35 KEYBOARD SEND-RECEIVE (KSR) SETS

35 RECEIVE-ONLY (RO) SETS

ACTUAL AND SCHEMATIC WIRING DIAGRAMS

1. GENERAL

1.01 This section is reissued to include wiring diagrams for KSR sets used in DATREX* Service for the TP186627 set logic assembly, and their related options. Wiring diagrams for RO sets used in DATA-PHONE® Service have also been included. In addition, the title has been changed to reflect the inclusion of actual wiring diagrams and the RO sets. Since it is a general revision marginal arrows ordinarily used to indicate changes and additions are omitted.

1.02 The sheet index, detached schematics, apparatus figures, and circuit notes are covered in wiring diagram 6020WD and consists of 20 pages.

1.03 The sheet index provides a complete contents listing for the detached schematics, apparatus figures, and circuit notes.

1.04 Detached schematics (B1 through B11) show the complete functioning paths of all relays and other apparatus.

1.05 The individual parts of a given relay, jack, key, or other component may perform various functions. Apparatus figures (C1 through C7) show these parts independent of the detached schematics (B1 through B11) and indicate the various functions performed. In addition, the apparatus figures serve as a convenient index for locating specific parts of areas in the associated detached schematics.

1.06 For circuit notes, refer to sheet D1.

SET LOGIC
ASSEMBLY

TABLE OF CONTENTS

186627
SET LOGIC
ASSEMBLY

SECTION I - GENERAL TECHNICAL DATA

1. Purpose of Circuit

1.01 The 186627 Set Logic Assembly is a basic module designed to provide facilities for the interconnection of Teletype terminal equipment and data sets which conform to the standards of the Electronics Industries Association. In accordance with these standards, all data and control leads of the data set carry polar voltage signals.

1.02 The 186627 Set Logic Assembly accepts current-no-current data and control signals from the teletypewriter and converts them into suitable polar signals for use by the data set. In addition, it accepts polar data and control signals from the data set and converts them into current-no-current signals for use by the teletypewriter.

2. General Description of Operation

2.01 The 186627 Set Logic Assembly, consisting of a main circuit card, a customer interface and connector circuit card, and a pushbutton assembly, is mounted in the front right hand corner of an M33 or M35 terminal.

2.02 The pushbutton assembly consists of six pushbuttons, these are: OFF (non-locking, releasing), ON (non-locking, releasing), ALARM (non-locking, non-releasing), LOCAL (locking, releasing), OUT OF SERVICE (locking, releasing), and TEST (locking, releasing).

2.03 The electronic circuitry required to perform the various set functions is mounted on the main circuit card. The customer interface and connector card is fastened to the main circuit card and is accessible at the rear of the set logic assembly for customer programming.

2.04 The 186627 Set Logic Assembly obtains its operating power from the call control unit in the teletype terminal.

2.05 Data Set Interface Leads

2.05 1 AA - Protective Ground - This conductor shall be electrically bonded to the frame of the terminal apparatus. It may be further connected to external grounds as required by applicable regulations.

2.05 2 AB - Signal Ground - This conductor establishes the common-ground reference potential for all interchange circuits except Circuit AA (Protective Ground). It may be connected to Circuit AA or the frame, as required by applicable regulations, and is available at TB - 18.

2.05 3 BA - Transmitted Data - Signals on this circuit are generated by the terminal apparatus for transmission to remote data sets.

SECTION I (CONTINUED)

2.05 4 BB - Received Data - Signals on this circuit are generated by the data set in response to data signal received from remote data sets.

2.05 5 CB - Clear to Send - Signals on this circuit are generated by the data set to indicate that the data set is ready to transmit data when in the ON condition.

2.05 6 CC - Data Set Ready - Signals on this circuit are generated by the data set to indicate that it is ready to operate (ON condition). The OFF condition indicates either:

a. Any abnormal or test condition which disables or impairs normal operation.

b. That the communication channel is switched to an alternate means of communication.

c. That the data set is not connected to the communication channel.

