this test, a D-channel XID frame is sent to the endpoint or adjunct over the point-to-point signaling link. The test passes if the endpoint or adjunct responds with a Layer 2 XID-RESPONSE frame.

This test must be administered to not run in the station administration form for ports on a TN2208.

Table 11-49. TEST #628 BRI XID

Error Code	Test Result	Description/ Recommendation
1000	ABORT	The BRI-SET, ASAI-ADJ, ATT-ADJ, LGATE-AJ, ATTE-AJ is busy. The test cannot be executed at this time: 1. Pause momentarily (30 seconds) and re-execute at this time. 2. If this problem persists, escalate this problem. **NOTE:** A BRI-PORT can also be busy. When using this for BRI-PORT/ABRI-PORT tests, the words "BRI-SET, ASAI-ADJ, ATT-ADJ, " can be changed to "BRI-PORT, ABRI-PORT, ATT-ADJ."
1005	ABORT	The endpoint is not administered to support XID Testing. 1. If the endpoint documentation reflects support XID testing, use the **change station extension** command to change the XID Testing? field on the form to "yes."

Continued on next page

Table 11-49. TEST #628 BRI XID — *Continued*

Error Code	Test Result	Description/ Recommendation
1113	ABORT	The signaling link between the switch and the endpoint is down. 1. Use the **test port PCSSpp l** command to clear any errors which prevent establishment of the signaling link. 2. Examine the results of the Signaling Link Status Test (#626) which is run as part of this command. If this test aborts or fails, follow the repair procedure for Test #626. 3. If the XID test continues to abort, escalate the problem.
1139	ABORT	The Packet Bus in the port network is out-of-service. 1. Follow the repair procedures for the Packet Bus. 2. After completing Step 1, execute the **test port long PCSSpp** command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.
1141	ABORT	The PKT-CTRL is out-of-service. 1. Refer to PKT-CTRL (Packet Control Circuit Pack) Maintenance documentation. 2. If Step 1 does not resolve the problem, escalate to the next tier.
1144	ABORT	The PPN Packet Bus is out-of-service. 1. Follow the repair procedures for the Packet Bus in the PPN. 2. After completing Step 1, execute the **test port long PCSSpp** command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.

Table 11-49. TEST #628 BRI XID — *Continued*

Error Code	Test Result	Description/ Recommendation
2012	ABORT	Internal System Error.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
2000	FAIL	The XID-RESPONSE message was not received from the endpoint. 1. Consult the endpoint documentation to determine if the Layer 2 XID and XID-RESPONSE messages are supported. If the documentation reflects no support for these messages, change XID Testing? field to "no" using the **change station extension** command. 2. If the endpoint supports these Layer 2 messages and the test continues to fail, assume the endpoint is defective and replace it. 3. If the test continues to fail, escalate the problem.
	PASS	The switch can successfully pass messages over the D-channel to the BRI endpoint.

BRI Layer 3 Query Test (#629)

This test is used to check the application layer communications between the switch and the endpoint or adjunct.

For BRI endpoints, an application message containing the appropriate endpoint service state is sent by the switch to the endpoint. The endpoint responds with an acknowledgment to the application message.

For ASAI and AT&T adjuncts, this test is not executed from the administration terminal. Rather, a query message is automatically sent by the switch every two minutes. Failure of the switch to receive a response to a query from the adjunct is logged in the Hardware Error Log.

Table 11-50. TEST #629 BRI Layer 3 Query

Error Code	Test Result	Description/ Recommendation
1005	ABORT	The endpoint's MIMs Supported? field is administered to "no." 1. Use the **change station extension** command to change the parameter only if the endpoint documentation reflects support for ISDN-BRI Management and Maintenance Procedures.
1113	ABORT	The signaling link between the switch and the endpoint or adjunct is down. 1. Use the **test port PCSSpp long** command to clear any errors which prevent establishment of the signaling link. 2. Examine the results of Test #626, which is executed with the command. If this test aborts or fails, follow the repair procedure for the Signaling Link Status Test. 3. Escalate problem if BRI Layer 3 Query Test continues to abort.
1139	ABORT	The Packet Bus in the port network is out-of-service. 1. Follow the repair procedures for the Packet Bus. 2. After completing Step 1, execute the **test port long PCSSpp** command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.

2012	ABORT	Internal System Error.

Continued on next page

Table 11-50. TEST #629 BRI Layer 3 Query — *Continued*

Error Code	Test Result	Description/ Recommendation
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
2068	ABORT	The endpoint has rejected the switch sent application message. This indicates that the endpoint does not support the ISDN-BRI Management and Maintenance Procedure for Endpoint Service Messages. 1. Use the **change station extension** command and change the MIMs Supported? field to "no."
2069	ABORT	The endpoint has returned an error response to the switch sent application message. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
2000	FAIL	No response is received from the endpoint or the adjunct. For BRI endpoints: 1. Consult the endpoint documentation to determine if ISDN-BRI Management and Maintenance Procedures are supported. If not supported, use the **change station extension** command to change the "MIMs Supported?" field to "no." Use the **busyout station extension** and **release station extension** commands to busyout and release the endpoint to resolve any endpoint alarms resulting from failure of this test. 2. If the endpoint supports these procedures and the test continues to fail, assume the endpoint is defective and replace it.
	PASS	The endpoint has successfully responded to the switch's application message.

BRI Set Audits Test (#630)

This is a series of two tests which are classified as audits. The switch sends messages to the BRI endpoint to perform the following tests:

- Ringer Audit - This audit ensures that both the switch and the endpoint agree as to the current state of the endpoint's ringer.
- Lamps Audit - This audit ensures that both the switch and the endpoint agree as to the current state of the endpoint's lamps.
- Call Activity Audit - This audit ensures that the state of calls is consistent between the switch and the endpoint.

This test is not executed for ASAI or AT&T adjunct because adjuncts do not employ ringers or lamps, or establish calls on the B-channels associated with the BRI interface.

Table 11-51. TEST #630 BRI Set Audits

Error Code	Test Result	Description/ Recommendation
1113	ABORT	The signaling link between the switch and the endpoint is down. 1. Use the **test port PCSSpp long** command to clear any errors which prevent establishment of the signaling link. 2. Examine the results of the Signaling Link Status Test (#626) which is run as part of this command. If this test aborts or fails, follow the repair procedure for Test #626. 3. If the BRI Set Audits test continues to abort, escalate the problem.
1139	ABORT	The Packet Bus in the port network is out-of-service. 1. Follow the repair procedures for the Packet Bus. 2. After completing Step 1, execute the **test port long PCSSpp** command, and review the results of the BRI Port Local LAN Loop Around Test to verify the repair.

2012	ABORT	Internal System Error.
2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

SPID Facility Test

This test is used to verify the wiring and operation of the signaling link between the switch and a endpoint or adjunct on a BRI interface. **This test is not executed from the administration terminal, but rather is executed by using a BRI test set equipped with a display.** The test set may replace the BRI set, ASAI or AT&T adjunct under test by plugging it into the same jack or by bridging it onto the wiring at some point between the switch and the endpoint (or adjunct), thereby creating a pseudo-BRI multipoint configuration.

When plugged into the port in this manner, the test set establishes a signaling link connection with the switch and attempts to complete SPID initialization by using the Service SPID administered for the system (see the System Maintenance Administration Form). If the test set displays the correct administered port address for the endpoint or adjunct under test, the test passes (see Service SPID Display which follows). If after one-minute nothing is displayed on the test set, the test fails.

SPID Facility Test

Test Result	Description / Recommendation
FAIL	No response is received from the endpoint. 1. Check the physical wiring between the switch and the endpoint or adjunct. 2. If test continues to fail, escalate to the next tier.
FAIL	Display does not match administered port address for the endpoint or adjunct. 1. Change station administration for endpoint or adjunct to match displayed port address. 2. If test continues to fail, escalate the problem.
PASS	Display matches administered port address for the endpoint or adjunct. For BRI endpoints: 1. Verify that the SPID values administered in the switch and the endpoint are consistent. 2. If the SPID values are correct, replace the endpoint. 3. If test continues to fail, escalate the problem. For ASAI adjuncts: 1. Verify that the TEI values administered in the switch and the adjunct are consistent. 2. If the TEI values are correct, consult the recommended repair procedures of the manufacturer for the adjunct. 3. If test continues to fail, escalate the problem.

The abbreviations used in (Service SPID Display) have the following meanings:

P	port network (1,2, ...)
C	Carrier (A,B,C, ...)
SS	Slot (01, 02, ...)
pp	port (01-12)
ext	extension one and two (one through 99999)
SPID	service order profile identifier

CABINET (Cabinet Sensors)

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run[1]	Full Name of MO
CABINET	MAJOR	test environment P	Cabinet Sensors
CABINET	MINOR[2]	test environment P	Cabinet Sensors

1 Where P is an appropriate port network number determined via the Port field from the Alarm or Error Log.

2 If a minor alarm occurs for a variable speed fan, the fan should be checked for a dirty filter. If the filter is not dirty, the fan should be replaced.

NOTE:
CABINET is valid only in a multicarrier cabinet system. For information concerning single-carrier cabinet systems, refer to the DC-POWER (Single-Carrier Cabinet Power) Maintenance documentation.

Each multicarrier cabinet is equipped either with six non-variable speed fans or with six variable speed fans.

