Avaya™ Interchange

Release 5.4/Intuity™ Interchange R5.3
Adding an Intuity AUDIX System That Uses
DCP or RS-232

Notice
Every effort was made to ensure that the information in this book was complete and accurate at the time of printing. However, information is subject to change.

Avaya Web Page
The World Wide Web home page for Avaya is http://www.avaya.com

Preventing Toll Fraud
Toll Fraud is the unauthorized use of your telecommunications system by an unauthorized party (for example, a person who is not a corporate employee, agent, subcontractor, or working on your company's behalf). Be aware that there is a risk of toll fraud associated with your system and that, if toll fraud occurs, it can result in substantial additional charges for your telecommunications services.

Avaya Fraud Intervention
If you s*uspect that you are being victimized* by toll fraud and you need technical assistance or support, call the Technical Service Center's Toll Fraud Intervention Hotline at 1.800.643.2353.

Providing Telecommunications Security
Telecommunications security of voice, data, and/or video communications is the prevention of any type of intrusion to, that is, either unauthorized or malicious access to or use of, your company's telecommunications equipment by some party.

Your company's "telecommunications equipment" includes both this Avaya product and any other voice/data/video equipment that could be accessed via this Avaya product (that is, "networked equipment").

An "outside party" is anyone who is not a corporate employee, agent, subcontractor, o ra person working on your company's behalf. Whereas, a "malicious party" is anyone, including someone who may be otherwise authorized, who accesses your telecommunications equipment with either malicious or mischievous intent.

Such intrusions may be either to/through synchronous (time-multiplexed and/or circuit-based) or asynchronous (character-, message-, or packet-based) equipment or interfaces for reasons of:
- Utilization (of capabilities special to the accessed equipment)
- Theft (such as, of intellectual property, financial assets, or toll-facility access)
- Eavesdropping (privacy invasions to humans)
- Mischief (troubling, but apparently innocuous, tampering)
- Harm (such as harmful tampering, data loss or alteration, regardless of motive or intent)

Be aware that there could be a risk of unauthorized intrusions associated with your system and/or its networked equipment. Also realize that, if such an intrusion should occur, it could result in a variety of losses to your company, including but not limited to, human/data privacy, intellectual property, material assets, financial resources, labor costs, and/or legal costs).

Your Responsibility for Your Company's Telecommunications Security
The final responsibility for securing both this system and its networked equipment rests with you — an Avaya customer's system administrator, your telecommunications peers, and your managers. Base the fulfillment of your responsibility on acquired knowledge and resources from a variety of sources including but not limited to:
- Installation documents
- System administration documents
- Security documents
- Hardware-/software-based security tools
- Shared information between you and your peers
- Telecommunications security experts

To prevent intrusions to your telecommunications equipment, you and your peers should carefully program and configure your:
- Avaya-provided telecommunications systems and their interfaces
- Avaya-provided software applications, as well as their underlying hardware/software platforms and interfaces
- Any other equipment networked to your Avaya products

Federal Communications Commission Statement
Part 15: Class A Statement. This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio-frequency energy and, if not installed and used in accordance with the instructions, could cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at his own expense.

European Union Declaration of Conformity
The "CE" mark affixed to the equipment means that the equipment conforms to the referenced European Union (EU) Directives listed below:
EMC Directive   89/336/EEC
Low-Voltage Directive 73/23/EEC
For more information on standards compliance, contact your local distributor.

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3
Adding an Intuity AUDIX System That Uses DCP/RS-232

Issue 1
January 2002

Adding an Intuity AUDIX System That Uses DCP or RS-232

Page 1

Adding an Intuity AUDIX System That Uses DCP or RS-232

This document describes how to add to your Interchange network a new Intuity™ AUDIX® system that uses the DCP or RS-232 protocols.

Keep in mind the following aspects of the instructions:

- Examples are included to aid in understanding, but the actual configurations and data you enter can vary greatly.

- The instructions apply to both Intuity Interchange R5.3 and Avaya™ Interchange R5.4.

- In general, it is recommended that the dial plan of the Interchange maintain as much consistency as possible between the addresses to send messages and the phone numbers subscribers dial when simply calling other subscribers. The examples in this document are designed to show such consistency.

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3 Issue 1
Adding an Intuity AUDIX System That Uses DCP/RS-232 January 2002

Adding an Intuity AUDIX System That Uses DCP or RS-232
Checklist for Adding an Intuity AUDIX DCP or RS-232 Endpoint Page 2

Checklist for Adding an Intuity AUDIX DCP or RS-232 Endpoint

To add a new Intuity AUDIX DCP or RS-232 digital messaging system to an existing Avaya or Intuity Interchange network, do the following:

Task	Details of Task
Task 1: Ensure That the New System and Interchange Are Enabled for DCP/RS232 (see page 3)	Check that Interchange and the new system are equipped and enabled for DCP and RS-232 connections. (Avaya Professional Services normally does this for you).
Task 2: Get Information About the System You Are Adding (see page 5)	Complete the Planning Worksheet included in this document. You or the Intuity AUDIX administrator get the system name, its mailbox IDs, its incoming dial string (phone number), and its network setup from the Local Machine Administration and Machine Profile screens. The switch administrator for your Interchange system and possibly the switch administrator for the new system will need to give you the dial plan and exact phone numbers (prefixes) for the Intuity AUDIX mailboxes.
Task 3: Determine How to Map the New System's Dial Plan (see page 14)	Complete the Dial Plan Mapping Worksheet in this document. (Avaya Professional Services normally does this for you).
Task 4: Determine the Type of Subscriber Update for the New System (see page 25)	Understand how full, dynamic, and directory view updates work and choose and design the best one for your system. (Avaya Professional Services normally does this for you)
Task 5: Create an Interchange Profile on the New System (see page 27)	Enter the Interchange as an Intuity AUDIX network node in to the new system using the Digital Network Machine Administration and Machine Profile screens on the Intuity AUDIX system. ⇨ **NOTE:** Be sure to enter the *exact* name, dial string (phone number), and password of Interchange.

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3
Adding an Intuity AUDIX System That Uses DCP/RS-232

Issue 1
January 2002

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 1: Ensure That the New System and Interchange Are Enabled for Page 3

Task 6: Identify the New System to the Interchange System (see page 32)	On Interchange, complete the AUDIX Digital Network Machine Administration screen for the new system.
Task 7: Administer Remote Machine Parameters (see page 35)	Complete the Remote Machine Parameters screen for the new system. Also complete the AUDIX Digital Machine Profile screen by using the Dial Plan Mapping Worksheet.
Task 8: Map the New System's Dial Plan for Interchange (see page 40)	Complete the Dial Plan Mapping screen for the new system by using the Dial Plan Mapping Worksheet.
Task 9: Administer Directory Views (see page 43)	Complete the Directory Views screen for the new system.
Task 10: Verify That the Endpoint Has Been Administered (see page 45)	Check for a new system entry on the Remote Machine List and the Remote Machine Dial Plan List.
Task 11: Test Digital Connectivity (see page 48)	Run the Remote Connection Test with the new system.
Task 12: Add Remote Subscribers to Interchange (see page 50)	Run a Remote Update on the new system.
Task 13: Verify the Subscriber Update (see page 51)	Run the Feature Daily Traffic Report on the Intuity AUDIX system. Run the Subscriber List by Machine Name on Interchange.
Task 14 (Optional): Manually Update the Intuity AUDIX System (see page 53)	Run **get remote_update** from the Intuity AUDIX system.
Task 15: Test the Connection (see page 55)	Send messages to and from the test mailbox on the new system.
Task 16: Update Remote Systems for Subscribers on the New System (see page 55)	Add information to Directory Views, if appropriate. Run **get remote_update** from Intuity AUDIX systems. Run Demand Update Push from Interchange to Aria®, Serenade®, and Octel® 100 systems.

Task 1: Ensure That the New System and Interchange Are Enabled for DCP/RS232

To ensure that the new system and Interchange are enabled for DCP/RS232, do the following:

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3
Adding an Intuity AUDIX System That Uses DCP/RS-232

Issue 1
January 2002

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 1: Ensure That the New System and Interchange Are Enabled for　　*Page 4*

- Check for at least one ACCX card, with at least one DCP and/or RS-232 port. (See the under .)

  ➡ **NOTE:**
  > The steps to check for ports on Interchange and Intuity AUDIX are identical, since much of the software is similar.

-

  ➡ **NOTE:**
  > The steps to check for ports on Interchange and Intuity AUDIX are identical, since much of the software is similar.

Additionally, you will need to check with your Interchange switch administrator, as well as with the switch administrator for the Intuity AUDIX system to ensure that the following items are configured:

- An RS232 cable and modem to connect the switch with the ACCX card for RS-232

- Configuration of the systems' switches, with a hunt group and a station or stations assigned to each of the local and remote switches' DCP and/or RS-232 modem ports

- Central office support for Software Defined Network (SDN), Dynamic SDDN, or another 56-Kbps service for DCP

Check That Interchange and the New System Are Enabled for DCP/RS232 Ports

1. Start at the Interchange main menu and select

   ```
   >Customer/Services Administration
   ```

   ```
       >Feature Options
   ```
   The system displays the Feature Options screen. (Figure 1).