2.05 7 CD - Data Terminal Ready - Signals on this circuit are generated by the terminal apparatus to control switching of the data set to a communications channel. The ON condition causes the data set to be connected to a communications channel. The OFF condition removes the data set from a communications channel for such reasons as terminating a call, freeing the line for alternate use, or permitting the use of the terminal apparatus for an alternate function.

2.05 8 CE - Ring Indicator - Signals on this circuit are generated by the data set to indicate that ringing current is being received from a remote station. The ON condition indicates that a ringing signal is being received with the OFF condition maintained at all other times.

2.06 Modes of Operation

2.06 1 The control circuits provide for the following modes of operation.

a. Call Origination

b. Unattended Answering

c. Local

d. Out of Service

e. Alarm

f. Test

g. Terminating a Call

SECTION I (CONTINUED)

2.07 Call Origination

2.07 1 The attendant must depress the ON pushbutton of the set logic assembly. (Refer to the appropriate data set circuit description for the correct dialing procedure, if applicable).

2.07 2 When the ON pushbutton is depressed, the Data Terminal Ready and the Disconnect Timers are activated, if the terminal is equipped with break detection circuitry, this circuitry is enabled at this time.

2.07 3 Approximately 2 seconds after the Data Terminal Ready Timer is activated, the set logic assembly transmits a Data Terminal Ready (CD) signal to the Data Set.

2.07 4 A connection must be made and the data set must have sent a Data Set Ready (CC) signal to the terminal within 2 minutes or the terminals disconnect circuitry will terminate the call.

2.08 Unattended Answering

2.08 1 If the remote terminal data set is equipped to answer a call automatically, that terminal can answer a call automatically and without an attendant being present.

2.09 Local

2.09 1 To enter the LOCAL mode, the attendant must depress the LOCAL pushbutton of the set logic assembly. This will energize the LOCAL relay which in turn puts a marking signal on the Transmit Data (BA) lead and the Data Terminal Ready (CD) lead is held in the off condition.

2.10 Out of Service

2.10 1 An OUT OF SERVICE pushbutton has been provided on the set logic assembly. When this key is depressed, such as for maintenance, a call cannot be answered automatically.

2.11 Alarm

2.11 1 An ALARM indication lamp has been provided that indicates a low paper condition.

2.12 Test

2.12 1 A TEST pushbutton has been provided on the set logic assembly, this pushbutton will activate external circuitry.

2.13 Terminating a Call

2.13 1 A call can be terminated in one of two ways, both of these procedures are recognized by the set logic assembly identically.

SECTION I (CONTINUED)

a. Transmission of an EOT code from a teletypewriter terminal.

b. Depressing the OFF pushbutton.

3. Support Information

3.01 The following documents are offered as support information for the 186627 Set Logic Assembly:

WDP0238 Wiring Diagram Package for the 186627 Set Logic Assembly.

8163WD Model 33 Automatic Send-Receive Keyboard Send-Receive and Receive only sets using the UCC29.

SECTION II - DETAILED DESCRIPTION

1. Originating a Call (FS-2)

1.01 The operator must depress the non-locking ON pushbutton. The RL2 relay energizes through the ON pushbutton. The RL2 relay is held energized through RL4-5B, RL1-4B, RL2-4M and the normally closed OFF pushbutton. When the RL2 relay energized, the RL2-2M contact closed, thus energizing the motor control relay, starting the motor and the Disconnect Timing Circuit.

1.02 When the RL2 relay energized, RL2-3M closed which started the Data Terminal Ready Timing Circuit. After 2 seconds the Data Terminal Ready Timing Circuit activated, energizing the RL3 relay through RL4-6B, RL5-2B, RL2-3M, and either the normally closed paper alarm contact or RL2-1M contact. The RL2-1M contact is an option that is provided by strapping TB-7 to TB-18, this will allow a station to originate a call in a low paper or paper out condition. The CC lead (P2-6) must go positive within 2 minutes after the ON key is depressed. The RL3 relay is now held energized through RL3-5M and RL1-2M. Normally, J1-1 is at -10 volts which indicates Data Terminal is not ready. When RL3 energizes RL3-6B opens, putting a +20V DC on J1-1 which indicates Data Terminal Ready.

