ATTRIBUTE Rtr Ldp defaultKeyTransitionDelay (ktDelay)

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the default delay time, in minute, for a new MD5 key to take affect. Each LDP neighbor uses this value by default and can be overridden by their corresponding *Rtr/<s> Ldp Nbr/<s> Cfg keyTransitionDelay* attribute.
Mib	no_mib
Values	Decimal (1..20160)
Units	minutes
Default	10

ATTRIBUTE Rtr Ldp lsrCapability

Access	Read: All Write: All
Description	This attribute specifies whether this component will have Label Edge Router (LER) capabilities or both LER and tandem Label Switch Router (LSR) capabilities. The default value for a Multiservice Switch 7400 is ***lerOnly***. The default value for a Multiservice Switch 15000 or Multiservice Switch 20000 is ***lerLsr***.
Mib	no_mib
Values	lerOnly lerLsr
Default	No default

GROUP Rtr Ldp Loop (Loop)

Properties	Provisioned
Description	This group contains parameters that handle loop detection.
Mib	no_mib

ATTRIBUTE Rtr Ldp loopDetection (loopDet)

Access	Read: All Write: All
Description	This attribute specifies a mechanism for finding looping LSPs. When the attribute value is ***on***, messages related to the set up of LSPs are checked to see if the path being setup has a loop. There is also a limit on the number of hops, which is used when loop detection is ***on***. This length is specified in the *hopCountLimit* attribute.
Mib	no_mib
Values	on off

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Rtr Ldp hopCountLimit (hcLimit)

Access	Read: All Write: All
Description	This attribute specifies a limit on the number of hops allowed for each LSP. It is used when setting up LSPs to detect loops. When enabling detection of loops with the *loopDetection* attribute, this attribute should be specified.
Mib	no_mib
Values	Decimal (2..40)
Default	10

COMPONENT Rtr Ldp Binding (Bind)

Instance	fecString (fec) [String (9..19, ASCII)] ldpIdString (ldpId) [String (9..21, ASCII)]
Groups	GROUP Rtr Ldp Bind InOperational (In) GROUP Rtr Ldp Bind OutOperational (Out)
Scope	Application
Description	*Rtr/<s> Ldp Binding/<s>,<s>* This component indicates an LSP through a unique Fec and remote Ldp identifier binding. The LSP in question is always referenced in terms of the relationship to the data path. The *Binding* component is recommended as a good way to view the Transport level LSPs. The instance identifier of the *Binding* components is the Fec and the remote Ldp identifier, where the Fec is “IP Address[Fec Prefix Length]”, and the remote Ldp identifier is “IP Address-Label Space Identifier”.
Mib	no_mib
Common Verbs	Help List Display

GROUP Rtr Ldp Bind InOperational (In)

Properties	Operational
Description	This group contains the attributes bound to a unique Fec and Ldp identifier for the labels generated locally.
Mib	no_mib

ATTRIBUTE Rtr Ldp Bind inLabel

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the transport label bound to the unique pairing of Fec and remote Ldp identifier. This is the locally generated label.
Mib	no_mib
Values	Decimal (0..1048575)
Default	No default

ATTRIBUTE Rtr Ldp Bind inUsageState (inUsage)

Access	Read: All Write: Illegal
Description	This attribute indicates the usage state of the *inLabel* attribute under the *Binding* component. The three possible states are: ***idle***, ***active***, and ***busy***. ***idle***: Indicates labels that are supplied but are not used to represent the LSP. ***active***: Indicates labels that are supplied and are selected for use to represent the LSP. Active labels can accept more users. ***busy***: Indicates labels that are supplied and are selected for use to represent the LSP. Busy labels cannot accept more users.
Mib	no_mib
Values	idle active busy
Default	No default

ATTRIBUTE Rtr Ldp Bind inOperationalState (inOp)

Access	Read: All Write: Illegal
Description	This attribute indicates the operational state of the *inLabel* attribute under the *Binding* component. The two possible states are: ***enabled*** and ***disabled***. ***enabled***: Indicates labels that are installed in the hardware for data path use. ***disabled***: Indicates labels that are not installed in the hardware.
Mib	no_mib
Values	disabled enabled
Default	No default

Copyright © 2006, Nortel Nortel Confidential

GROUP Rtr Ldp Bind **OutOperational (Out)**

Properties	Operational
Description	This group contains the attributes bound to a unique Fec and Ldp identifier for the labels supplied by the downstream neighbor.
Mib	no_mib

ATTRIBUTE Rtr Ldp Bind **outLabel**

Access	Read: All Write: Illegal
Description	This attribute indicates the transport label bound to the unique pairing of Fec and remote Ldp identifier. This label value is supplied by the downstream neighbor.
Mib	no_mib
Values	Decimal (0..1048575)
Default	No default

ATTRIBUTE Rtr Ldp Bind **outUsageState (outUsage)**

Access	Read: All Write: Illegal
Description	This attribute indicates the usage state of the *outLabel* attribute under the *Binding* component. The three possible states are: ***idle***, ***active***, and ***busy***. ***idle***: Indicates labels that are supplied but are not used to represent the LSP. ***active***: Indicates labels that are supplied and are selected for use to represent the LSP. Active labels can accept more users. ***busy***: Indicates labels that are supplied and are selected for use to represent the LSP. Busy labels cannot accept more users.
Mib	no_mib
Values	idle active busy
Default	No default

ATTRIBUTE Rtr Ldp Bind **outOperationalState (outOp)**

Access	Read: All Write: Illegal
Description	This attribute indicates the operational state of the *outLabel* attribute under the *Binding* component. The two possible states are: ***enabled*** and ***disabled***.

Properties	Operational
Description	This group contains the operational attributes of the *Neighbor* component.
Mib	no_mib

ATTRIBUTE Rtr Ldp Nbr sessionId

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Description	This attribute indicates the session identifier for the *Neighbor* component. The session identifier is formed by concatenating the local LDP identifier with the remote LDP identifier.
Mib	no_mib
Values	String (22..46, ASCII)
Default	No default

ATTRIBUTE Rtr Ldp Nbr sessionState

Access	Read: All Write: Illegal
Description	This attribute indicates the current state of the session represented by the *Neighbor* component. The session can be in any of the following five states: ***Non-existent - No Adjacencies***: Indicates that there are no adjacencies for this session. ***Non Existent - Require Provisioning***: Indicates that a dynamic session has at least one adjacency, but the *Rtr/<s> Ldp* ***acceptNonProvisionedNeighbor*** attribute is disabled. The dynamic TCP session is not being established. There are two ways to move this neighbor out of this state and attempt to establish a TCP session. Either set the *Rtr/<s> Ldp acceptNonProvisionedNeighbor* attribute to enabled or add a corresponding *Rtr/<s> Ldp Neighbor/<s>* component. If connectivity with this neighbor is not required in, then remove the corresponding *Rtr/<s> If/<x> LdpIf* from the current provisioning view. ***Non Existent - Throttling:*** Indicates that a session has at least one adjacency, but is currently throttling it is session setup with exponential back-off. ***Non Existent - Establishing TCP***: Indicates that the session is currently attempting to setup a TCP connection (either active or passive). ***Initialized***: Indicates the transmission of an initialization message in the active role, or the receiving of an acceptable initialization message in the passive role. In the passive role, receiving any other LDP message will cause a state change to ***Non Existent***. ***Opensent***: Indicates that an acceptable initialization message was received and a KeepAlive message is sent in response. Receiving any other LDP message will cause the value of the *sessionState* attribute to change to ***Non-Existent.*** ***Openrecv***: Indicates that an acceptable KeepAlive message has been

Copyright © 2006, Nortel Nortel Confidential

	received. Receiving any other LDP message will cause the value of the *sessionState* attribute to change to ***Non-Existent***. ***Operational***: Indicates that the session is operational and is receiving other LDP messages.
Mib	no_mib
Values	nonExistent-NoAdjacencies nonExistent-RequireProvisioning nonExistent-Throttling nonExistent-EstablishingTCP initialized opensent openrecv operational
Default	No default

ATTRIBUTE Rtr Ldp Nbr **ldpMode**

Access	Read: All Write: Illegal
Description	This attribute indicates the negotiated LDP Mode. The attribute can have a value of Downstream Unsolicited (***du***) or Downstream On Demand (***dod***).
Mib	no_mib
Values	dod du
Default	No default

ATTRIBUTE Rtr Ldp Nbr **keepAliveHoldTime**

Access	Read: All Write: Illegal
Description	This attribute indicates the current hold time (in seconds) for the session.
Mib	no_mib
Values	Decimal (0..65535)
Units	seconds
Default	No default

ATTRIBUTE Rtr Ldp Nbr **nextKeepAlive**

Access	Read: All Write: Illegal
Description	This attribute indicates the time (in seconds) left before the next keep alive message is sent to its remote neighbor.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	Decimal (0..65535)
Units	seconds
Default	No default

ATTRIBUTE Rtr Ldp Nbr keepAliveInterval

Access	Read: All Write: Illegal
Description	This attribute indicates (in seconds) the keep alive interval time. The interval represents how often a keep alive message is sent to its remote neighbor.
Mib	no_mib
Values	Decimal (0..65535)
Units	seconds
Default	No default

ATTRIBUTE Rtr Ldp Nbr tcpUpTime

Access	Read: All Write: Illegal
Description	This attribute indicates when the TCP connection first became active.
Mib	no_mib
Values	Time (DHMS)
Default	No default

ATTRIBUTE Rtr Ldp Nbr numberOfAdjacencies

Access	Read: All Write: Illegal
Description	This attribute counts the number of adjacencies managed by the *Neighbor* component.
Mib	no_mib
Values	Decimal (1..8)
Default	No default

ATTRIBUTE Rtr Ldp Nbr remoteTcpAddress

Access	Read: All Write: Illegal
Description	This attribute indicates the remote transport address coupled with the TCP port. If the neighbor fails to provide a value for the *remoteTcpAddress*

Copyright © 2006, Nortel Nortel Confidential

attribute, then the source address from the Hello message is used in its place.

The port number will be zero until the TCP session is operational.

Mib no_mib

Values String (9..21, ASCII)

VERB Clear Rtr Cpp

Impact	Service
Description	clear Vr/<string> Ip Cpp clear Rtr/<string> Cpp clear Rtr/<string> Vrf/<string> Cpp This command is intended for manually clearing all isolated addresses from the current *Cpp* component, and resume traffic to the locally destined addresses on all the FPs.

GROUP Rtr Cpp **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains the provisionable attributes for the *Cpp* component.
Mib	no_mib

ATTRIBUTE Rtr Cpp **packetsPerSecond (pps)**

Access	Read and write
Description	This attribute specifies the maximum number of packets per second a locally destined address on the VR/VRF can receive before being monitored by the *CPP* feature.
Mib	no_mib
Values	Decimal (100; 200; 300; 400; 500; 600; 700; 800; 900; 1000; 1100; 1200)
Default	1200

ATTRIBUTE Rtr Cpp **isolationTime (isolation)**

Access	Read and write
Description	This attribute specifies the amount of time a locally destined address will remain in isolation after exceeding the *packetsPerSecond* rate. If *gracePeriod* is non-zero, isolation will not occur until the conclusion of

Copyright © 2006, Nortel Nortel Confidential

the grace period.

A value of 0 indicates that a locally destined address which is isolated can only be cleared using the *CLEAR* command.

If the traffic to the address is still excessive after the isolationTime expires, this locally destined address will remain in isolation for *IsolationTime* * 2 period. If the traffic to the address is still excessive after 3 times of the above step, the address will be permanently isolated until it is cleared by the *CLEAR* verb.

The minimum value of *IsolationTime* other than zero is 30.

Mib	no_mib
Values	Decimal (0; 30..3600)
Units	seconds
Default	30

ATTRIBUTE Rtr Cpp gracePeriod (grace)

Access	Read and write
Description	This attribute specifies period of time used to sample the flow rate before the packets are discarded. The intent of the grace period is to measure the average flow rate during this period to ensure that the exceeded traffic flow rate was not due to bursty traffic. If *mode* is ***study***, a list of static record are generated every 15 minutes including a list of locally-destined addresses having excessive flow and its avarage flow rates during the gracePeriod. If *gracePeriod* is non-zero, isolation will not occur until the conclusion of the grace period. A value of 0 of this attribute when *mode* is ***protected*** indicates that no monitoring of the address will be performed after an excessive flow is detected and isolation occurs immediately. It is an error to have *mode* set to ***study*** and *gracePeriod* set to zero.
Mib	no_mib
Values	Decimal (0..300)
Units	seconds
Default	5

ATTRIBUTE Rtr Cpp mode

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies whether we are simply monitoring excessive traffic (***study***), or will ***protect*** the VR by discarding traffic during excessive traffic flows, or the feature is ***disabled***. It is an error to have *mode* set to ***study*** and *gracePeriod* set to zero.
Mib	no_mib
Values	study protect disabled
Default	disabled

GROUP Rtr Cpp Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *Cpp* component.
Mib	no_mib

ATTRIBUTE Rtr Cpp operationalStatus

Access	Read only
Description	This attribute indicates the current operational state of the *Cpp* component on this VR The following states are the valid states of the *Cpp* component: ***inactive***: there are currently no addresses on the VR/VRF being monitored or isolated. ***disabled***: the *Cpp* feature is currently disabled on the VR/VRF. ***monitoring***: there are currently addresses on the VR/VRF being monitored, but none are currently isolated. If the *mode* is set to ***study***, this state indicates there are currently addresses on the VR/VRF having excessive traffic. ***isolating***: there are currently addresses being isolated for this VR/VRF.
Mib	no_mib
Values	inactive disabled monitoring isolating
Default	No default

ATTRIBUTE Rtr Cpp isolatedDaCount

Access	Read only
Description	This attritute counts the total number of addresses currently being isolated for this VR.
Mib	no_mib
Values	Decimal (0..4096)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

GROUP Rtr Cpp OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Rtr Cpp adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	no_mib
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Rtr Cpp operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or

Copyright © 2006, Nortel Nortel Confidential

with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib: no_mib

Values: enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Rtr Cpp usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib: no_mib

Values: idle
active (activ)
busy

Default: idle

COLLECTED STATS Router ControlPlaneProtection

Description: The statistics record generated by the Router ControlPlaneProtection component.

ATTRIBUTE Rtr Cpp isolatedDa

Description: This attribute indicates the ip address of the isolated locally destined DA.

Values: IP address

ATTRIBUTE Rtr Cpp isolatedLp

Description: This attribute indicates the LP number on which the locally destined address is being isolated.

Values: Decimal (0..15)

ATTRIBUTE Rtr Cpp isolatedCounts

Description: This attribute indicates the number of counts that the isolated DA encountered during the last 15 minutes.

Values: Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Cpp averageFlowRate

Description	This attribute indicates the average flow rate of the isolated DA during the isolation period.
Values	Decimal (0..65535)

COMPONENT Rtr Cpp IsolatedDa

Instance	address [IP address] lp [Decimal (0..15)]
Groups	GROUP Rtr Cpp IsolatedDa Operational (Oper)
Scope	Application
Description	*Vr/<string> Ip Cpp IsolatedLocalAddress/<ipAddress>,<lp>* *Rtr/<string> Cpp IsolatedLocalAddress/<ipAddress>,<lp>* *Rtr/<string> Vrf/<string> Cpp IsolatedLocalAddress/<ipAddress>,<lp>* Each entry of this component represents a locally destined address being isolated. There is one instance of this component per isolated address per lp.
Mib	no_mib
Common Verbs	Help List Display

VERB Clear Rtr Cpp IsolatedDa

Impact	Service
Description	*Clear Vr/<string> Ip Cpp* IsolatedDa/< ipAddress> *Clear Rtr/<string> Cpp* IsolatedDa/<ipAddress> *Clear Rtr/<string> Vrf/<string> Cpp* IsolatedDa/<ipAddress> This command is intended for manually clearing the isolated address and resume traffic to the local address for all FPs.

GROUP Rtr Cpp IsolatedDa Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *IsolatedLocalAddress* component.
Mib	no_mib

Default	No default

COMPONENT Rtr MemoryManagement (Mm)

Groups	GROUP Rtr Mm Provisioned (Prov) GROUP Rtr Mm Operational (Oper)
Scope	Application
Description	*Vr/<string> MemoryManagement* *Rtr/<string> MemoryManagement* *Rtr/<string> Vrf/<string> MemoryManagement* This component represents a mechanism to control and monitor dynamic memory usage within a *VirtualRouter*, *Router*, or *VpnRouteForwarder*.
Mib	no_mib
Common Verbs	Help List Display

GROUP Rtr Mm Provisioned (Prov)

Properties	Provisioned
Description	This group contains all provisioned attributes for the *MemoryManagement* component.
Mib	no_mib

ATTRIBUTE Rtr Mm vrMaxHeapSpace (vrMax)

Access	Read and write
Description	This attribute specifies the maximum percentage of the total system heap space that is allowed for use by this *VirtualRouter*, *Router*, or *VpnRouteForwarder*. Attempted memory allocation beyond this limit will cause a *VirtualRouter* or *VpnRouteForwarder* to automatically lock. If memory allocation for a *Router* exceeds this limit, an alarm is raised but the component is not locked.
Mib	no_mib
Values	Decimal (0..100)
Units	%
Default	100

Copyright © 2006, Nortel Nortel Confidential

GROUP Rtr Mm Operational (Oper)

Properties	Operational
Description	This group contains all operational attributes for the *MemoryManagement* component.
Mib	no_mib

ATTRIBUTE Rtr Mm vrHeapSpaceBytesAllocated (vrBytesAlloc)

Access	Read only
Description	This attribute indicates the number of bytes of system dynamic memory which has been allocated to this *VirtualRouter*, *Router*, or *VpnRouteForwarder* component.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Mm vrHeapSpaceAllocated (vrAlloc)

Access	Read only
Description	This attribute indicates the percentage of the maximum permitted heap space for this *VirtualRouter*, *Router*, or *VpnRouteForwarder* component (as specified by *vrMaxHeapSpace* attribute) which is currently allocated.
Mib	no_mib
Values	Decimal (0..100)
Units	%
Default	No default

COMPONENT Rtr DifferentiatedServicesDomain (Dsd)

Instance	multiservice (ms) classSelector (cs) assuredForwarding (af) packetVoice (pv) wirelessUmts (umts) custom (cu)
Groups	GROUP Rtr Dsd LocalSourcePackets (Local)
Scope	Application
Description	*Vr/<string> DifferentiatedServicesDomain/<enum>* *Rtr/<string> DifferentiatedServicesDomain/<enum>* *Rtr/<string> Vrf/<string> DifferentiatedServicesDomain/<enum>* This component and its supcomponents represent a Differentiated Services administration domain for traffic management and congestion

Copyright © 2006, Nortel Nortel Confidential

control.

The *DifferentiatedServicesDomain* component instance identifies the domain type. The following domain types are available:

Multiservice (ms)
ClassSelector (cs)
AssuredForwarding (af)
PacketVoice (pv)
WirelessUmts (umts)
Custom (cu)

The *DifferentiatedServicesDomain* component is an optional subcomponent of the *Router*, *VpnRouteForwarder* and *VirtualRouter* components.

The *Router*, *VpnRouteForwarder*, and *VirtualRouter* components can have at most one *DifferentiatedServicesDomain* subcomponent.

If a *Router* component does not have a *DifferentiatedServicesDomain* subcomponent, then the *Router* operates as by default as follows. IP packets with Differentiated ServiceCode Point (DSCP) field value 48, and MPLS packets with Experimental Bits (EXP) field value 6, are treated with Per Hop Behavior (PHB) CS6; other IP and MPLS packets are treated with PHB DF for default forwarding. Locally generated routing control packets are treated with PHB CS6; other locally generated packets are treated with PHB DF. Per Hop Behaviors CS6 and DF are configured to provide the following values of scheduling class for 8, 4, 3, 2 queues, drop precedence, and EXP for MPLS encapsulation: (5, 2, 2, 0, low, 6) and (0, 0, 0, 0,, high, 0), respectively. This is equivalent to the default the configuration of the *DifferentiatedServicesDomain/custom* component instance.

If a *VpnRouteForwarder* component does not have a *DifferentiatedServicesDomain* subcomponent, then the *VpnRouteForwarder* component uses the *DifferentiatedServicesDomain* configuration of the *Router.*

Groups

GROUP Rtr Dsd MplsMap PhbMap Provisioned (Prov)
GROUP Rtr Dsd MplsMap PhbMap Operational (Oper)

Scope

Application

Description

Vr/<string> Dsd/<enum> MplsMap/<n> PerHopBehaviorMap/<phb>
Rtr/<string> Dsd/<enum> MplsMap/<n> PerHopBehaviorMap/<phb>

This component specifies a mapping from a *PerHopBehavior* component instance value to a three-bit Experimental (EXP) field value.

This mapping controls how the EXP field in an MPLS label is marked when a packet is forwarded by a Label Edge Router (LER) over a Label Switched Path (LSP) where the *MplsServiceMap* component is applied.

Copyright © 2006, Nortel
Nortel Confidential

The *DifferentiatedServicesDomain PerHopBehavior* component instance used to treat the packet prior to label encapsulation is used to select the EXP value for the label. If the *PerHopBehavior* component instance value used to treat the packet is not included among the existing *PerHopBehaviorMap* component instances, then the EXP value indicated by the *PerHopBehaviorMap* component whose instance is equal to 0 is used.

Each *PerHopBehaviorMap* component instance is equal to a decimal value in the range from 0 to 63. The following pairs of *PerHopBehaviorMap* component instances values are equal:
AF11 = 10,
AF12 =12,
AF13 =14,
AF31 = 26,
AF32 = 28,
AF33 = 30,
AF21 = 18,
AF22 = 20,
AF23 = 22,
AF41 = 34,
AF42 =36,
AF43 = 38
CS0 = 0,
CS1 = 8,
CS2 =16,
CS3 = 24,
CS4 =32 ,
CS5 = 40,
CS6 = 48,
CS7 = 56,
DF = 0,
EF = 46.

The first item in each pair above is a Per Hop Behavior designation identified in one of following IETF standards: RFC 2764 (“DiffServ Field Definition in IPv4 and IPv6 Headers”), RFC 2597 (“Assured Forwarding PHB Group”) or RFC 3246 (“An Expedited Forwarding PHB”). The the second item in each pair is the IETF recommended Differentiated Services Code Point (DSCP) value.

Each *PerHopBehaviorMap* subcomponent of the *MplsServiceMap* must have a unique instance value. A *PerHopBehaviorMap* subcomponent whose instance value is equal to 0 must exist.

A set of *PerHopBehaviorMap* subcomponents with instance values equal to the *DifferentiatedServicesDomain PerHopBehavior* subcomponent instance values is added automatically when the *MplsServiceMap*

Copyright © 2006, Nortel
Nortel Confidential

component is created.

Mib	no_mib

Properties	Provisioned
Description	This group contains the provisioned attributes of the *PerHopBehaviorMap* component.
Mib	no_mib

ATTRIBUTE Rtr Dsd MplsMap PhbMap experimentalBits (exp)

Access	Read and write
Description	This attribute specifies a three-bit Experimental (EXP) field value in the range from ***0*** to ***7*** that is marked into the MPLS label when a packet is forwarded by a Label Edge Router (LER) over a Label Switched Path (LSP) where the *MplsServiceMap* component is applied. The EXP value is selected according to the *PerHopBehaviorMap* component whose instance value is equal to the instance value of the *DifferentiatedServicesDomain PerHopBehavior* component used to treat the packet prior to label encapsulation. This attribute is set automatically to a default value according to a function of the *PerHopBehaviorMap* and *DifferentiatedServicesDomain* component instance values when the *PerHopBehaviorMap* component is created.
Mib	no_mib
Values	Decimal (0..7)
Default	No default

GROUP Rtr Dsd MplsMap PhbMap Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes of the *PerHopBehaviorMap* component.
Mib	no_mib

ATTRIBUTE Rtr Dsd MplsMap PhbMap operExperimentalBits (operExp)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates a three-bit Experimental (EXP) field value in the range from ***0*** to ***7*** that is marked into the MPLS label when a packet is forwarded by a Label Edge Router (LER) over a Label Switched Path (LSP) where the *MplsServiceMap* component is applied. The EXP value is selected according to the *PerHopBehaviorMap* component whose instance value is equal to the instance value of the *DifferentiatedServicesDomain PerHopBehavior* component used to treat the packet prior to label encapsulation. The value of this attribute is equal to the *experimentalBits* provisioned attribute.
Mib	no_mib
Values	Decimal (0..7)
Default	No default

ATTRIBUTE Rtr Dsd MplsMap PhbMap **operExperimentalBitsAlternative (operExpAlt)**

Access	Read only
Description	This attribute is similar to the *operExperimentalBits* operational attribute, except that it used only on PQC-based access FPs with ASIC Version 2.0 when an IP packet is forwarded by a Label Edge Router (LER) over a Label Switched Path (LSP) via a PQC-based trunk FP. In such situations only, the value of this attribute, instead of the *operExperimentalBits* operational attribute value, is used to mark the Experimental (EXP) field of the MPLS label. If the *MplsServiceMap* does not have a *MarkingPerformance* subcomponent, then the value of this attribute is equal to the *experimentalBits* provisioned attribute; otherwise the value of this attribute is determined as explained in the next paragraph. If "***x***" is the *schedulingClass4Queues* operational attribute value of the *DifferentiatedServicesDomain PerHopBehavior* component whose instance value is equal to the *PerHopBehaviorMap* component instance value, then the *PerHopBehaviorMap experimentalBitsAlternative* operational attribute value is equal to the "***x***th" element of the *MarkingPerformance experimentalBitsAlternative* provisioned attribute.
Mib	no_mib

Groups	GROUP Rtr Dsd MplsMap MarkingPerformance Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Dsd/<enum> MplsMap/<n> MarkingPerformance* *Rtr/<string> Dsd/<enum> MplsMap/<n> MarkingPerformance* This subcomponent is added to the *MplsServiceMap* component to enable high performance MPLS label encapsulation on some PQC-based ingress access FPs . IP packets that are forwarded from access FPs with PQC-ASIC Version 2.0 via PQC-based trunk FPs (any ASIC version) over an MPLS Label Switched Path (LSP) where the *MplsServiceMap* is applied are affected. Adding this component to the *MplsServiceMap* improves IP packet throughput on the affected access FPs but restricts how the three-bit Experimental (EXP) field of MPLS labels are marked, as explained in the description of the *operExperiementalBitsAlternative* operational attribute of the *MplsServiceMap PerHopBehaviorMap* component. Without the *MarkingPerformance* subcomponent, IP packets after being routed in hardware are encapsulated with MPLS labels by a software-assisted datapath that does not restrict how the EXP field of MPLS labels are marked. The *MarkingPerformance* subcomponent is added automatically to a *MpslServiceMap* subcomponent being added to a *DifferentiatedServicesDomain* component. This ensures that the high performance MPLS label encapsulation data path is used by default.

COMPONENT Rtr Dsd VpnDscpMap (VpnDscpMap)

Instance	String (1..20, ASCII)
Groups	GROUP Rtr Dsd VpnDscpMap Provisioned (Prov)
Scope	Application
Description	*Vr/<string> DifferentiatedServicesDomain/<enum> VpnDscpMap/<string>*

This component provides a mapping of customer DSCP values to carrier DSCP values for IP tunnel encapsulation in an IP VPN (RFC2764) network.

When an IP packet is forwarded from a customer Virtual Router (cVr) to a Virtual Connection Gateway (VCG) the customer IP header is encapsulated with a carrier IP header for transmission through the carrier network.

If the customer virtual router (cVr) has a *DifferentiatedServicesDomain* subcomponent where the *linkToVpnDscpMap* attribute is set, then the value of DSCP field in the IP packet forwarded by the customer Virtual Router (cVr) is translated by the mapping specified by the *assignedPhb* attribute of the associated *VpnDscpMap* to a DSCP value that is marked in the carrier IP header. If the customer *DifferentiatedServicesDomain linkToVpnDscpMap* attribute is not set, then the value of the DSCP field in the carrier IP header is set equal to the value of the DSCP field in the customer IP header.

The encapsulated IP packet is treated by the Virtual Connection Gateway (VCG) as specified by the *DifferentiatedServicesDomain PerHopBehavior* component instance associated with the carrier header DSCP value. If the carrier header DSCP value does not correspond to a *PerHopBehavior* subcomponent of the VCG's *DifferentiatedServicesDomain* component, then the IP packet is treated as specified by the *PerHopBehavior* component instance associated with DSCP ***0***.

The *VpnDscpMap* component can be added only to the *DiffServDomain* subcomponent of a *VirtualRouter* component where the *vpnMode* attribute is set to ***carrier***. It can be linked only to the *linkToVpnDscpMap* attribute of the *DiffServDomain* subcomponent of a *VirtualRouter* component where the *vpnMode* attribute is set to ***customer***.

The component instance is an arbitrary text string to allow the operator to assign a meaningful name for easy reference.

The *DiffServDomain* component is not allowed to have more than eight *VpnDscpMap* subcomponents.

Copyright © 2006, Nortel Nortel Confidential

	No more than one *DiffServDomain* component instance is allowed to have *VpnDscpMap* subcomponents

COMPONENT Rtr Dsd VpnCosMap (VpnCosMap)

Groups	GROUP Rtr Dsd VpnCosMap Provisioned (Prov)
Scope	Application
Description	*Vr/<string> DifferentiatedServicesDomain/<enum> VpnCosMap* This component provides a mapping of customer CoS values to carrier DSCP values for IP tunnel encapsulation in an IP VPN (RFC2764) network. When an IP packet is forwarded from a customer Virtual Router (cVr) to a Virtual Connection Gateway (VCG) the customer IP header is encapsulated with a carrier IP header for transmission through the carrier network. If the customer virtual router (cVr) does not have a *DifferentiatedServicesDomain* subcomponent and the Virtual Connection Gateway (VCG) has a *DifferentiatedServicesDomain VpnCosMap* component, then the IP CoS value assigned to the packet by the customer virtual router is translated by the mapping specified by the *assignedPhb* attribute of the *VpnCosMap* to a DSCP value that is marked in the carrier

Copyright © 2006, Nortel Nortel Confidential

IP header. If the *DifferentiatedServicesDomain* of the Virtual Connection Gateway (VCG) does not have a *VpnCosMap* subcomponent, then the value of the DSCP field in the carrier IP header is set to ***0*** unless the customer header DSCP value is ***48*** (which corresponds to PHB CS6 for IP network control packets). In the latter case the carrier header DSCP value is set to ***48*** also.

The encapsulated IP packet is treated by the Virtual Connection Gateway (VCG) as specified by the *DifferentiatedServicesDomain PerHopBehavior* component instance associated with the carrier header DSCP value. If the carrier header DSCP value does not correspond to a *PerHopBehavior* subcomponent of the VCG's *DifferentiatedServicesDomain* component, then the IP packet is treated as specified by the *PerHopBehavior* component instance associated with DSCP ***0***.

The *VpnCosMap* component can be added only to the *DiffServDomain* subcomponent of a *VirtualRouter* component where the *vpnMode* attribute is set to ***carrier***.

The *VpnCosMap* component is used to assist the migration of an IP VPN network without *DifferentiatedServicesDomain* components to an IP VPN network where every customer Virtual Router (cVr) and Virtual Connection Gateway (VCG) has a *DifferentiatedServicesDomain* component. The *VpnCosMap* components can be removed once the CoS to DiffServ network migration is completed.
The VpnCosMap component controls how the DSCP field in the carrier IP header is marked when IP packets are forwarded by the Virtual Connection Gateway (VCG) only if the operational value of the Vr trafficManagementMode (tmMode) attribute for the customer VirtualRouter component is set to hybrid .

Description

Vr/<string> Dsd/<enum> PerHopBehavior/<phb>
Rtr/<string> Dsd/<enum> PerHopBehavior/<phb>
Rtr/<string> Vrf/<string> Dsd/<enum> PerHopBehavior/<phb>

The attributes of the *PerHopBehavior* component specify per-packet traffic management parameters that control how individual packets are forwarded.

A packet is associated with a *PerHopBehavior* component instance by a packet classification mechanism. For IP packets, the associated *PerHopBehavior* component instance is equal to the value of the six-bit Differentiated Services Code Point (DSCP) field in the IP header. For MPLS packets forwarded by a Label Switched Router (LSR) over a Label Switched Path (LSP) where an *MplsServiceMap* component is applied, the associated *PerHopBehavior* component instance is equal to value of the *perHopBehavior* attribute of the *MplsServiceMap ExperimentalBitsMap* component whose instance is equal to the value of the three-bit Experimental (EXP) field of the MPLS label.

If the *PerHopBehavior* component instance associated with a packet is not included among the existing *PerHopBehavior* subcomponents of the *DifferentiatedServicesDomain*, then the packet is treated according to the *PerHopBehavior* component whose instance is equal to 0.

Each *PerHopBehavior* component instance is equal to a decimal value in

Copyright © 2006, Nortel
Nortel Confidential

the range from 0 to 63. The following pairs of *PerHopBehavior* component instances values are equal:
AF11 = 10,
AF12 =12,
AF13 =14,
AF31 = 26,
AF32 = 28,
AF33 = 30,
AF21 = 18,
AF22 = 20,
AF23 = 22,
AF41 = 34,
AF42 =36,
AF43 = 38
CS0 = 0,
CS1 = 8,
CS2 =16,
CS3 = 24,
CS4 =32,
CS5 = 40,
CS6 = 48,
CS7 = 56,
DF = 0,
EF = 46.

The first item in each pair above is a Per Hop Behavior designation identified in one of following IETF standards: RFC 2764 (“DiffServ Field Definition in IPv4 and IPv6 Headers”), RFC 2597 (“Assured Forwarding PHB Group”) or RFC 3246 (“An Expedited Forwarding PHB”). The the second item in each pair is the IETF recommended Differentiated Services Code Point (DSCP) value.

Each *PerHopBehavior* subcomponent of the *DifferentiatedServicesDomain* must have a unique instance value. A *PerHopBehavior* subcomponent whose instance value is equal to 0 must exist.

A set of *PerHopBehavior* subcomponents is added automatically when the *DifferentiatedServicesDomain* component is created. The members of this set is a function of the *DifferentiatedServicesDomain* component instance as indicated below.

ATTRIBUTE Rtr Dsd Phb dropPrecedence (dp)

Access: Read and write

Description: This attribute specifies the drop precedence value given to a packet that uses the *PerHopBehavior* component instance. This value is used to select a congestion threshold when the packet is placed on a queue that supports multiple congestion thresholds.

A drop precedence is assigned to a packet to control its loss sensitivity relative to other packets when the packets are placed into the same queue. Generally, the ***low*** value indicates the packet is less likely to be discarded when the queue is congested. This traffic has a higher probability of being forwarded. The ***high*** value indicates the packet is more likely to be discarded when the queue is congested. This traffic has a lower probability of being forwarded. The actual loss sensitivity of packets depends on the discarding mechanism at the queue.

ATTRIBUTE Rtr Dsd Tc **schedulingClass4Queues (sc4q)**

Access Read and write

Description This attribute specifies a logical scheduling class value in the range from ***0*** to ***3*** given to a packet that uses the *TrafficClass* component instance. This value is used to select a queue when the packet is transmitted at an interface that supports four queues per connection. It may also be used to select one of up to four link layer connections at interfaces where per-packet selection of egress connections is supported.

A scheduling class is assigned to a packet to control its scheduling behavior relative to other packets at the interface where the packets are transmitted. Generally, a numerically higher value indicates the packet is less likely to be delayed. This traffic is considered more urgent and less delay tolerant. A numerically lower value indicates the packet is more likely to be delayed. This traffic is considered less urgent and more delay tolerant. The actual scheduling behavior of packets depends on the scheduling mechanism at the interface.

This value is also used to select a one of up to four Layer 2 connections at the interface where the packet is transmitted. Per-packet selection of egress connections is supported only if these conditions are all true:

i) for the *Vr* component, the value of the associated *mediaType* attribute under the *IpPort* component is ***frameRelay***, ***atmMpeLlcEncap***, or

Copyright © 2006, Nortel Nortel Confidential

atmMpeVcEncap; for *Router* and *Vrf*, the media associated with the interface is *AtmMpe* or *IpoDlci*.
ii) more than one Layer 2 connection is configured to the next hop IP router, and
iii) each connection is configured with a different connection class value.

Normally the packet is transmitted on the connection whose connection class is equal to the *schedulingClass4Queues* value given to the packet. If that connection does not exist, then the connection having the next lower connection class is used. If that connection does not exist also, then the connection having the next higher connection class is used.

Locally generated IP multicast and IP broadcast packets are not eligible for per-packet selection of egress connections. Each of these packets is copied and transmitted individually on each of the available connections to the next hop IP router.

For *AtmMpe*, the connection class is specified by the *ipCos* attribute of the *AtmConnection* subcomponent. For *FrDte* the connection class is specified by the *ipCos* attribute of the *StaticDlci* and *DynamicDlciDef* subcomponents. For *IpDlciGroup* and *IpoDlci* the connection class is specified by the *ipCos* attribute of the *FrConnection* subcomponent.

If each Layer 2 connection is configured to provide different policing and scheduling characteristics, then the forwarding behaviors of IP and MPLS packets are differentiated as they transit through the Layer 2 network. In general, the scheduling characteristics of the connections should be configured to be better for numerically greater connection class values. For example, if four *AtmConnection* components are associated with *AtmIf* components configured for ATM service classes ***UBR***, ***nrtVBR***, ***rtVBR***, and ***CBR***, then the *ipCos* attributes of the *AtmConnection* components should be either ***0***,***1***,***2***, and ***3***, respectively, or ***0***,***1***,***3***, and ***2*** respectively.

The *schedulingClass4Queues* attribute is set automatically to a default value according to a function of the *TrafficClass*component instance value when the *TrafficClass* component is created. The default values are listed below. If the *TrafficClass* component instance is ***standard***, then this attribute must be set to ***0***.

Default values for all domains, except *assuredForwarding (af)*:

TrafficClass	*schedulingClass4Queues*
critical	***2***
premium	***3***
network	***2***
platinum	***1***
gold	***1***
silver	***1***
bronze	***1***
standard	***0***

Copyright © 2006, Nortel Nortel Confidential

Default values for *assuredForwarding (af)* domain only:

TrafficClass	*schedulingClass4Queues*
critical	***2***
premium	***3***
network	***2***
platinum	***3***
gold	***2***
silver	***1***
bronze	***0***
standard	***0***

ATTRIBUTE Rtr Dsd Tc operSchedulingClass8Queues (operSc8q)

Access Read only

Description This attribute indicates a logical scheduling class value in the range from ***0*** to ***7*** given to a packet that uses the *TrafficClass* component instance. This value is used to select a queue when the packet is transmitted at an interface that supports eight queues per connection.

A scheduling class is assigned to a packet to control its scheduling behavior relative to other packets at the interface where the packets are transmitted. Generally, a numerically higher value indicates the packet is less likely to be delayed. This traffic is considered more urgent and less delay tolerant. A numerically lower value indicates the packet is more likely to be delayed. This traffic is considered less urgent and more delay tolerant. The actual scheduling behavior of packets depends on the scheduling mechanism at the interface.

The value of this attribute is equal to value of the *schedulingClass8Queues* provisioned attribute of the *TrafficClass* component.

ATTRIBUTE Shelf cpEquipmentProtection

Access	Read and write
Description	This attribute specifies the type of Equipment Protection support provided by a spared CP configuration. The valid values are: ***hot***, enables delivery of provisioning data to standby CP and on CPSO allows switching to the current view. ***cold***, the default value which supports switchover to the committed view. When the attribute is set to ***hot***, applications which provide hot or warm CP based services, receive the provisioning data during *activate prov.* The cold CP based services receive the provisioning data during CP switchover, when the standby CP is taking over as active. On CPSO, hot and warm services are activated first followed by the cold services. Hence the activation time of cold services is potentially extended which will increase the service outage, compared to when this attribute is set to ***cold***. It is important to note that this attribute does not make any service warm or hot; instead, CP based services are provided the ability to reduce or eliminate call-setup outage due to a CPSO and to ensure stable calls are unaffected by a CPSO. The standby CP will be reset when the value of this attribute is changed. To set this attribute to ***hot***, the *maxNumberJournalFiles* attribute under the *ProvisioningSystem* component must be set to a value other than ***none***.
Mib	BaseShelf
Values	cold hot
Default	cold

ATTRIBUTE Shelf repeatFanAlarm

Access	Read and write
Description	On the Nortel Networks Multiservice Switch 15000 and the Nortel Networks Multiservice Switch 20000, there are three fans to cool the shelf. Because of a hardware limitation, it is not possible to determine how many fans are affected upon fan failure. Such fan failures are reported through a 7012 0051 alarm. This attribute specifies whether the 7012 0051 alarm should be set once or repeated on a regular basis: ***on*** - specifies that the fan alarm should be re-issued every eight hours until the alarm is cleared. Normally, the same alarm is never re-issued in order to minimize the number of alarms generated by a node. Nonetheless, selecting this option helps to compensate for the hardware limitation by providing a regular reminder (once per eight hour shift) that one or possibly more fans have failed on this node. In addition, if the alarm condition remains for more than 24 hours, the alarm severity is increased. That is, the first three alarms are issued with a severity of MAJOR, while all subsequent alarms have a severity of CRITICAL. ***off*** - specifies that the fan alarm be issued only once upon failure. This attribute is not applicable and is therefore ignored on the Nortel Networks Multiservice Switch 7400.
Mib	BaseShelf

COMPONENT Shelf Card

Instance	Decimal (0..15)
Groups	GROUP Shelf Card Provisioned (Prov) GROUP Shelf Card OsiState (State) GROUP Shelf Card Operational (Oper) GROUP Shelf Card Properties (Prop) GROUP Shelf Card Utilization (Util) GROUP Shelf Card Capacity (Cap)
Scope	Device
Description	*Shelf Card/n* The *Card* component is a subcomponent of the *Shelf* component. There are a maximum of 16 *Card* components defined, one corresponding to each physical card slot. This is necessary in order to be able to reflect which processor card is present in each slot at any time. For a shelf that does not contain 16 slots, the *Card* components only need to be defined for each of their physical card slots. This can be accomplished via the StartUp initial provisioning system. It is possible to add a *Card* component since it may be desirable to move a CP to a shelf that contains more physical card slots. This CP move would result in adding the provisioning information associated with the other processor cards instead of starting over.

VERB RESET Shelf Card

Impact	Service
Description	*Reset Shelf Card/n* *Reset -force Shelf Card/n* This command is used to reset a processor card. Resetting a processor card implies: (1) resetting the hardware (as if the card had just been powered on), (2) performing the card's self-tests, and (3) reloading the software (assuming an LP is configured to run on the card). A *Reset* command issued against the CP causes it to reload from the committed provisioning data file. A *Reset* command issued against an FP causes it to reload the same software it was already running. This is the software load that is derived from the provisioning data in the CP's current view (this may or may not be the committed view). **Options:** *-force* If the card number of the active CP is specified, this option causes the reset to occur against the active cp even if the current or edit view differs from the committed view, or if the standby OAM Ethernet port is not available, or if the standby CP is currently loading the committed provisioning data file. Use of this option would cause the loss of data in any unsaved view, and any FPs running uncommitted data would restart. On any card other than the active CP, -force has no meaning.

Copyright © 2006, Nortel
Nortel Confidential

VERB RESTART Shelf Card

Impact	Service
Description	*Restart Shelf Card/n* *Restart -force Shelf Card/n* This command is used to restart a processor card. Restarting a processor card causes the software to reinitialize itself and behave as if it had just been reloaded. A *Restart* command issued against a CP causes it to restart using the committed provisioning data. **Options:** *-force* If the card number of the active CP is specified, this option causes the restart to occur against the active CP even if the current or edit view differs from the committed view, or if the standby OAM Ethernet port is not available, or if the standby CP is currently loading the committed provisioning data file. Use of this option would cause the loss of data in any unsaved view, and any FPs running uncommitted data would restart. On any card other than the active CP, -force has no meaning.

VERB Lock Shelf Card

Impact	Service
Description	Lock [-force] [-Test] Shelf Card/n This command is used to lock the processor card. The card is reset and enters the OSI locked administrative state. If any clients are registered for the lock notification of this card then they are notified before resetting the card and the card is reset when it has finished providing service to those clients. Options: -force If this option is present, service to existing clients is terminated and the locked state is entered immediately. -test If this option is present, the card enters the OSI shuttingDown administrative state. While shutting down, the card continues to provide service to the existing clients but rejects any new requests for service. When the card is no longer providing service, it enters the OSI locked administrative state. The options force and test are mutually exclusive.

GROUP Shelf Card OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	BaseShelf

ATTRIBUTE Shelf Card adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	BaseShelf
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Shelf Card **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	BaseShelf
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Shelf Card **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	BaseShelf
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Shelf Card **availabilityStatus (osiAvail)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-

Copyright © 2006, Nortel Nortel Confidential

valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

ATTRIBUTE Shelf Card proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE Shelf Card controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.
Mib	BaseShelf
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE Shelf Card alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib	BaseShelf
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Shelf Card standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Default	notSet

ATTRIBUTE Shelf Card unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	BaseShelf
Values	false true
Default	false

GROUP Shelf Card Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes that reflect the current status of the card.
Mib	BaseShelf

ATTRIBUTE Shelf Card failureCause

Access	Read only
Description	This attribute indicates why the card has failed. This attribute is meaningful when the OSI *AvailabilityStatus* attribute is set to ***failed***. ***none*** - The card is operational. ***wrongCardType*** - The wrong card type has been inserted. ***notConfigured*** - The card is not configured. ***cannotLoadSoftware*** - The card can not load software. ***failedSelfTests*** - The card failed itself test. ***notResponding*** - The card is not responding. ***backplaneConnectivityProblem*** - The card is not properly connected to the backplane. ***unsupportedPecCode*** - The card with unsupported PEC code is inserted.

Mib	BaseShelf
Values	none wrongCardType notConfigured cannotLoadSoftware failedSelfTests notResponding backplaneConnectivityProblem unsupportedPecCode
Default	No default

ATTRIBUTE Shelf Card selfTestFault

Access	Read only
Description	This attribute indicates the result of the processor card's self-tests that were performed when it initially came up.
Mib	BaseShelf
Values	none
Default	No default

ATTRIBUTE Shelf Card sparingConnectionStatus (scstat)

Access	Read only
Description	This attribute indicates if the control signal received from a 1forN sparing panel or a 1for1 sparing panel is properly terminated. ***notApplicable*** - The card is not provisioned as part of a sparing configuration, and is not connected to any sparing panel. ***1for1Ok*** -The card is provisioned correctly for 1for1 sparing and is connected to the active relay of a 1for1 sparing panel. ***1forNOk*** -The card is provisioned correctly for either 1for1 or 1forN sparing and is connected to either the standby or active relay of a 1forN sparing panel. ***unconfirmed*** -The card is provisioned as part of a sparing configuration, but its connection status cannot be determined. This is expected for the standby card in a 1for1 sparing configuration. To determine if the card is connected to a sparing panel, perform a switchover of the LP to see if the card will grab a relay when it is active. If the card has grabbed the relay, the sparing connection status should change from, ***unconfirmed***, to ***1for1Ok*** and the LED on the sparing panel corresponding to that relay should be illuminated. Please note: Performing the switchover will disrupt traffic on the other card and this test should be conducted when no traffic is running on the active card. ***notConnected*** - The card is provisioned as part of a sparing configuration, but is not connected to a sparing panel. Remedial Action: Check the cable connectivity between the card and the

Copyright © 2006, Nortel Nortel Confidential

sparing panel.
incorrectlyConnected - The card is provisioned as part of a sparing configuration, but is connected to the wrong port on a 1forN panel, or is connected to a 1for1 sparing panel while configured for 1forN.
Remedial Action: Connect the cable to the port that was specified by the *sparingConnection* attribute.
inconsistentlyConnected - The card is provisioned as part of a 1forN sparing configuration, but is connected to a sparing panel which is not the same as the other cards sharing the same spare card.
Remedial Action: Ensure all cards that share the same spare card are connected to the same sparing panel.
This value is also used to indicate that two sparing panels with the same sparing panel IDs are being used by cards on the same shelf.
Remedial Action: Replace one of the sparing panels with another panel that has a different sparing panel ID. Sparing panel IDs are assigned at the time of manufacture and cannot be changed by the user.

COMPONENT Shelf Card BusTap

Instance	x y
Groups	GROUP Shelf Card BusTap OsiState (State) GROUP Shelf Card BusTap Operational (Oper) GROUP Shelf Card BusTap Errors
Scope	Device
Description	*Shelf Card/n BusTap/b* A *BusTap* component represents a physical bus tap on a card. A bus tap is a card's interface to a bus; it provides a pathway for the card to send cells over the bus to the other cards in the module, and to receive cells sent to it over the bus by the other cards in the module. A card's *BusTap* components are created automatically whenever the card begins acting as an active or standby LP, and remain in existence as long as the card remains operational; *BusTap* components cannot be added or deleted.
Mib	Bus
Common Verbs	Help List Display

GROUP Shelf Card BusTap OsiState (State)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Bus

ATTRIBUTE Shelf Card BusTap adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Bus
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Shelf Card BusTap operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: Bus

Values: enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Shelf Card BusTap usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: Bus

Values: idle
active (activ)
busy

Default: idle

ATTRIBUTE Shelf Card BusTap availabilityStatus (osiAvail)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

ATTRIBUTE **Shelf Card BusTap** **proceduralStatus (osiProc)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-

Copyright © 2006, Nortel Nortel Confidential

valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

ATTRIBUTE Shelf Card BusTap controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

Copyright © 2006, Nortel Nortel Confidential

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

ATTRIBUTE Shelf Card BusTap **alarmStatus (osiAlarm)**

Access — Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

ATTRIBUTE Shelf Card BusTap **standbyStatus (osiStby)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.
Mib	Bus

GROUP Shelf Card BusTap **Operational (Oper)**

Properties	Operational
Description	This attribute group contains operational attributes of a bus tap. This information outlines what the bus tap is doing and why it is doing it, and is primarily intended for use in diagnosing the cause of a bus-related problem reported by the module.
Mib	Bus

ATTRIBUTE Shelf Card BusTap **failuresInEffect**

Access	Read only
Description	This attribute records the hardware problems that prevent the bus tap from using the associated bus. It may contain any combination of the following values. ***selfTest***: the bus tap has failed its self-test ***clockSignal***: the bus tap is not receiving clock signals from the bus ***parityError***: the bus tap has detected too many parity errors on the bus
Mib	Bus
Set of	selfTest clockSignal parityError
Default	No default

ATTRIBUTE Shelf Card BusTap **dependenciesInEffect**

Access	Read only
Description	This attribute records the non-hardware problems that prevent the bus tap from using the associated bus. It may contain any combination of the following values. ***busLocked***: the bus is locked ***busDisabled***: the bus is disabled
Mib	Bus
Set of	busLocked busDisabled
Default	No default

ATTRIBUTE Shelf Card BusTap **cardsAvailable**

Access	Read only
Description	This attribute records the slot numbers of the cards that the bus tap considers available on the bus—that is, the cards that have an operational bus tap connected to the bus. The value of this attribute is determined automatically by the bus tap by monitoring signals generated by each bus tap on the bus; it cannot be changed by the operator. Normally, every card in the module signals its availability on both buses; if a card does not

Copyright © 2006, Nortel Nortel Confidential

	signal its availability on a bus this indicates that the card is not present or that its bus tap has failed. By examining this attribute for both of a card's *BusTap* components, it is possible to determine which cards are present in the module and which buses each can use. Note: If *failuresInEffect* contains either ***selfTest*** or ***clockSignal*** the bus tap is unable to monitor the availability of the bus taps on the bus; *cardsAvailable* will indicate that no bus taps are available on the bus.
Mib	Bus
Set of	Decimal (0..15)
Default	No default

ATTRIBUTE Shelf Card BusTap **cardsTxTo**

Access	Read only
Description	This attribute records the slot numbers of the cards which the bus tap is currently configured to transmit cells to. This configuration is managed automatically, and cannot be changed by the operator. By examining this attribute for both of a card's *BusTap* components, it is possible to determine which bus (if any) the card uses when it needs to transmits cells to a specific card in the module.
Mib	Bus
Set of	Decimal (0..15)
Default	No default

GROUP Shelf Card BusTap **Errors**

Properties	Operational
Description	This attribute group records errors that the bus tap has detected since the card was last rebooted. This information is intended for use in detecting and diagnosing bus-related problems within a module.
Mib	Bus

ATTRIBUTE Shelf Card BusTap **selfTestErrorCode**

Access	Read only
Description	This attribute records the error code generated by the most recent self-test of the bus tap. The value zero indicates that the self-test was successful. A non-zero value indicates that the self-test failed, and is used by the service technician when a defective card is returned for repair.
Mib	Bus
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Shelf Card BusTap **clockErrors**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute records the number of times that the bus tap has detected a loss of the fundamental clock signal used by the bus. Each occurrence may result in the loss of one or more cells or frames. This type of event may occur during normal operation of the module, for example when switching from one of the bus's clock sources to the other; it may also be caused by a hardware fault. The attribute's value wraps around to zero when it exceeds the maximum permitted value.
Mib	Bus
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Shelf Card BusTap endOfCellErrors

Access	Read only
Description	This attribute records the number of times that the bus tap has detected a loss of the end-of-cell timing signal used by the bus. Each occurrence may result in the loss of one or more cells or frames. This type of event may occur during normal operation of the module, for example switching the bus's clock source from one card to another; it may also be caused by a hardware fault. The attribute's value wraps around to zero when it exceeds the maximum permitted value.
Mib	Bus
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Shelf Card BusTap parityErrors

Access	Read only
Description	This attribute records the number of times that the bus tap has detected a cell with invalid parity on the bus. Each occurrence may result in the loss of one or more cells or frames. This type of event may occur during normal operation of the module, for example when a card is inserted, removed, or reboots; it may also be caused by a hardware fault. The attribute's value wraps around to zero when it exceeds the maximum permitted value.
Mib	Bus
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Shelf Card BusTap frmCongestionErrors

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute records the number of times that the bus tap was unable to receive a frame from the bus because all of its bus receive channels were in use. Each occurrence results in the loss of the frame. This type of event may occur during normal operation of the module, for example when the module is operating in single bus mode; it may also be caused by a hardware fault. The attribute's value wraps around to zero when it exceeds the maximum permitted value.
Mib	Bus
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Shelf Card BusTap frmCollisionErrors

Access	Read only
Description	This attribute records the number of times that the bus tap was unable to receive a frame from the bus because it did not receive the last cell of the frame before the first cell of the following frame from the same source. Each occurrence results in the loss of both frames. This type of event may occur during normal operation of the module, for example when a card reboots; it may also be caused by a hardware fault. The attribute's value wraps around to zero when it exceeds the maximum permitted value.
Mib	Bus
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Shelf Card BusTap frmTimeoutErrors

Access	Read only
Description	This attribute records the number of times that the bus tap was unable to receive a frame from the bus because the delay between two successive cells in that frame exceeded the maximum allowable duration. Each occurrence results in the loss of the frame. This type of event may occur during normal operation of the module, for example when the module changes bus mode; it may also be caused by a hardware fault. The attribute's value wraps around to zero when it exceeds the maximum permitted value.
Mib	Bus
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Shelf Card BusTap frmDeliveryErrors

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute records the number of times that the bus tap was unable to receive a frame from the bus because it was destined for a bus transmit queue; that is, the frame would have been immediately retransmitted over a bus. Each occurrence results in the loss of the frame. This type of event should never occur during normal operation of the module and indicates the occurrence of a hardware or software fault. The attribute's value wraps around to zero when it exceeds the maximum permitted value.
Mib	Bus
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Shelf Card BusTap frmSizeErrors

Access	Read only
Description	This attribute records the number of times that the bus tap was unable to receive a frame from the bus because it required more than 255 blocks of shared memory. Each occurrence results in the loss of the frame. This type of event should never occur during normal operation of the module and indicates improper configuration of the card or the occurrence of a hardware or software fault. The attribute's value wraps around to zero when it exceeds the maximum permitted value.
Mib	Bus
Values	Decimal (0..4294967295)
Default	No default

COMPONENT Shelf Card Test

Groups	GROUP Shelf Card Test OsiState (State) GROUP Shelf Card Test Setup GROUP Shelf Card Test Results
Scope	Device
Description	*Shelf Card/n Test* This component is used to verify the operation of a module's card*s*. A card test may be run when new hardware or services are commissioned, as part of a routine maintenance program, or to diagnose the cause of card- or bus-related problems. The *Test* component is created automatically for each card that is running as an active or standby LP; *Test* components cannot be added or deleted. A card test allows the operator to stress test new or existing cards under controlled conditions. The test circulates frames over the bus between the card under test and a distinct "target card", thereby exercising both cards and consuming bus bandwidth. The test frames follow the same route to their destination as normal frames. If the node is in dual bus mode, each

Copyright © 2006, Nortel Nortel Confidential

card test that is activated consumes bandwidth from both backplane buses in equal amounts; if the module is in single bus mode, only the bus in service is utilized.

The test frames generated by the card under test are grouped into two independent streams.
1) The loading frame stream circulates a set of “loading frames” between the card under test and the target card as rapidly as possible. The intent of this stream is to verify the operation of the cards and the backplane buses under a controlled load.
2) The verification stream transmits a series of “verification frames” from the card under test to the target card; as each frame is returned, its contents are verified and the next verification frame in the series is transmitted. The intent of this stream is to verify that frames are not being corrupted during transfer from card to card.
The card test can be configured to send frames from either or both streams. The priority, size, and content of the test frames can also be controlled.

Each card can run the card test independently. The operator can run the card test on any subset of the cards simultaneously and can specify different test frame configurations for each test. It is also possible for a card to act as the target card for more than one card under test, and for a card to act as a target card while it is itself under test. The flexibility provided by the card test allows the operator to tailor a set of card tests according to the testing to be performed.

Common Verbs:
Help
List
Display

VERB START **Shelf Card Test**

Impact: Service

Description: *Start Shelf Card/n Test*
This verb initiates the card test. If the card test is already running, the command has no effect and the test continues. The *Test* component on the target card must exist before the test can be run.

VERB STOP **Shelf Card Test**

Impact: Service

Description: *STOP Shelf Card/n Test*
This verb terminates the card test. If the card test is not running, the command has no effect.

GROUP **Shelf Card Test** **OsiState (State)**

Properties: Operational

Nortel Confidential

Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	BaseShelf

ATTRIBUTE Shelf Card Test **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	BaseShelf
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Shelf Card Test **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	BaseShelf
Values	enabled (ena) disabled (dis)

Default	disabled

ATTRIBUTE Shelf Card Test **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	BaseShelf
Values	idle active (activ) busy
Default	idle

GROUP Shelf Card Test **Setup**

Properties	Operational
Description	This attribute group contains the attributes that govern the operation of a card test. These attributes cannot be changed while a card test is running.
Mib	BaseShelf

ATTRIBUTE Shelf Card Test **targetCard (card)**

Access	Read and write
Description	This attribute specifies the slot number of the card to which frames are sent during the card test. There is no single default value for this attribute—it defaults to the slot number of the *Test* component's own card and must be changed to a different value before the test can be started.
Mib	BaseShelf
Values	Decimal (0..15)
Default	No default

ATTRIBUTE Shelf Card Test **frmTypes (types)**

Access	Read and write
Description	This attribute specifies the types of frames that are sent during the card test. It must contain at least one of the following values. ***loading***: A set of "loading frames" is circulated between the *Test* component and the *Test* component on the target card as rapidly as possible. This frame type should be selected when the test is intended to

Copyright © 2006, Nortel Nortel Confidential

	verify the operation of the cards and the backplane buses under a specified load. ***verification***: A single “verification frame” is transmitted to the *Test* component on the target card; when the frame is returned, its contents are verified and the next verification frame in the series is transmitted. This frame type should be selected when the test is intended to verify that frames are not being corrupted as they pass from card to card.
Mib	BaseShelf
Set of	loading verification
Default	(loading, verification)

ATTRIBUTE Shelf Card Test frmPriorities (priorities)

Access	Read and write
Description	This attribute specifies the priorities of the frames that are sent during the card test. It must contain at least one of the following values. ***lowPriority***: Low priority frames are sent. ***highPriority***: High priority frames are sent.
Mib	BaseShelf
Set of	lowPriority highPriority
Default	(lowPriority)

ATTRIBUTE Shelf Card Test frmPatternType (fpt)

Access	Read and write
Description	This attribute specifies the bit sequence to fill the frames used in the card test. It must contain one of the following values. ***ccitt32kBitPattern***: a pseudo-random sequence of 32 kbit is used ***ccitt8MBitPattern***: a pseudo-random sequence of 8 Mbit is used ***customizedPattern***: the pattern defined by the *customizedPattern* attribute is used
Mib	BaseShelf
Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

ATTRIBUTE Shelf Card Test customizedPattern (cp)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies a 32 bit sequence used to fill frames when the *framePatternType* attribute has a value of ***customizedPattern***. The default value gives a pattern of alternating 0 and 1 bits.
Mib	BaseShelf
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Shelf Card Test **duration**

Access	Read and write
Description	This attribute specifies the maximum length of time that the card test is allowed to run. The value is expressed in minutes. The maximum allowed value permits the card test to be run for up to 30 days.
Mib	BaseShelf
Values	Decimal (1..43200)
Units	minutes
Default	60

ATTRIBUTE Shelf Card Test **frmSize (size)**

Access	Read and write
Description	This attribute specifies for each priority level the number of data bytes in each frame sent during the card test. (The value specified does not include the 4-byte header that is automatically added to a frame when it is transmitted over the backplane.)
Mib	BaseShelf
Vector of	Decimal (16..16000)
Units	bytes
Index	lowPriority highPriority
Default	(lowPriority: 1024, highPriority: 56)

GROUP Shelf Card Test **Results**

Properties	Operational
Description	This attribute group contains the results of the card test that is currently running; if no test is running, the attribute group contains the results of the most recently completed card test. The attributes of the *Results* group are reset to their initial values whenever a card test is started or any attribute of the *Setup* group is set.

ATTRIBUTE Shelf Card FabricPort **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Fabric
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Shelf Card FabricPort **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Fabric
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Shelf Card FabricPort **availabilityStatus (osiAvail)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description

If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

ATTRIBUTE **Shelf Card FabricPort** **proceduralStatus (osiProc)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

ATTRIBUTE Shelf Card FabricPort controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.
Mib	Fabric
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE Shelf Card FabricPort alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib	Fabric
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)

ATTRIBUTE Shelf Card FabricPort **standbyStatus (osiStby)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

ATTRIBUTE Shelf Card FabricPort unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	Fabric
Values	false true
Default	false

GROUP Shelf Card FabricPort Operational (Oper)

Properties	Operational
Description	This attribute group contains operational attributes of a fabric port. This information outlines what the fabric port is doing and why it is doing it. It is primarily intended for use in diagnosing the cause of a fabric-related problem reported by the module.
Mib	Fabric

ATTRIBUTE Shelf Card FabricPort failuresInEffect

Access	Read only
Description	This attribute indicates the failures that prevent the fabric port from using the associated fabric. It may contain any combination of the following values: ***selfTest***: The port has failed its self-test. ***hardwareError***: An unrecoverable critical error has occurred on the hardware of the processor card which exchanges cells with fabric card. ***portProtocolError:*** Errors have occurred which violate the protocol between components of the fabric port in datapath. ***switchClockError***: The fabric card clock is no longer detected by the processor card. ***livelinessError***: A non-fatal hardware error has occurred on the component which exchanges cells with the fabric card. Excessive numbers of these errors on the fabric port may be indicating a serious hardware

Copyright © 2006, Nortel Nortel Confidential

problem.
dataCorruptionError: Cell payloads or headers are detected as being corrupted at the fabric port level.
linkLivelinessError: The link between the fabric port and the fabric card is not indicating liveliness.

Operator action: Run the fabric test to clear these errors.

Mib	Fabric

Default	No default

ATTRIBUTE Shelf Card FabricPort **dependenciesInEffect**

Access	Read only
Description	This attribute indicates the non-hardware problems that prevent the fabric port from using the associated fabric. It may be a combination of the following values: ***fabricLocked***: The fabric card is locked. ***fabricDisabled***: The fabric card is disabled. ***portDisabled***: The corresponding card port on the fabric is disabled.
Mib	Fabric
Set of	fabricLocked fabricDisabled portDisabled
Default	No default

ATTRIBUTE Shelf Card FabricPort **cardsAvailable**

Access	Read only
Description	This attribute indicates the slot numbers of the cards that the fabric port considers available through the fabric; that is, the cards that have an operational port connected to the fabric. The value of this attribute is determined automatically by the fabric port by monitoring signals generated by each fabric port connected to the fabric card. Normally, every card in the module signals its availability on both fabrics. If a card does not signal its availability on a fabric, then the card is not present or its fabric port has failed. By examining this attribute for both of a card's *FabricPort* components, it is possible to determine which cards are present in the module and which fabric each can use. Note: If *failuresInEffect* has a value of ***selfTest***, ***signalLoss***,

Copyright © 2006, Nortel Nortel Confidential

synchronizationLoss, or ***protocolError***, the fabric port is unable to monitor the availability of the fabric ports on the fabric. In such cases, *cardsAvailable* indicates that no fabric port is available on the fabric.

Mib	Fabric
Set of	Decimal (0..15)
Default	No default

ATTRIBUTE Shelf Card FabricPort **cardsTxTo**

Access	Read only
Description	This attribute indicates the slot number of the cards to which the fabric port is currently configured to transmit cells. This configuration is managed automatically, and cannot be changed by the operator. By examining this attribute for both of a card's *FabricPort* components, it is possible to determine which fabric (if any) the card uses when it needs to transmits cells to a specific card in the module.
Mib	Fabric
Set of	Decimal (0..15)
Default	No default

COMPONENT Shelf Card FabricPort **Test**

Groups	GROUP Shelf Card FabricPort Test OsiState (State) GROUP Shelf Card FabricPort Test Setup GROUP Shelf Card FabricPort Test Results
Scope	Device
Description	*Shelf Card/n Fabric/f Test* This component is used to verify the operation of a fabric port. A fabric port test may be run as part of a regular maintenance program or to diagnose the cause of a *FabricPort*-related problem. The *Test* component is created automatically, and cannot be added or deleted. The fabric port test ensures that the fabric port on a specific card is functioning properly at minimal utilization rates. The fabric port to be tested must be locked while testing is in progress. The test only involves the fabric port on the specified card. The results of the test can help to determine which portions of the fabric port system are faulty, if any. A fabric port test comprises several different tests. The tests are performed in the following order: **port test:** The fabric port selfTest **broadcast test:** The fabric port ensures that it can receive a broadcast frame over the fabric card from every operational card (including itself). **ping test:** The fabric port ensures that it can receive a low priority non-broadcast frame over the backplane from every operational card (including itself).

Copyright © 2006, Nortel Nortel Confidential

Once all of the tests have been performed, the ping test is repeated continuously until the fabric port test is terminated; this repetition helps to detect transient fabric card and fabric port faults. The fabric port test stops automatically after a specified time interval, or if it detects a port test failure, or a broadcast test failure.

Mib — Fabric

Common Verbs — Help, List, Display

VERB START Shelf Card FabricPort Test

Impact — Service

Description — *Start Shelf Card/n Fabric/f Test*
This verb initiates the fabric port test. If the fabric port test is already running, the command has no effect and the test continues. The fabric port must be locked before the test can be run.

VERB STOP Shelf Card FabricPort Test

Impact — Service

Description — *Stop Shelf Card/n Fabric/f Test*
This verb terminates the fabric port test. If the fabric port test is not running, the command has no effect.

GROUP Shelf Card FabricPort Test **OsiState (State)**

Properties — Operational

Description — This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib — Fabric

ATTRIBUTE Shelf Card FabricPort Test **adminState (osiAdmin)**

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — Fabric

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

GROUP Shelf Card FabricPort Test **Setup**

Properties	Operational
Description	This attribute group contains the attributes that govern the operation of a fabric card or fabric port test. These attributes cannot be changed while the fabric card or fabric port test is running.
Mib	Fabric

ATTRIBUTE Shelf Card FabricPort Test **duration**

Access	Read and write
Description	This attribute specifies the maximum length of time that the fabric card test is allowed to run. The maximum allowed value permits the fabric card test to be run for up to 30 days.
Mib	Fabric
Values	Decimal (1..43200)
Units	minutes
Default	2

ATTRIBUTE Shelf Card FabricPort Test **type**

Access	Read and write
Description	This attribute specifies the type of the test to be run. When this attribute is set to ***main***, a subsequent fabric card test verifies that the fabric ports on this card and the corresponding cards ports are functioning properly. When this attribute is set to ***scbPoll***, a subsequent fabric card test exercises all the secondary control bus (SCB) bus taps in the system corresponding to the fabric card under test.
Mib	Fabric
Values	main scbPoll
Default	main

GROUP Shelf Card FabricPort Test **Results**

Properties	Operational
Description	This attribute group contains the results of the fabric port test that is currently running; if no fabric port test is running, the attribute group contains the results of the most recently completed fabric port test. The attributes of the *Results* group are reset to their initial values, whenever a fabric card test is started or any attribute in the *Setup* group is set

Index	Decimal (0..15)
Default	No default

ATTRIBUTE Shelf Card FabricPort Test **pingTestFailures (pingFailures)**

Access	Read only
Description	This attribute indicates the number of ping test failures detected. Each failure represents a single low-priority frame that was not successfully transmitted from the fabric port to the fabric ports of other operational cards in the shelf. The fabric port test does *not* terminate automatically if a failure is detected.
Mib	Fabric
Vector of	Decimal (0..4294967295)
Index	Decimal (0..15)
Default	No default

COMPONENT Shelf Card **SparedServices (SpServ)**

Groups	GROUP Shelf Card SpServ OsiState (State)
Scope	Application
Description	*Shelf Card/n SparedServices* This component represents the rolled-up view of spared services which exist on the parent *Card*. The existence of this component is dependent on whether the parent *Card* has a mate *Card*, either in a single LP or multi-LP sparing configuration. The spared services themselves may be providing service or they may be operating in a standby mode. For an FP, the standby mode (cold or hot) is

Copyright © 2006, Nortel Nortel Confidential

dependent on the applications present on the *Lp* component linked to the parent *Card* component. For an CP, the standby mode (cold or hot) is dependent on the provisioning of the *cpEquipmentProtection* attribute in the *Shelf* component. If *cpEquipmentProtection* is provisioned as ***hot/cold***, then the standby mode of the spared services for the standby CP is hot/cold respectively.

