<b>Tables</b>		
A. Identification Codes for Recorded Announcements Within the United States . . . . .		3
B. Identification Codes for Recorded Announcements Within the TransCanada Telephone System . . . . .		16

**1. GENERAL**

**1.01** This section provides guidelines for the assignment of identification codes to recorded announcements and lists the identification codes presently in use. Table A lists the identification codes assigned to switching systems within the United States. Table B lists those assigned to TransCanada offices.

**1.02** This section is being reissued to update and add newly assigned identification codes. Since this reissue is a general revision, no revision arrows have been used to denote significant changes.

**2. PURPOSE**

**2.01** Identification codes are appended to recorded announcements to facilitate trouble tracing and to help locate the source of blockages encoun-

tered on the network. They provide a savings in both man-hours and circuit outage time since, except where Common Channel Interoffice Signaling (CCIS) is involved, call failures can be referred directly to the office where the blockage occurred.

**2.02** Experience has shown that adverse customer reaction to identification codes is minimized when the code number is placed at the end of the announcement. Since announcement trunks are arranged so that a customer hears the announcement from its beginning, the code will be heard only when the customer remains on the line throughout the entire message.

**2.03** In the future, it is planned to use prerecorded cassette tapes containing Special Information Tones (SITs) and announcements that will be transcribed to recorder/reproducers and announcement systems. With this development, calls encountering blockages and terminating in announcement systems could be accurately identified automated call detectors according to the appropriate SIT. If it is desirable to append location codes to announcement texts loaded from prepared SIT cassettes, care must be exercised to prevent mutilation or destruction of the SIT and announcement text. Generally, location codes should *not* be appended to SIT cassettes.

**3. ASSIGNMENT**

**3.01** Identification codes are assigned according to the following guidelines:

- (a) Codes are assigned to toll switching offices.
- (b) The first three digits of the code are the numbering plan area (NPA) code indicating the location of the switching office.
- (c) The fourth and fifth digits are assigned as follows:

**NOTICE**

Not for use or disclosure outside the  
Bell System except under written agreement

## SECTION 780-200-022

- Digit 1—Assigned to switching system serving as a Regional Center
- Digit 2 or 3—Assigned to switching systems serving as Sectional Centers
- Digit 4 and higher—Assigned to Primary and Toll Center switching systems.

**3.02** Switching systems with trunks utilizing CCIS signaling should append the letter *C* to their identification code. For example, the code for the Atlanta 4E office, with CCIS, would be 4041C. This is done to alert network maintenance that an announcement received at a CCIS office could be the result of a blockage condition beyond the office transmitting the announcement.

**3.03** Gateway office announcement codes will contain one additional suffix digit to further describe the announcement condition encountered. The authorized suffixes are as follows:

- Digit 1—International No Circuit

- Digit 2—International Reorder
- Digit 3—International Vacant Code
- Digit 4—International Unauthorized Code
- Digit 5—International Foreign Failure.

An example of an identification code of this type for Pittsburgh is 4121C1, indicating an NC condition to an international point from Pittsburgh.

## 4. ADMINISTRATION

**4.01** Requests for new assignments or changes to the attached list of United States system codes should be made to:

District Manager—Network Methods

Telephone: (201) 221-5788