Non-Variable Speed (Standard) Fan Option. A non-variable speed (standard) fan is indicated by one of the following Product Codes: "ED67077 G1," "ED67077 G2," or "ED67077 G3." Multicarrier cabinets with non-variable speed fans contain a fan speed control unit known as the AHD1 circuit pack. This circuit pack is designed to keep the temperature within the cabinet below 65^0 C (149^0 F). Air is drawn in by the three fans located in the front of the cabinet. The air is channeled upwards through a filter, then through carriers A, B, and C and out the top of the cabinet. Air is drawn in by the three fans located in the back of the cabinet as well. The air is channeled down through a filter, then through carriers D and E and out the bottom of the cabinet. The AHD1 circuit pack monitors five of the six temperature sensors located throughout the multicarrier cabinet, and it uses the output of these sensors to adjust fan speed and to report air flow problems. The Maintenance/Tape Processor in a Standard system PPN, the Duplication Interface circuit pack, a PPN for a High or Critical Reliability system, and the EPN Maintenance circuit pack in an EPN multicarrier cabinet system directly monitor the sixth sensor (S1) to report temperature problems. The Cabinet Sensors maintenance object represents the air flow and temperature problems reported by the AHD1 circuit pack and by the Maintenance/Tape Processor, the Duplication Interface circuit pack, or the EPN Maintenance circuit pack in the multicarrier cabinet systems.

The fans and the AHD1 circuit pack obtain their power from the -48 volt DC power supply of the 631 DB DC power unit in the A carrier. In a PPN cabinet for a High or Critical Reliability system, the 631 DB DC power unit in the B carrier can also provide power to the fans. The power goes from the power unit(s) to the current limiter card (982LS), over a wiring harness from the A carrier to the back of the fan unit, through the AHD1 circuit pack, and then to the fans. The front fans are wired in parallel with a rear fan. The repair scenarios that follow rely on the technician's ability to distinguish between high fan speed and low fan speed. The only way to distinguish between the fan speeds is by the sound of the fans. When operating at high speed, the fans make a higher pitched sound than when they run at low speed. The technician probably knows from prior experience what the fans sound like at low speed as well as at high speed.

Figure 11-12 shows a multicarrier cabinet system and the location of the temperature sensors S1 through S4 (there are actually two S3 sensors and two S4 sensors) as well as the location of the fans, the AHD1 circuit pack, and the filters. The figure also shows other environment-related components of a multicarrier cabinet system and can be ignored for this section on Cabinet Sensors.

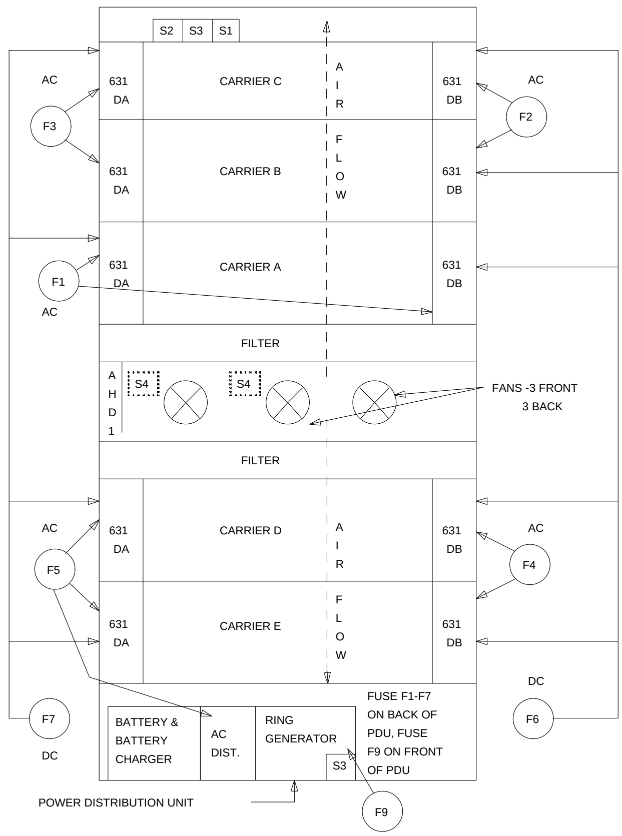

Figure 11-12. Multicarrier Cabinet Environment Components (CABINET) [Non-Variable Speed Fan Option]

Sensor S1 informs the Maintenance/Tape Processor, the Duplication Interface circuit pack, or the EPN Maintenance circuit pack when the temperature at the top of the cabinet reaches 65^0 C (149^0 F). Sensor S2 is not monitored by any circuit pack. However, when the temperature at the top of the cabinet reaches 70^0 C (158^0 F), this sensor causes the Power Distribution Unit to shut down power to the entire cabinet. At this point, Emergency Transfer is invoked, and no other system functions are provided.

The S3 and S4 sensors constantly report the temperature at the air exhaust in the cabinet (top and bottom S3 sensors) and at the air intake (S4 sensors). The AHD1 circuit pack uses this information to determine fan speed and air flow alarm state. If there is at least a 15 ^{0}C (27 ^{0}F) air temperature difference between the air exhaust and air intake, **and** if the air exhaust temperature is greater than 50 ^{0}C (122 ^{0}F), all the fans are turned up to high speed. If this condition exists, the AHD1 circuit pack reports an air flow problem which results in a Minor alarm against the Cabinet Sensors.

Variable Speed Fan Option. A variable speed fan is indicated by the Product Code "ED67077 G‘x,'" where ‘x’ is ‘4’ or a number greater than ‘4.’ A variable speed fan contains Thermal Speed Control and an alarm circuit. As a result, the AHD1 circuit pack is not required in this type of fan.

A variable speed fan has two connectors: a two pin connector for the -48 volt input power for backward compatibility, and the five pin Molex connector for speed control and alarm circuitry. The -48 volt power circuitry is isolated from the speed control and the alarm circuitry.

An alarm lead from all six variable speed fans is tied to a single lead leading to the processor circuit pack. Three fans on the front of the system are connected to an S3 sensor, which monitors the exhaust air temperature above carrier position "C." Three fans on the back of the system are connected to another S3 sensor, which monitors the exhaust air in the power distribution unit. The speed of the variable speed fans is determined by the temperature detected by the S3 sensors. Thus, the fans’ speed changes continuously according to the temperature of the exhaust air. If the fan speed drops below the preset limit, or if the fan fails, the fan alarm circuit reports an air flow problem, which results in a minor alarm.

A multicarrier cabinet containing variable speed fans is presented in Figure 11-13. Note that the two S4 sensors that are included with non-variable speed fans are not required with variable speed fans.

NOTE:
The new variable speed fans are backward compatible to the carriers for the non-variable speed fans. However, the carriers for the variable speed fans are not backward compatible to cabinets configured for the carriers for the non-variable speed fans. Finally, the carriers for the non-variable speed fans are not forward compatible to cabinets configured for the carriers for variable speed fans.

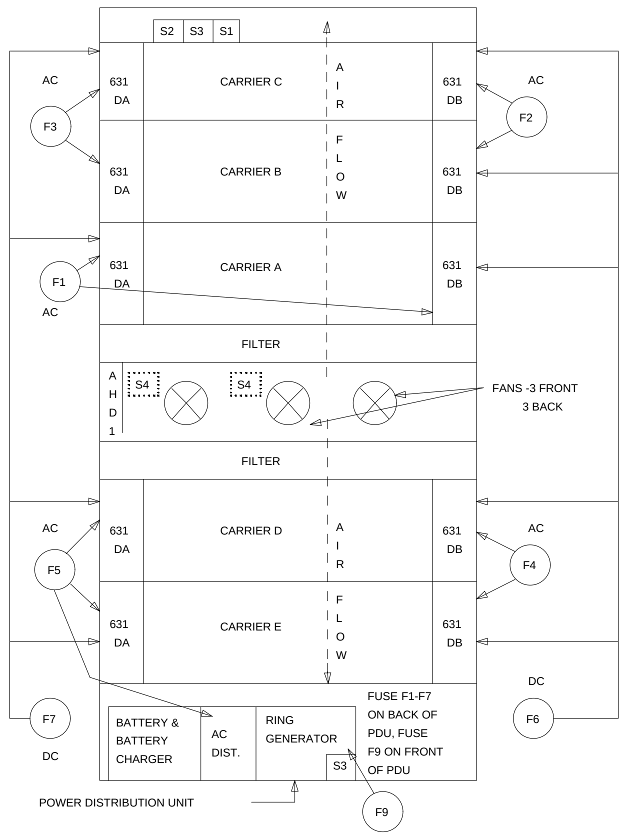

Figure 11-13. Multicarrier Cabinet Environment Components (CABINET) [Variable Speed Fan Option]

Replacement Procedures for AHD1 Fan Speed Controller Circuit Packs and Fans

AHD1 Fan Speed Controller Circuit Pack Replacement Procedure

NOTE:
The procedures in this section pertain only to non-variable speed (standard) fans.

1. Refer to Chapter 5, "Routine Maintenance Procedures", for details on removing power from the system.
2. Remove the fan assembly cover by pulling the cover outward.
3. Loosen and remove the retaining screw nearest the power plug on the front fan located to the extreme left.
4. Disconnect the power plug from the fan.
5. Loosen and remove the other retaining screw on the fan.
6. Remove the fan from the fan assembly.

CAUTION:
DO NOT TOUCH! Resistors on the circuit pack are hot.

7. Lift the latch on the AHD1 fan speed controller circuit pack.
8. Using the latch as a handle, pull the circuit pack up and out of its holder.
9. Insert a replacement AHD1 circuit pack, and push down on the latch until the latch snaps in place.
10. Position the fan, and reconnect the fan power plug.
11. Insert and tighten the retaining screws.
12. Replace the fan assembly cover.
13. Refer to Chapter 5, "Routine Maintenance Procedures", for details on restoring power to the switch.