The *SparedServices* component itself reflects the overall sparing status via its OSI *operationalState*, *availabilityStatus*, and *standbyStatus* attributes.

An *operationalState* of ***enabled*** on a card with active service instances, indicates that the spared services are configured and running. On a card with standby service instances, ***enabled*** indicates that they are able to take over from the active instances if the corresponding card fails.

An *operationalState* of ***disabled*** indicates that spared services are configured but are not yet running on this card. Also, on the card with standby instances of spared services, this state is entered while an activation is in progress for any components (spared service instances or any other components, for that matter) on the card. For the standby CP, this state can also be entered if the *journaling* attribute in the *ProvisioningSystem* component becomes operationally ***disabled***. If Switchover occurs in this ***disabled*** state, then the *standby card* will reset before taking over for the *active card*. If *CP Switchover* occurs in this ***disabled*** state when the *standbyStatus* is ***hotStandby***, then the whole shelf will be reset.

An empty value for the *availabilityStatus* indicates that all instances of spared services are either providing service or are ready to take over with their normal level of switchover support, as indicated by the *standbyStatus* attribute.

An *availabilityStatus* of ***degraded*** indicates that at least one standby service instance is not ready to take over with its normal level of switchover support. This value is valid only when the *standbyStatus* attribute has a value of ***hotStandby***. Refer to alarms from the *Shelf Card SparedServices* component to determine specific applications and their problems. For the standby CP, the value of *availailityStatus* attribute can be ***degraded*** when the file systems are out of synchronization, or when the *Provisioning* system has not finished synchronizing the active CP's configuration data. Note that ***degraded*** can appear even when the value of the *operationalState* attribute is ***disabled*** due to an activation.

A *standbyStatus* of ***providingService*** indicates that all spared service instances are active.

A *standbyStatus* of ***coldStandby*** indicates that all spared service instances are standby, and the normal or expected level of switchover support for the current combination of services on this card is cold. That is, there can be extended service outage on a switchover.

Copyright © 2006, Nortel Nortel Confidential

A *standbyStatus* of ***hotStandby*** indicates that all spared service instances are standby, and the normal or expected level of switchover support on an FP is either warm or hot, depending on the applications involved. That is, there is no service outage on switchover for the applications that are hot, and minimal service outage for the applications which are warm. The normal or expected level of switchover support on an CP is application dependent. Some applications can have warm or hot switchover support, other applications can have cold switchover support.

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components. The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***. The value ***logFull*** is not used. The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

ATTRIBUTE Shelf Card SpServ **proceduralStatus (osiProc)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

ATTRIBUTE Shelf Card SpServ **standbyStatus (osiStby)**

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Scope	Device
Description	*Shelf Card/n HwDiagnostics* The *Shelf Card/n HwDiagnostics* component allows automated tests of the individual cards on Nortel Networks Multiservice Switch 15000 and Nortel Networks Multiservice Switch 20000. Only one FP card can be tested at a time, testing of CP cards is not supported. The performed tests are comprehensive and allow the testing of all devices and data paths on the

Copyright © 2006, Nortel Nortel Confidential

targeted card. The performed test are a large subset of the tests conducted during manufacturing testing.

In order to perform the tests the card to be tested must first be locked. This will result in a service outage for the card being tested. Once the test has completed the card can be placed back in service by unlocking it.

Hardware diagnostics are not provided for standby cards that make use of single *Lp*, however diagnostics are provided for standby cards that make use of Dual Lp Equipment Protection (*Dlep*).

COMPONENT Shelf Bus Test

Groups	GROUP Shelf Bus Test OsiState (State) GROUP Shelf Bus Test Setup GROUP Shelf Bus Test Results
Scope	Device
Description	*Shelf Bus/b Test* The *Test* component is used to verify the operation of a bus. A bus test may be run as part of a regular maintenance program, or to diagnose the cause of a bus-related problem. The *Test* component is created automatically, and cannot be added or deleted. The bus test ensures that the bus taps on a specific bus are functioning properly at minimal utilization rates. The bus to be tested must be locked while testing is in progress. The test only involves bus taps on operational cards (active and standby LPs). If an operational card becomes non-operational or fails to respond during the test, it is dropped from the test and is not allowed to rejoin; however, the results of any tests on its bus tap up to that point are preserved. The results of the test can help to determine which portions of the bus system are faulty, if any. A bus test is composed of several different tests. The tests are performed in the following order. 1) Bus tap self-test: Each bus tap executes its self-test. 2) Clock source test: Each bus tap ensures that it can receive clock signals from the active control processor clock source and the alternate clock source (if present). 3) Broadcast test: Each bus tap ensures that it can receive a broadcast frame over the backplane from every operational card (including itself). 4) Ping test: Each bus tap ensures that it can receive a low priority non-broadcast frame over the backplane from every operational card (including itself). Once all of the tests have been performed, the ping test is repeated continuously until the bus test is terminated; this repetition helps to detect transient bus faults. The bus test stops automatically after a specified time

Copyright © 2006, Nortel Nortel Confidential

interval, or if it detects a bus tap self-test failure, an active control processor clock source test failure, or a broadcast test failure.

Mib: Bus

Common Verbs: Help, List, Display

VERB START Shelf Bus Test

Impact: Service

Description: *START Shelf Bus/b Test*
This verb initiates the bus test. If the bus test is already running, the command has no effect and the test continues. The bus must be locked before the test can be run.

VERB STOP Shelf Bus Test

Impact: Service

Description: *STOP Shelf Bus/b Test*
This verb terminates the bus test. If the bus test is not running, the command has no effect.

GROUP Shelf Bus Test **OsiState (State)**

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib: Bus

ATTRIBUTE Shelf Bus Test **adminState (osiAdmin)**

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

Copyright © 2006, Nortel Nortel Confidential

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — Bus

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Shelf Bus Test operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — Bus

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Shelf Bus Test usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — Bus

Values — idle
active (activ)
busy

Default — idle

GROUP Shelf Bus Test **Setup**

Properties	Operational
Description	This attribute group contains the attributes that govern the operation of a bus test. These attributes cannot be changed while the bus test is running.
Mib	Bus

ATTRIBUTE Shelf Bus Test **duration**

Access	Read and write
Description	This attribute specifies the maximum length of time that the bus test is allowed to run. The value is expressed in minutes. The maximum allowed value permits the bus test to be run for up to 30 days.
Mib	Bus
Values	Decimal (1..43200)
Units	minutes
Default	1

GROUP Shelf Bus Test **Results**

Properties	Operational
Description	This attribute group contains the results of the bus test that is currently running; if no bus test is running, the attribute group contains the results of the most recently completed bus test. The attributes of the *Results* group are reset to their initial values whenever a bus test is started or any attribute in the *Setup* group is set.
Mib	Bus

ATTRIBUTE Shelf Bus Test **elapsedTime**

Access	Read only
Description	This attribute records the length of time (in minutes) that the bus test has been running.
Mib	Bus
Values	Decimal (0..43200)
Units	minutes
Default	No default

ATTRIBUTE Shelf Bus Test **timeRemaining**

Access	Read only
Description	This attribute records the maximum length of time (in minutes) that the bus test will continue to run before stopping.

Copyright © 2006, Nortel Nortel Confidential

Mib	Bus
Values	Decimal (0..43200)
Units	minutes
Default	No default

ATTRIBUTE Shelf Bus Test causeOfTermination

Access	Read only
Description	This attribute records the reason the bus test ended. It contains one of the following values. ***neverStarted***: the bus test has not been started ***testRunning***: the bus test is currently running ***testTimeExpired***: the bus test ran for the specified duration ***stoppedByOperator***: a *STOP* command was issued ***selfTestFailure***: a failure was detected during the bus tap self-test ***clockSourceFailure***: a failure was detected during the test of the active control processor (CP) clock source ***broadcastFailure***: a failure was detected during the broadcast test
Mib	Bus
Values	neverStarted testRunning testTimeExpired stoppedByOperator selfTestFailure clockSourceFailure broadcastFailure
Default	No default

ATTRIBUTE Shelf Bus Test testsDone

Access	Read only
Description	This attribute records the tests that have been performed during the bus test. It may contain zero or more of the following values. ***selfTest***: the bus tap self-test has been performed ***clockSourceTest***: the clock source test has been performed ***broadcastTest***: the broadcast test has been performed ***pingTest***: at least one ping test has been performed
Mib	Bus
Set of	selfTest clockSourceTest broadcastTest pingTest
Default	No default

ATTRIBUTE Shelf Bus Test selfTestResults

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute records the results of the bus tap self-test, indexed by the slot number of the card containing the bus tap tested. Each entry contains one of the following values. +: the bus tap passed its self-test X: the bus tap failed its self-test .: the bus tap was not tested The bus test terminates automatically if a failure is detected.
Mib	Bus
Vector of	+ (pass) X (fail) . (noTest)
Index	Decimal (0..15)
Default	No default

ATTRIBUTE Shelf Bus Test clockSourceTestResults

Access	Read only
Description	This attribute records the results of the clock source test, indexed by the clock source and the slot number of the card containing the bus tap tested. Each entry contains one of the following values. +: the bus tap was able to receive clock signals from the clock source X: the bus tap was unable to receive clock signals from the clock source .: the bus tap was not tested against the clock source The bus test terminates automatically if a failure is detected involving the active control processor (CP) clock source.
Mib	Bus
Array of	+ (pass) X (fail) . (noTest)
Row	source [activeCP alternate]
Column	card [Decimal (0..15)]
Default	No default

ATTRIBUTE Shelf Bus Test broadcastTestResults

Access	Read only
Description	This attribute records the results of the broadcast test, indexed by the slot numbers of the card*s* containing the bus taps tested. Each entry contains one of the following values. +: a broadcast message was successfully sent from the transmitting bus tap to the receiving bus tap X: a broadcast message was not successfully sent from the transmitting

	bus tap to the receiving bus tap .: the associated pair of bus taps was not tested The bus test terminates automatically if a failure is detected.
Mib	Bus
Array of	+ (pass) X (fail) . (noTest)
Row	txCard [Decimal (0..15)]
Column	rxCard [Decimal (0..15)]
Default	No default

ATTRIBUTE Shelf Bus Test pingTests

Access	Read only
Description	This attribute records the number of ping tests performed, indexed by the slot numbers of the card*s* containing the bus taps involved. Each test attempts to transmit a single low-priority frame from the transmitting bus tap to the receiving bus tap.
Mib	Bus
Array of	Decimal (0..4294967295)
Row	txCard [Decimal (0..15)]
Column	rxCard [Decimal (0..15)]
Default	No default

ATTRIBUTE Shelf Bus Test pingTestFailures (pingFailures)

Access	Read only
Description	This attribute records the number of ping test failures detected, indexed by the slot numbers of the card*s* containing the bus taps involved. Each failure represents a single low-priority frame that was not successfully transmitted from the transmitting bus tap to the receiving bus tap. The bus test does *not* terminate automatically if a failure is detected.
Mib	Bus
Array of	Decimal (0..4294967295)
Row	txCard [Decimal (0..15)]
Column	rxCard [Decimal (0..15)]
Default	No default

COMPONENT Shelf Test

Groups	GROUP Shelf Test Provisioned (Prov) GROUP Shelf Test Setup GROUP Shelf Test Results
Scope	Device
Description	*PcsTest* The *PcsTest* component allows automated tests of the *Shelf* to be controlled for regular execution.
Mib	Bus
Common Verbs	Help List Display

VERB RUN Shelf Test

Impact	Service
Description	*RUN Shelf Test* This verb initiates the shelf test. It executes the test specified by *type* attribute.

GROUP Shelf Test Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisionable attributes of the *Test* component.
Mib	Bus

ATTRIBUTE Shelf Test automaticBusClockTest (clockTest)

Access	Read and write
Description	This attribute specifies whether or not a bus clock source test is automatically executed after a clock source's LP state changes, and after failure or recovery of the active CP bus clock source. Since tests of an alternate bus clock source may cause a minor loss of traffic, the attribute is set to ***disabled*** by default. If set to ***enabled,*** a bus clock source test is automatically executed. If the status of the corresponding *Shelf Bus clockSourceStatus* is changed after the test, an alarm is issued if the status is one of the following: ***ok, failed,*** or ***unknown***. If set to ***disabled***, no bus clock source test is automatically executed. However, a test can be executed by the *RUN* command. If the status is changed after the test, an alarm is issued if the status is one of the following: ***ok***, or ***failed***.
Mib	Bus

Copyright © 2006, Nortel Nortel Confidential

Values	enabled disabled
Default	disabled

GROUP Shelf Test Setup

Properties	Operational
Description	This attribute group contains the attributes that govern the operation of a shelf test.
Mib	Bus

ATTRIBUTE Shelf Test type

Access	Read and write
Description	type The attribute determines the test to be executed when the *RUN* command is applied to the component. Note that running a ***busClock*** test may cause a minor loss of traffic.
Mib	Bus
Values	busClock
Default	busClock

GROUP Shelf Test Results

Properties	Operational
Description	This attribute group contains the results of the *Shelf Test* that is currently running; if no test is running, the attribute group contains the results of the most recently completed *Shelf Test*. The attributes of the *Results* group are reset to their initial values whenever a corresponding *Shelf Test* is run or the corresponding attribute of the *Setup* group is set.
Mib	Bus

ATTRIBUTE Shelf Test busClockTestResult (busClock)

Access	Read only
Description	busClockTestResult This attribute records the result of the bus clock manual test. The result can be one of the following values. ***pass*** : the test passed ***fail*** : the test failed ***noTest*** : the test was not executed when *RUN* command is issued, because the shelf was in single bus mode.
Mib	Bus

Common Verbs	Help List Display LOCK Unlock

Copyright © 2006, Nortel
Nortel Confidential

VERB INSTALL **Shelf FabricCard**

Impact	Service
Description	*Install* -file(***s***) *Shelf FabricCard*/***n*** This verb initiates loading new software in to the writable bank of the fabric card. If the fabric card is already loading, the command has no effect and the loading continues. The fabric card must be locked and the fixed bank must be active before the loading of the writable bank can be started. Loading should only take a few seconds. The software to be loaded must first be downloaded from the SDS site using *Sw Dld*. Software loading of the fabric card is rare and does not need to be done on every upgrade. All software running on this node will be compatible with any software running in the fabric card. However later releases of the fabric card software contain enhancements, robustness features, and new functionality. An alarm is raised whenever a newer version of the fabric card software is available than that which is active in the fabric card. The alarm indicates which software should be loaded onto the fabric card. Again, it is not necessary to upgrade the software on the fabric card, but the switch will run more efficiently if it is. Any failures in loading the software either indicates corrupt software, bad hardware on the fabric card, or a malfunctioning secondary control bus (SCB). On failure repeat the *Install* and look for errors and alarms indicating faulty hardware. As a general rule, it is best to perform fabric card software loading when the switch is most idle. Both fabric cards should always be running the same software. If one fabric card is loaded with new software then the other fabric card should also be loaded with this new software. An alarm is raised when there is a mismatch in the software running on the two fabric cards.

GROUP **Shelf FabricCard** **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Fabric

ATTRIBUTE **Shelf FabricCard** **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: Fabric

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Shelf FabricCard operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: Fabric

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Shelf FabricCard usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib — Fabric

Values — idle
active (activ)
busy

Default — idle

ATTRIBUTE Shelf FabricCard availabilityStatus (osiAvail)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions,

Copyright © 2006, Nortel Nortel Confidential

the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib — Fabric

Set of
inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)

migrating

Default — No default

ATTRIBUTE Shelf FabricCard proceduralStatus (osiProc)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib: Fabric

Set of:
initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default: No default

ATTRIBUTE Shelf FabricCard controlStatus (osiCntrl)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib: Fabric

Set of:
subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default	No default

ATTRIBUTE Shelf FabricCard alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	Fabric
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Shelf FabricCard standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

Copyright © 2006, Nortel Nortel Confidential

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib	Fabric
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Shelf FabricCard unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	Fabric
Values	false true
Default	false

GROUP Shelf FabricCard Property (Prop)

Properties	Operational
Description	This attribute group indicates property attributes of a fabric card.
Mib	Fabric

ATTRIBUTE Shelf FabricCard productCode

Access	Read only
Description	This attribute indicates the product code (that is the PEC and revision codes) of the fabric card.
Mib	Fabric

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Shelf FabricCard secondaryControlBusFabricBustaps

Access	Read only
Description	Each fabric card has a bus tap on both of the system's secondary control buses. This indicates the state of each fabric card's bus tap onto the secondary control bus for which clocking is supplied by this fabric card. The enumerated values describe the state of the each bus tap. Possible values are: ***ok*** - The SCB is operational. ***txOrRxError*** - The bus failed due to Tx or Rx problems. ***pollError*** - The bus failed an SCB poll. ***testMessageError - The bus failed a fabric card test.*** ***none - The processor card is not available.*** ***unknown - The state cannot be determined due to faulty bustap on CP.***

GROUP Shelf FabricCard Errors

Properties	Operational
Description	This attribute group indicates errors that the fabric card has detected since the card was last rebooted. This information is intended for use in detecting and diagnosing the fabric-related problems within a module.
Mib	Fabric

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Shelf FabricCard **voltageErrors**

Access	Read only
Description	This attribute counts the voltage errors detected on the fabric. The value wraps to zero when it exceeds the maximum value.
Mib	Fabric
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Shelf FabricCard **temperatureErrors**

Access	Read only
Description	This attribute counts the temperature errors encountered on the fabric card. The value wraps to zero when it exceeds the maximum value.
Mib	Fabric
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Shelf FabricCard **fabricInternalErrors**

Access	Read only
Description	This attribute counts the internal errors encountered on the fabric card. The value wraps to zero when it exceeds the maximum value.
Mib	Fabric
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Shelf FabricCard **fabricInterfaceCrcErrors**

Access	Read only
Description	This attribute counts the CRC errors detected by the fabric card when receiving data from other cards. The value wraps to zero when it exceeds the maximum value.
Mib	Fabric
Values	Decimal (0..4294967295)
Default	No default

GROUP Shelf FabricCard **Banks**

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the attributes that govern the operation of a fabric card banks. These attributes cannot be changed while the fabric card writable bank is loading.
Mib	Fabric

ATTRIBUTE Shelf FabricCard fixedBankVersion

Access	Read only
Description	This attribute indicates what the fabric card software version in the fixed bank is. It is zero during start-up. After start-up it is queried from the fabric card.
Mib	Fabric
Values	Decimal (0.0..99.9)
Default	No default

ATTRIBUTE Shelf FabricCard writableBankVersion

Access	Read only
Description	This attribute indicates the software version that is loaded on the writable bank. It is zero if there is no version loaded.
Mib	Fabric
Values	Decimal (0.0..99.9)
Default	No default

ATTRIBUTE Shelf FabricCard recommendedVersionToInstall

Access	Read only
Description	This attribute indicates the recommended fabric application version to install using the *Install* command. If the current active software is up-to-date, it indicates no version is needed to install.
Mib	Fabric
Values	String (0..49, ASCII)
Default	No default

ATTRIBUTE Shelf FabricCard activeBank

Access	Read and write
Description	This attribute indicates which bank is the currently running. The writable bank can only be made active if it has been installed using the *Install* command at least once. ***writable***: Indicates the writable bank is the active bank. ***fixed***: Indicates the fixed bank is the active bank.

Copyright © 2006, Nortel Nortel Confidential

unknown: The software has not yet determined which is the active bank. This normally takes a few seconds when the software is first activated.

Mib — Fabric

Values — fixed
writable
unknown

Default — No default

ATTRIBUTE Shelf FabricCard bankOnShelfRestart

Access — Read only

Description — This attribute indicates which bank will be running when the shelf is reset or powered-down and then powered-up.

writable: Indicates the writable bank will be the bank on the next power up or reset.
fixed: Indicates the fixed bank will be the bank on the next power up or reset.
unknown: The software has not yet determined which is the bank on shelf restart. This normally takes a few seconds when the software is first activated.

Mib — Fabric

Values — fixed
writable
unknown

Default — No default

ATTRIBUTE Shelf FabricCard writableBankStatus

Access — Read only

Description — This attribute specifies the current status of the writable bank. It is set to ***unknown*** until the status is determined by the software. It takes a few seconds at software activation time to determine the status of the writable bank.

unknown: The switch has not yet determined the state of the writable bank. This happens only within the first few seconds the software is activated.
empty: No (valid) software is loaded in the writable bank.
loading: Software is currently loading into the writable bank.
loaded: The software has successfully loaded.

An example of a transition sequence for the writable bank status is: ***unknown*** -> ***empty***-> ***loading*** -> ***loaded***-> ***loading***.

On a failure, the status reverts to the previous status that was successful.

Copyright © 2006, Nortel
Nortel Confidential

For example if the ***loading*** fails, the status returns to ***empty***.

Mib	Fabric
Values	unknown empty loading loaded
Default	No default

ATTRIBUTE Shelf FabricCard downloadProgressPercent

Access	Read only
Description	This attribute indicates relative progress of a fabric software download as a percentage. When ***writableBankStatus*** is loading the value is between 0 and 100 inclusive. When ***writableBankStatus*** is ***empty*** or ***unknown*** the value is 0. When ***writableBankStatus*** is loaded it is 100.
Mib	Fabric
Values	Decimal (0..100)
Units	%
Default	No default

COMPONENT Shelf FabricCard Test

Groups	GROUP Shelf FabricCard Test OsiState (State) GROUP Shelf FabricCard Test Setup GROUP Shelf FabricCard Test Results
Scope	Device
Description	*Shelf FabricCard/b Test* This component is used to verify the operation of a fabric card. A fabric card test may be run as part of a regular maintenance program, or to diagnose the cause of a fabric-related problem. The *Test* component is created automatically, and cannot be added or deleted. When the *type* attribute is set to ***main***, the fabric card test ensures that the fabric ports on a specific fabric card are functioning properly at minimal utilization rates. The fabric card to be tested must be locked while testing is in progress. The test only involves fabric ports on operational cards (active and standby LPs). If an operational card becomes non-operational or fails to respond during the test, it is dropped from the test and is not allowed to rejoin; however, the results of any tests on its fabric port up to that point are preserved. The results of the test can help to determine which portions of the fabric card system are faulty, if any. A ***main*** type of fabric card test comprises several different tests. The tests are performed in the following order:

Copyright © 2006, Nortel Nortel Confidential

self test: The fabric card performs its self-test.
port test: The fabric port
broadcast test: Each fabric port ensures that it can receive a broadcast frame over the fabric card from every operational card (including itself).
ping test: Each fabric port ensures that it can receive a low priority non-broadcast frame over the backplane from every operational card (including itself).

Once all of the tests have been performed, the ping test is repeated continuously until the fabric card test is terminated; this repetition helps to detect transient fabric faults.

When the *type* attribute is set to ***scbPoll,*** the fabric card test ensures that the X and Y fabric bus taps and the function processor bus taps on a corresponding secondary control bus (SCB) are functioning properly. The test can be run without locking the fabric card. This test only involves SCB bus taps on operational cards (active and standby LPs) and the SCB bus taps on the fabric cards. If an operational card becomes non-operational or fails to respond during the test, it is removed from the test. The results of the test can help to determine which portions of the SCB are faulty, if any.

A ***scbPoll*** type of fabric card test comprises several SCB poll queries which run continuously for the duration of the test. At the reception of a poll query, each SCB bus tap ensures that it can receive a frame over the SCB from every operational card, including itself and the fabrics.

The fabric test stops automatically after a specified time interval, or if it detects a self-test failure, a port test failure, or a broadcast test failure.

Mib	Fabric
Common Verbs	Help List Display

VERB START Shelf FabricCard Test

Impact	Service
Description	*start Shelf FabricCard/f Test* This verb initiates the fabric card test. If the fabric card test is already running, the command has no effect and the test continues. The fabric card must be locked before the test can be run.

VERB STOP Shelf FabricCard Test

Impact	Service
Description	*stop Shelf FabricCard/b Test* This verb terminates the fabric card test. If the fabric card test is not running, the command has no effect.

GROUP Shelf FabricCard Test **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Fabric

ATTRIBUTE Shelf FabricCard Test **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Fabric
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Shelf FabricCard Test **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

Mib	Fabric
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Shelf FabricCard Test **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Fabric
Values	idle active (activ) busy
Default	idle

GROUP Shelf FabricCard Test **Setup**

Properties	Operational
Description	This attribute group contains the attributes that govern the operation of a fabric card or fabric port test. These attributes cannot be changed while the fabric card or fabric port test is running.
Mib	Fabric

ATTRIBUTE Shelf FabricCard Test **duration**

Access	Read and write
Description	This attribute specifies the maximum length of time that the fabric card test is allowed to run. The maximum allowed value permits the fabric card test to be run for up to 30 days.
Mib	Fabric
Values	Decimal (1..43200)
Units	minutes
Default	2

ATTRIBUTE Shelf FabricCard Test **type**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the type of the test to be run. When this attribute is set to ***main***, a subsequent fabric card test verifies that the fabric ports on this card and the corresponding cards ports are functioning properly. When this attribute is set to ***scbPoll***, a subsequent fabric card test exercises all the secondary control bus (SCB) bus taps in the system corresponding to the fabric card under test.
Mib	Fabric
Values	main scbPoll
Default	main

GROUP **Shelf FabricCard Test** **Results**

Properties	Operational
Description	This attribute group contains the results of the fabric card test that is currently running; if no fabric card test is running, the attribute group contains the results of the most recently completed fabric card test. The attributes of the *Results* group are reset to their initial values whenever a fabric card test is started or any attribute in the *Setup* group is set.
Mib	Fabric

ATTRIBUTE **Shelf FabricCard Test** **elapsedTime**

Access	Read only
Description	This attribute indicates the length of time that the fabric card test has been running.
Mib	Fabric
Values	Decimal (0..43200)
Units	minutes
Default	No default

ATTRIBUTE **Shelf FabricCard Test** **timeRemaining**

Access	Read only
Description	This attribute indicates the maximum length of time that the fabric card test runs before stopping.
Mib	Fabric
Values	Decimal (0..43200)
Units	minutes
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Shelf FabricCard Test **causeOfTermination**

Access	Read only
Description	This attribute indicates the reason the fabric card test ended. It contains one of the following values: ***neverStarted***: The fabric card test has not been started. ***testRunning***: The fabric card test is currently running. ***testTimeExpired***: The fabric card test ran for the specified duration. ***stoppedByOperator***: A stop command was issued. ***portTestFailure***: A failure was detected during the port test. ***fabricSelfTestFailure***: A failure was detected during the fabric card self-test. ***broadcastFailure***: A failure was detected during the broadcast test.
Mib	Fabric
Values	neverStarted testRunning testTimeExpired stoppedByOperator portTestFailure fabricSelfTestFailure broadcastFailure
Default	No default

ATTRIBUTE Shelf FabricCard Test **testsDone**

Access	Read only
Description	This attribute indicates the tests that have been performed during the fabric card test. It contains zero or more of the following values: ***selfTest***: The fabric card self-test has been performed. ***portTest***: The port test has been performed. ***broadcastTest***: The broadcast test has been performed. ***pingTest***: At least one ping test has been performed. This attribute is displayed only when the *type* attribute is set to ***main***
Mib	Fabric
Set of	selfTest portTest broadcastTest pingTest
Default	No default

ATTRIBUTE Shelf FabricCard Test **fabricSelfTestResults**

Access	Read only
Description	This attribute indicates the results of the fabric's self test. The fabric test terminates automatically if a failure is detected.

Copyright © 2006, Nortel Nortel Confidential

ok: The fabric self test is passed.
failed: The fabric self test is failed.
noTest: The default value indicates no self test is performed.

This attribute is displayed only when the *type* attribute is set to ***main***

COMPONENT Shelf FabricCard CardPort

Instance	Decimal (0..15)
Groups	GROUP Shelf FabricCard CardPort OsiState (State) GROUP Shelf FabricCard CardPort Operational (Oper) GROUP Shelf FabricCard CardPort CardPortErrors
Scope	Device
Description	*Shelf FabricCard/f cardPort/n* This component represents a physical port on a fabric card. A card port is the interface to the cards; it provides a pathway for the fabric card to send cells to the processor cards in the module and to receive cells sent to it from the processor cards. A fabric card's *CardPort* components are created automatically, can not be added or deleted.
Mib	Fabric
Common Verbs	Help List Display

GROUP Shelf FabricCard CardPort OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Fabric

ATTRIBUTE Shelf FabricCard CardPort adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock*

Copyright © 2006, Nortel Nortel Confidential

command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: Fabric

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Shelf FabricCard CardPort operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: Fabric

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Shelf FabricCard CardPort usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

Copyright © 2006, Nortel Nortel Confidential

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib — Fabric

Values — idle
active (activ)
busy

Default — idle

ATTRIBUTE Shelf FabricCard CardPort **availabilityStatus (osiAvail)**

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Default — No default

ATTRIBUTE Shelf FabricCard CardPort **proceduralStatus (osiProc)**

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is

Copyright © 2006, Nortel Nortel Confidential

not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

ATTRIBUTE Shelf FabricCard CardPort **controlStatus (osiCntrl)**

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

ATTRIBUTE Shelf FabricCard CardPort **alarmStatus (osiAlarm)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	Fabric
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Shelf FabricCard CardPort **standbyStatus (osiStby)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service

Copyright © 2006, Nortel Nortel Confidential

but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib — Fabric

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default — notSet

ATTRIBUTE Shelf FabricCard CardPort **unknownStatus (osiUnknw)**

Access — Read only

Description — This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Mib — Fabric

Values
false
true

Default — false

GROUP Shelf FabricCard CardPort **Operational (Oper)**

Properties — Operational

Description — This attribute group contains operational attributes of a card port. This information outlines what the card port is doing and why it is doing it and is primarily intended for use in diagnosing the cause of a port-related problem reported by the module.

Mib — Fabric

ATTRIBUTE Shelf FabricCard CardPort **failuresInEffect**

Access — Read only

Description — This attribute indicates the hardware problems that prevent the *CardPort* from using the fabric. It may contain any combination of the following

Copyright © 2006, Nortel Nortel Confidential

values.
selfTest: The port has failed its self-test.
crcError: The port has detected too many CRC errors.
signalLoss: The serial link receiver is not receiving a signal. That is, the electrical connection to the far end transmitter is not valid.
flowControlViolation: An unacceptable number of flow control violation errors have occurred.
synchronizationLoss: The serial link's phase or alignment is lost. Therefore, the port's synchronization is lost.
queueFull: The output queue is full.
syncLoss: The card port has lost synchronization with the fabric port.

Mib	Fabric
Set of	selfTest crcError signalLoss flowControlViolation synchronizationLoss queueFull syncLoss
Default	No default

ATTRIBUTE Shelf FabricCard CardPort **dependenciesInEffect**

Access	Read only
Description	This attribute indicates the non-hardware problems that prevent the port from using the associated fabric. It may contain the following values: ***fabricLocked*** - The fabric card is locked. ***fabricDisabled*** - The fabric card is disabled. ***portDisabled*** - The corresponding fabric port is disabled. ***cardNotInserted*** - The corresponding processor card is not inserted.
Mib	Fabric
Set of	fabricLocked fabricDisabled portDisabled cardNotInserted
Default	No default

GROUP Shelf FabricCard CardPort **CardPortErrors**

Properties	Operational
Description	This attribute group indicates errors that the card port has detected since the fabric card was last rebooted. This information is intended for use in detecting and diagnosing port-related problems within a module.
Mib	Fabric

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Shelf FabricCard CardPort **selfTestErrorCode**

Access	Read only
Description	This attribute indicates the error code generated by the most recent self-test of the port.
Mib	Fabric
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Shelf FabricCard CardPort **dataOrAddressCrcErrors**

Access	Read only
Description	This attribute indicates the packet data or address CRC errors encountered on the port. The value wraps to zero when it exceeds the maximum value.
Mib	Fabric
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Shelf FabricCard CardPort **flowControlViolationErrors**

Access	Read only
Description	This attribute counts the flow control violations (that is “threshold exceeded errors”) detected on the port. The value wraps to zero when it exceeds the maximum value.
Mib	Fabric
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Shelf FabricCard CardPort **livelinessErrors**

Access	Read only
Description	This attribute counts the liveliness errors detected on the card port. Liveliness errors are failures to receive yellow cells within a certain period of time. The value wraps to zero when it exceeds the maximum value. *Note*: **Yellow cells** are special types of packets which are generated by the fabric port and detected by the fabric card and the fabric port in order to check the link liveness with the fabric card.
Mib	Fabric
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Shelf FabricCard CardPort **lossOfSignalOrSyncErrors**

Access	Read only
Description	This attribute counts the loss of signal or loss of synchronization errors on the port that caused the port to fail. The value wraps to zero when it exceeds the maximum value.
Mib	Fabric
Values	Decimal (0..4294967295)
Default	No default

GROUP SigChan CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	VoiceNetworking

ATTRIBUTE SigChan customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	VoiceNetworking
Values	Decimal (0; 1..8191)
Default	0

GROUP SigChan IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	VoiceNetworking

ATTRIBUTE SigChan ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	VoiceNetworking
Values	up down testing

Copyright © 2006, Nortel Nortel Confidential

Default	up

ATTRIBUTE SigChan ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	VoiceNetworking
Values	Decimal (1..65535)
Default	No default

GROUP SigChan OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	VoiceNetworking

ATTRIBUTE SigChan snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	VoiceNetworking
Values	up down testing
Default	up

GROUP SigChan OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	VoiceNetworking

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	VoiceNetworking
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE SigChan operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	VoiceNetworking
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE SigChan usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib	VoiceNetworking
Values	idle active (activ) busy
Default	idle

GROUP SigChan Provisioned (Prov)

Properties	Provisioned
Description	This group represents the provisionable attributes of a *SigChan*.
Mib	VoiceNetworking

ATTRIBUTE SigChan commentText

Access	Read: All Write: All
Description	Use of this attribute is at the discretion of the system administrator. Typically, this attribute specifies the name of the customer that is using this *SigChan*.
Mib	VoiceNetworking
Values	String (0..40, ASCII)
Default	No default

ATTRIBUTE SigChan octothorpeEod (eod)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies whether the octothorpe (number sign) should be used as an end of dialling indication. When this character is received, only the digits that have been received to that point will be used for address resolution. All subsequent digits will be forwarded to the far-end, but they will not be used. The octothorpe will not be sent to the far-end.
Mib	VoiceNetworking
Values	yes no

Copyright © 2006, Nortel Nortel Confidential

Default	no

ATTRIBUTE SigChan forceNpiTon (fnt)

Access	Read: All Write: All
Description	This attribute, together with the *defaultNpiTon* attribute, controls Numbering Plan Identifier (NPI) and Type Of Number (TON) values to be used by the *SigChan* component for egress calls (if applicable). If set to ***yes***, NPI and TON values defined by the *defaultNpiTon* attribute unconditionally overwrite values received in the call setup message from the subnet.
Mib	VoiceNetworking
Values	yes no
Default	no

ATTRIBUTE SigChan defaultNpiTon (dnt)

Access	Read: All Write: All
Description	This attribute, together with the *forceNpiTon* attribute, controls Numbering Plan Identifier (NPI) and Type Of Number (TON) values to be used by the *SigChan* component for egress calls (if applicable). The combination of NPI and TON values defined by the *defaultNpiTon* attribute is used for an egress call whenever: - the call setup message received from subnet indicates that NPI or TON information is not supplied or doesn't make sense, or - attribute *forceNpiTon* is set to ***yes*** Mapping between values of the *defaultNpiTon* attribute and associated combinations of NPI and TON values follows: ***casUnknown***: NPI=unknown (0) TON=unknown (0) ***unknown***: NPI=E.164 (1) TON=unknown (0) ***international***: NPI=E.164 (1) TON=international (1) ***national***: NPI=E.164 (1) TON=national (2) ***subscriber***: NPI=E.164 (1) TON=subscriber (4) ***p0***: NPI=private(9) TON=0 ***p1***: NPI=private(9) TON=1 ***p2***: NPI=private(9) TON=2 ***p3***: NPI=private(9) TON=3 ***p4***: NPI=private(9) TON=4 ***p5***: NPI=private(9) TON=5 ***p6***: NPI=private(9) TON=6 ***p7***: NPI=private(9) TON=7

GROUP SigChan E1Cas TimerProv

Properties	Provisioned
Description	This group contains the various timers used by *Ds1Cas* component to handle a particular timing events.
Mib	VoiceNetworking

ATTRIBUTE SigChan E1Cas guardTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the amount of time needed after a channel is idled before it is made available for the next outgoing call to the link.
Mib	VoiceNetworking
Values	Decimal (50..30000)
Units	msec

Copyright © 2006, Nortel Nortel Confidential

Default	1000

ATTRIBUTE SigChan E1Cas winkTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the length of time that a *winkTx* signal is transmitted. This attribute is only referenced if the *winkTx* signal is defined
Mib	VoiceNetworking
Values	Decimal (100..1000)
Units	msec
Default	220

ATTRIBUTE SigChan E1Cas winkMinTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the minimum time that a *winkRx* signal, when received, must persist before being considered as a valid wink. Anything less is ignored. This value must be less than *winkMaxTime*. This attribute is only referenced if the *winkRx* Signal is defined
Mib	VoiceNetworking
Values	Decimal (100..1000)
Units	msec
Default	130

ATTRIBUTE SigChan E1Cas winkMaxTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the maximum time that a *winkRx* signal, when received, may persist before it is interpreted as a GLARE condition. This value must be larger than the *winkMinTime*. This attribute is only referenced if the *winkRx* Signal is defined
Mib	VoiceNetworking
Values	Decimal (100..1000)
Units	msec
Default	300

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan E1Cas seizeAckDelayTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the delay, after receiving any particular seize signal, before responding with a *seizeAckTx* or *winkTx* signal
Mib	VoiceNetworking
Values	Decimal (30..3000)
Units	msec
Default	180

ATTRIBUTE SigChan E1Cas seizeAckSupvTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the amount of time, on an outgoing call to the link, the network will wait to receive a *seizeAckRx* or a *winkRx* signal. Should this timer time-out, the call is considered as a seize failure. This timer is not started unless either the *seizeAckRx* or a *winkRx* signals are defined.
Mib	VoiceNetworking
Values	Decimal (1000..15000)
Units	msec
Default	4000

ATTRIBUTE SigChan E1Cas outpulseDelayTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the amount of delay, after transmitting any seize signal, before digit transmission begins. If the *seizeAckRx* or *winkRx* signal is defined, the timer is started upon complete reception of the signal. If the *seizeAckRx* or *winkRx* signal are not defined, the timer is started immediately after sending any particular seize signal.
Mib	VoiceNetworking
Values	Decimal (100..30000)
Units	msec

Copyright © 2006, Nortel Nortel Confidential

Default	400

ATTRIBUTE SigChan E1Cas endOfDialTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the amount of time allowed between digits after which any more digits are to be ignored.
Mib	VoiceNetworking
Values	Decimal (1000..30000)
Units	msec
Default	9000

ATTRIBUTE SigChan E1Cas disconnectTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the amount of time that a disconnect signal (*idleRx*, *clearBackRx* or *clearFwdRx*) must persist before it is interpreted as a valid disconnect signal.
Mib	VoiceNetworking
Values	Decimal (10..30000)
Units	msec
Default	500

ATTRIBUTE SigChan E1Cas disconnectSupvTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the amount of time allowed for the link to respond with a disconnect signal (*idleRx*, *clearBackRx* or *clearFwdRx*) once the network has already started the disconnect sequence.
Mib	VoiceNetworking
Values	Decimal (1000..60000)
Units	msec
Default	35000

GROUP SigChan E1Cas LinkCallStatistics

Properties	Operational
Description	This group contains the operational statistics on various call events on the link.
Mib	VoiceNetworking

ATTRIBUTE SigChan E1Cas totalCallsOutgoing

Access	Read only
Description	This attribute counts the outgoing node call attempts made to this link. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan E1Cas totalCallsIncoming

Access	Read only
Description	This attribute counts the incoming link call attempts made to this node. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan E1Cas outgoingAnsweredCalls

Access	Read only
Description	This attribute counts the outgoing node calls to this link that were answered by the link. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan E1Cas incomingAnsweredCalls

Access	Read only
Description	This attribute counts the incoming link calls that were answered by this node. That is a connect signal was transmitted by this node out to the link.

Copyright © 2006, Nortel Nortel Confidential

The counter wraps to zero when it exceeds its maximum value.

Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan E1Cas seizeFailures

Access	Read only
Description	This attribute counts the outgoing node call attempts to this link for which the link failed to respond correctly upon receiving a seize signal. That is, no seizure acknowledgment or wink was returned from link. This attribute does not count calls that encountered glare. Glare situations are counted via the *glareCalls* attribute. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan E1Cas releaseFailures

Access	Read only
Description	This attribute counts the times that the link failed to respond correctly during the disconnect sequence of a call. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan E1Cas activeChannels

Access	Read only
Description	This attribute counts the current number of active channels. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan E1Cas peakActiveChannels

Access	Read only
Description	This attribute counts the peak number of active channels. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan E1Cas glareCalls

Access	Read only
Description	This attribute counts the outgoing node call attempts to the link that encountered glare. Glare occurs when an outgoing node call attempt and an incoming link call attempt occur on the same channel simultaneously. Priority is given to the incoming call and the outgoing call is reattempted on another channel. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

COLLECTED STATS SignallingChannel E1Cas

Description	The statistics record generated by the SignallingChannel E1Cas component.

ATTRIBUTE SigChan E1Cas totalCallsOutgoing

Description	This spooled statistic counts the number of outgoing node call attempts made to this link in the last statistics collection interval.
Values	Decimal (0..65535)

ATTRIBUTE SigChan E1Cas totalCallsIncoming

Description	This attribute counts the number of incoming link call attempts made to this node in the last statistics collection interval.
Values	Decimal (0..65535)

ATTRIBUTE SigChan E1Cas seizeFailures

Description	This spooled statistic counts the number of outgoing node call attempts to this link for which the link failed to respond correctly upon receiving a seize signal in the last statistics collection interval. That is no seizure acknowledgment or wink was returned from link.

ATTRIBUTE SigChan E1Cas outgoingAnsweredCalls

Description This spooled statistic counts the number of outgoing node calls to this link that were answered by the link in the last statistics collection interval.

Values Decimal (0..65535)

ATTRIBUTE SigChan E1Cas incomingAnsweredCalls

Description This spooled statistic counts the number of incoming link calls that were answered by this node, connect signals transmitted by this node out to the link in the last statistics collection interval.

Values Decimal (0..65535)

ATTRIBUTE SigChan E1Cas peakActiveChannels

Description This spooled statistic counts the maximum number of channels that have been simultaneously active on this signalling channel during the last statistics collection interval.

Values Decimal (0..30)

COMPONENT SigChan E1Cas Framer (Framer)

Groups GROUP SigChan E1Cas Framer Provisioned (Prov)
GROUP SigChan E1Cas Framer OsiState (State)

Scope Application

Description *SigChan/n Ds1Cas Framer*
SigChan/n E1Cas Framer
SigChan/n J2Cas Framer
The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface

Copyright © 2006, Nortel Nortel Confidential

datapath statistics (such as frame counts and aborts).

Mib	VoiceNetworking
Common Verbs	Help List Display

GROUP SigChan E1Cas Framer Provisioned (Prov)

Properties	Provisioned
Description	This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.
Mib	VoiceNetworking

ATTRIBUTE SigChan E1Cas Framer interfaceName

Access	Read and write
Criticality	Process
Description	This attribute contains a hardware component name. The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.
Mib	VoiceNetworking
Values	Link (Hardware, applicationFramerName)
Default	No default

GROUP SigChan E1Cas Framer OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	VoiceNetworking

ATTRIBUTE SigChan E1Cas Framer adminState (osiAdmin)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	VoiceNetworking
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE SigChan E1Cas Framer operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	VoiceNetworking
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE SigChan E1Cas Framer usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

Copyright © 2006, Nortel Nortel Confidential

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Description
This attribute specifies what the value is, in ABCD terms, of the seize Voice signal when transmitted. This signal when transmitted identifies the call as a voice call. This signal can not be defined if the *seizeTx* or *seizeRx* are defined. The *seizeVoiceRx*, *seizeDataRx* and *seizeDataTx* must also be defined along with this signal. If defined, the value of the signal must be different from the *seizeDataTx* and *idleTx* signals.

GROUP SigChan Ds1Cas TimerProv

Properties Provisioned

Description This group contains the various timers used by *Ds1Cas* component to handle a particular timing events.

Copyright © 2006, Nortel Nortel Confidential

Mib	VoiceNetworking

ATTRIBUTE SigChan Ds1Cas guardTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the amount of time needed after a channel is idled before it is made available for the next outgoing call to the link.
Mib	VoiceNetworking
Values	Decimal (50..30000)
Units	msec
Default	1000

ATTRIBUTE SigChan Ds1Cas winkTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the length of time that a *winkTx* signal is transmitted. This attribute is only referenced if the *winkTx* signal is defined
Mib	VoiceNetworking
Values	Decimal (100..1000)
Units	msec
Default	220

ATTRIBUTE SigChan Ds1Cas winkMinTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the minimum time that a *winkRx* signal, when received, must persist before being considered as a valid wink. Anything less is ignored. This value must be less than *winkMaxTime*. This attribute is only referenced if the *winkRx* Signal is defined
Mib	VoiceNetworking
Values	Decimal (100..1000)
Units	msec
Default	130

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan Ds1Cas winkMaxTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the maximum time that a *winkRx* signal, when received, may persist before it is interpreted as a GLARE condition. This value must be larger than the *winkMinTime*. This attribute is only referenced if the *winkRx* Signal is defined
Mib	VoiceNetworking
Values	Decimal (100..1000)
Units	msec
Default	300

ATTRIBUTE SigChan Ds1Cas seizeAckDelayTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the delay, after receiving any particular seize signal, before responding with a *seizeAckTx* or *winkTx* signal
Mib	VoiceNetworking
Values	Decimal (30..3000)
Units	msec
Default	1000

ATTRIBUTE SigChan Ds1Cas seizeAckSupvTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the amount of time, on an outgoing call to the link, the network will wait to receive a *seizeAckRx* or a *winkRx* signal. Should this timer time-out, the call is considered as a seize failure. This timer is not started unless either the *seizeAckRx* or a *winkRx* signals are defined.
Mib	VoiceNetworking
Values	Decimal (1000..15000)
Units	msec
Default	4000

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan Ds1Cas outpulseDelayTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the amount of delay, after transmitting any seize signal, before digit transmission begins. If the *seizeAckRx* or *winkRx* signal is defined, the timer is started upon complete reception of the signal. If the *seizeAckRx* or *winkRx* signal are not defined, the timer is started immediately after sending any particular seize signal.
Mib	VoiceNetworking
Values	Decimal (100..30000)
Units	msec
Default	400

ATTRIBUTE SigChan Ds1Cas endOfDialTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the amount of time allowed between digits after which any more digits are to be ignored.
Mib	VoiceNetworking
Values	Decimal (1000..30000)
Units	msec
Default	9000

ATTRIBUTE SigChan Ds1Cas disconnectTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the amount of time that a disconnect signal (*idleRx*, *clearBackRx* or *clearFwdRx*) must persist before it is interpreted as a valid disconnect signal.
Mib	VoiceNetworking
Values	Decimal (10..30000)
Units	msec
Default	500

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan Ds1Cas disconnectSupvTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the amount of time allowed for the link to respond with a disconnect signal (*idleRx*, *clearBackRx* or *clearFwdRx*) once the network has already started the disconnect sequence.
Mib	VoiceNetworking
Values	Decimal (1000..60000)
Units	msec
Default	35000

GROUP SigChan Ds1Cas LinkCallStatistics

Properties	Operational
Description	This group contains the operational statistics on various call events on the link.
Mib	VoiceNetworking

ATTRIBUTE SigChan Ds1Cas totalCallsOutgoing

Access	Read only
Description	This attribute counts the outgoing node call attempts made to this link. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan Ds1Cas totalCallsIncoming

Access	Read only
Description	This attribute counts the incoming link call attempts made to this node. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan Ds1Cas outgoingAnsweredCalls

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the outgoing node calls to this link that were answered by the link. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan Ds1Cas incomingAnsweredCalls

Access	Read only
Description	This attribute counts the incoming link calls that were answered by this node. That is a connect signal was transmitted by this node out to the link. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan Ds1Cas seizeFailures

Access	Read only
Description	This attribute counts the outgoing node call attempts to this link for which the link failed to respond correctly upon receiving a seize signal. That is, no seizure acknowledgment or wink was returned from link. This attribute does not count calls that encountered glare. Glare situations are counted via the *glareCalls* attribute. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan Ds1Cas releaseFailures

Access	Read only
Description	This attribute counts the times that the link failed to respond correctly during the disconnect sequence of a call. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan Ds1Cas activeChannels

Access	Read only
Description	This attribute counts the current number of active channels. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan Ds1Cas peakActiveChannels

Access	Read only
Description	This attribute counts the peak number of active channels. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan Ds1Cas glareCalls

Access	Read only
Description	This attribute counts the outgoing node call attempts to the link that encountered glare. Glare occurs when an outgoing node call attempt and an incoming link call attempt occur on the same channel simultaneously. Priority is given to the incoming call and the outgoing call is reattempted on another channel. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

GROUP SigChan Ds1Cas Discrimination (Discr)

Properties	Provisioned
Description	This group provides the attributes necessary to implement voice and data call discrimination via the first received or transmitted digit of a call.
Mib	VoiceNetworking

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan Ds1Cas voiceDataDiscr

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies whether voice and data calls are to be identified via the *voiceCallDigit* or *dataCallDigit*.
Mib	VoiceNetworking
Values	off on
Default	off

ATTRIBUTE SigChan Ds1Cas voiceCallDigit

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the digit that will identify a call to be a voice call via the first digit. This value must be different than *dataCallDigit*.
Mib	VoiceNetworking
Values	Decimal (0..9)
Default	1

ATTRIBUTE SigChan Ds1Cas dataCallDigit

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the digit that will identify a call to be a data call via the first digit. This value must be different than *voiceCallDigit*.
Mib	VoiceNetworking
Values	Decimal (0..9)
Default	2

COLLECTED STATS SignallingChannel Ds1Cas

Description	The statistics record generated by the SignallingChannel Ds1Cas component.

ATTRIBUTE SigChan Ds1Cas totalCallsOutgoing

Description	This spooled statistic counts the number of outgoing node call attempts made to this link in the last statistics collection interval.

Copyright © 2006, Nortel Nortel Confidential

Values Decimal (0..65535)

ATTRIBUTE SigChan Ds1Cas totalCallsIncoming

Description This attribute counts the number of incoming link call attempts made to this node in the last statistics collection interval.

Values Decimal (0..65535)

ATTRIBUTE SigChan Ds1Cas seizeFailures

Description This spooled statistic counts the number of outgoing node call attempts to this link for which the link failed to respond correctly upon receiving a seize signal in the last statistics collection interval. That is no seizure acknowledgment or wink was returned from link.

Values Decimal (0..65535)

ATTRIBUTE SigChan Ds1Cas releaseFailures

Description This spooled statistic counts the number of times that the link failed to respond correctly during the disconnect sequence of a call in the last statistics collection interval.

Values Decimal (0..65535)

ATTRIBUTE SigChan Ds1Cas outgoingAnsweredCalls

Description This spooled statistic counts the number of outgoing node calls to this link that were answered by the link in the last statistics collection interval.

Values Decimal (0..65535)

ATTRIBUTE SigChan Ds1Cas incomingAnsweredCalls

Description This spooled statistic counts the number of incoming link calls that were answered by this node, connect signals transmitted by this node out to the link in the last statistics collection interval.

Values Decimal (0..65535)

ATTRIBUTE SigChan Ds1Cas peakActiveChannels

Description This spooled statistic counts the maximum number of channels that have been simultaneously active on this signalling channel during the last statistics collection interval.

Values Decimal (0..30)

COMPONENT SigChan Ds1Cas Framer (Framer)

Groups GROUP SigChan Ds1Cas Framer Provisioned (Prov)
GROUP SigChan Ds1Cas Framer OsiState (State)

Scope Application

Description *SigChan/n Ds1Cas Framer*
SigChan/n E1Cas Framer

Copyright © 2006, Nortel Nortel Confidential

SigChan/n J2Cas Framer
The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).

Default No default

GROUP SigChan Ds1Cas Framer OsiState (State)

Properties Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	VoiceNetworking

ATTRIBUTE SigChan Ds1Cas Framer adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	VoiceNetworking
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE SigChan Ds1Cas Framer operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	VoiceNetworking
Values	enabled (ena) disabled (dis)

Copyright © 2006, Nortel Nortel Confidential

Default	disabled

ATTRIBUTE SigChan Ds1Cas Framer **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	VoiceNetworking
Values	idle active (activ) busy
Default	idle

Description	This group conatins attirbutes that defines various settings that do not fall under any other group.
Mib	VoiceNetworking

ATTRIBUTE SigChan J2 toneTableSelection

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies which tone table to select when a call is to receive a given tone. 0 for North America 1 for Japan 2 for United Kingdom 3 for Germany 4 for France 5 for Central America (Brazil, Mexico) 6 for Chile 7 for Autralia
Mib	VoiceNetworking
Values	Decimal (0..7)
Default	1

GROUP SigChan J2 AbcdProv

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group specifies the attributes that define what the A bit pattern for a particular signal should be. The input is a 1 bit (0 or 1) format.
Mib	VoiceNetworking

ATTRIBUTE SigChan J2 signallingBits

Access	Read only
Criticality	Process
Description	This attribute specifies which bits are to be used for interpretation. (A,AB or ABCD).
Mib	VoiceNetworking
Values	A AB ABCD
Default	A

ATTRIBUTE SigChan J2 idleTx

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies what the value is, in A bit terms, of the idle signal is when transmitted. This signal must be different from the *connectTx* signal.
Mib	VoiceNetworking
Values	0 1
Default	1

ATTRIBUTE SigChan J2 idleRx

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies what the value is, in A bit terms, of the idle signal when received. This signal must be different from the *connectRx* signal.
Mib	VoiceNetworking
Values	0 1
Default	1

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan J2 faultTx

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies what the value is, in ABCD terms, of the fault signal when transmitted. It is transmitted when the timeslot is undefined or locked. This signal must be different from the *idleTx* signal.
Mib	VoiceNetworking
Values	0 1
Default	0

ATTRIBUTE SigChan J2 faultRx

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies what the value is, in ABCD terms, of the fault signal when received. When received, the channel status for the timeslot goes to a lockout state. This signal must be different from the *idleRx* signal.
Mib	VoiceNetworking
Values	0 1
Default	0

ATTRIBUTE SigChan J2 seizeTx

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies what the value is, in A bit terms, of the seize signal when transmitted. This signal must be different from the *idleTx* signal.
Mib	VoiceNetworking
Values	0 1
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan J2 seizeRx

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies what the value is, in A bit terms, of the seize signal when received. This signal must be different from the *idleRx* signal.
Mib	VoiceNetworking
Values	0 1
Default	0

ATTRIBUTE SigChan J2 seizeVoiceTx

Access	Read only
Criticality	Process
Description	This attribute specifies what the value is, in ABCD terms, of the seize Voice signal when transmitted. This signal when transmitted identifies the call as a voice call. This signal can not be defined if the *seizeTx* or *seizeRx* are defined. The *seizeVoiceRx*, *seizeDataRx* and *seizeDataTx* must also be defined along with this signal. If defined, the value of the signal must be different from the *seizeDataTx* and *idleTx* signals.
Mib	VoiceNetworking
Values	unused
Default	unused

ATTRIBUTE SigChan J2 seizeVoiceRx

Access	Read only
Criticality	Process
Description	This attribute specifies what the value is, in ABCD terms, of the seize Voice signal when received. This signal when received identifies the call as a voice call. This signal can not be defined if the *seizeTx* or *seizeRx* are defined. The *seizeVoiceTx*, *seizeDataRx* and *seizeDataTx* must also be defined along with this signal. If defined, the value of the signal must be different from the *seizeDataRx* and *idleRx* signals.
Mib	VoiceNetworking
Values	unused
Default	unused

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan J2 seizeDataTx

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies what the value is, in ABCD terms, of the seize Data signal when transmitted. This signal when transmitted identifies the call as a data call. This signal can not be defined if the *seizeTx* or *seizeRx* are defined. The *seizeDataRx*, *seizeVoiceRx* and *seizeVoiceTx* must also be defined along with this signal. If defined, the value of the signal must be different from the *seizeVoiceTx* and *idleTx* signals.
Mib	VoiceNetworking
Values	unused
Default	unused

ATTRIBUTE SigChan J2 seizeDataRx

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies what the value is, in ABCD terms, of the seize Data signal when received. This signal when received identifies the call as a data call. This signal can not be defined if the *seizeTx* or *seizeRx* are defined. The *seizeDataTx*, *seizeVoiceRx* and *seizeVoiceTx* must also be defined along with this signal. If defined, the value of the signal must be different from the *seizeVoiceRx* and *idleRx* signals.
Mib	VoiceNetworking
Values	unused
Default	unused

ATTRIBUTE SigChan J2 seizeAckTx

Access	Read only
Criticality	Process
Description	This attribute specifies what the value is, in ABCD terms, of the seizure acknowledgment signal when transmitted. If defined, the value of the signal must be different from the *idleTx* and the *connectTx* signals.
Mib	VoiceNetworking
Values	unused
Default	unused

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan J2 seizeAckRx

Access	Read only
Criticality	Process
Description	This attribute specifies what the value is, in ABCD terms, of the seizure acknowledgment when received. If defined, the value of the signal must be different from the *idleRx* and the *connectRx* signals.
Mib	VoiceNetworking
Values	unused
Default	unused

ATTRIBUTE SigChan J2 winkTx

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies what the value is, in A bit terms, of the wink signal when transmitted. This is a pulsed signal of *winkTime* duration. Where ***P*** specifies which bit is toggled. A pulse signal returns to the original A bit pattern before the start of transmission.
Mib	VoiceNetworking
Values	P unused
Default	P

ATTRIBUTE SigChan J2 winkRx

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies what the value is, in A bit terms, of the wink signal when received. This pulsed signal must be within the *winkMinTime* and *winkMaxTime* before it is considered as valid. Where ***P*** specifies which bit is toggled. A pulse signal returns to the original A bit pattern before the start of reception.
Mib	VoiceNetworking
Values	P unused
Default	P

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan J2 connectTx

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies what the value is, in ABCD terms, of the connect or answer signal when transmitted. The value of the signal must be different from the *idleTx* signal.
Mib	VoiceNetworking
Values	0 1
Default	0

ATTRIBUTE SigChan J2 connectRx

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies what the value is, in ABCD terms, of the connect or answer signal when received. The value of the signal must be different from the *idleRx* signal.
Mib	VoiceNetworking
Values	0 1
Default	0

ATTRIBUTE SigChan J2 clearBackTx

Access	Read only
Criticality	Process
Description	This attribute specifies what the value is, in ABCD terms, of the clear back signal when transmitted. This signal is sent, if defined, on an incoming call from the link when the network side first initiates the disconnect sequence. This value, if used, must be different from the *idleTx* and *connectTx* signals.
Mib	VoiceNetworking
Values	unused
Default	unused

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan J2 clearBackRx

Access	Read only
Criticality	Process
Description	This attribute specifies what the value is, in ABCD terms, of the clear back signal when received. This signal is received, if defined, on an outgoing call to the link when the link side first initiates the disconnect sequence. This value, if used, must be different from the *idleRx* and *connectRx* signal.
Mib	VoiceNetworking
Values	unused
Default	unused

ATTRIBUTE SigChan J2 clearFwdTx

Access	Read only
Criticality	Process
Description	This attribute specifies what the value is, in ABCD terms, of the clear forward signal when transmitted. This signal is sent, if defined, on an outgoing call to the link when the network side first initiates the disconnect sequence. This value, if used, must be different from the *idleTx* signal and any transmitted seize signal defined.
Mib	VoiceNetworking
Values	unused
Default	unused

ATTRIBUTE SigChan J2 clearFwdRx

Access	Read only
Criticality	Process
Description	This attribute specifies what the value is, in ABCD terms, of the clear forward signal when received. This signal is received, if defined, on an incoming call from the link when the network side first initiates the disconnect sequence. This value, if used, must be different from *idleRx* signal and any transmitted seize signal defined.
Mib	VoiceNetworking
Values	unused
Default	unused

GROUP SigChan J2 TimerProv

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the various timers used by *Ds1Cas* component to handle a particular timing events.
Mib	VoiceNetworking

ATTRIBUTE SigChan J2 guardTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the amount of time needed after a channel is idled before it is made available for the next outgoing call to the link.
Mib	VoiceNetworking
Values	Decimal (0..30000)
Units	msec
Default	1000

ATTRIBUTE SigChan J2 winkTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the length of time that a *winkTx* signal is transmitted. This attribute is only referenced if the *winkTx* signal is defined
Mib	VoiceNetworking
Values	Decimal (100..1000)
Units	msec
Default	220

ATTRIBUTE SigChan J2 winkMinTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the minimum time that a *winkRx* signal, when received, must persist before being considered as a valid wink. Anything less is ignored. This value must be less than *winkMaxTime*. This attribute is only referenced if the *winkRx* Signal is defined
Mib	VoiceNetworking
Values	Decimal (100..1000)
Units	msec

Copyright © 2006, Nortel Nortel Confidential

Default	130

ATTRIBUTE SigChan J2 winkMaxTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the maximum time that a *winkRx* signal, when received, may persist before it is interpreted as a GLARE condition. This value must be larger than the *winkMinTime*. This attribute is only referenced if the *winkRx* Signal is defined
Mib	VoiceNetworking
Values	Decimal (100..1000)
Units	msec
Default	300

ATTRIBUTE SigChan J2 seizeAckDelayTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the delay, after receiving any particular seize signal, before responding with a *seizeAckTx* or *winkTx* signal
Mib	VoiceNetworking
Values	Decimal (30..30000)
Units	msec
Default	180

ATTRIBUTE SigChan J2 seizeAckSupvTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the amount of time, on an outgoing call to the link, the network will wait to receive a *seizeAckRx* or a *winkRx* signal. Should this timer time-out, the call is considered as a seize failure. This timer is not started unless either the *seizeAckRx* or a *winkRx* signals are defined.
Mib	VoiceNetworking
Values	Decimal (1000..15000)
Units	msec
Default	4000

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan J2 outpulseDelayTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the amount of delay, after transmitting any seize signal, before digit transmission begins. If the *seizeAckRx* or *winkRx* signal is defined, the timer is started upon complete reception of the signal. If the *seizeAckRx* or *winkRx* signal are not defined, the timer is started immediately after sending any particular seize signal.
Mib	VoiceNetworking
Values	Decimal (100..30000)
Units	msec
Default	1000

ATTRIBUTE SigChan J2 endOfDialTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the amount of time allowed between digits after which any more digits are to be ignored.
Mib	VoiceNetworking
Values	Decimal (1000..30000)
Units	msec
Default	9000

ATTRIBUTE SigChan J2 disconnectTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the amount of time that a disconnect signal (*idleRx*, *clearBackRx* or *clearFwdRx*) must persist before it is interpreted as a valid disconnect signal.
Mib	VoiceNetworking
Values	Decimal (10..30000)
Units	msec
Default	500

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan J2 disconnectSupvTime

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the amount of time allowed for the link to respond with a disconnect signal (*idleRx*, *clearBackRx* or *clearFwdRx*) once the network has already started the disconnect sequence.
Mib	VoiceNetworking
Values	Decimal (1000..60000)
Units	msec
Default	35000

GROUP SigChan J2 LinkCallStatistics

Properties	Operational
Description	This group contains the operational statistics on various call events on the link.
Mib	VoiceNetworking

ATTRIBUTE SigChan J2 totalCallsOutgoing

Access	Read only
Description	This attribute counts the outgoing node call attempts made to this link. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan J2 totalCallsIncoming

Access	Read only
Description	This attribute counts the incoming link call attempts made to this node. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan J2 outgoingAnsweredCalls

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the outgoing node calls to this link that were answered by the link. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan J2 incomingAnsweredCalls

Access	Read only
Description	This attribute counts the incoming link calls that were answered by this node. That is a connect signal was transmitted by this node out to the link. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan J2 seizeFailures

Access	Read only
Description	This attribute counts the outgoing node call attempts to this link for which the link failed to respond correctly upon receiving a seize signal. That is, no seizure acknowledgment or wink was returned from link. This attribute does not count calls that encountered glare. Glare situations are counted via the *glareCalls* attribute. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan J2 releaseFailures

Access	Read only
Description	This attribute counts the times that the link failed to respond correctly during the disconnect sequence of a call. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan J2 activeChannels

Access	Read only
Description	This attribute counts the current number of active channels. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan J2 peakActiveChannels

Access	Read only
Description	This attribute counts the peak number of active channels. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan J2 glareCalls

Access	Read only
Description	This attribute counts the outgoing node call attempts to the link that encountered glare. Glare occurs when an outgoing node call attempt and an incoming link call attempt occur on the same channel simultaneously. Priority is given to the incoming call and the outgoing call is reattempted on another channel. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

COLLECTED STATS SignallingChannel J2Cas

Description	The statistics record generated by the SignallingChannel J2Cas component.

ATTRIBUTE SigChan J2 totalCallsOutgoing

Description	This spooled statistic counts the number of outgoing node call attempts made to this link in the last statistics collection interval.
Values	Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan J2 totalCallsIncoming

Description — This attribute counts the number of incoming link call attempts made to this node in the last statistics collection interval.

Values — Decimal (0..65535)

ATTRIBUTE SigChan J2 seizeFailures

Description — This spooled statistic counts the number of outgoing node call attempts to this link for which the link failed to respond correctly upon receiving a seize signal in the last statistics collection interval. That is no seizure acknowledgment or wink was returned from link.

Values — Decimal (0..65535)

ATTRIBUTE SigChan J2 releaseFailures

Description — This spooled statistic counts the number of times that the link failed to respond correctly during the disconnect sequence of a call in the last statistics collection interval.

Values — Decimal (0..65535)

ATTRIBUTE SigChan J2 outgoingAnsweredCalls

Description — This spooled statistic counts the number of outgoing node calls to this link that were answered by the link in the last statistics collection interval.

Values — Decimal (0..65535)

ATTRIBUTE SigChan J2 incomingAnsweredCalls

Description — This spooled statistic counts the number of incoming link calls that were answered by this node, connect signals transmitted by this node out to the link in the last statistics collection interval.

Values — Decimal (0..65535)

ATTRIBUTE SigChan J2 peakActiveChannels

Description — This spooled statistic counts the maximum number of channels that have been simultaneously active on this signalling channel during the last statistics collection interval.

Values — Decimal (0..30)

COMPONENT SigChan J2 Framer (Framer)

Groups — GROUP SigChan J2 Framer Provisioned (Prov)
GROUP SigChan J2 Framer OsiState (State)

Scope — Application

Description — *SigChan/n Ds1Cas Framer*
SigChan/n E1Cas Framer
SigChan/n J2Cas Framer
The *Framer* component controls link layer framing for application

Copyright © 2006, Nortel Nortel Confidential

components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).