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3   *Issue 1*

voice_ports                           6          6
```

Figure 1.   Feature Options Screen

2. Check that the following fields contain the right data:

High speed digital ports	For DCP, the Current column must contain at least one port.
Low speed digital ports	For RS232, the Current column must contain at least one port.

3. Press ⒡⒍ (Cancel).

4. Starting at the Intuity AUDIX main menu, repeat Step 1 and Step 2.

Task 2: Get Information About the System You Are Adding

Your Account Executive determines with you the needed information about the new system and completes a *Planning Worksheet for AUDIX*. Retrieve these items and enter them in the Planning Worksheet that follows.

To complete the worksheet, you or your Intuity AUDIX administrator will need to do the following:

1. Get the Name, Incoming Dial String, and Password of the New System (see page 7)

2. Check the Intuity AUDIX Dial Plan and Network Update Capabilities (see page 10)

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3   *Issue 1*

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 2: Get Information About the System You Are Adding   *Page 6*

3. Determine the Prefixes of the New System Mailboxes and Test Mailbox IDs (see page 13)

Additionally, you need to know how many digits are in the Interchange dial plan. Usually the dial plan consists of 7 or 10 digits, though the digits can be from 3 to 10.

Planning Worksheet

System Name: _____   **DCP Mode/RS-232 Data Rate**_____

Password: _____   **System Incoming Dial String** _____

End Node Test Mailbox(es)**: _____

Full Network Address Ranges for this End Node: excluding address ranges associated with those mailboxes which will never receive messages, such as Auto Attendant, Bulletin Board, etc. **Keep ranges as specific to the actual mailboxes as possible** and consider any potential growth. In an existing system, verify existing ranges (see Existing Point to Point Screen Information for mailbox list information. Interchange requires one network address length.

January 2002

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 2: Get Information About the System You Are Adding

Page 7

Get the Name, Incoming Dial String, and Password
of the New System

Use the following steps to get the name, incoming dial string, and password of the Intuity AUDIX. The administrator of the Intuity AUDIX system can do this for you.

⇒ NOTE:
You complete the steps that follow on the Intuity AUDIX system itself. These steps are almost identical to remote machine administration of the Intuity AUDIX system on Interchange, which you perform in .

1. Starting from the Intuity AUDIX main menu, select

> **> Networking Administration**

> **> Local Machine Administration**

The system displays the Local Machine Administration window (Figure 2 for DCP and Figure 3 for RS-232).

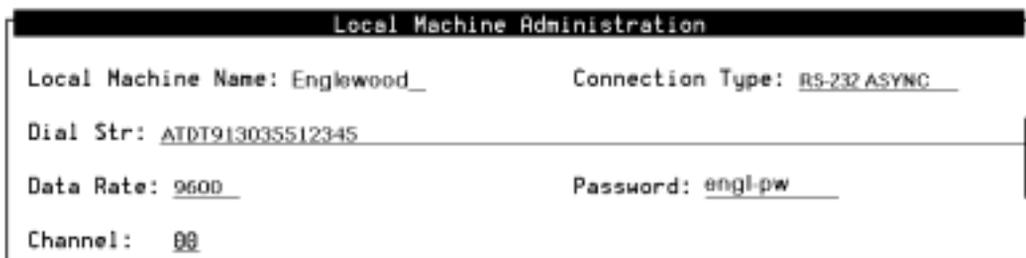

Figure 2.   Local Machine Administration Window (DCP)

Figure 3.   Local Machine Administration Window (RS-232)

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3
Adding an Intuity AUDIX System That Uses DCP/RS-232

Issue 1
January 2002

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 2: Get Information About the System You Are Adding   *Page 8*

> **NOTE:**
> Because the Intuity AUDIX system can use more than one type of digital
> networking simultaneously, the Connection Type might be other than DCP
> or RS-232. In this case, see Check the Channel Configurations (see page
> 12) to check for appropriate networking capability.

2. Check the **Local Machine Name** field for the name of the new
   system, and enter it in the Planning Worksheet (see page 6).

3. Check the **Dial Str** field for the incoming dial string of the new system.
   This string is normally the "Welcome to ...." number that subscribers use to
   get messages. The string is also usually the DID or uniform dial plan
   number of the hunt group containing the AUDIX ports.

   > **NOTE:**
   > See Considerations for the New System's Incoming Dial String (see
   > page 8), as this number might not be the actual number Interchange
   > dials to connect to the new system. After verifying the correct
   > number, enter it in the Planning Worksheet (see page 6).

   > **NOTE:**
   > For RS-232 connections, the dial string is *always* preceded by **atdt**.

4. Check the **Password** field for the password of the system. Interchange,
   as well as other systems that might be networked to the Intuity AUDIX
   system, use this password to connect to the AUDIX system. Enter the
   password in the Planning Worksheet (see page 6).

5. The **Data Rate** field should contain one of the following:

   - **56000**, if the Connection Type is DCP MODE 1

   - **64000**, if the Connection Type is DCP MODE 3

   - **9600**, or **19200** for RS-232

6. The **Channel** field contains **00**.

7. Press F6 (Cancel).

Considerations for the New System's Incoming Dial String

To verify the dial string Interchange must use to call the new system,
consult with your local switch administrator and the switch administrator for
the new system.

The main consideration is whether the phone number uses:

- The public network

- A private network

Phone Number Over Public Network

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3
Adding an Intuity AUDIX System That Uses DCP/RS-232

Issue 1
January 2002

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 2: Get Information About the System You Are Adding

Page 9

If you do *not* have a private phone network over which the Interchange calls the new messaging system, the phone number will be a public phone number and will include some or all of the following (see also Figure 4):
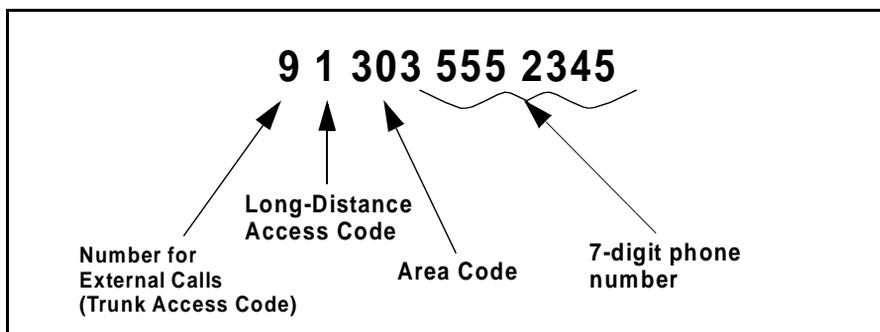

Figure 4. **Dial String Example over Public Network**

> **NOTE:**
> Be sure Interchange DCP ports are allowed to make long-distance calls, if necessary. This capability is usually determined by Interchange's assigned Class of Restriction on your switch. The area code, which is always required for long distance calls, might also be required if local calls require 10-digit dialing.

Phone Number over Private Network

If Interchange calls the system over a private network, the phone number will include one of the following (see Figure 5 or Figure 6):
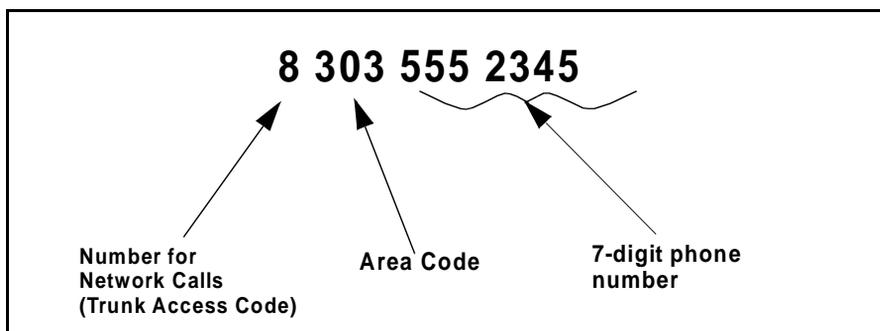

Figure 5. **Dial String Example over Private Network (with Dial Access Code)**

> **NOTE:**
> In this example, Interchange dials the private network access code, **8**, for toll-free calls to another company location. In addition, Interchange dials a 10-digit or 7-digit phone number, as in the public network example. Notice that you do *not* dial a **1** for long distance.

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3
Adding an Intuity AUDIX System That Uses DCP/RS-232

Issue 1
January 2002

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 2: Get Information About the System You Are Adding

Page 10
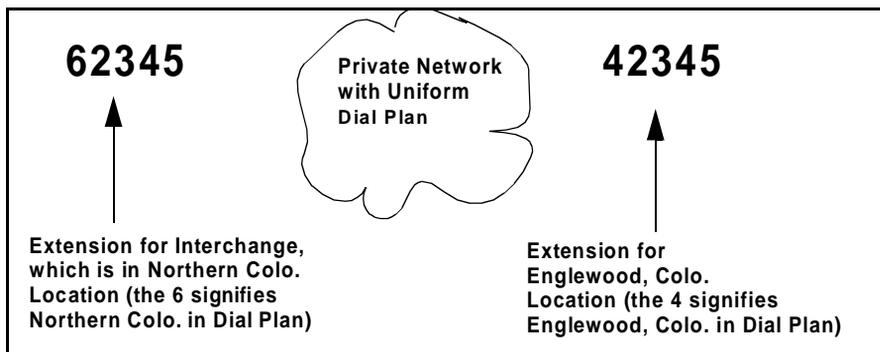

Figure 6. Dial String Example over Private Network (with Uniform Dial Plan)

> ➡ **NOTE:**
> In a private network with a uniform dial plan, extension numbers are
> usually 4 or 5 digits. The initial digit often signifies a specific location.
> In the example, **4** designates the Englewood location in the dial plan.

Dial Plan-Related Screens on DEFINITY Switches

On DEFINITY and IP600 switches, switch administrators use the following
screens to determine what number the Interchange is expected to, and is
allowed to, dial:

- Dial Plan
- Uniform Dial Plan
- Class of Restriction (COR)
- AAR or ARS Digit Analysis[1]
- AAR or ARS Digit Conversion
- Route Pattern

Check the Intuity AUDIX Dial Plan and Network Update Capabilities

To check the Intuity AUDIX dial plan and network update capabilities, do the
following:

1. Starting from the Intuity AUDIX main menu, select