Fan Replacement Procedure

NOTE:
The procedures in this section pertain to both non-variable speed (standard) fans and variable speed fans.

First, determine which fans are defective:

NOTE:
The following instructions are for servicing a Medium Cabinet. For a Small Cabinet (only two fans in the rear), follow Step 2A below, but start from the rear of the cabinet.

1. If any fan is **not** rotating, a more detailed inspection is required to determine why the fan has stopped operating. The fact that a fan is not spinning is not always proof that it is damaged. Since each front fan is electrically in parallel with a rear fan, an internal short circuit in a front fan prevents power from reaching the rear fan (and vice versa).

   Remove the fan assembly cover by pulling the cover outward. Remove the power connector from each inoperative front fan.

2. The following must be done to determine if the front fan or the rear fan has failed:

   a. Test the front fan:

      Measure the input impedance between the (+) and (-) input terminals of the front fan with an ohmmeter. **IMPORTANT: Attach the "common" lead of the ohmmeter to the fan's (-) input terminal and the "ohms" or "+" lead of the ohmmeter to the fan's (+) input terminal.**

      Follow the guidelines in the table below:

Input Impedance	Fan Analysis	Action	Next Step
2.0M < ohms < 20M	Good	None	Go to Step 2B
ohms < 2.0M	Short Circuit	Replace	Go to Step 3
ohms > 20M	Open Circuit	Replace	Go to Step 3

   b. Test the "paired" rear fan:

      From the front of the cabinet, use a voltmeter to measure the DC voltage across the two female contact pins in the connector housing of the fan wire harness removed from the inoperative front fan in Step 1. (This voltage is the same voltage seen across the input terminals of the paired fan in the rear of the assembly.)

      Follow the guidelines in the table below:

Input Impedance	Fan Analysis	Action	Next Step
VDC > 25V	Good	(AHD1 or Front Fan failed)	
VDC < 25V	Short Circuit	Replace	Go to Step 3

3. To replace a fan located at the front of the switch cabinet, remove the fan assembly cover by pulling the cover outward. To replace a fan located at the rear of the switch cabinet, use a No. 10 slot screwdriver or 5/16-inch (8mm) wrench and remove the panel covering the fan assembly.
4. Loosen and remove the retaining screw nearest the power plug on the defective fan.

DANGER:
48-volt power is present on the fan plug.

5. Disconnect the power plug from the defective fan.
6. Loosen and remove the other retaining screw on the fan.
7. Remove the fan from the fan assembly.
8. Position the replacement fan and reconnect the fan power plug.
9. Insert and tighten the retaining screws.
10. Replace the fan assembly cover or panel.

Hardware Error Log Entries and Test to Clear Values

Cabinet Sensors Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test environment P sh r 1
1	Any	Cabinet Temperature Query Test (#122)	MINOR	ON	test environment P sh r 3
257	Any	Cabinet Temperature Query Test (#122)	MAJOR	ON	test environment P sh r 3

1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Battery & Battery Charger Query Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Battery & Battery Charger Query Test (#5) (a)	X	X	ND
AC Power Query Test (#78) (b)	X	X	ND
Power Unit Query Test (carrier E) (#127) (c)	X	X	ND
Power Unit Query Test (carrier D) (#127) (c)	X	X	ND
Power Unit Query Test (carrier A) (#127) (c)	X	X	ND
Power Unit Query Test (carrier B) (#127) (c)	X	X	ND
Power Unit Query Test (carrier C) (#127) (c)	X	X	ND
Emergency Transfer Query Test (#124) (d)	X	X	ND
Cabinet Temperature Query Test (#122)	X	X	ND
External Alarm Lead Query Test (#120) (e)	X	X	ND
Analog Ring Generator Initialization Test (#117) (f)	X	X	ND
Analog Ring Generator Query Test (#118) (f)	X	X	ND

1 D = Destructive; ND = Nondestructive

Notes:

a. Refer to POWER (Battery & Battery Charger) Maintenance documentation for a description of this test.

b. Refer to AC-POWER (AC-Power) Maintenance documentation for a description of this test.

c. Refer to CARR-POW (Carrier Port Power Unit for AC- and DC-Powered Systems) Maintenance documentation for a description of this test.

d. Refer to EMG-XFER (Emergency Transfer) Maintenance documentation for a description of this test.

e. Refer to EXT-DEV (External Alarm) Maintenance documentation for a description of this test.

f. Refer to RING-GEN (Analog Ring Generator) Maintenance documentation for a description of this test. This test shows up in the test sequence only if there is a TN768 Tone-Clock circuit pack in the port network being tested.

Cabinet Temperature Query Test [for Non-Variable Speed Fans] (#122)

This test queries the Maintenance/Tape Processor in a Standard system PPN, the Duplication Interface circuit pack in a PPN for a High or Critical Reliability system, or the EPN Maintenance circuit pack in an EPN for the status of the cabinet sensors in the cabinet that contains non-variable speed fans.

NOTE:
The descriptions for Error Codes 1 and 2 (FAIL) in the following table are reversed for Generic 1 systems that use a TN731B maintenance circuit pack . That is, Error Code 1 indicates an "over temperature" problem while Error Code 2 indicates and "air flow" problem. If you are servicing a Generic 1 system, be sure to follow the proper service strategy.

Table 11-52. TEST #122 Cabinet Temperature Query Test [Non-Variable Speed Fans]

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-52. TEST #122 Cabinet Temperature Query Test [Non-Variable Speed Fans] — *Continued*

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to ABORT with Error Code 2000, check for system powering problems with the A carrier (PPN or EPN). Look for and resolve all AC-POWER and CARR-POW alarms in a multicarrier cabinet system or DC-POWER alarms in a single-carrier cabinet system. Then, repeat the test. 3. If the test continues to ABORT with a Error Code 2000, check for and resolve all DUPINT (Duplication Interface) errors in a Duplicated Option PPN, PR-MAINT (Maintenance/Tape Processor) errors in a standard PPN, or MAINT (EPN Maintenance circuit pack) errors in an EPN. Then, repeat the test. 4. If the test continues to ABORT with a Error Code 2000, escalate the problem.
2029	ABORT	Internal System Error. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-52. TEST #122 Cabinet Temperature Query Test [Non-Variable Speed Fans] — *Continued*

Error Code	Test Result	Description/ Recommendation
1	FAIL	The AHD1 circuit pack has reported an air flow problem. The temperature difference between the air intake and the air exhaust is at least 15^0 C (27^0 F) **and** the absolute temperature at the top of the cabinet is at least 50^0 C ($122\ ^0$F) (referred to as the 15^0 C/50^0 C criteria). The fans should be running at high speed. 1. If none of the fans are running, then: a. Look for and resolve all alarms against the CARR-POW (Carrier Port Power Unit). b. Verify -48 volt DC power is available to the fan units. Check the fan unit wiring harness connector. Check that there is 48 volt DC between pins 3, 9, 11 and 2, 8, 10. ■ If there is -48 volt DC power at the connector, there should be power to the fans. If the fans are not running, replace the AHD1. If the fans still do not run, escalate the problem. ■ If there is no -48 volt DC power at the connector, then the current limiter card (982LS) is probably defective. Replace the current limiter card. If the fans still do not run, escalate the problem. 2. If only a few of the fans are not running, replace the defective fans. 3. If all the fans can be started, wait five minutes and rerun the test. If the test fails again, proceed to Step 4 or 5 as applicable.

Continued on next page

Table 11-52. TEST #122 Cabinet Temperature Query Test [Non-Variable Speed Fans] — *Continued*

Error Code	Test Result	Description/ Recommendation
1	FAIL *(cont'd.)*	4. If the fans are not at high speed, measure the cabinet temperature at the air intake and the air exhaust at the top of the cabinet. a. If the 15^0 C/50^0 C criteria is met, there is a problem with either the AHD1 circuit pack or the fans that is preventing the fans from operating at high speed. Replace the AHD1 circuit pack and/or the fans. If this succeeds in getting the fans to run at high speed, wait five minutes to give the cabinet time to cool down and, rerun the test. If the problem persists, go to step 5. b. If the 15^0 C/50^0 C criteria is not met, the PR-MAINT (Maintenance/Tape Processor), DUPINT (Duplication Interface) circuit pack, or the EPN MAINT (Maintenance) circuit pack is incorrectly reporting this condition. Look for and resolve all errors on these maintenance objects first, then rerun the test. If the test still fails, escalate the problem. 5. If the fans are running at the high speed, check the items on list that follows. Any on of the items could be restricting or redirecting the flow of air within the cabinet. a. Check both filters. If a filter is dirty or clogged it should be cleaned or replaced. The filters can either be washed with soap and water or vacuumed. b. Make sure there is nothing (other than circuit packs) in the carrier slots that could be restricting the air flow. c. Make sure there are no missing (blank) circuit pack or carrier faceplates. Install and/or replace them as necessary. d. Make sure the cabinet door is properly closed. The door must be closed for the fans to be able to properly cool the cabinet. Wait five minutes to give the fans a chance to cool the cabinet. Rerun the test. If the tests still fails, proceed to Step 6.