Mib	VoiceNetworking
Common Verbs	Help List Display

GROUP SigChan J2 Framer Provisioned (Prov)

Properties	Provisioned
Description	This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.
Mib	VoiceNetworking

ATTRIBUTE SigChan J2 Framer interfaceName

Access	Read and write
Criticality	Process
Description	This attribute contains a hardware component name. The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.
Mib	VoiceNetworking
Values	Link (Hardware, applicationFramerName)
Default	No default

GROUP SigChan J2 Framer OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the

Copyright © 2006, Nortel Nortel Confidential

component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib VoiceNetworking

ATTRIBUTE SigChan J2 Framer adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib VoiceNetworking

Values locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

ATTRIBUTE SigChan J2 Framer operationalState (osiOper)

Access Read only

Description This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib VoiceNetworking

Values enabled (ena)
disabled (dis)

Default disabled

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan J2 Framer usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	VoiceNetworking
Values	idle active (activ) busy
Default	idle

COMPONENT SigChan J2 Dtmf

Groups	GROUP SigChan J2 Dtmf Provisioned (Prov)
Scope	Application
Description	*SigChan/n Ds1Cas Dtmf* *SigChan/n E1Cas Dtmf* *SigChan/n J2Cas Dtmf* This component defines attributes that defines what settings are need to recognize and transmit DTMF tones.

GROUP SigChan EQsig Layer2Options (L2)

Properties	Provisioned
Description	This group specifies the provisionable layer 2 attributes of the Q.931 ITU-T protocol.
Mib	VnetEtsiQsig

ATTRIBUTE SigChan EQsig t23

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the layer 2 enable request timer.
Mib	VnetEtsiQsig
Values	Decimal (1..15)
Units	seconds
Default	10

ATTRIBUTE SigChan EQsig t200

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the maximum time between a layer 2 frame and its acknowledgment.
Mib	VnetEtsiQsig
Values	Decimal (1..20)
Units	seconds
Default	1

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan EQsig n200

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the maximum number of re-transmissions of a layer 2 frame.
Mib	VnetEtsiQsig
Values	Decimal (1..8)
Default	3

ATTRIBUTE SigChan EQsig t203

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the maximum time for which layer 2 frames may be absent. Expiry triggers a check on whether the far end is alive.
Mib	VnetEtsiQsig
Values	Decimal (2..40)
Units	seconds
Default	10

ATTRIBUTE SigChan EQsig circuitSwitchedK

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the maximum number of sequentially numbered I frames (that is, window size (k)) that may be unacknowledged at any given time for a SAP supporting primary rate (64kbit/s) signalling.
Mib	VnetEtsiQsig
Values	Decimal (1..127)
Default	7

GROUP SigChan EQsig Layer3Options (L3)

Properties	Provisioned
Description	This group represents the provisionable Layer 3 timer attributes of the ETSI Qsig protocol.
Mib	VnetEtsiQsig

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan EQsig t309

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the data link failure timer; used to ride out temporary failures.
Mib	VnetEtsiQsig
Values	Decimal (15..120)
Units	seconds
Default	90

ATTRIBUTE SigChan EQsig t310

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the call proceeding state timer.
Mib	VnetEtsiQsig
Values	Decimal (10..120)
Units	seconds
Default	30

GROUP SigChan EQsig Provisioned (Prov)

Properties	Provisioned
Description	This group defines the general options of the D-channel signalling link.
Mib	VnetEtsiQsig

ATTRIBUTE SigChan EQsig side

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies whether the interface is the network or user side of the connection. The parameter applies to both the layer 2 and layer 3 of the interface. If this attribute is set to ***network***, then the interface is master during channel negotiation. If this attribute is set to ***user***, then the interface is slave during channel negotiation.
Mib	VnetEtsiQsig

Values	network user
Default	network

ATTRIBUTE SigChan EQsig maxNonCallConcurrent (nonCall)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the maximum number of simultaneous active non-call messages that are allowed.
Mib	VnetEtsiQsig
Values	Decimal (1..30)
Default	30

ATTRIBUTE SigChan EQsig overlapSendingEnabled (ose)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies whether overlap sending to the PBX is enabled.
Mib	VnetEtsiQsig
Values	enabled disabled
Default	enabled

ATTRIBUTE SigChan EQsig overlapReceivingEnabled (ore)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies whether overlap receiving from the PBX is enabled.
Mib	VnetEtsiQsig
Values	enabled disabled
Default	enabled

GROUP SigChan EQsig OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the

Copyright © 2006, Nortel Nortel Confidential

component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib VnetEtsiQsig

ATTRIBUTE SigChan EQsig adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib VnetEtsiQsig

Values locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

ATTRIBUTE SigChan EQsig operationalState (osiOper)

Access Read only

Description This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib VnetEtsiQsig

Values enabled (ena)
disabled (dis)

Default disabled

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan EQsig usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	VnetEtsiQsig
Values	idle active (activ) busy
Default	idle

GROUP SigChan EQsig Statistics (Stats)

Properties	Operational
Description	This group provides the operational components for the *EtsiQsig* component.
Mib	VnetEtsiQsig

ATTRIBUTE SigChan EQsig totalCallsToIf

Access	Read: All Write: Illegal
Description	This attribute counts the total number of calls that have been made to the interface. This counter wraps to zero when it exceeds its maximum value.
Mib	VnetEtsiQsig
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan EQsig totalCallsFromIf

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan EQsig nonCallAssocSessionsToIf

Access	Read: All Write: Illegal
Description	This attribute counts the total number of non-call associated sessions to the interface. This counter wraps to zero when it exceeds its maximum value.
Mib	VnetEtsiQsig
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan EQsig nonCallAssocSessionsFromIf

Access	Read: All Write: Illegal
Description	This attribute counts the total number of non-call associated sessions from the interface. This counter wraps to zero when it exceeds its maximum value.
Mib	VnetEtsiQsig
Values	Decimal (0..4294967295)
Default	0

GROUP SigChan EQsig Operational (Oper)

Properties	Operational
Description	This group provides the operational attributes for the EtsiQsig protocol.
Mib	VnetEtsiQsig

ATTRIBUTE SigChan EQsig activeChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the number of currently active channels. This includes data and voice channels.
Mib	VnetEtsiQsig
Values	Decimal (0..128)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan EQsig activeVoiceChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the number of channels that are currently carrying voice.
Mib	VnetEtsiQsig
Values	Decimal (0..128)
Default	0

ATTRIBUTE SigChan EQsig activeDataChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the number of channels that are currently carrying data. This does not include modem data.
Mib	VnetEtsiQsig
Values	Decimal (0..128)
Default	0

ATTRIBUTE SigChan EQsig peakActiveChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the maximum number of channels that have been active on this signalling channel during the last polling period.
Mib	VnetEtsiQsig
Values	Decimal (0..128)
Default	0

ATTRIBUTE SigChan EQsig peakActiveVoiceChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the maximum number of voice channels that have been active on this signalling channel during the last polling period.
Mib	VnetEtsiQsig

ATTRIBUTE SigChan EQsig peakActiveDataChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the maximum number of data channels that have been active on this signalling channel during the last polling period.
Mib	VnetEtsiQsig
Values	Decimal (0..128)
Default	0

ATTRIBUTE SigChan EQsig dChanStatus (dCh)

Access	Read: All Write: Illegal
Description	This attribute indicates the state of the D-channel. ***outOfService*** means that there is no layer 2 or layer 3 connectivity to the PBX. ***establishing*** means that the signalling channel is attempting to stage the layer 2. ***established*** means that the layer 2 is enabled. If the signalling channel stays in the ***established*** state, then it is waiting for a restart from the PBX. ***enabling*** means that the resources for processing calls are being initialized. If the signalling channel stays in the ***enabling*** state then it is waiting for a restart acknowledgement from the PBX. ***inService*** means that the resources for processing calls are available. ***restarting*** means that the resources for call processing are being re-initialized.
Mib	VnetEtsiQsig
Values	outOfService establishing established enabling inService restarting
Default	No default

GROUP SigChan EQsig Tools

Properties	Operational
Description	This contains a series of operational attributes which turn on and off several kinds of tracing.
Mib	VnetEtsiQsig

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan EQsig tracing

Access	Read: All Write: All
Description	This attribute defines which types of tracing are active for this signalling channel. The tracing messages are sent to the debug stream. To see the messages the *agentQueue* attribute in *Col/debug* must be greater than 0 and a Telnet NMIS session must list the debug stream in its data streams (ex. *set nmis telnet session/1 dataStreams debug*). Different types of tracing can be enabled simultaneously. Note that tracing consumes additional CPU resources and will slow down call processing on a heavily loaded card. If there is message block exhaustion tracing will be suspended for a period and then automatically re-enabled. An alarm is generated on tracing suspension and resumption. This mechanism protects the function processor against excessive numbers of tracing messages. Types of tracing include: ***protocolErrors*** - get details of any protocol errors which are occurring. Protocol errors are also reported in summary form as alarms. ***q931Summary*** - Summary of the Q.931 messages on the signalling link, including certain call details (calling number, called number, release codes). ***q931Hex*** - Q.931 messages displayed in hex format. Useful to determine protocol compliance in case of errors reported on local or remote ends. ***q931Symbolic*** - Q.931 messages parsed to give maximum detail. Useful for understanding content of messages flowing on the link. ***portHex*** - Messages in hex format being sent and received on the link.
Mib	VnetEtsiQsig
Set of	protocolErrors q931Summary q931Hex q931Symbolic portHex
Default	No default

GROUP SigChan EQsig EQsigSpecificProv

Properties	Provisioned
Description	This group provides EtsiQsig protocol specific provisioning.
Mib	VnetEtsiQsig

ATTRIBUTE SigChan EQsig msgSegmentation

Access	Read: All Write: All
Criticality	Process

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute allows users to enable/disable the EtsiQsig message segmentation service.
Mib	VnetEtsiQsig
Values	enabled disabled
Default	disabled

ATTRIBUTE SigChan EQsig e1ChannelNumbers

Access	Read: All Write: All
Criticality	Process
Description	This attribute is applicable to E1 interfaces only. It specifies the mapping scheme between channel numbers (identified in Layer 3 messages) and time slot numbers on the E1 link. When the attribute value is ***skip16***, channel numbers map directly to actual E1 time slots; therefore only channel numbers 1 - 15 and 17 - 31 are expected. When the value is ***contiguous***, channel numbers from 1 - 30 are expected, and the following mapping is used: channels 1 - 15 are mapped to time slots 1 - 15, and channels 16 - 30 are mapped to time slots 17 - 31. On T1 interfaces, channel numbers are always expected in the range 1 - 23.
Mib	VnetEtsiQsig
Values	skip16 contiguous
Default	skip16

GROUP SigChan EQsig EQsigSpecificOp

Properties	Operational
Description	This group provides specific operational attributes for the Etsi Qsig protocol.
Mib	VnetEtsiQsig

ATTRIBUTE SigChan EQsig segmentationAccepted

Access	Read: All Write: Illegal
Description	This attribute counts the total number of times a long Etsi Qsig message has been received from a PBX and forwarded to a subnet.

Copyright © 2006, Nortel Nortel Confidential

This counter wraps to zero when it exceeds its maximum value.

Mib VnetEtsiQsig

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE SigChan EQsig segmentationFailed

Access Read: All
Write: Illegal

Description This attribute counts the total number of times a long Etsi Qsig message has been received from a PBX and could not be forwarded as is to a subnet due to end-to-end incompatibility.

This counter wraps to zero when it exceeds its maximum value.

Mib VnetEtsiQsig

Values Decimal (0..4294967295)

Default 0

COLLECTED STATS SignallingChannel EtsiQsig

Description The statistics record generated by the SignallingChannel EtsiQsig component.

ATTRIBUTE SigChan EQsig peakActiveChannels

Description This collected statistic counts the maximum number of channels that have been active on this signalling channel in the last statistics collection interval.

Values Decimal (0..30)

COMPONENT SigChan EQsig Framer (Framer)

Groups	GROUP SigChan EQsig Framer Provisioned (Prov) GROUP SigChan EQsig Framer OsiState (State) GROUP SigChan EQsig Framer Statistics (Stats)
Scope	Application
Description	*SigChan/n EQsig Framer* The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface. The *Framer* component provides provisionable attributes related to data path aspects of the hardware interface (such as crc and frame length). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component. The *Framer* component contains operational attributes for link interface data path statistics (such as frame counts and aborts).
Mib	VnetEtsiQsig
Common Verbs	Help List Display

GROUP SigChan EQsig Framer Provisioned (Prov)

Properties	Provisioned
Description	This group represents the provisionable Layer 3 timer attributes of a the Nis signalling protocol.
Mib	VnetNisSig

ATTRIBUTE SigChan Nis t309

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the data link failure timer; used to ride out temporary failures.
Mib	VnetNisSig
Values	Decimal (15..120)
Units	seconds
Default	90

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan Nis t310

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the call proceeding state timer.
Mib	VnetNisSig
Values	Decimal (10..120)
Units	seconds
Default	10

GROUP SigChan Nis Provisioned (Prov)

Properties	Provisioned
Description	This group defines the general options of the D-channel signalling link.
Mib	VnetNisSig

ATTRIBUTE SigChan Nis side

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies whether the interface is the network or user side of the connection. The parameter applies to both the layer 2 and layer 3 of the interface. If this attribute is set to ***network***, then the interface is master during channel negotiation. If this attribute is set to ***user***, then the interface is slave during channel negotiation.
Mib	VnetNisSig
Values	network user
Default	network

ATTRIBUTE SigChan Nis maxNonCallConcurrent (nonCall)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the maximum number of simultaneous active non-call messages that are allowed.
Mib	VnetNisSig
Values	Decimal (1..30)

Copyright © 2006, Nortel Nortel Confidential

Default	30

GROUP SigChan Nis OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	VnetNisSig

ATTRIBUTE SigChan Nis adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	VnetNisSig
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE SigChan Nis operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or

Copyright © 2006, Nortel Nortel Confidential

with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib	VnetNisSig
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE SigChan Nis usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	VnetNisSig
Values	idle active (activ) busy
Default	idle

GROUP SigChan Nis Statistics (Stats)

Properties	Operational
Description	This group provides the operational components for the *NisSig* component.
Mib	VnetNisSig

ATTRIBUTE SigChan Nis totalCallsToIf

Access	Read: All Write: Illegal
Description	This attribute counts the total number of calls that have been made to the interface. The value wraps when it reaches its maximum.
Mib	VnetNisSig
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan Nis totalCallsFromIf

Access	Read: All Write: Illegal
Description	This attribute counts the total number of calls from the interface. The value wraps when it reaches its maximum.
Mib	VnetNisSig
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan Nis nonCallAssocSessionsToIf

Access	Read: All Write: Illegal
Description	This attribute counts the total number of non-call associated sessions to the interface. The value wraps when it reaches its maximum.
Mib	VnetNisSig
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE SigChan Nis nonCallAssocSessionsFromIf

Access	Read: All Write: Illegal
Description	This attribute counts the total number of non-call associated sessions from the interface. The value wraps when it reaches its maximum.
Mib	VnetNisSig
Values	Decimal (0..4294967295)
Default	0

GROUP SigChan Nis Operational (Oper)

Properties	Operational
Description	This group provides the operational attributes for the NisSig protocol.
Mib	VnetNisSig

ATTRIBUTE SigChan Nis activeChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the number of currently active channels. This includes data and voice channels.
Mib	VnetNisSig

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..128)
Default	0

ATTRIBUTE SigChan Nis activeVoiceChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the number of channels that are currently carrying voice.
Mib	VnetNisSig
Values	Decimal (0..128)
Default	0

ATTRIBUTE SigChan Nis activeDataChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the number of channels that are currently carrying data. This does not include modem data.
Mib	VnetNisSig
Values	Decimal (0..128)
Default	0

ATTRIBUTE SigChan Nis peakActiveChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the maximum number of channels that have been active on this signalling channel during the last polling period.
Mib	VnetNisSig
Values	Decimal (0..128)
Default	0

ATTRIBUTE SigChan Nis peakActiveVoiceChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the maximum number of voice channels that have been active on this signalling channel during the last polling period.
Mib	VnetNisSig
Values	Decimal (0..128)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan Nis peakActiveDataChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the maximum number of data channels that have been active on this signalling channel during the last polling period.
Mib	VnetNisSig
Values	Decimal (0..128)
Default	0

ATTRIBUTE SigChan Nis dChanStatus (dCh)

Access	Read: All Write: Illegal
Description	This attribute indicates the state of the D-channel. ***outOfService*** means that there is no layer 2 or layer 3 connectivity to the PBX. ***establishing*** means that the signalling channel is attempting to stage the layer 2. ***established*** means that the layer 2 is enabled. If the signalling channel stays in the ***established*** state, then it is waiting for a restart from the PBX. ***enabling*** means that the resources for processing calls are being initialized. If the signalling channel stays in the ***enabling*** state then it is waiting for a restart acknowledgement from the PBX. ***inService*** means that the resources for processing calls are available. ***restarting*** means that the resources for call processing are being re-initialized.
Mib	VnetNisSig
Values	outOfService establishing established enabling inService restarting
Default	No default

GROUP SigChan Nis Tools

Properties	Operational
Description	This contains a series of operational attributes which turn on and off several kinds of tracing.
Mib	VnetNisSig

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan Nis tracing

Access	Read: All Write: All
Description	This attribute defines which types of tracing are active for this signalling channel. The tracing messages are sent to the debug stream. To see the messages the *agentQueue* attribute in *Col/debug* must be greater than 0 and a Telnet NMIS session must list the debug stream in its data streams (ex. *set nmis telnet session/1 dataStreams debug*). Different types of tracing can be enabled simultaneously. Note that tracing consumes additional CPU resources and will slow down call processing on a heavily loaded card. If there is message block exhaustion tracing will be suspended for a period and then automatically re-enabled. An alarm is generated on tracing suspension and resumption. This mechanism protects the function processor against excessive numbers of tracing messages. Types of tracing include: ***protocolErrors*** - get details of any protocol errors which are occurring. Protocol errors are also reported in summary form as alarms. ***q931Summary*** - Summary of the Q.931 messages on the signalling link, including certain call details (calling number, called number, release codes). ***q931Hex*** - Q.931 messages displayed in hex format. Useful to determine protocol compliance in case of errors reported on local or remote ends. ***q931Symbolic*** - Q.931 messages parsed to give maximum detail. Useful for understanding content of messages flowing on the link. ***portHex*** - Messages in hex format being sent and received on the link.
Mib	VnetNisSig
Set of	protocolErrors q931Summary q931Hex q931Symbolic portHex
Default	No default

GROUP SigChan Nis NisSpecificProv

Properties	Provisioned
Description	This group provides NIS protocol specific provisioning.
Mib	VnetNisSig

ATTRIBUTE SigChan Nis chanMaintenanceHandling (cmh)

Access	Read: All Write: All
Criticality	Process

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies how channel maintenance events should be handled upon startup. Channel maintenance events include locking and unlocking a channel or channel registration. The decision is either to send individual channel RESTART messages, SERVICE messages, or nothing. Note that channel registration only occurs after the global interface restart at startup. Setting this attribute to enable SERVICE messages ensures that SERVICE messages occur at startup and whenever a channel goes into or out of service. If this attribute is not set to enable SERVICE messaging, a RESTART is always sent on unlocking a channel. ***globalOnStartup*** provides the minimum required functionality at startup, without any individual channel confirmation. Note that when this is set, channel RESTART is still used for channel unlock. ***globalOnStartup*** applies to *SigChan* startup only. ***serviceMessage*** enables sending and receiving SERVICE messages. If this attribute is set to ***serviceMessage***, SERVICE messages are used for channel maintenance on channel lock, channel unlock, and startup. ***restartMessage*** specifies that individual channel RESTARTs when the SigChan starts up. If this attribute is set to ***restartMessage***, a RESTART message is used to send at startup and channel unlock.
Mib	VnetNisSig
Values	globalOnStartup (gbl) serviceMessage (svc) restartMessage (rest)
Default	restartMessage

COLLECTED STATS SignallingChannel NisSig

Description	The statistics record generated by the SignallingChannel NisSig component.

ATTRIBUTE SigChan Nis peakActiveChannels

Description	This collected statistic counts the maximum number of channels that have been active on this signalling channel in the last statistics collection interval.
Values	Decimal (0..30)

ATTRIBUTE SigChan Nis peakActiveVoiceChannels

Description	This collected statistic counts the maximum number of voice channels that have been active on this signalling channel in the last statistics collection interval.
Values	Decimal (0..30)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan Nis peakActiveDataChannels

Description — This collected statistic counts the maximum number of data channels that have been active on this signalling channel in the last statistics collection interval.

Values — Decimal (0..30)

ATTRIBUTE SigChan Nis totalCallsToIf

Description — This collected statistic counts the total number of calls that have been made to the interface in the last statistics collection interval.

Values — Decimal (0..65535)

ATTRIBUTE SigChan Nis totalCallsFromIf

Description — This collected statistic counts the number of calls from the interface in the last statistics collection interval.

Values — Decimal (0..65535)

ATTRIBUTE SigChan Nis nonCallAssocSessionsToIf

Description — This collected statistic counts the number of non-call associated sessions to the interface in the last statistics collection interval.

Values — Decimal (0..65535)

ATTRIBUTE SigChan Nis nonCallAssocSessionsFromIf

Description — This collected statistic counts the number of non-call associated sessions from the interface in the last statistics collection interval.

Values — Decimal (0..65535)

ATTRIBUTE SigChan Nis frmToIf

Description — This collected statistic counts the number of frames transmitted to the link interface by *Framer* in the last statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE SigChan Nis frmFromIf

Description

This collected statistic counts the number of frames received from the link interface by *Framer* in the last statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE SigChan Nis octetFromIf

Description — The number of bytes received from the link interface by *Framer* in the last statistics collection interval.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan Nis octetToIf

Description	The number of bytes sent to the link interface by *Framer* in the last statistics collection interval.
Values	Decimal (0..4294967295)

COMPONENT SigChan Nis Framer (Framer)

Groups	GROUP SigChan Nis Framer Provisioned (Prov) GROUP SigChan Nis Framer OsiState (State) GROUP SigChan Nis Framer Statistics (Stats)
Scope	Application
Description	*SigChan/n Nis Framer* The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface. The *Framer* component provides provisionable attributes related to data path aspects of the hardware interface (such as CRC and frame length). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component. The *Framer* component contains operational attributes for link interface data path statistics (such as frame counts and aborts).
Mib	VnetNisSig
Common Verbs	Help List Display

Description	This attribute indicates the maximum value of the *activeVoiceChannels* attribute during the last polling period.
Mib	VnetEuroIsdn
Values	Decimal (0..128)
Default	0

ATTRIBUTE SigChan Elsdn peakActiveDataChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the maximum value of the *activeDataChannels* attribute during the last polling period.
Mib	VnetEuroIsdn
Values	Decimal (0..128)
Default	0

ATTRIBUTE SigChan Elsdn dChanStatus (dCh)

Access	Read: All Write: Illegal
Description	This attribute indicates the state of the D-channel. ***outOfService*** means that there is no layer 2 or layer 3 connectivity to the PBX. ***establishing*** means that the signalling channel is attempting to stage the layer 2. ***established*** means that the layer 2 is enabled. If the signalling channel stays in the ***established*** state, then it is waiting for a restart from the PBX. ***enabling*** means that the resources for processing calls are being initialized. If the signalling channel stays in the ***enabling*** state then it is waiting for a restart acknowledgment from the PBX. ***inService*** means that the resources for processing calls are available. ***restarting*** means that the resources for call processing are being initialized.

GROUP SigChan Elsdn Tools

Properties — Operational

Description — This contains a series of operational attributes which turn on and off several kinds of tracing.

Mib — VnetEuroIsdn

ATTRIBUTE SigChan Elsdn tracing

Access — Read: All
Write: All

Description — This attribute defines which types of tracing are active on the signalling channel. The tracing messages are sent to the debug stream. To see the messages the *agentQueueSize* attribute of the *Lp/x Eng Ds/debug* component must be greater than 0 and the operator's NMIS session must have the debug stream included in its data stream list (for example: *set Nmis Telnet Session/1 dataStreams deb*). Several types of tracing can be enabled simultaneously.

Note that tracing consumes additional CPU resources and slows down call processing on a heavily loaded card. If there is message block exhaustion tracing is suspended for a period of time and then automatically re-enabled. An alarm is generated on tracing suspension and resumption. This mechanism protects the function processor against excessive numbers of tracing messages.

Types of tracing include:
protocolErrors - get details of any protocol errors which are occurring. Protocol errors are also reported in summary form as alarms.
q931Summary - summary of the Q.931 messages on the signalling link.
q931Hex - Q.931 messages displayed in hex format. Useful to determine protocol compliance in case of errors reported on local or remote ends.
q931Symbolic - Q.931 messages parsed to give maximum detail. Useful for understanding content of messages flowing on the link.
portHex - Q.921 messages in hex format being sent and received on the link.

GROUP SigChan Elsdn Options (Opt)

Properties	Provisioned
Description	This group specifies the provisionable attributes specific to the Euro ISDN (ETSI-T) protocol.
Mib	VnetEuroIsdn

ATTRIBUTE SigChan Elsdn variant

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the specific variant of the Euro ISDN (ETSI-T) protocol. Supported variants are: ***etsiGeneric*** - provides generic ETSI-T protocol. Only proxy of the NETWORK side of the protocol is implemented, ***austria*** - provides ETSI-T protocol variant as per the Austrian national specification. Only the USER side of the protocol is implemented, ***germany*** - provides ETSI-T protocol variant as per the German national specification. Only the USER side of the protocol is implemented.
Mib	VnetEuroIsdn
Values	etsiGeneric austria germany
Default	etsiGeneric

ATTRIBUTE SigChan Elsdn connectServiceTimer (cst)

Access	Read: All Write: All
Description	This attribute specifies duration of the “await connection” supervisory timer which applies to non call-associated sessions providing bearer-independent connection-oriented transport for supplementary services. The timer is started at the ingress node when a REGISTER message is received from the source PBX and stopped when a virtual circuit with the egress node is established. If the timer expires, the non call-associated session is cleared. The “await connection” timer (attribute *connectServiceTimer*) together with “await response” timer (attribute *responseServiceTimer*) provide equivalent of the T-ACTIVATE timer described in the relevant supplementary service specifications. A change of the timer value does not apply to timers already running.
Mib	VnetEuroIsdn

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (1..10)
Units	seconds
Default	8

ATTRIBUTE SigChan Elsdn responseServiceTimer (rst)

Access	Read: All Write: All
Description	This attribute specifies duration of the “await response” supervisory timer which applies to non call-associated sessions providing bearer-independent connection-oriented transport for supplementary services. The timer is started at the ingress node when creation of a virtual circuit with the egress node is confirmed and stopped when the first message from the destination PBX is received. If the timer expires, the non call-associated session is cleared. The “await connection” timer (attribute *connectServiceTimer*) together with “await response” timer (attribute *responseServiceTimer*) provide equivalent of the T-ACTIVATE timer described in the relevant supplementary service specifications. A change of the timer value does not apply to timers already running.
Mib	VnetEuroIsdn
Values	Decimal (1..10)
Units	seconds
Default	8

ATTRIBUTE SigChan Elsdn lifetimeServiceTimer (lst)

Access	Read: All Write: All
Description	This attribute specifies duration of the service lifetime supervisory timer which applies to non call-associated sessions providing bearer-independent connection-oriented transport for supplementary services. The timer limits the duration of a virtual call. It is started at the ingress node at the moment the first response message from the destination PBX has been received and stopped when the non call-associated session is released. If the timer expires, the non call-associated session is cleared. This timer is equivalent to the T-CCBS6 timer described in the relevant supplementary service specifications. A change of the timer value does not apply to timers already running.

GROUP SigChan Elsdn EuroSpecificProv

Properties	Provisioned
Description	This group provides Euro ISDN protocol specific provisioning.
Mib	VnetEuroIsdn

ATTRIBUTE SigChan Elsdn chanMaintenanceHandling (cmh)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies how channel maintenance events should be handled upon startup. Channel maintenance events include locking and unlocking a channel or channel registration. The decision is either to send individual channel RESTART message, or global interface restart at startup. A RESTART is always sent on unlocking a channel. ***globalOnStartup*** provides the minimum required functionality at startup, without any individual channel confirmation. Note that when this is set, channel RESTART is still used for channel unlock. ***globalOnStartup*** applies to *SigChan* startup only. ***restartMessage*** specifies that individual channel RESTARTs when the SigChan starts up. If this attribute is set to ***restartMessage***, a RESTART message is used to send at startup and channel unlock, Global Restart is implemented first for in this choice. ***restartOnlyMessage*** specifies that individual channel RESTARTs when the SigChan starts up. If this attribute is set to ***restartOnlyMessage***, a RESTART message is used to send at startup and channel unlock, Global Restart is not implemented for this choice.
Mib	VnetEuroIsdn
Values	globalOnStartup (gbl) restartMessage (rest) restartOnlyMessage (reso)
Default	globalOnStartup

COLLECTED STATS SignallingChannel EuroIsdn

Description	The statistics record generated by the SignallingChannel EuroIsdn component.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan Elsdn peakActiveChannels

Description — This collected statistic counts the maximum number of channels that have been active on this signalling channel in the last statistics collection interval.

Values — Decimal (0..30)

ATTRIBUTE SigChan Elsdn peakActiveVoiceChannels

Description — This collected statistic counts the maximum number of voice channels that have been active on this signalling channel in the last statistics collection interval.

Values — Decimal (0..30)

ATTRIBUTE SigChan Elsdn peakActiveDataChannels

Description — This collected statistic counts the maximum number of data channels that have been active on this signalling channel in the last statistics collection interval.

Values — Decimal (0..30)

ATTRIBUTE SigChan Elsdn totalCallsToIf

Description — This collected statistic counts the total number of calls that have been made to the interface in the last statistics collection interval.

Values — Decimal (0..65535)

ATTRIBUTE SigChan Elsdn totalCallsFromIf

Description — This collected statistic counts the number of calls from the interface in the last statistics collection interval.

Values — Decimal (0..65535)

ATTRIBUTE SigChan Elsdn nonCallAssocSessionsToIf

Description — This collected statistic counts the number of non-call associated sessions to the interface in the last statistics collection interval.

Values — Decimal (0..65535)

ATTRIBUTE SigChan Elsdn nonCallAssocSessionsFromIf

Description — This collected statistic counts the number of non-call associated sessions from the interface in the last statistics collection interval.

Values — Decimal (0..65535)

ATTRIBUTE SigChan Elsdn frmToIf

Description — This collected statistic counts the number of frames transmitted to the link interface by *Framer* in the last statistics collection interval.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan Elsdn frmFromIf

Description

This collected statistic counts the number of frames received from the link interface by *Framer* in the last statistics collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE SigChan Elsdn octetFromIf

Description The number of bytes received from the link interface by *Framer* in the last statistics collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE SigChan Elsdn octetToIf

Description The number of bytes sent to the link interface by *Framer* in the last statistics collection interval.

Values Decimal (0..4294967295)

COMPONENT SigChan Elsdn Framer (Framer)

Groups
GROUP SigChan Elsdn Framer Provisioned (Prov)
GROUP SigChan Elsdn Framer OsiState (State)
GROUP SigChan Elsdn Framer Statistics (Stats)

Scope Application

Description *SigChan/n EuroIsdn Framer*

The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to data path aspects of the hardware interface (such as CRC and frame length). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface data path statistics (such as frame counts and aborts).

GROUP SigChan Elsdn Framer Provisioned (Prov)

Properties Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.
Mib	VnetEuroIsdn

ATTRIBUTE SigChan Elsdn Framer interfaceName

Access	Read and write
Criticality	Process
Description	This attribute contains a hardware component name. The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.
Mib	VnetEuroIsdn
Values	Link (Hardware, applicationFramerName)
Default	No default

GROUP SigChan Elsdn Framer OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	VnetEuroIsdn

ATTRIBUTE SigChan Elsdn Framer adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

	permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	VnetEuroIsdn
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE SigChan Elsdn Framer operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	VnetEuroIsdn
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE SigChan Elsdn Framer usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	VnetEuroIsdn
Values	idle active (activ) busy
Default	idle

List
Display

Copyright © 2006, Nortel Nortel Confidential

GROUP SigChan Gw Operational (Oper)

Properties	Operational
Description	This group contains an operational attribute which indicates signalling protocol conversion capabilities of the *SigChan* component.
Mib	VoiceNetworking

ATTRIBUTE SigChan Gw gatewayCapability (gwc)

Access	Read only
Description	This attribute indicates the *SigChan* component's capability to convert from one access signalling type to another. Access signalling protocols (protocols between a node and external switching equipment, for example a PBX) are grouped into protocol groups. Protocols within the same protocol group are considered completely compatible. This means that no extra processing is needed when a call originates from an ingress link using protocol A and terminates on an egress link using protocol B if protocols A and B belong to the same protocol group. The following protocol groups are defined: ***etsiQsigPG*** - ETSI QSIG protocol group containing ETSI QSIG protocol, ***mcdnFamilyPG*** - MCDN Family protocol group containing NIS, Meridian Customer Defined Network (MCDN) peer to peer, and MCDN User to Network (UNI) protocols, ***analogAndCasPG*** - Analog and CAS protocol group containing most of the analog and channel associated signalling protocols with steady state line signalling and DTMF register signalling, ***euroIsdnPG*** - EURO ISDN protocol group containing most of the European national ISDN protocols based on ETSI ISDN (ETSI-T) standard. For every of the protocols group this attribute indicates what is the level of protocol conversion support available on the *SigChan* component: ***noGw*** - no protocol conversion available for the protocol group, ***singleEndedGw*** - only full protocol conversion available for the protocol group (that is the *SigChan* component on the other side of the subnet does not have to get involved in the gateway processing), ***doubleEndedGw*** - only partial protocol conversion available for the protocol group (that is both *SigChan* components, ingress and egress, have to get involved in signalling conversion), ***singleOrDoubleEndedGw*** - both, full and partial protocol conversions available for the protocol group, ***nativePG*** - the protocol group is the native protocol group for the *SigChan* component.

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies whether overlap receiving from the PBX is enabled.
Mib	VnetMcdnSig
Values	enabled disabled
Default	enabled

ATTRIBUTE SigChan Mcdn chanMaintenanceHandling (cmh)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies handling of channel maintenance events such as locking and unlocking a channel or channel registration on start-up. The decision here is whether to send individual channel RESTART messages, SERVICE messages, or nothing. Note that channel registration only occurs after the global interface restart at startup. The attribute controls start-up handling absolutely, and channel lock and unlock conditionally. That is, setting this to enable SERVICE messages ensures SERVICE messages at start-up and whenever a channel goes into or out of service. However, if this is not set to enable SERVICE messaging, a RESTART is always sent on unlocking a channel. ***globalOnStartup*** provides the minimum required function at start-up, without any individual channel confirmation. Note that when this is set, channel RESTART is still used for channel unlock. ***globalOnStartup*** applies to *SigChan* start-up only. ***serviceMessage*** enables sending and receiving SERVICE messages. If enabled, SERVICE messages are always used for channel maintenance on channel lock, channel unlock and start-up. ***restartMessage*** provides individual channel RESTARTs when a *SigChan* starts up. If enabled, the RESTART is used at start-up and channel unlock. However, if both SERVICE and RESTART messages are disabled, the RESTART will still be used when a channel unlocks.

GROUP SigChan Mcdn OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	VnetMcdnSig

ATTRIBUTE SigChan Mcdn adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	VnetMcdnSig
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE SigChan Mcdn operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or

Copyright © 2006, Nortel Nortel Confidential

	with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	VnetMcdnSig
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE SigChan Mcdn usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	VnetMcdnSig
Values	idle active (activ) busy
Default	idle

Default	No default

GROUP SigChan Mcdn Tools

Properties	Operational
Description	This contains a series of operational attributes which turn on and off several kinds of tracing.
Mib	VnetMcdnSig

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan Mcdn tracing

Access	Read: All Write: All
Description	This attribute defines which types of tracing are active for this signalling channel. The tracing messages are sent to the debug stream. To see the messages the *agentQueue* attribute in *Col/debug* must be greater than 0 and a Telnet NMIS session must list the debug stream in its data streams (ex. *set nmis telnet session/1 dataStreams debug*). Different types of tracing can be enabled simultaneously. Note that tracing consumes additional CPU resources and will slow down call processing on a heavily loaded card. If there is message block exhaustion tracing will be suspended for a period and then automatically re-enabled. An alarm is generated on tracing suspension and resumption. This mechanism protects the function processor against excessive numbers of tracing messages. Types of tracing include: ***protocolErrors*** - get details of any protocol errors which are occurring. Protocol errors are also reported in summary form as alarms. ***q931Summary*** - Summary of the Q.931 messages on the signalling link, including certain call details (calling number, called number, release codes). ***q931Hex*** - Q.931 messages displayed in hex format. Useful to determine protocol compliance in case of errors reported on local or remote ends. ***q931Symbolic*** - Q.931 messages parsed to give maximum detail. Useful for understanding content of messages flowing on the link. ***portHex*** - Messages in hex format being sent and received on the link.
Mib	VnetMcdnSig
Set of	protocolErrors q931Summary q931Hex q931Symbolic portHex
Default	No default

ATTRIBUTE SigChan Mcdn messageTraced (msgtrc)

GROUP SigChan Mcdn ConnectionlessFeatures (Cls)

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group enables and disables the support of the MCDN proprietary signalling for connectionless features on the local signalling channel.
Mib	VnetMcdnSig

ATTRIBUTE SigChan Mcdn clsFeaturesSupported (clsfsup)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the features to be supported by MCDN “TCAP” connection-less messaging. Note that some features such as Network ACD combine connection-less and connection oriented. In the NACD case, the connection-less messaging enables the source and target PBXs to establish the networked relationship, and calls sent across the network (connection oriented) will contain basic information relating the call to the feature. Feature Definitions: ***networkAcd***: transfer of a call from a pool of agents to a second pool of agents across the network. ***networkMessageService***: message waiting capability (for example, lamps on sets). Also includes signalling for voice mail, but is not limited to voice mail. ***networkVoiceMail***: a specific subset of Network Message Service, separated functionally as it always terminates on an interactive voice response mailbox application. ***networkRingAgain***: ring again to remote sets. ***electronicLock***: change of set capabilities by a remote user dialling the applicable code and password. ***remoteCallForward***: call forwarding a phone via applicable code and password. ***callPickupNetworkWide*** (call pickup world wide): scan for a ringing call on another node, to enable the scanning set to pick up the call. ***networkPackage1***: a collection of other features including but not limited to network clock synchronization. Note that on the Meridian 1, this is a general purpose group used for very small features not requiring a new ISDN Facility feature type. ***isdnApplicationInterface***: network wide support of a number of Meridian 1 Application Module Link features. ***mobilityMultisiteNetworking***: the capability to use a wireless phone in multiple sites, by having the phone register on arrival at the new site, and having the PBX at the new site negotiate the set “relocation” with the base PBX. ***networkTimeSynchronization***: the capability that allows multiple Meridian1’s in the network to have the same time, to be synchronized. ***miscellaneous***: Any feature that is not listed above.

GROUP SigChan Mcdn ConnectionOrientedFeatures (Co)

Properties	Provisioned
Description	This group enables and disables the support of the MCDN proprietary signalling for the listed features on the local signalling channel.
Mib	VnetMcdnSig

ATTRIBUTE SigChan Mcdn dropBackCongestion (dbb)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies if the Meridian 1 Drop Back Congestion Handling for trunks is enabled, and what type is being supported.
Mib	VnetMcdnSig
Values	noDropBackAllowed (ndbb) dropBackToOriginator (dborig) dropBackToPriorNode (dbnode)
Default	dropBackToOriginator

ATTRIBUTE SigChan Mcdn networkNameDisplay (name)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies what Name Display is supported.

Copyright © 2006, Nortel Nortel Confidential

nd1 corresponds to the Meridian 1 RCAP (Remote CAPability) ***nd1***. This translates as caller provides name info in SETUP, ringing party name in ALERTING, redirection name in NOTIFY, and answering party name in CONNECT (as applicable, and if the name changes).

nd2 corresponds to the Meridian 1 RCAP (Remote CAPability) ***nd2***. This translates as caller provides name info in SETUP, answering party provides name in NOTIFY on answer.

nd3 corresponds to the Meridian 1 RCAP (Remote CAPability) ***nd3***, which is ***nd1*** plus name information in call clearing messages (busy user, etc.) where a specific user was found but either could not answer or cleared the call. This corresponds to the QSIG name display.

Mib	VnetMcdnSig
Set of	nameDisplay1 (nd1) nameDisplay2 (nd2) nameDisplay3 (nd3)
Default	No default

ATTRIBUTE SigChan Mcdn multisiteBusinessGroup (mbg)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies whether to enable transport for the Meridian 1 Multisite Business Group IE. The Meridian 1 allows multiple "Tenants" to exist on a single PBX. These Tenants have limited access to each other and to system resources. That is, users associated with “Tenant group one” cannot use trunks, attendants, and features from another group, and so forth. The Multi-Site Business Group is a single Tenant existing on more than one PBX. As an example, “tenant one” on a PBX may "own" resources belonging to “tenant one” on another PBX. The Multi-Site Business Group IE as used in the Meridian 1 Network Tenant Services feature enables linking the two tenants together.
Mib	VnetMcdnSig
Values	transport discard
Default	transport

ATTRIBUTE SigChan Mcdn conOrFeaturesSupported (confsup)

Access	Read: All Write: All
Criticality	Process

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute indicates the features to be supported by MCDN “ROSE” connection oriented messaging.

Feature Definitions:
networkAttendantService: network wide support of Attendant (“operator”) services.
classOfServiceTransport: this is not a ROSE feature. Class of Service transport takes place in the called party number when provisioned on the Meridian 1 to use an ESN signalling type.
trunkRouteOptimization: dropping of redundant links in a call, when a set call forwards a call prior to answer.
remoteVirtualQueuing: queuing at a remote node without requiring a B channel to be kept up.
offHookQueuing: Queuing by maintaining the speech path to the queuing node.
networkCallTrace: call progress tracing across a network (that is, call reached node a, node b, terminated at c,...).
networkIntercom: network wide access to an intercom system on a Meridian 1.
callPickupNetworkWide: connection oriented messages associated with the TCAP call pickup scan operation. The messages that actually pick up the ringing call.
radioPaging: access to a radio paging system network wide, allowing single radio paging facilities in a relatively dense local PBX network.
networkAccess: information to enable access to PBX features from outside the network. Additional data is provided to identify access capabilities for a specific call. (Similar to transmitting authorization code capabilities network wide.)
antiTromboning: actually includes two capabilities - NAS (Network Attendant Service) and Trunk Anti-Tromboning. Calls that exit the subnet to a PBX and are transferred back to a network number via the same D channel can be optimized. If PBX A (node A) calls across the subnet to node B, D channel Z, to PBX B, and PBX B transfers across D channel Z to node B and therefore to PBX C/node C, this allows that call to simplify to PBX/node A to PBX/node C.
miscellaneous: Any feature that is not listed above.

COMPONENT SigChan InternalCauseMap (ICmap)

Groups	GROUP SigChan ICmap InternalCauseCode (IntCause)
Scope	Application
Description	*SigChan/n VnetInternalCauseManipulation* This component represents the provisionable attributes for the internal, node, and subnet generated cause codes of an establishing call. This component can be added for most of the ISDN (common channel signalling) protocols (*EtsiQsig*, *NisSig*, *EuroIsdn*) and cannot be added for a channel associated signalling protocol. This component is useful in a network where the originating PBX has restricted conditions to initiating alternate rerouting (rerouting on just one, specific, clearing cause code).
Mib	VoiceNetworking
Common Verbs	Help List Display Add DELete

GROUP SigChan ICmap InternalCauseCode (IntCause)

Properties	Provisioned
Description	This group contains the provisionable, node-generated clearing reasons of an establishing call.
Mib	VoiceNetworking

ATTRIBUTE SigChan ICmap egressLinkOutOfServCause

Access	Read: All Write: All
Description	This attribute specifies the cause code sent to the originating PBX when the data link to the remote PBX is down or when remote channels are in maintenance. If the component is not added or if the default value ***autoConfigure*** is provisioned for the attribute the cause code sent to the originating PBX is not manipulated and the clearing process is not influenced. For this case, a typical cause code value sent back to the originating PBX is 27.
Mib	VoiceNetworking
Values	Decimal (0..127) autoConfigure (auto)
Default	autoConfigure

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan ICmap chanOrCircNotAvailCause

Access	Read: All Write: All
Description	This attribute specifies the cause code sent to the originating PBX if no timeslot is available for an incoming call. If the component is not added or if the default value ***autoConfigure*** is provisioned for the attribute the cause code sent to the originating PBX is not manipulated and the clearing process is not influenced. For this case, a typical cause code value sent back to the originating PBX is 34.
Mib	VoiceNetworking
Values	Decimal (0..127) autoConfigure (auto)
Default	autoConfigure

ATTRIBUTE SigChan ICmap tempFailureCause

Access	Read: All Write: All
Description	This attribute specifies the cause code sent to the originating PBX when PORS fails to establish a call due to congestion or a disabled trunk. It is also generated when the calling side fails to decode payload capabilities sent by the called side. If the component is not added or if the default value ***autoConfigure*** is provisioned for the attribute the cause code sent to the originating PBX is not manipulated and the clearing process is not influenced. For this case, a typical cause code value sent back to the originating PBX is 41.
Mib	VoiceNetworking
Values	Decimal (0..127) autoConfigure (auto)
Default	autoConfigure

ATTRIBUTE SigChan ICmap switchCongestCause

Access	Read: All Write: All
Description	This attribute specifies the cause code sent to the originating PBX when the allocation of internal resources for an incoming call fails. If the component is not added or if the default value ***autoConfigure*** is provisioned for the attribute the cause code sent to the originating PBX is not manipulated and the clearing process is not influenced. For this case, typical cause code values sent back to the originating PBX are 42 for NIS and 41 for ETSI.

ATTRIBUTE SigChan ICmap reqChanOrCircNotAvailCause

Access	Read: All Write: All
Description	This attribute specifies the cause code sent to the originating PBX when an exclusively requested channel is not in service or a channel request is unsuccessful. If the component is not added or if the default value ***autoConfigure*** is provisioned for the attribute the cause code sent to the originating PBX is not manipulated and the clearing process is not influenced. For this case, a typical cause code value sent back to the originating PBX is 44.
Mib	VoiceNetworking
Values	Decimal (0..127) autoConfigure (auto)
Default	autoConfigure

ATTRIBUTE SigChan ICmap resourceUnavailCause

Access	Read: All Write: All
Description	This attribute specifies the cause code sent to the originating PBX when the path establishing timer expires, when the switched voice service associated to a call is locked by CAS or when an H-channel is requested. If the component is not added or if the default value ***autoConfigure*** is provisioned for the attribute the cause code sent to the originating PBX is not manipulated and the clearing process is not influenced. For this case, typical cause code values sent back to the originating PBX are 47 for NIS and 44 for ETSI.
Mib	VoiceNetworking
Values	Decimal (0..127) autoConfigure (auto)
Default	autoConfigure

ATTRIBUTE SigChan ICmap servNotAllowedCause

Access	Read: All Write: All
Description	This attribute specifies the cause code sent to the originating PBX when the requested call type (voice or data) is not compatible with *Vroute typeOfRoute* at the calling side. If the component is not added or if the default value ***autoConfigure*** is provisioned for the attribute the cause code sent to the originating PBX is

Copyright © 2006, Nortel Nortel Confidential

not manipulated and the clearing process is not influenced. For this case, a typical cause code value sent back to the originating PBX is 63.

Mib	VoiceNetworking
Values	Decimal (0..127) autoConfigure (auto)
Default	autoConfigure

ATTRIBUTE SigChan ICmap noSuchChannelCause

Access	Read: All Write: All
Description	This attribute specifies the cause code sent to the originating PBX when a requested channel does not exist. If the component is not added or if the default value ***autoConfigure*** is provisioned for the attribute the cause code sent to the originating PBX is not manipulated and the clearing process is not influenced. For this case, a typical cause code value sent back to the originating PBX is 82.
Mib	VoiceNetworking
Values	Decimal (0..127) autoConfigure (auto)
Default	autoConfigure

ATTRIBUTE SigChan ICmap incompatDestCause

Access	Read: All Write: All
Description	This attribute specifies the cause code sent to the originating PBX when the calling and called side capabilities do not match. If the component is not added or if the default value ***autoConfigure*** is provisioned for the attribute the cause code sent to the originating PBX is not manipulated and the clearing process is not influenced. For this case, a typical cause code value sent back to the originating PBX is 88.
Mib	VoiceNetworking
Values	Decimal (0..127) autoConfigure (auto)
Default	autoConfigure

	the set of attributes that apply to a VC connection to an X.25 trace receiver.
Mib	X25TraceRcvr
Opt. Subcomp.	COMPONENT SrvTrace Rcvr X25 Dna ClosedUserGroup (Cug)
Common Verbs	Help List Display

GROUP SrvTrace Rcvr X25 Dna Address

Properties	Provisioned
Description	This group contains attributes common to all *Dna*s. This group is composed of two attributes that define a DNA. These attributes are used to interpret the format of the address digits.
Mib	X25TraceRcvr

ATTRIBUTE SrvTrace Rcvr X25 Dna numberingPlanIndicator (npi)

Access	Read and write
Description	This attribute indicates the Numbering Plan Indicator (NPI) of the DNA that is entered. The address may belong to an E.164 or X.121 plan.
Mib	X25TraceRcvr
Values	x121 e164
Default	x121

ATTRIBUTE SrvTrace Rcvr X25 Dna dataNetworkAddress (dna)

Access	Read and write
Description	The attribute contains digits which form a unique identifier for the calling end of the trace connection. DNA digits are selected and assigned by network operators. The maximum DNA length is 15 digits.
Mib	X25TraceRcvr
Values	BCD (1..15)
Default	No default

GROUP SrvTrace Rcvr X25 Dna OutgoingOptions

Properties	Provisioned
Description	This group defines call options for outgoing calls.
Mib	X25TraceRcvr

ATTRIBUTE SrvTrace Rcvr X25 Dna outCalls (ouc)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute, if set to a value of ***allowed***, indicates that outgoing calls (from the DTE to the network) can be made using this particular *Dna*. If set to a value of ***disallowed***, then outgoing calls cannot be made using this *Dna* - such calls will be cleared by the local DCE. This attribute corresponds to the ITU-T 'Outgoing Calls Barred' feature. At least one of *outCalls* and *incCalls* must be set to a value of ***allowed*** for this Dna to be usable.
Mib	X25TraceRcvr
Values	disallowed allowed
Default	allowed

ATTRIBUTE SrvTrace Rcvr X25 Dna outDefaultPriority (odf)

Access	Read and write
Description	This attribute, if set to a value of ***normal***, indicates that the default priority for outgoing calls (from the DTE to the network) using this particular *Dna* is normal priority - if the priority is not specified in the call. If this attribute is set to a value of ***high*** then the default priority for outgoing calls using this particular *Dna* is high priority.
Mib	X25TraceRcvr
Values	normal high
Default	high

ATTRIBUTE SrvTrace Rcvr X25 Dna outIntl (oic)

Access	Read only
Description	This attribute, if set to a value of ***allowed***, indicates that outgoing international calls (from the DTE to the network) can be made using this particular *Dna*. If set to a value of ***disallowed***, then such calls cannot be made using this *Dna* - such calls will be cleared by the local DCE. This attribute also currently controls access to the E.164 numbering plan, and if set to a value of ***allowed***, then cross-numbering plan calls are allowed. This attribute is ignored if the corresponding attribute *outCalls* is set to a value of ***disallowed***.
Mib	X25TraceRcvr
Values	disallowed allowed

Copyright © 2006, Nortel Nortel Confidential

Default	allowed

ATTRIBUTE SrvTrace Rcvr X25 Dna outDefaultPathReliability (opr)

Access	Read only
Description	This attribute specifies the default reliability class of routing for all calls (from the DTE to the network) using this particular *Dna*. The chosen default reliability class of routing normally applies to all packets (including the call packets) travelling into the network. If the *outPathReliabilityOverRide* attribute is subscribed to, the default reliability class of routing is chosen by the calling party. This attribute, if set to a value of ***normal***, indicates that the default class of routing is normal reliability routing. If set to a value of ***high***, then the default class of routing is high reliability routing. High reliability is the standard choice for most DPN and Nortel Networks Multiservice Switch services. It usually indicates that packets are overflowed or retransmitted at various routing levels. Typically high reliability results in duplication and disordering of packets in the network when errors are detected or during link congestion. However, the VC handles the duplication and disordering to ensure that packets are delivered to the DTE properly.
Mib	X25TraceRcvr
Values	normal high
Default	high

ATTRIBUTE SrvTrace Rcvr X25 Dna outPathReliabilityOverRide (oro)

Access	Read only
Description	This attribute, if set to a value of ***no***, specifies that the called end of the connection will not use the calling end provisioning data for reliability class of routing to override the provisioning data at the called end.
Mib	X25TraceRcvr
Values	yes no
Default	no

ATTRIBUTE SrvTrace Rcvr X25 Dna outPathReliabilitySignal (ores)

Access	Read only
Description	This attribute, if set to a value of ***disallowed***, specifies that reliability routing signaling is not used.
Mib	X25TraceRcvr

Copyright © 2006, Nortel Nortel Confidential

Values	allowed disallowed
Default	disallowed

ATTRIBUTE SrvTrace Rcvr X25 Dna outAccess (oua)

Access	Read and write
Description	This attribute is an extension of the Closed User Group (CUG) facility, as follows: This attribute, if set to a value of ***allowed***, indicates that outgoing calls (from the DTE to the network) to the open (non-CUG) part of the network are permitted. It also permits outgoing calls to DTEs that have Incoming Access capabilities. If set to a value of ***disallowed***, then such calls cannot be made using this *Dna* - such calls will be cleared by the local DCE. This attribute corresponds to the ITU-T 'Closed User Group with Outgoing Access' feature.
Mib	X25TraceRcvr
Values	disallowed allowed
Default	disallowed

GROUP SrvTrace Rcvr X25 Dna IncomingOptions

Properties	Provisioned
Description	This group defines the call options for incoming calls.
Mib	X25TraceRcvr

ATTRIBUTE SrvTrace Rcvr X25 Dna incCalls (inc)

Access	Read only
Description	This attribute, if set to a value of ***allowed***, indicates that incoming calls (from the network to the DTE) can be made to this *Dna*. If set to a value of ***disallowed***, then incoming calls cannot be made to this *Dna* - such calls will be cleared by the local DCE. This attribute corresponds to the ITU-T 'Incoming Calls Barred' feature for DNAs in that incoming calls are barred if this attribute is set to a value of ***disallowed***. Either *outCalls*, or *incCalls* (or both) must be set to a value of ***allowed*** for this *Dna* to be usable.
Mib	X25TraceRcvr
Values	disallowed allowed
Default	disallowed

Copyright © 2006, Nortel Nortel Confidential

GROUP SrvTrace Rcvr X25 Dna CallOptions

Properties	Provisioned
Description	This group defines additional options for calls which are not specific to the direction of the call.
Mib	X25TraceRcvr

ATTRIBUTE SrvTrace Rcvr X25 Dna packetSizes (pks)

Access	Read only
Description	This attribute specifies the allowable packet sizes supported for call setup using this DNA. ITU-T recommends that packet size 128 be always supported. The bit placement for the packet sizes is as follows: Bit 0 - Packet Size 16 Bit 1 - Packet Size 32 Bit 2 - Packet Size 64 Bit 3 - Packet Size 128 Bit 4 - Packet Size 256 Bit 5 - Packet Size 512 Bit 6 - Packet Size 1024 Bit 7 - Packet Size 2048 Bit 8 - Packet Size 4096 This list of allowable packet sizes must always include the default packet sizes: *defaultRecvFrmNetworkPacketSize* and *defaultSendToNetworkPacketSize*.
Mib	X25TraceRcvr
Set of	16 32 64 128 256 512 1024 2048 4096
Default	(2048)

ATTRIBUTE SrvTrace Rcvr X25 Dna defaultRecvFrmNetworkPacketSize (rps)

Access	Read only
Description	This attribute specifies the default local receive packet size from network to DTE for calls using this particular *Dna*. The *packetSizes* attribute must be set with corresponding value.
Mib	X25TraceRcvr

Copyright © 2006, Nortel Nortel Confidential

Values	16 32 64 128 256 512 1024 2048 4096
Default	2048

ATTRIBUTE SrvTrace Rcvr X25 Dna defaultSendToNetworkPacketSize (sps)

Access	Read only
Description	This attribute specifies the default local send packet size from DTE to network for all calls using this particular *Dna*. The *packetSizes* attribute must be set with corresponding value.
Mib	X25TraceRcvr
Values	16 32 64 128 256 512 1024 2048 4096
Default	2048

ATTRIBUTE SrvTrace Rcvr X25 Dna defaultRecvFrmNetworkThruputClass (drt)

Access	Read and write
Description	This attribute specifies the default receive throughput class, (towards the interface) for all calls using this particular *Dna*.
Mib	X25TraceRcvr
Values	Decimal (0..15)
Default	10

ATTRIBUTE SrvTrace Rcvr X25 Dna defaultSendToNetworkThruputClass (dst)

Access	Read and write
Description	This attribute specifies the default send throughput class (towards the network) for all calls using this particular *Dna*.
Mib	X25TraceRcvr
Values	Decimal (0..15)

Copyright © 2006, Nortel Nortel Confidential

Default	10

ATTRIBUTE SrvTrace Rcvr X25 Dna defaultRecvFrmNetworkWindowSize (rws)

Access	Read only
Description	This attribute specifies the default number of data packets that can be received by the DTE from the DCE before more packets can be received. This view is oriented with respect to the DTE.
Mib	X25TraceRcvr
Values	Decimal (1..7)
Default	1

ATTRIBUTE SrvTrace Rcvr X25 Dna defaultSendToNetworkWindowSize (sws)

Access	Read only
Description	This attribute specifies the default number of data packets that can be transmitted from the DTE to the DCE and must be acknowledged before more packets can be transmitted.
Mib	X25TraceRcvr
Values	Decimal (1..7)
Default	1

ATTRIBUTE SrvTrace Rcvr X25 Dna packetSizeNegotiation (psn)

Access	Read only
Description	This attribute, if set to a value of ***local***, indicates that packet sizes can be negotiated locally at the interface irrespective of the setting at the remote interface. If set to ***endtoEnd***, then the packet size negotiation is between the local and remote interface (i.e. packet sizes are the same on both interfaces).
Mib	X25TraceRcvr
Values	endToEnd local
Default	local

ATTRIBUTE SrvTrace Rcvr X25 Dna cugFormat (cft)

Access	Read only
Description	This attribute specifies which CUG format is used when DTE signals CUG indices, ***basic*** or ***extended***. A ***basic*** CUG index format is two digits long. An ***extended*** CUG index format is four digits long. This attribute, if set to ***extended***, indicates that the DTE signals and receives CUG indices in extended CUG format. If set to a value of ***basic***, then the DTE signals and receives CUG indices in the basic CUG format.

Copyright © 2006, Nortel Nortel Confidential

Mib	X25TraceRcvr
Values	basic extended
Default	basic

COMPONENT SrvTrace Rcvr X25 Dna **ClosedUserGroup (Cug)**

Instance	Decimal (1..1)
Groups	GROUP SrvTrace Rcvr X25 Dna Cug CugOptions
Scope	Application
Description	*SrvTrace Rcvr/<string> X25 Dna ClosedUserGroup* The component defines options associated with a national or international CUG (Closed User Group) identifier. Other DNAs in the network can have CUGs defined which groups these DNAs by their *Cug interlockCode* attribute value. If DNAs are defined with CUGs, calls from DNAs which do not have the same *interlockCode* attribute value defined are refused. Attributes *incAccess* and *outAccess* can override this rule. If this component is present, the X.25 interface which connects to the X.25 trace receiver must be provisioned with the same *Cug interlockCode* attribute value.
Mib	X25TraceRcvr
Common Verbs	Help List Display Add DELete

GROUP SrvTrace Rcvr X25 Dna Cug **CugOptions**

Properties	Provisioned
Description	Attributes in this group define the *ClosedUserGroup* component options associated with the *interlockCode* attribute. DNAs with the same CUG (*interlockCode*) can make calls within this group. Various combinations of attributes are defined under this option which permit or prevent calls in the same CUG group.
Mib	X25TraceRcvr

ATTRIBUTE SrvTrace Rcvr X25 Dna Cug **type**

Access	Read and write
Description	This attribute specifies the CUG type - the CUG is either a national CUG, or an international CUG. International closed user groups are usually established between DTEs for which there is an intermediary X.75 Gateway, whereas national closed user groups are usually established between DTEs for which there is no intermediary X.75 Gateway. (National

Copyright © 2006, Nortel Nortel Confidential

CUGs cannot normally traverse an X.75 Gateway).

If this attribute is set to ***national***, then the CUG is a national CUG, in which case, the *dnic* attribute should be left at its default value since it is not part of a national CUG. If this attribute is set to ***international***, then the CUG is an international CUG, in which case, the *dnic* attribute should be set appropriately as part of the *Cug interlockCode* attribute value.

Mib X25TraceRcvr

Values national
international

Default national

ATTRIBUTE SrvTrace Rcvr X25 Dna Cug **dnic**

Access Read and write

Description This attribute specifies the DNIC (Data Network ID Code) of the *Cug* by which packet networks are identified. This attribute is not applicable if the CUG is a national CUG, as specified by the *Cug type* attribute. There are usually 1 or 2 DNICs assigned per country, for public networks. The U.S. is an exception where each BOC has a DNIC. Also, a group of private networks can have its own DNIC.

DNIC value is not an arbitrary number. It is assigned by international agreement and controlled by ITU-T.

Mib X25TraceRcvr

Values BCD (4)

Default 0000

ATTRIBUTE SrvTrace Rcvr X25 Dna Cug **interlockCode (ilc)**

Access Read and write

Description This attribute specifies the CUG identifier of a national or international CUG call. It is an arbitrary number and it can also be called CUG in some descriptions. Interfaces (*Dna*s) defined with this number can only make calls to *Dna*s defined with the same *interlockCode* attribute value.

Mib X25TraceRcvr

Values Decimal (0..65535)

Default 0

ATTRIBUTE SrvTrace Rcvr X25 Dna Cug **preferential (pre)**

Access Read only

Description This attribute, if set to a value of ***yes***, indicates that this *Cug* is the preferential CUG, in which case it will be used during the call establishment phase if the DTE has not explicitly specified a CUG index in the call request packet. If set to a value of ***no***, then this *Cug* is not the

Copyright © 2006, Nortel Nortel Confidential

preferential CUG.

Only one of the *Cug* components associated with a particular DNA can be the preferential CUG - only one *Cug* component can have this attribute set to ***yes***.

Mib	X25TraceRcvr
Values	no yes
Default	yes

ATTRIBUTE SrvTrace Rcvr X25 Dna Cug **outCalls (ouc)**

Access	Read only
Description	This attribute, if set to a value of ***allowed***, indicates that outgoing calls (from the DTE into the network) can be made using this particular *Cug*. If set to a value of ***disallowed***, then outgoing calls cannot be made using this *Cug* - such calls will be cleared by the local DCE. This attribute corresponds to the ITU-T 'Outgoing Calls Barred' feature for CUG*s* in that outgoing calls are barred if this attribute is set to a value of ***disallowed***.
Mib	X25TraceRcvr
Values	disallowed allowed
Default	allowed

ATTRIBUTE SrvTrace Rcvr X25 Dna Cug **incCalls (inc)**

Access	Read only
Description	This attribute, if set to a value of ***allowed***, indicates that incoming calls (from the network to the DTE) can be made using this particular *Cug*. If set to a value of ***disallowed***, then incoming calls cannot be made using this *Cug* - such calls will be cleared by the local DCE. This attribute corresponds to the ITU-T 'Incoming Calls Barred' feature for CUG*s* in that incoming calls are barred if this attribute is set to a value of ***disallowed***.
Mib	X25TraceRcvr
Values	disallowed allowed
Default	disallowed

ATTRIBUTE SrvTrace Rcvr X25 Dna Cug **privileged (pri)**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute, if set to a value of ***yes***, indicates that this *Cug* is a privileged CUG. In DPN, at least one side of a call setup within a CUG must have the CUG as a privileged CUG. If set to a value of ***no***, then the *Cug* is not privileged. If both the local DTE and the remote DTE subscribe to the CUG, but it is not privileged, then the call will be cleared. This attribute is typically used for a host DTE which must accept calls from many other DTE's in which case the other DTE's cannot call one another, but can call the host. In this example, the host would have the privileged CUG, and the other DTE's would belong to the same CUG, but it would not be privileged.
Mib	X25TraceRcvr
Values	no yes
Default	yes

COMPONENT SrvTrace Rcvr X25 DirectCall (Dc)

Groups	GROUP SrvTrace Rcvr X25 Dc Options
Scope	Application
Description	*SrvTrace Rcvr/<string> X25 DirectCall* This component defines direct call options for the call to the X.25 trace receiver. The connection is initiated on receipt of a *Start FrUni/n SrvTrace* command.
Mib	X25TraceRcvr
Common Verbs	Help List Display

GROUP SrvTrace Rcvr X25 Dc Options

Properties	Provisioned
Description	The *Options* group defines attributes associated with the SVC direct call.
Mib	X25TraceRcvr

ATTRIBUTE SrvTrace Rcvr X25 Dc remoteNpi (rnpi)

Access	Read and write
Description	This attribute indicates the numbering plan used for the *remoteDna*.

ATTRIBUTE SrvTrace Rcvr Fr Dna outDefaultPathReliability (opr)

Access	Read only
Description	This attribute specifies the default class of routing for reliability routing for all outgoing calls (from the DTE to the network) using this particular *Dna*. The chosen default class of routing applies to all outgoing calls established using this *Dna*, and applies to the packets travelling in both directions on all outgoing calls (local to remote, and remote to local). For incoming calls, the default class of routing is chosen by the calling party (as opposed to DPN, where either end of the call can choose the default routing class). This attribute, if set to a value of ***normal***, indicates that the default class of routing is normal reliability routing. If set to a value of ***high***, then the default class of routing is high reliability routing. High reliability is the standard choice for most DPN and Nortel Networks Multiservice Switch services. It usually indicates that packets are overflowed or retransmitted at various routing levels. Typically high reliability results in duplication and disordering of packets in the network when errors are detected or during link congestion. However, the VC handles the duplication and disordering to ensure that packets are delivered to the DTE properly. For the Frame Relay service, duplication of packets is not desired, in which case, normal reliability may be chosen as the preferred class of routing.
Mib	FrTraceRcvr

Copyright © 2006, Nortel Nortel Confidential

Values	normal high
Default	high

ATTRIBUTE SrvTrace Rcvr Fr Dna outPathReliabilityOverRide (oro)

Access	Read only
Description	This attribute, if set to a value of ***no***, specifies that the called end of the connection will not use the calling end provisioning data for reliability class of routing to override the provisioning data at the called end.
Mib	FrTraceRcvr
Values	yes no
Default	no

ATTRIBUTE SrvTrace Rcvr Fr Dna outPathReliabilitySignal (ores)

Access	Read only
Description	This attribute, if set to a value of ***disallowed***, specifies that reliability routing signaling is not used.
Mib	FrTraceRcvr
Values	allowed disallowed
Default	disallowed

ATTRIBUTE SrvTrace Rcvr Fr Dna outAccess (oua)

Access	Read and write
Description	This attribute is an extension of the Closed User Group (CUG) facility, as follows: This attribute, if set to a value of ***allowed,*** indicates that outgoing calls (from the DTE to the network) to the open (non-CUG) part of the network are permitted. It also permits outgoing calls to DTEs that have Incoming Access capabilities. If set to a value of ***disallowed***, then such calls cannot be made using this *Dna* - such calls will be cleared by the local DCE. This attribute corresponds to the ITU-T 'Closed User Group with Outgoing Access' feature for DNAs in that outgoing access is granted if this attribute is set to a value of ***allowed***.
Mib	FrTraceRcvr
Values	disallowed allowed
Default	disallowed

GROUP SrvTrace Rcvr Fr Dna IncomingOptions

Copyright © 2006, Nortel Nortel Confidential

Properties	Provisioned
Description	This group defines the call options for incoming calls.
Mib	FrTraceRcvr

ATTRIBUTE SrvTrace Rcvr Fr Dna **incCalls (inc)**

Access	Read only
Description	This attribute, if set to a value of ***allowed***, indicates that incoming calls (from the network to the DTE) can be made to this *Dna*. If set to a value of ***disallowed***, then incoming calls cannot be made to this *Dna* - such calls will be cleared by the local DCE. This attribute corresponds to the ITU-T 'Incoming Calls Barred' feature for DNAs in that incoming calls are barred if this attribute is set to a value of ***disallowed***. Either *outCalls*, or *incCalls* (or both) must be set to a value of ***allowed*** for this *Dna* to be usable.
Mib	FrTraceRcvr
Values	disallowed allowed
Default	disallowed

GROUP SrvTrace Rcvr Fr Dna **CallOptions**

Properties	Provisioned
Description	This group defines additional options for calls not related directly to the direction of a call.
Mib	FrTraceRcvr

ATTRIBUTE SrvTrace Rcvr Fr Dna **packetSizes (pks)**

Access	Read only
Description	This attribute indicates the allowable packet sizes supported for calls setup using this *Dna*. To set a given packet size to be allowed on the *Dna*, the packet size is entered, and the corresponding bit in the structure is set to a value of 1. To set a given packet size to be disallowed on the *Dna*, the packet size is entered preceded with the '~' character, and the corresponding bit in the structure is set to a value of 0. ITU-T recommends that packet size 128 always be supported. The bit placement for the packet sizes is as follows: Bit 0 - Packet Size 16 Bit 1 - Packet Size 32 Bit 2 - Packet Size 64 Bit 3 - Packet Size 128 Bit 4 - Packet Size 256

Copyright © 2006, Nortel Nortel Confidential

Bit 5 - Packet Size 512
Bit 6 - Packet Size 1024
Bit 7 - Packet Size 2048
Bit 8 - Packet Size 4096

This attribute relates to the *defaultRecvFrmNetworkPacketSize* and *defaultSendToNetworkPacketSize* attributes.