1.03 When the CC lead goes positive the Q2 transistor turns on which energizes the RL1 Relay through RL4-4B, and the ON pushbutton is illuminated. Two minutes after depressing the ON pushbutton the Disconnect Timing Circuit activates and attempts to energize the RL4 Relay through RL1-1B, since the CC lead is on, the RL1 Relay would be energized opening the RL1-1B, thus preventing the RL4 Relay from being energized. If the CC lead did not turn on within 2 minutes, the RL1 Relay would not energize, thus the RL1-1B contact would be closed and the RL4 Relay would be energized which would terminate the call and turn off the motor.

1.04 If the CC lead did come up then the motor is running and the terminal is ready to transmit or receive data. At the conclusion of transmission, the call can be terminated by receiving an EOT character which causes operation of the RL4 Relay or by the operator pushing the OFF pushbutton which also operates the RL4 Relay. This causes the RL3 Relay to drop out by opening the RL4-6B contact which turns off the CD lead and transferring the RL4-4 contact which causes RL1 to drop

SECTION II (CONTINUED)

out. RL4-4M locks RL4 to ground through the Q2 transistor. When the CD lead turns off, the data set takes down the CC lead and RL4 drops out. The ON lamp is extinguished.

2. Receiving a Call (FS-2)

2.01 The Teletype terminal can answer a call unattended, as follows: the CC lead comes up turning on Q2 which energizes the RL1 Relay. With the RL1 Relay energized, RL1-5M closes which enables the break detection circuit. Once RL1 energizes, the sequence is the same as a manual start except the motor is started by the RL1-6M contact and Data Terminal Ready Timing Circuit is started by the RL1-3M contact. The CD lead (P2-20) going on indicates to the data set that the terminal is ready and the call should be maintained. If CD doesn't come up, CC will go down thus removing power from the RL1 relay and turning the motor off.

3. Send Circuit Operation (FS-1)

3.01 Half Duplex

3.01 1 When the send and break contacts are closed, -20 volts is applied to the junction R10 and CR11. Diode CR11 conducts causing the positive terminal of capacitor C1 to charge rapidly to about -15 volts from the voltage divider formed by CR11, R11 and R12 turning transistor Q7 off due to the application of this negative voltage to its base. A voltage of -8 volts is applied to the BA lead (P2-2) through the voltage divider consisting of R10, CR10, and the data set impedance indicating a mark. At the same time, a -20 volts is applied to the anode of CR1 which turns Q1 on, energizing the selector magnet driver. When either the send or break contact opens, +20 volts is applied to the BA lead (P2-2) indicating a space. The send contact opening will cause +20 volts to be applied to the anode of CR1 which turns off Q1, dropping out the selector magnet driver. The break contact opening will have no effect on CR1, therefore, it will not be recognized by the selector magnet driver. If this open contact condition lasts for more than 500 milliseconds, as would be caused by holding the BREAK key operated, capacitor C1 discharges through R12 to ground. After about 500 milliseconds of discharge, Q7 conducts and remains conducting until the open contact condition ceases. With Q7 conducting -6 volts is applied to the BA lead (P2-2) through R14, CR12 and Q7 which forms a voltage divider with the data set impedance.

3.02 Full Duplex

3.02 1 Full duplex operation would be the same as for half duplex operation, except that the path to the anode of CR1 is now open, therefore, the local selector magnet driver will not respond to incoming signals and no local copy will be received.

4. Receive Circuit Operation (FS-1)

4.01 A negative voltage of -20 volts maximum at BB (P2-3) will cause Q1 to be on, which indicates mark, causing the selector magnet driver to be energized. A positive voltage of +20 volts maximum will cause Q1 to be off, indicating space, and de-energizing the selector magnet driver.