Continued on next page

Table 11-52. TEST #122 Cabinet Temperature Query Test [Non-Variable Speed Fans] — *Continued*

Error Code	Test Result	Description/ Recommendation
1	FAIL *(cont'd.)*	6. At this point, there should be nothing impeding the air flow, and the fans should be running at high speed. Check the temperatures for the 15^0 C/50^0 C criteria. a. If the 15^0 C/50^0 C criteria exists, a temperature problem exists, and the fans (at high speed) should cool down the switch. Wait five minutes and rerun the test. If the test still fails, the ambient room temperature is probably too high, and the room should be cooled. b. If the 15^0 C/50^0 C criteria does not exist, the AHD1 circuit pack, the fans, or the S3 or S4 sensors are defective. Replace these items one at a time (in the order listed). Rerun the test between each replacement. Failures can occur on the Maintenance/Tape Processor, the Duplication Interface, and the EPN Maintenance circuit pack that **are not** detected by the respective maintenance, but that cause many, if not all, environment tests to fail. If many environment tests are failing, the suspect circuit pack, depending on the system configuration, should be replaced and the test rerun. If this does not clear the problem, follow normal escalation procedures.

Continued on next page

Table 11-52. TEST #122 Cabinet Temperature Query Test [Non-Variable Speed Fans] — *Continued*

Error Code	Test Result	Description/ Recommendation
2	FAIL	The PR-MAINT (Maintenance/Tape Processor), DUPINT (Duplication Interface) circuit pack, or the EPN MAINT (Maintenance) circuit pack has reported a temperature problem because the S1 sensor has detected a temperature of at least 65^0 C (149^0 F). The entire cabinet is in danger of being powered down if the temperature reaches 70 ^{0}C (158^0 F). 1. If none of the fans are running: a. Look for and resolve all alarms against the CARR-POW (Carrier Port Power Unit). b. Verify that 48 volt DC is available to the fan units. Check the fan unit wiring harness connector. Verify that there is 48 volt DC between pins (3, 9, 11 and 2, 8, 10). ■ If there is 48 volt DC at the connector, there should be power to the fans. If the fans are not running, replace the AHD1. If the fans still do not run, follow normal escalation procedures. ■ If there is not 48 volt DC at the connector, the current limiter card (982LS) is probably defective. Replace the current limiter card. If the fans still do not run, escalate the problem. 2. If only a few of the fans are not running, replace the defective fans. 3. If all the fans can be started, wait five minutes, and rerun the test.If the test fails again, proceed to Step

Continued on next page

Table 11-52. TEST #122 Cabinet Temperature Query Test [Non-Variable Speed Fans] — *Continued*

Error Code	Test Result	Description/ Recommendation
2	FAIL *(cont'd.)*	4. Check the temperature at the top of the cabinet. If the temperature is at least 65^0 C (149^0 F), the ambient room temperature is too high, and the fans cannot cool the system. Unless the room temperature is reduced, the system is going to shut down soon. If the temperature is less than 65^0 C, then: a. The PR-MAINT (Maintenance/Tape Processor), DUPINT (Duplication Interface) circuit pack, or the EPN MAINT (Maintenance) circuit pack may be incorrectly reporting this condition. First, look for and resolve all errors on these MOs, then rerun the test. If this test fails again, return to Step 1. If there are no errors, continue. b. The sensor S1 may be incorrectly reporting the temperature at the top of the cabinet. Replace sensor S1, and rerun the test. If the test still fails, escalate the problem.
3	FAIL	The AHD1 circuit pack has reported both air flow and temperature problems. Resolve the airflow error first, then, correct the temperature error as described previously.
	PASS	The AHD1 circuit pack has not reported any temperature or air flow problems. The temperatures at the air exhaust at the top of the cabinet and the air intake at the bottom of the cabinet can be measured and the results compared against the criteria described previously. If a problem has been reported, troubleshoot this problem by using the procedures for the "FAIL" cases described previously.

CAP-MEM (Memory Card Capacity) [386 Systems]

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run	Full Name of MO
CAP-MEM	MINOR/ WARNING[1]	test card-mem long	Memory Card Capacity

1 The WARNING alarm is generated when the alarm is downgraded by using the **set option** command.

Memory Card Capacity tracks the percentage of used translation storage space on the memory card. Whenever translation space usage on the memory card reaches 98% of capacity, an alarm is generated. This alarm serves to inform the user that a larger flash card may be required for the system.

Hardware Error Log Entries and Test to Clear Values

Memory Card Capacity Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
1 (a)	112	Memory Card Capacity Test (#1014)	MINOR/ WARNING (b)	OFF	test card-mem long

Notes:

a. The memory card translation storage space is at least or more than 98% full.

b. This alarm has been downgraded by the **set option** command.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table that follows when you are inspecting errors in the system. By clearing error codes associated with the "Memory Card Capacity Test," for example, you may also clear errors generated from other tests in the testing sequence. The "Memory Card Capacity Test" can be initiated via either the **test card-mem long** command or after a **save translation** command.

Memory Card Capacity Test (#1014)		X	ND

1 D = Destructive; ND = Nondestructive

Notes:

a. Refer to 12V-PWR (12 Volt Power Supply) Maintenance documentation for a description of this test.

b. Refer to CARD-MEM (Memory Card) Maintenance documentation for a description of this test.

Memory Card Capacity Test (#1014)

This test is a nondestructive test. The purpose of the test is to verify that the percentage of translation storage space used in the memory card is less than 98%.

This test can be initiated through a system technician demanded **test card-mem long** command, or it can be executed as part of a maintenance test sequence after the **save translation** operation.

Table 11-53. TEST #1014 Memory Card Capacity Test

Error Code	Test Result	Description/ Recommendation
112	ABORT	The Memory Card Translation storage is at least 98% full. 1. Inform the user that it may be necessary to upgrade to a larger flash card. 2. Replace the memory card with a larger one, or downgrade the alarm to WARNING by using the **set option** command. 3. Rerun the test.
2012 2106 2114	ABORT	Internal System Error 1. Retry the command at one minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
2013 2100	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one minute intervals a maximum of five times 2. If the test continues to abort, escalate the problem.
2108	ABORT	The NETCON circuit pack is not a TN777B circuit pack. 1. Follow the Standard Repair Procedures for repairing the NETCON circuit pack with the TN777B circuit pack. 2. Re-enter the **test card-mem long** command.

Continued on next page

Table 11-53. TEST #1014 Memory Card Capacity Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2110	ABORT	No Memory card is inserted. 1. Insert a formatted memory card into the slot at the TN777B NETCON circuit pack. 2. Rerun the test.
	PASS	The Memory Card Translation storage is less than 98% full.

CARD-MEM (Memory Card)

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run	Full Name of MO
CARD-MEM	MAJOR[1]		Memory Card
CARD-MEM	MINOR	test card-mem long	Memory Card
CARD-MEM	WARNING	test card-mem sh	Memory Card

1 The "MAJOR" alarm occurs only at power-up time or on a Reset System 3, 4, or 5 when the switch cannot load all translations from the memory card.

A memory card contains a set of flash EPROM memory devices. The data can be stored in a memory card and can remain nonvolatile, even when the power is off. In a 386 system, the memory card is installed into the TN777B NETCON circuit pack to save the translations, announcements, and core dumps. During the system reboot or a system power down condition, the in-core system maintenance hardware error logs are temporarily saved in the memory card before the system goes down. When the system is restarted, the error logs file is read back from the memory card.

The Hard Patch feature also uses the memory card as temporary storage when LMM applies an update file to the in-core system software. The system software is stored in the "flash" section of main memory. The memory card used for saving translations doesn't contain a copy of the system software.

The recommended size of a memory card for each configuration is described in the following table.

Memory Card Size	Usage	File Names
1 Megabyte	Without Announcements	translation
4 Megabyte	With Announcements	translation announcements
10 Megabyte	With Announcements	translation announcements
10 Megabyte	Maintenance	translation announcements core_ dump
10 Megabyte	System Upgrade	system_software

Customers can have either 1 MB, 4 MB, or 10 MB memory cards for the normal operations. 10 MB memory cards are also used for maintenance and software upgrades. The software upgrade memory card cannot be used for saving translations.

Always use 4 MB memory Cards, 10 MB memory cards should only be used when a 4MB card gives an error in the CAP-MEM Maintenance Object Test #1014 (Memory Card Capacity Test).

A memory card has a write-protection switch along its edge. If the write-protection switch is enabled, the memory card cannot be written to.

The 12 volt power supply unit located in TN777B NETCON circuit pack supports the erase and write operations of flash memory devices in the TN786B or TN790 Processor circuit pack. The unit also supports the memory card inserted in the TN777B NETCON circuit pack. If the 12 volt power supply unit cannot be turned on to supply 12 volts, all erase and write operations fail. Refer to 12V-PWR (12 volt power supply) Maintenance documentation for a detailed description.

To write data (for example, translations) onto a memory card, the system software first erases the memory card and then writes the data. An erased bit can be written again, but a written bit cannot be changed or written again until after the next erasure. Software erase and write operations on a memory card take longer as the card usage increases. A memory card that cannot be erased or written to by software should be replaced.

Removing A Memory Card From The Slot

A memory card can be removed from the slot at the TN777B NETCON circuit pack only when the fourth yellow LED with a label "card-in-use" is not glowing. Otherwise, the memory card operation might be interrupted abnormally, and the files stored in the memory card may become corrupted.