ATTRIBUTE SrvTrace Rcvr Fr Dna cugFormat (cft)

Access Read only

Description This attribute specifies which CUG format is used when DTE signals CUG indices, ***basic*** or ***extended***. A ***basic*** CUG index format is two digits long and an ***extended*** format is four digits long.

This attribute, if set to a value of ***extended***, indicates that the DTE signals and receives CUG indices in extended CUG format. If set to a value of ***basic***, then the DTE signals and receives CUG indices in the basic CUG format.

Mib FrTraceRcvr

Values basic
extended

Default basic

COMPONENT SrvTrace Rcvr Fr Dna ClosedUserGroup (Cug)

Instance Decimal (1..1)

Groups GROUP SrvTrace Rcvr Fr Dna Cug CugOptions

Scope Application

Description *SrvTrace Rcvr/<string> Fr Dna ClosedUserGroup*
This component defines options associated with national or international CUG Identifier. Other DNAs in the network can have CUGs defined which groups these DNAs by their *Cug interlockCode* attribute value. If DNAs are defined with CUGs, calls from DNAs which do not have the same *interlockCode* attribute value defined are refused. Attributes *incAccess* and *outAccess* can override this rule.

If this component is present, the Frame Relay interface which connects to

Copyright © 2006, Nortel Nortel Confidential

the Frame Relay trace receiver must be provisioned with the same *Cug interlockCode* attribute value.

GROUP SrvTrace Rcvr Fr Dna Cug CugOptions

Properties Provisioned

Description Attributes in this group define the *ClosedUserGroup* component options associated with the *interlockCode* attribute. DNAs with the same CUG (*interlockCode*) can make calls within this group. Various combinations which permit or prevent calls in the same CUG group are defined here.

Mib FrTraceRcvr

ATTRIBUTE SrvTrace Rcvr Fr Dna Cug type

Access Read and write

Description This attribute specifies the CUG type - the CUG is either a national CUG, or an international CUG. International closed user groups are usually established between DTEs for which there is an intermediary X.75 Gateway, whereas national closed user groups are usually established between DTEs for which there is no intermediary X.75 Gateway. (National CUGs cannot normally traverse an X.75 Gateway).

This attribute, if set to a value of ***national***, then the CUG is a national CUG, in which case, the *dnic* attribute should be left at its default value since it is not part of a national CUG. If set to a value of ***international***, then the CUG is an international CUG, in which case, the *dnic* attribute should be set appropriately as part of the *Cug interlockCode* attribute.

Mib FrTraceRcvr

Values
national
international

Default national

ATTRIBUTE SrvTrace Rcvr Fr Dna Cug dnic

Access Read and write

Description This attribute specifies the DNIC (Data Network ID Code) of the *Cug* by which packet networks are identified. This attribute is not applicable if the CUG is a national CUG, as specified by the *Cug type* attribute. There are usually 1 or 2 DNICs assigned per country, for public networks. The U.S. is an exception where each BOC has a DNIC. Also, a group of private networks can have its own DNIC.

Copyright © 2006, Nortel Nortel Confidential

DNIC value is not an arbitrary number. It is assigned by international agreement and controlled by ITU-T.

Mib FrTraceRcvr

Values BCD (4)

Default 0000

ATTRIBUTE SrvTrace Rcvr Fr Dna Cug **interlockCode (ilc)**

Access Read and write

Description This attribute specifies the CUG identifier of a national or international CUG call. It is an arbitrary number and it also can be called CUG in some descriptions. Interfaces (DNAs) defined with this number can only make calls to DNAs defined with the same *interlockCode* attribute value.

Mib FrTraceRcvr

Values Decimal (0..65535)

Default 0

ATTRIBUTE SrvTrace Rcvr Fr Dna Cug **preferential (pre)**

Access Read only

Description This attribute, if set to a value of ***yes***, indicates that this *Cug* is the preferential CUG, in which case it will be used during the call establishment phase if the DTE has not explicitly specified a CUG index in the call request packet. If set to a value of ***no***, then this *Cug* is not the preferential CUG.

Only one of the *Cug* components associated with a particular DNA can be the preferential CUG - only one *Cug* component can have this attribute set to ***yes***.

Mib FrTraceRcvr

Values no
yes

Default yes

ATTRIBUTE SrvTrace Rcvr Fr Dna Cug **outCalls (ouc)**

Access Read only

Description This attribute, if set to a value of ***allowed***, indicates that outgoing calls (from the DTE into the network) can be made using this particular *Cug*. If set to a value of ***disallowed***, then outgoing calls cannot be made using this *Cug* - such calls will be cleared by the local DCE.

This attribute corresponds to the ITU-T 'Outgoing Calls Barred' feature for CUG*s* in that outgoing calls are barred if this attribute is set to a value of ***disallowed***.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrTraceRcvr
Values	disallowed allowed
Default	allowed

ATTRIBUTE SrvTrace Rcvr Fr Dna Cug incCalls (inc)

Access	Read only
Description	This attribute, if set to a value of ***allowed***, indicates that incoming calls (from the network to the DTE) can be made using this particular *Cug*. If set to a value of ***disallowed***, then incoming calls cannot be made using this *Cug* - such calls will be cleared by the local DCE. This attribute corresponds to the ITU-T 'Incoming Calls Barred' feature for CUG*s* in that incoming calls are barred if this attribute is set to a value of ***disallowed***.
Mib	FrTraceRcvr
Values	disallowed allowed
Default	disallowed

ATTRIBUTE SrvTrace Rcvr Fr Dna Cug privileged (pri)

Access	Read only
Description	This attribute, if set to a value of ***yes***, indicates that this *Cug* is a privileged CUG. In DPN, at least one side of a call setup within a CUG must have the CUG as a privileged CUG. If set to a value of ***no***, then this *Cug* is not privileged. If both the local DTE and the remote DTE subscribe to the CUG, but it is not privileged, then the call will be cleared. This attribute is typically used for a host DTE which must accept calls from many other DTEs, in which case the other DTEs cannot call each other, but can call the host. In this example, the host would have the privileged CUG, and the other DTEs would belong to the same CUG, but it would not be privileged.
Mib	FrTraceRcvr

ATTRIBUTE SrvTrace Session **sessionState**

Access	Read only
Description	This attribute indicates the state of the trace session. The ***active*** value is the normal state for a running trace session. The ***waitingForSession***, ***waitingForProvisioningData***, ***callingReceiver*** and ***binding*** values are all normal transient states used to establish a session with the trace receiver on receipt of a *Start* command. In the

Copyright © 2006, Nortel Nortel Confidential

waitingForSession state, a trace session is being allocated. In the ***waitingForProvisioningData*** state, a trace session has been allocated and receiver provisioning data, used to setup the call to the receiver, is being retrieved. In the ***callingReceiver*** state, the call to the receiver is being established. In the ***binding*** state, the call to the receiver has been established and the service data path is being adjusted to include trace. The ***unbinding***, ***clearingCallToReceiver*** and ***releasingSession*** values are all normal transient states used to disconnect a session with the trace receiver on receipt of a *Stop* command. In the ***unbinding*** state, the service data path is being adjusted to remove trace. In the ***clearingCallToReceiver*** state, the call to the receiver is being cleared. In the ***releasingSession*** state, a trace session is being deallocated.
A value of ***abortingDueToCallFailure*** indicates that the call to the trace receiver has disconnected unexpectedly and trace is stopping. The clear cause and diagnostic for the failure is reported. Correct the fault indicated and retry the *Start* command.
Values of ***initializing*** and ***idle*** can never be seen since these states occur before a *Session* component is created and after it is destroyed.

ATTRIBUTE SrvTrace Session **callState**

Access: Read only

Description: This attribute indicates the state of the trace call to the receiver.
The ***dataTransfer*** value is the normal state for the call.
The ***initializing***, ***creatingVc***, ***waitingApiUp***, ***calling***, and ***enteringDataTransfer*** values are all normal transient states used to establish a call to the trace receiver on receipt of a *Start* command. These states occur during the ***callingReceiver*** state of the *sessionState* attribute. In the ***initializing*** state, receiver provisioning data, used to setup the call to the receiver, is being retrieved. In the ***creatingVc*** state, the local VC is being created. In the ***calling*** state, the direct call to the receiver is being connected. In the ***enteringDataTransfer*** state, the call to the receiver has been accepted and the data path is being established.
The ***clearing***, ***terminatingVc*** and ***terminated*** values are all normal transient states used to disconnect a call with the trace receiver on receipt of a *Stop* command. These states occur during the

Copyright © 2006, Nortel Nortel Confidential

clearingCallToReceiver state of the *sessionState* attribute. In the ***clearing*** state, the call to the receiver is being cleared. In the ***terminatingVc*** state, the local VC is being destroyed. In the ***terminated*** state, the call is down and all cleanup is complete.
A value of ***reseting*** indicates a data sequencing problem has occurred on the call. This value is applicable for sessions to X.25 trace receivers only and indicates an incompatibility with the receiver. Tracing continues, however some trace data may have been lost.
A value of ***terminating*** is a normal transient state which occurs if a *Stop* command is received before the local VC has been created.

Mib	TraceBase
Values	initializing creatingVc calling clearing enteringDataTransfer terminatingVc dataTransfer reseting terminating terminated waitingApiUp
Default	No default

ATTRIBUTE SrvTrace Session queueState

Access	Read only
Description	This attribute indicates the state of the trace queue. A value of ***normal*** indicates that traced data is being queued normally. A value of ***full*** indicates that trace data is being discarded because the queue is full. A value of ***blocked*** indicates that trace data is being discarded because the trace VC is not able to transport the data.
Mib	TraceBase
Values	normal full blocked
Default	normal

ATTRIBUTE SrvTrace Session framesQueued

Access	Read only
Description	This attribute indicates the number of traced frames that are currently queued to be sent to the VC.

Default	No default

GROUP SrvTrace Session X25 Vc **IntervalData (Intd)**

Properties	Operational
Description	This group defines display of interval data collected by *Vc*. Data in this group is variable and may depend on time when this *display* command is issued.
Mib	X25TraceRcvr

ATTRIBUTE SrvTrace Session X25 Vc **elapsedTimeTillNow**

Access	Read only
Description	This attribute displays the elapsed time representing the period of this interval data. It is elapsed time in 0.1 second increments since *Vc* started.
Mib	X25TraceRcvr
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE SrvTrace Session X25 Vc **segmentsRx**

Access	Read only
Description	This attribute displays the number of segments received at the time command was issued. This is the segment received count maintained by accounting at each end of the *Vc*. This counter is updated only when the packet cannot be successfully delivered out of the sink *Vc* and to the sink

Copyright © 2006, Nortel Nortel Confidential

AP Conditions in which packets may be discarded by the sink *Vc* include: missing packets due to subnet discards, segmentation protocol violations due to subnet discard, duplicated and out-of-ranged packets and packets that arrive while *Vc* is in path recovery state.

Mib	X25TraceRcvr
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE SrvTrace Session X25 Vc **segmentsSent**

Access	Read only
Description	This attribute displays the number of segments sent at the time command was issued. This is the segment sent count maintained by accounting at the source *Vc*. *Vc* only counts packets that *Vc* thinks can be delivered successfully into the subnet. In reality, these packets may be dropped by trunking, for instance. This counter is not updated when splitting fails, when *Vc* is in a path recovery state, when packet forwarding fails to forward this packet and when subsequent packets have to be discarded as we want to minimize the chance of out-of-sequence and do not intentionally send out-of-sequenced packets into the subnet.
Mib	X25TraceRcvr
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE SrvTrace Session X25 Vc **startTime**

Access	Read only
Description	This attribute displays the start time of this interval period. If *Vc* spans 12 hour time or time of day change *startTime* reflects new time as recorded at 12 hour periods or time of day changes.
Mib	X25TraceRcvr
Values	Time (DHMS)
Default	No default

ATTRIBUTE SrvTrace Session X25 Vc **callReferenceNumber**

Access	Read only
Description	This attribute displays the call reference number which is a unique number generated by the switch.The same Call Reference Number is stored in the interval data (accounting record) at both ends of the call. It can be used as one of the attributes in matching duplicate records generated at each end of the call.
Mib	X25TraceRcvr

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	No default

GROUP SrvTrace Session X25 Vc **Statistics (Stats)**

Properties	Operational
Description	*... Statistics(Stats)* This group defines general attributes collected by general *Vc*. The purpose of *Vc* attributes is to aid end users and verification people to understand the *Vc* internal behavior. This is particularly useful when the network has experienced abnormality and we want to isolate problems and pinpoint trouble spots. Attributes are collected on a per *Vc* basis. Until a need is identified, statistics are not collected at a processor level. Each attribute is stored in a 32 bit field and is initialized to zero when a *Vc* enters into the data transfer state. When a PVC is disconnected and then connected again, the attributes will be reset. Attributes cannot be reset through other methods.
Mib	X25TraceRcvr

ATTRIBUTE SrvTrace Session X25 Vc **ackStackingTimeouts**

Access	Read only
Description	This attribute counts the number of ack stacking timer expiries. It is used as an indicator of the acknowledgment behavior across the subnet when ack stacking is in effect. If it expires often, usually this means end users will experience longer delay. The ack stacking timer specifies how long the *Vc* will wait before finally sending the subnet acknowledgment. if this attribute is set to a value of 0, then the *Vc* will automatically return acknowledgment packets without delay. If this attribute is set to a value other than zero, then the *Vc* will wait for this amount of time in an attempt to piggyback the acknowledgment packet on another credit or data packet. If the *Vc* cannot piggyback the acknowledgment packet within this time, then the packet is returned without piggybacking.
Mib	X25TraceRcvr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE SrvTrace Session X25 Vc **outOfRangeFrmFromSubnet**

Access	Read only
Description	This attribute counts the number of subnet frames discarded due to the sequence number being out of range. Two Categories apply for the General *Vc* 1) lost Acks (previous Range) 2) unexpected Packets (next Range) *Vc* internally maintains its own sequence number of packet order and sequencing. Due to packet retransmission, *Vc* may receive duplicate

Copyright © 2006, Nortel Nortel Confidential

packets that have the same *Vc* internal sequence number. Only 1 copy is accepted by the *Vc* and other copies of the same packets are detected through this count. This attribute can be used to record the frequency of packet retransmission due to *Vc* and other part of the subnet.

Mib	X25TraceRcvr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE SrvTrace Session X25 Vc **duplicatesFromSubnet**

Access	Read only
Description	This attribute counts the number of subnet packets discarded due to duplication. It is used to detect software error fault or duplication caused by retransmitting.
Mib	X25TraceRcvr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE SrvTrace Session X25 Vc **frmRetryTimeouts**

Access	Read only
Description	This attribute counts the number of frames which have retransmission time-out. If packets from *Vc* into the subnet are discarded by the subnet, the source *Vc* will not receive any acknowledgment. The retransmission timer then expires and packets will be retransmitted again. Note that the *Vc* idle probe may be retransmitted and is included in this count. This statistics does not show the distribution of how many times packets are retransmitted (e.g. first retransmission results in successful packet forwarding).
Mib	X25TraceRcvr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE SrvTrace Session X25 Vc **peakRetryQueueSize**

Access	Read only
Description	This attribute indicates the peak size of the retransmission queue. This attribute is used as an indicator of the acknowledgment behavior across the subnet. It records the largest body of unacknowledged packets.
Mib	X25TraceRcvr
Values	Decimal (0..5000)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE SrvTrace Session X25 Vc **peakOoSeqQueueSize**

Access	Read only
Description	This attribute indicates the peak size of the out of sequence queue. This attribute is used as an indicator of the sequencing behavior across the subnet. It records the largest body of out of sequence packets.
Mib	X25TraceRcvr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE SrvTrace Session X25 Vc **peakOoSeqFrmForwarded**

Access	Read only
Description	This attribute indicates the peak size of the sequence packet queue. This attribute is used as an indicator of the sequencing behavior across the subnet. It records the largest body of out of sequence packets, which by the receipt of an expected packet have been transformed to expected packets. The number of times this peak is reached is not recorded as it is traffic dependent.
Mib	X25TraceRcvr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE SrvTrace Session X25 Vc **peakStackedAcksRx**

Access	Read only
Description	This attribute indicates the peak size of wait acks. This attribute is used as an indicator of the acknowledgment behavior across the subnet. It records the largest collective acknowledgment.
Mib	X25TraceRcvr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE SrvTrace Session X25 Vc **subnetRecoveries**

Access	Read only
Description	This attribute counts the number of successful *Vc* recovery attempts. This attribute is used as an indicator of how many times the *Vc* path is broken but can be recovered. This attribute is useful to record the number of network path failures.
Mib	X25TraceRcvr
Values	Decimal (0..5000)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE SrvTrace Session X25 Vc windowClosuresToSubnet

Access	Read only
Description	This attribute counts the number of window closures to subnet. A packet may have been sent into the subnet but its acknowledgment from the remote *Vc* has not yet been received. This is a 8 bit sequence number.This number is useful in detecting whether the *Vc* is sending any packet into the subnet.
Mib	X25TraceRcvr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE SrvTrace Session X25 Vc windowClosuresFromSubnet

Access	Read only
Description	This attribute counts the number of window closures from subnet. This attribute is useful in detecting whether the *Vc* is receiving any packet from the subnet.
Mib	X25TraceRcvr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE SrvTrace Session X25 Vc wrTriggers

Access	Read only
Description	This attribute displays the number of times the *Vc* stays within the W-R region. The W-R region is a value used to determined the timing of credit transmission. Should the current window size be beneath this value, the credits will be transmitted immediately. Otherwise, they will be transmitted later with actual data. The wrTriggers statistic is therefore used to analyze the flow control and credit mechanism.
Mib	X25TraceRcvr
Values	Decimal (0..5000)
Default	No default

VERB Ping SrvTrace Session Fr Vc

Impact	Passive
Description	Ping *[-roundTripDelay] [-sendPktDataSize(octets)] [-returnPktDataSize(octets)]* FrUni/*<n>* Dlci/*<n>* Vc Ping causes a query packet to be sent to the destination module where the Frame Relay DLCI VC terminates. It can be used to either display the path of the VC being used by the Frame Relay DLCI or to measure the round trip delay of the Frame Relay DLCI connection. Since the query packet carries the same path selector as the Frame Relay data packets and the Frame Relay VC's transfer priority (TP) is used to set the RCOS, reliability and emission priority of the query packet, the path taken by the ping query packet will be the same as that of the Frame Relay data except at the source and destination module. The ping packets originate from the CP rather than the Frame Relay DLCI's FP. At the far end, it is also the CP that receives the ping packets and returns them, rather than the Frame Relay FP. Note that this command does not provide any information regarding the status of the far end VC process. If, however, the destination module is unreachable or the VC path is congested, the operator will be notified. The ping command can be issued with or without options. If no options are

Copyright © 2006, Nortel Nortel Confidential

specified, the command reports the path of the VC associated with the Frame Relay DLCI. When the command is used to find the VC path, it displays the RID and MID of each module that the query packet passes through on its way to the destination. If the roundTripDelay option is specified, the command reports the time taken to reach the destination and back. For the roundTripDelay option, the path taken by the query packets in both directions (from the source to the destination and from the destination back to the source) is the same as that of the Frame Relay data except at the source and destination where the ping packets are generated and bounced back by the CP rather than the Frame Relay DLCI's FP.

The ping command supports the following options:

-roundTripDelay (-rtd): If this option is selected, the round trip delay time to reach the destination and back will be reported. The round trip delay is calculated by timing how long it takes to send five packets to the destination node and back. The packet size can be specified using the sendPktSize and returnPktSize options. The minimum, maximum and average time taken by the returned packets are reported. If this option is not selected, the path taken to the destination is displayed.

-sendPktDataSize: This option specifies the number of data octets to be included in the round trip delay query packet. The rtd query packet consists of the Nortel Networks proprietary common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are sent to the destination. The actual number of data octets sent is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default value is 64 octets if *transferPriority* of the *Frame Relay DLCI Dc* is 11, and 128 octets otherwise. This option is ignored if the -rtd option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

-returnPktDataSize: This option specifies the number of data octets to be included in the round trip delay acknowledge packet. The rtd acknowledge packet consists of the Nortel Networks proprietary common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control

Copyright © 2006, Nortel Nortel Confidential

information. If the value specified for this option is less than 12, 12 octets are returned to the source. The actual number of data octets returned is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default value is 64 octets if *transferPriority* of the *Frame Relay DLCI Dc* is 11, and 128 octets otherwise. This option is ignored if the -rtd option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

GROUP SrvTrace Session Fr Vc **CallData (Cad)**

Properties	Operational
Description	This group represents operational call data related to Frame Relay *Vc*. It can be displayed only for Frame Relay *Vc* which is created by application.
Mib	FrTraceRcvr

Values	normal high interrupting
Default	No default

ATTRIBUTE SrvTrace Session Fr Vc **emissionPriorityFromNetwork (epfrom)**

Access	Read only
Description	This attribute displays the network internal emission priority from the network.
Mib	FrTraceRcvr
Values	normal high interrupting
Default	No default

ATTRIBUTE SrvTrace Session Fr Vc **dataPath (dapa)**

Access	Read only
Description	This attribute indicates the data path used by the connection. The data path is provisioned in *Dna* and *DirectCall* components. The displayed value of this attribute can be different from the provisioned value. If the connection is using ***dprsOnly*** data path, the string ***dprsOnly*** is displayed. (dynamic packet routing system) If the connection is using ***dprsMcsOnly*** data path, the string

Copyright © 2006, Nortel Nortel Confidential

dprsMcsOnly is displayed.

If the connection is using ***dprsMcsFirst*** data path, the string ***dprsMcsFirst*** is displayed.

Mib	FrTraceRcvr
Values	String (0..32, ASCII)
Default	No default

ATTRIBUTE SrvTrace Session Fr Vc **dprsMcsEndPoint (dmep)**

Access	Read only
Description	This attribute displays the data path used by the connection. Data path is provisioned in *Dna* and *DirectCall* components. If the connection is using ***dprsOnly*** data path, this attribute is empty. If the connection is using ***dprsMcsOnly*** or ***dprsMcsFirst*** data path, this attribute displays component name of the dprsMcsEndPoint.
Mib	FrTraceRcvr
List of	The name of the component
Default	No default

GROUP SrvTrace Session Fr Vc **IntervalData (Intd)**

Properties	Operational
Description	This group defines display of interval data collected by *Vc*. Data in this group is variable and may depend on time when this *display* command is issued.
Mib	FrTraceRcvr

ATTRIBUTE SrvTrace Session Fr Vc **elapsedTimeTillNow**

Access	Read only
Description	This attribute displays the elapsed time representing the period of this interval data. It is elapsed time in 0.1 second increments since *Vc* started.
Mib	FrTraceRcvr
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE SrvTrace Session Fr Vc **segmentsRx**

Access	Read only
Description	This attribute displays the number of segments received at the time command was issued. This is the segment received count maintained by

Copyright © 2006, Nortel Nortel Confidential

accounting at each end of the *Vc*. This counter is updated only when the packet cannot be successfully delivered out of the sink *Vc* and to the sink AP Conditions in which packets may be discarded by the sink *Vc* include: missing packets due to subnet discards, segmentation protocol violations due to subnet discard, duplicated and out-of-ranged packets and packets that arrive while *Vc* is in path recovery state.

Mib	FrTraceRcvr
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE SrvTrace Session Fr Vc **segmentsSent**

Access	Read only
Description	This attribute displays the number of segments sent at the time command was issued. This is the segment sent count maintained by accounting at the source *Vc*. *Vc* only counts packets that *Vc* thinks can be delivered successfully into the subnet. In reality, these packets may be dropped by trunking, for instance. This counter is not updated when splitting fails, when *Vc* is in a path recovery state, when packet forwarding fails to forward this packet and when subsequent packets have to be discarded as we want to minimize the chance of out-of-sequence and do not intentionally send out-of-sequenced packets into the subnet.
Mib	FrTraceRcvr
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE SrvTrace Session Fr Vc **startTime**

Access	Read only
Description	This attribute displays the start time of this interval period. If *Vc* spans 12 hour time or time of day change *startTime* reflects new time as recorded at 12 hour periods or time of day changes.
Mib	FrTraceRcvr
Values	Time (DHMS)
Default	No default

ATTRIBUTE SrvTrace Session Fr Vc **callReferenceNumber**

Access	Read only
Description	This attribute displays the call reference number which is a unique number generated by the switch.The same Call Reference Number is stored in the interval data (accounting record) at both ends of the call. It can be used as one of the attributes in matching duplicate records generated at each end of the call.

Mib	FrTraceRcvr
Values	Decimal (0..4294967295)
Default	No default

GROUP SrvTrace Session Fr Vc **FrameRelayData (Frd)**

Properties	Operational
Description	This group defines Frame Relay attributes collected by Frame Relay *Vc*. The purpose of *Vc* attributes is to aid end users and verification people to understand the *Vc* internal behavior. This is particularly useful when the network has experienced abnormality and we want to isolate problems and pinpoint trouble spots. Attributes are collected on a per *Vc* basis. Until a need is identified, statistics are not collected at a processor level. Each attribute is stored in a 32 bit field and is initialized to zero when a *Vc* enters into the data transfer state. When a PVC is disconnected and then connected again, the attributes will be reset. Attributes cannot be reset through other methods. Frame Relay *Vc* uses a best effort data packet delivery protocol and a different packet segmentation and combination methods from the General *Vc*. The Frame Relay *Vc* uses the same call setup and control mechanism (e.g. the support of non-flow control data packets) as in a General *Vc*. Most General *Vc* statistics and internal variables are used in a Frame Relay *Vc* and are displayed by software developers
Mib	FrTraceRcvr

ATTRIBUTE SrvTrace Session Fr Vc **frmCongestedToSubnet**

Access	Read only
Description	This attribute displays the number of frames from link discarded due to lack of resources. It keeps track of the number of frames from link that have to be discarded. The discard reasons include insufficient memory for splitting the frame into smaller subnet packet size.
Mib	FrTraceRcvr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE SrvTrace Session Fr Vc **cannotForwardToSubnet**

Access	Read only
Description	This attribute displays the number of discarded packets that can not be forwarded into the subnet because of subnet congestion. Number of frames from link discarded due to failure in forwarding a packet from *Vc* into the subnet.- This attribute is increased when packet forwarding fails to forward a packet into the subnet. If a frame is split into multiple subnet packets and a partial packet has to be discarded, all

Copyright © 2006, Nortel Nortel Confidential

	subsequent partial packets that have not yet been delivered to the subnet will be discarded as well.
Mib	FrTraceRcvr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE SrvTrace Session Fr Vc notDataXferToSubnet

Access	Read only
Description	This attribute records the number of frames from link discarded when the *Vc* tries to recover from internal path failure.
Mib	FrTraceRcvr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE SrvTrace Session Fr Vc outOfRangeFrmFromSubnet

Access	Read only
Description	This attribute displays the number of frames from subnet discarded due to out of sequence range for arriving too late.
Mib	FrTraceRcvr
Values	Decimal (0..255)
Default	No default

ATTRIBUTE SrvTrace Session Fr Vc combErrorsFromSubnet

Access	Read only
Description	This attribute records the number of subnet packets discarded at the sink *Vc* due to the *Vc* segmentation and combination protocol error. Usually, this occurs when the subnet discards packets and thus this statistics can be used to guest the number of subnet packets that are not delivered to the *Vc*. It cannot be used as an actual measure because some subnet packets may have been delivered to *Vc* but have to be discarded because these are partial packets to a frame in which some other partial packets have not been properly delivered to *Vc*
Mib	FrTraceRcvr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE SrvTrace Session Fr Vc duplicatesFromSubnet

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute displays the number of subnet packets discarded due to duplication. Although packets are not retransmitted by the Frame Relay *Vc*, it is possible for the subnet to retransmit packets. When packets are out-of-sequenced and copies of the same packets arrive, then this attribute is increased.
Mib	FrTraceRcvr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE SrvTrace Session Fr Vc **notDataXferFromSubnet**

Access	Read only
Description	This attribute displays the number of subnet packets discarded when data transfer is suspended in *Vc* recovery.
Mib	FrTraceRcvr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE SrvTrace Session Fr Vc **frmLossTimeouts**

Access	Read only
Description	This attribute displays the number of lost frame timer expiries. When this count is excessive, the network is very congested and packets have been discarded in the subnet.
Mib	FrTraceRcvr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE SrvTrace Session Fr Vc **ooSeqByteCntExceeded**

Access	Read only
Description	This attribute displays the number times that the out of sequence byte threshold is exceeded. When the threshold is exceeded, this condition is treated as if the loss frame timer has expired and all frames queued at the sink *Vc* are delivered to the AP. We need to keep this count to examine if the threshold is engineered properly. This should be used in conjunction with the peak value of out-of-sequenced queue and the number of times the loss frame timer has expired. This count should be relatively small when compared with loss frame timer expiry count.
Mib	FrTraceRcvr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE SrvTrace Session Fr Vc **peakOoSeqPktCount**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute displays the frame relay peak packet count of the out of sequence queue. This attribute records the maximum queue length of the out-of-sequenced queue. The counter can be used to deduce the message buffer requirement on a *Vc*.
Mib	FrTraceRcvr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE SrvTrace Session Fr Vc **peakOoSeqFrmForwarded**

Access	Read only
Description	This attribute displays the frame relay peak size of the sequence packet queue. The subnet may deliver packets out-of-sequenced. These packets are then queued in an out-of-sequenced queue, waiting for a packet with the expected sequence number to come. When that packet arrives, this attribute records the maximum number of packets that were out-of-sequenced, but now have become in-sequenced. The statistics is used to measure expected queue size due to normal subnet packet disorder (not due to subnet packet discard). Current implementation also uses this statistics to set a maximum size for the out-of-sequenced queue.
Mib	FrTraceRcvr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE SrvTrace Session Fr Vc **sendSequenceNumber**

Access	Read only
Description	This attribute displays the Vc internal packet's send sequence number. Note that a "packet" in this context, may be either a user data packet, or an OAM frame.
Mib	FrTraceRcvr
Values	Decimal (0..1048575)
Default	No default

ATTRIBUTE SrvTrace Session Fr Vc **pktRetryTimeouts**

Access	Read only
Description	This attribute displays the number of packets which have retransmission time-outs. When this count is excessive, the network is very congested and packets have been discarded in the subnet.
Mib	FrTraceRcvr

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..5000)
Default	No default

ATTRIBUTE SrvTrace Session Fr Vc **peakRetryQueueSize**

Access	Read only
Description	This attribute displays the peak size of retransmission queue. This attribute is used as an indicator of the acknowledgment behavior across the subnet. Records the largest body of unacknowledged packets.
Mib	FrTraceRcvr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE SrvTrace Session Fr Vc **subnetRecoveries**

Access	Read only
Description	This attribute displays the number of successful *Vc* recovery attempts.
Mib	FrTraceRcvr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE SrvTrace Session Fr Vc **ooSeqPktCntExceeded**

Access	Read only
Description	This attribute displays the number times that the out of sequence packet threshold is exceeded. When the threshold is exceeded, this condition is treated as if the loss frame timer has expired and all frames queued at the sink *Vc* are delivered to the AP. We need to keep this count to examine if the threshold is engineered properly. This should be used in conjunction with the peak value of out-of-sequenced queue and the number of times the loss frame timer has expired. This count should be relatively small when compared with loss frame timer expiry count.
Mib	FrTraceRcvr
Values	Decimal (0..255)
Default	No default

ATTRIBUTE SrvTrace Session Fr Vc **peakOoSeqByteCount**

Access	Read only
Description	This attribute displays the frame relay peak byte count of the out of sequence queue. This attribute records the maximum queue length of the out-of-sequenced queue. The counter can be used to deduce the message buffer requirement on a *Vc*.

GROUP Ss7 Mtp3 Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes of the *Mtp3* component.
Mib	Ss7

ATTRIBUTE Ss7 Mtp3 mtpType

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the type of MTP3. The possible values for *mtpType* are: ***mtp3*** - This is the standard MTP layer 3 from Q.704 that supports signalling units up to 272 octets in length. ***mtp3b*** - This is the MTP layer 3 broadband variant that supports signalling units up to 4096 octets in length. For the SS7 stack on the Iu interface this attribute must be set to ***mtp3b***. For the SS7 stack on the Call Server interface this attribute must be set to ***mtp3***. Changing the value of this attribute causes all the linksets associated with the MTP3 layer to be restarted.
Mib	Ss7
Values	mtp3 mtp3b
Default	mtp3b

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Ss7 Mtp3 origPointCode (opc)

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the point code of the node that the MTP3 layer manages. The point code must be provisioned in one of the following formats: basic***:*** The point code is provisioned as a decimal number in the range ***1***..***16383***. A value of ***0*** is not valid. segmented: The point code is provisioned as three integers, separated by dots. The first integer must be in the range ***0***..***7***, the second integer must be in the range ***0..255***, and the third integer must be in the range ***0***..***7***. A value of ***0.0.0*** is not valid. This attribute must not specify a point code identical to that specified by *adjPointCode*. Changing the value of this attribute causes all the linksets associated with this MTP3 layer to be restarted.
Mib	Ss7
Values	Integer Sequence
Default	No default

ATTRIBUTE Ss7 Mtp3 changeoverHoldoffTimer (t1)

Access	Read: All Write: All
Description	This attribute specifies the value of the timer T1 defined in ITU-T recommendation Q.704. This timer value determines how long to wait for a failed link to become available when changeover is required, but there is no alternate link. It is used to avoid message mis-sequencing on changeover. This timer is started when a link goes down and a changeover is required, but changeover messages cannot be exchanged on an alternate link. This timer is stopped when the failed link becomes available. Upon timer expiration, it sends all the retrieved (layer 2) and buffered (layer 3) messages down the new link and marks changeover as complete.
Mib	Ss7
Values	Decimal (500..1200)
Units	msec

Copyright © 2006, Nortel Nortel Confidential

Default	500

ATTRIBUTE Ss7 Mtp3 changeoverAckTimer (t2)

Access	Read: All Write: All
Description	This attribute specifies the value of the timer T2 defined in ITU-T recommendation Q.704. This timer is started when MTP layer 3 receives a Backward Sequence Number of the next signalling unit to be Transmitted (BSNT) from a link in the changeover process. This timer is stopped when the link becomes available, or when a changeover message is received while waiting for an ack. Upon timer expiration, the link is released. The number of expiries of this timer is indicated by the attribute *changeoverAckTimeouts*.
Mib	Ss7
Values	Decimal (700..2000)
Units	msec
Default	700

ATTRIBUTE Ss7 Mtp3 changebackDiversionDelayTimer (t3)

Access	Read: All Write: All
Description	This attribute specifies the timer value for the timer T3 defined in ITU-T recommendation Q.704. It provides time controlled diversion-delay to avoid mis-sequencing on changeback. This timer is started when a link is in changeback and the signalling point at the remote end of newly available link is not accessible via an alternative link. Upon timer expiry, traffic is restarted on the link.
Mib	Ss7
Values	Decimal (500..1200)
Units	msec
Default	500

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Ss7 Mtp3 firstAttemptChangebackAckTImer (t4)

Access	Read: All Write: All
Description	This attribute specifies the timer value for the timer T4 defined in ITU-T recommendation Q.704. This timer is started when a link is in changeback and the Signalling Point (SP) at the remote end of the newly available link is accessible via an alternative link. This timer is stopped when a link has attempted changeback for the first time and receives a changeback ack for every changeback declaration sent. Upon timer expiration, *secondAttemptChangebackAckTimer* is started and all the unacknowledged changeback declarations are re-sent. The number of resends of the changeback declarations is indicated by the attribute *changebackDeclarationTimeouts*.
Mib	Ss7
Values	Decimal (500..1200)
Units	msec
Default	500

ATTRIBUTE Ss7 Mtp3 secondAttemptChangebackAckTimer (t5)

Access	Read: All Write: All
Description	This attribute specifies the timer value for the timer T5 defined in ITU-T recommendation Q.704. It creates a delay to avoid oscillation of initial alignment failure and link restart. The timer is started when a link does not changeback in the first attempt with *firstAttemptChangeBackAckTimer.* The timer is stopped when a link is in the second attempt of changeback and receives a changeback ack for every changeback declaration sent. Upon timer expiration, changeback is terminated. The number of expiries of this timer is indicated by the attribute *secondAttemptChangebackAckTimeouts*.
Mib	Ss7
Values	Decimal (500..1200)
Units	msec

Copyright © 2006, Nortel Nortel Confidential

Default	500

ATTRIBUTE Ss7 Mtp3 uninhibitAckTimer (t12)

Access	Read: All Write: All
Description	This attribute specifies the timer value for the timer T12 defined in ITU-T recommendation Q.704. The timer is started every time a link *Uninhibit* command is executed. The timer is stopped when the link uninhibit is acknowledged by the remote end. Upon timer expiry, the uninhibit is started again for a maximum of one more time. If it fails this time, the uninhibit is cancelled. The number of expiries of this timer is indicated by the attribute *uninhibitAckTimeouts*.
Mib	Ss7
Values	Decimal (800..1500)
Units	msec
Default	800

ATTRIBUTE Ss7 Mtp3 forceUninhibitTimer (t13)

Access	Read: All Write: All
Description	This attribute specifies the timer value for the timer T13 defined in ITU-T recommendation Q.704. The timer is started when this end initiates a link force uninhibit. The timer is stopped when the signalling link uninhibit is acknowledged. Upon timer expiry, the uninhibit is started again one more time. If it fails this time, the uninhibit is cancelled. The number of expiries of this timer is indicated by the attribute *forceUninhibitTimeouts.*
Mib	Ss7
Values	Decimal (800..1500)
Units	msec
Default	800

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Ss7 Mtp3 inhibitAckTimer (t14)

Access	Read: All Write: All
Description	This attribute specifies the value of the timer T14 defined in ITU-T recommendation Q.704. This timer waits for inhibition acknowledgement. The timer is started when an *Inhibit* command is executed. The timer is stopped when the local link inhibit is denied or successful. Upon expiry, the local link inhibit request is cancelled.
Mib	Ss7
Values	Decimal (2..3)
Units	seconds
Default	2

ATTRIBUTE Ss7 Mtp3 initialAlignmentDelayTimer (t17)

Access	Read: All Write: All
Description	This attribute specifies the value of the timer T17 defined in ITU-T recommendation Q.704. It creates a delay to avoid oscillation of initial alignment failure and link restart. This timer is started when a signalling link is started. Upon timer expiry, it sends a START message to layer 2.
Mib	Ss7
Values	Decimal (800..1500)
Units	msec
Default	800

ATTRIBUTE Ss7 Mtp3 localInhibitTestTimer (t22)

Access	Read: All Write: All
Description	This attribute specifies the value of the timer T22 (Local inhibit test timer) defined in ITU-T recommendation Q.704. This timer is started when a link becomes locally inhibited. Upon timer expiry, if the link is still unavailable and locally inhibited, the timer is restarted, and a local inhibit test message is sent to the remote end.
Mib	Ss7

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (180..360)
Units	seconds
Default	180

ATTRIBUTE Ss7 Mtp3 remoteInhibitTestTimer (t23)

Access	Read: All Write: All
Description	This attribute specifies the value of the timer T23 (Remote inhibit test timer) defined in ITU-T recommendation Q.704. This timer is started when a link becomes remote inhibited. Upon timer expiry, if the link is still unavailable and remotely inhibited, the timer is restarted, and a remote inhibit test message is sent to the remote end
Mib	Ss7
Values	Decimal (180..360)
Units	seconds
Default	180

ATTRIBUTE Ss7 Mtp3 sltAckTimer (tQ707T1)

Access	Read: All Write: All
Description	This attribute specifies the value of the Supervision timer to wait for a signalling link test acknowledgement message. This timer is started every time a Signalling Link Test Controller (SLTC) sends out a test message. The timer is stopped when the SLTC receives an acknowledge message from the peer MTP3 layer. Upon timer expiration, if this is the first attempt, this timer is restarted and a second attempt is made. If the timer expires after the second attempt, the MTP3 layer is informed of a broken link.
Mib	Ss7
Values	Decimal (4..12)
Units	seconds
Default	4

ATTRIBUTE Ss7 Mtp3 sltIntervalTimer (tQ707T2)

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the value of the Interval timer defined in ITU-T recommendation Q.707 for sending signalling link test messages. The timer is started when a link comes in service, and each time the timer expires if the link is still good. The timer is stopped when the link fails, as determined by the *sltAckTimer*. Upon timer expiry, another test message is sent to the peer and the timer is restarted.
Mib	Ss7
Values	Decimal (30..90)
Units	seconds
Default	30

ATTRIBUTE Ss7 Mtp3 reroutingHoldOffTimer (t6)

Access	Read: All Write: All
Description	This attribute specifies the timer value for the timer T6 defined in ITU-T recommendation Q.704. It provides delay to avoid message mis-sequencing on controlled rerouting. This timer is started when a signalling route toward a given destination becomes available and the controlled rerouting procedure is invoked. Upon timer expiry, traffic is restarted on the route made available.
Mib	Ss7
Values	Decimal (500..1200)
Units	msec
Default	800

ATTRIBUTE Ss7 Mtp3 routeSetTestRepeatTimer (t10)

Access	Read: All Write: All
Description	This attribute specifies the value of the timer T10 defined in ITU-T recommendation Q.704. It indicates the repeat frequency of the route set test message. This timer is started when a signalling-route-set-test message is sent after receiving a transfer-prohibited (TFP) message for a specific destination. Upon timer expiry, the signalling-route-set-test message is resent.

Copyright © 2006, Nortel Nortel Confidential

	The timer is sopped when a transfer-allowed (TFA) message is received, indicating that the destination has become accessible.
Mib	Ss7
Values	Decimal (30..60)
Units	seconds
Default	30

GROUP Ss7 Mtp3 OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Ss7

ATTRIBUTE Ss7 Mtp3 adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Ss7
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Ss7 Mtp3 operationalState (osiOper)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Ss7
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Ss7 Mtp3 usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Ss7
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Ss7 Mtp3 Ls adjPointCode (apc)

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the point code of the node that this node directly connects to through this linkset. The point code must be provisioned in one of the following formats: basic***:*** The point code is provisioned as a decimal number in the range ***1***..***16383***. A value of ***0*** is not valid. segmented: The point code is provisioned as three integers, separated by dots. The first integer must be in the range ***0***..***7***, the second integer must be in the range ***0***..***255***, and the third integer must be in the range ***0***..***7***. A value of ***0.0.0*** is not valid. This attribute must not specify a point code identical to that specified by *origPointCode*. Changing the value of this attribute causes all the linksets associated with the MTP3 layer to be restarted.
Mib	Ss7
Values	Integer Sequence
Default	No default

ATTRIBUTE Ss7 Mtp3 Ls networkIndicator (netInd)

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies whether the network is a national network, or an international network. This attribute determines the value that is filled in the Network Indicator field of the messages sent to the remote end.This attribute must match what the peer MTP3 layer on the remote end expects in the messages. Changing the value of this attribute causes all the linksets associated with this MTP3 layer to be restarted.Each meaning of each valid value for *networkIndicator* is described in SS7 Mtp3 specification Q.704. ***international*** - MTP3 node is a member of an “International” network. ***internationalSpare*** - MTP3 node is a member of an “International Spare” network.

national
nationalSpare

Default: international

GROUP Ss7 Mtp3 Ls OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib: Ss7

ATTRIBUTE Ss7 Mtp3 Ls adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values	idle active (activ) busy
Default	idle

ATTRIBUTE Ss7 Mtp3 Ls availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-

Copyright © 2006, Nortel Nortel Confidential

valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

ATTRIBUTE Ss7 Mtp3 Ls proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

alarmOutstanding (outst)

Default: No default

ATTRIBUTE Ss7 Mtp3 Ls standbyStatus (osiStby)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

ATTRIBUTE Ss7 Mtp3 Ls Lk standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

GROUP Ss7 Mtp3 Rs OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Ss7

ATTRIBUTE Ss7 Mtp3 Rs adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Ss7
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Ss7 Mtp3 Rs operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

Copyright © 2006, Nortel Nortel Confidential

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: Ss7

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Ss7 Mtp3 Rs usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: Ss7

Values:
idle
active (activ)
busy

Default: idle

ATTRIBUTE Ss7 Mtp3 Rs availabilityStatus (osiAvail)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be

Copyright © 2006, Nortel Nortel Confidential

present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

ATTRIBUTE Ss7 Mtp3 Rs proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.
Mib	Ss7
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE Ss7 Mtp3 Rs controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib	Ss7
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE Ss7 Mtp3 Rs alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

The value ***true*** indicates that the actual state of the component is not known for sure.

Mib: Ss7

Values: false, true

Default: false

COMPONENT Ss7 Mtp3 Rs Route (Ro)

Instance: Decimal (0..1)

Groups: GROUP Ss7 Mtp3 Rs Ro Provisoned (Prov), GROUP Ss7 Mtp3 Rs Ro OsiState (State)

Scope: Application

Description: Ss7 Mtp3/n Routeset/n Route/n

This component represents an MTP3 route that conveys signalling information between two signalling points using a specific adjacent signalling point.

Mib: Ss7

Common Verbs: Help, List, Display, Add, DELete, Unlock

VERB LOCK Ss7 Mtp3 Rs Ro

Impact: Service

Description: *Lock [-force] Mtp3/n Routeset/n Route/n*

This verb causes the specified *Ss7Route* component to immediately enter the OSI ***locked*** administrative state. Traffic flow ceases on the newly locked Route and is diverted to the unlocked Route of the RouteSet. The Lock command fails if executed on the last unlocked Route of a RouteSet. The last unlocked Route of a ROuteSet must be locked using the force option.

Options:
-force
If this option is specified, the *Route* is locked even if it is the only unlocked Route in the RouteSet.

The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	Ss7
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE **Ss7 Mtp3 Rs Ro** **proceduralStatus (osiProc)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal

Copyright © 2006, Nortel Nortel Confidential

functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib: Ss7

Set of:
initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default: No default

ATTRIBUTE Ss7 Mtp3 Rs Ro **controlStatus (osiCntrl)**

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Default	No default

ATTRIBUTE Ss7 Mtp3 Rs Ro **alarmStatus (osiAlarm)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	Ss7
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Ss7 Mtp3 Rs Ro **standbyStatus (osiStby)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib: Ss7

Values:
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default: notSet

ATTRIBUTE Ss7 Mtp3 Rs Ro **unknownStatus (osiUnknw)**

Access: Read only

Description: This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Mib: Ss7

Values:
false
true

Default: false

Description	This group contains the provisionable attributes of the *Ss7SignallingConnControlPart* component.
Mib	Ss7

ATTRIBUTE Ss7 Sccp maxConnections (maxC)

Access	Read: All Write: All
Description	This attribute specifies the maximum number of signalling connections supported by an SCCP instance across all the local subsystems. The current number of open signalling connections is indicated by the attribute *activeConnections.* The number of times a signalling connection establishment was refused because the number of open connections has reached the maximum value is indicated by the attribute *rejectedConnections.* Changes to this attribute affect only new connections. No existing connections will be affected by any changes made to this attribute.
Mib	Ss7
Values	Decimal (1000..200000)
Default	16000

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Ss7 Sccp timerConnEst (tConnEst)

Access	Read: All Write: All
Description	This attribute specifies the value of the TConnEst timer defined in the ITU-T spec Q.714. This is the period of time to wait for a CONNECTION CONFIRM message from the remote user of SCCP. This timer is started when a CONNECT REQUEST message is sent to the remote SCCP layer. This timer is stopped when either a CONNECT CONFIRM, RELEASED, or CONNECT REFUSED message is received, or when a routing failure happens. Upon timer expiration, the resources associated with the connection are released and a disconnect message is sent to the local user(s). The number of timeouts of this timer is indicated by the attribute *connEstTmouts*.
Mib	Ss7
Values	Decimal (60..120)
Units	seconds
Default	60

ATTRIBUTE Ss7 Sccp timerInactivitySend (tIas)

Access	Read: All Write: All
Description	This attribute specifies the value of the Tias timer defined in Q.714. This is the period of time to wait before sending an INACTIVITY TEST message for a connection when there are no messages to send. The timer is started when a CONNECT CONFIRM or CONNECT RESPONSE message is received. The timer is restarted if a DATA FORM 1 message is transmitted. This timer is stopped when a DISCONNECT, RELEASE COMPLETE or ERROR message is received, or when a routing failure occurs. If the timer expires on an open connection, an INACTIVITY TEST message is sent. It is recommended that the timer be set to a value that is half as long as the *tIarTimer*.
Mib	Ss7

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (300..600)
Units	seconds
Default	300

ATTRIBUTE Ss7 Sccp timerInactivityReceive (tIar)

Access	Read: All Write: All
Description	This attribute specifies the value of the inactivity receive timer defined in Q.714. This is the period of time to wait on receiving a message for a connection, before releasing the connection. This timer is started when a CONNECT CONFIRM or CONNECT RESPONSE message is received. This timer is restarted if a DATA FORM 1 or INACTIVITY TEST message is received. This timer is stopped when a DISCONNECT, RELEASED, or ERROR message is received, or when a routing failure occurs. If this timer expires on an open connection, a DISCONNECT message is sent and the resources are released. It is recommended that the timer be set to a value that is twice as long as *tIasTimer*. The number of timeouts of this timer is indicated by the attribute *inactivityReceiveTimeouts*.
Mib	Ss7
Values	Decimal (660..1260)
Units	seconds
Default	660

ATTRIBUTE Ss7 Sccp timerRel (tRel)

Access	Read: All Write: All
Description	This attribute specifies the value of the release timer defined in Q.714. This is the period of time to wait for a RELEASE COMPLETE message in response to the initial release attempt. This timer is started when a RELEASED message is sent. This timer is stopped when a RELEASE COMPLETE or ERROR message is received, or on a routing failure.

Copyright © 2006, Nortel Nortel Confidential

	Upon timer expiration, a RELEASE message is sent and the *tRepeatRelTimer* is started. The number of timeouts of this timer is indicated by the attribute *tRelTimeouts*.
Mib	Ss7
Values	Decimal (10..20)
Units	seconds
Default	10

ATTRIBUTE Ss7 Sccp timerRepeatRel (tRepeatRel)

Access	Read: All Write: All
Description	This attribute specifies the value of the repeat release timer. This is the period of time to wait for a RELEASE COMPLETE message after *tRelTimer* has expired. This timer determines the interval between successive release retries. This timer is started when *tRelTimer* expires. This timer is stopped when a RELEASE COMPLETE or an ERROR message is received, or when a routing failure occurs. Upon timer expiration, the timer is restarted for a maximum of ten times. Upon the tenth timer expiration, the resources are released. The number of timeouts of this timer is indicated by the attribute *tRepeatRelTimeouts.*
Mib	Ss7
Values	Decimal (10..20)
Units	seconds
Default	10

ATTRIBUTE Ss7 Sccp classOfService (classOfServ)

Access	Read: All Write: All
Description	This attribute specifies the type of service provided by the SCCP layer. The different service classes are: ***0*** - This class represents basic connectionless service. ***2***- This class represents basic connection-oriented service. Any combination of these classes can be provisioned by the user, but at least one class must be specified.

GROUP Ss7 Sccp OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Ss7

ATTRIBUTE Ss7 Sccp adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Ss7
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Ss7 Sccp operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

Copyright © 2006, Nortel Nortel Confidential

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib	Ss7
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Ss7 Sccp usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Ss7
Values	idle active (activ) busy
Default	idle

GROUP Ss7 Sccp Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes of the *Ss7SignallingConnControlPart* component.
Mib	Ss7

ATTRIBUTE Ss7 Sccp timerConnEstTimeouts (tConnEstTo)

Access	Read: All Write: Illegal
Description	This attribute counts the timeouts of the *tConnEstTimer.* The counter wraps to zero when it exceeds the maximum value.

Description	This group contains the provisionable attributes needed by the SSCOP sub-layer of SAAL-NNI.
Mib	Ss7

ATTRIBUTE Ss7 SaalNni maxPdusBetweenPolls (maxPdus)

Access	Read: All Write: All
Description	This attribute specifies the maximum number of Signalling Data PDUs that can be sent without sending a POLL PDU, as defined in ITU-T recommendation Q.2110.
Mib	Ss7
Values	Decimal (1..1000)
Default	500

ATTRIBUTE Ss7 SaalNni ccTimer (cc)

Access	Read: All Write: All
Description	This attribute specifies the time between transmissions of ‘BGN’, ‘END’, ‘RS’ and ‘ER’ PDUs, as defined in ITU-T recommendation Q.2110. The timer is started when any one of these PDUs is transmitted. The timer is stopped when a proper acknowledgement is received (e.g. BGNAK, ENDAK, RSACK, or ERACK). Upon timer expiry the PDU will be retransmitted. The PDU is transmitted a maximum of *maxCc* times. If the timer expires *maxCc* times, the link will be released, and the and the number of times this happens will be indicated by the attribute *maxCcReached.* Layer 3 will attempt to bring the link back up.
Mib	Ss7
Values	Decimal (100..1000)
Units	msec
Default	200

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Ss7 SaalNni maxCc

Access	Read: All Write: All
Description	This attribute specifies the maximum number of allowed unacknowledged transmissions of 'BGN', 'END', 'ER' or 'RS' Protocol Data Units (PDUs) as defined in ITU-T recommendation Q.2110. If the number of unacknowledged transmissions exceeds this value, the link will be released, and the number of times this happens will be indicated by the attribute *maxCcReached*.
Mib	Ss7
Values	Decimal (1..1000)
Default	4

ATTRIBUTE Ss7 SaalNni keepAliveTimer (tKeepAl)

Access	Read: All Write: All
Description	This attribute specifies the time between sending of POLL PDUs when there is no activity on the link, as defined in ITU-T recommendation Q.2110. The timer is started when either the *pollTimer* or the *keepAliveTimer* expires and there are no PDUs queued for sending. The timer is stopped when a data request (SD PDU) is ready to be sent. Upon expiry this timer sends a POLL PDU. The value of *keepAliveTimer* should be set to a value greater that *pollTimer* and greater than the round-trip delay of a PDU.
Mib	Ss7
Values	Decimal (100..1000)
Units	msec
Default	100

ATTRIBUTE Ss7 SaalNni noResponseTimer (noResp)

Access	Read: All Write: All
Description	This attribute specifies the time interval during which at least one STAT PDU should be received. The timer is started when a POLL PDU is sent.

Copyright © 2006, Nortel Nortel Confidential

The timer is stopped when a STAT PDU is received.

Upon timer expiry, the link is released, that is, brought out of service. Layer 3 will then attempt to bring it back to service.

The value of the *noResponseTimer* must not be less than the sum of the *keepAliveTimer* and one round-trip delay of a Protocol Data Unit (PDU).

The number of expiries of this timer is indicated by the attribute *noResponseTimeouts.*

Mib	Ss7
Values	Decimal (500..2000)
Units	msec
Default	1500

ATTRIBUTE Ss7 SaalNni pollTimer

Access	Read: All Write: All
Description	This attribute specifies the time between sending of POLL PDUs when the link has traffic, as defined in ITU-T recommendation Q.2110. The timer is started when the link enters the Data Transfer Ready State. The timer is stopped when the link is released. Upon expiry, a POLL PDU is sent and *pollTimer* is restarted if the link has traffic.
Mib	Ss7
Values	Decimal (100..1000)
Units	msec
Default	100

ATTRIBUTE Ss7 SaalNni idleTimer

Access	Read: All Write: All
Description	This attribute specifies the idle time after receipt of a STAT PDU, as defined in ITU-T recommendation Q.2110. The timer is started when a STAT PDU is received. The timer is stopped when data is sent or received on the link. Upon expiry, a POLL PDU is sent and the *noResponseTimer* is started.

Copyright © 2006, Nortel Nortel Confidential

The value of the *idleTimer* must be greater that the sum of the *pollTimer* and the maximum round trip delay of a PDU.

Mib	Ss7
Values	Decimal (100..1000)
Units	msec
Default	100

GROUP Ss7 SaalNni SscfProv (Sscf)

Properties	Provisioned
Description	This group contains provisionable attributes needed by the SSCF sub layer of SAAL-NNI.
Mib	Ss7

ATTRIBUTE Ss7 SaalNni provingMode

Access	Read: All Write: All
Description	This attribute allows the operator to place the link into one of the link proving modes defined in ITU-T recommendation Q.2140. ***normal*** - This mode corresponds to the MAAL-FORCE_PROVING-request. It forces the SAAL-NNI layer to utilize proving when bringing up the link. ***neutral*** - This mode corresponds to the MAAL-CLEAR_FORCE_MODES-request.It specifies that the layer using SAAL-NNI will select the proving mode. ***emergency*** - This mode corresponds to the MAAL-FORCE_EMERGENCY-request. It causes proving to be skipped. When this attribute is set to ***neutral,*** the layer that uses SAAL_NNI (MTP3) selects the proving mode, but when the attribute is set to ***normal*** or ***emergency***, instructions from the entity which uses SAAL-NNI are ignored.
Mib	Ss7
Values	normal neutral emergency
Default	neutral

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Ss7 SaalNni linkReEstablishTimer (t1)

Access	Read: All Write: All
Description	This attributes specifies the time between the link release action and the next link re-establish action during alignment, as defined in ITU-T recommendation Q.2140. This timer is started when a release indication or confirmation is received while the link is in the Alignment or InService state. This timer is stopped in one of two cases: If the SAAL-NNI layer successfully receives an establish request or establish confirm from the peer SAAL-NNI layer. If the SAAL_NNI layer receives a stop indication or release request from the layer 3 user or layer management respectively. Upon timer expiration, link alignment and proving is re-started.
Mib	Ss7
Values	Decimal (0..30)
Units	seconds
Default	5

ATTRIBUTE Ss7 SaalNni alignmentAcceptTimer (t2)

Access	Read: All Write: All
Description	This attributes specifies the total time to attempt alignment and is defined in ITU-T recommendation Q.2140. This timer is started when a start request is received. If the link is put in service before the expiry of this timer, no action is performed. This timer is stopped in one of two cases. If the SAAL-NNI layer successfully passes from the link proving state to the InService state. If the SAAL-NNI layer receives a stop indication from the layer 3, or a release request from layer management. Upon timer expiration, link establishment is cancelled and link is taken out of service. Layer 3 will attempt to bring the link back in service. The value of this timer can be adjusted if link proving fails due to an inability to send the target number proving PDUs indicated by the attribute *targetProvingPdus.* The current number of proving PDUs sent successfully is indicated by the attribute *currentProvingPdus*.

Mib	Ss7
Values	Decimal (5..150)
Units	seconds
Default	30

GROUP Ss7 SaalNni OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Ss7

ATTRIBUTE Ss7 SaalNni adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Ss7
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Ss7 SaalNni operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation.

Copyright © 2006, Nortel Nortel Confidential

Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib: Ss7

Values: enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Ss7 SaalNni usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib: Ss7

Values: idle
active (activ)
busy

Default: idle

GROUP Ss7 SaalNni Operational (Oper)

Properties: Operational

Description: This group contains the operational attributes of the *SS7SaalNni* component.

Mib: Ss7

ATTRIBUTE Ss7 SaalNni state (provSt)

Access: Read: All
Write: Illegal

Description: This attribute indicates the proving state of the link. The different states are:
notStarted - Proving has not started.
incomplete - Proving is in progress, but not completed yet.
completeSuccess - Proving has been completed successfully.
completeFailed - This proving attempt failed.

VERB Tidy Sw

Impact	Configuration
Description	*Tidy Sw* This verb is used to remove all unreferenced *AV* operational subcomponents along with all their associated software files from the disk. This means that an *AV* can be removed only if all of the following conditions are met: 1) The AV is not specified in the AVL in the Current view (that is, the one currently activated). 2) The AV is not specified in the AVL of the Edit view if it has been semantically checked. 3) The AV is not specified in any AVL which would become active if an existing semantically-checked provisioning file is loaded and activated. 4) The AV is not specified in any *AVL* in the journaling files. 5) The AV is not the parent AV of a patched AV that is ineligible for *Tidy*ing because it doesn't meet one or more of the above criteria. The *Tidy* command is mutually exclusive with *Check Prov*, *Download*, *Check Sw AutoPatch* and *Remove* commands. It will fail, not removing any *AVs*, if either a *Check Prov*, a *Download*, a *Remove, a Check Sw AutoPatch, or a Tidy* command is still in progress, or the file system is locked or otherwise unavailable.

GROUP Sw Provisioned (Prov)

Properties	Provisioned
Description	This group contains the Provisionable attributes for the *SW* component.
Mib	Software

ATTRIBUTE Sw avList (avl)

Access	Read and write
Description	This attribute specifies, for each application, which version of its *Features* and the associated software will be loaded when any of its *Features* are selected in an *LPT*. A version of the "base" application must be specified. All names specified by the user must actually be *AV* names. All *AVs* specified must be compatible with each other. No more than one version of a single application can be specified
Mib	Software
List of	String (1..30, ASCII)
Default	No default

ATTRIBUTE Sw patchList (patl)

Access	Read and write
Description	This attribute specifies which patches are to be loaded and enabled. Only patches for *Av*'s that appear in the *AvList* may be specified.

Copyright © 2006, Nortel Nortel Confidential

	Only patches appearing as instances of *Sw Av Patch* may be specified. Patch names are case insensitive. Except for case, patch names must be typed as they appear as instances of *Sw Av Patch*. All patches specified must be compatible with one another. Any prerequisite patches for specified patches, must themselves be specified. A patch must be specified only once in the list.
Mib	Software
List of	String (1..30, ASCII)
Default	No default

GROUP Sw Operational (Oper)

Properties	Operational
Description	This group contain the operational attributes for the *SW* component.
Mib	Software

ATTRIBUTE Sw tidyStatus

Access	Read only
Description	This attribute indicates the tidy or remove status. If the value is ***inactive***, no tidy or remove is in progress. If the value is ***inProgress*** or ***querying***, the tidy or remove process has begun and therefore no further *Tidy Sw or Remove sw/<avName>* command is allowed until status returns to inactive.
Mib	Software
Values	inactive inProgress querying
Default	No default

ATTRIBUTE Sw avBeingTidied

Access	Read only
Description	This attribute indicates the name of the AV currently being tidied or removed. An empty string indicates there is no AV being tidied.
Mib	Software
Values	String (1..30, ASCII)
Default	No default

ATTRIBUTE Sw avListToTidy

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute holds the list of names of AVs to be tidied or removed. As AVs are successfully cleaned, they are removed from this list and added to *avListTidied*.
Mib	Software
List of	String (1..30, ASCII)
Default	No default

ATTRIBUTE Sw avListTidied

Access	Read only
Description	This attribute holds the list of names of AVs which have been successfully tidied or removed as a result of the last *Tidy Sw or Remove Sw av/<avName>* command. It is cleared each time a new *Tidy Sw or Remove Sw av/<avName>* command is issued.
Mib	Software
List of	String (1..30, ASCII)
Default	No default

COMPONENT Sw Download (Dld)

Groups	GROUP Sw Dld Operational (Oper)
Scope	Device
Description	*Sw Dld* The *Download* component manages the retrieval of software from the Software Distribution Site (SDS). The module initiates the connection to the SDS and retrieves the files it wants according to the *AVs* specified by the user in *avListToDownload*.
Mib	Software
Common Verbs	Help List Display

VERB Start Sw Dld

Impact	Configuration
Description	*Start -u(<userid>) -p(<password>) -h(<host>) Sw Dld* This command is used to start a download. Before starting the download, the *avListToDownload* should be set up, specifying what to download. The *Start* will fail if a *Remove*, a *Tidy, a Check Sw AutoPatch,* or a *Check Prov* are in progress.

Copyright © 2006, Nortel Nortel Confidential

VERB Stop Sw Dld

Impact	Configuration
Description	*Stop Sw Dld* This command is used to stop a download. Note that it may not be possible to start another download immediately since it may take some time to tear down the IP connection (that is, the entity handling the connection may be suspended and not be able to even detect that a stoppage was requested).

GROUP Sw Dld **Operational (Oper)**

Properties	Operational
Description	This group contains the operational attributes for the *Download* component.
Mib	Software

ATTRIBUTE Sw Dld **avBeingDownloaded**

Access	Read only
Description	This attribute indicates the name of the AV currently being downloaded. If the download is ***inProgress***, this attribute will indicate the same as the first AV in the list of AV's to be downloaded. If there is no AV being downloaded, this attribute will indicate an empty string.
Mib	Software
Values	String (0..30, ASCII)
Default	No default

ATTRIBUTE Sw Dld **status**

Access	Read only
Description	This attribute indicates the download status. If the value is ***inactive***, no download is in progress. This is the value required in order to issue a *Start* command. If the value is ***inProgress***, the download procedure has begun. This process starts from the time a Software Distribution Site (SDS) login is attempted and continues through the time during which files are actually being transferred. If the value is ***stopping***, a user has requested a stoppage but the connections have not yet been completely torn down.
Mib	Software
Values	inactive inProgress stopping
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Sw Dld filesToTransfer

Access	Read only
Description	This attribute indicates the number of files which are still left to transfer for the *AV* currently being downloaded. It is cleared each time a new *AV* is processed from the *avListToDownload*. Note that for each *AV*, the value of this attribute will be 0 until the actual number of files to transfer has been computed.
Mib	Software
Values	Decimal (0..1000)
Default	No default

ATTRIBUTE Sw Dld processorTargets

Access	Read and write
Description	This attribute indicates the processor based object file to download on switch. After a CP restart or software migration, this attribute is initialized to the processor targets present on the CP disk for the current provisioned Application Versions (*AVs)*. This attribute can have the following values: ***i960*** - Object files for cards with an i960 processor are to be downloaded. ***ppc*** - Object files for cards with a PowerPC processor are to be downloaded.
Mib	Software
Set of	i960 ppc
Default	No default

ATTRIBUTE Sw Dld avListToDownload (dldList)

Access	Read and write
Description	This attribute holds the list of names of *AVs* to be downloaded. If a download is in progress, the first one in the list is the one currently being downloaded. As *AVs* are successfully downloaded, they are removed from this list and added to the *downloadedAvList*. The user cannot specify an *AV* which already exists on disk. It must first be removed before re-downloading it (see the *Tidy* and *Remove* commands).
Mib	Software
List of	String (1..30, ASCII)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Sw Dld downloadedAvList

Access	Read only
Description	This attribute holds the list of names of *AVs* which have been successfully downloaded as a result of the last *Start* command. It is cleared each time the *Start* command is issued.
Mib	Software
List of	String (1..30, ASCII)
Default	No default

COMPONENT Sw ApplicationVersion (Av)

Instance	String (1..30, ASCII)
Groups	GROUP Sw Av Operational (Oper)
Scope	Device
Description	*Sw Av/<name>* This component represents a particular version of an application that is available to use in the *AVL*. They can only be created by downloading and can only be deleted by using the *Tidy* or *Remove* commands. The *PatchVersion* subcomponent only exists for the patch *AV*. The component contains the patch version files which are used to determine the status and category of a given patch. It is used in conjunction with the *AutoPatch* component for the auto-patch feature. An *AV* has one or more *Feature* subcomponents, and it may have one or more Patch subcomponents which belong to it.

VERB Remove Sw Av

Impact	Configuration
Description	*Remove Sw Av/<name>* This command is used to remove an AV component and the associated software files from the disk as long as it is unreferenced. This means that an *AV* can be removed only if all of the following conditions are met: 1) The AV is not specified in the *AVL* in the Current view (that is, the one currently activated). 2) The AV is not specified in the *AVL* in the Edit view if it has been semantically checked. 3) The AV is not specified in any *AVL* which would become active if an existing semantically-checked provisioning file is loaded and activated. 4) The AV is not specified in any *AVL* in the journaling files. 5) The AV is not a parent AV to a patched AV. To remove an AV that has patched AVs based upon it, first remove the patched AVs. To clean up unused provisioning files, see the “Tidy Prov” command. To clean up journaling files, see the “Commit Prov” command. The *Remove* command is mutual exclusive with *Check Prov*, *Download*, *Check Sw AutoPatch*, and *Tidy* command. It will fail, not removing this *AV*, if either a *Check Prov*, a *Download*, a *Tidy, a Check Sw AutoPatch,* or a *Remove* command is still in progress, or if the file system is locked or otherwise unavailable.