SECTION II (CONTINUED)

5. Local Operation (FS-1 & 3)

5.01 The LOCAL locking pushbutton will energize the RL5 Relay. This closes RL5-6M which will keep the BA lead at a -20 volts. The RL5-2B contact opens the operate path for the RL3 Relay, thus maintaining the CD lead at a -10 volts indicating that the data terminal is not ready. The RL5-3M contact also closes which operates the Motor Control relay starting the station's motor. The terminal now operates locally. To get out of local and in an off condition, the OFF pushbutton is depressed which mechanically releases the LOCAL pushbutton, dropping out the RL5 Relay. When the LOCAL pushbutton is depressed, the lamp under the pushbutton is on.

6. Strapping Options

6.01 Option A - Half Duplex (FS-1)

6.01 1 By strapping TB-16 to TB-17, the send circuit signals are fed into the receive circuit and the set is in half duplex.

6.02 Option B - Full Duplex (FS-1)

6.02 1 By strapping TB-1 to TB-16, the send circuit signals are isolated from the receive circuit in an on line mode, and the set is in full duplex. (Factory wired).

6.03 Option C - Low Paper Originating (FS-3)

6.03 1 By strapping TB-7 to TB-18 (circuit common) the set will be able to originate a call in a low paper condition.

6.04 Option D - DATA-PHONE ® (FS-3)

6.04 1 By strapping TB-14 to TB-19 the data terminal ready relay will be held energized, thus indicating to the data set that the terminal is ready. This is required in automatic answer DATA-PHONE ® applications.

6.05 Option E - Data Terminal Ready Timer Bypass (FS-3)

6.05 1 By strapping TB-15 to TB-19 the data terminal ready timing circuit would be bypassed.

6.06 Option F - Distributor Control (FS-5)

6.06 1 By strapping TB-5 to TB-10 the set's distributor would be enabled.

7. Controls

7.01 Off

7.01 1 The OFF pushbutton does not contain an indicator lamp.

SECTION II (CONTINUED)

7.01 2 Depressing the OFF pushbutton operates the RL4 Relay, thus placing the terminal in the off condition. The OFF pushbutton overrides any remote start-up command and the terminal will be off as long as the pushbutton is depressed.

7.01 3 Operating the OFF pushbutton will release any locking pushbutton that had been depressed. (LOCAL, OUT OF SERVICE OR TEST).

7.02 On

7.02 1 The ON pushbutton contains an indicator lamp. The lamp is on whenever the terminal receives a Data Set Ready (CC) from the data set.

7.02 2 Depressing the ON pushbutton operates the RL2 Relay, the procedure that would follow is fully described in paragraph 1 of this section.

7.02 3 Operating the ON pushbutton will release any locking pushbutton that had been depressed.

7.03 Local

7.03 1 The LOCAL pushbutton contains an indicator lamp. The lamp is on whenever the terminal is in the Local mode.

7.03 2 Depressing the LOCAL pushbutton operates the RL5 Relay, the procedure that would follow is fully described in paragraph 5 of this section.

7.03 3 Operating the LOCAL pushbutton will release any other locking pushbutton that had been depressed.

7.04 Out of Service

7.04 1 The OUT OF SERVICE pushbutton contains an indicator lamp. The lamp is on whenever the terminal is placed in the Out of Service mode.

7.04 2 Depressing the OUT OF SERVICE pushbutton holds the RL4 Relay operated, thus placing the terminal in the Off mode.

7.04 3 Operating the OUT OF SERVICE pushbutton will release any other locking pushbutton that had been depressed.

7.05 Test

7.05 1 The TEST pushbutton contains an indicator lamp. The lamp is on whenever the TEST pushbutton is depressed.

7.05 2 Depressing the TEST pushbutton closes the L1-1/3 contact of the pushbutton assembly. This contact is presented at TB-2 and TB-4 and is intended to activate external test circuitry.

7.05 3 Operating the TEST pushbutton will not prevent the terminal from receiving a call as described in paragraph 2 of this section.

SECTION II (CONTINUED)

7.05 4 Operating the TEST pushbutton will release any other locking pushbutton that has been depressed.