Resolving an Alarm Raised Against a Memory Card

The list that follows discusses the procedures for resolving an alarm that is raised against a memory card:

1. Remove the inserted memory card from the slot at the TN777B NETCON circuit pack while the "card-in-use" amber LED on TN777B is not glowing.
2. Insert the new formatted memory card firmly into the slot at the TN777B NETCON circuit pack.
3. Enter the **test card-mem** command to verify the new memory card.
4. If the alarm cannot be resolved by replacing the memory card, do the following:
    a. Remove the memory card from the TN777B NETCON circuit pack.

   b. Replace the TN777B NETCON circuit pack in the appropriate control carrier. Since the TN777B is in the SPE control complex, follow the standard procedures for replacing an SPE circuit pack.
   c. Insert the memory card back into the slot at the TN777B circuit pack.
   d. Enter the **test network-control [long]** command to verify the new TN777B and the memory card.
5. Once the alarm is resolved, enter the **save translation** command to store the current system translations to the memory card.
6. If applicable, enter the **save announcements** command to store the current announcements to the memory card.

1537(g)	104 105 106 107 108	Memory Card Erase/Write/Read Test (#693)	MINOR	OFF	test card-mem long
3329(h)	any	None	MINOR/ MAJOR	OFF	
3841(i)	Any	Save Translation	MINOR	OFF	save translation
3843(j)	Any	Save Translation	MINOR	OFF	save translation

1 Run the Short Test sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

a. System detects that no memory card is inserted in the slot at the TN777B NETCON circuit pack. If a memory card is in place, the memory card may have a bad physical connection.

b. System software cannot recognize the inserted memory card because the inserted memory card is not formatted or the directories in the memory card are corrupted. The system cannot use this memory card. The memory card must be replaced with a good memory card.

c. The inserted memory card does not have enough storage space to support system operations, such as saving translations and, if applicable, announcements; or, the memory card is a system-upgrade memory card that cannot be used for saving translations. This hardware error raises a WARNING/OFF_BOARD alarm. The memory card should be replaced with one of the recommended size.

   The "Aux Data" field contains the following error codes:

   - 101: Inserted memory card is a system-upgrade memory card
   - 102: While the announcement feature is in use, no announcement file is available in the memory card
   - 103: The inserted memory card is a system-upgrade memory card, and, while the announcement feature is in use, no announcement file is available in the memory card.
   - 116: The capacity of the inserted memory card doesn’t match the system configuration.
   - 118: While the announcement feature is in use, no announcement file is available in the memory card, and the capacity of the inserted memory card doesn’t match the system configuration.
   - 132: System translation reaches a 98% capacity of the memory card reserved storage space.
   - 134: While the announcement feature is in use, no announcement file is available in the memory card, and system translation reaches a 98% capacity of the memory card reserved storage space.
   - 148: The capacity of the inserted memory card doesn’t match the system configuration, and system translation reaches a 98% capacity of the memory card reserved storage space.
   - 150: While the announcement feature is in use, no announcement file is available in the memory card, and the capacity of the inserted memory card doesn’t match the system configuration. Also, the system translation reaches a 98% capacity of the memory card reserved storage space.

d. The write-protection switch of the memory card is in the "protected" position. A write-protected memory card can not be erased or written. Before entering the **test** command to resolve the alarm, follow the standard procedure for taking the memory card out of the slot. Then, change the "write-protection" switch to the "not-protected" position. Finally, insert the memory card back into the slot.

e. The memory card has been detected with a broken directory. A MINOR/OFF_BOARD alarm is raised when maintenance cannot restore the broken directory. The memory card must be replaced before the test to resolve the alarm is run.

   The "Aux Data" field contains the following error codes:

   - 104: Directories on the memory card are corrupted and cannot be recovered.
   - 105: "0" cannot be written into the memory card before an erase operation.
   - 106: Memory card cannot be erased.
   - 107: Data cannot be written into a memory card after an erasure.
   - 108: 12 volt power supply for directory recovery can't be turned on. The 12 volt power supply on TN777B NETCON circuit pack may be defective. Follow the standard procedure to replace the TN777B NETCON circuit pack.

f. The translations file stored in the memory card is corrupted with a checksum error during the read operation. The memory card can no longer hold the written data. Enter the **save translation** command to restore the translations. Then, run the **test** command to clear the alarm. If the error occurs repeatedly, replace the memory card.

g. The maintenance test "Memory Card Erase/Write/Read Test" failed. Enter the **status card-mem** command to verify that a user's memory card is inserted and that the write-protection switch of the memory card is off. Rerun the **test card-mem** command to verify that the 12 volt power supply is functional.

   Enter the **test card-mem long** command again to verify the test result of the "Memory Card Erase/Write/Read Test." If the test still fails, the memory card should be replaced. After the new memory card is inserted, enter the **test card-mem long** command again to resolve the alarm.

   The "Aux Data" field contains the same error codes as for Error Type "1025." See Note (e).

h. There was an error while translations were being loaded. The relevant alarm occurs at power-up or on a Reset System 3, 4, or 5 if the switch cannot load translations.

   In a standard system, the alarm invokes Emergency Transfer. The repair procedure for a standard system is provided in the list that follows:

NOTE:
Follow this procedure **only** if there are no other memory card errors or alarms. If such errors or alarms exist, resolve them before trying to resolve this alarm.

1. After you resolve all other memory card problems, issue the **reset system 3** command.
2. After the system is restarted, issue the **status card-mem** command.
3. If the "translation" is not present, insert a backup memory card and then issue the **reset system 3** command.
4. If the problem is *not* resolved, follow normal escalation procedures.

NOTE:
In a High or Critical Reliability System where the problem is in the Standby SPE, use the procedure above substituting **reset spe-standby 3** and **status card-mem a/b** for the Standby SPE.

i. The "save translation" operation failed. The reasons for failure are described in the "Aux Data" field and include the following:

1	Directory file on the memory card failed the checksum test
2	NETCON is not a TN777B circuit pack
3	Too many commands are running
4	Command has been aborted
5	Command has collided with a current command
6	Software controller is idle
7	Memory card has been erased
8	Only one good directory is on the card
9	All directories are corrupted, and the memory card needs reformatting
10	Hard patch file is full
11	Hardware fault: data can't be written into the memory card
12	Software error: passed parameters were out of range
13	Command has been aborted
14	Magic number is illegal
15	Driver was trapped when reading the memory card
16	No memory card is inserted

Continued on next page

17	Second directory in the memory card couldn't be found
18	File in the memory card is not available
19	Memory card does not match the system usage
20	Memory card is too small for the system usage
21	Broken directory couldn't be recovered
22	System upgrade card is inserted
23	Illegal write is requested
24	Generic software failure
25	Driver timed out
26	Driver is unable to program "O's" in the memory card
27	Memory card can't be erased
28	Memory card is write-protected
29	12 volt power supply could not be turned on
109	Standby SPE does not respond to the request from the Active SPE
124	Can't access Standby SPE for saving translation

A MINOR/OFF_BOARD alarm is raised when two consecutive "save translation" operations fail. The alarm is resolved only when the translation is saved onto the memory card successfully.

j. The save translations failure is due to other hardware failures. Enter the **test card-mem long** command and resolve other card-mem failures first. After the all test card-mem pass message is received, use the **save translation** command to resolve this error.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when you are inspecting errors in the system. By clearing error codes associated with the *Memory Card Insertion Test* for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	Reset Board Sequence	D/ND[1]
12 Volt Power Supply Test (#701) (a)	X	X		ND
Memory Card Insertion Test (#695)	X	X		ND
Memory Card Format and Read Test (#696)	X	X		ND
Memory Card Match Test (#697)	X	X		ND
Memory Card Write-Protected Test (#698)	X	X		ND
Memory Card Directory Recovery Test (#699)	X	X		ND
Memory Card Translation Data Integrity Test (#694)		X		ND
Memory Card Erase/Write/Read Test (#693)		X		ND

1 D = Destructive; ND = Nondestructive

a. Refer to 12V-PWR (12 Volt Power Supply) Maintenance documentation for a description of this test.

Memory Card Erase/Write/Read Test (#693)

The purpose of this test, which is nondestructive, is to verify the erase, write, and read operations. The test erases the backup copy of the translation file stored in the memory card, and it verifies that the erase operation works. The test then writes the primary copy of the translation file from the same memory card to the erased flash segment, and it verifies that the translation file is written successfully.

This test can be initiated through a system technician demanded **test card-mem long** command, or it can be executed as part of a maintenance test sequence when the "save translation" and "save announcements" operations fail. The test and relevant applications (for example, saving translations, saving announcements) cannot be executed at the same time.

Table 11-54. TEST #693 Memory Card Erase/Write/Read Test

Error Code	Test Result	Description/ Recommendation
1192	ABORT	Applications are accessing the memory card. 1. Wait 10 minutes for the applications to complete. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to abort, escalate the problem.
2012 2106 2114	ABORT	Internal System Error. 1. Retry the command at one minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
2013 2100 none	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
2108	ABORT	The NETCON circuit pack is not a TN777B circuit pack. 1. Follow the Standard Repair Procedures for replacing the NETCON circuit pack with the TN777B circuit pack. 2. Re-enter the **test card-mem** command.