GROUP Sw Av Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for an *AV* component.
Mib	Software

ATTRIBUTE Sw Av processorTargets

Access	Read only
Description	This is a list of the processor based object file types which exist on disk for a given AV. Semantic check will validate that the object files needed for a provisioned card type are present as part of an application.
Mib	Software
Set of	i960 ppc
Default	No default

ATTRIBUTE Sw Av description (descr)

Access	Read only
Description	This attribute describes the functionality of the *AV*. If the *AV* is a patched *AV*, this attribute describes the new behavior delivered by the patched *AV*.
Mib	Software

Copyright © 2006, Nortel Nortel Confidential

Values	String (0..512, ASCII)
Default	No default

ATTRIBUTE Sw Av compatibleAvList

Access	Read only
Description	This is a list of the *AV* names which specify the minimum version of all other applications that can be used in conjunction with this *AV* in an *AVL*. Semantic checks will validate that *AVs* within the *AVL* are indeed compatible.
Mib	Software
List of	String (1..30, ASCII)
Default	No default

COMPONENT Sw Av Feature (Feat)

Instance	String (1..30, ASCII)
Scope	Device
Description	*Sw Av/<name> Feat/<name>* There is one of these components for each provisionable feature of the parent AV component. Each feature's name can be used in an Lpt's feature list attribute. A feature component does not have any attributes of its own.
Mib	Software
Common Verbs	Help List Display

COMPONENT Sw Av Patch (Patch)

Instance	String (1..30, ASCII)
Groups	GROUP Sw Av Patch Operational (Oper)
Scope	Device
Description	*Sw Av/<name> Patch/<name>* There is one of these components for each patch of the parent AV component that has been downloaded to the switch.
Mib	Software
Common Verbs	Help List Display

Copyright © 2006, Nortel Nortel Confidential

GROUP Sw Av Patch Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *Patch* component.
Mib	Software

ATTRIBUTE Sw Av Patch description (descr)

Access	Read only
Description	This attribute indicates the new behavior that the patch provides. The availability of this description is dependent on the disk being available.
Mib	Software
Values	String (0..512, ASCII)
Default	No default

ATTRIBUTE Sw Av Patch patchType (type)

Access	Read only
Description	This attribute indicates the patch type. This attribute can have a value of ***tap*** (transparent application), ***cpReset***, or ***fpReset.*** TAP patches do not require a card reset in order for the patch to become active, whereas Reset patches involve the full replacement of an executable file and therefore necessitate the reloading of the cards on which that file is active. Because the *patchType* attribute is not stored in memory and must be retrieved from the CP disk, the availability of this attribute is dependent on the disk being available.
Mib	Software
Set of	tap cpReset fpReset none
Default	No default

ATTRIBUTE Sw Av Patch patchStatus (status)

Access	Read only
Description	This attribute indicates the current status of a patch. The patch status can be one of three values: ***released*** (denoting a patch that is GA), ***verification*** (denoting a patch that is still in Beta testing) and ***none*** (default, when the system is not sure of the patch status). Because the *patchStatus* attribute is not stored in memory and must be retrieved from the CP disk, the availability of this attribute is dependent on the disk being available.
Mib	Software

Copyright © 2006, Nortel Nortel Confidential

Values	released verification none
Default	No default

ATTRIBUTE Sw Av Patch patchCategory (category)

Access	Read only
Description	This attribute indicates the current category of a patch. The patch category can be one of six values: ***GEN*** (General Availability), ***LTD*** (Limited Distribution), ***DBG*** (Debug Content in the patch), ***OBS*** (Standard Obsolete patch), ***OBE*** (Emergency Obsolete patch), and ***NONE*** (default, when the system is not sure of the patch category). Because the *patchCategory* attribute is not stored in memory and must be retrieved from the CP disk, the availability of this attribute is dependent on the disk being available.
Mib	Software
Values	gen ltd dbg obs obe none
Default	No default

ATTRIBUTE Sw Av Patch autoEligible (auto)

Access	Read only
Description	This attribute indicates whether a patch is eligible for auto- application. If the value of this attribute is ***no***, it overrides any other eligibility considerations and the patch is ineligible. However, if the value of this attribute is ***yes***, the patch must still meet all of the other criteria for auto-application eligibility. Because the *autoEligible* attribute is not stored in memory and must be retrieved from the CP disk, the availability of this attribute is dependent on the disk being available.
Mib	Software
Values	yes no none
Default	No default

ATTRIBUTE Sw Av Patch mutuallyExclusive (mutEx)

Access	Read only
Description	This attribute indicates patches that are mutually exclusive to the patch being displayed. Because the *mutuallyExclusive* attribute is not stored in

Copyright © 2006, Nortel Nortel Confidential

memory and must be retrieved from the CP disk, the availability of this attribute is dependent on the disk being available.

Mib	Software
List of	String (1..30, ASCII)
Default	No default

ATTRIBUTE Sw Av Patch prerequisites (prereq)

Access	Read only
Description	This attribute indicates patches that are prerequisites to the patch being displayed. Prerequisite patches must appear in the *Sw patchList* along with the patch in question. Because the *prerequisites* attribute is not stored in memory and must be retrieved from the CP disk, the availability of this attribute is dependent on the disk being available.
Mib	Software
List of	String (1..30, ASCII)
Default	No default

ATTRIBUTE Sw Av Patch activateAfter (actAft)

Access	Read only
Description	This attribute indicates the patch or patches that are activated prior to the patch currently being displayed, when all patches are provisioned (that is, the patch being displayed is activated following the activation of the patches listed in this attribute). For example, if patch A is the patch listed in patch B's *activateAfter* attribute, patch A is activated before patch B, when both patch A and B are present in the *Sw patchList* attribute. Since the *activateAfter* attribute is not stored in memory and must be retrieved from the CP disk, the availability of this attribute is dependent on the disk being available.
Mib	Software
List of	String (1..30, ASCII)
Default	No default

ATTRIBUTE Sw Av Patch supersedes (super)

Access	Read only
Description	This attribute indicates patches that are superseded by the patch being displayed. This patch and any of the patches that it supersedes are mutually exclusive to the patch being displayed. Because the *supersedes* attribute is not stored in memory and must be retrieved from the CP disk, the availability of this attribute is dependent on the disk being available.

COMPONENT TdmaIwfBearerChannel (TdmaBc)

Instance	csIndex [Decimal (1..10)] bcIndex [Decimal (1..14030)]
Groups	GROUP TdmaBc Operational (Oper) GROUP TdmaBc CustomerIdentifierData (CidData) GROUP TdmaBc OsiState (State)
Scope	Application
Description	*TdmaBc/<csIndex>,<bcIndex>* This component represents an individual bearer channel resource for a given *TdmaIwfCallServer*. Depending on the call type requested, the *TdmaIwfCallServer* links one or more *TdmaIwfBearerChannel*s in a single DMS-MTX InterWorking Function (IWF) call. Each *TdmaIwfBearerChannel* is linked to a channel on a DS1 or E1 port on a *TdmaIwfLogicalProcessor* (one *TdmaIwfBearerChannel* per channel). The instance value *csIndex* is the logical identifier for the DMS-MTX and is used for associating the call server with this *TdmaIwfBearerChannel* instance. The instance value *bcIndex* is the logical identifier for the *TdmaIwfBearerChannel*. It and the csIndex together define a unique *TdmaIwfBearerChannel*.

Mib	TdmaIwf
Values	The name of the component
Default	No default

GROUP TdmaBc CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	TdmaIwf

ATTRIBUTE TdmaBc customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	TdmaIwf
Values	Decimal (0; 1..8191)
Default	0

GROUP TdmaBc OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	TdmaIwf

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE TdmaBc adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	TdmaIwf
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE TdmaBc operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	TdmaIwf

COMPONENT TdmaBc Framer

Groups
GROUP TdmaBc Framer Provisioned (Prov)
GROUP TdmaBc Framer Statistics (Stats)
GROUP TdmaBc Framer LinkOptions (Link)
GROUP TdmaBc Framer OsiState (State)

Scope Device

Description
TdmaBc/<csIndex>,<bcIndex> Framer
The *TdmaIwfFramer* component controls link layer framing for application components sending and receiving data on a link interface. The *TdmaIwfFramer* component provides provisionable attributes related to datapath aspects of the hardware interface rather than interface specific attributes which are associated with hardware components. The *TdmaIwfFramer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

GROUP TdmaBc Framer Provisioned (Prov)

Properties Provisioned

Description

This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.

Mib TdmaIwf

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE TdmaBc Framer interfaceName

Access	Read and write
Criticality	Process
Description	This attribute contains a hardware component name. The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.
Mib	TdmaIwf
Values	Link (Hardware, applicationFramerName)
Default	No default

GROUP TdmaBc Framer Statistics (Stats)

Properties	Operational
Description	This group contains the operational statistics data for a *TdmaIwfFramer* component.
Mib	TdmaIwf

ATTRIBUTE TdmaBc Framer txFrames

Access	Read only
Description	This attribute counts the number of frames transmitted to the link interface by *TdmaIwfFramer.* The counter wraps when it exceeds the maximum value.
Mib	TdmaIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE TdmaBc Framer rxFrames

Access	Read only
Description	This attribute counts the number of frames received from the link interface by *TdmaIwfFramer.* The counter wraps when it exceeds the maximum value.
Mib	TdmaIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE TdmaBc Framer rxBytes

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of bytes received from the link interface by *TdmaIwfFramer*. The counter wraps when it exceeds the maximum value.
Mib	TdmaIwf
Values	Decimal (0..4294967295)
Default	0

GROUP TdmaBc Framer LinkOptions (Link)

Properties	Provisioned
Description	This group contains provisionable attributes for the *TdmaIwfFramer* which controls link layer framing for application components sending and receiving data on a link interface for this particular *TdmaIwfBearerChannel*.
Mib	TdmaIwf

ATTRIBUTE TdmaBc Framer framingType

Access	Read: All Write: Service
Criticality	Process
Description	This attribute indicates the type of framing for the link layer data received and transmitted on this channel. This attribute has one of the following values: ***btdsFraming***: Bit transparent framing for the *TdmaIwfBearerChannel* components on MVP cards. ***mtxFraming***: DMS-MTX InterSystem Link Protocol (ISLP) framing required for the *TdmaIwfBearerChannel* components on DS1C/E1C cards.
Mib	TdmaIwf
Values	btdsFraming mtxFraming
Default	No default

GROUP TdmaBc Framer OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	TdmaIwf

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE TdmaBc Framer adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	TdmaIwf
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE TdmaBc Framer operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	TdmaIwf
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE TdmaBc Framer usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component.

training
connected
releasing

Default: No default

ATTRIBUTE TdmaBc Modem mobileSideFlowControlState (mobileFlow)

Access:
Read: All
Write: Illegal

Copyright © 2006, Nortel
Nortel Confidential

Description	This attribute indicates the state of flow control based on whether flow control was requested by the mobile side of the connection and an indication was sent to an upper layer protocol. This attribute has one of the following values: ***on***: Flow control is active towards the mobile side of the call. ***off***: Flow control is not active towards the mobile side of the call.
Mib	TdmaIwf
Values	on off
Default	No default

ATTRIBUTE TdmaBc Modem pstnSideFlowControlState (pstnFlow)

Access	Read: All Write: Illegal
Description	This attribute indicates the state of flow control based on whether flow control was requested by the PSTN side of the connection and an indication was sent to the Digital Signal Processor. This attribute has one of the following values: ***on***: Flow control is active towards the DSP (PSTN side of the call). ***off***: Flow control is not active towards the DSP (PSTN side of the call).
Mib	TdmaIwf
Values	on off
Default	No default

ATTRIBUTE TdmaBc Modem asyncMode (async)

Access	Read: All Write: Illegal
Description	This attribute indicates whether conversion between synchronous and asynchronous data format (specifically, the stripping or insertion of start and stop bits) is being performed. The value is ***on*** unless the V.42 layer is active or it is a fax call. This attribute has one of the following values: ***on***: Conversion between synchronous and asynchronous data is being performed. ***off***: Conversion between synchronous and asynchronous data is not being performed.
Mib	TdmaIwf
Values	on off
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE TdmaBc Modem outbandFlowControl (outbandFlow)

Access	Read: All Write: Illegal
Description	This attribute indicates whether outband flow control conversions are being performed. If outband flow control is on, then when the Modem Application Layer (MAL) receives an xon or xoff from the PSTN, the MAL converts the instruction into a primitive and sends it to the Data Service Control (DSC). In the opposite direction with outband flow control on, when the MAL receives a primitive from the DSC, the MAL converts the primitive into an xon or xoff and forwards it to the PSTN. If outband flow control is off, then all flow control is handled inband. The modem performs either inband or outband flow control unless V.42 layer is active, it is a fax call, or no flow control was specified by the DMS-MTX. This attribute has one of the following values: ***on***: Conversion to and from out-of-band signaling is enabled. ***off***: Conversion to and from out-of-band signaling is disabled.
Mib	TdmaIwf
Values	on off
Default	No default

ATTRIBUTE TdmaBc Modem outbandBreak (outbandBrk)

Access	Read: All Write: Illegal
Description	This attribute indicates whether inband or outband break control conversions are being performed. If outband break control is on, when the modem detects a break condition coming from the PSTN, the Modem Application Layer (MAL) converts the instruction into a primitive and forwards it to the Data Service Control (DSC). In the opposite direction with outband break control on, when the MAL receives a primitive from the DSC, the MAL converts the primitive into a break and forwards it to the PSTN. When a break condition is discovered all subsequent incoming data is discarded until a start bit is received.
Mib	TdmaIwf
Values	on off
Default	No default

ATTRIBUTE TdmaBc Modem autobaud

Access	Read: All Write: Illegal
Description	This attribute indicates whether autobaud is active. The modem is instructed at call setup time by the DMS-MTX on the

Copyright © 2006, Nortel Nortel Confidential

following:
(1) the initial modem data rate value, and
(2) whether a modem is allowed to perform autobauding (***on***) or not (***off***). With autobauding on, the modem is allowed to connect using a valid modem data rate less than or equal to the initial rate specified to the modem by the DMS-MTX. If a modem cannot perform autobauding and the carrier cannot be established at the initial data rate, the modem is disabled.

Units	octets
Default	No default

ATTRIBUTE TdmaBc V42 rxN401FrameSize (rxN401)

Access	Read: All Write: Illegal
Description	This attribute indicates the current value of N401, that is negotiated during Exchange Identification (XID). This is the maximum number of octets that can be carried in the information field of an information frame received from the PSTN modem. An incoming information frame carrying data octets more than this size shall be rejected by the IWF V.42. The value used for XID negotiations can be provisioned via *TdmaCs/* V42.*
Mib	TdmaIwf
Values	Decimal (1..255)
Units	octets
Default	No default

ATTRIBUTE TdmaBc V42 txKWindowSize (txK)

Access	Read: All Write: Illegal
Description	This attribute indicates the current value of k, that is negotiated during Exchange Identification (XID). This is the size of flow control sliding window used for the information frames that the V.42 transmits to the PSTN modem. This size governs the maximum number of information frames that the IWF V.42 error-correcting entity can have outstanding (that is, unacknowledged). The value used for XID negotiations can be provisioned via *TdmaCs/* V42.*
Mib	TdmaIwf
Values	Decimal (0..127)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE TdmaBc V42 rxKWindowSize (rxK)

Access	Read: All Write: Illegal
Description	This attribute indicates the current value of k that is negotiated during Exchange Identification (XID). This is the size of flow control sliding window used for information frames transmitted from the PSTN modem. This size governs the maximum number of information frames that the peer of the IWF V.42 error-correcting entity can have outstanding (that is, unacknowledged). The value used for XID negotiations can be provisioned via *TdmaCs/* V42.*
Mib	TdmaIwf
Values	Decimal (1..127)
Default	No default

ATTRIBUTE TdmaBc V42 v42ActiveInCall

Access	Read: All Write: Illegal
Description	This attribute indicates whether V42 is really being used in this data call.
Mib	TdmaIwf
Values	notActiveInCall activeInCall
Default	notActiveInCall

ATTRIBUTE TdmaBc V42 v42BisActiveInCall

Access	Read: All Write: Illegal
Description	This attribute indicates whether V42bis is really being used in this data call.
Mib	TdmaIwf
Values	notActiveInCall activeInCall
Default	notActiveInCall

GROUP TdmaBc V42 Statistics (Stats)

Properties	Operational
Description	This group contains statistical attributes that measure the V.42 error detection and correction performance.
Mib	TdmaIwf

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE TdmaBc V42 rxIBytes

Access	Read: All Write: Illegal
Description	This attribute counts the total number of bytes that the V.42 actually received from the PSTN modem in a data call. The counter wraps when it exceeds the maximum value.
Mib	TdmaIwf
Values	Decimal (0..4294967295)
Units	octets
Default	0

ATTRIBUTE TdmaBc V42 txIBytes

Access	Read: All Write: Illegal
Description	This attribute counts the total number of bytes that the V.42 transmitted to the PSTN modem in a data call. The counter wraps when it exceeds the maximum value.
Mib	TdmaIwf
Values	Decimal (0..4294967295)
Units	octets
Default	0

ATTRIBUTE TdmaBc V42 rxIFrames

Access	Read: All Write: Illegal
Description	This attribute counts the total number of Information (I) frames that the V.42 received from the PSTN modem in a data call. The counter wraps when it exceeds the maximum value.
Mib	TdmaIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE TdmaBc V42 txIFrames

Access	Read: All Write: Illegal
Description	This attribute counts the total number of information frames that the V.42 transmitted to the PSTN modem in a data call. The counter wraps when it exceeds the maximum value.

Copyright © 2006, Nortel Nortel Confidential

Mib	TdmaIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE TdmaBc V42 retransmittedFrames (retransFrm)

Access	Read: All Write: Illegal
Description	This attribute counts the total number of frames retransmitted by the IWF V.42 entity in a data call. The V.42 retransmits the same frame when the associated T401 acknowledgment timer timeouts or when a Reject (REJ) supervisory frame has been received from the PSTN modem. The counter wraps when it exceeds the maximum value.
Mib	TdmaIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE TdmaBc V42 t1AckTimeouts (t1Timeout)

Access	Read: All Write: Illegal
Description	This attribute counts the total number of times that the T401 timer has timed out within a data call. If this timer times-out frequently, the operator may need to adjust the provisioned parameter T401 acknowledgment timer to a larger time amount, since every time that V.42 sends out a frame it sets the T401 timer to wait for the peer's acknowledgment of the frame. When the timer times-out and no acknowledgment has been received, the V.42 sends the same frame to its peer. The counter wraps when it exceeds the maximum value.
Mib	TdmaIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE TdmaBc V42 remoteBusyIndications (remoteBusy)

Access	Read: All Write: Illegal
Description	This attribute counts the total number of times the PSTN modem enters a busy state (the IWF has received a Receive Not Ready message) and asks the IWF V.42 not to send Information (I) frames to it until it is ready to receive information frames again (indicated by receipt of a Receive Ready message or a data message). The counter wraps when it exceeds the maximum value.
Mib	TdmaIwf

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE TdmaBc V42 localBusyIndications (localBusy)

Access	Read: All Write: Illegal
Description	This attribute counts the total number of times the IWF V.42 enters in a busy condition and asks the peer to stop sending information frames until it has cleared up from the busy condition. The V.42 enters busy condition when its data buffer is about to be overflowed by the incoming Information (I) frames. The counter wraps when it exceeds the maximum value.
Mib	TdmaIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE TdmaBc V42 badFramesRx (badFrmRx)

Access	Read: All Write: Illegal
Description	This attribute counts the total number of bad frames the IWF V.42 has received from the PSTN remote modem within the data call. In this instance, “bad frames” refer to the V.42 protocol error frames other than the check sequence error frames. The counter wraps when it exceeds the maximum value.
Mib	TdmaIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE TdmaBc V42 crcErrorsRx (crcErrRx)

Access	Read: All Write: Illegal
Description	This attribute counts the total number of frames received from the remote PSTN modem that contain incorrect frame check sequence. A high value signifies the condition of the physical medium is poor. The counter wraps when it exceeds the maximum value.
Mib	TdmaIwf
Values	Decimal (0..4294967295)
Default	0

COMPONENT TdmaBc V42Bis

Groups	GROUP TdmaBc V42Bis Operational (Oper) GROUP TdmaBc V42Bis Statistics (Stats)
Scope	Application
Description	*TdmaBc/<csIndex>,<bcIndex> V42bis* This component represents the group of measurements for the ITU-T V.42bis data compression protocol established for an IWF call (on the mobile station to the IWF link or the IWF to PSTN fax modem link) on this particular *TdmaIwfBearerChannel.* Note that this component is present only if the current or most recent call involved this protocol.
Mib	TdmaIwf
Common Verbs	Help List Display

GROUP TdmaBc V42Bis Operational (Oper)

Properties	Operational
Description	This group contains operational attributes that measure the performance of *IwfV42bis*.
Mib	TdmaIwf

ATTRIBUTE TdmaBc V42Bis protocolModeEncoder (modeEncoder)

Access	Read: All Write: Illegal
Description	This attribute indicates the current mode of the *IwfV42bis* encoder. This mode can be either: ***transparent***: A mode of operation in which compression has been selected but data is being transmitted in uncompressed form. Transparent mode command sequences may be inserted into the data stream. ***compressed***: A mode of operation in which data is transmitted in codewords. The encoder switches between the two modes depending on whether the data coming from the Date Terminal Equipment (DTE) is suitable for compression. The data compression function periodically determines the compressibility of the data based on a comparison of the number of bits required to represent a segment of the data stream before and after compression.
Mib	TdmaIwf
Values	transparent compressed
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE TdmaBc V42Bis protocolModeDecoder (modeDecoder)

Access	Read: All Write: Illegal
Description	This attribute indicates the current mode of the V.42bis decoder. This mode can be either: ***transparent***: A mode of operation in which compression has been selected but data is being transmitted in uncompressed form. Transparent mode command sequences may be inserted into the data stream. ***compressed***: A mode of operation in which data is transmitted in codewords. The encoder (at the mobile or PSTN) switches between the two modes depending on whether the data coming from the Date Terminal Equipment (DTE) is suitable for compression. The data compression function periodically determines the compressibility of the data based on a comparison of the number of bits required to represent a segment of the data stream before and after compression.
Mib	TdmaIwf
Values	transparent compressed
Default	No default

ATTRIBUTE TdmaBc V42Bis p0CompressionDirection (p0)

Access	Read: All Write: Illegal
Description	This attribute indicates the direction in which V.42bis is active, negotiated at link setup by the data link protocol through Exchange Identification (XID) negotiation of parameter P0 (compression direction). The value used for XID negotiations can be provisioned via *TdmaCs/* V42bis*. This attribute has one of the following values: ***noCompression***: No data compression. ***compInitrResp***: The data sent by the IWF to the other entity is compressed. ***compRespInitr***: The data received by the IWF from the other entity is compressed. ***compBoth***: compression in both directions.
Mib	TdmaIwf
Values	noCompression compInitrResp compRespInitr compBoth
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE TdmaBc V42Bis p1MaximumCodewords (p1)

Access	Read: All Write: Illegal
Description	This attribute indicates the maximum number of codewords in the dictionary negotiated at link setup by the data link protocol by way of the Exchange Identification (XID) negotiation of parameter P1 (number of codewords). The value used for XID negotiations can be provisioned via *TdmaCs/* V42bis*.
Mib	TdmaIwf
Values	Decimal (0..4096)
Default	No default

ATTRIBUTE TdmaBc V42Bis p2MaximumStringSize (p2)

Access	Read: All Write: Illegal
Description	This attribute indicates the maximum number of characters allowed in a string represented by a codeword negotiated at link setup by the data link protocol by way of the Exchange Identification (XID) negotiation of parameter P2 (maximum string size). The value used for XID negotiations can be provisioned via *TdmaCs/* V42bis.*
Mib	TdmaIwf
Values	Decimal (6..250)
Default	No default

ATTRIBUTE TdmaBc V42Bis lastDecodeError (lastDecodeErr)

Access	Read: All Write: Illegal
Description	This attribute indicates last error found by the decoder. This attribute has one of the following values: ***none***: No errors found. ***badStepup***: Receipt of STEPUP (step up codeword size) codeword when it would cause C2 (current code word size) to exceed N1 (maximum code word size). ***codewordEqC1***: Receipt of a codeword, at any time, equal to C1 (next empty dictionary entry). ***emptyCodeword***: Receipt of a codeword representing an empty dictionary entry. ***reservedCommand***: Receipt of a reserved command code. ***generalError***: Receipt of any other error. The action taken by V.42bis on detecting an error is provisioned via *TdmaCs/* V42bis.*
Mib	TdmaIwf

Copyright © 2006, Nortel Nortel Confidential

Values	none badStepup codewordEqC1 emptyCodeword rsvdCommand generalError
Default	none

ATTRIBUTE TdmaBc V42Bis compRatioEncoder

Access	Read: All Write: Illegal
Description	This attribute indicates the number of uncompressed bytes divided by the number of compressed bytes. A value greater than one means that the data is being compressed. This is the compression ratio achieved by the V.42bis encoder running on the Passport. This attribute is relevant for both protocol modes transparent and compressed as the encoder switches between the two modes.
Mib	TdmaIwf
Values	Decimal (0.00..300.00)
Default	No default

ATTRIBUTE TdmaBc V42Bis compRatioDecoder

Access	Read: All Write: Illegal
Description	This attribute indicates the number of uncompressed bytes divided by the number of compressed bytes. A value greater than one means that the data is being compressed. This is the compression ratio achieved by the V.42bis encoder at the mobile or PSTN. This attribute is relevant for both protocol modes transparent and compressed as the encoder switches between the two modes.
Mib	TdmaIwf
Values	Decimal (0.00..300.00)
Default	No default

GROUP TdmaBc V42Bis Statistics (Stats)

Properties	Operational
Description	This group contains statistical attributes that measure the performance of *IwfV42bis*.
Mib	TdmaIwf

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE TdmaBc V42Bis modeChangesEncode (modeChgEncode)

Access	Read: All Write: Illegal
Description	This attribute counts the number of mode changes (from transparent to compressed or from compressed to transparent) by the encoder. The counter wraps when it exceeds the maximum value.
Mib	TdmaIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE TdmaBc V42Bis modeChangesDecode (modeChgDecode)

Access	Read: All Write: Illegal
Description	This attribute counts the number of mode changes (from transparent to compressed or from compressed to transparent) by the decoder. The mode changes are determined by the encoder at the mobile or the PSTN. The counter wraps when it exceeds the maximum value.
Mib	TdmaIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE TdmaBc V42Bis resetsEncode

Access	Read: All Write: Illegal
Description	This attribute counts the number of resets sent by the encoder. A reset is a command code sent by the encoder to force dictionary reinitialization. The counter wraps when it exceeds the maximum value.
Mib	TdmaIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE TdmaBc V42Bis resetsDecode

Access	Read: All Write: Illegal
Description	This attribute counts the number of resets received by the decoder. A reset is a command code sent by the encoder to force dictionary reinitialization. The resets of the decoder are determined by the encoder at the mobile or PSTN. The counter wraps when it exceeds the maximum value.
Mib	TdmaIwf

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE TdmaBc V42Bis reinitializations (reInit)

Access	Read: All Write: Illegal
Description	This attribute counts the number of times V.42bis is reinitialized because of a destructive break (a destructive break is a break that causes data to be discarded) occurring on the error-corrected connection initiated by either the mobile or PSTN. The counter wraps when it exceeds the maximum value.
Mib	TdmaIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE TdmaBc V42Bis errorsInDecode (errDecode)

Access	Read: All Write: Illegal
Description	This attribute counts the number of errors found by the decoder. The errors could be any of the following: 1.Receipt of STEPUP (step up codeword size) codeword when it would cause C2 (current code word size) to exceed N1 (maximum code word size). 2. Receipt of a codeword, at any time, equal to C1 (next empty dictionary entry). 3. Receipt of a codeword representing an empty dictionary entry. 4. Receipt of a reserved command code. 5. Receipt of any other error. The counter wraps when it exceeds the maximum value. The action taken by V.42bis on detecting any of these errors is provisioned via *TdmaCs/* V42bis.*
Mib	TdmaIwf
Values	Decimal (0..4294967295)
Default	0

GROUP TdmaCs MiscProvisioned (MiscProv)

Properties	Provisioned
Description	This group contains general provisioning data for the *TdmaIwfCallServer* that does not fit within other provisioning groups.
Mib	TdmaIwf

ATTRIBUTE TdmaCs commentText

Access	Read: All Write: All
Description	Use of this attribute is at the discretion of the system administrator. Typically, this attribute is used to specify the name of the DMS-MTX configured for this *TdmaIwfCallServer* plus any other commentary information.
Mib	TdmaIwf
Values	String (0..40, ASCII)
Default	""

ATTRIBUTE TdmaCs mtxIpAddress (ipAddr)

Access	Read: All Write: Configuration
Description	This attribute specifies the Internet Protocol (IP) Address of the Mobile Telephone Exchange (MTX) that is permitted to set up MTX InterWorking Function (IWF) data calls using this *TdmaIwfCallServer*. This address must be specified in order for this *TdmaIwfCallServer* to provide service. If call setups are attempted from an MSC which does not have this address, those calls are rejected. The *callsRequested* statistic of this *TdmaIwfCallServer* is incremented and appropriate call failure logs are generated at the MSC.
Mib	TdmaIwf
Values	IP address

Copyright © 2006, Nortel Nortel Confidential

Default	0.0.0.0

ATTRIBUTE TdmaCs virtualRouterName (vr)

Access	Read: All Write: Configuration
Criticality	Component
Description	This attribute specifies the virtual router that this *TdmaIwfCallServer* uses for transmitting and receiving signaling messages to and from the DMS-MTX.
Mib	TdmaIwf
Values	The name of the component
Default	No default

ATTRIBUTE TdmaCs voiceLaw (encoding)

Access	Read: All Write: Configuration
Description	This attribute specifies the voice law to be established for the IWF to PSTN modem link for calls established by this *TdmaIwfCallServer*. This attribute has one of the following values: ***aLaw***: A protocol for encoding voice-band audio, Pulse Code Modulation (PCM). ***muLaw***: A protocol for encoding voice-band audio, PCM. Note that this value must match the voice law used at the DMS-MTX connected to this *TdmaIwfCallServer*.
Mib	TdmaIwf
Values	aLaw muLaw
Default	No default

GROUP TdmaCs CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	TdmaIwf

ATTRIBUTE TdmaCs customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the

Copyright © 2006, Nortel Nortel Confidential

component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Mib	TdmaIwf
Values	Decimal (0; 1..8191)
Default	0

GROUP TdmaCs OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	TdmaIwf

ATTRIBUTE TdmaCs adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	TdmaIwf

Copyright © 2006, Nortel Nortel Confidential

Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE TdmaCs operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	TdmaIwf
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE TdmaCs usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	TdmaIwf
Values	idle active (activ) busy
Default	idle

GROUP TdmaCs Statistics (Stats)

Properties	Operational
Description	This group contains operational attributes that measure the performance used for the calls set up by this particular *TdmaIwfCallServer*.

COMPONENT TdmaCs DataCircuitTerminatingEquipment (Dce)

Scope Application

Description TdmaCs/<csIndex> Dce
This component represents an instance of the Data Circuit-Terminating Equipment (DCE). The DCE represents a layer of the protocol stack for the network-side connection to the Public Switched Telephone Network. It is responsible for call control, AT-command handling, user-data transport, online-command signaling, break signaling, circuit/signal lead transport, and compression negotiation. The DCE is based on the BMI (BSC, MSC, IWF) portion of the IS-135 standard.

ATTRIBUTE TdmaCs V42 t400DetectTimer (t400)

Access	Read: All Write: Service
Description	This attribute specifies the maximum amount of time that the IWF waits for an Originator Detection Pattern (ODP) or Answerer Detection Pattern (ADP). ODP/ADP is a series of special bit patterns used during the call setup procedures. If the IWF is the originator of the call, it starts sending ODP patterns and waits for an ADP for the duration of T400 from the answerer at call setup time. If the IWF is the answerer of the call, it waits for an ODP for T400 seconds from the originator and if it receives during that time it sends an ADP pattern to the originator at the call setup time. Since both sides operate with different values of T400 timer, a higher value increases the chance of a successful call setup. Changes to this attribute do not affect existing calls.
Mib	TdmaIwf
Values	Decimal (0.75..2.54)
Units	seconds
Default	0.75

ATTRIBUTE TdmaCs V42 t401AckTimer (t401)

Access	Read: All Write: Service
Description	This attribute specifies the maximum amount of time that the IWF waits for an acknowledgment before retransmitting a frame. Since information about the T401 timer is not carried in the Exchange Identification (XID) negotiations at call setup time, both sides operate with different timer values. The value for T401 depends on many factors, such as propagation delay or frame processing time. A frame is retransmitted up to N400 times if the timer T401 expires before an acknowledgment for a frame is actually received. The performance of the data link layer can be impacted by the value of this timer as retransmissions of frames occur on expiry of timer T401. Changes to this attribute do not affect existing calls.
Mib	TdmaIwf
Values	Decimal (0.50..9.00)
Units	seconds
Default	4.00

ATTRIBUTE TdmaCs V42 t402AckDelayTimer (t402)

Access	Read: All Write: Service

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the maximum amount of time that the IWF may wait following the receipt of any frame requiring a reply before it initiates transmission of an appropriate reply in order to ensure that the reply frame is received by the remote error-correcting entity prior to expiration of the T401 timer of the remote error-correcting entity. Since information about the T402 timer is not carried in the Exchange Identification (XID) negotiations at call setup, both sides operate with different timer values. If this timer expires, then the reply that would have been returned prior to its expiration is not sent. The performance of the data link layer can be impacted by the value of this timer as retransmissions of frames occur on expiry of timer T401. For better performance, a value of *t402AckDelayTimer* (T402) equal to half the value of *t401AckTimer* (T401) is recommended. Changes to this attribute do not affect existing calls.
Mib	TdmaIwf
Values	Decimal (0.25..4.50)
Units	seconds
Default	2.00

ATTRIBUTE TdmaCs V42 t403IdleProbeTimer (t403)

Access	Read: All Write: Service
Description	This attribute specifies the maximum amount of time that the IWF allows to elapse without frames being exchanged. The link is permitted to remain idle with no frames being exchanged on the data link. Upon expiry of this timer, the IWF polls its peer for status. Since information about the T403 timer is not carried in the Exchange Identification (XID) negotiations at call setup time, both sides operate with different timer values. Changes to this attribute do not affect existing calls.
Mib	TdmaIwf
Values	Decimal (30..90)
Units	seconds
Default	60

ATTRIBUTE TdmaCs V42 txN401FrameSize (txN401)

Access	Read: All Write: Service
Description	This attribute specifies the maximum number of octets that can be carried in the information field of an Information (I) frame, Exchange Identification (XID) frame, and a Unnumbered Information (UI) frame from the IWF to the remote entity. The default value is 128 octets, and no XID negotiations required for *txN401FrameSize*. If the value for *txN401FrameSize* value is set to other than 128 octets, then XID frames are exchanged to negotiate

Copyright © 2006, Nortel Nortel Confidential

a value. The value provided for *txN401FrameSize* sets up the bounds during XID negotiations. The IWF performs XID negotiations with this value as a minimum or maximum value. If a value greater than 128 is specified, then the IWF negotiates or attempts to negotiate a value between the 128 (as a minimum) and the given value (as a maximum). If a value less than 128 is specified, then the IWF attempts to negotiate a value between the given value (as a minimum) and 128 (as a maximum). Any value can be specified as long as it is within the provisionable limits. However, a value equal to or close to 128 is recommended.
Changes to this attribute do not affect existing calls.

Mib	TdmaIwf
Values	Decimal (1..255)
Units	octets
Default	128

ATTRIBUTE TdmaCs V42 rxN401FrameSize (rxN401)

Access	Read: All Write: Service
Description	This attribute specifies the maximum number of octets that can be carried in the information field of an Information (I) frame, Exchange Identification (XID) frame, and a Unnumbered Information (UI) frame from the remote entity to the IWF. The default value is 128 octets, and no XID negotiations are required for *rxN401FrameSize*. If the value set for *rxN401FrameSize* is other than 128, XID frames are exchanged to negotiate a value. The value provided for *rxN401FrameSize* sets up the bounds during XID negotiations. The IWF performs XID negotiations with this value as a minimum or maximum value. If a value greater than 128 is specified, then the IWF attempts to negotiate for a value between 128 (as a minimum) and the given value (as a maximum). If a value less than 128 value is specified, then the IWF attempts to negotiate for a value between the given value (as a minimum) and 128 (as a maximum). Any value can be specified as long as it is within the provisionable limits. However, a value equal to or close to the default is recommended. Changes to this attribute do not affect existing calls.
Mib	TdmaIwf
Values	Decimal (1..255)
Units	octets
Default	128

ATTRIBUTE TdmaCs V42 txKWindowSize (txK)

Access	Read: All Write: Service

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the maximum number of outstanding unacknowledged sequenced Information (I) frames from the IWF to the remote entity. The default value is 15 frames, and if this value is used then no Exchange Identification (XID) negotiations are required for *txKWindowSize*. If the value set for *txKWindowSize* is other than 15, then XID frames are exchanged to negotiate a value. The value provided for *txKWindowSize* sets up the bounds during XID negotiations. The IWF performs XID negotiations with this value as a minimum or maximum value. If a value greater than 15 is specified, then the IWF attempts to negotiate a value between 15 (as a minimum) and the given value (as a maximum). If a value less than 15 is specified, then the IWF attempts to negotiate for a value between the given value (as a minimum) and 15 (as a maximum). Any value can be specified as long at it is within the provisionable limits. However, a value equal to or close to the default is recommended. Changes to this attribute do not affect existing calls.
Mib	TdmaIwf
Values	Decimal (1..255)
Default	15

ATTRIBUTE TdmaCs V42 rxKWindowSize (rxK)

Access	Read: All Write: Service
Description	This attribute specifies the maximum number of outstanding unacknowledged sequenced Information (I) frames from the remote entity to the IWF. The default value is 15 frames, and if this value is used then no Exchange Identification (XID) negotiations are required for *rxKWindowSize*. If the value set for rxKWindowSize is other than 15, then XID frames are exchanged to negotiate a value. The value provided for *rxKWindowSize* sets up the bounds during XID negotiations. The IWF performs XID negotiations with this value as a minimum or maximum value. If a value greater than 15 is specified, then the IWF attempts to negotiate a value between 15 (as a minimum) and the given value (as a maximum). If a value less than 15 is specified, then the IWF attempts to negotiate for a value between the given value (as a minimum) and 15 (as a maximum). Any value can be specified as long as it is within the provisionable limits. However, a value equal to or close to the default is recommended. Changes to this attribute do not affect existing calls.
Mib	TdmaIwf
Values	Decimal (1..255)
Default	15

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE TdmaCs V42 n400RetransLimit (n400)

Access	Read: All Write: Service
Description	This attribute specifies the maximum number of times the IWF retransmits a frame upon expiry of *t401AckTimer* before appropriate recovery action is taken. Information about N400 (Retransmission Limit) is not carried in the Exchange Identification (XID) negotiation at call setup time so both sides operate with different N400 values. Changes to this attribute do not affect existing calls.
Mib	TdmaIwf
Values	Decimal (0..255)
Default	1

ATTRIBUTE TdmaCs V42 fcsLength

Access	Read: All Write: Service
Description	This attribute specifies whether a 16 bit or a 32 bit Frame Check Sequence (FCS) will be used for the link between the IWF and the far end DCE. This attribute has one of the following values: ***fcs16***: Use only a 16 bit FCS. ***fcs32Or16***: 32 bit FCS is preferred; Use a 16 bit FCS if needed. ***fcs32Only***: Use only a 32 it FCS; If unavailable, drop the connection.
Mib	TdmaIwf
Values	fcs16 fcs32Or16 fcs32
Default	fcs32Or16

COMPONENT TdmaCs V42Bis

Groups	GROUP TdmaCs V42Bis Provisioned (Prov)
Scope	Application
Description	*TdmaCs/<csIndex> V42bis* This component represents an instance of ITU-T V.42bis data compression protocol. Its attributes specify various default settings for aspects of the V.42bis protocol, which may be used in an IWF call on the mobile station to IWF link or the IWF to PSTN modem link or both.
Mib	TdmaIwf
Common Verbs	Help List Display

GROUP TdmaCs V42Bis Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the V.42bis data compression protocol parameters used for the calls set up by this particular CallServer. Changes to these attributes do not affect existing calls.
Mib	TdmaIwf

ATTRIBUTE TdmaCs V42Bis p0CompressionDirection (p0)

Access	Read: All Write: Service
Description	This attribute specifies the V.42bis data compression direction to be supported. The value for compression direction is negotiated at link setup by the data link protocol by way of the Exchange Identification (XID) negotiation of parameter P0 (compression direction). During XID negotiation of parameter P0, both sides (IWF and mobile or IWF and PSTN) agree on the compression direction. This attribute has one of the following values: ***noCompression***: No compression is present. ***compInitrResp***: The data sent by the IWF to the other entity is compressed. ***compRespInitr***: The data received by the IWF from the other entity is compressed. ***compBoth***: The data sent and received by the IWF is compressed. Changes to this attribute do not affect existing calls.
Mib	TdmaIwf
Values	noCompression compInitrResp compRespInitr compBoth
Default	compBoth

ATTRIBUTE TdmaCs V42Bis p1MaximumCodewords (p1)

Access	Read: All Write: Service
Description	This attribute specifies the maximum number of V.42bis codewords the IWF supports. A codeword is a binary number that represents a string of characters in compressed form. V.42bis keeps a dictionary of codewords for each compression direction. Changes to this attribute impact the compression ratio for the encoder (component *TdmaBc V42Bis* attribute *compRatioEncoder*). Changes also impact the amount of memory used (more memory is used when increasing the attribute). The gain in performance obtained from the selection of a larger dictionary may be offset by the larger codeword size needed, and for certain types of data,

Copyright © 2006, Nortel Nortel Confidential

better performance may be obtained by using a smaller dictionary.
Changes to this attribute do not affect existing calls.

Mib TdmaIwf

Values Decimal (512..4096)

Default 512

ATTRIBUTE TdmaCs V42Bis p2MaximumStringSize (p2)

Access Read: All
Write: Service

Description This attribute specifies the maximum number of characters allowed in a string represented by a codeword that the IWF supports. Each codeword in a V.42bis dictionary represents a string of characters. Changes to this attribute impact the compression ratio for the encoder.
Changes to this attribute do not affect existing calls.

Mib TdmaIwf

Values Decimal (6..250)

Default 6

ATTRIBUTE TdmaCs V42Bis actionOnError (actOnErr)

Access Read: All
Write: Service

Description This attribute specifies whether or not V.42bis takes down the call or resets the link when any of the following errors occur:
1.Receipt of STEPUP (step up codeword size) codeword when it would cause C2 (current code word size) to exceed N1 (maximum code word size).
2. Receipt of a codeword, at any time, equal to C1 (next empty dictionary entry).
3. Receipt of a codeword representing an empty dictionary entry.
4. Receipt of a reserved command code.
5. Receipt of any other error.
If the value is ***resetLink***, the error corrected connection and V.42bis dictionaries are reset. Some data is lost but the call continues. If the value is ***takeDownCall***, the call is taken down.
Changes to this attribute do not affect existing calls.

Mib TdmaIwf

Values resetLink
takeDownCall

Default resetLink

Description	This attribute specifies the digits that must be dialed at the mobile for this call to be identified as a FastConnect call. The dialed digits are used to identify a FastConnect call if the mobile does not support the Direct Async Data Service (DADS) service code. Up to ten access codes can be provisioned.

COMPONENT TdmaIwfFcBearerChannel (TdmaFcBc)

Instance	csIndex [Decimal (1..10)] bcIndex [Decimal (1..14030)]
Groups	GROUP TdmaFcBc Provision (Prov) GROUP TdmaFcBc Operational (Oper) GROUP TdmaFcBc CustomerIdentifierData (CidData) GROUP TdmaFcBc OsiState (State)
Scope	Application
Description	*TdmaIwfFcBearerChannel/<csIndex>,<bcIndex>* This component represents an individual bearer channel resource for the network (LAN) side of a FastConnect call. If the call type requested is a FastConnect call, the *TdmaIwfCallServer* links one *TdmaIwfBearerChannel* and one *TdmaIwfFcBearerChannel* in a single DMS-MTX InterWorking Function (IWF) call. The instance value *csIndex* is the logical identifier for the DMS-MTX and is used for associating the call server with this *TdmaIwfFcBearerChannel* instance. The instance value *bcIndex* is the logical identifier for the *TdmaIwfFcBearerChannel*. It and the csIndex together define a unique *TdmaIwfFcBearerChannel*. This component is specific to the ***tdmaIwfFastConnect*** feature of the ***tdmaIwf*** application.

ATTRIBUTE TdmaFcBc callType

Access	Read: All Write: Illegal
Description	This attribute indicates the current call type. This attribute has one of the following values: ***analogSpeech***: Analog speech calls. ***digitalSpeech***: Digital speech calls. ***analogPrefSpeech***: Analog preferred speech calls. ***digitalPrefSpeech***: Digital preferred speech calls. ***asyncData***: Asynchronous data service calls. ***g3Fax***: Group 3 fax calls. ***rejected***: Rejected calls. ***stuIII***: STU III calls. ***notUsedYet***: Bearer Channel has not been used in a call yet. ***directAsyncData***: FastConnect or Direct Async Data Service (DADS) calls.
Mib	TdmaIwf
Values	analogSpeech digitalSpeech analogPrefSpeech digitalPrefSpeech asyncData g3Fax rejected stuIII notUsedYet directAsyncData
Default	No default

ATTRIBUTE TdmaFcBc lastResponseCode (respCode)

Access	Read: All Write: Illegal
Description	This attribute indicates the MSC/IWF Interface Protocol (MIP) Message Router (MMR) response code returned for the last call which was active on this particular *TdmaIwfBearerChannel*. This attribute has one of the following values: ***noCause***: No cause available. ***unassignedNumber***: Unallocated or unassigned number. ***noRouteToDest***: No route to destination. ***normalClearing***: The call was terminated normally. ***userBusy***: User busy. ***noResponse***: No carrier. ***userNoAnswer***: No answer from user. ***invalidNumberFormat***: Translation or routing problem. ***unspecNormal***: Normal, unspecified.

Copyright © 2006, Nortel Nortel Confidential

temporaryFailure: Temporary failure.
channelUnavailable: Channel unavailable.
resourceUnavailable: Resources unavailable to handle call.
qosUnavailabled: Specified rate of call unavailable.
serviceUnavailable: Service not implemented.
unimplementedOption: Option not implemented.
invalidCallRefValue: Invalid call reference value.
invalidChannel: Identified channel does not exist.
unspecInvalidMessage: Invalid message, unspecified.
missingMandatoryIe: Missing mandatory information element.
invalidMessageType: Message type not implemented.
incompatibleMessage: Message not compatible with call state.
timerRecovery: Recovery on timer expiration.
protocolError: Protocol error, unspecified.

Mib	TdmaIwf
Values	noCause unassignedNumber noRouteToDest normalClearing userBusy noResponse userNoAnswer invalidNumberFormat unspecNormal temporaryFailure channelUnavailable resourceUnavailable qosUnavailable serviceUnavailable unimplementedOption invalidCallRefValue invalidChannel unspecInvalidMessage missingMandatoryIe invalidMessageType incompatibleMessage timerRecovery unspecProtocolError
Default	No default

ATTRIBUTE TdmaFcBc mateBearerChannel (mateBc)

Access	Read: All Write: Illegal
Description	This attribute contains the name of the mate *TdmaIwfBearerChannel* that this *TdmaIwfBearerChannel* is involved with in the currently active call. In the case of a FastConnect call, this mate is a *TdmaIwfFcBearerChannel*.

Copyright © 2006, Nortel Nortel Confidential

Mib	TdmaIwf
Values	The name of the component
Default	No default

GROUP TdmaFcBc CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	TdmaIwf

ATTRIBUTE TdmaFcBc customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	TdmaIwf
Values	Decimal (0; 1..8191)
Default	0

GROUP TdmaFcBc OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	TdmaIwf

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE TdmaFcBc adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	TdmaIwf
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE TdmaFcBc operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	TdmaIwf
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE TdmaFcBc usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib	TdmaIwf
Values	idle active (activ) busy
Default	idle

COMPONENT TdmaFcBc UpperRelay (Ur)

Groups	GROUP TdmaFcBc Ur Operational (Oper) GROUP TdmaFcBc Ur Statistics (Stats)
Scope	Application
Description	*TdmaBc/<csIndex>,<bcIndex> UpperRelay* This component represents the group of measurements for the Upper Relay function established for each half of a DMS-MTX IWF asynchronous data or fax call (internally between the two *TdmaIwfBearerChannel*s involved in a call) from this particular *TdmaIwfBearerChannel* perspective.
Mib	TdmaIwf
Common Verbs	Help List Display

GROUP TdmaFcBc Ur Operational (Oper)

Properties	Operational
Description	This group contains operational attributes that measure the performance of the *UpperRelay*.
Mib	TdmaIwf

ATTRIBUTE TdmaFcBc Ur rxBufferSize

Access	Read: All Write: Illegal
Description	This attribute indicates the size of the receive flow control buffer. This attribute may be viewed via *TdmaBc/*,*,*,* UpperRelay*.
Mib	TdmaIwf
Values	Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

Opt. Subcomp.	COMPONENT Time Server
Common Verbs	Help List Display

GROUP Time Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes of the *Time* component.
Mib	Time

ATTRIBUTE Time syncStatus

Access	Read only
Description	This attribute indicates the XNTP (Network Time Protocol) synchronization status of this module. If the value is ***synchronized*** or ***synchronizing***, the *syncSource* attribute indicates the IP address of the main network time server. The values have the following meanings: ***synchronized*** -- The module is synchronized with the network time server. ***unsynchronized*** -- There is no network time server selected as XNTP server for the module to synchronize its time with. ***synchronizing*** -- The module is trying to synchronize with the network time server. ***unknown*** -- The synchronization status of the module is unknown.

Copyright © 2006, Nortel

Nortel Confidential

Mib	Time
Values	synchronized unsynchronized synchronizing unspecified
Default	No default

ATTRIBUTE Time moduleTime

Access	Read and write
Description	This attribute indicates the current date and time on this module. The *moduleTime* is obtained by adding an offset to the reference time, which is the Universal Time Coordinated (UTC). When the *moduleTime* is set, it keeps the value even if the card boots. It is the time used for time stamps, such as in alarms and accounting data. The operator resets the current date and time by setting this attribute when *syncStatus* is ***unsynchronized***. Setting this attribute is not allowed if *syncStatus* is ***synchronized*** or ***synchronizing***.
Mib	Time
Values	Time (DHMS)
Default	No default

ATTRIBUTE Time mainServer

Access	Read only
Description	This attribute indicates the IP address of the main network time server that this module synchronizes with. If *syncStatus* is ***unsynchronized,*** then *mainServer* is 0.0.0.0.
Mib	Time
Values	IP address
Default	No default

ATTRIBUTE Time xntpVersion

Access	Read only
Description	This attribute indicates the current protocol version of XNTP running on this module.
Mib	Time
Values	Decimal (0..15)
Default	No default

ATTRIBUTE Time offset

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the number of minutes to be added to the reference time, which is Universal Coordinated Time (UTC), to obtain the *moduleTime*. It keeps its value even if the card reboots. However, if the node is powered-off for an extended period of time, it may reset to the default value.
Mib	Time
Values	Signed (-720..900)
Units	minutes
Default	0

ATTRIBUTE Time leapSecondsApplied

Access	Read only
Description	This attribute indicates the current number of leap seconds being applied in the system.
Mib	Time
Values	Signed (-1000..1000)
Default	No default

ATTRIBUTE Time syncSources

Access	Read only
Description	This attribute indicates the IP addresses of the network time servers that this module synchronizes with. XNTP uses the clock values of the network time servers to set its *moduleTime*.
Mib	Time
List of	IP address
Default	No default

GROUP Time Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioned attributes of the Time component.
Mib	Time

ATTRIBUTE Time timeDifferenceLimit (tdl)

Access	Read and write
Description	This attribute specifies the allowed difference between the times reported by provisioned time servers. The *timeDifferenceLimit* value is provisioned based on the sensitivity of time dependent applications and the network topology in use. An application more sensitive to time requires consistently close times reported by the time servers. A more elaborate network

Copyright © 2006, Nortel Nortel Confidential

topology may cause the time servers to report a wider range of time differences due to network delays than a simple network. An alarm is issued when the times reported by two time servers differ by more than the specified amount.

The value ***nolimit*** disables the check.

Mib	Time
Values	Decimal (0.001..1000.000) nolimit
Units	msec
Default	nolimit

ATTRIBUTE Time leapSecondDate (lsd)

Access	Read and write
Description	This attribute is provisioned only on systems that require support for processing leap second events. This attribute specifies the UTC date on which the number of leap seconds has or will be changed from *preLeapSeconds* to *postLeapSeconds*; that is, the date on which a leap second is either inserted or deleted. This would normally be on June 30 or December 31. Bulletin C from the International Earth Rotation Service (www.iers.org) announces leap seconds. A leap second is added or removed at the end of a UTC day. That is, if a leap second is inserted, it takes two seconds from 23:59:59 to 0:00:00 instead of one. If a leap second is deleted, time will jump from 23:59:58 to 0:00:00 in one second instead of two. A leap second is applied in the system only when it is detected, which occurs some time after the *leapSecondDate* and can vary depending on the network topology. If a leap second is not detected within 23 hours of the *leapSecondDate*, it will be automatically applied in the system.
Mib	Time
Values	Time (D)
Default	No default

ATTRIBUTE Time preLeapSeconds (preLs)

Access	Read and write
Description	This attribute is provisioned only on systems that require support for processing leap second events. This attribute specifies the number of leap seconds applied in the system

Copyright © 2006, Nortel Nortel Confidential

on or before the UTC date specified by *leapSecondDate*.

preLeapSeconds must differ from *postLeapSeconds* by one.

Mib	Time
Values	Decimal (0..999)
Default	31

ATTRIBUTE Time postLeapSeconds (postLs)

Access	Read and write
Description	This attribute is provisioned only on systems that require support for processing leap second events. This attribute specifies the number of leap seconds applied in the system after the UTC date specified by *leapSecondDate*. *postLeapSeconds* must differ from *preLeapSeconds* by one.
Mib	Time
Values	Decimal (0..999)
Default	32

COMPONENT Time Server

Instance	Decimal (1..10)
Groups	GROUP Time Server Provisioned (Prov) GROUP Time Server OsiState (State) GROUP Time Server Operational (Oper)
Scope	Device
Description	*Time Server/n* The *Server* component represents a single network time server that this module can use for network time synchronization.
Mib	Time
Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP Time Server Provisioned (Prov)

Properties	Provisioned

Description	This group contains the provisionable attributes of the *Server* component.
Mib	Time

ATTRIBUTE Time Server ipAddress (ipAddr)

Access	Read and write
Criticality	Component
Description	This attribute specifies the IP address of a network time server that the module will attempt to synchronize with. The value of *ipAddress* must be unique across all *Server* components.
Mib	Time
Values	IP address
Default	No default

ATTRIBUTE Time Server ipStack

Access	Read and write
Criticality	Component
Description	This attribute specifies the IP stack that XNTP uses to communicate with the network time server. If ***ipiFrIpiVc*** is selected, then an *IpiFr* or *IpiVc* component must be provisioned on this module. If ***vrIp*** is selected, then *IP* must be provisioned under the management *VR* on this module.
Mib	Time
Values	ipiFrIpiVc vrIp
Default	ipiFrIpiVc

ATTRIBUTE Time Server stratumLimit

Access	Read and write
Description	This attribute specifies the limit for the stratum reported by the remote time server. Stratum is an integer used by the Network Time Protocol to indicate the topological distance between a client and a time server. A smaller stratum value indicates a better topological distance to a time server. When the stratum reported by the remote time server exceeds this value, alarm 70150015 is raised. A clear alarm is issued when the reported stratum is no longer greater than this value.
Mib	Time
Values	Decimal (1..15)
Default	15

Values	Decimal (0..16)
Default	No default

ATTRIBUTE Time Server poll

Access	Read only
Description	This attribute indicates the time interval for the module to poll the network time server for time synchronization. This value is the log to the base 2 of the poll interval in seconds. In other words, the poll interval in seconds is equal to 2**_poll_.
Mib	Time
Values	Decimal (0..15)
Default	No default

ATTRIBUTE Time Server pktSent

Access	Read only
Description	This attribute counts the packets sent to the network time server.
Mib	Time
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Time Server pktRecv

Access	Read only
Description	This attribute counts the packets received from the network time server, including the invalid packets.
Mib	Time
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Time Server pktValid

Access	Read only
Description	This attribute counts the valid packets received from the network time server.
Mib	Time
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Time Server timeOffset

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the time by which this server's view of time is ahead of the module's view of reference time. Adding this value to the module's view of reference time gives the server's view of time. If the module and the server's view of time differ by more than 1000 seconds, then ***large*** is displayed.
Mib	Time
Values	Signed (-1000000000..1000000000) large
Units	microsec
Default	No default

ATTRIBUTE Time Server delay

Access	Read only
Description	This attribute indicates the roundtrip delay to the time server over the network path between them. If the delay exceeds 100 seconds, then ***large*** is displayed.
Mib	Time
Values	Signed (-100000000..100000000) large
Units	microsec
Default	No default

ATTRIBUTE Time Server status

Access	Read only
Description	This attribute indicates the status of the network time server. ***main*** -- This network time server is working properly, and is the system servers (synchronization sources) of the module. ***primary*** -- This network time server is working properly, and is the primary servers (one of the synchronization sources) of the module ***secondary*** -- This network time server is working properly, but its offset and dispersion is not stable or too high so that it can not be selected as one of the primary time synchronization sources. But if the primary synchronization sources are not available, it can take over the responsibility and become the time synchronization source of the module. ***unused*** -- This network time server is not used as a server (synchronization source) of the module. ***noResponse*** -- This network time server is not responding to the module's time synchronization request. This could be caused by network error or protocol error, or network time server configuration error. ***stratumTooHigh*** -- This network time server has a bad stratum (higher than 15), or its stratum is higher than the module's stratum. ***leapUnsync*** -- This network time server's leap value indicates that this

Copyright © 2006, Nortel Nortel Confidential

	network time server is not synchronized. ***clockUnsync*** -- This network time server's clock values indicates that this network time server is not synchronized. ***rootTooNoisy*** -- This network time server's root dispersion is too high, so that its time stamp is not used. ***peerTooNoisy*** -- The modules dispersion relative to this network time server is too high, so this network time server's time stamp is not used. ***faultStick*** -- This offset of the module relative to this network time server is out of the range or too high, so that it can not be selected as one of the primary time synchronization source.

COLLECTED STATS Trunk

Scope	Network
Description	*Trunk/n* The *Trunk* component provides a connection between two Nortel Networks Multiservice Switches. It controls a protocol stack associated with a logical port on a function processor that provides an interconnection to another node with a *Trunk* component. It requires the existence of the *Routing* component. Note that ***dpnRouting*** also needs to be included in the *featureList* of CP's *LogicalProcessorType* component. Either an *AtmAccess*, *MplsAccess,* or *Unacknowledged* subcomponent

Copyright © 2006, Nortel

Nortel Confidential

must be added to provide the underlying link protocol and associated hardware that the *Trunk* will use.

Common Verbs	Help List Display Add DELete Unlock

VERB LOCK Trk

Impact	Service
Description	*Lock [-force][-forever] <component name>* This verb causes the specified component to enter the OSI ***shuttingDown*** administrative state. While shutting down, the component continues to provide service to existing clients but rejects any new requests for service. In some cases, locking a component causes all its subcomponents to shut down also. When the component is no longer providing service, it enters the OSI ***locked*** administrative state. **Options:** *-force* If this option is present, service to current clients is terminated and the ***locked*** state is entered immediately (that is, without first going through the ***shuttingDown*** state). Without this option, *Lock* behaves as described above. *-forever* If this option is present, then after service to current clients is terminated and the ***locked*** state is entered, an unlock command is required to get the service into the ***unlocked*** state. Without this option, the service automatically returns to the ***unlocked*** state after five minutes.

GROUP Trk IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.

Copyright © 2006, Nortel Nortel Confidential

Mib	Trunks

ATTRIBUTE Trk ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	Trunks
Values	up down testing
Default	up

ATTRIBUTE Trk ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	Trunks
Values	Decimal (1..65535)
Default	No default

GROUP Trk Provisioned (Prov)

Properties	Provisioned
Description	This group of attributes provides the parameters used by the layer 3 *Trunk* to *Trunk* staging protocol.
Mib	Trunks

ATTRIBUTE Trk expectedRemoteNodeName (expectedRemote)

Access	Read and write
Description	This attribute specifies the expected node name of the module to which this *Trunk* is connected. Once entered, the node name must correspond to the *Mod nodeName* attribute of the remote node. The *Trunk* end points exchange their node name through the *Trunk* staging protocol. The staged value is validated and the *remoteValidationAction* will be executed for those values not matching the value supplied for this attribute. If this attribute is an empty string, then the comparison is always successful.
Mib	Trunks

Copyright © 2006, Nortel Nortel Confidential

Values	String (0..12, ASCII)
Default	No default

ATTRIBUTE Trk remoteValidationAction (validation)

Access	Read and write
Description	This attribute specifies the action to be taken if there is a mismatch between the *expectedRemoteNodeName* attribute and the value received from the remote end. The *remoteValidationAction* determines the action when a value is supplied to the *expectedRemoteNodeName* attribute. If this attribute is provisioned to ***continue*** then upon an unsuccessful validation staging continues, otherwise, if ***disable*** is set then the *Trunk* does not continue to stage but, attempts to stage again after a one minute time out. All unsuccessful validation when the *expectedRemoteNodeName* has been set result in the generation of an alarm.
Mib	Trunks
Values	continue disable
Default	continue

ATTRIBUTE Trk maximumExpectedRoundTripDelay (maxRtd)

Access	Read and write
Description	This is the maximum round trip delay value used by the Trunk staging protocol, in conjunction with *measuredSpeedToIf*, to determine if it has taken too long to successfully stage with a remote Trunk. The value specified must be larger than the *measuredRoundTripDelay* or the Trunk may not successfully stage.
Mib	Trunks
Values	Decimal (1..1500)
Units	msec
Default	1500

ATTRIBUTE Trk idleTimeOut

Access	Read and write
Description	This attribute specifies the Trunk protocol idle time out duration in units of seconds. If the local Trunk does not receive any packets from the link for the period specified by this attribute, the Trunk enters Are You There (AYT) mode for up to two seconds. If the Trunk does not receive any packets from the remote during the AYT mode it will restage; otherwise, it exits AYT mode and continues to provide service.
Mib	Trunks

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (2..30)
Units	seconds
Default	4

GROUP Trk Overrides

Properties	Provisioned
Description	Theses attribute comprise the set of provisionable override parameters supported by both the *Trunk* and *DpnGateway* components. The attributes are used when reporting operational attributes (used for metric calculations) to the routing system.
Mib	Trunks

ATTRIBUTE Trk overrideTransmitSpeed (ots)

Access	Read and write
Description	This is the overridden value of link speed (bit/s) that, if staged successfully with the remote, is reported to the routing system for metric calculations. A zero indicates that an override value has not been provided and that only the measured value will be reported to the routing system. If this value is changed on a *Trunk* or *DpnGateway* that is enabled, the LOCK and UNLOCK commands must be issued to the component to restage the override with the remote.
Mib	Trunks
Values	Decimal (0; 1000..4294967295)
Units	bit/s
Default	0

ATTRIBUTE Trk overrideRoundTripDelay (ortd)

Access	Read and write
Description	This is the overridden value of link delay (ms) that, if staged successfully with the remote, is reported to the routing system for metric calculations. A zero indicates that an override value has not been provided and that only the measured value will be reported to the routing system. If this value is changed on a *Trunk* or *DpnGateway* that is enabled, the LOCK and UNLOCK commands must be issued to the component to restage the override with the remote.
Mib	Trunks
Values	Decimal (0.0..1500.0)
Units	msec
Default	0.0

Copyright © 2006, Nortel Nortel Confidential

GROUP Trk OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Trunks

ATTRIBUTE Trk adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Trunks
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Trk operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or

Copyright © 2006, Nortel Nortel Confidential

with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: Trunks

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Trk usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: Trunks

Values:
idle
active (activ)
busy

Default: idle

ATTRIBUTE Trk availabilityStatus (osiAvail)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

Copyright © 2006, Nortel
Nortel Confidential

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	Trunks
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Trk proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.
Mib	Trunks
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE Trk controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib	Trunks
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE Trk alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Copyright © 2006, Nortel Nortel Confidential

Mib	Trunks
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Trk standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.
Mib	Trunks
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Trk unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

Copyright © 2006, Nortel Nortel Confidential

	The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	Trunks
Values	false true
Default	false

GROUP Trk OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	Trunks

ATTRIBUTE Trk snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	Trunks
Values	up down testing
Default	up

GROUP Trk Operational (Oper)

Properties	Operational
Description	This is the group of operational attributes supported by the *Trunk*.
Mib	Trunks

ATTRIBUTE Trk remoteComponentName (remote)

Access	Read only
Description	This is the component name of the remote end which it has supplied through the *Trunk* staging protocol.
Mib	Trunks
Values	String (1..27, ASCII)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

GROUP Trk Transport

Properties	Operational
Description	This group of attributes contains the set of operational parameters measured and maintained by both the *Trunk* and *DpnGateway* components.
Mib	Trunks

ATTRIBUTE Trk measuredSpeedToIf (spd)

Access	Read only
Description	This attribute indicates the current “transmittable” bandwidth of the underlying facility. For a *Trunk* with a *Unack* subcomponent, and a *DpnGateway* with a *Utp* subcomponent, if a serial port is used, the value is the measured transmit speed of the port; if a channelized port (E1/DS1) is used, the value is the measured transmit speed of the *Channel*. For a *Trunk* with an *AtmAccess* subcomponent, the value is calculated by converting the VCC transmit cell rate to an equivalent bit rate. The VCC transmit cell rate is determined based on the *vccReportingBw* attribute of the *Trunk AtmAccess* component. If *vccReportingBw* has a value of ***pcr*** and attribute *bwElastic* of *AtmAccess* has a value of ***no***, the peak cell rate (PCR) of the VCC, defined in *txTrafficDescParm* of *AtmIf Vcc Vcd*, is used. If *vccReportingBw* has a value of ***pcr*** and attribute *bwElastic* of *AtmAccess* has a value of ***yes***, the minimum of the PCR, defined in *txTrafficDescParm* of *AtmIf Vcc Vcd*, and the current cell rate (CCR) of the VCC is used. If *vccReportingBw* has a value of ***acr***, the best measurement of the actual cell rate (ACR) of the VCC is used, which is the minimum of the PCR, the CCR and the actual shaping rate (ASR). For a *Trunk* with an *MplsAccess* subcomponent, the value is the transmit bandwidth reserved on the MPLS transport *Lsp*. For a *DpnGateway* with a *FrAccess* subcomponent, the value indicates the *committedInformationRate* of *FrAccess FrMuxSetup*. A value of zero is displayed when the underlying facility is disabled or the current “transmittable” bandwidth is unknown.
Mib	Trunks
Values	Decimal (0..4294967295)
Units	bit/s
Default	0

ATTRIBUTE Trk maxTxUnit (mtu)

Access	Read only
Description	This is the maximum transmission unit (byte size) that is supported by the *Trunk* or *DpnGateway* component. This size includes the data and routing headers. A value of zero indicates the MTU has not yet been determined.