8. Indicators

8.01 Alarm

8.01 1 The ALARM lamp is turned on when the terminal goes into a low paper (or paper out with sprocket feed) condition. If a message is being transmitted when a low paper condition is sensed, the operation of the terminal will remain uneffected. After the terminal is turned off, a call may be originated only if Option C (see paragraph 6.03 of this section) has been implemented, but a call cannot be received.

9. Power (FS-6)

9.01 +24 VDC and -20 VDC are supplied to the logic assembly from the call control unit (UCC29) contained in the teletypewriter.

9.02 The +24 VDC and -20 VDC together with zener diodes CR5 and CR6 and resistors R5 and R8 are used to supply -20 VDC clamped and +20 VDC clamped for EIA output leads.

10. Timing Circuit Operation (FS-2 & 3)

10.01 Component cross reference:

Designation	Disconnect Timer (2 min.)	Data Terminal Ready Timer (2 sec.)
Ra	R21	R17
Rb	R22	R16
Rc	R25	R20
C	C2	C3
Qa	Q5	Q3
Qb	Q6	Q4

10.02 When Relay RL1 or RL2 are operated, +24 VDC is applied across the RC Timing components Rc and C when the voltage at the junction of Rc and C is approximately 12.5 VDC, Qa is turned on. The turn on time is determined by time constant multiplier which is provided by the gate voltage divider Ra and R6. When Qa turns on it pulses the gate of Qb thus turning Qb on.

SECTION III - REFERENCE DATA

1. Working Limits

1.01 Ambient Temperature Range - 40°F to 110°F.

1.02 Relative Hunidity Range - 0 to 95 percent.

SECTION III - (CONTINUED)

2. Abbreviations and Functional Designations

2.01 Abbreviations Used:

AA	Protective Ground
AB	Signal Ground
BA	Transmitted Data
BB	Received Data
CB	Clear to Send
CC	Data Set Ready
CD	Data Terminal Ready
CE	Ring Indicator

2.02 Functional Designations

Designation	Meaning
C	Capacitor
CR	Diode
J1	Receptacle, Pushbutton Assembly
J3	Receptacle, "Piggyback" Card
J4	Receptacle, Call Control Unit
J5	Plug, Call Control Unit
L	Plug, Pushbutton Assembly
P1	Plug, Pushbutton Assembly cable
P2	Plug, EIA, Data Set
P3	Plug, "Piggyback" Card
Q	Transistor, SCR or PUT
R	Resistor
RL1	Relay, Data Set Ready
RL2	Relay, On
RL3	Relay, Data Terminal Ready
RL4	Relay, Off
RL5	Relay, Local
TB	Terminal Board

3. Connecting Circuits

3.01 Data sets or stations conforming to EIA RS-232-B Standard.

3.02 Teletype machines equipped with a UC629.

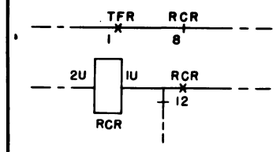
NOTES

1. FOR CROSS REFERENCE OF BELL AND TELETYPE CODES, SEE E.S.I. 4.002-35.
2. ISSUE 1 OF THIS ISSUE CONTROL SHEET REPLACES ISSUE 33 OF 6020WD-A1.
3. 27K RESISTOR IS NOT PRESENT ON SOME SETS
4. FUSE IS NOT PRESENT ON SOME SETS.
5. C FUSE TERMINATION TR-2 CHANGED TO R-1 WHEN AG FUSE ADDED.
6. WIRING STATUS:
   RECTANGULAR BOX INDICATES HISTORY OF WIRING CHANGES
   00-B — NOTE NUMBER
   B - DENOTES WIRING BEFORE THE CHANGE DESCRIBED BY THE DESIGNATED NOTE ENTERED THE PRODUCT.
   00-A
   A - DENOTES WIRING AFTER THE CHANGE DESCRIBED BY THE DESIGNATED NOTE ENTERED THE PRODUCT.
7. WIRING WAS CHANGED TO PROVIDE MAKE BEFORE BREAK TRANSFER CONTACT FOR ENERGIZING RCR RELAY. FORMER WIRING WAS AS FOLLOWS:



8. SOME UNITS DO NOT HAVE THIS NETWORK.
9. ON ISSUE 13 OF SHEET B4, DIODE CR11A WAS ABSENT.

CIRCUIT DESCRIPTION

THE SELECTOR MAGNET DRIVER CIRCUIT IS POWERED FROM A SOURCE OF 117 VOLT ALTERNATING CURRENT THROUGH A STEP DOWN ISOLATION TRANSFORMER. DIODES CR1 AND CR2 PROVIDE FULL WAVE RECTIFICATION OF THE REDUCED VOLTAGE TO -20 VOLTS DC AT TERMINAL 15. THE CIRCUIT COMMON IS CONNECTED TO TERMINAL 2 AND A POWER SUPPLY FILTER CAPACITOR IS CONNECTED BETWEEN TERMINALS 2 AND 15.

THE DIRECT CURRENT SIGNAL LINE CIRCUIT IS CONNECTED THROUGH TERMINALS 7 AND 2. WITH AN ALTERNATE CONNECTION THROUGH R10 AT TERMINAL 14 PROVIDING A CURRENT LIMITING FUNCTION.

IN THE MARKING CONDITION, Q1 IS OFF-BIASED. WITH Q1 OFF, THE BASE OF Q2 WILL BE CLAMPED AT THE ZENER REFERENCE VOLTAGE BY DIODE CR4. THIS VOLTAGE CLAMP IS THEN TRANSLATED TO CURRENT REGULATION BY THE TRANSISTOR ACTION OF Q2. THE REGULATED MAGNET CURRENT IS ADJUSTED TO .500 AMPERES BY RHEOSTAT R4.

WITH THE SIGNAL LINE IN THE OPEN OR SPACING CONDITION, Q1 IS TURNED ON BY BASE CURRENT SUPPLIED THROUGH RESISTOR R1. THE POTENTIAL AT THE COLLECTOR OF Q1 WILL BE NEAR ZERO. OFF-BIASING Q2. WITH Q2 OFF, NO SELECTOR MAGNET CURRENT FLOWS, ALLOWING THE MAGNET TO RELEASE. DURING THE TURN OFF OF Q2 THE INDUCTIVE TRANSIENT DEVELOPED AT THE COLLECTOR IS SUPPRESSED BY THE NETWORK CONSISTING OF CR3, R9, AND C1.

"SNAP-ACTION" IS SUPPLIED TO THE CIRCUIT TRANSITIONS BY FEEDBACK IN THE EMITTER CIRCUITS OF TRANSISTORS Q1 AND Q2.