Continued on next page

Table 11-54. TEST #693 Memory Card Erase/Write/Read Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2110	ABORT	No memory card is inserted. 1. Insert a formatted memory card into the slot at the TN777B NETCON circuit pack. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to abort, escalate the problem.
2111	ABORT	Inserted memory card cannot be recognized. 1. Insert a formatted memory card into the slot at the TN777B NETCON circuit pack. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to abort, escalate the problem.
2112	ABORT	Internal system error. The inserted memory card is a "system-upgrade" memory card. 1. Replace the inserted memory card with a user's memory card. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to abort, escalate the problem.
2115	ABORT	The memory card is write-protected. 1. Take the memory card out, and change the "write-protection" switch to the "not-protected" position. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-54. TEST #693 Memory Card Erase/Write/Read Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2113	ABORT	The inserted memory card has only one directory file. 1. Enter the **test card-mem** command, and verify that the "Memory Card Directory Recovery Test" (#699) passes. If the directory file cannot be recovered, replace the memory card. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to abort, escalate the problem.
2117	ABORT	No translation file has been saved onto the memory card. 1. Enter the **save translation** command, and verify that the translations are saved onto the memory card successfully. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-54. TEST #693 Memory Card Erase/Write/Read Test — *Continued*

Error Code	Test Result	Description/ Recommendation
104	FAIL	Directories on the memory card are corrupted and cannot be recovered.
105	FAIL	"0" cannot be written into memory before an erase operation.
106	FAIL	Memory card cannot be erased.
107	FAIL	Data cannot be written onto a memory card after an erasure. 1. Replace the memory card and re-run the test. 2. If the test continues to fail, escalate the problem.
108	FAIL	12 volt power supply for the Memory Card Erase/Write/Read Test can't be turned on. The 12 volt power supply on TN777B NETCON circuit pack may be defective. 1. Re-enter the **test card-mem** command, and verify the result of Test 701 for the 12 Volt Power Supply. 2. If Test 701 fails, follow the Standard Repair Procedure to replace the TN777B NETCON circuit pack with a new TN777B circuit pack. 3. Re-enter the command a one minute intervals a maximum of five times. 4. If the test continues to fail, escalate the problem.

Memory Card Translation Data Integrity Test (#694)

This test, which is nondestructive, verifies the integrity of the translation file stored in the memory card by reading (without any PREC updates) the translation file from the memory card and by then performing a checksum error checking. The calculated checksum value is compared with the recorded checksum value in the translation file. If these two values are different, this indicates that the translation file is corrupted.

Table 11-55. TEST #694 Memory Card Translation Data Integrity Test

Error Code	Test Result	Description/ Recommendation
2012 2106 2114	ABORT	Internal System Error. 1. Retry the command at one minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
2013 2100 none	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
2108	ABORT	The NETCON circuit pack is not a TN777B circuit pack. 1. Follow the Standard Repair Procedures for replacing the NETCON circuit pack with the TN777B circuit pack. 2. Re-enter the **test card-mem** command.
2110	ABORT	No memory card is inserted. 1. Insert a formatted memory card into the slot at the TN777B NETCON circuit pack. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-55. TEST #694 Memory Card Translation Data Integrity Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2111	ABORT	Inserted memory card cannot be recognized. 1. Insert a new formatted memory card into the slot at the TN777B NETCON circuit pack. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to abort, escalate the problem.
2112	ABORT	Internal system error. The inserted memory card is a "system-upgrade" memory card. 1. Replace the inserted memory card with a user's memory card. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to abort, escalate the problem.
Any	FAIL	A checksum error is detected in the translation file that is stored in the inserted memory card. 1. Enter the **save translation** command, and verify that translations can be successfully saved onto the memory card. 2. Rerun the test. 3. If the test fails again, replace the memory card, and repeat Steps 1 and 2. 4. If the test continues to fail after the memory card is replaced, escalate the problem.
	PASS	No checksum error is found in the translation file.

Memory Card Insertion Test (#695)

This test, which is nondestructive, verifies whether a memory card is inserted into the memory card slot at the TN777B NETCON circuit pack and also whether the system can detect its existence.

Table 11-56. TEST #695 Memory Card Insertion Test

Error Code	Test Result	Description/ Recommendation
2012 2106 2114	ABORT	Internal System Error. 1. Retry the command at one minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
2013 2100 none	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
2108	ABORT	The NETCON circuit pack is not a TN777B circuit pack. 1. Follow the Standard Repair Procedures for replacing the NETCON circuit pack with the TN777B circuit pack. 2. Re-enter the **test card-mem** command.

Continued on next page

Table 11-56. TEST #695 Memory Card Insertion Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	FAIL	No memory card is inserted in the TN777B NETCON circuit pack, or the inserted memory card has a bad connection. 1. Insert a memory card into the slot at the TN777B NETCON circuit pack. 2. If a memory card is already inserted, take the memory card out and examine the connectors of the memory card and the TN777B NETCON circuit pack. Insert the memory card into the slot again. 3. When a memory card is pushed into the slot, make sure that the memory card is inserted firmly into the slot. 4. Re-enter the **test card-mem** command. If the test still fails, replace the memory card, and then repeat this step one more time. 5. If the test still fails after you replace the memory card, replace the TN777B NETCON circuit pack. Follow the Standard Repair Procedures for a memory card. 6. If the problem can not be resolved by replacing both memory card and TN777B NETCON circuit pack, escalate the problem.
	PASS	A memory card is inserted into the TN777B NETCON circuit pack, and the system can recognize its existence.

Memory Card Format and Read Test (#696)

This test is a nondestructive test. The memory card used in a 386 system must be formatted before an application. The test reads the directory file from the memory card, and it verifies the integrity of the directory file.

Table 11-57. TEST #696 Memory Card Format and Read Test

Error Code	Test Result	Description/ Recommendation
2012 2106 2114	ABORT	Internal System Error. 1. Retry the command at one minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
2013 2100 none	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
2108	ABORT	The NETCON circuit pack is not a TN777B circuit pack. 1. Follow the Standard Repair Procedures for replacing the NETCON circuit pack with the TN777B circuit pack. 2. Re-enter the **test card-mem** command.
2110	ABORT	No memory card is inserted. 1. Insert a formatted memory card into the slot at the TN777B NETCON circuit pack. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to abort, escalate the problem.
2113	ABORT	One of the two directories in the memory card is corrupted. 1. Re-enter the **test card-mem** command, and verify that Test #699 passes. 2. If the test is aborted again with this error code, replace the memory card.

Continued on next page

Table 11-57. TEST #696 Memory Card Format and Read Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	FAIL	System software cannot recognize the inserted memory card. The memory card is not formatted, or the directories of the memory card are corrupted. 1. Replace the memory card with a new formatted memory card. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to fail, escalate the problem.
	PASS	System recognizes the inserted memory card, and it can read the directories from the memory card.

Memory Card Match Test (#697)

This test is a nondestructive test. The test verifies the inserted memory card for consistency with the system configuration. The test helps answer the following questions:

- Is the inserted memory card a system software upgrade card?
- Does the size of the inserted memory card match the capacity of the system configuration?
- Does the inserted memory card contain the Announcement file for a system with an Announcement circuit pack?
- Does the size of the translations in the system reach 98% of the reserved storage space on the memory card?

If the answer to any of these questions is "yes," maintenance raises a WARNING alarm for service attention. A new memory card is usually required.

Table 11-58. TEST #697 Memory Card Match Test

Error Code	Test Result	Description/ Recommendation
2012 2106 2114	ABORT	Internal System Error. 1. Retry the command at one minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
2013 2100 none	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
2108	ABORT	The NETCON circuit pack is not a TN777B circuit pack. 1. Follow the Standard Repair Procedures for replacing the NETCON circuit pack with the TN777B circuit pack. 2. Re-enter the **test card-mem** command.
2110	ABORT	No memory card is inserted. 1. Insert a formatted memory card into the slot at the TN777B NETCON circuit pack. 2. Rerun the test.

Continued on next page

Table 11-58. TEST #697 Memory Card Match Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2111	ABORT	Inserted memory card is not formatted. 1. Insert a formatted memory card into the slot at the TN777B NETCON circuit pack. 2. Rerun the test.
101	FAIL	The inserted memory card is a system-upgrade memory card. 1. Replace the memory card with a user's memory card. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to fail, escalate the problem.
102	FAIL	The inserted memory card does not contain an Announcements file, and the system is configured with the Announcement feature. 1. Replace the memory card with a 10 MB memory card. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to fail, escalate the problem.
103	FAIL	The memory card is a system-upgrade memory card and, while the announcement feature is in use, no announcement file is available in the memory card. 1. Replace the memory card with one of a larger size. See the system configuration guidelines. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to fail, escalate the problem.

Continued on next page

Table 11-58. TEST #697 Memory Card Match Test — *Continued*

Error Code	Test Result	Description/ Recommendation
116	FAIL	The capacity of the inserted memory card doesn't match the system configuration. 1. Replace the memory card with one of a larger size. See the system configuration guidelines. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to fail, escalate the problem.
118	FAIL	While the announcement feature is in use, no announcement file is available in the memory card, and the capacity of the inserted memory card doesn't match the system configuration. 1. Replace the memory card with one of a larger size. See the system configuration guidelines. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to fail, escalate the problem.
132	FAIL	Translation reaches 98% of the memory card reserved storage space. 1. Replace the memory card with one of a larger size. See the system configuration guidelines. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to fail, escalate the problem.
134	FAIL	While the announcement feature is in use, no announcement file is available in the memory card, and system translation reaches a 98% capacity of the memory card reserved storage space. 1. Replace the memory card with one of a larger size. See the system configuration guidelines. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to fail, escalate the problem.

Continued on next page

Table 11-58. TEST #697 Memory Card Match Test — *Continued*

Error Code	Test Result	Description/ Recommendation
148	FAIL	The capacity of the inserted memory card doesn't match the system configuration, and system translation reaches 98% of the memory card reserved storage space. 1. Replace the memory card with one of a larger size. See the system configuration guidelines. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to fail, escalate the problem.
150	FAIL	While the announcement feature is in use, no announcement file is available in the memory card, and the capacity of the inserted memory card doesn't match the system configuration. Also, system translation reaches a 98% capacity of the memory card reserved storage space. 1. Replace the memory card with one of a larger size. See the system configuration guidelines. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to fail, escalate the problem.
	PASS	The inserted memory card matches the system configuration, and the card has enough space for saving translations and (if applicable) announcements.