Copyright © 2006, Nortel Nortel Confidential

Mib	Trunks
Values	Decimal (0..65535)
Units	bytes
Default	0

ATTRIBUTE Trk measuredRoundTripDelay (rtd)

Access	Read only
Description	This attribute indicates the measured Round Trip Delay (msec) discovered with the remote through the *Trunk* and *DpnGateway* staging protocols. The value includes emission, propagation, and queuing delays. A 512 byte data packet is used to perform the measurement. A value of zero is displayed when the link is disabled or the measured Round Trip Delay is unknown.
Mib	Trunks
Values	Decimal (0.0..1500.0)
Units	msec
Default	0.0

GROUP Trk Statistics (Stats)

Properties	Operational
Description	These attributes comprise the statistics collected by the *Trunk* component.
Mib	Trunks

ATTRIBUTE Trk areYouThereModeEntries (ayt)

Access	Read only
Description	This attribute counts the number of times that the component has entered Are You There mode. This counter wraps around to zero when the maximum value is exceeded.
Mib	Trunks
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Trk pktFromIf (pkt)

Access	Read only
Description	This attribute counts the number of packets received from the remote module. It does not include the packets received from the interrupting queue. This counter wraps around to zero when the maximum value is exceeded.
Mib	Trunks

Copyright © 2006, Nortel Nortel Confidential

Values	Long Integer
Default	No default

ATTRIBUTE Trk trunkPktFromIf (trk)

Access	Read only
Description	This attribute counts the number of internal trunk protocol packets (including those from the interrupting queue) received from the remote module. These packets are forwarded to the *Trunk* component. This counter wraps around to zero when the maximum value is exceeded.
Mib	Trunks
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Trk trunkPktToIf (trkti)

Access	Read only
Description	This attribute counts the number of internal trunk protocol packets (including those through the interrupting queue) transmitted to the remote module. This counter wraps around to zero when the maximum value is exceeded.
Mib	Trunks
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Trk discardUnforward (disc)

Access	Read only
Description	This attribute counts the number of packets received from the remote module that have been discarded. It does not include the packets received from the interrupting queue that have been discarded. This counter wraps around to zero when the maximum value is exceeded. Two main reasons that cause this counter to increase are: (1) the remote protocol is not compatible with the local protocol stack or, (2) the packet cannot be forwarded due to a recent loss of connectivity or due to congestion.
Mib	Trunks
Values	Long Integer
Default	No default

ATTRIBUTE Trk discardTrunkPktFromIf (discTrk)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of internal trunk protocol packets (including those on the interrupting queue) received from the remote module that have been discarded. This counter wraps around to zero when the maximum value is exceeded. The three main reasons that cause this counter to increase are: (1) the two Trunks are not synchronized, (2) the remote trunk protocol is not the same version as the local protocol, and (3) the remote trunk has restaged.
Mib	Trunks
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Trk intPktFromIf (intPkt)

Access	Read only
Description	This attribute counts the number of packets received on the interrupting queue from the remote module. This counter wraps around to zero when the maximum value is exceeded.
Mib	Trunks
Values	Long Integer
Default	No default

ATTRIBUTE Trk discardIntUnforward (discInt)

Access	Read only
Description	This attribute counts the number of packets received on the interrupting queue from the remote module that have been discarded. This counter wraps around to zero when the maximum value is exceeded. Two main reasons that cause this counter to increment are: (1) the remote protocol is not compatible to the local protocol stack and, (2) the packet cannot be forwarded due to either a recent loss of connectivity or due to congestion.
Mib	Trunks
Values	Long Integer
Default	No default

ATTRIBUTE Trk stagingAttempts (statt)

Access	Read only
Description	This attribute counts the number of times that the staging protocol has attempted to stage with the remote module. This counter wraps around to zero when the maximum value is exceeded. The main reason that causes this counter to increment is that the local hardware is up but, the local protocol cannot stage with the remote protocol due to a faulty connection.

Copyright © 2006, Nortel Nortel Confidential

If the value is zero, then the local hardware has never enabled successfully.

Mib	Trunks
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Trk discardTrunkPktToIf (discTrkti)

Access	Read only
Description	This attribute counts the number of internal trunk protocol packets (including those through the interrupting queue) that have been discarded before being transmitted to the remote module. This counter wraps around to zero when the maximum value is exceeded. The main reason that causes this counter to increment is that the trunk can not get sufficient resources to create an internal trunk protocol packet.
Mib	Trunks
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Trk utilization (util)

Access	Read only
Description	This attribute indicates the average trunk utilization. For a *Trunk/n* with an *Unack* subcomponent, the value is the link receive utilization. It is calculated every minute by comparing the number of octets received from the remote module against the value of the *Trunk/n measuredSpeedToIf*. Since the trunk application solely owns the physical link, the maximum link utilization is 100%. For a *Trunk/n* with an *AtmAccess* subcomponent, the value is the VCC(s) transmit utilization. It is calculated every 30 seconds by comparing the number of cells transmitted by *AtmIf Vcc(s)* against the value of the *Trunk/n measuredSpeedToIf*. The VCCs include the trunk VCC indicated by *atmConnection* of *Trunk/n AtmAccess* and the PORS SPO (Short Path Oriented) multiplexing VCC if applicable. The PORS SPO multiplexing VCC only applies to a *Trunk/n* with subcomponents *Pa AtmAccess*, where the *mode* of *AtmAccess* is ***multiplexing***, and the *AtmAccess* is linked to a second VCC indicated by *atmConnection* of *Pa AtmAccess*. Since the trunk application shares a physical link with other applications, the VCCs utilization can exceed 100%, and the value 200% is chosen as the maximum calculated utilization. For a *Trunk/n* with an *MplsAccess* subcomponent, the value is the receive utilization. It is calculated every 30 seconds by comparing the number of octets received from the remote module against the value of the *Trunk/n measuredSpeedToIf*. Since the trunk application shares a physical link

Copyright © 2006, Nortel Nortel Confidential

	with other applications, utilization can exceed 100%, and the value 200% is chosen as the maximum calculated utilization.
Mib	Trunks
Values	Decimal (0..200)
Units	%
Default	No default

ATTRIBUTE Trk pktFromIfByPrio (pktBp)

Access	Read only
Description	This attribute counts the number of packets received by the *Trunk*. It is a vector indexed by the emission priorities (*ep0*, *ep1*, and *ep2*) of the packets. The highest emission priority is *ep0*. These counters wrap around to zero when the maximum value is exceeded.
Mib	Trunks
Vector of	Long Integer
Index	ep0 ep1 ep2
Default	No default

ATTRIBUTE Trk discPktFromIfByPrio (discBp)

Access	Read only
Description	This attribute counts the number of packets received from the remote module that have been discarded. It is a vector indexed by the emission priorities (*ep0*, *ep1* and *ep2*) of the packets. The highest emission priority is *ep0*. These counters wrap around to zero when the maximum value is exceeded. Two main reasons that cause this counter to increment are: (1) the remote protocol is not compatible to the local protocol stack and, (2) the packet cannot be forwarded due to either a recent loss of connectivity or due to congestion.
Mib	Trunks
Vector of	Long Integer
Index	ep0 ep1 ep2
Default	No default

ATTRIBUTE Trk octetFromIfByPrio (octBp)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the octets coming from the remote module which are received by the Trunk. It is a vector indexed by the emission priorities (*ep0*, *ep1* and *ep2*) of the packets. The highest emission priority is *ep0*. These counters wrap around to zero when the maximum value is exceeded.
Mib	Trunks
Vector of	Long Integer
Index	ep0 ep1 ep2
Default	No default

GROUP Trk SpeedReporting

Properties	Provisioned
Description	This group of provisionable attributes provides the ability to disable or enable the generation of speed change alarms by the *Trunk* component. It also provides the ability to disable or enable the Dynamic Speed Reporting mechanism.
Mib	Trunks

ATTRIBUTE Trk speedReportingHoldOff (spdHO)

Access	Read and write
Description	This attribute specifies the hold off time for reporting speed increases. When the *measuredSpeedToIf* reaches a level specified by the *speedReportingThresholds* attribute, the value specifies the duration (in units of seconds) for which the *measuredSpeedToIf* must maintain that level before it will be reported.
Mib	Trunks
Values	Decimal (1..1200)
Units	seconds
Default	30

ATTRIBUTE Trk lowSpeedAlarmThreshold (lowAla)

Access	Read and write
Description	This attribute specifies the lower end of the range of normal speeds for this Trunk. If the *measuredSpeedToIf* drops below this value the *Trunk* component generates a SET alarm. When the *measuredSpeedToIf* reaches or exceeds the value of this attribute, the *Trunk* component will generate a CLEAR alarm.
Mib	Trunks
Values	Decimal (0; 1..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Units	bit/s
Default	0

ATTRIBUTE Trk highSpeedAlarmThreshold (hiAla)

Access	Read and write
Description	This attribute specifies the upper end of the range of normal speeds for this Trunk. If the *measuredSpeedToIf* exceeds this value the *Trunk* component generates a SET alarm. When the *measuredSpeedToIf* returns to or falls below the value of this attribute, the *Trunk* component will generate a CLEAR alarm.
Mib	Trunks
Values	Decimal (1..4294967295)
Units	bit/s
Default	4294967295

ATTRIBUTE Trk speedReportingThresholds (spdTh)

Access	Read and write
Description	This attribute controls the behavior of the Dynamic Speed Reporting mechanism. If its value is empty then the mechanism is disabled and neither increases nor decreases are reported. Otherwise, the attribute may contain up to seven threshold levels which are used to control the reporting of speed increases. Speed decreases are always reported immediately. If the *measuredSpeedToIf* increases such that it reaches one of the threshold levels which is greater than the last reported speed, the Trunk starts the *speedReportingHoldOff* timer. If the speed remains above this threshold until the timer expires, the *Trunk* component then reports the *measuredSpeedToIf*; otherwise the increase is not reported.

Units	bit/s
List Size	7
Default	No default

COLLECTED STATS Trunk

Description	The statistics record generated by the Trunk component.

ATTRIBUTE Trk remoteComponentName (remote)

Description	This attribute is the component name of the remote end which it has supplied through the *Trunk* staging protocol.

Copyright © 2006, Nortel Nortel Confidential

Values String (1..26, ASCII)

ATTRIBUTE Trk measuredSpeedToIfMax

Description This is the maximum measured transmit speed (bit/s) of the link. A value of zero is provided when the link is disabled for the whole interval or the measured speed is unknown.

Values Decimal (0..4294967295)

ATTRIBUTE Trk measuredSpeedToIfMin

Description This is the minimum measured transmit speed (bit/s) of the link. A value of zero is provided when the link is disabled for any part of the interval or the measured speed is unknown.

Values Decimal (0..4294967295)

ATTRIBUTE Trk measuredSpeedToIfCurrent

Description This is the current measured transmit speed (bit/s) of the link. A value of zero is provided when the link is disabled or the measured speed is unknown.

Values Decimal (0..4294967295)

ATTRIBUTE Trk measuredRoundTripDelayMax

Description This is the maximum measured Round Trip Delay (ms) discovered with the remote through the *Trunk* staging protocols. A value of zero is provided when the link is disabled for the whole interval or the delay is unknown.

Values Decimal (0..1500)

ATTRIBUTE Trk measuredRoundTripDelayMin

Description This is the minimum measured Round Trip Delay (ms) discovered with the remote through the *Trunk* staging protocols. A value of zero is provided when the link is disabled for any part of the interval or the delay is unknown.

Values Decimal (0..1500)

ATTRIBUTE Trk measuredRoundTripDelayCurrent

Description This is the measured Round Trip Delay (ms) discovered with the remote through the *Trunk* staging protocols. A value of zero is provided when the link is disabled or the delay is unknown.

Values Decimal (0..1500)

ATTRIBUTE Trk porsNormPktFromIf (normPkt)

Description This attribute counts the number of normal priority packets received on the PORS *Trunk* normal priority queue in the last statistics collection interval.

Values Long Integer

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Trk porsNormDiscUnforwardFromIf (normDisc)

Description — This attribute counts the number of normal priority packets discarded from the PORS *Trunk* normal priority queue in the last statistics collection interval.

Values — Long Integer

ATTRIBUTE Trk porsNormOctetFromIf (normOctet)

Description — This attribute counts the number of normal priority bytes received on the PORS *Trunk* normal priority queue in the last statistics collection interval.

Values — Long Integer

ATTRIBUTE Trk porsIntPktFromIf (intPkt)

Description — This attribute counts the number of interrupting priority packets received on the PORS *Trunk* interrupting priority queue in the last statistics collection interval.

Values — Long Integer

ATTRIBUTE Trk porsIntDiscUnforwardFromIf (intDisc)

Description — This attribute counts the number of interrupting priority packets discarded from the PORS *Trunk* interrupting priority queue in the last statistics collection interval.

Values — Long Integer

ATTRIBUTE Trk porsIntOctetFromIf (intOctets)

Description — This attribute counts the number of interrupting priority bytes received on the PORS *Trunk* interrupting priority queue in the last statistics collection interval.

Values — Long Integer

ATTRIBUTE Trk remoteComponentName (remote)

Description — This attribute is the component name of the remote end which it has supplied through the *Trunk* or *DpnGateway* staging protocol.

Values — String (1..26, ASCII)

ATTRIBUTE Trk measuredSpeedToIfMax

Description — This is the maximum measured transmit speed (bit/s) of the link. A value of zero is provided when the link is disabled for the whole interval or the measured speed is unknown.

Values — Decimal (0..4294967295)

COMPONENT Trk UnAcked (UnAcked)

Groups	GROUP Trk UnAcked Provisioned (Prov) GROUP Trk UnAcked OsiState (State)
Scope	Network
Description	*Trunk/n Unacknowledged* The *Unacknowledged* component provides a Layer 2 protocol that adds the minimum of overhead to data on the link. A *Framer* subcomponent is automatically added providing the underlying HDLC framing and associated hardware that the *Unacknowledged* component will use.
Mib	UnackTrunks
Subcomponents	COMPONENT Trk UnAcked Framer
Common Verbs	Help List Display Add DELete

GROUP Trk UnAcked Provisioned (Prov)

Properties	Provisioned
Description	This group of provisionable attributes contains the parameters used by *Unacknowledged*, *Utp,* and *FrAccess* for monitoring link quality.
Mib	UnackTrunks

ATTRIBUTE Trk UnAcked maximumErroredInterval

Access	Read and write
Description	This attribute specifies the interval time over which the error threshold (as specified by *receiveErrorSensitivity)* must be continuously exceeded before the *Unacknowledged, Utp,* or *FrAccess* component can be degraded. Once the error interval count exceeds the provisioned value,

Copyright © 2006, Nortel Nortel Confidential

	the *Unacknowledged*, *Utp,* or *FrAccess* component issues an alarm indicating that link quality has degraded, and it disables its parent component. The exception to this is a value of zero, the default, which indicates that the mechanism is completely disabled.
Mib	UnackTrunks
Values	Decimal (0; 1..15)
Units	minutes
Default	0

ATTRIBUTE Trk UnAcked receiveErrorSensitivity

Access	Read and write
Description	This attribute is the allowable error rate beyond which the *Unacknowledged*, *Utp,* or *FrAccess* component can be degraded if it persists for a duration longer than the *maximumErrorInterval*. The threshold is expressed as a percentage of number of errored frames in the last interval per number of frames received in the last interval. The exception to this is a value of zero, which indicates that the mechanism is completely disabled. The configurable values are: 0 = the mechanism is completely disabled 1 = 1/(2**1) 2 = 1/(2**2) 3 = 1/(2**3) : 10 = 1/(2**10)
Mib	UnackTrunks
Values	Decimal (0; 1..10)
Default	3

GROUP Trk UnAcked OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	UnackTrunks

ATTRIBUTE Trk UnAcked adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: UnackTrunks

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Trk UnAcked operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: UnackTrunks

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Trk UnAcked usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	UnackTrunks
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Trk UnAcked availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions,

Copyright © 2006, Nortel Nortel Confidential

the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

ATTRIBUTE Trk UnAcked proceduralStatus (osiProc)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib — UnackTrunks

Set of
initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)

Default — No default

ATTRIBUTE Trk UnAcked controlStatus (osiCntrl)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

ATTRIBUTE Trk UnAcked alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	UnackTrunks
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Trk UnAcked standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

Copyright © 2006, Nortel Nortel Confidential

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib: UnackTrunks

Values:
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default: notSet

ATTRIBUTE Trk UnAcked unknownStatus (osiUnknw)

Access: Read only

Description: This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Mib: UnackTrunks

Values:
false
true

Default: false

GROUP Trk UnAcked Framer LinkOptions (Link)
GROUP Trk UnAcked Framer OsiState (State)
GROUP Trk UnAcked Framer Statistics (Stats)
GROUP Trk UnAcked Framer LinkUtilization (Util)
GROUP Trk UnAcked Framer LinkUtilThreshold (UtilThreshold)

COLLECTED STATS Trunk UnAcked Framer

Scope: Device

Description:
Trunk/n Unack Framer

Copyright © 2006, Nortel Nortel Confidential

The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length) rather than interface specific attributes (such as modem leads and clocking) which are associated with specific hardware components (such as *V35/n* or *DS1/n*). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).

Mib	UnackTrunks
Common Verbs	Help List Display

GROUP Trk UnAcked Framer **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.
Mib	UnackTrunks

ATTRIBUTE Trk UnAcked Framer **interfaceName**

Access	Read and write
Criticality	Process
Description	This attribute contains a hardware component name. The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.
Mib	UnackTrunks
Values	Link (Hardware, applicationFramerName)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

GROUP Trk UnAcked Framer LinkOptions (Link)

Properties	Provisioned
Description	This group contains attributes defining the framing of data on the link interface.
Mib	UnackTrunks

ATTRIBUTE Trk UnAcked Framer framingType

Access	Read and write
Criticality	Process
Description	This attribute specifies the type of framing protocol that will be used for frames transmitted to the link interface and received from the link interface. If the value of this attribute is set to the default *interrupting*, then a Proprietary hdlc protocol is used which allows for voice cells to interrupt transmission of data frames, transmit the voice cell, and then continue transmitting the data frame. If the value of this attribute is set to *hdlc*, then the standard hdlc protocol is used for the sequential transmission of individual frames.
Mib	UnackTrunks
Values	hdlc interrupting
Default	interrupting

ATTRIBUTE Trk UnAcked Framer dataInversion

Access	Read and write
Description	This attribute determines whether data bits are to be inverted (1 to 0 and 0 to 1) before transmission of frames to the interface. If the value of this attribute is On, the incoming data bits will also be inverted when frames are received from the link before being processed. This option is typically used in ***hdlc*** framing mode when inversion is used to guarantee 1's density. Note that aborts (in ***hdlc*** and ***interrupting*** modes) are corrupted when data is inverted.
Mib	UnackTrunks
Values	off on
Default	off

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Trk UnAcked Framer **frameCrcType**

Access	Read and write
Description	This attribute defines the type of CRC used. The CRC value calculated is appended to the end of the frames transmitted to the link. The CRC value is removed from the end of frames received from the link and checked for correctness. NoCrc means that CRC is not used.
Mib	UnackTrunks
Values	crc16 crc32 noCrc
Default	crc16

ATTRIBUTE Trk UnAcked Framer **flagsBetweenFrames**

Access	Read and write
Description	This attribute defines the number of flags that are inserted between frames sent to the link interface.
Mib	UnackTrunks
Values	Decimal (1..16)
Default	1

GROUP Trk UnAcked Framer **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	UnackTrunks

ATTRIBUTE Trk UnAcked Framer **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — UnackTrunks

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Access	Read only

Description

This attribute is the utilization of the interrupting data traffic received from the link as a percentage of the available bandwidth on the link. Note that this includes traffic with a Transfer Priority (TP) of 11 and/or Emission Priority of 1. The utilization is the average for the last minute.

Mib	UnackTrunks
Values	Decimal (0..100)
Units	%
Default	0

GROUP Trk UnAcked Framer **LinkUtilThreshold (UtilThreshold)**

Properties	Provisioned

Description

This group contains all of the provisioning data required to set the link utilization alarm thresholds. All thresholds are percentages which can take on any value in the range of 0% through 100%. The value 100% is used to disable an individual threshold. For values other than 100%, a semantic check ensures that the minor alarm threshold is less than the other thresholds and that the major alarm threshold is less than the critical alarm threshold.

Mib	UnackTrunks

ATTRIBUTE Trk UnAcked Framer **minorLinkUtilAlarmThreshold (minor)**

Access	Read and write

Description

This attribute provides the threshold value which defines when a minor alarm would be issued, denoting a sustained total average link utilization. The total average link utilization is calculated based on the number of received bytes. The Set alarm is issued after 3 minutes of utilization greater than the given threshold. The corresponding Clear alarm is issued after a subsequent 3 minutes of utilization less than or equal to the given threshold.

Copyright © 2006, Nortel Nortel Confidential

The value 100% is used to disable an individual threshold. For values other than 100%, a semantic check ensures that the minor alarm threshold is less than the other thresholds.

Mib UnackTrunks

Values Decimal (0..100)

Units %

Default 75

ATTRIBUTE Trk UnAcked Framer majorLinkUtilAlarmThreshold (major)

Access Read and write

Description

This attribute provides the threshold value which defines when a major alarm would be issued, denoting a sustained total average link utilization. The total average link utilization is calculated based on the number of received bytes. The Set alarm is issued after 3 minutes of utilization greater than the given threshold. The corresponding Clear alarm is issued after a subsequent 3 minutes of utilization less than or equal to the given threshold.
The value 100% is used to disable an individual threshold. For values other than 100%, a semantic check ensures that the major alarm threshold is greater than the minor threshold and less than the critical threshold.

Mib UnackTrunks

Values Decimal (0..100)

Units %

Default 85

ATTRIBUTE Trk UnAcked Framer criticalLinkUtilAlarmThreshold (critical)

Access Read and write

Description

This attribute provides the threshold value which defines when a critical alarm would be issued, denoting a sustained total average link utilization. The total average link utilization is calculated based on the number of received bytes. The Set alarm is issued after 3 minutes of utilization greater than the given threshold. The corresponding Clear alarm is issued after a subsequent 3 minutes of utilization less than or equal to the given threshold.
The value 100% is used to disable an individual threshold. For values other than 100%, a semantic check ensures that the critical alarm threshold is greater than the other thresholds.

Mib UnackTrunks

Values Decimal (0..100)

Units	%
Default	95

ATTRIBUTE Trk UnAcked Framer linkUtilAlarmStatus (status)

Access	Read and write
Description	This attribute provides control of the generation of link utilization alarms. If the value is ***disabled***, none of the alarms are generated (this is equivalent to setting all of the thresholds to 100%). If the value is ***enabled***, the individual thresholds are handled.
Mib	UnackTrunks
Values	enabled (ena) disabled (dis)
Default	disabled

COLLECTED STATS Trunk UnAcked Framer

Description	The statistics record generated by the Trunk UnAcked Framer component.

ATTRIBUTE Trk UnAcked Framer rxBytes

Description	This attribute provides the number of bytes received on the link by the Framer in the last collection interval.
Values	Long Integer

ATTRIBUTE Trk UnAcked Framer rxFrames

Description	This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.
Values	Long Integer

ATTRIBUTE Trk UnAcked Framer txBytes

Description	This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.
Values	Long Integer

ATTRIBUTE Trk UnAcked Framer txFrames

Description	This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.
Values	Long Integer

ATTRIBUTE Trk UnAcked Framer rxTotalLinkUtil

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.
Values	Decimal (0..100)

COMPONENT Trk AtmAccess (Atm)

Groups	GROUP Trk Atm Provisioned (Prov) GROUP Trk Atm Interface GROUP Trk Atm OsiState (State) GROUP Trk Atm UtilThreshold (Util) GROUP Trk Atm Statistics (Stats)

COLLECTED STATS Trunk AtmAccess

Scope	Network
Description	*Trunk/n AtmAccess* The *AtmAc*cess component provides a Layer 2 protocol that adds no overhead to data on the ATM link that it accesses.
Mib	AtmTrunks
Common Verbs	Help List Display Add DELete

GROUP Trk Atm Provisioned (Prov)

Properties	Provisioned
Description	This group of provisionable attributes contains the parameters used by *AtmAccess* for monitoring link quality.
Mib	AtmTrunks

ATTRIBUTE Trk Atm receiveErrorSensitivity

Access	Read and write
Description	This attribute specifies the allowable error rate beyond which the *AtmAccess* component can be degraded if the error rate persists for a duration longer than the *maximumErrorInterval*. The threshold is expressed as a percentage. It is the ratio of the number of errored cells in the last interval over the number of cells received in the last interval. For AAL5, the number of errored cells is converted from *rxFrameDiscard* of *AtmIf Vcc* using the assumption that three ATM cells are used to carry a 128 byte AAL5 frame. The number of received cells is specified by *rxCell* of *AtmIf Vcc*. The configurable values are: 0 = the mechanism is completely disabled 1 = 1/(2**1)

Copyright © 2006, Nortel Nortel Confidential

2 = 1/(2**2)
3 = 1/(2**3)
:
10 = 1/(2**10)

Mib	AtmTrunks
Values	Decimal (0; 1..10)
Default	3

ATTRIBUTE Trk Atm maximumErroredInterval

Access	Read and write
Description	This attribute specifies the interval time over which the error threshold (as specified by *receiveErrorSensitivity)* must be continuously exceeded before the *AtmAccess* component can be degraded. Once the error interval count exceeds the provisioned value, the *AtmAccess* component issues an alarm indicating that link quality has degraded, and it disables its parent component. The exception to this is a value of zero, the default, which indicates that the mechanism is completely disabled.
Mib	AtmTrunks
Values	Decimal (0.0; 0.5; 1.0; 1.5; 2.0; 2.5; 3.0; 3.5; 4.0; 4.5; 5.0; 6.0; 7.0; 8.0; 9.0; 10.0; 11.0; 12.0; 13.0; 14.0; 15.0)

Default	0.0

GROUP Trk Atm Interface

Properties	Provisioned
Description	This group of attributes provides the parameters used by the *AtmAccess* component for specifying access to an ATM interface.
Mib	AtmTrunks

ATTRIBUTE Trk Atm atmConnection (ac)

Access	Read and write
Criticality	Component
Description	This attribute specifies the component name of the ATM Layer 2 AAL5 interface that the *AtmAccess* component will use.
Mib	AtmTrunks
Values	Link (Hardware, applicationName)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Trk Atm bwElastic (bwE)

Access	Read and write
Criticality	Component
Description	This attribute specifies how changes in the bandwidth of the *atmConnection* are handled by the ATM software. If its value is ***no,*** the *atmConnection* will be released by the ATM software if it is incapable of providing the bandwidth specified by the peak cell rate (PCR) defined in *txTrafficDescParm* of *AtmIf Vcc Vcd*. If the value is ***yes,*** the *atmConnection* is not released in this situation, but its bandwidth may be reduced. Also, if this value is ***yes***, the Dynamic Speed Reporting mechanism must be enabled, by provisioning at least one value in the *speedReportingThresholds* attribute of the parent *Trunk* component.
Mib	AtmTrunks
Values	no yes
Default	no

ATTRIBUTE Trk Atm vccReportingBw (vccRepBw)

Access	Read and write
Criticality	Component
Description	This attribute specifies how the bandwidth of the VCC is reported to the parent *Trunk* component. If its value is ***pcr*** and attribute *bwElastic* of *AtmAccess* has a value of ***no***, the peak cell rate (PCR) of the VCC, defined in *txTrafficDescParm* of *AtmIf Vcc Vcd,* is reported. If its value is ***pcr*** and attribute *bwElastic* of *AtmAccess* has a value of ***yes***, the minimum of the PCR, defined in *txTrafficDescParm* of *AtmIf Vcc Vcd*, and the current cell rate (CCR) of the VCC is reported. If its value is ***acr,*** the best measurement of the actual cell rate (ACR) of the VCC is reported, which is the minimum of the PCR, the CCR and the actual shaping rate (ASR). The value of the reported bandwidth of the VCC is indicated by the *measuredSpeedToIf* attribute of the parent *Trunk* component.
Mib	AtmTrunks
Values	pcr acr
Default	pcr

GROUP Trk Atm OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this

Copyright © 2006, Nortel Nortel Confidential

group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib — AtmTrunks

ATTRIBUTE Trk Atm adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib — AtmTrunks

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Trk Atm operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib — AtmTrunks

Copyright © 2006, Nortel Nortel Confidential

Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Trk Atm usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	AtmTrunks
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Trk Atm availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	AtmTrunks
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Trk Atm proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib	AtmTrunks
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE Trk Atm controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

Copyright © 2006, Nortel Nortel Confidential

The value ***suspended*** indicates that the service has been administratively suspended.

Mib — AtmTrunks

Set of — subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default — No default

ATTRIBUTE Trk Atm alarmStatus (osiAlarm)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

ATTRIBUTE Trk Atm standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.
Mib	AtmTrunks
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Trk Atm unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	AtmTrunks
Values	false true
Default	false

GROUP Trk Atm UtilThreshold (Util)

Properties	Provisioned
Description	This group contains all of the provisioning data required to set the ATM VCC utilization alarm thresholds. The ATM VCC utilization is indicated by the *lastCalculatedVccUtilization* attribute. All thresholds are percentages which can take on any value in the range of 0% through 200%. The value 200% is used to disable an individual threshold. For values other than 200%, the minor alarm threshold must be less than the other thresholds and the major alarm threshold must be less than the critical alarm threshold.
Mib	AtmTrunks

ATTRIBUTE Trk Atm minorVccUtilAlarmThreshold (minor)

Access	Read and write
Description	This attribute specifies the threshold value at which a minor alarm will be issued based on a sustained average ATM VCC utilization as indicated by the *lastCalculatedVccUtilization* attribute. The Set alarm is issued after 3 minutes of utilization greater than the threshold. The corresponding Clear alarm is issued after a subsequent 3 minutes of utilization less than or equal to the threshold. The value 200% is used to disable this threshold. For values other than 200%, the minor alarm threshold must be less than the other thresholds.
Mib	AtmTrunks
Values	Decimal (0..200)
Units	%
Default	75

ATTRIBUTE Trk Atm majorVccUtilAlarmThreshold (major)

Access	Read and write
Description	This attribute specifies the threshold value at which a major alarm will be issued based on a sustained average ATM VCC utilization as indicated by the *lastCalculatedVccUtilization* attribute. The Set alarm is issued after 3 minutes of utilization greater than the threshold. The corresponding Clear alarm is issued after a subsequent 3 minutes of utilization less than or equal to the threshold. The value 200% is used to disable this threshold. For values other than 200%, the major alarm threshold must be greater than the minor threshold and less than the critical threshold.

Units	cells

ATTRIBUTE Trk Atm rxDiscard

Description	This attribute counts the number of cells or frames received from the interface on the *Vcc* that have been discarded (due to congestion, non-conformance with UPC or AAL reassembly problems) in the last collection interval.
Values	Long Integer

ATTRIBUTE Trk Atm rxDiscardClp

Description	This attribute counts the number of cells or frames received from the interface on the *Vcc* with the CLP=1 that have been discarded (due to congestion, non-conformance with UPC or AAL reassembly problems) in the last collection interval.
Values	Long Integer

ATTRIBUTE Trk Atm txCellRateMax

Description	This attribute indicates the maximum transmit cell throughput rate of the *Vcc* in the last collection interval.

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE Trk Atm txCellRateMin

Description	This attribute indicates the minimum transmit cell throughput rate of the *Vcc* in the last collection interval.
Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE Trk Atm txCellRateAvg

Description	This attribute indicates the average transmit cell throughput rate of the *Vcc* in the last collection interval.
Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE Trk Atm txClpCellRateMax

Description	This attribute indicates the maximum transmit cell throughput rate with the CLP=1 of the *Vcc* in the last collection interval.
Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE Trk Atm txClpCellRateMin

Description	This attribute indicates the minimum transmit cell throughput rate with the CLP=1 of the *Vcc* in the last collection interval.
Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE Trk Atm txClpCellRateAvg

Description	This attribute indicates the average transmit cell throughput rate with the CLP=1 of the *Vcc* in the last collection interval.
Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE Trk Atm rxCellRateMax

Description	This attribute indicates the maximum receive cell throughput rate of the *Vcc* in the last collection interval.
Values	Decimal (0..4294967295)
Units	cell/s

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Trk Atm rxCellRateMin

Description	This attribute indicates the minimum receive cell throughput rate of the *Vcc* in the last collection interval.
Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE Trk Atm rxCellRateAvg

Description	This attribute indicates the average receive cell throughput rate of the *Vcc* in the last collection interval.
Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE Trk Atm rxClpCellRateMax

Description	This attribute indicates the maximum receive cell throughput rate with the CLP=1 of the *Vcc* in the last collection interval.
Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE Trk Atm rxClpCellRateMin

Description	This attribute indicates the minimum receive cell throughput rate with the CLP=1 of the *Vcc* in the last collection interval.
Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE Trk Atm rxClpCellRateAvg

Description	This attribute indicates the average receive cell throughput rate with the CLP=1 of the *Vcc* in the last collection interval.
Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE Trk Atm rxTotalVccUtil

Description	This attribute indicates the average total receive *Vcc* utilization computed based on comparing the total number of cells received on the *Vcc* with the estimated available bandwidth in the last collection interval.
Values	Decimal (0..200)
Units	%

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Trk Atm txTotalVccUtil

Description	This attribute indicates the average total transmitted *Vcc* utilization computed based on comparing the total number of cells transmitted on the *Vcc* with the estimated available bandwidth in the last collection interval.
Values	Decimal (0..200)
Units	%

COMPONENT Trk PathAdmin (Pa)

Groups	GROUP Trk Pa Prov GROUP Trk Pa Oper GROUP Trk Pa Adaptation
Scope	Application
Description	*Trunk/n PathAdmin* This component manages all path related activities on behalf of the trunk. This component is provisioned with a maximum count of *LogicalChannels* that it is allowed to create and a maximum percent of the trunk's outgoing bandwidth that it is permitted to allocate to these *LogicalChannels.*
Mib	PorsTrunks
Opt. Subcomp.	COMPONENT Trk Pa AtmAccess (Atm)
Common Verbs	Help List Display Add DELete

GROUP Trk Pa Prov

Properties	Provisioned
Description	This group contains all provisionable attributes relevant to path oriented traffic on a trunk. These attributes provide the maximum number of Logical Channels that are permitted under a *Trunk/n* and the maximum total bandwidth they are allowed to occupy as a percentage of the outgoing trunk bandwidth.
Mib	PorsTrunks

ATTRIBUTE Trk Pa maxLc (maxLc)

Access	Read: All Write: All
Criticality	Process
Description	This attribute indicates the number of Logical Channels (*LCh/n*) supported on this trunk. This attribute is used to allocate memory on the trunk FP for the PORS forwarding tables.Unless running in mapped mode on ATM

Copyright © 2006, Nortel Nortel Confidential

hardware, the *PathAdmin* will add 100 channels to *maxLc* to reduce the chances of allocation clashes. However, you should never see more than *maxLc* channels in use for any extended period of time. On ATM hardware in mapped mode the *PathAdmin* will only add 10 channels to *maxLc* to permit more efficient use of the available VCC space.

The *PathAdmin* may not be able to honor a request for *maxLc* channels. This will happen when the neighbor *PathAdmin* asks for less channels than this *PathAdmin*. To resolve the conflict the *PathAdmin* will always pick the minimum of the two *maxLc* values. This minimum value is called the *negotiatedMaxLc* and can be viewed as an operational parameter of the *PathAdmin*.

Note that in mapped mode on ATM hardware, the value of this attribute provides an upper bound to the number of VCCs that this *Trunk/n PathAdmin* can occupy. It is not a guarantee that *maxLc* VCCs will be available to this *PathAdmin* because the VCC space is a shared resource on the card or port.

Mib	PorsTrunks
Values	Decimal (0..65435)
Default	512

ATTRIBUTE Trk Pa maxReservedBwOut (mrbwout)

Access	Read: All Write: All
Description	This attribute controls the percentage of trunk bandwidth which may be reserved by outgoing path oriented traffic on the trunk. The sum of *requiredBandwidth* attributes for all paths on this trunk must not exceed this attribute. Setting this attribute to zero (0) prevents paths from being established on this trunk. The limit of reserved bandwidth for incoming path oriented traffic is set using the same attribute on the trunk component on the other end of the trunk.This attribute may be changed without the trunk being restaged. If the value is decreased, calls may be bumped as necessary to free up bandwidth. Increasing the value has no impact on existing calls and new calls are able to use the new bandwidth. If this attribute is set to greater than 100%, connectionless traffic is given a minimum of 1Kbit per second for administrative traffic. A value greater than 100% overbooks the trunk bandwidth. By overbooking bandwidth, more calls are able to be established using the unused bandwidth reserved by idle *PLCs*.
Mib	PorsTrunks
Values	Decimal (0..200)
Units	%
Default	50

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Trk Pa trunkSecurity (tsec)

Access	Read: All Write: All
Criticality	Process
Description	This attribute indicates the security level of the trunk. Zero(0) represents the most secure trunk and seven(7) represents the least secure. The path's minimum security requirement is indicated by the *Plc requiredSecurity* attribute, with values identical in range and meaning to this attribute. PORS ensures that the route selected does not contain a trunk whose *PathAdmin trunkSecurity* attribute is numerically greater than the path's *requiredSecurity*.
Mib	PorsTrunks
Values	Decimal (0..7)
Default	0

ATTRIBUTE Trk Pa supportedTrafficTypes (sttyp)

Access	Read: All Write: All
Criticality	Process
Description	This attribute indicates the type of traffic that can be transmitted on the trunk. There are eight(8) possible traffic types, and the trunk can transmit all of them if desired. The ***voice, data*** and ***video*** traffic types are defined, and five(5) other traffic types can be defined by the network administration. This attribute is used in the route selection process to limit the route to trunks that support the traffic type carried by the path. The *requiredTrafficType* attribute of the *PLC* indicates the type of traffic carried on the path.
Mib	PorsTrunks
Set of	voice data video trafficType1 (tt1) trafficType2 (tt2) trafficType3 (tt3) trafficType4 (tt4) trafficType5 (tt5)
Default	(voice, data, video, trafficType1, trafficType2)

ATTRIBUTE Trk Pa trunkType (ttyp)

Access	Read: All Write: All
Criticality	Process

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute lists the type of the trunk. There can be up to eight(8) types of trunks. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six(6) remaining types that can be defined by the network administration. The set of allowed trunk types for a path is indicated in the *permittedTrunkType* attribute of the *PLC*. When selecting a route, PORS only chooses trunks whose P*athAdmin trunkType* are in the *permittedTrunkTypes* set of the path.
Mib	PorsTrunks
Values	terrestrial satellite trunkType1 (tt1) trunkType2 (tt2) trunkType3 (tt3) trunkType4 (tt4) trunkType5 (tt5) trunkType6 (tt6)
Default	terrestrial

ATTRIBUTE Trk Pa customerParameter (cpar)

Access	Read: All Write: All
Criticality	Process
Description	This attribute indicates the customer defined parameter for the trunk. Its value, a number from zero(0) to seven(7), is chosen by a network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary *PLC* attribute, *requiredCustomerParameter*, also has a value from zero(0) to seven(7). The Route Selector does not consider trunks whose *PathAdmin customerParameter* is greater than the *requiredCustomerParameter* of the path.
Mib	PorsTrunks
Values	Decimal (0..7)
Default	0

ATTRIBUTE Trk Pa trunkCost (tcost)

Access	Read: All Write: All
Description	This attribute is the cost metric for the trunk. This value is assigned by the network administration to represent the network cost of using this trunk. It can be related to distance, speed, dollars, or any other factor that could be taken into consideration. If the trunkAttributeToMinimize is set to *trunkCost*, PORS finds a route with the smallest sum of the PathAdmin *trunkCost* attribute over all trunks. The trunk cost can be increased or decreased without disrupting the service to the link. If it is increased and

Copyright © 2006, Nortel Nortel Confidential

	the PORS optimization feature is enabled calls will move off this link to lower cost links when possible. If the cost is decreased new calls will be attracted to this link.
Mib	PorsTrunks
Values	Decimal (1..255)
Default	128

ATTRIBUTE Trk Pa overrideTrunkDelay (ovrtd)

Access	Read: All Write: All
Description	This attribute specifies the override value of parent trunk's half round trip delay (propagation delay), which is used by the *PathAdmin* to negotiate the value of *negotiatedTrunkDelay*. A value of zero indicates that an override value has not been provided, and that the measured propagation delay value is used for negotiation.
Mib	PorsTrunks
Values	Decimal (0..1500)
Units	msec
Default	0

GROUP Trk Pa Oper

Properties	Operational
Description	This group contains all operational attributes relevant to path oriented and connectionless bandwidth utilization and path activity on a trunk.
Mib	PorsTrunks

ATTRIBUTE Trk Pa state

Access	Read: All Write: Illegal
Description	This attribute gives the operational state of the *PathAdmin* component. The *PathAdmin* may be ***up, down, goingDown, staging*** or ***downWaitingRestage***.
Mib	PorsTrunks
Values	String (1..80, ASCII)
Default	No default

ATTRIBUTE Trk Pa usedLc (ulc)

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute gives the total number of Logical Channels currently busy on the trunk. When this number reaches *maxLc*, no more paths are allowed to instantiate through this trunk. Note that it is possible for *usedLc* to be less than *maxLc* but for there to be no currently free *LogicalChannels*. This is because a *LogicalChannel* can be in one of several intermediate states between ***free*** and ***busy***.
Mib	PorsTrunks
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Trk Pa negotiatedMaxLc (nmlc)

Access	Read: All Write: Illegal
Description	This attribute gives the actual value of *maxLc* that the *PathAdmin* has decided on after negotiation with the far end *PathAdmin*. If there is disagreement between the two *PathAdmin*'s *maxLc* provisionable attributes the smaller of the two is chosen on both sides. This attribute reflects the minimum of these two *maxLc*'s.
Mib	PorsTrunks
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Trk Pa maxReservableBwOut (mrbwo)

Access	Read: All Write: Illegal
Description	This attribute gives the total bandwidth that this *PathAdmin* is allowed to reserve. This number is computed by multiplying the parent trunk's *measuredSpeedToIf* attribute by the *maxReservedBwOut* provisionable attribute of this *PathAdmin*.
Mib	PorsTrunks
Values	Decimal (0..4294967295)
Units	bit/s
Default	No default

ATTRIBUTE Trk Pa overReservedBwOut (orbwo)

Access	Read: All Write: Illegal
Description	When bumping is required to free up enough bandwidth for a new path there exists a short period of time when both the new path and the soon to be bumped path are occupying the same bandwidth. This means that the total amount of reserved bandwidth will exceed *maxReservableBwOut.*

Copyright © 2006, Nortel Nortel Confidential

When this happens the *unreservedBwOut* attribute will be 0 and the *overReservedBwOut* attribute will be non-zero to indicate by how much we are currently overcommitted. This value should quickly drop back to zero as the bumping starts to clear the lower *holdingPriority* calls.

Mib	PorsTrunks
Values	Decimal (0..4294967295)
Units	bit/s
Default	No default

ATTRIBUTE Trk Pa unreservedBwOut (urbwo)

Access	Read: All Write: Illegal
Description	This attribute gives the total of amount of bandwidth that is still available for reservation by new connections. When this number reaches 0 the *PathAdmin* will no longer admit new connections to the trunk. This number represents available bandwidth in the outward going direction. To determine the inward available bandwidth you must query the *PathAdmin* at the other end of this *Trunk*.
Mib	PorsTrunks
Values	Decimal (0..4294967295)
Units	bit/s
Default	No default

ATTRIBUTE Trk Pa clashCount (clcnt)

Access	Read: All Write: Illegal
Description	This attribute gives the total number of path setup requests that resulted in an *LCh/n* or *Vcc/x.y* clash. A large value for this number is an indicator of poor performance by the *PathAdmin* in its allocation of *LCh/n* or *Vcc/x.y* components. In general the channels will be allocated in opposite orders at each end of the *Trunk* but this may not always be the case. Note that as the *PathAdmin* runs out of *LCh/n* or *Vcc/x.y* components the number of clashes will increase.
Mib	PorsTrunks
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Trk Pa negotiatedSupportedTrafficTypes (nsttyp)

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute gives the actual value of *supportedTrafficTypes* that the *PathAdmin* has decided on after negotiation with the far end *PathAdmin*. If there is disagreement between the two *PathAdmin*'s *supportedTrafficTypes* provisionable attributes the union of the two is chosen on both sides. This attribute reflects the union of these two *supportedTrafficTypes* 's. It is this union that is advertised to all other nodes in the network and which is used for routing decisions.
Mib	PorsTrunks
Set of	voice data video trafficType1 (tt1) trafficType2 (tt2) trafficType3 (tt3) trafficType4 (tt4) trafficType5 (tt5)
Default	No default

ATTRIBUTE Trk Pa negotiatedTrunkSecurity (ntsec)

Access	Read: All Write: Illegal
Description	This attribute gives the actual value of the *trunkSecurity* that the *PathAdmin* has decided on after negotiation with the far end *PathAdmin*. If there is disagreement between the two *PathAdmin*'s *trunkSecurity* provisionable attributes the larger of the two is chosen on both sides. This attribute reflects the maximum of these two *trunkSecurity*'s.
Mib	PorsTrunks
Values	Decimal (0..7)
Default	No default

ATTRIBUTE Trk Pa negotiatedCustomerParameter (ncpar)

Access	Read: All Write: Illegal
Description	This attribute gives the actual value of customerParameter that the *PathAdmin* has decided on after negotiation with the far end *PathAdmin*. If there is disagreement between the two *PathAdmin*'s customerParameter provisionable attributes the larger of the two is chosen on both sides. This attribute reflects the maximum of these two customerParameter's.

GROUP Trk Pa Adaptation

Properties	Provisioned
Description	This group of provisionable attributes controls the PORS adaptive routing mechanism. Adaptation is triggered by high trunk utilization, and is used to alleviate the high utilization condition on the parent *Trunk/n* component. For a *Trunk/n* with *an Unack* subcomponent, the link receive utilization (indicated by *utilization* of *Trunk/n)* is used for triggering adaptation. For a *Trunk/n* with an *AtmAccess* subcomponent, the aggregation of the transmit VCCs utilization (indicated by *utilization* of *Trunk/n)*, VP utilization, and PORT utilization (normal port or IMA port if *Ima* is used) is used for triggering adaptation.
Mib	PorsTrunks

ATTRIBUTE Trk Pa maxAdaptationLevel (maxadpl)

Access	Read: All Write: All
Description	This attribute specifies the maximum adaptation level that the parent trunk can reach. It determines the highest degree of adaptation that can be triggered by high trunk utilization. When the first degree of adaptation is triggered, new calls are prevented from being established over the parent trunk, and the *adaptationLevel* changes to level one (1).

Copyright © 2006, Nortel Nortel Confidential

When the second degree of adaptation is triggered, some connections starting from the lowest *holdingPriority* attempt to reroute their paths using alternate trunks, and the *adaptationLevel* changes to level two (2).

When the third degree of adaptation is triggered, some connections starting from the lowest *holdingPriority* are bumped away from the parent trunk, and the *adaptationLevel* changes to level three (3).

The configurable values are:
0 - The adapation mechanism is disabled.
1 - Only the first degree of adaptation can be triggered.
2 - Up to two degrees of adaptation can be triggered.
3 - Up to three degrees of adaptation can be triggered.

Regardless of its value, the operator command *CLEAR -hotSwap or CLEAR* (without an option) can always be issued on a particular *LCh/n* to cause the entire path to be rerouted if possible or bumped.

Mib PorsTrunks

Values Decimal (0..3)

Default 0

ATTRIBUTE Trk Pa adaptationBandwidth (adpbw)

Access Read: All
Write: All

Description This attribute specifies the amount of bandwidth to be potentially freed up by rerouting connections if possible or freed up by bumping connections on the trunk when the second or third degree of adaptation is triggered.

The *adaptationBandwidth* value is used to determine the number of connections to be rerouted or bumped starting from the lowest *holdingPriority*, such that the total of the chosen connections reserved outgoing bandwidth *requiredTxBandwidth* reaches this *adaptationBandwidth* value.

If its value is greater than the *maxReservableBwOut* of *Trunk/n Pa*, the *maxReservableBwOut* amount of bandwidth is used for rerouting or bumping.

Mib PorsTrunks

Values Decimal (0..4294967295)

Units bit/s

Default 64000

ATTRIBUTE Trk Pa adaptationThreshold (adpth)

Access Read: All
Write: All

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute specifies three utilization thresholds used to trigger the three degrees of adaptation. It is a vector indexed by (*level1*, *level2*, and *level3*).

While the PORS *adaptationLevel* is zero (0),
- if the trunk utilization has exceeded the *level1* value for the period of time specified by the *set* value of *adaptationHoldOffTime*, the first degree of adaptation is triggered. Meanwhile, the *Trunk/n Pa* component generates a SET alarm indicating that the PORS adaptation mechanism is active. The PORS *adaptationLevel* increases to level one (1).

While the PORS *adaptationLevel* is one (1),
- if the trunk utilization has exceeded the *level2* value for the period of time specified by the *set* value of *adaptationHoldOffTime*, the second degree of adaptation is triggered. The PORS *adaptationLevel* increases to level two (2).
- Otherwise, if the trunk utilization has exceeded the *level1* value for an additional period of time specified by the *set* value of *adaptationHoldOffTime*, the PORS *adaptationLevel* remains unchanged.
- Otherwise, if the trunk utilization has subsequently fallen back to a level at or below the *level1* value for the period of time specified by the *clear* value of *adaptationHoldOffTime*, new calls are allowed to be established over the parent trunk. Meanwhile, the *Trunk/n Pa* component generates a CLEAR alarm indicating that the PORS adaptation mechanism is no longer active. The PORS *adaptationLevel* decreases to level zero (0).

While the PORS *adaptationLevel* is two (2),
- if the trunk utilization has exceeded the *level3* value for the period of time specified by the *set* value of *adaptationHoldOffTime*, the third degree of adaptation is triggered. The PORS *adaptationLevel* increases to level three (3).
- Otherwise, if the trunk utilization has exceeded the *level2* value for an additional period of time specified by the *set* value of *adaptationHoldOffTime*, the second degree of adaptation is triggered again, and the PORS *adaptationLevel* remains unchanged.
- Otherwise, if the trunk utilization has subsequently fallen back to a level at or below the *level2* value for the period of time specified by the *clear* value of *adaptationHoldOffTime*, the PORS *adaptationLevel* decreases to level one (1).

While the PORS *adaptationLevel* is three (3),
- if the trunk utilization has exceeded the *level3* value for an additional period of time specified by the *set* value of *adaptationHoldOffTime*, the third degree of adaptation is triggered again, and the PORS *adaptationLevel* remains unchanged.
- Otherwise, if the trunk utilization has subsequently fallen back to a level at or below the *level3* value for the period of time specified by the *clear* value of *adaptationHoldOffTime*, the PORS *adaptationLevel* decreases to level two (2).

For a *Trunk/n* with an *Unack* subcomponent, the link receive utilization (indicated by *utilization* of *Trunk/n*) is monitored against the thresholds.

Copyright © 2006, Nortel
Nortel Confidential

Since the trunk application solely owns the physical link, the maximum link receive utilization is 100%. The restrictions on the setting of the three thresholds are:
- when *maxAdaptationLevel* is 1, the value of *(level1)* must be in the range of 0% to 100%.
- when *maxAdaptationLevel* is 2, the values of *(level1* and *level2)* must be the range of 0% to 100%, and the value of *level1* must be less than or equal to the value of *level2*.
- when *maxAdaptationLevel* is 3, the values of (*level1*, *level2*, and *level3*) must be in the range of 0% to 100%, and the value of *level1* must be less than or equal to the value of level2, which must be less than or equal to the value of level3.

For a *Trunk/n* with an *AtmAccess* subcomponent, the aggregation of transmit VCCs utilization (indicated by *utilization* of *Trunk/n*), VP utilization, and PORT utilization (normal port or IMA port if *Ima* is used) is monitored against the thresholds. Since the trunk application shares a physical link with other applications, both the VCCs and VP utilizations can exceed 100%, and the value 200% is chosen as the maximum calculated utilization for VCCs and VP, so all thresholds can take on any value in the range of 0% to 200%. The restrictions on the setting of the three thresholds are:
- when *maxAdaptationLevel* is 2, the value of *level1* must be less than or equal to the value of *level2*.
- when *maxAdaptationLevel* is 3, the value of *level1* must be less than or equal to the value of level2, which must be less than or equal to the value of level3.

ATTRIBUTE Trk Pa adaptationHoldOffTime (adpho)

Access	Read: All Write: All
Description	This attribute specifies two interval times. It is a vector indexed by (*set clear*). The *set* value specifies the period of time for which the trunk utilization must be above the utilization threshold specified by *adaptationThreshold* before the corresponding degree of adaptation is triggered. The *clear* value specifies the period of time for which the trunk utilization must be at or below the utilization threshold specified by *adaptationThreshold* before the PORS *adaptationLevel* is decreased by one (1).

COMPONENT Trk Pa AtmAccess (Atm)

Groups	GROUP Trk Pa Atm Prov
Scope	Network
Description	*Trunk/n PathAdmin AtmAccess* This subcomponent is optionally added to the *PathAdmin* component on ATM hardware. Without this subcomponent the *PathAdmin* will transport all Path Oriented traffic as AAL5 encapsulated cells on the *Trunk AtmAccess localConnection* VCC. With this subcomponent added under the *PathAdmin* the *PathAdmin* will operate in one of two modes. These modes are referred to as mapping and multiplexing and the selection of the mode is done by setting the *PathAdmin AtmAccess mode* attribute to either ***mapping*** or ***multiplexing***. When the mode is set to ***mapping***, the *PathAdmin* will create new VCCs for each new *LCh* that it sets up. In mapped mode the CPU usage is normally 0 for a connection and so the ATM FP can support a great many more mapped mode connections than it can multiplexed mode connections. Connections whose *maximumTransmissionUnit* is exactly 45 will use the SPO adaption layer to efficiently fit a single voice frame into a single cell with minimum overhead. All other connections will use the AAL5 adaption layer protocol. When the mode is set to ***multiplexing***, the *PathAdmin* will look at the attribute *atmConnection* which points to a second provisioned ATM VCC. The *PathAdmin* will then multiplex voice frames onto this second VCC using a proprietary Short Path Oriented adaption layer which encapsulates one voice frame into one voice cell with low overhead. The *PathAdmin* will multiplex all non voice traffic over the *Trunk/n AtmAccess atmConnection* VCC using the AAL5 protocol.

ATTRIBUTE Trk Pa Atm mode (mode)

Access	Read and write
Criticality	Process
Description	This attribute specifies the operating mode of the PathAdmin. When set to ***multiplexing*** the *PathAdmin* to multiplex voice calls to the given atmConnection using single cell per voice packet transport. All other calls will be multiplexed using AAL5 over the Trunk's VCC. When set to ***mapping*** the *PathAdmin* will allocate a VCC per *LCh/n*. In ***mapping*** mode the *atmConnection* should not be set. The VCC chosen for a given connection can be seen in the *LCh localConnection* attribute.
Mib	PorsAtmTrunks
Values	multiplexing (mux) mapping (map)
Default	multiplexing

COMPONENT Trk LogicalChannel (LCh)

Instance	Decimal (1..65535)
Groups	GROUP Trk LCh Oper
Scope	Application
Description	*Trunk/n LogicalChannel/n* This component is automatically created when a new path sets up over the *Trunk* and is deleted when that path terminates. An application component name followed by a series of *LogicalChannel* component names followed by an application component name serve to uniquely identify a path. Issuing a *clear* to this component will cause the entire path to collapse and

Copyright © 2006, Nortel Nortel Confidential

all resources to be freed. Normally the end point components will attempt to reroute after a clear and may even reroute over this same trunk.

VERB CLEAR Trk LCh

Impact Service

Description

Clear [-hotSwap] <component name>
Clearing an *LCh* (with no options specified) causes the entire path to be abruptly terminated and its resources freed. The end point applications see a disruption in service while their *LC*s attempt to find new routes. It is possible that the new route may go right back over the trunk from which it was cleared. Clearing is normally used in conjunction with a trunk lock. The trunk is locked and its *LCh/n* manually cleared. This is more controlled than to *lock force* a trunk.

Options:
-hotSwap
If this option is present, the entire path is not terminated abruptly. Instead, the end point application sends traffic using the existing path while its *LC* attempts to find an alternate route. If an alternate route is found and a path is established, the data traffic is swapped from the current path to the alternate path, the current path is terminated, and the alternate path becomes the current path. Otherwise, if an alternate route is not found, the existing path continues to be used.

When '*clear -hotSwap*' is issued against an *LCh/n* which is on a ***manual*** or ***forced*** path, the path gets re-setup.

GROUP Trk LCh Oper

Properties Operational

Description This group contains all operational attributes pertaining to the *Logical Channel* component owned by this trunk.

Mib PorsTrunks

ATTRIBUTE Trk LCh nextHop (nhop)

Access
Read: All
Write: Illegal

Description The *nextHop* is the name of the component across the bus which is forwarding packets to us. Inversely the *nextHop* of our *nextHop* component is us. More precisely*, LCh/n* components point to each other across the bus via their *nextHop* attributes. In the case where the next hop is an

Copyright © 2006, Nortel Nortel Confidential

application the *nextHop* attribute will indicate the component name of this application.

Mib PorsTrunks

Values The name of the component

Default No default

ATTRIBUTE Trk LCh setupPriority (sp)

Access Read: All
Write: Illegal

Description This attribute gives the priority at which a path is established. Zero (0) is the highest priority and four (4) is the lowest. When PORS establishes a path through the network, it uses the *setupPriority* attribute to determine its potential for bumping established paths to acquire their bandwidth. The *holdingPriority*, a complementary attribute of this component, indicates the priority a path maintains once it is established. A new path can bump an existing path if the new path's *setupPriority* is higher (or numerically less) than the existing path's *holdingPriority*.

Mib PorsTrunks

Values Decimal (0..4)

Default No default

ATTRIBUTE Trk LCh holdingPriority (hp)

Access Read: All
Write: Illegal

Description This attribute gives the priority that a path holds once it is established. Zero (0) is the highest priority and four (4) is the lowest. A path's *holdingPriority* determines its likelihood of being bumped by a new path to acquire its bandwidth. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time. A new path can bump an existing path if the new path's *setupPriority* is higher (or numerically less) than the existing path's *holdingPriority*.

Mib PorsTrunks

Values Decimal (0..4)

Default No default

ATTRIBUTE Trk LCh emissionPriority (ep)

Access Read: All
Write: Illegal

Description This attribute indicates the urgency with which packets on the *LCh*'s path are emitted by this trunk. The *emissionPriority* translates into the trunk's emission queue. Zero (0) indicates the highest *emissionPriority*, while three (3) indicates the lowest. Packets with a higher *emissionPriority* (or

Copyright © 2006, Nortel Nortel Confidential

numerically less) are put on an emission queue which is serviced before a queue which accepts packets of a lower *emissionPriority* and hence experience smaller delays traversing congested trunks.

Mib	PorsTrunks
Values	Decimal (0..3)
Default	No default

ATTRIBUTE Trk LCh discardPriority (dp)

Access	Read: All Write: Illegal
Description	This attribute indicates the importance of the packets on the path. Zero (0) is used for paths carrying the most important traffic, and two (3) is used for paths carrying the least important traffic. In times of congestion, the *discardPriority* is used by packet forwarding on the trunk to determine which packets are discarded first to reduce the load. Packets with a higher *discardPriority* (or numerically less) are discarded after packets with a lower *discardPriority* (or numerically higher).
Mib	PorsTrunks
Values	Decimal (0..3)
Default	No default

Default	No default

ATTRIBUTE Trk LCh mode

Access	Read: All Write: Illegal
Description	This attribute gives the operational mode of the *LogicalChannel* component. It indicates what kind of transport is being performed on the packets in the channel. There are 7 possible values of this attribute as follows: ***unknown*** - not currently in busy state, type of forwarding not determined yet. ***hdlcFrmMux -*** frames are being multiplexed (multiple *LCh/n* on same port or channel) using HDLC encapsulation. ***aal5FrmMux*** - frames are being multiplexed (multiple *LCh/n* on same ATM VCC) using the AAL5 segmentation and recombination protocol. ***spoFrmMux*** - frames are being multiplexed (multiple *LCh/n* on same ATM VCC) using the Short Path Oriented segmentation and recombination protocol. This is a proprietary protocol which encapsulates voice frames into a single ATM cell unlike AAL5 which would require two cells to transport the 45 byte voice frames. ***aal5FrmMap*** - frames are being mapped (a single *LCh/n* per ATM VCC) using the AAL5 segmentation and recombination protocol. AAL5 mapped frames are forwarded by hardware in both directions and require no CPU intervention. ***spoFrmMap*** - frames are being mapped (a single *LCh/n* per ATM VCC) using the Short Path Oriented segmentation and recombination protocol. SPO mapped frames are forwarded by hardware in both directions and require no CPU intervention in all but one special case. In particular CPU is required only if frames are being forwarded to an *LCh/n* whose *mode* is ***spoFrmMux***. ***cellMap*** - ATM cells are being relayed directly over the bus with no segmentation and recombination protocol. The segmentation and recombination is only done at transition points between frame based cards and ATM cell based cards so this hop represents a pure tandem cell hop, ATM card to ATM card. No CPU is required to process these cells.
Mib	PorsTrunks

with Transport Resource Manager. They have a status which reflects the current view of the link.

Mib	BaseRouting

ATTRIBUTE Trm Lk status

Access	Read only
Description	This attribute indicates if the inactive link is disabled, joining, waiting to join, or in standby mode. ***inactive*** - The link is known to TRM but is not active. This can mean that it is disabled, or has not yet started to join. ***joining*** - The link has requested to join the routing systems. ***online***- The link is active and has joined one or more routing systems.
Mib	BaseRouting
Values	inactive joining online
Default	No default

ATTRIBUTE Trm Lk throughput

Access	Read only
Description	This attribute indicates the throughput of the link. This value represents a nominal bandwidth available for connection-less traffic, after the maximum reserved for path-oriented traffic has been subtracted from trunk bandwidth. If a trunk speed override is specified, it is used instead. The “throughput” value can be exceeded by connection-less traffic whenever path-oriented traffic is not using it’s reserved bandwidth.
Mib	BaseRouting
Values	Decimal (1..640000000)
Units	kbit/s
Default	No default

ATTRIBUTE Trm Lk maxTxUnit

Access	Read only
Description	This attribute indicates the maximum data unit in bytes of this link. It represents the maximum frame length (including user data and routing headers) that can be sent on the link.
Mib	BaseRouting
Values	Decimal (1..65535)

Copyright © 2006, Nortel Nortel Confidential

Units	bytes
Default	No default

ATTRIBUTE Trm Lk linkComponentName

Access	Read only
Description	This attribute indicates the link's component name. A link is either a trunk or a gateway to another module. The component name may be used to obtain additional information from the link system.
Mib	BaseRouting
Values	The name of the component
Default	No default

ATTRIBUTE Trm Lk delay

Access	Read only
Description	This attribute indicates the round trip delay of the link in milliseconds. This value represents a nominal delay for connection-less traffic. Connection-less traffic is biased away from trunks carrying path-oriented traffic by increasing this value. The value of this attribute is a function of the percentage of reserved path-oriented bandwidth and takes a maximum value of 1500ms for 100% path-oriented trunks. If a delay override is specified, it will be used instead.
Mib	BaseRouting
Values	Decimal (1.0..1500.0)
Units	msec
Default	No default

GROUP Trm Lk ForwardingStatistics (FwdStats)

Properties	Operational
Description	This group of attributes is used to display egress statistics collected by packet forwarding on this link. The statistics can be used to monitor congestion conditions and packet discards on a link.
Mib	BaseRouting

ATTRIBUTE Trm Lk fciSet

Access	Read only
Description	This attribute counts the packets whose FCI bits are set by packet forwarding due to congestion on this link, and when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of either ***loadshare*** or ***loadspread***. This counter wraps around to zero when the maximum value is reached.

Copyright © 2006, Nortel Nortel Confidential

Mib	BaseRouting
Values	Decimal (0..2147483647)
Default	No default

ATTRIBUTE Trm Lk overflowAttempts

Access	Read only
Description	This attribute counts the number of times DPRS packet forwarding attempts to overflow packets to another link in a link group due to congestion on this link. It is used only when the *forwardingPolicy* attribute in the *Routing DpnAddressPlan* component is set to a value of either ***loadshare*** or ***loadspread***. This counter wraps around to zero when the maximum value is reached.
Mib	BaseRouting
Values	Decimal (0..2147483647)
Default	No default

ATTRIBUTE Trm Lk pathOverflowAttempts

Access	Read only
Description	This attribute counts the number of times DPRS packet forwarding attempts to overflow packets to another link group due to congestion on the link group of this link. It is used only when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of either ***loadshare*** or ***loadspread***. This counter wraps around to zero when the maximum value is reached.
Mib	BaseRouting
Values	Decimal (0..2147483647)
Default	No default

ATTRIBUTE Trm Lk discardCongested

Access	Read only
Description	This attribute counts the packets that have been discarded by packet forwarding due to congestion on this link and when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of either ***loadshare*** or ***loadspread***. This attribute is a vector with three entries. Each entry corresponds to a discard priority of the packet. The first entry represents the discard count of packets with discard priority 1, the second entry discard priority 2, and the third entry discard priority 3. Each entry (counter) wraps around to zero when the maximum value is reached.

Default	No default

COMPONENT Trm LinkGroup (Lg)

Instance	String (1..12, ASCII)
Scope	Network
Description	*Trm LinkGroup /<neighborNodeName>* This component is a dynamic subcomponent of *TransportResource*. It has operational attributes only which are stored and maintained by this component for the purpose of displaying link groups. A link group contains 1 to 4 links, all of which are active. The neighbor node name is the node name provisioned in the *Module* component on the remote node if the link group connects to a Nortel Networks Multiservice Switch. Otherwise it is the remote module node name provisioned in the components of gateways in this link group. Links in a link group can have differing throughputs and round trip delays. If the difference within the set of throughputs, or within the set of delays is significant, some links may not be used. The rule that is applied is that links within 50% of the throughput of the highest throughput link are used for the throughput RCOS. similarly links within 50% of the delay of the lowest delay link are used for the throughput RCOS. As links are added or removed from the link group, the set of links which are used is re-evaluated.

Copyright © 2006, Nortel Nortel Confidential

Description	*Trm Lg/<neighborNodeName> Link /<linkInstance>* This component is a dynamic subcomponent of *LinkGroup*. It has operational attributes only which are stored and maintained by this component for displaying links in a link group. There are 1 to 4 active links in a link group. A link group object is not created until there is at least one active link in the group. Inactive links are not shown in a link group.
Mib	BaseRouting
Common Verbs	Help List Display

GROUP Trm Lg Lk Operational (Oper)

Properties	Operational
Description	*Trm Lk/<n> Operational* This group of attributes is used to list links. These links are all registered with Transport Resource Manager. They have a status which reflects the current view of the link.
Mib	BaseRouting

ATTRIBUTE Trm Lg Lk status

Access	Read only
Description	This attribute indicates if the inactive link is disabled, joining, waiting to join, or in standby mode. ***inactive*** - The link is known to TRM but is not active. This can mean that it is disabled, or has not yet started to join. ***joining*** - The link has requested to join the routing systems. ***online***- The link is active and has joined one or more routing systems.
Mib	BaseRouting
Values	inactive joining online
Default	No default

ATTRIBUTE Trm Lg Lk throughput

Access	Read only
Description	This attribute indicates the throughput of the link. This value represents a nominal bandwidth available for connection-less traffic, after the maximum reserved for path-oriented traffic has been subtracted from trunk bandwidth. If a trunk speed override is specified, it is used instead. The “throughput” value can be exceeded by connection-less traffic whenever path-oriented traffic is not using it’s reserved bandwidth.