```
>AUDIX Administration
```

---

1.   Automatic Alternate Routing (AAR) is the feature for routing calls over a private network.
     Alternate Routing Selection (ARS) is the feature for routing calls over a public network.

Issue 1
January 2002

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 2: Get Information About the System You Are Adding

Page 11

The system displays a blank administration screen.

2. Enter **change machine** at the **enter command:** prompt.

The system displays the Machine Profile screen (Figure 7).
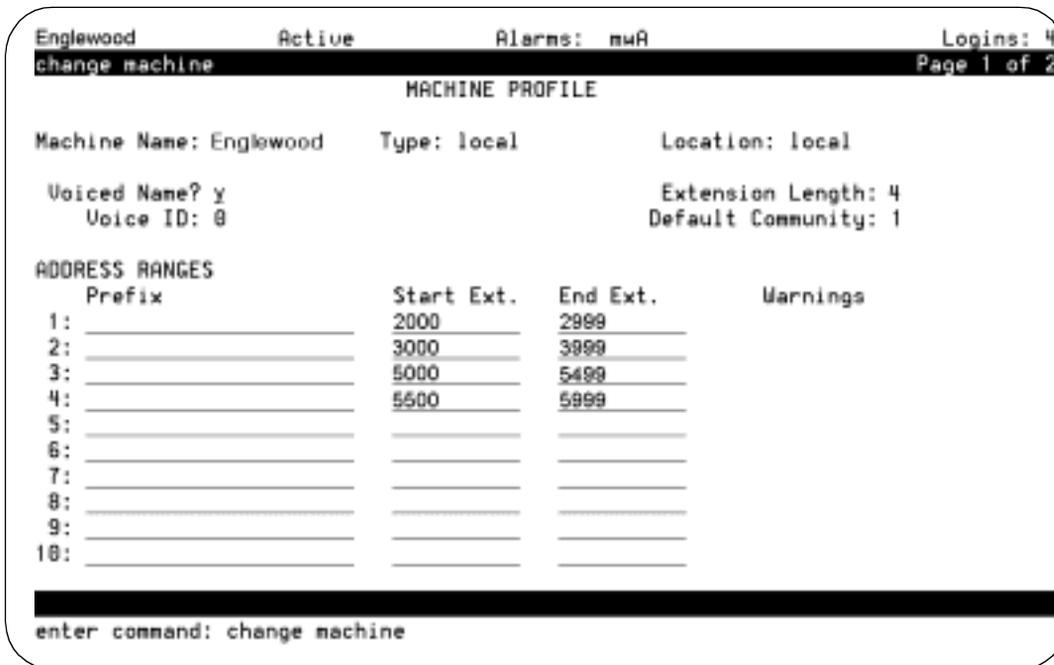

Figure 7. Machine Profile Screen for the Local Machine — Page 1

3. Note the extension ranges and record them in your Planning Worksheet (see page 6).

⚠ CAUTION:

*Be sure that ranges do **not** include the extensions of automated attendants, bulletin boards, and other special mailboxes that are not intended to accept messages. If these mailboxes are included, then messages sent to Enterprise Lists defined by remote machine will fail and will show up in your delivery status reports. More importantly, messages might actually be sent to mailboxes that are not intended to receive E-list messages.*

4. Press F7 (NextPage).

The system displays page 2 of the Machine Profile screen (Figure 8).

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3   *Issue 1*

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 2: Get Information About the System You Are Adding   *Page 12*
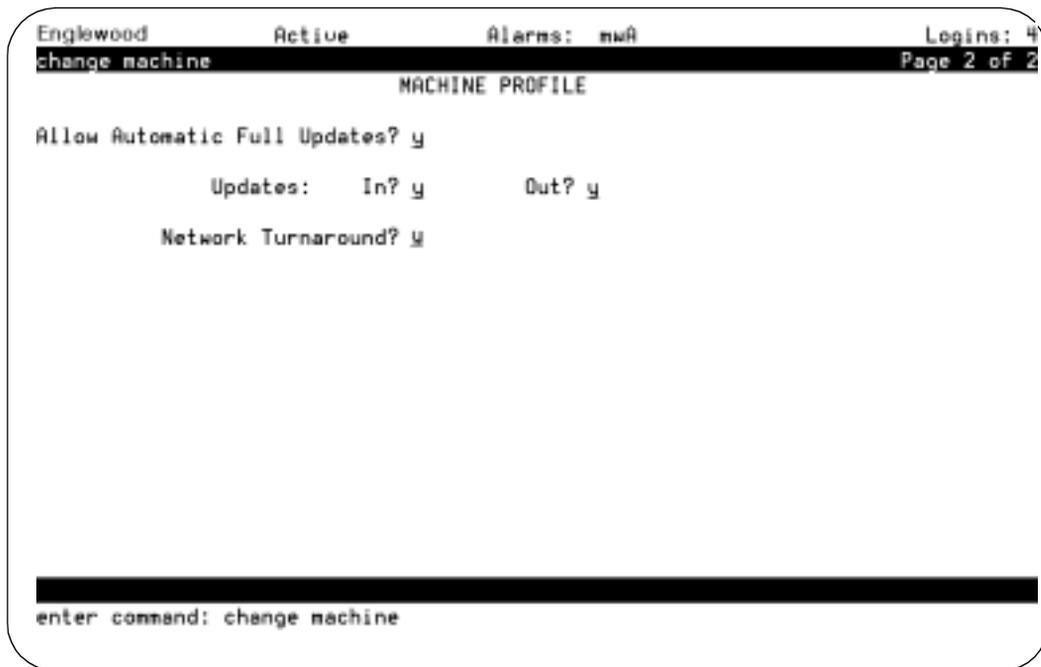

Figure 8.   Machine Profile Screen for the Local Machine — Page 2

5. In the **Allow Automatic Full Updates** field, type **y**.

6. Type **y**, if necessary, in all other fields.

7. When you finish updating the local machine information, press F3 (Save) to save the information in the system database.

   The cursor returns to the command line, and the system displays the message Command Successfully Completed.

8. Type **exit** to leave AUDIX Administration.

Check the Channel Configurations

1. Start at the Intuity AUDIX main menu and select

   > **Networking Administration**

   > **Networking Channel Administration**

   The system displays the Networking Channel Administration window (Figure 9).

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3   Issue 1
Adding an Intuity AUDIX System That Uses DCP/RS-232   January 2002

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 2: Get Information About the System You Are Adding   Page 13