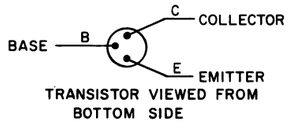
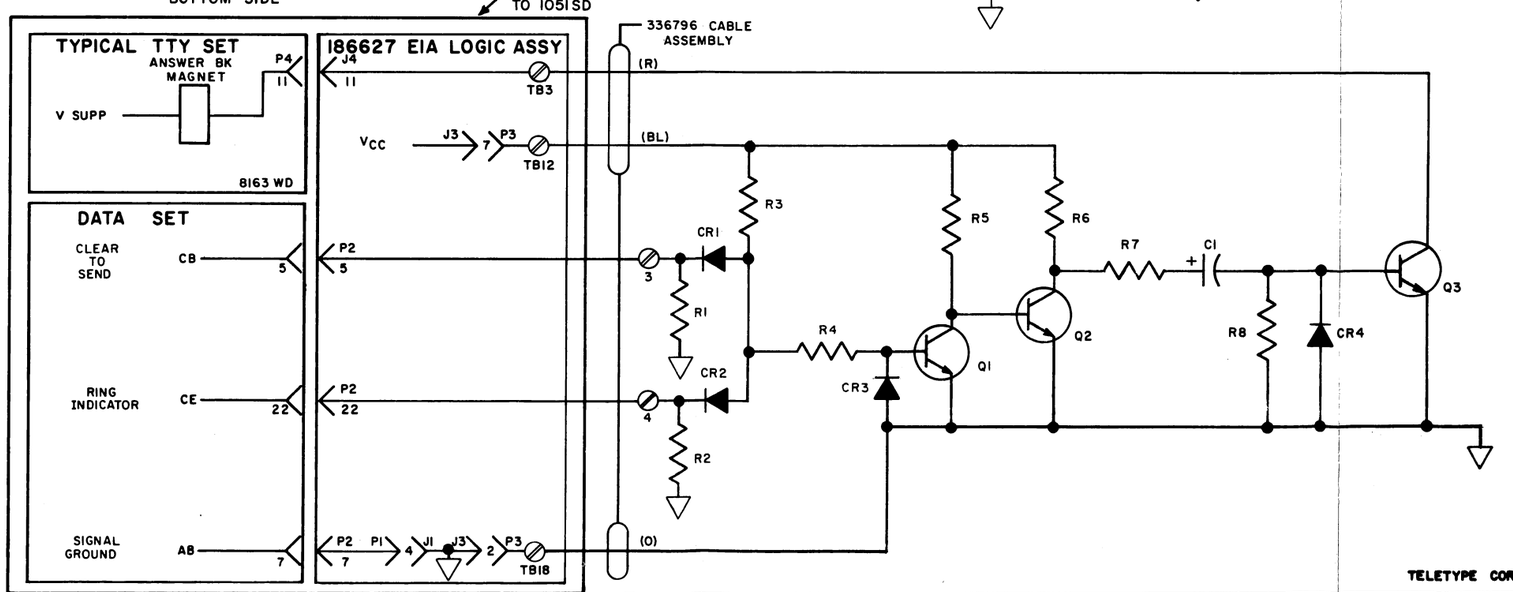
336194 ETCHED CIRCUIT BOARD



TRANSISTOR VIEWED FROM BOTTOM SIDE



ANSWER BACK TRIP MAGNET DRIVER

THE TRIP MAGNET DRIVER CARD PROVIDES A TIMED (8 TO 350 MS), 350 MA (MAXIMUM) PATH THROUGH THE ANSWER BACK TRIP MAGNET TO GROUND, (TERMINAL 1) IN RESPONSE TO THE SIMULTANEOUS APPLICATION OF TWO EIA "ON" VOLTAGES (+3V TO +25V) AT INPUT TERMINALS 3 AND 4. (THE SIMULTANEOUS "ON" VOLTAGE INPUT DURATION MUST EXCEED 350 MS.)

THE CIRCUIT OPERATION IS STRAIGHTFORWARD. AN "OFF" INPUT (-3V TO -25V) ON EITHER TERMINAL 3 OR 4 WILL REVERSE BIAS THE Q1 EMITTER BASE JUNCTION HOLDING Q1 OFF. TRANSISTOR Q2, WILL BE "ON" AND C1 (GROUNDED AT BOTH SIDES) IS UNCHARGED. THE SIMULTANEOUS APPLICATION OF TWO "ON" VOLTAGE TURNS ON Q1, TURNING OFF Q2 AND ALLOWING C1 TO CHARGE. THE C1 CHARGING CURRENT (THROUGH THE BASE EMITTER JUNCTION OF Q3, R6, AND R7) WILL TURN ON Q3 HOLDING IT ON LONG ENOUGH TO ASSURE TRIPPING THE ANSWER BACK MAGNET, BUT NOT SO LONG AS TO CAUSE DOUBLE TRIPPING. THE RETURN TO THE OFF STATE OF EITHER INPUT WILL TURN ON Q2 DISCHARGING C1 THROUGH R7, Q2 AND CR4. (DISCHARGE TIME IS APPROXIMATELY 35 MS.)

INPUT / OUTPUT REQUIREMENTS (SEE TEST CIRCUIT)