Copyright © 2006, Nortel Nortel Confidential

Mib	BaseRouting
Values	Decimal (1..640000000)
Units	kbit/s
Default	No default

ATTRIBUTE Trm Lg Lk maxTxUnit

Access	Read only
Description	This attribute indicates the maximum data unit in bytes of this link. It represents the maximum frame length (including user data and routing headers) that can be sent on the link.
Mib	BaseRouting
Values	Decimal (1..65535)
Units	bytes
Default	No default

ATTRIBUTE Trm Lg Lk linkComponentName

Access	Read only
Description	This attribute indicates the link's component name. A link is either a trunk or a gateway to another module. The component name may be used to obtain additional information from the link system.
Mib	BaseRouting
Values	The name of the component
Default	No default

ATTRIBUTE Trm Lg Lk delay

Access	Read only
Description	This attribute indicates the round trip delay of the link in milliseconds. This value represents a nominal delay for connection-less traffic. Connection-less traffic is biased away from trunks carrying path-oriented traffic by increasing this value. The value of this attribute is a function of the percentage of reserved path-oriented bandwidth and takes a maximum value of 1500ms for 100% path-oriented trunks. If a delay override is specified, it will be used instead.
Mib	BaseRouting
Values	Decimal (1.0..1500.0)
Units	msec
Default	No default

Copyright © 2006, Nortel Nortel Confidential

GROUP Trm Lg Lk ForwardingStatistics (FwdStats)

Properties	Operational
Description	This group of attributes is used to display egress statistics collected by packet forwarding on this link. The statistics can be used to monitor congestion conditions and packet discards on a link.
Mib	BaseRouting

ATTRIBUTE Trm Lg Lk fciSet

Access	Read only
Description	This attribute counts the packets whose FCI bits are set by packet forwarding due to congestion on this link, and when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of either ***loadshare*** or ***loadspread***. This counter wraps around to zero when the maximum value is reached.
Mib	BaseRouting
Values	Decimal (0..2147483647)
Default	No default

ATTRIBUTE Trm Lg Lk overflowAttempts

Access	Read only
Description	This attribute counts the number of times DPRS packet forwarding attempts to overflow packets to another link in a link group due to congestion on this link. It is used only when the *forwardingPolicy* attribute in the *Routing DpnAddressPlan* component is set to a value of either ***loadshare*** or ***loadspread***. This counter wraps around to zero when the maximum value is reached.
Mib	BaseRouting
Values	Decimal (0..2147483647)
Default	No default

ATTRIBUTE Trm Lg Lk pathOverflowAttempts

Access	Read only
Description	This attribute counts the number of times DPRS packet forwarding attempts to overflow packets to another link group due to congestion on the link group of this link. It is used only when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of either ***loadshare*** or ***loadspread***. This counter wraps around to zero when the maximum value is reached.
Mib	BaseRouting
Values	Decimal (0..2147483647)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Trm Lg Lk discardCongested

Access	Read only
Description	This attribute counts the packets that have been discarded by packet forwarding due to congestion on this link and when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of either ***loadshare*** or ***loadspread***. This attribute is a vector with three entries. Each entry corresponds to a discard priority of the packet. The first entry represents the discard count of packets with discard priority 1, the second entry discard priority 2, and the third entry discard priority 3. Each entry (counter) wraps around to zero when the maximum value is reached.
Mib	BaseRouting
Vector of	Decimal (0..2147483647)
Index	discardPriority_1 (dp1) discardPriority_2 (dp2) discardPriority_3 (dp3)
Default	No default

COMPONENT Trm Lg LogicalNetworkNumber (LNN)

Instance	Decimal (0..2047)
Groups	GROUP Trm Lg LNN Operational (Oper)
Scope	Network
Description	*Trm Lg/<neighborNodeName> LNN /<logical network number>* This component is a dynamic subcomponent of *LinkGroup*. It has operational attributes only which are stored and maintained by this component for displaying address plans supported over this link group. A logical network number (which is used as an instance to this component) uniquely identifies an address plan and its traffic in a network.
Mib	BaseRouting
Common Verbs	Help List Display

GROUP Trm Lg LNN Operational (Oper)

Properties	Operational
Description	*Trm Lg/<neighborNodeName> LNN/<logical network number> Operational* This group of attributes is the information associated with an address plan.
Mib	BaseRouting

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Trm Lg LNN linkType

Access	Read only
Description	This attribute indicates how the LNN is transported over the link group. It can be one of three types: *trunk* - the LNN is supported by Topology over a link between two Nortel Networks Multiservice Switches. *internal gateway* - the LNN is supported by an address plan (but not Topology) over a link between two Nortel Networeks Multiservice Switches. *external gateway* - the LNN is supported by an address plan (but not Topology) over a link between a Nortel Networks Multiservice Switch and a node that is not a Nortel Networks Multiservice Switch.
Mib	BaseRouting
Values	trunk internalGateway externalGateway
Default	No default

ATTRIBUTE Trm Lg LNN addressPlanComponentName (addrPlanCompName)

Access	Read only
Description	This attribute indicates the component name of the address plan which owns the logical network number of this component.
Mib	BaseRouting
Values	The name of the component
Default	No default

GROUP Vct Dna Address

Properties	Provisioned
Description	*Address* group contains attributes common to all *Dna's*. Every *Dna* used in

Copyright © 2006, Nortel Nortel Confidential

	the network is defined with this group of 2 attributes. String of address digits is complemented by type of address and Npi. These attributes are used to interpret format of the address digits.
Mib	VcTester

ATTRIBUTE Vct Dna numberingPlanIndicator (npi)

Access	Read and write
Criticality	Process
Description	This attribute indicates the Numbering Plan Indicator (NPI) of the *Dna* that is entered. Address may belong to X.121 or E.164 plans. X.121 is used in packet switched data networks.
Mib	VcTester
Values	x121 e164
Default	x121

ATTRIBUTE Vct Dna dataNetworkAddress (dna)

Access	Read and write
Criticality	Process
Description	*Dna* attribute contains digits which form unique identifier of the customer interface. It can be compared (approximation only) to telephone number where phone number identifies unique telephone set. *Dna* digits are selected and assigned by network operators.
Mib	VcTester
Values	BCD (1..15)
Default	No default

GROUP Vct Dna OutgoingOptions

Properties	Provisioned
Description	*OutgoingOptions* group defines call options of a *Dna* for calls which are made out of the interface represented by *Dna*. All these options are not used for calls arriving to the interface represented by *Dna*.
Mib	VcTester

ATTRIBUTE Vct Dna outCalls (ouc)

Access	Read and write
Description	This attribute, if set to a value of ***allowed*** indicates that outgoing calls (from the DTE to the network) can be made using this particular *D*na. If set to a value of ***disallowed***, then outgoing calls cannot be made using this *Dna* - such calls will be cleared by the local DCE. This attribute

Copyright © 2006, Nortel Nortel Confidential

corresponds to the ITU-T 'Outgoing Calls Barred' feature for *Dnas* in that outgoing calls are barred if this attribute is set to a value of ***disallowed***. Either *outCalls*, or *incCalls* (or both) must be set to a value of ***allowed*** for this *Dna* to be usable.

Mib	VcTester
Values	disallowed allowed
Default	allowed

ATTRIBUTE Vct Dna outNormalCharge (onc)

Access	Read and write
Description	This attribute, if set to a value of ***allowed*** indicates that outgoing normal charged calls (from the DTE to the network) can be made using this particular *Dna*. If set to a value of ***disallowed***, then such calls cannot be made using this *Dna* - such calls will be cleared by the local DCE. This attribute is ignored if the corresponding attribute, *outCalls* is set to a value of ***disallowed***.
Mib	VcTester
Values	disallowed allowed
Default	allowed

ATTRIBUTE Vct Dna outReverseCharge (orc)

Access	Read and write
Description	This attribute, if set to a value of ***allowed*** indicates that outgoing reverse charged calls (from the DTE to the network) can be made using this particular *Dna*. If set to a value of ***disallowed***, then such calls cannot be made using this *Dna* - such calls will be cleared by the local DCE. This attribute is ignored if the corresponding attribute, outCalls is set to a value of ***disallowed***.
Mib	VcTester
Values	disallowed allowed
Default	allowed

ATTRIBUTE Vct Dna outForceReverseCharge (ofr)

Access	Read and write
Description	This attribute specifies whether to force outgoing reverse charged calls. This attribute, if set to a value of ***yes*** forces reverse charging on all outgoing calls (from the DTE to the network) using this particular *Dna* unless the caller specifies a NUI in which case the call is charged to the NUI. If set to a value of ***no*** then reverse charging is not forced for outgoing

Copyright © 2006, Nortel Nortel Confidential

	calls. This attribute is ignored if the corresponding attribute, *outCalls* is set to a value of ***disallowed***.This attribute must be semantically consistent with the corresponding attribute, *outReverseChargeCalls*.
Mib	VcTester
Values	no yes
Default	no

ATTRIBUTE Vct Dna outNormalPriority (onp)

Access	Read and write
Description	This attribute, if set to a value of ***allowed*** indicates that outgoing normal priority calls (from the DTE to the network) can be made using this particular *Dna*. If set to a value of ***disallowed***, then such calls cannot be made using this *Dna* - such calls will be cleared by the local DCE. This attribute is ignored if the corresponding attribute, *outCalls* is set to a value of ***disallowed***. This option can be also included in X.25 signaling, in such case it will be overruled.
Mib	VcTester
Values	disallowed allowed
Default	allowed

ATTRIBUTE Vct Dna outHighPriority (ohp)

Access	Read and write
Description	This attribute, if set to a value of ***allowed*** indicates that outgoing high priority calls (from the DTE to the network) can be made using this particular *Dna*. If set to a value of ***disallowed***, then such calls cannot be made using this *Dna* - such calls will be cleared by the local DCE. This attribute is ignored if the corresponding attribute, *outCalls* is set to a value of ***disallowed***. This option can be also included in X.25 signaling, in such case it will be overruled.
Mib	VcTester
Values	disallowed allowed
Default	allowed

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vct Dna outDefaultPriority (odf)

Access	Read and write
Description	This attribute, if set to ***normal*** indicates that the default priority for outgoing calls (from the DTE to the network) using this particular *Dna* is normal priority - if the priority is not specified by the DTE. If this attribute is set to ***high*** then the default priority for outgoing calls using this particular *Dna* is high priority. It can be overridden by the discardPriority under DLCI Direct Call subcomponent. This option can be also included in X.25 signaling, in such case it will be overruled.
Mib	VcTester
Values	normal high
Default	normal

ATTRIBUTE Vct Dna outIntl (oic)

Access	Read and write
Description	This attribute, if set to a value of ***allowed*** indicates that outgoing international calls (from the DTE to the network) can be made using this particular *Dna*. If set to a value of ***disallowed***, then such calls cannot be made using this *Dna* - such calls will be cleared by the local DCE. This attribute also currently controls access to the E.164 numbering plan, and if set to a value of ***allowed***, then cross-numbering plan calls are allowed. This attribute is ignored if the corresponding attribute, *outCalls* is set to a value of ***disallowed***.
Mib	VcTester
Values	disallowed allowed
Default	disallowed

ATTRIBUTE Vct Dna outFsRestrictedResponse (ofrc)

Access	Read and write
Description	This attribute, if set to a value of ***allowed*** indicates that outgoing fast select calls (from the DTE to the network) with a restricted response can be made using this particular *Dna*. If set to a value of ***disallowed***, then such calls cannot be made using this *Dna* - such calls will be cleared by

Copyright © 2006, Nortel Nortel Confidential

	the local DCE. This attribute is ignored if the corresponding attribute, *outCalls* is set to a value of ***disallowed***.
Mib	VcTester
Values	disallowed allowed
Default	disallowed

ATTRIBUTE Vct Dna outFsUnrestrictedResponse (ofu)

Access	Read and write
Description	This attribute, if set to a value of ***allowed*** indicates that outgoing fast select calls (from the DTE to the network) with an unrestricted response can be made using this particular *Dna*. If set to a value of ***disallowed***, then such calls cannot be made using this *Dna* - such calls will be cleared by the local DCE. This attribute is ignored if the corresponding attribute, *outCalls* is set to a value of ***disallowed***.
Mib	VcTester
Values	disallowed allowed
Default	disallowed

ATTRIBUTE Vct Dna outPathSensitivitySignal (oss)

Access	Read and write
Description	This is the sensitivity signaling. If this attribute is set to ***allowed***, the signaled value on sensitivity will be used.
Mib	VcTester
Values	allowed disallowed
Default	disallowed

ATTRIBUTE Vct Dna outDefaultPathReliability (opr)

Access	Read and write
Description	This attribute specifies the default class of routing for reliability routing for all outgoing calls (from the DTE to the network) using this particular *Dna*. The chosen default class of routing applies to all outgoing calls established using this *Dna*, and applies to the packets travelling in both directions on all outgoing calls (local to remote, and remote to local). For incoming calls, the default class of routing is chosen by the calling party (as opposed to DPN, where either end of the call can choose the default routing class). This attribute, if set to a value of ***normal***, indicates that the default class of

Copyright © 2006, Nortel Nortel Confidential

routing is normal reliability routing. If set to a value of ***high***, then the default class of routing is high reliability routing.

High reliability is the standard choice for most DPN and Nortel Networks Multiservice Switch services. It usually indicates that packets are overflowed or retransmitted at various routing levels. Typically high reliability results in duplication and disordering of packets in the network when errors are detected or during link congestion. However, the *Vc* handles the duplication and disordering to ensure that packets are delivered to the DTE properly.

For the Frame Relay service, duplication of packets is not desired, in which case, ***normal*** reliability may be chosen as the preferred class of routing.

Mib	VcTester
Values	normal high
Default	high

ATTRIBUTE Vct Dna outPathReliabilityOverRide (oro)

Access	Read and write
Description	If outReliabilityOverRide set in the call request, the called end will use the calling end provisioning data on reliability to override his provisioning data.
Mib	VcTester
Values	yes no
Default	no

ATTRIBUTE Vct Dna outPathReliabilitySignal (ores)

Access	Read and write
Description	*outPathReliabilitySignal* is reliability routing signaling. If this attribute is set to ***allowed***, the signaled value on reliability will be used.
Mib	VcTester
Values	allowed disallowed
Default	disallowed

ATTRIBUTE Vct Dna outAccess (oua)

Access	Read and write
Description	This attribute is an extension of the Closed User Group (CUG) facility, as follows: This attribute, if set to a value of ***allowed*** indicates that outgoing calls

Copyright © 2006, Nortel Nortel Confidential

(from the DTE to the network) to the open (non-CUG) part of the network are permitted. It also permits outgoing calls to DTE's that have Incoming Access capabilities. If set to a value of ***disallowed***, then such calls cannot be made using this *Dna* - such calls will be cleared by the local DCE. This attribute corresponds to the ITU-T 'Closed User Group with Outgoing Access' feature for *Dna's* in that outgoing access is granted if this attribute is set to a value of ***allowed***.

Mib	VcTester
Values	disallowed allowed
Default	disallowed

ATTRIBUTE Vct Dna defaultTransferPriority (dtp)

Access	Read and write
Description	This attribute specifies the default transfer priority to network for all outgoing calls using this particular *Dna*. It is overRidden by the *transferPriority* provisioned in the *DLCI* Direct Call sub-component. The transfer priority is a preference specified by an application according to its delay-sensitivity requirement. Frames with high transfer priority are served by the network before the frames with normal priority. Each transfer priority contains a predetermined setting for trunk queue (interrupting, delay or throughput), and routing metric (delay or throughput). When the transfer priority is set at ***high***, the trunk queue is set to high, the routing metric is set to delay. When the transfer priority is set at ***normal***, the trunk queue is set to normal, the routing metric is set to throughput. The default of *defaultTransferPriority* is ***normal.***
Mib	VcTester
Values	normal high
Default	normal

ATTRIBUTE Vct Dna transferPriorityOverRide (tpor)

Access	Read and write
Description	When this attribute is set to ***yes***, the called end will use the calling end provisioning data on transfer priority to override its own provisioning data. If it is set ***no***, the called end will use its own provisioning data on transfer

Copyright © 2006, Nortel Nortel Confidential

priority.

For more information about transfer priority, please refer to the previous attribute *defaultTransferPriority*.

The default of *transferPriorityOverRide* is ***no***.

Mib	VcTester
Values	yes no
Default	no

GROUP Vct Dna IncomingOptions

Properties	Provisioned
Description	*IncomingOptions* defines set of options for incoming calls. These options are used for calls arriving to the interface represented by *Dna*. For calls originated from the interface, *IncomingOptions* attributes are not used.
Mib	VcTester

ATTRIBUTE Vct Dna incCalls (inc)

Access	Read and write
Description	This attribute, if set to a value of ***allowed*** indicates that incoming calls (from the network to the DTE) can be made to this *Dna*. If set to a value of ***disallowed***, then incoming calls cannot be made to this *Dna* - such calls will be cleared by the local DCE. This attribute corresponds to the ITU-T 'Incoming Calls Barred' feature for *Dna's* in that incoming calls are barred if this attribute is set to a value of ***disallowed***. Either *outCalls*, or *incCalls* (or both) must be set to a value of ***allowed*** for this *Dna* to be usable.
Mib	VcTester
Values	disallowed allowed
Default	allowed

ATTRIBUTE Vct Dna incHighPriorityReverseCharge (ihp)

Access	Read and write
Description	This attribute, if set to a value of ***allowed*** indicates that incoming high priority, reverse charged calls (from the network to the DTE) can be made to this *Dna*. If set to a value of ***disallowed***,then such calls cannot be made to this *Dna* - such calls will be cleared by the local DCE. This attribute, together with *the incNormalPriorityReverseChargeCalls* attribute corresponds to the ITU-T 'Reverse Charging Acceptance' feature for *Dna's* in that

Copyright © 2006, Nortel Nortel Confidential

reverse charged calls are accepted if both attributes are set to a value of ***allowed***.
This attribute is ignored if the corresponding attribute, *incCalls* is set to a value of ***disallowed***.

Mib	VcTester
Values	disallowed allowed
Default	allowed

ATTRIBUTE Vct Dna incNormalPriorityReverseCharge (inp)

Access	Read and write
Description	This attribute, if set to a value of ***allowed*** indicates that incoming normal priority, reverse charged calls (from the network to the DTE) can be made to this *Dna*. If set to a value of ***disallowed***, then such calls cannot be made to this *Dna* - such calls will be cleared by the local DCE. This attribute, together with th*e incHighPriorityReverseChargeCalls* attribute corresponds to the ITU-T 'Reverse Charging Acceptance' feature for *Dna's* in that reverse charged calls are accepted if both attributes are set to a value of ***allowed***. This attribute is ignored if the corresponding attribute, *incCalls* is set to a value of ***disallowed***.
Mib	VcTester
Values	disallowed allowed
Default	allowed

ATTRIBUTE Vct Dna incIntlNormalCharge (iin)

Access	Read and write
Description	This attribute, if set to a value of ***allowed*** indicates that incoming international normal charged calls (from the network to the DTE) can be made to this *Dna*. If set to a value of ***disallowed***, then such calls cannot be made to this *Dna* - such calls will be cleared by the local DCE. This attribute also currently controls access to/from the E.164 numbering plan, and if set to a value of ***allowed***, then cross-numbering plan calls (also normal charged) are allowed. This attribute is ignored if the corresponding attribute, ***incCalls*** is set to a value of ***disallowed***.
Mib	VcTester
Values	disallowed allowed
Default	allowed

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vct Dna incIntlReverseCharge (iir)

Access	Read and write
Description	This attribute, if set to a value of ***allowed*** indicates that incoming international reverse charged calls (from the network to the DTE) can be made to this *Dna*. If set to a value of ***disallowed***, then such calls cannot be made to this *Dna* - such calls will be cleared by the local DCE. This attribute also currently controls access to/from the E.164 numbering plan, and if set to a value of ***allowed***, then cross-numbering plan calls (also normal charged) are allowed. This attribute is ignored if the corresponding attribute, *incCalls* is set to a value of ***disallowed***.
Mib	VcTester
Values	disallowed allowed
Default	allowed

ATTRIBUTE Vct Dna incFastSelect (ifs)

Access	Read and write
Description	This attribute specifies whether fast select calls may be received. This attribute, if set to a value of ***allowed*** indicates that incoming fast select calls (from the network to the DTE) can be made to this *Dna*. If set to a value of ***disallowed***, then such calls cannot be made to this *Dna* - such calls will be cleared by the local DCE. This attribute corresponds to the ITU-T 'Fast Select Acceptance' feature for *Dnas* in that incoming fast select calls are accepted if this attribute is set to a value of ***allowed***. This attribute is ignored if the corresponding attribute, *incCalls* is set to a value of ***disallowed***.
Mib	VcTester
Values	disallowed allowed
Default	disallowed

ATTRIBUTE Vct Dna incSameService (iss)

Access	Read and write
Description	This attribute, if set to a value of ***allowed*** indicates that incoming calls from the same service type (eg: X.25, ITI, SNA) (from the network to the DTE) can be made to this *Dna*. If set to a value of ***disallowed***, then such calls cannot be made to this *Dna* - such calls will be cleared by the local DCE. This attribute is ignored if the corresponding attribute, *incCalls* is set to a value of ***disallowed***.
Mib	VcTester

Copyright © 2006, Nortel Nortel Confidential

Values	disallowed allowed
Default	allowed

ATTRIBUTE Vct Dna incChargeTransfer (ict)

Access	Read and write
Description	This attribute, if set to a value of ***yes*** indicates that the charges for incoming normal charged calls from a DTE with the same DNIC (calls from the network to the DTE) will be transferred to the called DTE. If set to a value of ***no***, then charges will not be transferred. This attribute is ignored if the corresponding attribute, *incCalls* is set to a value of ***disallowed***.
Mib	VcTester
Values	no yes
Default	no

ATTRIBUTE Vct Dna incAccess (ina)

Access	Read and write
Description	This attribute is an extension of the Closed User Group (CUG) facility, as follows: This attribute, if set to a value of ***allowed*** indicates that incoming calls (from the network to the DTE) from the open (non-CUG) part of the network are permitted. It also permits incoming calls from DTE's that have Outgoing Access capabilities. If set to a value of ***disallowed***, then such calls cannot be made to this *Dna* - such calls will be cleared by the local DCE. This attribute corresponds to the ITU-T 'Closed User Group with Incoming Access' feature for *Dnas* in that incoming access is granted if this attribute is set to a value of ***allowed***.
Mib	VcTester
Values	disallowed allowed
Default	disallowed

GROUP Vct Dna CallOptions

Properties	Provisioned
Description	*CallOptions* group defines additional options for calls not related directly to direction of a call.
Mib	VcTester

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vct Dna serviceCategory (cat)

Access	Read and write
Description	This attribute is assigned for each different type of service within which this *Dna* is configured. It is placed into the Service Category attribute in the accounting record by both ends of the *Vc*.

2048
4096

Default 128

ATTRIBUTE Vct Dna defaultRecvFrmNetworkThruputClass (drt)

Access Read and write

Description This attribute indicates the default receive throughput class for all calls using this particular *Dna*.

Mib VcTester

Values Decimal (3..15)

Default 10

ATTRIBUTE Vct Dna defaultSendToNetworkThruputClass (dst)

Access Read and write

Description This attribute indicates the default send throughput class for all calls using this particular *Dna*.

Mib VcTester

Values Decimal (0..15)

Default 10

ATTRIBUTE Vct Dna defaultRecvFrmNetworkWindowSize (rws)

Access Read and write

Description This attribute indicates the default number of data packets that can be received by the DTE from the DCE before more packets can be received. This view is oriented with respect to the DTE.

Mib VcTester

Values Decimal (1..7)

Default 2

ATTRIBUTE Vct Dna defaultSendToNetworkWindowSize (sws)

Access Read and write

Description This attribute indicates the number of data packets that can be transmitted from the DTE to the DCE and must be acknowledged before more packets can be transmitted.

Mib VcTester

Values Decimal (1..7)

Default 2

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vct Dna packetSizeNegotiation (psn)

Access	Read and write
Description	This attribute, if set to ***local*** indicates that packet sizes can be negotiated locally at the interface irrespective of the remote interface. If set to ***endToEnd***, then local negotiation is not permitted and packet sizes are negotiated between both ends of the VC.
Mib	VcTester
Values	endToEnd local
Default	endToEnd

ATTRIBUTE Vct Dna cugFormat (cft)

Access	Read and write
Description	This attribute specifies which cug format is used when DTE signals CUG indices, basic or extended. This attribute, if set to ***extended*** indicates that the DTE signals and receives CUG indices in extended CUG format. If set to a value of ***basic***, then the DTE signals and receives CUG indices in the basic CUG format.
Mib	VcTester
Values	basic extended
Default	basic

ATTRIBUTE Vct Dna cug0AsNonCugCall (cnc)

Access	Read and write
Description	This attribute, if set to ***allowed*** indicates that when a CUG index of 0 is signaled in a call request packet, the call is treated as a non-CUG call. If this attribute is set to ***disallowed***, then a CUG index of 0 is treated as an index, and an attempt is made to find the particular CUG corresponding with the *Dna*.
Mib	VcTester
Values	disallowed allowed
Default	disallowed

ATTRIBUTE Vct Dna signalPreferentialCugToLink (spc)

Access	Read and write
Description	This attribute, if set to ***no***, indicates that, at the destination (called) DTE, when a CUG call is received using the called DTE's preferential CUG, the preferential CUG's index is not signaled to the called DTE in the incoming

Copyright © 2006, Nortel Nortel Confidential

call request packet. Otherwise, the preferential CUG's index is signaled to the link in the incoming call request packet.

Mib VcTester

Values
no
yes

Default no

ATTRIBUTE Vct Dna signalIntlAddressToLink (sia)

Access Read and write

Description

This attribute, if set to ***yes***, indicates that all addresses presented by the network (DCE) to the link (DTE) within incoming call request., call connected and clear packets are presented in international format with no prefix digit. International format includes DNIC in the address.

Mib VcTester

Values
no
yes

Default no

ATTRIBUTE Vct Dna fastSelectCallsOnly (fso)

Access Read and write

Description

This attribute, if set to ***yes***, indicates that the service is permitted restricted fast select calls in both the incoming and the outgoing directions using this *Dna*. If set to ***no***, then non fast select calls are permitted as well.

Mib VcTester

Values
no
yes

Default no

ATTRIBUTE Vct Dna preselectRpoa (prp)

Access Read and write

Description This attribute, if set to ***yes***, indicates that this *Dna* subscribes to a pre-selected RPOA, in which case, the pre-selected RPOA is contained in the *rpoa* attribute described below. If set to ***no***, then a pre-selected RPOA is not subscribed.

Mib VcTester

Values
no
yes

Default no

ATTRIBUTE Vct Dna accountClass (acl)

Access	Read and write
Description	This attribute specifies the accounting class which is reserved for network operations usage. Its value is returned in the accounting record in the local and remote service type attributes. Use of this attribute is decided by network operator and it is an arbitrary number.
Mib	VcTester
Values	Decimal (0..255)
Default	0

ATTRIBUTE Vct Dna accountCollection (aco)

Access	Read and write
Description	This attribute indicates that accounting records are to be collected by the network for the various reasons: billing, test, study, auditing. The last of the parameters, force, indicates that accounting records are to be collected irrespective of other collection reasons. If none of these reasons are set, then accounting will be suppressed.
Mib	VcTester
Set of	bill test study audit force
Default	(bill)

ATTRIBUTE Vct Dna serviceExchange (sre)

Access	Read and write
Description	This attribute is an arbitrary number, entered by the network operator. The value of *serviceExchange* is included in the accounting record generated by *Vc*.
Mib	VcTester
Values	Decimal (0..255)
Default	0

ATTRIBUTE Vct Dna egressAccounting (ega)

Access	Read and write
Description	*egressAccounting* specifies if Egress accounting is enabled by Frame Relay service. Disabling of Egress accounting means that only segment

Copyright © 2006, Nortel Nortel Confidential

counts are collected by VC and there are no frame relay counts in accounting records for Frame Relay service. Enabling of Egress accounting means that the accounting records for Frame Relay contain frame relay specific counts.

Mib VcTester

Values yes
no

Default no

ATTRIBUTE Vct Dna rpoa

Access Read and write

Description *rpoa* - Recognized Private Operating Agency is a ITU-T specified facility which allows the user to specify--at call setup time--the next transit network the call should use. The *rpoa* can override all routing decisions. If *Dna* subscribes to *preselectRpoa* as indicated by the previously described attribute, (*preselectRpoa* set to ***yes***) then this attribute contains preselected *rpoa*. If the *preselectRpoa* attribute is set to ***no***, then this attribute can be left at its default.
This preselected *rpoa* will be used for all outgoing call request packets using this *Dna* if an *rpoa* is not explicitly specified in the call request. The *rpoa* represents the *dnic* of the directly connected network through which the call will be routed in the presence of the *rpoa*.

Mib VcTester

Values BCD (4)

Default 0000

ATTRIBUTE Vct Dna dataPath (dpa)

Access Read and write

Description

This attribute specifies the data path to be used by Virtual Circuits on this interface. If the connection has a *DirectCall* component then the value can be overridden by the *dataPath* attribute of the *DirectCall* component.

This value applies to the connection after data transfer state is reached. All the data and control traffic will be sent using this data path. If the provisioned *dataPath* is not available the connection is not established.

The value of the *dataPath* is signaled by both ends of the connection. If this value is not the same at both ends ***dprsOnly*** is used for the duration of the connection.

A virtual circuit connection is always established using ***dprsOnly*** even if this attribute is provisioned as some other value.

dprsOnly - dynamic packet routing system is used

Copyright © 2006, Nortel Nortel Confidential

dprsMcsOnly - DPRS Multiservice Cut-Through Switching path is used.

dprsMcsFirst - DPRS Multiservice Cut-Through Switching path is used if it is available. If it is not available ***dprsOnly*** is used.

Mib	VcTester
Values	dprsOnly dprsMcsOnly dprsMcsFirst
Default	dprsOnly

COMPONENT Vct Dna ClosedUserGroup (Cug)

Instance	Decimal (0..255)
Groups	GROUP Vct Dna Cug CugOptions
Scope	Application
Description	*Fruni/n Dna Cug* *ClosedUserGroup* options defines options associated with national or international *Cug* Identifier. Other *Dna's* in the network can have *Cug's* defined which groups these *Dna's* by *Cug interlockCode*. If *Dna's* are defined with *Cugs*, calls from *Dna's* which do not have the same *interlockCode* defined are refused. Attributes *incAccess* and *outAccess* can override this rule.
Mib	VcTester
Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP Vct Dna Cug CugOptions

Properties	Provisioned
Description	This group defines options for. Attributes in this group defines *ClosedUserGroup* options associated with *interlockCode*. *Dna's* with the same *Cug* (*interlockCode*) can make calls within this group. Various combinations which permit or prevent calls in the same *Cug* group are defined here.
Mib	VcTester

ATTRIBUTE Vct Dna Cug type

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the Cug type - the Cug is either a national Cug, or an international Cug. International closed user groups are usually established between DTE's for which there is an X.75 Gateway between; whereas national closed user groups are usually established between DTE's for which there is no X.75 Gateway between. (National Cugs cannot normally traverse an X.75 Gateway). If this attribute is set to ***national***, then the *Cug* is a national *Cug*, in which case, the *dnic* should be left at its default value since it is not part of a national *Cug*. If this attribute is set to ***international***, then the *Cug* is an international *Cug*, in which case, the *dnic* should be set appropriately as part of the *Cug interlockCode*.
Mib	VcTester
Values	national international
Default	national

ATTRIBUTE Vct Dna Cug dnic

Access	Read and write
Description	This attribute specifies the *dnic* (Data Network ID Code) of the *Cug* by which packet networks are identified. This attribute is not applicable if the *Cug* is a ***national*** *Cug*, as specified by the Cug *type* attribute. There are usually 1 or 2 *dnics* assigned per country, for public networks. The U.S. is an exception where each BOC has a *dnic*. Also, a group of private networks can have its own *dnic*. *dnic* value is not an arbitrary number. It is assigned by international agreement and controlled by ITU-T.
Mib	VcTester
Values	BCD (4)
Default	0000

ATTRIBUTE Vct Dna Cug interlockCode (ilc)

Access	Read and write
Description	This attribute specifies the *Cug* identifier of a national or international *Cug* call. It is an arbitrary number and it also can be called Cug in some descriptions. Interfaces (*Dna's*) defined with this number can make calls to *Dna's* with the same *interlockCode*.
Mib	VcTester
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Vct Dna Cug preferential (pre)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute, if set to ***yes*** indicates that this *Cug* is the preferential *Cug*, in which case it will be used during the call establishment phase if the DTE has not explicitly specified a *Cug* index in the call request packet. If set to ***no***, then this *Cug* is not the preferential *Cug*. Only one of the *Cugs* associated with a particular *Dna* can be the preferential *Cug* - only one *Cug* can have this attribute set to ***yes***.
Mib	VcTester
Values	no yes
Default	no

ATTRIBUTE Vct Dna Cug outCalls (ouc)

Access	Read and write
Description	This attribute, if set to ***allowed*** indicates that outgoing calls (from the DTE into the network) can be made using this particular *Cug*. If set to a value of ***disallowed***, then outgoing calls cannot be made using this *Cug* - such calls will be cleared by the local DCE. This attribute corresponds to the ITU-T 'Outgoing Calls Barred' feature for *cugs* in that outgoing calls are barred if this attribute is set to a value of ***disallowed***.
Mib	VcTester
Values	disallowed allowed
Default	allowed

ATTRIBUTE Vct Dna Cug incCalls (inc)

Access	Read and write
Description	This attribute, if set to ***allowed*** indicates that incoming calls (from the network to the DTE) can be made using this particular *Cug*. If set to ***disallowed***, then incoming calls cannot be made using this *Cug* - such calls will be cleared by the local DCE. This attribute corresponds to the ITU-T 'Incoming Calls Barred' feature for *Cugs* in that incoming calls are barred if this attribute is set to a value of ***disallowed***.
Mib	VcTester
Values	disallowed allowed
Default	allowed

ATTRIBUTE Vct Dna Cug privileged (pri)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute, if set to ***yes*** indicates that this *Cug* is a privileged *Cug*. In DPN, at least one side of a call setup within a *Cug* must have the *Cug* as a privileged *Cug*. If set to ***no***, then the *Cug* is not privileged. If both the local DTE and the remote DTE subscribe to the *Cug*, but it is not privileged, then the call will be cleared. This attribute is typically used for a host DTE which must accept calls from many other DTE's in which case the other DTE's cannot call one another, but can call the host. In this example, the host would have the privileged *Cug*, and the other DTE's would belong to the same *Cug*, but it would not be privileged.
Mib	VcTester
Values	no yes
Default	yes

COMPONENT Vct Dna HuntGroupMember (HgM)

Groups	GROUP Vct Dna HgM Interface (If) GROUP Vct Dna HgM Operational (Op)
Scope	Application
Description	*GvcIf/n Dna/n HgMember* This component specifies the Hunt Groups to which this member belongs. A hunt group member subscribes to at least one hunt group.
Mib	VcTester
Subcomponents	COMPONENT Vct Dna HgM HuntGroupAddress (HgAddr)
Common Verbs	Help List Display Add DELete

GROUP Vct Dna HgM Interface (If)

Properties	Provisioned
Description	This group contains the interface parameters between the *HuntGroupMember* and the Hunt Group server.
Mib	VcTester

ATTRIBUTE Vct Dna HgM availabilityUpdateThreshold (aut)

Access	Read and write
Description	This attribute indicates the number of channels that have to be freed or occupied before the Availability Message Packet (AMP) is sent to the Hunt Group Server informing it of the status of this interface.
Mib	VcTester

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4096)
Default	1

GROUP Vct Dna HgM Operational (Op)

Properties	Operational
Description	This group contains the operational attributes of the *HuntGroupMember* component.
Mib	VcTester

ATTRIBUTE Vct Dna HgM maxAvailableChannels (maxAc)

Access	Read only
Description	This attribute indicates the maximum number of available channels for this *HuntGroupMember*.
Mib	VcTester
Values	Decimal (0..4096)
Default	No default

ATTRIBUTE Vct Dna HgM availableChannels (ac)

Access	Read only
Description	This attribute indicates the number of available channels reported to the hunt group in the Availability Message Packet (AMP). It is modified by adding 1 by the application when a channel is freed and subtracting 1 when a channel is occupied.
Mib	VcTester
Values	Decimal (0..4096)
Default	No default

ATTRIBUTE Vct Dna HgM availabilityDelta (ad)

Access	Read only
Description	This attribute indicates the net change in the available channels since the last Availability Message Packet (AMP) was sent to the Hunt Group. Once the absolute value of this attribute reaches the *availabilityUpdateThreshold* an AMP is sent to the host and the *availabilityDelta* is reset to 0. If this attribute is positive it means an increase of the number of available channels. If it is negative it means a decrease in the number of available channels.
Mib	VcTester
Values	Signed (-4096..4096)
Default	No default

Instance	Decimal (0..1)
Groups	GROUP Vct Dna HgM HgAddr Address (Addr)
Scope	Application
Description	*GvcIf/n Dna/n HgM HuntGroupAddress/n* This component specifies the Hunt Group address to which this member belongs. A hunt group member belongs to at least one hunt group.
Mib	VcTester
Common Verbs	Help List Display Add DELete

GROUP Vct Dna HgM HgAddr Address (Addr)

Properties	Provisioned
Description	This group contains attributes common to all DNAs. Every DNA used in the network is defined with this group of 2 attributes. String of address digits complemented by the NPI.
Mib	VcTester

ATTRIBUTE Vct Dna HgM HgAddr numberingPlanIndicator (npi)

Access	Read and write
Description	This attribute indicates the Numbering Plan Indicator (NPI) the *Dna* that is entered. Address may belong to X.121 or E.164 plans.
Mib	VcTester
Values	x121 e164
Default	x121

ATTRIBUTE Vct Dna HgM HgAddr dataNetworkAddress (dna)

Access	Read and write
Description	This attribute contains digits which form unique identifier of the customer interface. It can be compared (approximation only) telephone number where phone number identifies unique telephone set. *Dna* digits are selected and assigned by network operators.
Mib	VcTester
Values	BCD (1..15)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

COMPONENT Vct DirectCall (Dc)

Instance	Decimal (1..10)
Groups	GROUP Vct Dc Options
Scope	Application
Description	*Fruni/n Dlci*/n dc This component defines direct call options for calls issued without operator intervention. Connection is complete and can be initiated automatically. Frequency of connection tries is controlled by retry timer.
Mib	VcTester
Common Verbs	Help List Display Add DELete

GROUP Vct Dc Options

Properties	Provisioned
Description	*Options* group defines attributes associated with direct call. It defines complete connection in terms of path and call options. This connection can be permanent (pvc) or switched (svc). It can have facilities. The total number of bytes of facilities including the facility codes, and all of the facility data from all of the four classes of facilities: ITU-T_Facilities DTE_Facilities National_Facilities International_Facilities must not exceed maximum subnet packet size defined for the whole network in ModuleData Vcs component.
Mib	VcTester

ATTRIBUTE Vct Dc localNpi (lnpi)

Access	Read and write
Description	This attribute specifies the Numbering Plan Indicator (NPI) of the *localDna*.
Mib	VcTester
Values	x121 e164
Default	x121

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vct Dc localDna (ldna)

Access	Read and write
Description	This attribute specifies the Data Network Address (*Dna*) of the local DTE. This address is used in formatting of call request to *remoteDna*.
Mib	VcTester
Values	BCD (0..15)
Default	No default

ATTRIBUTE Vct Dc remoteNpi (rnpi)

Access	Read and write
Description	Remote numbering Plan Indicator (Npi) indicates the numbering plan used in the *remoteDna*.
Mib	VcTester
Values	x121 e164
Default	x121

ATTRIBUTE Vct Dc remoteDna (rdna)

Access	Read and write
Description	This attribute specifies the Data Network Address (*Dna*) of the remote. This is the called (destination) DTE address (*Dna*) to which this direct call will be sent. Initially, the called DTE address attribute must be present, that is, there must be a valid destination address. However, it may be possible in the future to configure the direct call with a mnemonic address, in which case, this attribute will contain a zero-length *Dna*, and the mnemonic address will be carried as one of the facilities.
Mib	VcTester
Values	BCD (1..15)
Default	No default

ATTRIBUTE Vct Dc remoteLcn (rlcn)

Access	Read and write
Description	This attribute provides the remote LCN (Logical Channel Number) - it is used only for PVCs, where attribute *type* is set to ***permanentMaster*** or ***permanentSlave*** or ***permanentBackupSlave***. In ***switched*** case, value of *remoteLcn* is not known when call request is made.
Mib	VcTester

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4095)
Default	0

ATTRIBUTE Vct Dc type

Access	Read and write
Description	This attribute specifies the type of *Vc* call: ***switched,*** ***permanentMaster***, ***permanentSlave***, ***permanentSlaveWithBackup,*** ***permanentBackupSlave***, ***spvcMaster***, ***spvcSlave***, ***spvcSlaveWithBackup,*** ***spvcBackupSlave***. If the value of this attribute is set to ***switched*** then the remote end must also be provisioned as ***switched***. No information at the remote end is defined about this switched interface. If the value is set to ***permanentMaster,*** then a permanent connection will be established between 2 ends. The remote end must be defined as a ***permanentSlave***, ***permanentBackupSlave*** or ***permanentSlaveWithBackup***. The connection cannot be established if the remote end is defined as anything else. The end defined as ***permanentMaster*** always initiates the calls. It will attempt to call once per minute. If the value is set to ***permanentSlave*** then a permanent connection will be established between 2 ends. The remote end must be defined as a ***permanentMaster.*** The connection cannot be established if the remote end is defined as anything else. The ***permanentSlave*** *end* will attempt to call once per minute. If the value is set to ***permanentSlaveWithBackup*** then a permanent connection will be established between the two ends. The remote end must be defined as a ***permanentMaster.*** The connection cannot be established if the remote interface end is defined as anything else. The ***permanentSlaveWithBackup*** *end* will attempt to call once per minute. When *type* is set to ***permanentSlaveWithBackup*** connection will be cleared if interface becomes unavailable. This enables a retry of the connection which can be redirected to ***permanentBackupSlave***. If the value is set to ***permanentBackupSlave*** then a permanent connection will be established between the 2 ends only if the ***permanentMaster*** end is disconnected from the ***permanentSlaveWithBackup*** end and a backup call is established by the redirection system. If the ***permanentSlaveWithBackup*** interface becomes visible again, the ***permanentBackupSlave*** end is disconnected

Copyright © 2006, Nortel Nortel Confidential

and the ***permanentSlaveWithBackup*** end is reconnected to the ***permanentMaster*** end. The ***permanentBackupSlave*** end does not try to establish pvc call.

Mib — VcTester

Values
switched (svc)
permanentMaster (master)
permanentSlave (slave)
permanentBackupSlave (backSl)
permanentSlaveWithBackup (slavWB)
spvcMaster (spvcM)
spvcSlave (spvcS)
spvcBackupSlave (spvcBackS)
spvcSlaveWithBackup (spvcSWBack)

Default — switched

ATTRIBUTE Vct Dc svcAutoCallRetry (acr)

Access — Read and write

Description — *svcAutoCallRetry* is used only for ***switched*** calls, in which case the attribute *type* is set to ***switched***. Otherwise, this attribute is ignored by the *Vc*s.
This attribute, if set to ***yes*** for Svc, indicates that the *Vc* will continually try to establish the SVC rather than clearing the *Vc* after the first unsuccessful call attempt. Further, if the call fails while in data transfer phase, then the *Vc* will automatically attempt to reconnect. The call attempts are made by the *Vc* once per time provisioned in *InterfaceOptions* as *callRetryTimer*, repeatedly. If set to ***no*** for SVCs, then the *Vc* behaves in the standard mode, making a single call attempt.

Mib — VcTester

Values
no
yes

Default — no

ATTRIBUTE Vct Dc userData (usd)

Access — Read and write

Description — This attribute contains the user data, if present. *userData* is a 0 to 16 length string which is appended to the call request packet that is presented to the called (destination) DTE.

User data can be a 0 to 128 byte string for fast select calls; otherwise it is 0 to 16 byte string.

Fast select calls are indicated as such using the X.25 ITU-T facility for 'Reverse Charging'.

The length of the user data attribute is not verified during service

Copyright © 2006, Nortel Nortel Confidential

provisioning. If more than 16 bytes of user data is specified on a call without the fast select option, then the call is cleared with a clear cause of 'local procedure error', and a diagnostic code of 39 (as defined in the ITU-T X.25 Recommendation).

Mib	VcTester
Values	String (0..128, Hex)
Default	No default

ATTRIBUTE Vct Dc discardPriority (dp)

Access	Read and write
Description	This attribute specifies the discard priority for outgoing call using this *DLCI*. The discard priority has three provisioning values: ***normal, high,*** and ***useDnaDefPriority***. Traffic with ***normal*** priority are discarded first than the traffic with ***high*** priority. The *Dna* default value (provisioned by *outDefaultPriority*) is taken if this attribute is set to the value ***useDnaDefPriority***. The default of *discardPriority* is ***useDnaDefPriority***.
Mib	VcTester
Values	normal high useDnaDefPriority
Default	useDnaDefPriority

ATTRIBUTE Vct Dc dataPath (dpa)

Access	Read and write
Description	This attribute specifies the data path to be used by Virtual Circuits on this interface. The value of the *dataPath* attribute in the *Dna* component is overridden by this attribute if the value is not ***useDnaValue***. This value applies to the connection after data transfer state is reached. All the data and control traffic will be sent using this data path. If the provisioned *dataPath* is not available the connection is not established. The value of the *dataPath* is signaled by both ends of the connection. If this value is not the same at both ends ***dprsOnly*** is used for the duration of the connection. A virtual circuit connection is always established using ***dprsOnly*** even if this attribute is provisioned as some other value. ***dprsOnly*** - dynamic packet routing system is used

Copyright © 2006, Nortel Nortel Confidential

dprsMcsOnly - dprs Multi-Service Cut-Through Switching path is used.

dprsMcsFirst - dprs Multi-Service Cut-Through Switching path is used if it is available. If it is not available ***dprsOnly*** is used.

useDnaValue - use the value provisioned in *Dna* component.

Mib VcTester

Values
dprsOnly (dpOnly)
dprsMcsOnly (mcOnly)
dprsMcsFirst (mcFrst)
useDnaValue (dnaVal)

Default dprsOnly

ATTRIBUTE Vct Dc cugIndex (ci)

Access Read and write

Description

This attribute specifies the CUG index which is to be signaled in PVC call requests to the remote end.

The type of CUG signaling is defined in attribute *cugType* in this component.

Mib VcTester

Values Decimal (0..255)

Default 0

ATTRIBUTE Vct Dc cugType (ct)

Access Read and write

Description

This attribute specifies the type of CUG signaling to be used in PVC call request. Index of CUG to be used is defined in attribute *cugIndex* in this component.

Possible values are:
cug - signal cug
cugOa - signal cug with outgoing access
doNotSignal - no CUG in call request

Mib VcTester

Values
cug
cugOa
doNotSignal

Default doNotSignal

GROUP Vct Vc CallData (Cad)

Properties	Operational
Description	This group represents operational call data related to General *Vc*. It can be displayed only for General *Vc* which is created by application.
Mib	VcTester

ATTRIBUTE Vct Vc type

Access	Read only
Description	This attribute displays the type of call, ***pvc*** or ***svc***. *type* is provided at provisioning time.
Mib	VcTester
Values	pvc svc
Default	No default

ATTRIBUTE Vct Vc state

Access	Read only
Description	This attribute displays the state of call control. P5 state is not supported but is listed for completeness. Transitions from one state to another take very short time. *state* most often displayed is ***dataTransferP4***.

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..255)
Default	No default

ATTRIBUTE Vct Vc calledNpi

Access	Read only
Description	This attribute displays the Numbering Plan Indicator (NPI) of the called end.
Mib	VcTester
Values	x121 e164
Default	No default

ATTRIBUTE Vct Vc calledDna

Access	Read only
Description	This attribute displays the Data Network Address (*Dna*) of the called (destination) DTE to which this call is sent. This address if defined at receiving end will complete *Vc* connection.
Mib	VcTester
Values	BCD (1..15)
Default	No default

ATTRIBUTE Vct Vc calledLcn

Access	Read only
Description	This attribute displays the Logical Channel Number of the called end. It is valid only after both ends of *Vc* exchanged relevant information.
Mib	VcTester
Values	Decimal (1..65535)
Default	No default

ATTRIBUTE Vct Vc callingNpi

Access	Read only
Description	This attribute displays the Numbering Plan Indicator (NPI) of the calling end.
Mib	VcTester
Values	x121 e164
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vct Vc callingDna

Access	Read only
Description	This attribute displays the Data Network Address (*Dna*) of the calling end.
Mib	VcTester
Values	BCD (1..15)
Default	No default

ATTRIBUTE Vct Vc callingLcn

Access	Read only
Description	This attribute displays the Logical Channel Number of the calling end.
Mib	VcTester
Values	Decimal (1..65535)
Default	No default

ATTRIBUTE Vct Vc accountingEnabled

Access	Read only
Description	This attribute indicates that this optional section of accounting record is suppressed or permitted. If *accountingEnabled* is ***yes***, conditions for generation of accounting record were met. These conditions include billing options, vc recovery conditions and Module wide accounting data options.
Mib	VcTester
Values	yes no
Default	No default

ATTRIBUTE Vct Vc fastSelectCall

Access	Read only
Description	This attribute displays that this is a fast select call.
Mib	VcTester
Values	yes no
Default	No default

ATTRIBUTE Vct Vc localRxPktSize

Access	Read only
Description	This attribute displays the locally negotiated size of send packets.
Mib	VcTester

Copyright © 2006, Nortel Nortel Confidential

Values	unknown 16 32 64 128 256 512 1024 2048 4096
Default	No default

ATTRIBUTE Vct Vc localTxPktSize

Access	Read only
Description	This attribute displays the locally negotiated size of send packets.
Mib	VcTester
Values	unknown 16 32 64 128 256 512 1024 2048 4096
Default	No default

ATTRIBUTE Vct Vc localTxWindowSize

Access	Read only
Description	This attribute displays the send window size provided on incoming call packets or the default when a call request packet does not explicitly provide the window size.
Mib	VcTester
Values	Decimal (0..127)
Default	No default

ATTRIBUTE Vct Vc localRxWindowSize

Access	Read only
Description	This attribute displays the receive window size provided on incoming call packets or the default when a call request does not explicitly provide the window sizes.

Copyright © 2006, Nortel Nortel Confidential

Mib	VcTester
Values	Decimal (0..127)
Default	No default

ATTRIBUTE Vct Vc pathReliability

Access	Read only
Description	This attribute displays the path reliability.
Mib	VcTester
Values	high normal
Default	No default

ATTRIBUTE Vct Vc accountingEnd

Access	Read only
Description	This attribute indicates if this end should generate an accounting record. Normally, ***callingEnd*** is the end to generate an accounting record.
Mib	VcTester
Values	callingEnd calledEnd
Default	No default

ATTRIBUTE Vct Vc priority

Access	Read only
Description	This attribute displays whether the call is a ***normal*** or a ***high*** priority call.
Mib	VcTester
Values	normal high
Default	No default

ATTRIBUTE Vct Vc segmentSize

Access	Read only
Description	This attribute displays the segment size (in bytes) used on the call. It is used to calculate the number of segments transmitted and received.
Mib	VcTester
Values	Decimal (0..4096)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vct Vc subnetTxPktSize

Access	Read only
Description	This attribute displays the locally negotiated size of the data packets on this *Vc*.
Mib	VcTester
Values	unknown 16 32 64 128 256 512 1024 2048 4096
Default	No default

ATTRIBUTE Vct Vc subnetTxWindowSize

Access	Read only
Description	This attribute displays the current send window size of *Vc*.
Mib	VcTester
Values	Decimal (0..4096)
Default	No default

ATTRIBUTE Vct Vc subnetRxPktSize

Access	Read only
Description	This attribute displays the locally negotiated size of receive packets.
Mib	VcTester
Values	unknown 16 32 64 128 256 512 1024 2048 4096
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vct Vc subnetRxWindowSize

Access	Read only
Description	This attribute displays the receive window size provided on incoming call packets and to the default when a call request does not explicitly provide the window sizes.
Mib	VcTester
Values	Decimal (0..4096)
Default	No default

ATTRIBUTE Vct Vc maxSubnetPktSize

Access	Read only
Description	This attribute displays the maximum packet size allowed on *Vc*.
Mib	VcTester
Values	Decimal (0..4096)
Default	No default

ATTRIBUTE Vct Vc transferPriorityToNetwork

Access	Read only
Description	This attribute displays the priority in which data is transferred to the network. The transfer priority is a preference specified by an application according to its delay-sensitivity requirement. Frames with high transfer priority are served by the network before the frames with normal priority. Each transfer priority contains a predetermined setting for trunk queue (interrupting, delay or throughput), and routing metric (delay or throughput). When the transfer priority is set at ***high***, the trunk queue is set to high, the routing metric is set to delay. When the transfer priority is set at ***normal***, the trunk queue is set to normal, the routing metric is set to throughput.
Mib	VcTester
Values	normal high
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vct Vc transferPriorityFromNetwork

Access	Read only
Description	This attribute displays the priority in which data is transferred from the network. The transfer priority is a preference specified by an application according to its delay-sensitivity requirement. Frames with high transfer priority are served by the network before the frames with normal priority. Each transfer priority contains a predetermined setting for trunk queue (interrupting, delay or throughput), and routing metric (delay or throughput). When the transfer priority is set at ***high***, and the trunk queue is set to high, the routing metric is set to delay. When the transfer priority is set at ***normal***, the trunk queue is set to normal, and the routing metric is set to throughput.
Mib	VcTester
Values	normal high
Default	No default

GROUP Vct Vc IntervalData (Intd)

Properties	Operational
Description	This group defines display of interval data collected by *Vc*. Data in this group is variable and may depend on time when this *display* command is issued.
Mib	VcTester

ATTRIBUTE Vct Vc elapsedTimeTillNow

Access	Read only
Description	This attribute displays the elapsed time representing the period of this interval data. It is elapsed time in 0.1 second increments since *Vc* started.
Mib	VcTester
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE Vct Vc segmentsRx

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute displays the number of segments received at the time command was issued. This is the segment received count maintained by accounting at each end of the *Vc*. This counter is updated only when the packet cannot be successfully delivered out of the sink *Vc* and to the sink AP Conditions in which packets may be discarded by the sink *Vc* include: missing packets due to subnet discards, segmentation protocol violations due to subnet discard, duplicated and out-of-ranged packets and packets that arrive while *Vc* is in path recovery state.
Mib	VcTester
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE Vct Vc segmentsSent

Access	Read only
Description	This attribute displays the number of segments sent at the time command was issued. This is the segment sent count maintained by accounting at the source *Vc*. *Vc* only counts packets that *Vc* thinks can be delivered successfully into the subnet. In reality, these packets may be dropped by trunking, for instance. This counter is not updated when splitting fails, when *Vc* is in a path recovery state, when packet forwarding fails to forward this packet and when subsequent packets have to be discarded as we want to minimize the chance of out-of-sequence and do not intentionally send out-of-sequenced packets into the subnet.
Mib	VcTester
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE Vct Vc startTime

Access	Read only
Description	This attribute displays the start time of this interval period. If *Vc* spans 12 hour time or time of day change *startTime* reflects new time as recorded at 12 hour periods or time of day changes.
Mib	VcTester
Values	Time (DHMS)
Default	No default

ATTRIBUTE Vct Vc callReferenceNumber

Access	Read only
Description	This attribute displays the call reference number which is a unique number generated by the switch.The same Call Reference Number is stored in the interval data (accounting record) at both ends of the call. It can be used as

Copyright © 2006, Nortel Nortel Confidential

	one of the attributes in matching duplicate records generated at each end of the call.
Mib	VcTester
Values	Decimal (0..4294967295)
Default	No default

GROUP Vct Vc Statistics (Stats)

Properties	Operational
Description	*... Statistics(Stats)* This group defines general attributes collected by general *Vc*. The purpose of *Vc* attributes is to aid end users and verification people to understand the *Vc* internal behavior. This is particularly useful when the network has experienced abnormality and we want to isolate problems and pinpoint trouble spots. Attributes are collected on a per *Vc* basis. Until a need is identified, statistics are not collected at a processor level. Each attribute is stored in a 32 bit field and is initialized to zero when a *Vc* enters into the data transfer state. When a PVC is disconnected and then connected again, the attributes will be reset. Attributes cannot be reset through other methods.
Mib	VcTester

ATTRIBUTE Vct Vc ackStackingTimeouts

Access	Read only
Description	This attribute counts the number of ack stacking timer expiries. It is used as an indicator of the acknowledgment behavior across the subnet when ack stacking is in effect. If it expires often, usually this means end users will experience longer delay. The ack stacking timer specifies how long the *Vc* will wait before finally sending the subnet acknowledgment. if this attribute is set to a value of 0, then the *Vc* will automatically return acknowledgment packets without delay. If this attribute is set to a value other than zero, then the *Vc* will wait for this amount of time in an attempt to piggyback the acknowledgment packet on another credit or data packet. If the *Vc* cannot piggyback the acknowledgment packet within this time, then the packet is returned without piggybacking.
Mib	VcTester
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Vct Vc outOfRangeFrmFromSubnet

Access	Read only
Description	This attribute counts the number of subnet frames discarded due to the sequence number being out of range.

Copyright © 2006, Nortel Nortel Confidential

	Two Categories apply for the General *Vc* 1) lost Acks (previous Range) 2) unexpected Packets (next Range) *Vc* internally maintains its own sequence number of packet order and sequencing. Due to packet retransmission, *Vc* may receive duplicate packets that have the same *Vc* internal sequence number. Only 1 copy is accepted by the *Vc* and other copies of the same packets are detected through this count. This attribute can be used to record the frequency of packet retransmission due to *Vc* and other part of the subnet.
Mib	VcTester
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Vct Vc duplicatesFromSubnet

Access	Read only
Description	This attribute counts the number of subnet packets discarded due to duplication. It is used to detect software error fault or duplication caused by retransmitting.
Mib	VcTester
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Vct Vc frmRetryTimeouts

Access	Read only
Description	This attribute counts the number of frames which have retransmission time-out. If packets from *Vc* into the subnet are discarded by the subnet, the source *Vc* will not receive any acknowledgment. The retransmission timer then expires and packets will be retransmitted again. Note that the *Vc* idle probe may be retransmitted and is included in this count. This statistics does not show the distribution of how many times packets are retransmitted (e.g. first retransmission results in successful packet forwarding).
Mib	VcTester
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Vct Vc peakRetryQueueSize

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the peak size of the retransmission queue. This attribute is used as an indicator of the acknowledgment behavior across the subnet. It records the largest body of unacknowledged packets.
Mib	VcTester
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Vct Vc peakOoSeqQueueSize

Access	Read only
Description	This attribute indicates the peak size of the out of sequence queue. This attribute is used as an indicator of the sequencing behavior across the subnet. It records the largest body of out of sequence packets.
Mib	VcTester
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Vct Vc peakOoSeqFrmForwarded

Access	Read only
Description	This attribute indicates the peak size of the sequence packet queue. This attribute is used as an indicator of the sequencing behavior across the subnet. It records the largest body of out of sequence packets, which by the receipt of an expected packet have been transformed to expected packets. The number of times this peak is reached is not recorded as it is traffic dependent.
Mib	VcTester
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Vct Vc peakStackedAcksRx

Access	Read only
Description	This attribute indicates the peak size of wait acks. This attribute is used as an indicator of the acknowledgment behavior across the subnet. It records the largest collective acknowledgment.
Mib	VcTester
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Vct Vc subnetRecoveries

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of successful *Vc* recovery attempts. This attribute is used as an indicator of how many times the *Vc* path is broken but can be recovered. This attribute is useful to record the number of network path failures.
Mib	VcTester
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Vct Vc windowClosuresToSubnet

Access	Read only
Description	This attribute counts the number of window closures to subnet. A packet may have been sent into the subnet but its acknowledgment from the remote *Vc* has not yet been received. This is a 8 bit sequence number.This number is useful in detecting whether the *Vc* is sending any packet into the subnet.
Mib	VcTester
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Vct Vc windowClosuresFromSubnet

Access	Read only
Description	This attribute counts the number of window closures from subnet. This attribute is useful in detecting whether the *Vc* is receiving any packet from the subnet.
Mib	VcTester
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Vct Vc wrTriggers

Access	Read only
Description	This attribute displays the number of times the *Vc* stays within the W-R region. The W-R region is a value used to determined the timing of credit transmission. Should the current window size be beneath this value, the credits will be transmitted immediately. Otherwise, they will be transmitted later with actual data. The wrTriggers statistic is therefore used to analyze the flow control and credit mechanism.
Mib	VcTester
Values	Decimal (0..5000)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

COMPONENT Vct Vcfr

Groups	GROUP Vct Vcfr CallData (Cad) GROUP Vct Vcfr IntervalData (Intd) GROUP Vct Vcfr FrameRelayData (Frd)
Scope	Application
Description	This component defines the statistics collected by Frame Relay Vc. It is needed for lightweight vc.
Mib	VcTester
Common Verbs	Help List Display

VERB Ping Vct Vcfr

Impact	Passive
Description	*Ping [-roundTripDelay] [-sendPktDataSize(octets)] [-returnPktDataSize(octets)] FrUni/<n> Dlci/<n> Vc* *Ping* causes a query packet to be sent to the destination module where the Frame Relay DLCI VC terminates. It can be used to either display the path of the VC being used by the Frame Relay DLCI or to measure the round trip delay of the Frame Relay DLCI connection. Since the query packet carries the same path selector as the Frame Relay data packets and the Frame Relay VC's transfer priority (TP) is used to set the RCOS, reliability and emission priority of the query packet, the path taken by the *ping* query packet will be the same as that of the Frame Relay data except at the source and destination module. The *ping* packets originate from the CP rather than the Frame Relay DLCI's FP. At the far end, it is also the CP that receives the ping packets and returns them, rather than the Frame Relay FP. Note that this command does not provide any information regarding the status of the far end VC process. If, however, the destination module is unreachable or the VC path is congested, the operator will be notified. The *ping* command can be issued with or without options. If no options are specified, the command reports the path of the VC associated with the Frame Relay DLCI. When the command is used to find the VC path, it displays the RID and MID of each module that the query packet passes through on its way to the destination. If the *roundTripDelay* option is specified, the command reports the time taken to reach the destination and back. For the *roundTripDelay* option, the path taken by the query packets in both directions (from the source to the destination and from the destination back to the source) is the same as that of the Frame Relay data except at the source and destination where the *ping* packets are

Copyright © 2006, Nortel Nortel Confidential

generated and bounced back by the CP rather than the Frame Relay DLCI's FP.

The *ping* command supports the following options:

-roundTripDelay (-rtd): If this option is selected, the round trip delay time to reach the destination and back will be reported. The round trip delay is calculated by timing how long it takes to send five packets to the destination node and back. The packet size can be specified using the *sendPktSize* and *returnPktSize* options. The minimum, maximum and average time taken by the returned packets are reported. If this option is not selected, the path taken to the destination is displayed.

-sendPktDataSize: This option specifies the number of data octets to be included in the round trip delay query packet. The rtd query packet consists of the Passport common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are sent to the destination. The actual number of data octets sent is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default packet data size, 128 octets, will be used. This option is ignored if the *-rtd* option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

-returnPktDataSize: This option specifies the number of data octets to be included in the round trip delay acknowledge packet. The rtd acknowledge packet consists of the Passport common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are returned to the source. The actual number of data octets returned is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default packet data size, 128 octets, will be used. This option is ignored if the *-rtd* option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

GROUP Vct Vcfr CallData (Cad)

Properties	Operational
Description	This group represents operational call data related to Frame Relay *Vc*. It can be displayed only for Frame Relay *Vc* which is created by application.

ATTRIBUTE Vct Vcfr segmentsRx

Access	Read only
Description	This attribute displays the number of segments received at the time command was issued. This is the segment received count maintained by accounting at each end of the *Vc*. This counter is updated only when the packet cannot be successfully delivered out of the sink *Vc* and to the sink AP Conditions in which packets may be discarded by the sink *Vc* include: missing packets due to subnet discards, segmentation protocol violations due to subnet discard, duplicated and out-of-ranged packets and packets that arrive while *Vc* is in path recovery state.
Mib	VcTester
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE Vct Vcfr segmentsSent

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute displays the number of segments sent at the time command was issued. This is the segment sent count maintained by accounting at the source *Vc*. *Vc* only counts packets that *Vc* thinks can be delivered successfully into the subnet. In reality, these packets may be dropped by trunking, for instance. This counter is not updated when splitting fails, when *Vc* is in a path recovery state, when packet forwarding fails to forward this packet and when subsequent packets have to be discarded as we want to minimize the chance of out-of-sequence and do not intentionally send out-of-sequenced packets into the subnet.
Mib	VcTester
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE Vct Vcfr startTime

Access	Read only
Description	This attribute displays the start time of this interval period. If *Vc* spans 12 hour time or time of day change *startTime* reflects new time as recorded at 12 hour periods or time of day changes.
Mib	VcTester
Values	Time (DHMS)
Default	No default

ATTRIBUTE Vct Vcfr callReferenceNumber

Access	Read only
Description	This attribute displays the call reference number which is a unique number generated by the switch.The same Call Reference Number is stored in the interval data (accounting record) at both ends of the call. It can be used as one of the attributes in matching duplicate records generated at each end of the call.
Mib	VcTester
Values	Decimal (0..4294967295)
Default	No default

GROUP Vct Vcfr FrameRelayData (Frd)

Properties	Operational
Description	This group defines Frame Relay attributes collected by Frame Relay *Vc*. The purpose of *Vc* attributes is to aid end users and verification people to understand the *Vc* internal behavior. This is particularly useful when the network has experienced abnormality and we want to isolate problems and pinpoint trouble spots. Attributes are collected on a per *Vc* basis. Until a need is identified,

Copyright © 2006, Nortel Nortel Confidential

	statistics are not collected at a processor level. Each attribute is stored in a 32 bit field and is initialized to zero when a *Vc* enters into the data transfer state. When a PVC is disconnected and then connected again, the attributes will be reset. Attributes cannot be reset through other methods. Frame Relay *Vc* uses a best effort data packet delivery protocol and a different packet segmentation and combination methods from the General *Vc*. The Frame Relay *Vc* uses the same call setup and control mechanism (e.g. the support of non-flow control data packets) as in a General *Vc*. Most General *Vc* statistics and internal variables are used in a Frame Relay *Vc* and are displayed by software developers
Mib	VcTester

ATTRIBUTE Vct Vcfr frmCongestedToSubnet

Access	Read only
Description	This attribute displays the number of frames from link discarded due to lack of resources. It keeps track of the number of frames from link that have to be discarded. The discard reasons include insufficient memory for splitting the frame into smaller subnet packet size.
Mib	VcTester
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Vct Vcfr cannotForwardToSubnet

Access	Read only
Description	This attribute displays the number of discarded packets that can not be forwarded into the subnet because of subnet congestion. Number of frames from link discarded due to failure in forwarding a packet from *Vc* into the subnet.- This attribute is increased when packet forwarding fails to forward a packet into the subnet. If a frame is split into multiple subnet packets and a partial packet has to be discarded, all subsequent partial packets that have not yet been delivered to the subnet will be discarded as well.
Mib	VcTester
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Vct Vcfr notDataXferToSubnet

Access	Read only
Description	This attribute records the number of frames from link discarded when the *Vc* tries to recover from internal path failure.
Mib	VcTester
Values	Decimal (0..5000)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Vct Vcfr outOfRangeFrmFromSubnet

Access	Read only
Description	This attribute displays the number of frames from subnet discarded due to out of sequence range for arriving too late.
Mib	VcTester
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Vct Vcfr combErrorsFromSubnet

Access	Read only
Description	This attribute records the number of subnet packets discarded at the sink *Vc* due to the *Vc* segmentation and combination protocol error. Usually, this occurs when the subnet discards packets and thus this statistics can be used to guest the number of subnet packets that are not delivered to the *Vc*. It cannot be used as an actual measure because some subnet packets may have been delivered to *Vc* but have to be discarded because these are partial packets to a frame in which some other partial packets have not been properly delivered to *Vc*
Mib	VcTester
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Vct Vcfr duplicatesFromSubnet

Access	Read only
Description	This attribute displays the number of subnet packets discarded due to duplication. Although packets are not retransmitted by the Frame Relay *Vc*, it is possible for the subnet to retransmit packets. When packets are out-of-sequenced and copies of the same packets arrive, then this attribute is increased.
Mib	VcTester
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Vct Vcfr notDataXferFromSubnet

Access	Read only
Description	This attribute displays the number of subnet packets discarded when data transfer is suspended in *Vc* recovery.
Mib	VcTester

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Vct Vcfr frmLossTimeouts

Access	Read only
Description	This attribute displays the number of lost frame timer expiries. When this count is excessive, the network is very congested and packets have been discarded in the subnet.
Mib	VcTester
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Vct Vcfr ooSeqByteCntExceeded

Access	Read only
Description	This attribute displays the number times that the out of sequence byte threshold is exceeded. When the threshold is exceeded, this condition is treated as if the loss frame timer has expired and all frames queued at the sink *Vc* are delivered to the AP. We need to keep this count to examine if the threshold is engineered properly. This should be used in conjunction with the peak value of out-of-sequenced queue and the number of times the loss frame timer has expired. This count should be relatively small when compared with loss frame timer expiry count.
Mib	VcTester
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Vct Vcfr peakOoSeqPktCount

Access	Read only
Description	This attribute displays the frame relay peak packet count of the out of sequence queue. This attribute records the maximum queue length of the out-of-sequenced queue. The counter can be used to deduce the message buffer requirement on a *Vc*.
Mib	VcTester
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Vct Vcfr peakOoSeqFrmForwarded

Access	Read only
Description	This attribute displays the frame relay peak size of the sequence packet queue. The subnet may deliver packets out-of-

Copyright © 2006, Nortel Nortel Confidential

	sequenced. These packets are then queued in an out-of-sequenced queue, waiting for a packet with the expected sequence number to come. When that packet arrives, this attribute records the maximum number of packets that were out-of-sequenced, but now have become in-sequenced. The statistics is used to measure expected queue size due to normal subnet packet disorder (not due to subnet packet discard). Current implementation also uses this statistics to set a maximum size for the out-of-sequenced queue.
Mib	VcTester
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Vct Vcfr sendSequenceNumber

Access	Read only
Description	This attribute displays the Vc internal packet's send sequence number. Note that a "packet" in this context, may be either a user data packet, or an OAM frame.
Mib	VcTester
Values	Decimal (0..1048575)
Default	No default

ATTRIBUTE Vct Vcfr pktRetryTimeouts

Access	Read only
Description	This attribute displays the number of packets which have retransmission time-outs. When this count is excessive, the network is very congested and packets have been discarded in the subnet.
Mib	VcTester
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Vct Vcfr peakRetryQueueSize

Access	Read only
Description	This attribute displays the peak size of retransmission queue. This attribute is used as an indicator of the acknowledgment behavior across the subnet. Records the largest body of unacknowledged packets.
Mib	VcTester
Values	Decimal (0..5000)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vct Vcfr subnetRecoveries

Access	Read only
Description	This attribute displays the number of successful *Vc* recovery attempts.
Mib	VcTester
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Vct Vcfr ooSeqPktCntExceeded

Access	Read only
Description	This attribute displays the number times that the out of sequence packet threshold is exceeded. When the threshold is exceeded, this condition is treated as if the loss frame timer has expired and all frames queued at the sink *Vc* are delivered to the AP. We need to keep this count to examine if the threshold is engineered properly. This should be used in conjunction with the peak value of out-of-sequenced queue and the number of times the loss frame timer has expired. This count should be relatively small when compared with loss frame timer expiry count.

COMPONENT VirtualMedia (Vm)

Instance	Decimal (0..15)
Scope	Application
Description	*VirtualMedia/n* The *VirtualMedia* component represents an instance of a logical media. *VirtualMedia* provides IP connectivity between virtual routers on the same module, and supports an ‘always-up IP interface’ concept; i.e interface stays up unless it is administratively disabled or the hardware goes down. *VirtualMedia* can be used to support inter-VR communication, or by BGP-4 to establish an ‘always-up IP interface’.