```
                    Networking Channel Administration
CHANNEL      TYPE         RATE     STATUS          MACHINE      ACTIVITY
-------      ----         ----     ------          -------      --------
   1          DCP        56000     IDLE
   2          DCP        56000     IDLE
   3      RS-232 ASYNC   9600      IDLE
   4      RS-232 ASYNC   9600      IDLE
   5          DCP                  NOT EQUIPPED
   6          DCP                  NOT EQUIPPED
   7          DCP                  NOT EQUIPPED
   8          DCP                  NOT EQUIPPED
   9          DCP                  NOT EQUIPPED
  10          DCP                  NOT EQUIPPED
  11          DCP                  NOT EQUIPPED
  12          DCP                  NOT EQUIPPED
```

Figure 9.   Networking Channel Administration Window

2. Check that the window lists `DCP` or `RS-232` ports, as appropriate, and that the ports show a status other than **NOT EQUIPPED**.

    If the necessary ports are not listed, you will need to configure them. If the necessary ports are not equipped, you will need to equip them.

Determine the Prefixes of the New System Mailboxes and Test Mailbox IDs

1. Determine the **End Node Test Mailbox** on the new system. You use this mailbox to send and receive test messages through Interchange. Ask the administrator of the new system for a mailbox number. Enter the number in your Planning Worksheet (see page 6).

2. Determine the **Area Code and/or Local Exchange Prefix(es)** that Interchange must use to send messages to mailboxes on the new system. Enter the prefixes in your Planning Worksheet (see page 6).

    Ask the switch administrator for the new system to get the correct digits. These digits are required because Interchange uses a specified address length (normally 7 or 10 digits for the US) to process all messages.

    The prefix comprises the digits that normally precede the mailbox IDs when someone calls the mailbox from outside of the switch location. The prefix could actually replace digits in the mailbox IDs, as will be defined as a part of Dial Plan Mapping. Usually, prefixes are associated with Direct Inward Dial (DID) trunks that direct calls to the mailboxes. That is, the prefix combined with the mailbox ID is usually the phone number of a subscriber.

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3   *Issue 1*
Adding an Intuity AUDIX System That Uses DCP/RS-232   *January 2002*

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 3: Determine How to Map the New System's Dial Plan   *Page 14*

For example, mailboxes in the range **20000** to **29999** might normally be preceded by **303-55**. Therefore, if an outside caller wanted to leave a message for mailbox **20001**, that caller would actually dial **303-552-0001**. This example assumes the local area requires 10-digit dialing.

It is possible, however, in a 10-digit dialing area, that mailboxes on the new system could be preceded by *different* prefixes. Therefore, although some mailboxes are preceded by **303-55,** the extension range **50000** to **59999** might be preceded by **720-48**. In this case, an outside caller would dial **720-485-5460** to call mailbox **55460**.

Task 3: Determine How to Map the New System's Dial Plan

> **NOTE:**
> Avaya Professional Services normally determines how to map the dial plan for you and sends you a Dial Plan Mapping Worksheet. In this case, you can skip this task.

The Interchange network dial plan can use a uniform address length that consists of from 3 to 10 digits. However, it is strongly recommended that Interchange use a 7-digit or 10-digit dial plan. The new system, on the other hand, will likely have a different dial plan, one that usually uses 4 or 5 digits. In most cases, therefore, you will have to map the dial plan of the new system to the Interchange network address length.

> **NOTE:**
> If the mailbox IDs on the new system have exactly the same number of digits as the address length used in the Interchange network dial plan, then you might not need to perform dial plan mapping. For example, if the Interchange dial plan calls for 10-digit addresses, and the mailbox IDs on the new system always use 10 digits, you do not need to map the dial plans. As another example, if the Interchange dial plan uses the 5-digit uniform dial plan of a private network, and the new system's mailbox IDs also use the same 5-digit uniform dial plan within the same private network, you do not need to map the dial plans.

> **CAUTION:**
> *Since every Interchange address must be unique, there might be circumstances in which the new system's mailbox ID length matches the Interchange dial plan, but because the new system is not part of the same switch private network, the mailbox IDs might not be unique within the Interchange network. This situation is quite common, which is why it is normally recommended to use a 10-digit Interchange dial plan and dial plan mapping.*

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3
Adding an Intuity AUDIX System That Uses DCP/RS-232

Issue 1
January 2002

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 3: Determine How to Map the New System's Dial Plan

Page 15

Use the following instructions and the Dial Plan Mapping Worksheet (see page 23), to determine how to map the new system's dial plan. This worksheet is normally provided to you by Avaya Professional Services.

1. Note these two critical rules:

   - The digit or digits you enter in the Map From column for each Mailbox ID range must be *unique*.

   - If you have only one prefix that you are mapping to and you do not have to replace the initial digit or digits of the mailbox IDs[2], you can set the Map From Length to **0**.

   ## ⚠ CAUTION:
   If you change your dial plan later (for example, if you add more extensions that have a different DID prefix) and need to add Mailbox ID ranges for this system, you will have to remove the system from the Interchange network and add it again to the network with the new dial plan. This task could entail a significant amount of work.

   Therefore, if you anticipate the need to change the dial plan for this endpoint in the future, you might want to use a Map From Length of **1** *or more. See Figure 13 on page 19, which illustrates the alternative to Map From Length* **0** *in anticipation of future changes.*

2. Check your Planning Worksheet (see page 6) for the mailbox ID (extension) ranges of the new system. Review the examples that follow and fill out the Dial Plan Mapping Worksheet (see page 23), according to whether you have:

   - A broken or unbroken range of extensions

   - Ranges of extensions that have different prefixes and the first digit or digits in the **start** field are unique.

   - Ranges of extensions that have different prefixes and the first digit or digits in the **start** field are shared.

   - Initial digits in mailbox IDs that must be replaced with different digits.

---

2. If the new system's mailbox IDs must conform to a Uniform Dial Plan, the initial digit or digits of the mailbox IDs can overlap, **and differ from**, the ending digit or digits of the local exchange prefix. See Sample Dial Plan Mapping (When Prefixes Replace Initial Mailbox Digits) (see page 21).

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3
Adding an Intuity AUDIX System That Uses DCP/RS-232

Issue 1
January 2002

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 3: Determine How to Map the New System's Dial Plan

Page 16

Sample Dial Plan Mapping (Single Unbroken Range of Mailbox IDs)

In Figure 10, since there is a single unbroken MAILBOX ID range (**2000** to **5999**), you enter **0** in the **Map From Length** field on the Dial Mapping Worksheet. In this case, you leave the **Map From** field for the range blank. Then, the **Map To** digits specify the area code and local exchange 3-digit prefix. You can get these numbers from your Planning Worksheet (see page 6).

When these digits are added to the 4-digit mailbox IDs, Interchange has the necessary 10 digits.

Remote Machine Name: Englewood		Mailbox ID Length: 4	
		Map From Length: **0**	
MAILBOX ID:		NETWORK ADDRESS DIAL PLAN MAPPING	
Start	End	Map From	Map To
2000	5999		303555

Figure 10.   Sample Dial Plan Map with a Single Range (0 Map From Length)

Keep in mind that Interchange allows you to use a **Map From Length** of up to **9**. In some circumstances with the previous example, you might choose to use a **Map From Length** of **1**, **2**, **3**, or even **4** with the range **2000** to **5999**.

In a likely scenario with range **2000** to **5999,** you might anticipate the need to change the Dial Plan Mapping later, so you choose **1** for the **Map From Length**, *not* **0**. In this case, the map would appear as follows (Figure 11).

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3　　　　　*Issue 1*

2000	5999	2	3035552
		3	3035553
		4	3035554
		5	3035555

Figure 11.　Sample Dial Plan Map with a Single Range (1 Map From Length)

Sample Dial Plan Mapping (Broken Ranges of Mailbox IDs with Map From 0)

In Figure 12, there are broken MAILBOX ID ranges. In this case, ranges 4000 to 4999 and 5500 to 5799 can be omitted for one of two reasons:

- The range contains auto-attendant mailboxes and other extensions for which mailboxes have not been assigned.

- Another messaging system, which uses the same prefix as this system, will use the mailbox ranges 4000 to 4999 and 5500 to 5799.

In this example, you can still enter **0** in the **Map From Length** field on the Dial Mapping Worksheet. In this case, you leave the **Map From** field for the range blank. Then, for the **Map To** digits for the first range, specify the area code and local exchange 3-digit prefix. Then, leave the remaining Map From and Map To fields blank. Interchange will automatically apply the prefix to the remaining ranges.

When the prefix digits are added to the 4-digit mailbox IDs, Interchange has the necessary 10 digits.

> ⚠ **CAUTION:**
> *If it is possible that this system will add mailbox ranges at a later time, do not use Map From Length 0. Instead, use Map From Length 1, as in Figure 13. If you use Map From Length 0, and then later must change the dial plan so that you must use a different Map From Length, you will have to remove the system from the Interchange network and then add it again.*

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3   *Issue 1*

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 3: Determine How to Map the New System's Dial Plan   *Page 18*

Remote Machine Name: Englewood   Mailbox ID Length: 4

Map From Length: **0**

MAILBOX ID:		NETWORK ADDRESS DIAL PLAN MAPPING	
Start	End	Map From	Map To
2000	2999		303555
3000	3999		
5000	5499		
5800	5999		

Figure 12. Sample Dial Plan Map with Multiple Ranges (0 Map From Length)

Sample Dial Plan Mapping (Broken Ranges of Mailbox IDs with Map From 1)

In Figure 13, as in the previous example, there are also broken MAILBOX ID ranges.

However, say that in this example, you anticipate that you will need to change the dial plan for this system in the future, so you avoid entering a **0** Map From Length. If you were to enter **0**, you would have to remove the system and add it again to change its dial plan. So, instead, you can enter **1** in the **Map From Length** field on the Dial Mapping Worksheet. In this case, enter the first digit of the first Mailbox ID range in the **Map From** field. Then, for the **Map To** digits for the first range, specify the area code, local exchange 3-digit prefix, and the first digit of that same Mailbox ID range. Then, enter the first digit of the next range with a unique start digit, and so on.

When the prefix digits are added to the 4-digit mailbox IDs, Interchange has the necessary 10 digits.

> $\Longrightarrow$ **NOTE:**
> Notice that the last Mailbox ID range, **5800** to **5899** does not have **Map From** and **Map To** digits entered next to it. This is because the **Map From 5** and **Map To 3035555** digits apply to any range that starts with **5**.

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3 **Adding an Intuity AUDIX System That Uses DCP/RS-232**

5800	5999		

Figure 13.   Sample Dial Plan Map with Multiple Ranges (1 Map From Length)

Sample Dial Plan Mapping (Ranges That Require Different Prefixes)

In Figure 14, there are broken MAILBOX ID ranges, and one range has a different **Map To** prefix. This situation requires a **Map From Length** of **1** or greater.

In this example, the range with a different prefix, 5000 to 5999 begins with a unique Start digit. Therefore, you can enter **1** in the **Map From Length** field on the Dial Mapping Worksheet. In this case, then, the **Map To** digits for the ranges consist of the first digit of each range, and the **Map From** digits specify the area codes and local exchange 3-digit prefixes for their respective Mailbox ID ranges.

Remote Machine Name: Englewood		Mailbox ID Length: 4	
		Map From Length: **1**	
MAILBOX ID:		NETWORK ADDRESS DIAL PLAN MAPPING	
Start	End	Map From	Map To
2000	2999	2	3035552
3000	3999	3	3035553
5000	5999	5	7205515

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3
Adding an Intuity AUDIX System That Uses DCP/RS-232

Issue 1
January 2002

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 3: Determine How to Map the New System's Dial Plan

Page 20

Sample Dial Plan Mapping (Ranges with Different Prefixes and Shared Start Digits)

In the following example, the new system had two MAILBOX ID ranges with the same initial digit **5** (**5000** to **5499** and **5500** to **5999**), but their DID prefixes were different and, therefore, must be differentiated in the Dial Plan Map. Also, because entries in the **Map From** column for each range must be unique, there must be **2** Map From digits. That is, you *cannot* set up dial plan mapping with one Map From digit as follows:

Remote Machine Name: Englewood   Mailbox ID Length: 4

Map From Length: **1**

MAILBOX ID   NETWORK ADDRESS DIAL PLAN MAPPING

You cannot do this!! See Figure 15 instead.

MAILBOX ID		NETWORK ADDRESS DIAL PLAN MAPPING	
Start	End	Map From	Map To
2000	2999	2	3035552
3000	3999	3	3035553
5000	5499	**5**	3035555
5500	5999	**5**	7205515
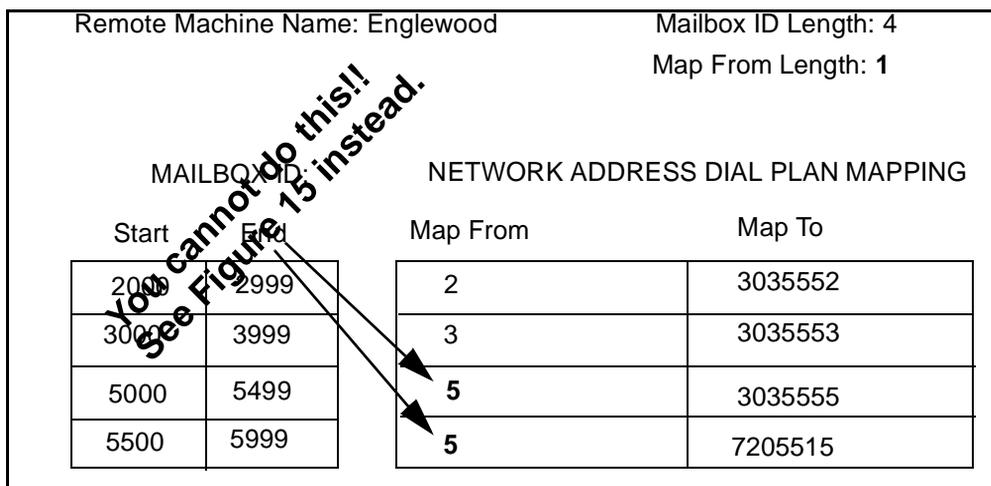

Instead, you must break out every MAILBOX ID range so that the first two digits in each range are unique (see Figure 15). This requirement includes ranges that have unique initial digits (**2000** to **2999** and **3000** to **3999** in the example). The **Map To** digits include 8 digits that specify area code, the local exchange 3-digit prefix, and two additional digits that match the **Map From** digits. When the Map To digits are added to the remaining 2 digits of the mailbox IDs, Interchange has the 10 digits required for the mailboxes.

		59	72055159

These match.

Originally 5000 to 5499 and 5500 to 5999. Now broken out for mapping.

Figure 15. Dial Plan with Multiple Prefixes (2 Map From Length)

Sample Dial Plan Mapping (When Prefixes Replace Initial Mailbox Digits)

In Figure 16, there are broken MAILBOX ID ranges, and the two ranges have different **Map To** prefixes. *Additionally,* the mailbox IDs are part of a 5-digit Uniform Dial Plan across two switches so that the initial digits of the mailbox IDs overlap the final digits of the phone number prefixes. In this case, the Dial Plan

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3   *Issue 1*

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 3: Determine How to Map the New System's Dial Plan   *Page 22*

Map will replace the initial digit of the MAILBOX ID ranges with a different digit. This situation also requires a `Map From Length` of **1** or greater.

In this example, a mailbox in the first range might be **21333**, but its external phone number would be **303-555-1333**. In the Dial Plan Mapping screen, the initial mailbox digit **2** is replaced with the final digit of the prefix, in this case, **5**. A mailbox in the second range might be **54444**, but its external phone number would be **720-551-4444**. In the Dial Plan Mapping screen, the initial mailbox digit **5** is replaced with the final digit of the prefix, in this case, **1**.

Task 3: Determine How to Map the New System's Dial Plan

Page 24

4. In the **Map From Length** field, enter the number of digits that Interchange will replace with mapping digits to convert the current mailbox IDs to Interchange network address length and to ensure unique addresses across the Interchange network.

   The **Map From Length** can be **0** to **9** digits, and how many digits you map can vary greatly depending on how readily the new system's mailbox ranges fit into the existing Interchange network. However, as in the preceding samples, this number will often be based on considerations such as the following:

   - One range (for example, **0000** to **9999** — in this case, you might type **0**) (but see the Caution that follows).

   - Broken ranges, each with unique prefixes (for example, **2000** to **2999** with prefix 303-555 and **4000** to **4999** with prefix 720-551 — in this case, you might type **1**).

   - Multiple ranges that share start digits but have different prefixes (for example, **5000** to **5499** with prefix 303-555 and **5500** to **5999** with prefix 720-551, where **5** is a shared start digit — in this case, you might type **2**).

   - Ranges whose initial digits must be replaced with different digits (for example, a uniform dial plan range of **50000** to **59999**, but a local exchange prefix that ends in **1** — in this case, you might type **1**).

   ## ⚠ CAUTION:
   *If you use Map From Length **0**, you **cannot** change this value later. Instead, you must remove the remote system from the Interchange network and add it again.*

5. In the **Mailbox ID Start** and **End** fields, list the mailbox ID ranges of the new system. You get the ranges from your .

6. In the first **Map From** field, type the digit(s) that match the first digit(s) of the first **MAILBOX ID Start** and **End** range. This field can be blank if Interchange will add the same Map To digits for all ranges and no digits in the mailbox IDs must be replaced with different digits. However, the number of digits you enter must match the number of digits specified in the **Map From Length** field.

   In the example in , the first field contains **20**, because the mailbox ID range starts with 20, and these first two digits will be replaced with the last two digits of the **Map To** digit string.

7. In the first **Map To** field, type the area code and DID prefix of the mailbox IDs. For these numbers, check your Planning Worksheet. The last digits in this field must match the digits in the **Map From** field.

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3　　　　*Issue 1*
Adding an Intuity AUDIX System That Uses DCP/RS-232　　　　*January 2002*

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 4: Determine the Type of Subscriber Update for the New System　　　　*Page 25*

In the example in [Figure 15](), the first field contains **30355520**, with the last two digits, **20**, as substitutes for the first two digits **20** of the mailbox range, thereby creating mailbox IDs of 10 digits. For example, the first mailbox would have a network address of **303-555-2000**, and the last mailbox in this range would have an address of **303-555-2099**.

> **NOTE:**
> If the **Map From** field is blank, the **Map To** digits will simply be added to the mailbox IDs to total 10 digits.

Task 4: Determine the Type of Subscriber Update for the New System

To keep the remote subscriber list for the new system up to date with subscribers within the Interchange network, you must select one of four options for the new system:

Full updates　　Full updates include, in the new system's remote subscriber list, every subscriber on every system in the Interchange network. This option ensures that subscribers on the new system can address by name every subscriber in the network. However, this option can require a large amountof disk space on the new system, and remote subscribers who do not send or receive messages will be stored unnecessarily.

If you select this option, Interchange performs a full update when you first administer the new system. Subsequent updates include changes to subscriber lists of remote systems, where subscribers have been added or removed. Subsequent updates occur in either of the following:

- When you perform a Demand Remote Update from the Intuity AUDIX system.

- When Interchange receives a subscriber change from a remote system. If the new Intuity AUDIX system has Automatic Full Updates turned on, these updates occur automatically according to the message delivery schedule of Interchange and the Intuity AUDIX.

> **⚠ CAUTION:**
> *If you begin with full updates and later change to dynamic subscriber updates, Interchange will remove all subscribers from the remote subscriber directory and begin to repopulate the directory with dynamic updates.*

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3
Adding an Intuity AUDIX System That Uses DCP/RS-232

Issue 1
January 2002

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 4: Determine the Type of Subscriber Update for the New System
Page 26

Dynamic updates	With this option, each time a subscriber on the new system sends a message to a remote subscriber, that remote subscriber is added to the Dynamic Directory List for the new system. Likewise, each time a remote subscriber sends a message to a subscriber on the new system, that remote subscriber is added to the list.
	If, typically within the next 90 days (see Dynamic Sub Expiration Days on the Remote Machine Profile screen), no other messages are sent from the new system to that remote subscriber, or vice versa, that remote subscriber is removed from the list. This removal helps save storage space on the new system.
Directory View updates only	With this option, the new system's remote subscriber list will include subscribers within ranges of extensions on systems you specify. A Directory View list for a system is static, and as with full updates, this option can use a lot of disk space. Additionally, with this option, subscribers who fall outside the ranges and systems you specify will not be addressable by name from the new system.
	If you select this option, Interchange performs a directory view update when you first administer the new system. Subsequent updates include changes to subscriber lists of remote systems, where subscribers have been added or removed. Subsequent updates occur in either of the following:
	■ When you perform a Demand Remote Update from this system
	■ When Interchange receives a subscriber change from a remote system
Combination of Dynamic and Directory View updates	You can use Dynamic Subscriber Updates and Directory Views in combination. In this case, dynamic updates occur as described above, but the Directory Views option also identifies specific ranges of extensions on specific remote systems to ensure that remote subscribers on those systems can be addressed by name on the new system.
	This type of setup is useful when you are converting high-traffic point-to-point systems to the Interchange network and/or when it is important that all or a subset of remote subscribers on a specific system is addressable by name for subscribers on the new system.
None	With this option, Interchange will not update the subscriber names list for the new system. This might be a useful option during testing or early during the addition of the new system to discourage subscribers on the system from sending messages through Interchange.

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 5: Create an Interchange Profile on the New System   *Page 27*

# Task 5: Create an Interchange Profile on the New System

To add an Intuity AUDIX system to your Interchange network, you must identify the Interchange system to the Intuity AUDIX networking software. To do this, you do the following *on the Intuity AUDIX system*:

1. [Complete the Digital Network Machine Administration Window](#)

2. [Complete the Machine Profile Screen for the Remote Machine](#)

Complete the Digital Network Machine Administration Window

Use the Digital Network Machine Administration window of the Intuity AUDIX system to enter information for connecting to the remote machine.

1. Starting from the Intuity AUDIX main menu, select