Memory Card Write-Protection Test (#698)

This test, which is nondestructive, verifies whether the write-protected switch on the memory card is turned on. The memory card cannot be erased or written to when the write-protected switch is on.

Table 11-59. TEST #698 Memory Card Write-Protected Test

Error Code	Test Result	Description/ Recommendation
2012 2106 2114	ABORT	Internal System Error. 1. Retry the command at one minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
2013 2100 none	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
2108	ABORT	The NETCON circuit pack is not a TN777B circuit pack. 1. Follow the Standard Repair Procedures for replacing the NETCON circuit pack with the TN777B circuit pack. 2. Re-enter the **test card-mem** command.
2110	ABORT	No memory card is inserted. 1. Insert a formatted memory card into the slot at the TN777B NETCON circuit pack. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to abort, escalate the problem.
2111	ABORT	Inserted memory card is not formatted. 1. Insert a formatted memory card into the slot at the TN777B NETCON circuit pack. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-59. TEST #698 Memory Card Write-Protected Test — *Continued*

Error Code	Test Result	Description/ Recommendation
	FAIL	The "Write-Protection" switch of the inserted memory card is turned on at the "protection" position. 1. Take the inserted memory card out, and move the "write-protection" switch to the "not-protected" position. 2. Insert the memory card back into the slot. 3. Retry the command at one minute intervals a maximum of five times. 4. If the test continues to fail, escalate the problem.
	PASS	The inserted memory card is not write-protected.

Memory Card Directory Recovery Test (#699)

This test is a nondestructive test. All memory cards, except the memory card for system software upgrade, have two copies of both directory files and translation files to ensure that there is at least a good translation file in the memory card at any time, especially during the "save translation" operation.

If one of the two directory files (for example, the directory file) is missing or broken (for example, the directory file has a bad checksum), maintenance can build the directory file.

The Memory Card Directory Recovery Test

- Verifies the integrity of both active and backup directory files in a memory card, and
- Requests a rebuilding of the directory file if the file is missing or corrupted.

When the test passes, both directories are sane.

If the memory card is a system-upgrade memory card, the test is aborted.

If the test fails, the broken or missing directory cannot be rebuilt. As a result, all subsequent "write-to-memory card" operations are blocked. Whenever an alarm is raised and Error Type 1025 for "CARD-MEM" is active, the memory card should be replaced.

Table 11-60. TEST #699 Memory Card Directory Recovery Test

Error Code	Test Result	Description/ Recommendation
1192	ABORT	Contention error. Applications are accessing the memory card. 1. Wait 10 minutes for the applications to complete. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to abort, escalate the problem.
2012 2106 2114	ABORT	Internal System Error. 1. Retry the command at one minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-60. TEST #699 Memory Card Directory Recovery Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2013 2100 none	ABORT	Could not allocate the necessary system resources to run this test. 1. Retry the command at one minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
2108	ABORT	The NETCON circuit pack is not a TN777B circuit pack. 1. Follow the Standard Repair Procedures for replacing the NETCON circuit pack with the TN777B circuit pack. 2. Re-enter the **test card-mem** command.
2110	ABORT	No memory card is inserted. 1. Insert a formatted memory card into the slot at the TN777B NETCON circuit pack. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to abort, escalate the problem.
2111	ABORT	Inserted memory card cannot be recognized. 1. Insert a new formatted memory card into the slot at the TN777B NETCON circuit pack. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to abort, escalate the problem.
2112	ABORT	Internal system error. The inserted memory card is a "system-upgrade" memory card. 1. Replace the inserted memory card with a user's memory card. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to abort, escalate the problem.

Continued on next page

Table 11-60. TEST #699 Memory Card Directory Recovery Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2115	ABORT	The memory card is write-protected. 1. Take the memory card out, flip the "write-protection" switch to the "not-protected" position, and insert the memory card back into the slot. 2. Retry the command at one minute intervals a maximum of five times. 3. If the test continues to abort, escalate the problem.
104	FAIL	Directories in the memory card are corrupted and cannot be recovered.
105	FAIL	"0" cannot be written into memory before an erase operation.
106	FAIL	Memory card cannot be erased.
107	FAIL	Data cannot be written into a memory card after the erase operation. Maintenance cannot restore the missing or broken directory file in the inserted memory card. 1. Replace the memory card with a new formatted one. 2. Retry the command at one minute intervals a maximum of five times. If the test continues to fail, escalate the problem.
108	FAIL	12 volt power supply for directory recovery can't be turned on. The 12 volt power supply on TN777B NETCON circuit pack may be defective.
		1. Re-enter the **test card-mem** command, and verify the result of Test 701 for 12 Volt Power Supply. 2. If Test 701 fails, follow the Standard Repair Procedure to replace the TN777B NETCON circuit pack with a new TN777B circuit pack. 3. Retry the command at one minute intervals a maximum of five times. 4. If the test continues to fail, escalate the problem
	PASS	Both directory files in the inserted memory card are sane.

CARR-POW (Carrier Port Power Unit) for AC-Powered Systems

MO Name As It Appears in Alarm Log	Alarm Level	Initial System Technician Command to Run[1]	Full Name of MO
CARR-POW	MAJOR	recycle carrier PC	Carrier Port Power Unit

1 Recycle the carrier indicated by the PORT field in the Alarm Log.

DEFINITY Generic 1 offers two basic cabinet type configurations: (1) the multicarrier cabinet system and (2) the single-carrier cabinet system. Both cabinet system configurations may be powered by either an external AC or DC power source.

NOTE:
For environment maintenance, the aspects of a PPN configuration for a High or Critical Reliability system or of an EPN cabinet configuration are irrelevant.

The environment maintenance strategy to be used depends on both the cabinet configuration and the type of powering. Therefore, refer to the following list to find the appropriate MO section(s).

- For a single-carrier cabinet system, refer to the "DC-POWER (Single-Carrier Cabinet Power)" Maintenance documentation for environment maintenance strategy.
- For a multicarrier cabinet system using an external AC power source, refer to one or more of the following Maintenance documentation sections: "AC-POWER (AC Power) for AC-Powered Systems", "CARR-POW (Carrier Port Power Unit) for AC-Powered Systems", or "POWER (Battery & Battery Charger) for AC-Powered Systems".
- For a multicarrier cabinet system using an external DC power source, refer to one or more of the following Maintenance documentation sections: "AC-POWER (AC Power) for DC-Powered Systems", "CARR-POW (Carrier Port Power Unit) for DC-Powered Systems", or "POWER (Battery & Battery Charger) for DC-Powered Systems".

Every carrier in the system must be supplied with +5 volt, -48 volt, and -5 volt DC power for the various circuit packs to operate properly. This power is supplied to the carriers as follows: AC from a wall outlet comes into the PDU, which distributes the power via a set of fuses (F1 to F7) to the power units. Each carrier in the system is equipped with two power units: the 631 DA AC power unit and the 631 DB AC power unit, which together supply the required voltages to the carrier. Figure 11-14 illustrates the position of the power unit and the power distribution unit (PDU) and shows which power unit each fuse controls (Figure 11-14 also shows other Environment maintenance-related items that can be ignored for this section on Carrier Port Power Unit). Figure 11-15 illustrates the position of the power unit and the PDU and shows which power unit each fuse controls in a small cabinet (from a System 75 R1V3 upgrade). Figure 11-16 shows the position of the fuses on the PDU and describes how to replace a fuse. The TN2036 Voltage Range circuit pack provides easy access for testing the various voltages on the backplane pins. For more information, refer to the "Troubleshooting Backplane Voltage Problems" section found in Chapter 5, "Routine Maintenance Procedures".

The power unit has two LEDs: if the yellow LED is lit it means the power unit is operating as normal; if the red LED is lit it means the power unit has a fault; and if neither is lit it LED means no external power is being supplied. The CARR-POW (Carrier Port Power Unit) MO represents the pair of power units that power each carrier in a multicarrier cabinet system. If a problem is reported by hardware for a power unit on a port carrier, the system can recycle the pair of power units in a port carrier; however, if the problem is reported on a control carrier, the system cannot recycle the pair of power units in a control carrier. In a standard multicarrier cabinet (PPN or EPN) carrier A is the control carrier, and carriers B, C, D, and E are the port carriers. In a High or Critical Reliability system multicarrier cabinet (PPN or EPN), carriers A and B are the control carriers, and carriers C, D, and E are the port carriers. However, carrier B can be recycled only if the Active Expansion Interface Link and Active Tone-Clock circuit pack are in the A carrier.

Loss of the 631 DB Carrier Port DC Power Unit in the active control carrier (the A carrier for a standard system and either the A or B carrier for a High or Critical Reliability system) causes loss of the administration terminal. In a High or Critical Reliability system, the Active SPE should switch to the Standby SPE if there is a CARR-POW alarm.

Recycling a carrier turns off the pair of power units, and turns them back on two seconds later.

WARNING:

Recycling carriers disrupts service for all circuit packs on the carrier.

The DEFINITY Generic 1 can also support neon message waiting lamps on analog telephones. If this is required, then the carrier(s) that contains the TN769 Analog Neon circuit packs must also be supplied with 165 volt to power the neon lights. The 165 volt can only be supplied by a TN752 or a TN755B power unit circuit pack. The following table lists all power unit and power-related circuit packs for the system and indicates the voltages they can supply. Figure 11-14 through Figure 11-19 show a schematic of each power unit type. The TN2036 Voltage Range circuit pack provides easy access for testing the various voltages on the backplane pins. Refer to Chapter 2 in *DEFINITY Communications System Generic 1 and Generic 3 Installation and Test*, 555-230-104.