```
> Networking Administration

    > Remote Machine Administration

        > Digital Network Machine Administration
```
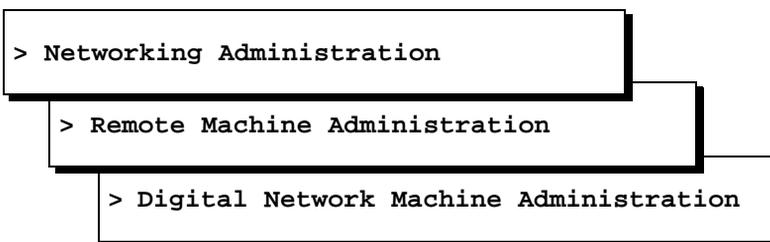

The system displays the Digital Network Machine Administration window ([Figure 17](#) for DCP or [Figure 18](#) for RS-232).

```

Figure 18.   Digital Network Machine Administration Window (RS-232)

2. In the **Machine Name** field, type the name of the Interchange system and press ENTER. In the example, the name would be **central**. The name must be unique to any other system names that Intuity AUDIX communicates with.

   To make sure the name is unique, press F2 (Choices) to display a list of valid remote machines.

3. In the **Connection** field, type **DCP MODE 1**, **DCP MODE 3**, or **RS-232 ASYNC**.

4. In the **Dial Str** field, type the phone number of the Interchange. In the example, it's **919705551111** (**atdt919705551111** if RS-232). The Interchange phone number would be found at the AMIS Analog Parameters screen on Interchange, which you access from the Interchange Administration and System Parameters menus.

   As when Interchange dials the new system, the phone number you enter must take into account whether the calls will occur over a private or public network. This, in turn, will determine whether an outside access number (normally 9), a network access number (normally 8), or a private network extension (usually 4- or 5-digits) will be used, and whether a long-distance number (1) should be included. See .

5. In the **Message Transmission Schedule Start**, **End**, and **Interval** fields, you normally leave the defaults. It is recommended that the first row be **00:02**, **23:59**, and **00:05** respectively. This schedule means that between 12:02 a.m. and 11:59 p.m., the Intuity AUDIX system sends any queued messages every 5 minutes. However, if there are many Intuity AUDIX systems in the Interchange network using the DCP or RS-232 protocol, you might want to stagger the start times on each system to prevent overloading Interchange.

   In the second and third rows, leave the defaults as well. You don't use these schedules.

Issue 1
January 2002

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 5: Create an Interchange Profile on the New System

Page 29

6. In the **`Data Rate`** field, type **56000** (for DCP Mode 1), **64000** (for DCP Mode 3), or **9600** or **19200** for RS-232.

7. In the **`Password`** field, type the password required to log in to Interchange. If you do not remember the password, check the Local Machine Administration screen for Interchange.

8. In the **`Channel`** field, type **00**. With **00**, Intuity AUDIX uses whatever channel is available at the moment.

9. In the **`Machine Type`** field, type **Intuity 4.0 or later**. Interchange is treated as a networked Intuity AUDIX R4.0 by Intuity AUDIX systems.

10. In the **`Send Multimedia Messages`** field, type **y**. Generally, it is best to allow AUDIX to send all components of multimedia messages to Interchange. Then, if the target system cannot accept all components, a recorded message tells the receiver about the part that failed.

11. Press F6 (Cancel) to return to the Remote Machine List menu

12. When you finish entering information for a remote machine, press F2 (Add). (If you do not see ADD on your screen, press F8 (CHG-KEYS) to access the alternate set of function keys.)

   The system adds the information and returns you to the **`Machine Name`** field.

13. Press F6 (Cancel) repeatedly to return to the main menu.

Complete the Machine Profile Screen for the Remote Machine

Use the Machine Profile screen to enter additional networking information about Interchange, such as address ranges and remote update information.

1. Starting from the Intuity AUDIX main menu, select

   ```
   > AUDIX Administration
   ```
   The system displays a blank administration screen.

2. At the command line, type **change machine *interchange_name***, and press ENTER. ***interchange_name*** is the name you entered in

   The system displays page 1 of the Machine Profile screen (Figure 19).

   NOTE:
   If you do not know the names of the remote machines, enter **list machines** at the enter command prompt. The system displays a list of all machines administered on the system.

enter command: change machine central
```

Figure 19.   Machine Profile Screen for a Remote Machine — Page 1

> ➡ **NOTE:**
> The **Machine Name**, **Type**, **Location**, and **Voice ID**
> fields are display only and cannot be changed. The **Voiced
> Name?** field is display only and changes from **n** to **y** after you have
> recorded a name for Interchange.

3. In the **Extension Length** field, type the extension length of the
   Interchange network dial plan, usually 7 or 10 digits. In the example, the
   Interchange network dial plan is **10** digits.

4. In the **Default Community ID** field, type **1**.

5. In the **Prefix** column for ADDRESS RANGES, leave the fields blank.

   Normally the prefix is used for point-to-point Intuity AUDIX networked
   systems, such that, to address a message, a subscriber enters the
   system's prefix to identify the system (for example, **22**), and then the
   mailbox ID of the recipient (for example, **1234**).

   The prefix is, therefore, not necessarily an area code or local exchange
   prefix. It is simply a code to identify the remote system for messaging.

   Since Interchange is not for point-to-point networking, and because the
   network address is normally a 7-digit or 10-digit address, you do not
   normally use a prefix to identify Interchange.

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3
Adding an Intuity AUDIX System That Uses DCP/RS-232

Issue 1
January 2002

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 5: Create an Interchange Profile on the New System

Page 31

6. In the first fields in the **start Ext.** and **End Ext.** columns, type the start and end points of the extension ranges on the Interchange network.

   In the example, **0000000000** to **9999999999** is the range because Interchange has a 10-digit dial plan, and it is anticipated that all networked messaging will be sent through Interchange

7. Press ⑦ (NextPage). The system displays page 2 of the Machine Profile screen (Figure 20).

Figure 20.   Machine Profile Screen for a Remote Machine — Page 2

8. In the **Send to Non-Administered Recipients?** field, type **y**.

   y allows the Intuity AUDIX system to send messages to addresses for which no subscriber name is known.

9. In the **UPDATES: In?** field, type **y** to allow Intuity AUDIX to accept updates from Interchange.

10. In the **UPDATES: Out?** field, type **y** to allow Intuity AUDIX to send updates to Interchange.

11. In the **Network Turnaround?** field, type **y** to allow the Intuity AUDIX system to send messages and subscriber updates to Interchange by using connections that Interchange has already established to send messages and updates to Intuity AUDIX. This turnaround helps reduce total time on, and cost of, network communications between systems.

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3

└──────────────────────────────────────────────────────────────────┘
```

Figure 22. AUDIX Digital Network Machine Administration Screen

2. In the **Machine Name** field, enter a name for the new system. Check with the administrator of the new system for the exact name. In the example, the name is **Englewood**, which is the location of the system.

   The name must be unique within your Interchange network and must match exactly the name entered in to the AUDIX system.

   Use F2 (Choices) to view the existing AUDIX digital system names to make sure that you enter a unique name.

> ⚠️ **CAUTION:**
> *The name must be unique on both the local Interchange and any other Interchange systems, if you have them, in your network.To make sure that you are using a unique name, you can check the Remote Machine List on all Interchange systems in your network. This screen lists all machine names, including AMIS systems and those systems that use Serenade Digital, Aria Digital, and Octel Analog Networking protocols. The path to access this screen is as follows:*

3.

```
> Interchange Administration
```
```
    > Remote Machine Administration
```
```
        > Remote Machine Lists
```
```
            > Remote Machine List

Adding an Intuity AUDIX System That Uses DCP/RS-232

Issue 1
January 2002

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 6: Identify the New System to the Interchange System

Page 34
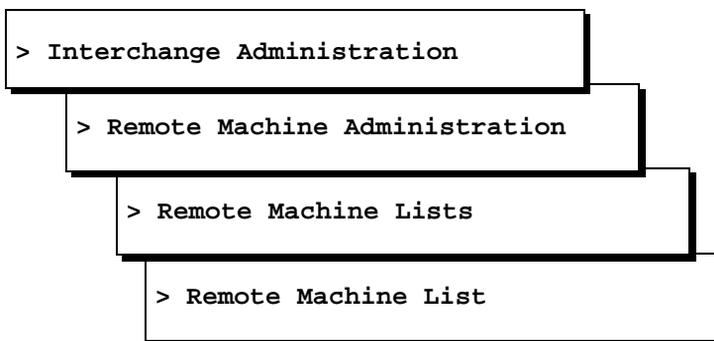

4. In the **Connection Type** field, enter **DCP MODE 1**, **DCP MODE 3,** or **RS-232 ASYNC**.

5. In the **Dial Str** field, enter the phone number of the new system. This number should be available from your Planning Worksheet. If the connection is RS-232, precede the phone number with **ATDT**.

   The phone number could be:

   - A 4- or 5-digit number in a private phone network

   - An **8** (or another trunk access number) followed by a 7- or 10-digit number in a private network

   - A public phone number preceded by a **9**

   In the example, the number **913035512345** (**ATDT913035512345** for RS-232) indicates the Interchange must call over the public network (requires **9** for outside access) and the call is long-distance (requires **1**).

   You can also enter a "**P"** (including quotes) to make the Interchange pause. One pause equals 1.5 seconds. For example, if we entered the dial string as **9"P"13035512345**, the effect is a 1.5-second pause after the Interchange system dials **9**.

6. In the **Message Transmission Schedule Start**, **End**, and **Interval** fields, you normally leave the defaults. It is recommended that the first row be **00:02**, **23:59**, and **00:05** respectively. This schedule means that between 12:02 a.m. and 11:59 p.m., Interchange will send any queued messages every 5 minutes. However, if there are many Intuity AUDIX systems in the Interchange network using a digital protocol, you might want to stagger the start times on each system to prevent overloading Interchange.

   In the second and third rows, leave the defaults as well. You do not use these schedules.

7. In the **Data Rate** field, type **56000** (for DCP Mode 1), **64000** (for DCP Mode 3), or **9600** or **19200** for RS-232. The rate must match exactly the rate you entered for Interchange on the Intuity AUDIX system.

8. In the **Password** field, type the password required to log in to the new system. Get this password from Get the Name, Incoming Dial String, and Password of the New System (see page 7).

9. In the **Channel** field, type **00**. With **00**, Interchange will use whatever channel is available at the moment.

10. In the **Machine Type** field, type **Intuity 3.0** or **Intuity 4.0 or later**.

11. In the **Send Multimedia Messages** field, type **y**. Generally, it is best to allow Interchange to send all components of multimedia messages. Then, if the target system cannot accept all components, a recorded message tells the receiver about the part that failed.

Task 7: Administer Remote Machine Parameters *Page 35*

12. When you finish entering information for the new system, press ⌨F8⌨ (Chg-Keys).

13. Press ⌨F3⌨ (Add).

    After you press this key, the system adds the information and returns you to the Machine Name field. You see the following message on your screen:

    ```
    Machine Added, Enter Machine Name, use <CHOICES> for
    list
    ```

Task 7: Administer Remote Machine Parameters

Perform this task to define other characteristics of the new system, most importantly, the dial plan of the mailboxes on the new system. Use the Dial Plan Mapping Worksheet from Avaya Professional Services or your Dial Plan Mapping Worksheet (see page 23) to complete this task.

To set remote machine parameters, do the following:

1. Start at the Interchange main menu and select

   > **Interchange Administration**

   > **Remote Machine Administration**

   > **Remote Machine Parameters**
   The system displays the Remote Machine Parameters screen (Figure 23).

```
                          Remote Machine Parameters
Remote Machine Name: Englewood_____  Machine Type: INTUITY 4.0 ____

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3
Adding an Intuity AUDIX System That Uses DCP/RS-232

Issue 1
January 2002

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 7: Administer Remote Machine Parameters

Page 36

2. In the **Remote Machine Name** field, type the name of the new system you added in , and press ENTER. If you do not remember the exact name, press F2 (Choices) to display a list of valid remote machines. In the example, you would type **Englewood**.

   The system automatically fills in the **Machine Type** field with **INTUITY 3.0** or **INTUITY 4.0**.

3. In the **Avaya** or **Intuity Interchange?** field, leave the default **n** (no). The new remote system is not an Interchange.

4. In the **Mailbox ID Length** field, type the length of the mailbox IDs of the new system. If a sample mailbox ID (or extension) is **2345**, the length is *4*.

   In most cases, this number will be **4** or **5**, but the number can be up to 10 digits if, for example, mailboxes have their own incoming trunk group. In the example, the mailbox IDs will be **4** digits long.

5. Leave the defaults in the following fields:

   ■ **Default Language: us-eng**

      There are no other languages currently supported.

   ■ **Failed Msg. Notification Priority? n**

      y means that a subscriber on this system who sends a message to a subscriber on another system will receive a priority notification if the message is not delivered to that subscriber.

   ■ **Msg ID? n**

      y means that failed message notification, if turned on, will include the original message ID.

   ■ **Send Message for Warning? y** or **n**

      y indicates that the **original** message is sent back to a subscriber after he or she has sent a message from the AUDIX system to a subscriber on a remote system that has the Extended Absence Greeting (EAG) warning activated. The return of this message is in addition to the message indicating the actual EAG warning condition. This capability is convenient for users who resend messages to someone else who is available.

   ■ **Default NameNet Type: U**

      U means "usage-based" and indicates that directory entries are temporarily available based on the network traffic of a particular remote system. This field is used when subscribers associated with this new system are stored on a legacy Octel system as NameNet entries.

   ■ **Organization:** Leave blank.

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3
Adding an Intuity AUDIX System That Uses DCP/RS-232

Issue 1
January 2002

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 7: Administer Remote Machine Parameters

Page 37

This field is for your information. It can be a record of the name of the organization this system supports, the name of the organization that maintains the system, or any other name you choose.

- **Org Unit:** Leave blank.

    This field is for your information. It can be a record of the department number this system supports, the department number that maintains the system, or any other name or number you choose.

- **Node ID:** Display only, created by Interchange.