Power Supply	+5	-48V	-5V	165V	Cabinet Position
631 WA	yes	no	no	no	Left Side
631 WB	no	yes	no	no	Right Side
631 AR	yes	no	no	no	Left Side
631 BR	no	yes	no	no	Right Side
631 DA	yes	no	no	no	Left Side
631 DB	no	yes	yes	no	Right Side
TN736	no	no	yes	no	-
TN752	no	no	yes	yes	-
TN755B	no	no	no	yes	-

Power Unit Replacement Procedures

The procedures for replacing the various power units are given below:

Replacing a 631AR or 631BR AC Power Unit

If the power unit to be replaced is in a control carrier of a PPN system, refer to "Removing Power" and "Restoring Power" in Chapter 5, "Routine Maintenance Procedures", before replacing the power unit. To replace the power unit, implement the following steps:

1. Set the power switch to OFF, and unplug the power cord.
2. Move the locking slide on the power unit to its leftmost position and unlatch the locking lever.
3. Remove the power unit from the carrier.
4. Before installing the replacement power unit in the carrier, turn the power unit on its side and operate rocker switches 1 through 4 on the dip switch as follows:

Switch	631AR Position	631BR Position
1	open	open
2	closed	closed
3	open	open
4	closed	open

NOTE:
In the open position, the rocker is down on the side opposite the number. In the closed position, the rocker is down on the side adjacent to the number.

5. Move the locking slide on the replacement power unit to the extreme left position and open the locking lever.
6. Insert the power unit into the carrier until some resistance is felt.
7. Lift the locking lever upward until it latches.
8. Move the locking lever slide on the power unit to the extreme right position.
9. Connect the power cord and set the power switch to ON.

Replacing a 631DA or 631DB AC Power Unit

If the power unit to be replaced is in a control carrier of a PPN system, refer to "Removing Power" and "Restoring Power" in Chapter 5, "Routine Maintenance Procedures" before replacing the power unit. To replace the power unit, follow the procedure below:

1. Unplug the power cord.
2. Move the locking slide on the power unit to the extreme left position and unlatch the locking lever.
3. Remove the power unit from the carrier.
4. Move the locking slide on the replacement power unit to the extreme left position and open the locking lever.
5. Insert the power unit into the carrier until some resistance is felt.
6. Lift the locking lever upward until it latches.
7. Move the locking lever slide on the power unit to the extreme right position.
8. Connect the power cord and set the power switch to ON.

Replacing a TN736 or TN752 Power Unit Circuit Pack

If the TN736 or TN752 power unit circuit pack is in a control carrier of a PPN system, then refer to the "Handling Control Circuit Packs" section in Chapter 5, "Routine Maintenance Procedures". Replacing either power unit interrupts the -5 volt supply to the carrier. This causes all the analog circuit packs in the carrier to fail their Loop Around Tests and may cause failures in circuit packs in the control complex. After the power unit has been replaced, look for alarms against these maintenance objects. If ANL-LINE alarms exist, refer to Test #47 (Loop Around and Conference Test) in ANL-LINE Maintenance documentation. For CO-TRK alarms, refer to Test #33 (Loop Around and Conference Test) in CO-TRK Maintenance documentation.

Hardware Error Log Entries and Test to Clear Values

Carrier Port Power Unit Error Log Entries

Error Type	Aux Data	Associated Test	Alarm Level	On/Off Board	Test to Clear Value
0[1]	0	Any	Any	Any	test environment P sh r 1
1(a)(b)	0 or 1	Power Unit Query Test (#127)	MAJOR	ON	test environment P r 2

1 Run the Short Test Sequence first. If all tests pass, run the Long Test Sequence. Refer to the appropriate test description and follow the recommended procedures.

Notes:

a. Where P is an appropriate port network number taken for the PORT field of the Error Log.

b. Run the Power Unit Query Test (#127) first using the **test environment P r 2** command. Then, if a carrier must be recycled to clear the CARR-POW alarm, use the **recycle carrier PC** command to run the Power Unit Recycle Test (#126). The Power Unit Recycle Test (#126) is not included in either the long or Short Test Sequences.

WARNING:
The Power Unit Recycle Test (#126) is destructive. For more information, refer to the description of this test.

System Technician-Demanded Tests: Descriptions and Error Codes

Always investigate tests in the order presented in the table below when inspecting errors in the system. By clearing error codes associated with the *Battery & Battery Charger Query Test*, for example, you may also clear errors generated from other tests in the testing sequence.

Order of Investigation	Short Test Sequence	Long Test Sequence	D/ND[1]
Battery & Battery Charger Query Test (#5) (a)	X	X	ND
AC Power Query Test (#78) (b)	X	X	ND
Power Unit Query Test (carrier E) (#127)	X	X	ND
Power Unit Query Test (carrier D) (#127)	X	X	ND
Power Unit Query Test (carrier A) (#127)	X	X	ND
Power Unit Query Test (carrier B) (#127)	X	X	ND
Power Unit Query Test (carrier C) (#127)	X	X	ND
Emergency Transfer Query Test (#124) (c)	X	X	ND
Cabinet Temperature Query Test (#122) (d)	X	X	ND
External Alarm Lead Query Test (#120) (e)	X	X	ND
Analog Ring Generator Initialization Test (#117) (f)	X	X	ND
Analog Ring Generator Query Test (#118) (f)	X	X	ND

1 D = Destructive; ND = Nondestructive

Notes:

a. Refer to POWER (Battery & Battery Charger) Maintenance documentation for a description of this test.

b. Refer to AC-POWER (AC Power) Maintenance documentation for a description of this test.

c. Refer to EMG-XFER (Emergency Transfer) Maintenance documentation for a description of this test.

d. Refer to CABINET (Cabinet Sensors) Maintenance documentation for a description of this test.

e. Refer to EXT-DEV (External Alarm) Maintenance documentation for a description of this test.

f. Refer to RING-GEN (Analog Ring Generator) Maintenance documentation for a description of this test. This test only shows up in the test sequence if there is a TN768 Tone-Clock circuit pack in the port network being tested.

Power Unit Recycle Test (#126)

This test is destructive.

This test is destructive because it requires all circuit packs in the recycled carrier to be removed and inserted. These actions cause all calls originating or terminating on circuit packs in this carrier to be dropped. The pair of power units in the specified carrier is recycled. Both power units in the carrier are turned off for two seconds and then back on again. After the power units have been turned back on, the test queries the Maintenance/Tape Processor in Standard system PPN, the Duplication Interface circuit pack in a PPN for a system with High or Critical Reliability, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system for the status of pair of power units in the specified carrier. If both power units are on and functioning, then the test passes. If both power units are not on and functioning, the test fails, and BOTH power units are turned off.

Table 11-61. TEST #126 Power Unit Recycle Test

Error Code	Test Result	Description/ Recommendation
1000	ABORT	System resources required to run this test are not available. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1129	ABORT	Only occurs when recycling carrier 2B. Indicates that the Active Tone-Clock for the EPN is in carrier 2B. 1. Issue the **set tone-clock 2A** command. 2. Rerun the test.
1130	ABORT	Only occurs when recycling carrier 2B. Indicates that the Active Expansion Interface Link for the EPN is in carrier 2B. 1. Issue the **set expansion-link A01** command. 2. Rerun the test.

Continued on next page

Table 11-61. TEST #126 Power Unit Recycle Test — *Continued*

Error Code	Test Result	Description/ Recommendation
2000	ABORT	Response to the test request was not received within the allowable time period.
2029	ABORT	Internal System Error. 1. Retry the command at one-minute intervals a maximum of five times. 2. If the test continues to abort, escalate the problem.
1 (Carrier E) 2 (Carrier D) 4 (Carrier A) 8 (Carrier B) 16 (Carrier C)	FAIL	There is a problem with one or both Power Unit(s) on the recycled carrier. 1. Since the Power Unit Recycle Test failed, both Power Units in the recycled carrier should have been powered off by the system software. Both power units should be showing a red status LED, instead of a green one. Since the Power Unit Query Test is a subset of the Power Unit Recycle Test, the Power Unit Query Test (#127) should also fail. Run the Power Unit Query Test by using the **test environment P** command where P is the appropriate port network number. 2. If the test fails, follow the repair procedures described for Test #127. If problem persists, follow normal escalation procedures.
	PASS	Both power units in the recycled carrier were found to be healthy by the Maintenance/Tape Processor in a Standard system PPN, the Duplication Interface circuit pack in a PPN for a system with High or Critical Reliability, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system after the power units were powered down and back up. If the status LEDs on both power units are not showing green, then the PR-MAINT (Maintenance/Tape Processor), DUPINT (Duplication Interface) circuit pack, or the EPN MAINT (Maintenance) circuit pack may have incorrectly reported the state of the power units. Look for and resolve any alarms on these MOs.

Power Unit Query Test (#127)

This test queries the Maintenance/Tape Processor in a Standard system PPN, the Duplication Interface circuit pack in a PPN for a system with High or Critical Reliability, or the EPN Maintenance circuit pack in an EPN multicarrier cabinet system for the status of pair of power units in the specified carrier. If both power units are on and functioning, then the test passes. If both are not on and functioning, it fails.

Table 11-62. TEST #127 Power Unit Query Test

Error Code	Test Result	Description/ Recommendation