- **Comments:** Leave **none.**

    This field is for your information. You might want to enter the name and phone number of the contact person for the new system.

6. In the **ADDRESS RANGE (Mailbox ID)** fields, type the address ranges (up to 10) of the new system. While the screen allows you to enter more than 10 ranges, Interchange recognizes only the first 10 ranges you enter. Check your Dial Plan Mapping Worksheet for these ranges.

⚠ CAUTION:

*Do **not** simply use the ranges from your Planning Worksheet or the ranges given to you by the switch administrator for the new system. Also use the Dial Plan Mapping Worksheet that you received from Professional Services or the worksheet you completed yourself. The ranges you enter here will reappear on the Dial Plan Mapping screen, which you will complete in .*

*In the example (Figure 23), the mailbox ranges reflect the ranges entered on the Planning Worksheet as **2000** to **2999, 3000** to **3999, 5000** to **5499**, and **5500** to **5999**. The 5000 to 5999 range was broken out into two ranges to simply illustrate and emphasize the fact that the latter half of the range, **5500** to **5999**, has a different area code and local exchange prefix from that of **5000** to **5499**. You could actually enter the 5000 to 5999 range as a single range on the Remote Parameters screen and then later break down the range on the Dial Plan Mapping screen to deal with the differing prefixes within the range.*

⚠ CAUTION:

*Be sure that ranges do **not** include the extensions of automated attendants, bulletin boards, and other special mailboxes that are not intended to accept messages. If these mailboxes are included, then messages sent to Enterprise Lists defined by remote machine will fail and will show up in your delivery status reports. More importantly, messages might actually be sent to mailboxes that are not intended to receive E-list messages.*

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 7: Administer Remote Machine Parameters *Page 38*

7. Press $\fbox{ENTER}$ or $\fbox{TAB}$ if you need to add more ranges than those that are available on the initial screen.

8. After you have entered all appropriate address ranges, press $\fbox{F5}$ (Details).

   The system displays the Machine Profile screen (<u>Figure 24</u>). It contains a display-only name for the **Remote Machine Name** field.
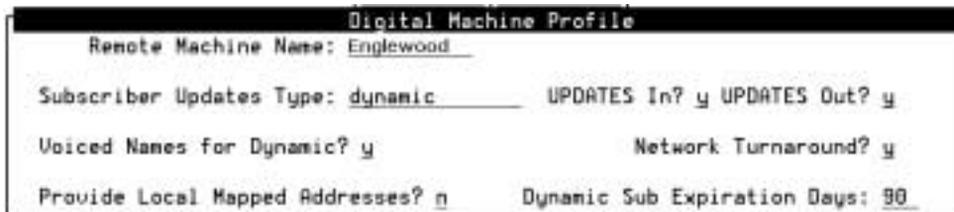

Figure 24. AUDIX Digital Machine Profile Screen

9. In the **Subscriber Updates Type** field, type the type of update you want for the new system:

dynamic   This is the *recommended* ongoing setting because this setting helps save storage space on the AUDIX system.

For the dynamic updates type, each time a subscriber on this system sends a message to a remote subscriber, that remote subscriber is added to the Dynamic Directory List for the AUDIX system. Likewise, each time a remote subscriber sends a message to a subscriber on the AUDIX system, that remote subscriber is added to the list.

If, typically within the next 90 days (see Dynamic Sub Expiration Days), no other messages are sent from the AUDIX system to that remote subscriber, or vice versa, that remote subscriber is removed from the list.

$\Longrightarrow$ NOTE:
If you choose **dynamic**, you can still use the Directory Views screen to create directory views of specific systems and mailbox ranges on those systems.

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3　　　　　　　*Issue 1*
Adding an Intuity AUDIX System That Uses DCP/RS-232　　　　　　　*January 2002*

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 7: Administer Remote Machine Parameters　　　　　　　*Page 39*

full　　　　Type **full** if you want to perform an initial demand pull of all subscribers for this new system. A full demand pull uploads all subscribers from the new system to Interchange. A full demand update on the Intuity AUDIX to pull remote subscribers from Interchange downloads all registered Interchange subscribers from all networked systems.

By selecting this option, you automatically create, for the new system, a directory view (see definition that follows) for all subscribers on every node in the Interchange network. When you access the Directory View screen (Figure 26), you will see every system in your Interchange network listed.

> ⚠️ **CAUTION:**
> *Be sure the new system has enough storage space before using this option.*

directory　　Use this setting to point to the Directory View screen to update
view　　　the subscriber directory for specific systems and ranges. Since this selection is a static list, the subscriber directory includes only those subscribers included in the Directory view.

none　　　With this option, Interchange will not update the subscriber names list for the new system.

10. In the **UPDATES: In?** field, type **y** to allow Interchange to accept updates from the new system.

11. In the **UPDATES: Out?** field, type **y** to allow Interchange to send updates to the new system.

12. In the **Voiced Names for Dynamic?** field, type **y** to allow Interchange to send recorded voice names to the new system during dynamic updates, if any. Type **n** if the subscriber update type is *not* dynamic.

13. In the **Network Turnaround?** field, type **y** to allow Interchange to send messages and subscriber updates to the new system by using connections that the new system has already established when it sends messages and updates to Interchange. This turnaround helps reduce total time on, and cost of, network communications between systems.

14. In the **Provide Local Mapped Addresses?** field, type **n.**

This field applies only if the subscriber update type for the new system is **full**. If you type **y**, Interchange sends the new system updates of the new system's own subscribers during a full update. Setting the value to **y** ensures that the Interchange subscriber list is always in sync with the list on the new system. However, it also can result in subscribers on the new system appearing in the local subscriber lists twice, once with a local address and once with a full Interchange address.

15. In the **Dynamic Sub Expiration Days** field, leave the default **90**.

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3　　　　　　*Issue 1*
Adding an Intuity AUDIX System That Uses DCP/RS-232　　　　　　　　*January 2002*

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 8: Map the New System's Dial Plan for Interchange　　　　　　　　　*Page 40*

This value is the number of days a dynamically-added remote subscriber stays in the new system's Dynamic Directory List without anyone sending messages from the new system to that remote subscriber or that remote subscriber sending messages to the new system.

16. Press F3 (Save).

Task 8: Map the New System's Dial Plan for Interchange

Interchange uses a single-length dial plan for its network. You will have to map the dial plan of the new system to the Interchange network address length.

To do this mapping, you need the Dial Plan Mapping Worksheet from Professional Services or a worksheet that you completed on your own. These worksheets list the area codes and central office prefixes that can be used in conjunction with the new system's dial plan to create Interchange network addresses, usually addresses that match external direct dialing of the new system's mailboxes.

To administer the remote machine dial plan, do the following:

1. Start at the Interchange main menu and select

> **Interchange Administration**

> **Remote Machine Administration**

> **Dial Plan Mapping**

The system displays the Dial Plan Mapping screen ().

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3
Adding an Intuity AUDIX System That Uses DCP/RS-232

Issue 1
January 2002

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 8: Map the New System's Dial Plan for Interchange

Page 41

Figure 25. Dial Plan Mapping Screen

2. In the **Remote Machine Name** field, type the name of the new
   system, and press ENTER. If you do not remember the exact name, press
   F2 (Choices) to display a list of valid remote machines. In the example, you
   would type **Englewood**.

   After you press ENTER, the system displays information in the **Mailbox
   ID Length** and **MAILBOX ID Start** and **End** fields. You had entered
   this information previously in the Remote Machine Parameters screen.

3. In the **Map From Length** field, type the number of digits, within each
   mailbox ID, for which Interchange will substitute digits. Check the list of
   MAILBOX IDs. If you have a single range (for example, **30000** to **60000**) or
   multiple ranges that use the same prefix, enter **0** in the **Map From Length**
   field. In this case, you can leave the **Map From** column for the range
   blank.

   If you have more than one range (usually to accommodate different area
   codes or DID prefixes), and the first digit of the **start** and **End** fields for
   each range are unique, enter **1** in the **Map From Length** field. Also enter
   1 if the last digit of the **Map From** prefix has to replace the first digit of the
   MAILBOX IDS.

   If any ranges share first digits but have different prefixes, then you might
   need to enter **2** or higher in the **Map From Length** field.

   > ⚠ **CAUTION:**
   > *Be careful about using **0** in the **Map From Length** field. If you
   > change your dial plan later (for example, if you add more
   > extensions that have a different DID prefix) and need to add
   > Mailbox ID ranges for this system, you will have to remove the*

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3
Adding an Intuity AUDIX System That Uses DCP/RS-232

Issue 1
January 2002

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 8: Map the New System's Dial Plan for Interchange

Page 42

> *system from the Interchange network and add it again with the new dial plan. This task could entail a significant amount of work.*
>
> *Therefore, if you anticipate the need to change the dial plan for this endpoint in the future, you might want to use a "Map From Length" of 1 or more. See Figure 13 on page 19, which illustrates the alternative to Map From Length 0 in anticipation of future changes.*

4. In the first **Map From** field, type the digit (or digits) that match the first digit (or digits) of the first **MAILBOX ID Start** and **End** range. This field must be blank if the **Map From Length** field is **0**. Otherwise, the number of digits you enter must match the number of digits specified in the **Map From Length** field.

   In the example, the first field contains **20**, because the mailbox ID range starts with 20, and these first two digits will be replaced with the last two digits of the **Map To** digit string.

5. In the first **Map To** field, type the area code and DID prefix of the mailbox IDs. Check your Planning Worksheet for these numbers. The last digits in this field must match the digits in the **Map From** field.

   In the example, the first field contains **30355520**, with the last two digits, **20,** as substitutes for the first two digits **20** of the mailbox range, thereby creating mailbox IDs of 10 digits. For example, the first mailbox would have an Interchange network address of **303-555-2000**, and the last mailbox in this range would have an address of **303-555-2099**.

   $\implies$ **NOTE:**
   If the **Map From** field is blank, the **Map To** digits will simply be added to the mailbox IDs to total 10 digits.

6. Repeat Step 4 and Step 5 for each MAILBOX ID range.

   $\implies$ **NOTE:**
   There can be more than one DID prefix for the new system. Again, check your Planning Worksheet or consult with your switch administrator for the new system.

   In the example (see Figure 15 on page 21 for a full illustration), the range **5500** to **5999** has the area code **720** and the local exchange prefix of **551**, which is different than the prefix for the range **5000** to **5499**.

7. Press [F3] (Save).

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3
Adding an Intuity AUDIX System That Uses DCP/RS-232

Issue 1
January 2002

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 9: Administer Directory Views
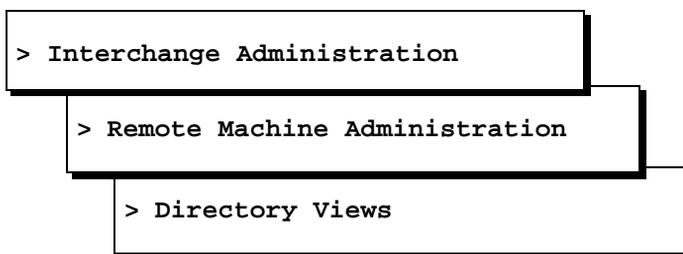

Page 43

Task 9: Administer Directory Views

The Directory View screen allows you to define, for the new system, the other remote systems for which Interchange will provide updates to the new system. You can specify a range of mailbox IDs from which to accept update information.

➡ NOTE:

If you selected **full** as the Subscriber Update Type on the Machine Profile screen (Figure 20 on page 31), you do not need to administer Directory Views. Interchange will automatically include *all* remote systems in the Interchange network in the new system's Directory Views.

To administer directory views, do the following:

1. Start at the Avaya Interchange main menu and select

```
> Interchange Administration

    > Remote Machine Administration

        > Directory Views
```

The system displays the Directory View screen (Figure 26).

Figure 26.   Directory View Screen

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3
Adding an Intuity AUDIX System That Uses DCP/RS-232

Issue 1
January 2002

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 9: Administer Directory Views

Page 44

2. In the **Machine Name** field, type the name of the new system and then press (ENTER).

   The system displays the current directory view information, if information exists, for this machine. If you selected **full** as the Subscriber Update Type for this system on the Machine Profile screen ([Figure 20 on page 31](#)), Interchange will display all remote systems in the Interchange network.

3. Press F3 (Continue).

4. In the **Remote Machine Name** column, type the name of another system in the Interchange network. Interchange updates the subscriber list for the new system with subscribers from this remote system.

   In the example, **Fort Collins**, **Denver**, and **Manhattan** are systems whose subscribers Interchange will dynamically include in, or remove from, the new system's remote subscriber directory.

5. In the **Network Address: Start** and **End** fields, type the first and last subscriber addresses to form a range of addresses on the remote system. These addresses must match addresses as defined in the Dial Plan Mapping screen for this remote system.

   In the example, the Manhattan system, as defined in its Dial Plan Mapping screen, has two mailbox ranges, one of **0000** to **7999**, with **Map To** entries of **2125550** through **2125557.** The other mailbox range for Manhattan is **8000** to **8999**, with a **Map To** entry of **6465558**. (This second range is the result of adding a different set of extensions in Manhattan, for which a different DID prefix had to be used.) As a result, the ranges of addresses for the Directory View are **2125552000** to **2125557999** and **6465558000** to **6465558999**.

6. In the **Voiced Name?** field, leave the default **y** to have each subscriber's voiced name stored in the remote subscriber directory.

7. Press F3 (Save).

8. Press F4 (Reselect) to enter another remote machine and repeat this procedure, or press F6 (Cancel) to exit the screen and return to the Remote Machine Administration menu.

Adding All Machines

If you have many systems in the Interchange network, and you want to add most or almost all remote systems to the new system's directory view, you can add all machines and then delete those that should not be included.
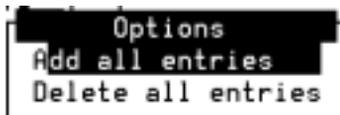

➡️ NOTE:

Adding all machines to Directory Views is the equivalent of defining a full subscriber update type for the new system.

To add all machines listed in a directory view, do the following:

1. From the Directory View screen, press F7 (Options).

    remote_machine_name is name of Interchange.

    The system displays the List Remote Extensions screen.

8. Check that the remote users of Interchange's new system are listed.

9. Enter **list measurements feature day** at the **enter command:**
    prompt.

    The system displays the Feature Daily Traffic screen.

10. Verify the new number of remote users.

11. Enter **display administration-log** at the **enter command:** prompt.

    The system displays the Administration Log screen.

12. Verify that no conflicts or problems occurred with the remote update.

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3　　　　　*Issue 1*
Adding an Intuity AUDIX System That Uses DCP/RS-232　　　　　*January 2002*

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 15: Test the Connection　　　　　*Page 55*

13. Press F1 (Cancel).

    The cursor returns to the command line, and the system displays the
    message `Command Successfully Completed.`

14. Enter **exit** at the **enter command:** prompt to leave AUDIX
    Administration.

Task 15: Test the Connection

To test the connection between Interchange and the new messaging system, do
the following:

1. Log in to a voice mailbox on a *different* messaging system in the
   Interchange network.

2. Create a test message (for example, "This is a test message from Bob.
   Please message me back").

3. Address and send the message to the test mailbox on the new messaging
   system. The address normally includes the whole Interchange network
   address, which includes the Map To digits, as defined in Task 8: Map the
   New System's Dial Plan for Interchange (see page 40), and the remaining
   digits of the specific mailbox.

4. Log in to the test voice mailbox of the new messaging system. Either you or
   the system administrator of the new messaging system can do this. For the
   test mailbox, check the **End Node Test Mailboxes** identified in your
   Planning Worksheet (see page 6).

5. In the test mailbox on the new system, listen to the test message sent in
   Step 3. Also in the test mailbox, send a reply to the test message back to
   the mailbox on the other system.

6. Listen to the reply in the mailbox you logged in to in Step 1.

Task 16: Update Remote Systems for
Subscribers on the New System

Once you have added the new system to the Interchange network, the other
remote systems in the network need to recognize the subscribers on the new
system for name addressing. The method you use to update a remote system for
the new system's subscribers depends on what type of system the remote system
is and how you have administered the Subscriber Update Type for that system
(see Table 1).

➡ NOTE:

If, over a short period of time, you are adding more than one system to your
Interchange network, you might want to wait until all systems have been
added before manually updating the existing systems in your network.

Avaya Interchange Release 5.4/INTUITY Interchange Release 5.3   *Issue 1*
Adding an Intuity AUDIX System That Uses DCP/RS-232   *January 2002*

Adding an Intuity AUDIX System That Uses DCP or RS-232
Task 16: Update Remote Systems for Subscribers on the New System   *Page 56*

Table 1.   Remote Node Update Options

Update Type	Remote System Type	Steps to Update a Remote System
Full	Intuity AUDIX TCP/IP, DCP, RS-232	If you have the **full** Subscriber Update Type turned on for an Intuity AUDIX remote system, perform for that remote system the same steps as in Task 14 (Optional): Manually Update the Intuity AUDIX System (see page 53) (do this during off hours for RS-232 systems).
	Aria, Serenade, and Octel 100	If you have the **full** Subscriber Update Type turned on for an Aria, Serenade, or Octel 100 remote system, perform Manually Update an Aria, Serenade, or Octel 100 (see page 57) for the remote system. If the remote system uses Octel Analog Networking, complete this task during off hours.
	VPIM/AMIS	Full updates are not supported.
Dynamic	All systems	No action is required if the remote system already uses dynamic updates.
		Subscribers on the new system become known to subscribers on the existing remote system as subscribers from the new system send messages to subscribers on the remote system or vice versa. This method, of course, means that subscribers on the remote system cannot address a subscriber by name on the new system until a message has been sent to or from that subscriber.
Directory Views	Intuity AUDIX TCP/IP, DCP, RS-232	If you have directory views turned on for an Intuity AUDIX remote system, add the new system to the Directory Views screen for the Intuity AUDIX. Then, complete for that remote system the same steps as in Task 14 (Optional): Manually Update the Intuity AUDIX System (see page 53) (do this during off-hours for RS-232 systems).
	Aria, Serenade, and Octel 100	If you have directory views turned on for an Aria, Serenade, or Octel 100 remote system, add the new system to the Directory Views screen for the remote system. Then, perform the steps in Manually Update an Aria, Serenade, or Octel 100 (see page 57) for the remote system. These steps are identical for all Aria, Serenade, and Octel 100 systems. If the remote system uses Octel Analog Networking, complete this task during off hours.
	VPIM/AMIS	Directory Views are not supported.

Adding an Intuity AUDIX System That Uses DCP or RS-232
*Task 16: Update Remote Systems for Subscribers on the New System*

Page 57

## Manually Update an Aria, Serenade, or Octel 100

> **NOTE:**
> The following procedure can require a great deal of time to complete since the communication is over an analog connection. As a result, full and Directory View updates are generally not recommended for systems using Octel Analog Networking.

To update Aria, Serenade, and Octel 100 systems with the subscribers in the system you just added, perform a demand remote push on Interchange. To perform a demand remote push, do the following:

1. Start from the Interchange main menu and select
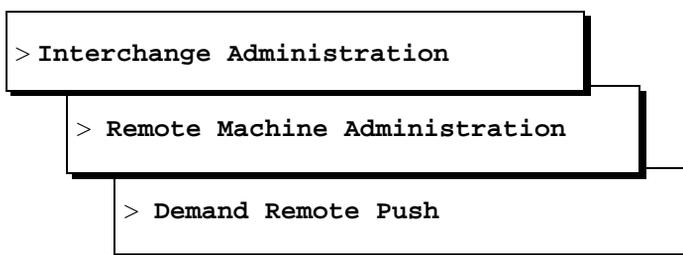

> **Interchange Administration**

> **Remote Machine Administration**

> **Demand Remote Push**

The system displays the Demand Remote Push screen (Figure 2).

```
┌──────────── Demand Remote Push ────────────┐
│                                            │
│   Remote Machine Name: Englewood_____   │
│                                            │
│                                            │
└────────────────────────────────────────────┘
```

Figure 2. **Demand Remote Push Screen**

2. Enter a remote machine name, or press F2 (Choices) to display a list of valid remote machines.

3. Press F3 (Continue).

The system displays the following Demand Remote Push screen (Figure 2-1).

Page 58

Figure 2-1.   Demand Remote Push Screen

The system will now update the Aria, Serenade, or Octel 100 remote system with any ASCII or voiced names that have been added on Interchange from the new system.

⇒ NOTE:
You can press F5 (Abort) to stop the demand remote push or F6 (Cancel) to return to the previous and re-enter an extension range.

4. Press F6 (Cancel) until you return to the Interchange Administration menu.