GROUP Vm If MediaProv (Mp)

Properties: Provisioned

Description: This group contains the base provisioning data for the media base component.

Mib: VirtualMedia

ATTRIBUTE Vm If linkToProtocolPort (pp)

Access: Read and write

Criticality: Component

Description: This attribute specifies the *ProtocolPort* to which this interface is linked to. The protocol port is the logical interface to the network. The protocol port component describes the logical characteristics of this interface.

Mib: VirtualMedia

Values: Link (Service, linkToMedia)

Default: No default

GROUP Vm If CustomerIdentifierData (CidData)

Properties: Provisioned

Description: This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

Mib: VirtualMedia

ATTRIBUTE Vm If customerIdentifier (cid)

Access: Read and write

Description: This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a

Copyright © 2006, Nortel Nortel Confidential

	CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	VirtualMedia
Values	Decimal (0; 1..8191)
Default	0

GROUP Vm If IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	VirtualMedia

ATTRIBUTE Vm If ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	VirtualMedia
Values	up down testing
Default	up

ATTRIBUTE Vm If ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	VirtualMedia
Values	Decimal (1..65535)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

GROUP Vm If OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	VirtualMedia

ATTRIBUTE Vm If snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	VirtualMedia
Values	up down testing
Default	up

GROUP Vm If OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	VirtualMedia

ATTRIBUTE Vm If adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

	permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	VirtualMedia
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Vm If operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	VirtualMedia
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Vm If usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	VirtualMedia
Values	idle active (activ) busy
Default	idle

Copyright © 2006, Nortel Nortel Confidential

GROUP Vm If Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the *If* component.
Mib	VirtualMedia

ATTRIBUTE Vm If mode

Access	Read and write
Criticality	Component
Description	This attribute specifies the mode of operation of the *Vm If*. The following modes are supported: ***alwaysUpInterface***, ***alwaysUpSummaryInterface*** and ***interVrConnection***. ***alwaysUpInterface***: This mode limits the *Vm If* to provide the functionality of an 'always up interface' only. Inter-VR communcation is not possible when this mode is selected. Memory consumption by the *Vm If* is significantly less on the FP when this mode is selected. Hence this mode should be used when the sole purpose of the *Vm If* is to provide an always up interface for an application like BGP4. ***alwaysUpSummaryInterface***: This mode limits the *Vm If* to provide the functionality of an 'always up interface' in which more than one host can be sumarized. Inter-VR communcation is not possible when this mode is selected. Memory consumption by the *Vm If* is significantly less on the FP when this mode is selected. Hence this mode should be used when the sole purpose of the *Vm If* is to provide an always up interface for an application like VPN in which specific host information is configured by the user. ***interVrConnection***: This mode provides the full capability of VirtualMedia, that is, 'always up interface' and inter-VR communication.
Mib	VirtualMedia
Values	alwaysUpInterface interVrConnection alwaysUpSummaryInterface
Default	alwaysUpInterface

Groups	GROUP Vncs Vp LogicalConnectionOptions (LCOps) GROUP Vncs Vp FramerOptions (FrOps) GROUP Vncs Vp Statistics (Stats)
Scope	Network
Description	*Vncs/n VoiceProfile/n* A *VoiceProfile* component contains all provisionable logical connection attributes and framer attributes used to set up a virtual circuit. Directory-number prefixes are mapped to *VoiceProfile* instances by the *Vncs Dp Dn* component. Many directory-number prefixes use the same profile.
Mib	VncsCallServer
Common Verbs	Help List Display Add DELete

GROUP Vncs Vp LogicalConnectionOptions (LCOps)

Properties	Provisioned
Description	The attributes of this group collectively form part of a template used to describe and set up a switched logical connection. The attributes of a switched logical connection are similar to the attributes of a permanent logical connection.
Mib	VncsCallServer

ATTRIBUTE Vncs Vp setupPriority (spri)

Access	Read and write
Description	This attribute specifies the priority at which a path is established. Zero is the highest priority and four is the lowest. When PORS establishes a path through the network, it uses the *setupPriority* attribute to determine its potential for bumping established paths to acquire their bandwidth. The *holdingPriority*, a complementary attribute of this attribute, indicates the priority a path maintains once it is established. A new path can bump an existing path if the new path's *setupPriority* is higher (numerically less) than the existing path's *holdingPriority*.
Mib	VncsCallServer
Values	Decimal (0..4)
Default	2

ATTRIBUTE Vncs Vp holdingPriority (hpri)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the priority that a path holds once it is established. Zero is the highest priority and four is the lowest. A path's *holdingPriority* determines its likelihood of being bumped by a new path to acquire its bandwidth. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time. A new path can bump an existing path if the new path's *setupPriority* is higher (numerically less) than the existing path's *holdingPriority*.
Mib	VncsCallServer
Values	Decimal (0..4)
Default	2

ATTRIBUTE Vncs Vp bumpPreference (bpref)

Access	Read and write
Description	This attribute specifies when bumping occurs in the route selection process. A connection with higher (numerically less) *setupPriority* may bump a connection with lower (numerically higher) *setupPriority* in order to acquire its bandwidth and be established. By default, bumping occurs only when it is necessary. That is, a connection will bump another connection only if there is no other way for the connection to be established. A connection may be set to bump in order to use the best available route it may have.
Mib	VncsCallServer
Values	bumpWhenNecessary bumpToObtainBestRoute
Default	bumpWhenNecessary

ATTRIBUTE Vncs Vp requiredTrafficType (rttyp)

Access	Read and write
Description	This attribute specifies the type of traffic transmitted over the path. There are eight possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. These are arbitrary designations for traffic type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1,*** then only trunks that include ***trafficType1*** in *supportedTrafficType* will be candidates for this connection.
Mib	VncsCallServer
Values	voice data video

trafficType4 (tt4)
trafficType5 (tt5)

Default voice

ATTRIBUTE Vncs Vp permittedTrunkTypes (pttyp)

Access Read and write

Description This attribute specifies up to eight types of trunks that can be used on the route. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the Trunk component. When selecting a route, PORS chooses only trunks whose *trunkType*s are in the *permittedTrunkTypes* for the path.

trunkType4 (tt4)
trunkType5 (tt5)
trunkType6 (tt6)

Default (terrestrial, satellite, trunkType1, trunkType2, trunkType3)

ATTRIBUTE Vncs Vp requiredSecurity (rsec)

Access Read and write

Description This attribute specifies the required minimum level of security of the trunks on the route. Zero represents the most secure and seven represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the Trunk component, and has values identical in range and meaning to the *requiredSecurity* attribute. PORS ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity*.

Mib VncsCallServer

Values Decimal (0..7)

Default 4

ATTRIBUTE Vncs Vp requiredCustomerParm (rcparm)

Access Read and write

Description This attribute specifies the allowed customer defined parameter of the trunks on the route. Its value, a number from zero to seven, is chosen by

Copyright © 2006, Nortel Nortel Confidential

network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path.

Mib	VncsCallServer
Values	Decimal (0..7)
Default	4

ATTRIBUTE Vncs Vp pathAttributeToMinimize (pamin)

Access	Read and write
Description	This attribute specifies whether a route is selected on the basis of minimizing the cost or the delay. Each trunk has a cost and a delay metric associated with it. The cost of a selected route is the sum of the trunk cost metrics for all trunks included in the route. The delay of a selected route is the sum of the trunk delay metric for all trunks included in the route.
Mib	VncsCallServer
Values	cost delay
Default	cost

ATTRIBUTE Vncs Vp maximumAcceptableCost (maxCost)

Access	Read and write
Description	This attribute specifies an upper bound on the cost metric of a route, which is the sum of the cost metrics of all trunks on the route. The cost metric is the *trunkCost* attribute of the Trunk component. If for any trunk the *trunkCost* is larger than the *maximumAcceptableCost*, then that trunk is not considered during the route selection. While a shortest route is being selected, the route cost is being compared with the *maximumAcceptableCost* attribute, and this is done for any minimization criterion. No route is selected if the cost metric of the shortest route is larger than the *maximumAcceptableCost*.
Mib	VncsCallServer
Values	Decimal (0..65535)
Default	1280

ATTRIBUTE Vncs Vp maximumAcceptableDelay (maxDelay)

Access	Read and write
Description	This attribute specifies an upper bound on the delay of a route, which is the sum of the delays of all trunks on the route. It should be provisioned with a reasonable maximum acceptable delay for the end to end one way

Copyright © 2006, Nortel Nortel Confidential

delay of a 512-byte packet. Remember, that the trunk during its staging measures a *measuredRoundTripDelay*. This delay is divided by two and truncated to an integer number of milliseconds to provide a one way delay which is used to populate the delay in this trunk object in the topological database. The value includes emission, propagation, and queuing delays. A 512-byte packet is used to perform the measurement.
If for any trunk the half of the trunk's *measuredRoundTripDelay* is larger than the *maximumAcceptableDelay*, then that trunk is not considered during the route selection.
While a shortest route is being selected, the route delay is being compared with the *maximumAcceptableDelay* attribute, and this is done for any minimization criterion. No route is selected if the delay metric of the shortest route is larger than the *maximumAcceptableDelay*.

Mib	VncsCallServer
Values	Decimal (0..100000)
Units	msec
Default	100000

ATTRIBUTE Vncs Vp emissionPriority (epri)

Access	Read and write
Description	This attribute specifies the urgency with which packets on the path are emitted by the trunks on the route. *EmissionPriority* of zero indicates the highest emission priority, while two indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher).
Mib	VncsCallServer
Values	Decimal (0..2)
Default	0

ATTRIBUTE Vncs Vp discardPriority (dpri)

Access	Read and write
Description	This attribute specifies the importance of the packets on the path. One is used for paths carrying the most important traffic, and three is used for paths carrying the least important traffic. Packets with lower *discardPriority* (numerically) are discarded after packets with a higher *discardPriority* (numerically).
Mib	VncsCallServer
Values	Decimal (1..3)
Default	1

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vncs Vp pathFailureAction (pfa)

Access	Read and write
Description	This attribute specifies whether the application can tolerate momentary interruption of a path while a new path is selected. If ***disconnectConnection*** is chosen, the application is informed as soon as possible about a failure by disconnection. If the attribute is set to ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails, the application is informed of the failure. With this option set to ***reRoutePath***, the LCo may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are different at both ends only the calling end is allowed to reconnect. All *pathTypes* respect this attribute. Also on a *manualPath* with both ends provisioned with independent paths (at least with respect to the failure) this option will have the desired effect that the path is rerouted without complete disconnection at both ends.
Mib	VncsCallServer
Values	reRoutePath disconnectConnection
Default	reRoutePath

ATTRIBUTE Vncs Vp optimization (opt)

Access	Read and write
Description	This attribute specifies whether this connection should attempt to optimize its path when requested by the *Rtg Pors* component. Every path is optimal when it is established, but as network traffic patterns and configurations change this path may no longer be optimal. The PORS connection manager on a module requests circuits to optimize at the *optimizationInterval*.
Mib	VncsCallServer
Values	disabled enabled
Default	enabled

ATTRIBUTE Vncs Vp maximumAcceptableGatewayCost (maxGateCost)

Access	Read and write
Description	This attribute indicates an upper bound on the gateway cost metric of a route, which is the sum of the gateway cost metrics of all gateway links on the route. It has the same semantics as the *maximumAcceptableCost* except that gateway cost metrics are used instead of trunk cost metrics. Gateway cost metrics are provisioned under *Trunk Address* component of

Copyright © 2006, Nortel Nortel Confidential

a gateway link specifying a gateway costs of reaching an address through the link.

Mib	VncsCallServer
Values	Decimal (0..65535)
Default	2048

GROUP Vncs Vp FramerOptions (FrOps)

Properties	Provisioned
Description	This group contains attributes which define how audio data is carried across the network.
Mib	VncsCallServer

ATTRIBUTE Vncs Vp silenceSuppression

Access	Read and write
Description	This attribute specifies when silence suppression is desired during voice traffic on an audio call. If *silenceSuppression* is ***off***, silence suppression is never desired. If *silenceSuppression* is ***on***, silence suppression is always desired. If *silenceSuppression* is ***congested***, silence suppression is desired only when the network is congested. If *silenceSuppression* is ***slow***, silence suppression is desired only after 20 seconds without audio. If *silenceSuppression* is ***slowAndCongested***, both the ***slow*** and ***congested*** options are desired. The negotiated silence suppression is available in *Vsr Svs Framer negotiatedSilenceSuppression*.
Mib	VncsCallServer
Values	off on congested slow slowAndCongested
Default	on

ATTRIBUTE Vncs Vp silenceSuppressionFactor

Access	Read and write
Description	This attribute specifies the expected savings (percent reduction) in required bandwidth if silence suppression is used. If silence suppression is used, the bandwidth required for the connection will be lower than if silence suppression is not used. However, the routing system will not be aware of the unused bandwidth unless that bandwidth is specified by this

Copyright © 2006, Nortel Nortel Confidential

attribute.
If the value specified for the expected savings is too low, then some bandwidth made available by the use of silence suppression will be wasted. If the value specified for the expected savings is too high, then some connections may fail to set up because the routing system will over-calculate the amount of bandwidth available.
The effectiveness of silence suppression can be influenced by language related speech patterns.

Mib	VncsCallServer
Values	Decimal (0..60)
Units	%
Default	40

ATTRIBUTE Vncs Vp dataCallsAccepted (dca)

Access	Read and write
Description	This attribute specifies whether data calls are allowed if this profile is used.
Mib	VncsCallServer
Values	no yes
Default	yes

ATTRIBUTE Vncs Vp faxIdleSuppressionG711G726

Access	Read: Passive Write: Service
Description	This attribute specifies the fax idle suppression parameter used during negotiation with the remote end across the subnet. It applies only to fax traffic, not voice or modem traffic. The negotiated G.711/G.726 fax idle suppression is available in *Vsr Svs Framer negotiatedFisG711G726.*
Mib	VncsCallServer
Values	off on
Default	on

ATTRIBUTE Vncs Vp insertedOutputDelay

Access	Read: Passive Write: Service
Description	This attribute specifies the amount of added output delay used to compensate for cross network delay variations. It applies to voice, modem and fax traffic. It is required to add output delay so that the statistical

Copyright © 2006, Nortel Nortel Confidential

variation in the transit time of cells crossing the network does not cause gaps in speech. Backbone networks where high priority traffic consumes a high percentage of trunk bandwidth will require a higher *insertedOutputDelay* to compensate for the greater cell delay variation (CDV).

This attribute is ignored if this call runs on a ***1pDS1V*** or ***1pE1V*** card.

Units: msec

Default: 22

ATTRIBUTE Vncs Vp dtmfRegeneration (detGen)

Access:
Read: Passive
Write: Service

Description: This attribute specifies the DTMF regeneration parameter used during negotiation with the remote end across the subnet.

If *dtmfRegeneration* is ***on***, it is desired that DTMF tones received from the link are first converted to digits before being sent to the subnet. When a digit is received from the subnet, its respective DTMF tone is desired to be generated before being sent to the link.

If *dtmfRegeneration* is ***off***, it is desired that DTMF tones are transported transparently as audio.

DTMF regeneration is not supported on ***1pDS1V***, ***1pE1V***, and ***J2MV*** cards. On these cards, the value of *dtmfRegeneration* is ignored.

The negotiated DTMF regeneration is available in *Vsr Svs Framer negotiatedDtmfRegeneration*.

ATTRIBUTE Vncs Vp v17EncodedAsG711G726

Access	Read and write
Criticality	Process
Description	This attribute specifies how services using this *VoiceProfile* negotiate with V.17 fax machines. This attribute is not used unless the negotiated ***fax*** encoding, available in *Vsr Svs Framer negotiatedEncoding*, is ***v29V27Relay*** and the negotiated ***modemFax*** encoding, available in *Vsr Svs Framer negotiatedEncoding*, is ***g711***, ***g726*** or ***g711G726***. If *v17EncodedAsG711G726* is ***no,*** it is desired that V.17 fax machines be instructed to use V.29 so that V.29 fax traffic sent by fax machines can be demodulated and encoded using fax relay. If *v17EncodedAsG711G726* is ***yes***, it is desired that V.17 fax machines be permitted to use V.17 so that V.17 fax traffic sent by fax machines can be encoded using G.711 or G.726. The actual encoding performed depends on the negotiated minimum and maximum ***modemFax*** rates, available in *Vsr Svs Framer negotiatedRates*. The actual negotiation between services using this *VoiceProfile* and V.17 fax machines is available in *Vsr Svs Framer* ***negotiatedV17AsG711G726***.
Mib	VncsCallServer
Values	no yes
Default	no

ATTRIBUTE Vncs Vp voiceRates

Access	Read: Passive Write: Service
Description	This attribute specifies the minimum and maximum ***voice*** rate parameters used during negotiation with the remote end across the subnet. For ***g711G726*** encoding, rates can change during voice traffic due to congestion in the network. Therefore, you can have differing minimum and maximum rates for ***g711G726*** encoding. All other encodings have a fixed rate for the duration of voice traffic and so their minimum and maximum rates can not be modified. The negotiated minimum and maximum ***voice*** rates are available in *Vsr Svs Framer negotiatedRates*.

ATTRIBUTE Vncs Vp voiceEncodingChoice

Access
Read: Passive
Write: Service

Description

This attribute specifies preferences regarding the encoding of voice traffic. During the setup of an audio call, the local and remote ends negotiate a common encoding to use. The local end's ordered list of preferred encodings is given by all *voiceEncodingChoice* elements that are not set to *none*. Prior to negotiation, the local end removes encodings from its list that it cannot use for a particular call. For example, the card for a particular call may not support certain encodings. After this local check, the local end sends its voice encoding preferences to the remote end. The remote end chooses the most preferred encoding that it can support from the list and this encoding is the one used during voice traffic. If the remote end cannot support any encodings on the local end's list, a call does not proceed and an alarm is issued.

The current encoding and encoding rate are available in *Vsr Svs currentEncoding* and *Vsr Svs currentRate*.

The encoding choice ***g711Only*** specifies that pulse code modulation (PCM) defined by ITU-T G.711 should be performed to encode voice traffic for calls using this profile. In this case, all voice traffic is carried uncompressed at 64 kbit/s.

The encoding choice ***g711G726*** specifies that either pulse code modulation (PCM) defined by ITU-T G.711 or adaptive differential pulse code modulation (ADPCM) defined by ITU-T G.726 should be performed to encode voice traffic for calls using this profile. The actual encoding performed depends on congestion in the network and the settings of the ***g711G726*** row of the *voiceRates* attribute.

The encoding choice of ***g728Only*** specifies that the Low Delay Coded Excited Linear Predictive Coder (LD-CELP) algorithm defined by ITU-T G.728 should be performed to encode voice traffic for calls using this profile. In this case, all voice traffic is carried at 16 kbit/s.

The encoding choice of ***g729Only*** specifies that the Conjugated Structure Algebraic Code Excited Linear Predictive Coder (CS-ACELP) algorithm defined by ITU-T G.729 should be performed to encode voice traffic for

Copyright © 2006, Nortel
Nortel Confidential

calls using this profile. In this case, all voice traffic is carried at 8 kbit/s.

The encoding choice of ***none*** specifies the end of the encoding choice list. No other encoding choice can appear after ***none***, and ***none*** cannot appear as the first choice. The only encoding choice that can appear more than once in *voiceEncodingChoice* is ***none***.

G.728 and G.729 encoding cannot be performed on a ***1pDS1V***, ***1pE1V*** or ***J2MV*** card.

The negotiated ***voice*** encoding is available in *Vsr Svs Framer negotiatedEncoding*.

Index	first second third
Default	(g729Only, g728Only, g711G726)

ATTRIBUTE Vncs Vp modemFaxRates

Access	Read: Passive Write: Service
Description	This attribute specifies the minimum and maximum modemFax and fax rate parameters used during negotiation with the remote end across the subnet. For ***g711Only*** encoding, all modem/fax traffic is carried uncompressed at 64 kbit/s, so this row of *modemFaxRates* cannot be changed. For ***g711G726*** encoding, rates can change during modemFax and fax traffic due to congestion in the network. The minimum and maximum rates that can occur during the ***modemFax*** traffic are specified by the ***g711G726*** row of *modemFaxRates*. The ***relay*** row of *modemFaxRates* specifies the minimum and maximum rates of sending fax machines that are allowed for fax relay. ***relay*** does not apply to modem calls. The negotiated minimum and maximum ***modemFax*** and ***fax*** rates are available in *Vsr Svs Framer negotiatedRates*.
Mib	VncsCallServer
Array of	Decimal (0.0; 0.3; 1.2; 2.4; 4.8; 7.2; 9.6; 12.0; 14.4; 16.0; 24.0; 32.0; 64.0)

Default	(64.0, 64.0, 32.0, 64.0, 0.0, 14.4)

ATTRIBUTE Vncs Vp modemFaxEncodingChoice

Access	Read: Passive Write: Service
Description	This attribute specifies preferences regarding the encoding of modemFax and fax traffic. During the setup of an audio call, the local and remote ends negotiate one common encoding to use during modemFax traffic and one common encoding to use during fax traffic. The local end's ordered list of preferred encodings is given by all *modemFaxEncodingChoice* elements that are not set to ***none***. Prior to negotiation, the local end removes encodings from its list that it cannot use for a particular call. For example, the card for a particular call may not be able to support certain encodings, or in the case of ***relay***, the rate of the sending machine may not be supported. After this local check, the local end sends its modem/fax encoding preferences to the remote end. The remote end uses the two most preferred encodings that it can support from the list to determine the encoding used during modemFax traffic and the encoding used during fax traffic. If the remote end cannot support any encodings on the local end's list, a call does not proceed and an alarm is issued. The current encoding and encoding rate are available in *Vsr Svs currentEncoding* and *Vsr Svs currentRate*. The encoding choice ***g711Only*** specifies that pulse code modulation (PCM) defined by ITU-T G.711 should be performed to encode modem/fax traffic for calls using this profile. In this case, all modem/fax traffic is carried uncompressed at 64 kbit/s. The encoding choice ***g711G726*** specifies that either pulse code modulation (PCM) defined by ITU-T G.711 or adaptive differential pulse code modulation (ADPCM) defined by ITU-T G.726 should be performed to encode modem/fax traffic for calls using this profile. The actual encoding performed depends on congestion in the network and the settings of the ***g711G726*** row of the *modemFaxRates* attribute. The encoding choice of ***relay*** specifies that modulated modem/fax traffic is demodulated and sent through the network as cells at the base rate of the sending machine. The types of modulation/demodulation supported are V.29 up to 9.6 kbit/s and V.27 up to 4.8 kbit/s. Only fax traffic can use ***relay***.

Copyright © 2006, Nortel Nortel Confidential

If *modemFaxEncodingChoice* is ***relay, none, none***, modem traffic is not supported. If *modemFaxEncodingChoice* is ***none, none, none***, all traffic is treated like voice traffic.

Fax relay cannot be performed on ***1pDS1V, 1pE1V*** or ***J2MV*** cards.

The negotiated ***modemFax*** and ***fax*** encodings are available in *Vsr Svs Framer negotiatedEncoding*.

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies how to map the numbering plan indication and the type of number into the *Vncs* database *diallingPlan1*. There are three numbering plans that are allowed, unknown, E.164, and private. Within each of these, there are eight possible type of numbers. Since the name for the type of numbers for the private numbering plans varies from protocol to protocol, a generic scheme has been adopted. ***unknown*** means that the sending and receiving switches have no knowledge of the numbering plan. ***international*** means that the sending switch has identified the number format as matching the E.164 international dialling plan. ***national*** means that the sending switch has identified the number as conforming to the E.164 national dialling plan ***subscriber*** means that the number is the address of a customer conforming to the local public network. ***p0***, ***p1***, ***p2***, ***p3***, ***p4***, ***p5***, ***p6*** and ***p7*** are private numbering plans, with a type

Copyright © 2006, Nortel Nortel Confidential

	of number zero to seven. ***casUnknown*** means any number received from a Channel Associated Signalling (CAS) trunk.

ATTRIBUTE VRoute huntingAlgorithm (rha)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the type of hunting algorithm that should be used by the *VoiceRoute* and *VoiceSubroutes* when selecting a channel to make an outgoing call. ***bottomUpLinear*** means that a call from the subnet will be passed to the lowest instance of the *VoiceSubroute*s, which in turn will pass the call to the lowest instance of *SwitchedVoiceService*. If there are no available *SwitchedVoiceService*s in that *VoiceSubroute* then the process will be repeated for the next lowest instance of *VoiceSubroute.* ***topDownLinear*** means that a call from the subnet will be passed to the highest instance of the *VoiceSubroutes*, which in turn will pass the call to the highest instance of *SwitchedVoiceService*. If there are no available *SwitchedVoiceService*s in that *VoiceSubroute* then the process will be repeated for the next highest instance of *VoiceSubroute*.
Mib	VoiceNetworking
Values	bottomUpLinear topDownLinear
Default	bottomUpLinear

ATTRIBUTE VRoute minimumDigitsToRoute (mdtr)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the number of digits that must be received before an address resolution request will be sent to the

Copyright © 2006, Nortel Nortel Confidential

	VoiceNetworkingCallServer. Once this level has been exceeded an address resolution request will be sent for every digit received until the dialled number has been resolved in the database. This number should be set to a value which represents the average number of digits that will allow for a unique end-point to be identified. If the number is set too low, then the number of simultaneous calls that can be handled by the *VoiceNetworkingCallServer* will be reduced since the number of address resolution requests sent for each call will be increased. If it is set too high then address resolution request messages will not be sent to the *VoiceNetworkingCallServer* until the end-of-dial timer has expired (approximately 12 seconds after the last digit has been received). This can result in very long call setup times.
Mib	VoiceNetworking
Values	Decimal (1..16)
Default	3

ATTRIBUTE VRoute voiceNetworkingCallServer (vncs)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies which *Vncs* instance should be used by all calls into this *VoiceRoute* from the PBX.
Mib	VoiceNetworking
Values	Link (Service, voiceRoutes)
Default	No default

ATTRIBUTE VRoute overrideDirectoryNumber (odn)

Access	Read: All Write: All
Criticality	Process
Description	The number specified here will be used in place of the dialled number to lookup the destination in the *VoiceNetworkingCallServer*. A null string means that the routing decision should be based on the dialled number. The numbering plan type that will be used will be *noAccessCode*.
Mib	VoiceNetworking
Values	BCD (0..24)
Default	""

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE VRoute privateNetworkIdentifer (pni)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the private network identifier (PNI) value. If the value is zero then connection-less supplementary service transport for TCAP formatted FACILITY messages is not supported.
Mib	VoiceNetworking
Values	Decimal (0..32700)
Default	0

ATTRIBUTE VRoute subroutes

Access	Read: All Write: All
Description	This attribute specifies all of the *VoiceSubroutes* which are associated with this *VoiceRoute*. There is a maximum of 16 *VoiceSubroutes* allowed per *VoiceRoute*.
Mib	VoiceNetworking
List of	Link (Service, voiceRoute)
List Size	16
Default	No default

GROUP VRoute CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	VoiceNetworking

ATTRIBUTE VRoute customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to

Copyright © 2006, Nortel Nortel Confidential

	issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as “NetMan” in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers.
Mib	VoiceNetworking
Values	Decimal (0; 1..8191)
Default	0

GROUP VRoute IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	VoiceNetworking

ATTRIBUTE VRoute ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	VoiceNetworking
Values	up down testing
Default	up

ATTRIBUTE VRoute ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	VoiceNetworking
Values	Decimal (1..65535)
Default	No default

GROUP VRoute OsiState (State)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	VoiceNetworking

ATTRIBUTE VRoute adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	VoiceNetworking
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE VRoute operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	VoiceNetworking
Values	enabled (ena) disabled (dis)

Copyright © 2006, Nortel Nortel Confidential

Default	disabled

ATTRIBUTE VRoute usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	VoiceNetworking
Values	idle active (activ) busy
Default	idle

GROUP VRoute OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	VoiceNetworking

ATTRIBUTE VRoute snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	VoiceNetworking
Values	up down testing
Default	up

GROUP VRoute Statistics (Stats)

Properties	Operational
Description	This group provides the operational attributes for the *VoiceRoute* component. It contains information relating to calls that originate from the network.

Copyright © 2006, Nortel Nortel Confidential

Mib	VoiceNetworking

ATTRIBUTE VRoute totalCallsFromSubnet

Access	Read: All Write: Illegal
Description	This attribute counts the total number of calls that have been received from the subnet, including calls that fail. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE VRoute callsClearedNoChannel

Access	Read: All Write: Illegal
Description	This attribute counts the total number of calls from the subnet that were rejected when all of the in-service channels were busy. When a call is rejected for this reason, the cause code sent to the originator is 34, no circuit/channel available. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE VRoute callsClearedOutOfService

Access	Read: All Write: Illegal
Description	This attribute counts the total number of calls from the subnet that were rejected because all of the channels were out-of-service. A channel is considered out-of-service if it is unavailable for any reason other than it is being engaged in handling a call. That is, an operator lock of any of the components required for the channel's operation, or problems which interfere with the connection to the PBX, will cause the channel to be considered out-of-service. When a call is rejected for this reason, the cause code sent back to the originator is 27, destination out-of-service. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE VRoute callsRejected

Access	Read: All Write: Illegal
Description	This attribute counts the total number of calls from the subnet that were rejected because they were: 1) voice calls to a *typeOfRoute* which is set *to* ***data***, 2) data calls to a *typeOfRoute* which is set to ***voice***, 3) using a signalling protocol which is incompatible with this end. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	0

GROUP VRoute Operational (Oper)

Properties	Operational
Description	This group provides the operational attributes for the *VoiceRoute* component. It displays information relating to calls that originate from the subnet.
Mib	VoiceNetworking

ATTRIBUTE VRoute degradedSubroutes

Access	Read: All Write: Illegal
Description	This attribute indicates all of the *VoiceSubroute*s that have at least one *SwitchedVoiceService* whose *operationalState* is ***disabled***.
Mib	VoiceNetworking
List of	The name of the component
List Size	16
Default	No default

COLLECTED STATS VoiceRoute

Description	The statistics record generated by the VoiceRoute component.

ATTRIBUTE VRoute totalCallsFromSubnet

Description	This spooled statistic counts the calls that have been received from the subnet in the last statistics collection interval, including calls that fail.
Values	Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE VRoute callsClearedNoChannel

Description	This spooled statistic counts the calls from the subnet that were rejected when all of the in-service channels were busy in the last statistics collection interval. When a call is rejected for this reason, the cause code sent to the originator is 34, no circuit/channel available.
Values	Decimal (0..65535)

ATTRIBUTE VRoute callsClearedOutOfService

Description	This spooled statistic counts the calls from the subnet that were rejected because all of the channels were out-of-service in the last statistics collection interval. A channel is considered out-of-service if it is unavailable for any reason other than it is being engaged in handling a call. That is, an operator lock of any of the components required for the channel's operation, or problems which interfere with the connection to the PBX, will cause the channel to be considered out-of-service. When a call is rejected for this reason, the cause code sent back to the originator is 27, destination out-of-service.
Values	Decimal (0..65535)

ATTRIBUTE VRoute callsRejected

Description	This spooled statistic counts the calls from the subnet that were rejected in the last statistics collection interval because they were: 1) voice calls to a *typeOfRoute* which is set *to* ***data***, 2) data calls to a *typeOfRoute* which is set to ***voice***, 3) using a signalling protocol which is incompatible with this end.
Values	Decimal (0..65535)

COMPONENT VRoute VnetRouteDebug (Debug)

Scope	Application
Description	*VRoute/n Debug* The *Debug* component defines the debug operational characteristics of the *VoiceRoute* component.
Mib	VoiceNetworking
Common Verbs	Help List Display

COMPONENT VRoute Interface

Groups	GROUP VRoute Interface Provisioned (Prov)
Scope	Application

Copyright © 2006, Nortel Nortel Confidential

Description	*VoiceRoute/n Interface* This component defines the interface between a voice route and a PBX. It is ignored for calls running on ***1pDS1V*** or ***1pE1V*** cards.
Mib	VoiceNetworking
Common Verbs	Help List Display

GROUP VRoute Interface **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains attributes specifying the interface to a PBX.
Mib	VoiceNetworking

ATTRIBUTE VRoute Interface **ingressAudioGain**

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies the gain in dB that is applied to data coming from outside the network before it is transferred across the network. It applies to voice, modem and fax traffic. For example, ingress gain is applied to audio data coming from a PBX. If *ingressAudioGain* is negative, a loss is applied. *ingressAudioGain* and *egressAudioGain* are used in loss planning, which is the configuration of the devices in a network to ensure that the signal level from any point in the network to any other point is correct. *ingressAudioGain* is ignored for calls on ***1pDS1V*** and ***1pE1V*** cards. For calls running on these cards, ingress audio gain is not under the user's control and egress audio gain is determined by the *audioGain* attribute in the appropriate *Vncs/m VoiceProfile/n*.
Mib	VoiceNetworking
Values	Signed (-12..12)
Units	dB
Default	0

ATTRIBUTE VRoute Interface **egressAudioGain**

Access	Read: Passive Write: Service
Criticality	Process

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the gain in dB that is applied to data leaving the network. It applies to voice, modem and fax traffic. For example, egress gain is applied to audio data going to a PBX. If *egressAudioGain* is negative, a loss is applied. *ingressAudioGain* and *egressAudioGain* are used in loss planning, which is the configuration of the devices in the network to ensure that the signal level from any point in the network to any other point is correct. *egressAudioGain* is ignored for calls running on ***1pDS1V*** and ***1pE1V*** cards. For calls running on these cards, egress audio gain is determined by the *audioGain* attribute in the appropriate *Vncs/m VoiceProfile/n*.
Mib	VoiceNetworking
Values	Signed (-12..12)
Units	dB
Default	0

ATTRIBUTE VRoute Interface **tandemPassThrough (tpt)**

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies whether tandem pass through is desired. If *tandemPassThrough* is ***enabled***, tandem pass through is used if possible. If *tandemPassThrough* is ***disabled***, tandem pass through is not used under any circumstances. The actual state of tandem pass through is indicated in *Vsr Svs Framer tptStatus*. The negotiated tandem pass through is available in *Vsr Svs Framer negotiatedTandemPassThrough*. Tandem pass through is not supported on ***1pDS1V*** and ***1pE1V*** cards, so *tandemPassThrough* is ignored on these cards.
Mib	VoiceNetworking
Values	enabled disabled
Default	disabled

ATTRIBUTE VRoute Interface **comfortNoiseCap**

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies the maximum level at which comfort noise is generated. The comfort noise is limited by *comfortNoiseCap* before

Copyright © 2006, Nortel Nortel Confidential

egressAudioGain is applied. The default value of ***-40*** dBm0 equates to the maximum level of comfort noise available and effectively disables the *comfortNoiseCap*.

Mib	VoiceNetworking
Values	Signed (-78; -65; -60; -54; -52; -50; -48; -46; -44; -42; -40)
Units	dBm0
Default	-40

ATTRIBUTE VRoute Interface **speechHangoverTime**

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies the time after the end of speech before silence suppression starts. It applies only to voice traffic. It is not used unless *Vsr Svs Framer negotiatedSilenceSuppression* is ***on***, ***congested*** or ***slowAndCongested***. Higher values of *speechHangoverTime* reduce undesirable clipping but increase bandwidth usage. *speechHangoverTime* is not used on ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** and ***J2MV*** cards.
Mib	VoiceNetworking
Values	Decimal (10..500)
Units	msec
Default	150

ATTRIBUTE VRoute Interface **faxHangoverTimeG711G726**

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies the time after the end of fax traffic before G.711/ G.726 fax idle suppression starts. It applies only if the negotiated fax encoding, available in *Vsr Svs Framer negotiatedEncoding*, is ***g711***, ***g726*** or ***g711G726*** and *Vsr Svs Framer negotiatedFisG711G726* is ***on***. Higher values of *faxHangoverTimeG711G726* reduce undesirable clipping but increase bandwidth usage. *faxHangoverTimeG711G726* is not used on ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** and ***J2MV*** cards.

Copyright © 2006, Nortel Nortel Confidential

Mib	VoiceNetworking
Values	Decimal (300..20000)
Units	msec
Default	1000

ATTRIBUTE VRoute Interface **modemFaxSpeechDiscrim (fsd)**

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies whether this *VoiceRoute* differentiates between modemFax traffic and speech. If *modemFaxSpeechDiscrim* is ***on*** and a false 2100 Hz tone is detected, any *Svs* using this route reverts to speech mode when speech is detected. *modemFaxSpeechDiscrim* is not used on ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** and ***J2MV*** cards.
Mib	VoiceNetworking
Values	on off
Default	on

ATTRIBUTE VRoute Interface **echoTailDelay**

Access	Read and write
Criticality	Process
Description	This attribute specifies the maximum echo canceller tail delay coverage. It should be selected higher than the summation of the round trip delay of echo and hybrid response time. A ***32***ms setting is good for a radius of 2700 km, assuming that the signal is going through 4 exchanges and the hybrid response time is 6ms. A ***64***ms setting offers even greater coverage (more distance or more switches), with comparable convergence time. The recommended setting is ***64***ms. This attribute is not used on ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V***, ***J2MV***, ***1pE1Mvp***, ***1pDS1Mvp,*** or ***1pTTC2mMvp*** card.
Mib	VoiceNetworking
Values	Decimal (32; 64)
Units	msec
Default	64

ATTRIBUTE VRoute Interface **echoReturnLoss**

Access	Read and write
Criticality	Process

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the echo return loss parameter of the echo canceller. If the line quality is poor, in terms of echo, selecting a higher value may allow the echo canceller to perform better. A side effect is that the voice level is attenuated by the same amount, which may not always be acceptable. This attribute is not used on ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V***, ***J2MV***, ***1pE1Mvp***, ***1pDS1Mvp,*** or ***1pTTC2mMvp*** card.
Mib	VoiceNetworking
Values	Decimal (0; 3; 6)
Units	dB
Default	6

ATTRIBUTE VRoute Interface **ecanBypassMode**

Access	Read and write
Criticality	Process
Description	This attribute specifies when version 2 internal echo cancellers are placed in bypass mode on this *VoiceRoute*. This attribute only applies if ***v2*** of *echoCancellation* is ***on***. If *ecanBypassMode* is ***g165***, the internal echo canceller is placed in bypass mode as per ITU-T G.165. If *ecanBypassMode* is ***g164***, the internal echo canceller is placed in bypass mode as per ITU-T G.164. If *ecanBypassMode* is ***never***, the internal echo canceller is never placed in bypass mode. This mode should only be used for debugging. This attribute does not apply to ***1pE1V***, ***1pDS1V***, ***J2MV***, ***1pE1Mvp***, ***1pDS1Mvp,*** or ***1pTTC2mMvp*** cards.
Mib	VoiceNetworking
Values	g164 g165 never
Default	g165

ATTRIBUTE VRoute Interface **echoCancellation**

Access	Read and write
Criticality	Process
Description	This attribute specifies whether echo cancellation is performed on this *VoiceRoute*. ***v1*** specifies whether echo cancellation is performed by version 1 internal echo cancellers. ***v2*** specifies whether echo cancellation is performed by version 2 echo cancellers. If *echoCancellation* is ***on***, the internal echo canceller is enabled and echo cancellation is performed. If *echoCancellation* is ***off***, the internal echo canceller is placed in transparent bypass mode and echo cancellation is never performed.

COMPONENT VRoute DataNetworkAddress (Dna)

Groups	GROUP VRoute Dna Address
Scope	Application
Description	*vroute/n Dna* This is the description of the VRoute *Dna* component. It offers a subset of the generic *Dna* component attributes.
Mib	VoiceNetworking
Opt. Subcomp.	COMPONENT VRoute Dna HuntGroupMember (Hgm)
Common Verbs	Help List Display

GROUP VRoute Dna Address

Properties	Provisioned
Description	*Address* group contains attributes common to all *Dna's*. Every *Dna* used in the network is defined with this group of 2 attributes. String of address digits is complemented by type of address and Npi. These attributes are used to interpret format of the address digits.
Mib	VoiceNetworking

ATTRIBUTE VRoute Dna numberingPlanIndicator (npi)

Access	Read and write
Criticality	Process
Description	This attribute indicates the Numbering Plan Indicator (NPI) of the *Dna* that is entered. Address may belong to X.121 or E.164 plans. X.121 is used in packet switched data networks.
Mib	VoiceNetworking
Values	x121 e164
Default	e164

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE VRoute Dna dataNetworkAddress (dna)

Access	Read and write
Criticality	Process
Description	*Dna* attribute contains digits which form unique identifier of the customer interface. It can be compared (approximation only) to telephone number where phone number identifies unique telephone set. *Dna* digits are selected and assigned by network operators.
Mib	VoiceNetworking
Values	BCD (0..15)
Default	No default

COMPONENT VRoute Dna HuntGroupMember (Hgm)

Groups	GROUP VRoute Dna Hgm Provisioned (Prov) GROUP VRoute Dna Hgm Operational (Op)
Scope	Application
Description	*Vroute/n Dna/n HuntGroupMember* When present under a DNA component, this component specifies that the DNA is a member of a hunt group. Each hunt group member subscribes to at least one hunt group. The hunt group server's DNA must be added to the VnetHuntGroupAddress which is the sub-component of VnetHuntGroupMember. By adding the DNA correct availability of the vroute will be reported to the hunt group to process calls.
Mib	VoiceNetworking
Subcomponents	COMPONENT VRoute Dna Hgm HuntGroupAddress (HgAddr)
Common Verbs	Help List Display Add DELete

GROUP VRoute Dna Hgm Provisioned (Prov)

Properties	Provisioned
Description	This group contains the interface parameters between the *HuntGroupMember* and the hunt group server.
Mib	VoiceNetworking

ATTRIBUTE VRoute Dna Hgm usageDeltaUpdateThreshold (aut)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies by how much the availability of a hunt group member must change before the member's availability is updated to the hunt group server. A value of zero ensures that an update will be sent if the value of the availability changes. The attribute that reports the availability is *currentAvailability*.
Mib	VoiceNetworking
Values	Decimal (0..4096)
Default	1

GROUP VRoute Dna Hgm Operational (Op)

Properties	Operational
Description	This group contains the operational attributes of the *HuntGroupMember* component.
Mib	VoiceNetworking

ATTRIBUTE VRoute Dna Hgm maxAvailableChannels (maxAc)

Access	Read only
Description	This attribute indicates the maximum number of available channels for this *HuntGroupMember*.
Mib	VoiceNetworking
Values	Decimal (0..4096)
Default	No default

ATTRIBUTE VRoute Dna Hgm availableChannels (ac)

Access	Read only
Description	This attribute indicates the number of available channels reported to the hunt group in the Availability Message Packet (AMP). It is incremented by the application when a channel is freed and decremented when a channel is active.
Mib	VoiceNetworking
Values	Decimal (0..4096)
Default	No default

ATTRIBUTE VRoute Dna Hgm availabilityDelta (ad)

Access	Read only
Description	This attribute specifies the delta between the actual availability of a hunt group member and the hunt group member's *currentAvailability*. Once the absolute value of this attribute reaches the *usageDeltaUpdateThreshold,* the *currentAvailability* of the hunt group member is updated with the actual availability and the *availabilityDelta* is reset to 0.

Copyright © 2006, Nortel Nortel Confidential

If this attribute is positive, the number of available channels has increased since the last Availability Message Packet was sent. If it is negative, the number of available channels has decreased since the last AMP was sent.

Mib	VoiceNetworking

COMPONENT VRoute VoiceAccounting (Acct)

Groups	GROUP VRoute Acct Provisioned (Prov)
Scope	Application
Description	*Vroute/n VoiceAccounting* The *VoiceAccounting* component defines the operational characteristics of the accounting system of the *Vroute* component. Accounting record generation for calls on the *Vroute* is managed by this component.
Mib	VoiceNetworking
Common Verbs	Help List Display

GROUP VRoute Acct Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes of a *VoiceAccounting* component.
Mib	VoiceNetworking

ATTRIBUTE VRoute Acct accountCollection (aco)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies that accounting records are to be collected for the various reasons: ***bill***, ***test***, ***study***, ***audit***. The last of the parameters, ***force***, specifies that accounting records are to be collected irrespective of other collection reasons. If none of these reasons is set, then accounting will be suppressed.

Copyright © 2006, Nortel Nortel Confidential

Mib	VoiceNetworking
Set of	bill test study audit force
Default	No default

ATTRIBUTE VRoute Acct accountClass (acl)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the accounting class which is reserved for network operations usage. Its value is returned in the accounting record in the local and remote service type attributes. The use of this attribute is decided by the network operator.
Mib	VoiceNetworking
Values	Decimal (0..255)
Default	0

ATTRIBUTE VRoute Acct serviceExchange (sre)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies a user defined value, Data Service Exchange, as entered by the network operator and reported in the accounting record.
Mib	VoiceNetworking
Values	Decimal (0..255)
Default	0

ATTRIBUTE VRoute Acct digitsSuppressed (ds)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the number of trailing digits which will be suppressed in the *calledNumber* in the accounting records. Each of the specified number of trailing digits are replaced with an “X”. This option exists to satisfy privacy requirements in a number of countries.
Mib	VoiceNetworking

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..8)
Default	0

ATTRIBUTE VRoute Acct accountingOptions (ao)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies optional settings for the voice networking accounting system. The options are: ***suppressTerminatingEndRecords*** - setting this option suppresses the generation of accounting records at the destination node. This reduces the volume of accounting data. This option has local significance only. It only suppresses the generation of accounting records for calls received by this node.
Mib	VoiceNetworking
Set of	suppressTerminatingEndRecords (ster)
Default	No default

COMPONENT VRoute lgDigitManipulation (ldm)

Groups	GROUP VRoute ldm Provisioned (Prov)

Description	This group contains the provisionable attributes for the *lgDigitManipulation* component.
Mib	VoiceNetworking

ATTRIBUTE VRoute ldm variant (var)

Access	Read and write
Criticality	Process

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the variant of ingress digit manipulation to perform. Selecting ***blindLeading*** specifies ingress digit manipulation is performed on the leading end of the called number. Selecting ***none*** disables ingress digit manipulation. A warning is generated if ***none*** is selected and *digitsToInsert* is not empty or *numDigitsToDelete* is not 0.
Mib	VoiceNetworking
Values	none blindLeading
Default	blindLeading

ATTRIBUTE VRoute Idm digitsToInsert (dti)

Access	Read and write
Criticality	Process
Description	This attribute specifies the digits to insert and only applies when *variant* is ***blindLeading***. There can be up to 16 digits inserted. Acceptable values are the digits 0 through 9 and the characters # (octothorpe) and * (star). An error is generated if any of the digits are not in the acceptable range. A warning is generated if *digitsToInsert* is not empty and the *variant* selection is ***none***.
Mib	VoiceNetworking
Values	String (0..16, ASCII)
Default	No default

ATTRIBUTE VRoute Idm numDigitsToDelete (ndtd)

Access	Read and write
Criticality	Process
Description	This attribute specifies the number of leading digits to delete and only applies when *variant* is ***blindLeading***. There can be up to 16 digits deleted. A warning is generated if *numDigitsToDelete* is not 0 and the *variant* selection is ***none***.
Mib	VoiceNetworking
Values	Decimal (0..16)
Default	0

ATTRIBUTE VRoute Idm callRouting (cr)

Access	Read and write
Criticality	Process
Description	This attribute specifies whether calls are routed before or after performing digit manipulation and only applies when *variant* is ***blindLeading***. Selecting ***routeOnDialledDigits*** specifies that calls are routed prior to

Copyright © 2006, Nortel Nortel Confidential

	performing ingress digit manipulation. Selecting ***routeOnModifiedDigits*** specifies that calls are routed after performing ingress digit manipulation.
Mib	VoiceNetworking
Values	routeOnDialledDigits routeOnModifiedDigits
Default	routeOnModifiedDigits

COMPONENT VirtualRouter (Vr)

Instance	String (1..16, ASCII)
Groups	GROUP Vr AdministrativeControl (AdminContorl) GROUP Vr CustomerIdentifierData (CidData) GROUP Vr OperationalStatus (OperStatus) GROUP Vr OsiState (State) GROUP Vr IfNumberOper GROUP Vr Operational
Scope	Application
Description	*Vr/<string>* The *VirtualRouter* component represents an instance of a Router on the platform. *Vr* provides a mechanism to segregate router traffic and maintenance activities based on a logical separation of ports into separate *VirtualRouters*. At any time the number of *VirtualRouter* components existing in the current view plus the number of newly created *VirtualRouter* components in the edit view must be less than the maximum allowed number of virtual routers. This is regardless of how many *VirtualRouter* components may have been deleted in the edit view. Any *VirtualRouter* which, when created in the edit view, results in a total count greater than the maximum allowed, is labelled as invalid and must be deleted. It is recommended that the deletion of any *VirtualRouter* components

Copyright © 2006, Nortel

Nortel Confidential

existing in the current view should be activated using the *Activate Prov* command before creating any new *VirtualRouter* components.

VERB TELNET Vr

Impact	Passive
Description	*Telnet -ipAddress(<IP address>) Vr/<string>* This command allows access to the Telnet client, attempting to set up a connection from this node to the specified IP address within the specified VR address space. Options: *ipAddress* - This mandatory option specifies the IP address of the remote node to which the user wants to Telnet within this VR's address space.

GROUP Vr AdministrativeControl (AdminContorl)

Properties	Provisioned
Description	This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component.
Mib	VirtualRouter

ATTRIBUTE Vr snmpAdminStatus

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This sets the desired state of this Virtual Router (VR). The ***up*** state indicates the VR is operational. The ***down*** state indicates the VR is not operational. The ***down*** state is only valid when the *managementAccess* attribute is ***disabled***. The ***testing*** state is invalid for a VR.
Mib	VirtualRouter
Values	up down testing
Default	up

ATTRIBUTE vr managementAccess

Access	Read and write
Description	This attributes specifies the routing capabilities of this Virtual Router (VR) and controls the TCP access into that VR. External access is only permitted through the VR that has this attribute ***enabled***. The attribute allows the following subcomponents to be provisioned: *Ipx*, *Bridging*, *Sna*, *Sres*, *NetSentry*, and *Snmp*. Exactly one VR must have this attribute set to ***enabled.*** The first provisioned VR has its *managementAccess* attribute set to ***enabled*** by default. The *managementAccess* attribute of subsequent VRs is set to ***disabled***.
Mib	VirtualRouter
Values	disabled enabled
Default	No default

ATTRIBUTE vr virtualPrivateIntranetIdentifier (vpiId)

Access	Read and write
Description	This attribute specifies the Virtual Private Intranet (VPI) associated with this Virtual Router. If this attribute is not set to the default value, it must be unique on the node. Virtual Routers on different nodes that are interconnected with each other should have the same VPI value.

Copyright © 2006, Nortel Nortel Confidential

	Note that this attribute will be obsoleted in the near future. It's functionality is replaced by the *virtualPrivateNetworkIdentifier* attribute. Any affected tools using this attribute should be converted to use the *vpnId* attribute instead.
Mib	VirtualRouter
Values	Decimal (0..2047)
Default	0

ATTRIBUTE Vr vpnMode (vpnm)

Access	Read and write
Description	This attribute specifies if the virtual router behaves as a carrier Virtual Router or a customer Virtual Router.
Mib	VirtualRouter
Values	customer carrier
Default	customer

ATTRIBUTE Vr virtualPrivateNetworkIdentifier (vpnId)

Access	Read and write
Description	This attribute specifies the Virtual Private Network (VPN) associated with this Virtual Router. This is a globally unique identifier composed of a three-octet long Organizationally Unique Identifier (OUI) followed by a four-octet long VPN index. The value "00-00-00-00-00-00-00" identifies an unspecified vpnId and should be set to other non-zero values when the autoDiscovery attribute under same virtual router ***vr***/x ***ip tunnel msep***/y is enabled.
Mib	VirtualRouter
Values	String (7, Dashed Hex)
Default	00-00-00-00-00-00-00

ATTRIBUTE Vr virtualRouterProcessor (vrp)

Access	Read and write
Criticality	Process
Description	This attribute specifies the *LogicalProcessor* on which this *VirtualRouter* resides. The Management Virtual Router must reside on ***Lp/0***. The following card types may support a Virtual Router: ***CP***

Copyright © 2006, Nortel Nortel Confidential

CPeD
CPeE
VpnXc

WARNING:
When changing this attribute the *operationalState* of the *LogicalProcessor* originally associated with this *VirtualRouter* must be ***enabled*** when the provisioning is activated. This is required for the IP control path to be updated correctly on all IP media logical processors.

If the original *LogicalProcessor* is not ***enabled*** when the provisioning is activated then the IP control path for all IP medias linked to this *VirtualRouter* will be disabled. The only method to recover the IP control path is to reset the LogicalProcessor for each of the associated IP medias.

Mib	VirtualRouter
Values	Link (Hardware, linkToApplications)
Default	No default

GROUP vr CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	VirtualRouter

ATTRIBUTE vr customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	VirtualRouter
Values	Decimal (0; 1..8191)

Copyright © 2006, Nortel Nortel Confidential

Default	0

GROUP vr OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	VirtualRouter

ATTRIBUTE vr snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	VirtualRouter
Values	up down testing
Default	up

GROUP vr OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	VirtualRouter

ATTRIBUTE vr adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

Copyright © 2006, Nortel Nortel Confidential

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — VirtualRouter

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Vr operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — VirtualRouter

Values
enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Vr usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — VirtualRouter

Values
idle
active (activ)
busy

Default — idle

COMPONENT Vr DifferentiatedServicesDomain (Dsd)

Instance	multiservice (ms) classSelector (cs) assuredForwarding (af) packetVoice (pv) wirelessUmts (umts) custom (cu)
Groups	GROUP Vr Dsd LocalSourcePackets (Local)
Scope	Application
Description	*Vr/<string> DifferentiatedServicesDomain/<enum>* *Rtr/<string> DifferentiatedServicesDomain/<enum>* *Rtr/<string> Vrf/<string> DifferentiatedServicesDomain/<enum>* This component and its supcomponents represent a Differentiated Services administration domain for traffic management and congestion control. The *DifferentiatedServicesDomain* component instance identifies the domain type. The following domain types are available: *Multiservice (ms)* *ClassSelector (cs)* *AssuredForwarding (af)* *PacketVoice (pv)* *WirelessUmts (umts)* *Custom (cu)* The *DifferentiatedServicesDomain* component is an optional subcomponent of the *Router*, *VpnRouteForwarder* and *VirtualRouter* components. The *Router*, *VpnRouteForwarder*, and *VirtualRouter* components can have at most one *DifferentiatedServicesDomain* subcomponent. If a *Router* component does not have a *DifferentiatedServicesDomain* subcomponent, then the *Router* operates as by default as follows. IP packets with Differentiated ServiceCode Point (DSCP) field value 48, and MPLS packets with Experimental Bits (EXP) field value 6, are treated with Per Hop Behavior (PHB) CS6; other IP and MPLS packets are treated with PHB DF for default forwarding. Locally generated routing control packets are treated with PHB CS6; other locally generated packets are treated with PHB DF. Per Hop Behaviors CS6 and DF are configured to provide the following values of scheduling class for 8, 4, 3, 2 queues, drop precedence, and EXP for MPLS encapsulation: (5, 2, 2, 0, low, 6) and (0, 0, 0, 0,, high, 0), respectively. This is equivalent to the default the configuration of the *DifferentiatedServicesDomain/custom* component instance.

Copyright © 2006, Nortel Nortel Confidential

If a *VpnRouteForwarder* component does not have a *DifferentiatedServicesDomain* subcomponent, then the *VpnRouteForwarder* component uses the *DifferentiatedServicesDomain* configuration of the *Router.*

GROUP Vr Dsd LocalSourcePackets (Local)

Properties: Provisioned

Description: This group contains provisioned attributes of the *DifferentiatedServicesDomain* component.

Mib: VirtualRouter

ATTRIBUTE Vr Dsd phbGeneralSource (phbG)

Access: Read and write

Description: This attribute indicates the *PerHopBehavior* component instance that controls the forwarding behavior of each locally generated packet that is not used for network routing control.

For a locally-generated IP packet that is not used for network routing control, the Differentiated Services Code Point (DSCP) field of the packet is set equal to this attribute value.

For a locally-generated ICMP echo request packet, the DSCP field is overridden by the *-tos* or *-dscp* option of the *Ping* command. For a locally-generated ICMP echo reply packet, the DSCP field is set to the DSCP value contained in the IP header of the received request packet. In any case, the forwarding behavior of the ICMP packet controlled by the *PerHopBehavior* component instance that is equal to value of the DSCP field.

ATTRIBUTE Vr Dsd MplsMap ExpMap dropPrecedence (dp)

Access — Read only

Description — This attribute indicates the drop precedence value used to treat an MPLS packet whose three-bit Experimental (EXP) field value is equal to the *ExperimentalBitsMap* component instance value when the packet is forwarded by a Label Switch Router (LSR) over an LSP where the *MplsServiceMap* component is applied.

The value of this attribute is equal to the *dropPrecedence* provisioned attribute value of *DifferentiatedServices PerHopBehavior* component instance that is equal to the *ExperimentalBitsMap perHopBehavior*

Scope	Application
Description	*Vr/<string> Dsd/<enum> MplsMap/<n> PerHopBehaviorMap/<phb> Rtr/<string> Dsd/<enum> MplsMap/<n> PerHopBehaviorMap/<phb>*

This component specifies a mapping from a *PerHopBehavior* component instance value to a three-bit Experimental (EXP) field value.

This mapping controls how the EXP field in an MPLS label is marked when a packet is forwarded by a Label Edge Router (LER) over a Label Switched Path (LSP) where the *MplsServiceMap* component is applied.

The *DifferentiatedServicesDomain PerHopBehavior* component instance used to treat the packet prior to label encapsulation is used to select the EXP value for the label. If the *PerHopBehavior* component instance value used to treat the packet is not included among the existing *PerHopBehaviorMap* component instances, then the EXP value indicated by the *PerHopBehaviorMap* component whose instance is equal to 0 is used.

Each *PerHopBehaviorMap* component instance is equal to a decimal value in the range from 0 to 63. The following pairs of *PerHopBehaviorMap* component instances values are equal:
AF11 = 10,
AF12 =12,
AF13 =14,
AF31 = 26,
AF32 = 28,
AF33 = 30,
AF21 = 18,
AF22 = 20,
AF23 = 22,
AF41 = 34,
AF42 =36,
AF43 = 38
CS0 = 0,
CS1 = 8,
CS2 =16,
CS3 = 24,
CS4 =32 ,
CS5 = 40,
CS6 = 48,
CS7 = 56,
DF = 0,
EF = 46.

The first item in each pair above is a Per Hop Behavior designation identified in one of following IETF standards: RFC 2764 (“DiffServ Field Definition in IPv4 and IPv6 Headers”), RFC 2597 (“Assured Forwarding PHB Group”) or RFC 3246 (“An Expedited Forwarding PHB”). The the second item in each pair is the IETF recommended Differentiated Services

Copyright © 2006, Nortel Nortel Confidential

Code Point (DSCP) value.

Each *PerHopBehaviorMap* subcomponent of the *MplsServiceMap* must have a unique instance value. A *PerHopBehaviorMap* subcomponent whose instance value is equal to 0 must exist.

A set of *PerHopBehaviorMap* subcomponents with instance values equal to the *DifferentiatedServicesDomain PerHopBehavior* subcomponent instance values is added automatically when the *MplsServiceMap* component is created.

GROUP Vr Dsd MplsMap PhbMap **Operational (Oper)**

Properties	Operational
Description	This group contains the operational attributes of the *PerHopBehaviorMap* component.
Mib	VirtualRouter

ATTRIBUTE Vr Dsd MplsMap PhbMap **operExperimentalBits (operExp)**

Access	Read only
Description	This attribute indicates a three-bit Experimental (EXP) field value in the range from ***0*** to ***7*** that is marked into the MPLS label when a packet is forwarded by a Label Edge Router (LER) over a Label Switched Path (LSP) where the *MplsServiceMap* component is applied. The EXP value is selected according to the *PerHopBehaviorMap* component whose instance value is equal to the instance value of the *DifferentiatedServicesDomain PerHopBehavior* component used to treat the packet prior to label encapsulation. The value of this attribute is equal to the *experimentalBits* provisioned attribute.
Mib	VirtualRouter
Values	Decimal (0..7)
Default	No default

ATTRIBUTE Vr Dsd MplsMap PhbMap **operExperimentalBitsAlternative (operExpAlt)**

Access	Read only
Description	This attribute is similar to the *operExperimentalBits* operational attribute, except that it used only on PQC-based access FPs with ASIC Version 2.0 when an IP packet is forwarded by a Label Edge Router (LER) over a Label Switched Path (LSP) via a PQC-based trunk FP. In such situations only, the value of this attribute, instead of the *operExperimentalBits* operational attribute value, is used to mark the Experimental (EXP) field of the MPLS label. If the *MplsServiceMap* does not have a *MarkingPerformance* subcomponent, then the value of this attribute is equal to the *experimentalBits* provisioned attribute; otherwise the value of this attribute is determined as explained in the next paragraph. If "***x***" is the *schedulingClass4Queues* operational attribute value of the *DifferentiatedServicesDomain PerHopBehavior* component whose instance value is equal to the *PerHopBehaviorMap* component instance value, then the *PerHopBehaviorMap experimentalBitsAlternative* operational attribute value is equal to the "***x***th" element of the

COMPONENT Vr Dsd MplsMap MarkingPerformance

Groups	GROUP Vr Dsd MplsMap MarkingPerformance Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Dsd/<enum> MplsMap/<n> MarkingPerformance* *Rtr/<string> Dsd/<enum> MplsMap/<n> MarkingPerformance* This subcomponent is added to the *MplsServiceMap* component to enable high performance MPLS label encapsulation on some PQC-based ingress access FPs . IP packets that are forwarded from access FPs with PQC-ASIC Version 2.0 via PQC-based trunk FPs (any ASIC version) over an MPLS Label Switched Path (LSP) where the *MplsServiceMap* is applied are affected. Adding this component to the *MplsServiceMap* improves IP packet throughput on the affected access FPs but restricts how the three-bit Experimental (EXP) field of MPLS labels are marked, as explained in the description of the *operExperiementalBitsAlternative* operational attribute of the *MplsServiceMap PerHopBehaviorMap* component. Without the *MarkingPerformance* subcomponent, IP packets after being routed in hardware are encapsulated with MPLS labels by a software-assisted datapath that does not restrict how the EXP field of MPLS labels are marked. The *MarkingPerformance* subcomponent is added automatically to a *MpslServiceMap* subcomponent being added to a *DifferentiatedServicesDomain* component. This ensures that the high performance MPLS label encapsulation data path is used by default.

COMPONENT Vr Dsd VpnDscpMap (VpnDscpMap)

Instance	String (1..20, ASCII)
Groups	GROUP Vr Dsd VpnDscpMap Provisioned (Prov)
Scope	Application
Description	*Vr/<string> DifferentiatedServicesDomain/<enum> VpnDscpMap/<string>*

This component provides a mapping of customer DSCP values to carrier DSCP values for IP tunnel encapsulation in an IP VPN (RFC2764) network.

When an IP packet is forwarded from a customer Virtual Router (cVr) to a Virtual Connection Gateway (VCG) the customer IP header is encapsulated with a carrier IP header for transmission through the carrier network.

If the customer virtual router (cVr) has a *DifferentiatedServicesDomain* subcomponent where the *linkToVpnDscpMap* attribute is set, then the value of DSCP field in the IP packet forwarded by the customer Virtual Router (cVr) is translated by the mapping specified by the *assignedPhb* attribute of the associated *VpnDscpMap* to a DSCP value that is marked in the carrier IP header. If the customer *DifferentiatedServicesDomain linkToVpnDscpMap* attribute is not set, then the value of the DSCP field in the carrier IP header is set equal to the value of the DSCP field in the customer IP header.

The encapsulated IP packet is treated by the Virtual Connection Gateway (VCG) as specified by the *DifferentiatedServicesDomain PerHopBehavior* component instance associated with the carrier header DSCP value. If the carrier header DSCP value does not correspond to a *PerHopBehavior* subcomponent of the VCG's *DifferentiatedServicesDomain* component, then the IP packet is treated as specified by the *PerHopBehavior* component instance associated with DSCP ***0***.

The *VpnDscpMap* component can be added only to the *DiffServDomain* subcomponent of a *VirtualRouter* component where the *vpnMode* attribute is set to ***carrier***. It can be linked only to the *linkToVpnDscpMap* attribute of the *DiffServDomain* subcomponent of a *VirtualRouter* component where the *vpnMode* attribute is set to ***customer***.

Copyright © 2006, Nortel Nortel Confidential

The component instance is an arbitrary text string to allow the operator to assign a meaningful name for easy reference.

The *DiffServDomain* component is not allowed to have more than eight *VpnDscpMap* subcomponents.

No more than one *DiffServDomain* component instance is allowed to have *VpnDscpMap* subcomponents

COMPONENT Vr Dsd VpnCosMap (VpnCosMap)

Groups	GROUP Vr Dsd VpnCosMap Provisioned (Prov)
Scope	Application
Description	*Vr/<string> DifferentiatedServicesDomain/<enum> VpnCosMap* This component provides a mapping of customer CoS values to carrier DSCP values for IP tunnel encapsulation in an IP VPN (RFC2764) network. When an IP packet is forwarded from a customer Virtual Router (cVr) to a Virtual Connection Gateway (VCG) the customer IP header is encapsulated with a carrier IP header for transmission through the carrier network. If the customer virtual router (cVr) does not have a *DifferentiatedServicesDomain* subcomponent and the Virtual Connection Gateway (VCG) has a *DifferentiatedServicesDomain VpnCosMap* component, then the IP CoS value assigned to the packet by the customer virtual router is translated by the mapping specified by the *assignedPhb* attribute of the *VpnCosMap* to a DSCP value that is marked in the carrier

Copyright © 2006, Nortel Nortel Confidential

IP header. If the *DifferentiatedServicesDomain* of the Virtual Connection Gateway (VCG) does not have a *VpnCosMap* subcomponent, then the value of the DSCP field in the carrier IP header is set to ***0*** unless the customer header DSCP value is ***48*** (which corresponds to PHB CS6 for IP network control packets). In the latter case the carrier header DSCP value is set to ***48*** also.

The encapsulated IP packet is treated by the Virtual Connection Gateway (VCG) as specified by the *DifferentiatedServicesDomain PerHopBehavior* component instance associated with the carrier header DSCP value. If the carrier header DSCP value does not correspond to a *PerHopBehavior* subcomponent of the VCG's *DifferentiatedServicesDomain* component, then the IP packet is treated as specified by the *PerHopBehavior* component instance associated with DSCP ***0***.

The *VpnCosMap* component can be added only to the *DiffServDomain* subcomponent of a *VirtualRouter* component where the *vpnMode* attribute is set to ***carrier***.

The *VpnCosMap* component is used to assist the migration of an IP VPN network without *DifferentiatedServicesDomain* components to an IP VPN network where every customer Virtual Router (cVr) and Virtual Connection Gateway (VCG) has a *DifferentiatedServicesDomain* component. The *VpnCosMap* components can be removed once the CoS to DiffServ network migration is completed.
The VpnCosMap component controls how the DSCP field in the carrier IP header is marked when IP packets are forwarded by the Virtual Connection Gateway (VCG) only if the operational value of the Vr trafficManagementMode (tmMode) attribute for the customer VirtualRouter component is set to hybrid .

Description

Vr/<string> Dsd/<enum> PerHopBehavior/<phb>
Rtr/<string> Dsd/<enum> PerHopBehavior/<phb>
Rtr/<string> Vrf/<string> Dsd/<enum> PerHopBehavior/<phb>

The attributes of the *PerHopBehavior* component specify per-packet traffic management parameters that control how individual packets are forwarded.

A packet is associated with a *PerHopBehavior* component instance by a packet classification mechanism. For IP packets, the associated *PerHopBehavior* component instance is equal to the value of the six-bit Differentiated Services Code Point (DSCP) field in the IP header. For MPLS packets forwarded by a Label Switched Router (LSR) over a Label Switched Path (LSP) where an *MplsServiceMap* component is applied, the associated *PerHopBehavior* component instance is equal to value of the *perHopBehavior* attribute of the *MplsServiceMap ExperimentalBitsMap* component whose instance is equal to the value of the three-bit Experimental (EXP) field of the MPLS label.

If the *PerHopBehavior* component instance associated with a packet is not included among the existing *PerHopBehavior* subcomponents of the *DifferentiatedServicesDomain*, then the packet is treated according to the *PerHopBehavior* component whose instance is equal to 0.

Each *PerHopBehavior* component instance is equal to a decimal value in

Copyright © 2006, Nortel
Nortel Confidential

the range from 0 to 63. The following pairs of *PerHopBehavior* component instances values are equal:
AF11 = 10,
AF12 =12,
AF13 =14,
AF31 = 26,
AF32 = 28,
AF33 = 30,
AF21 = 18,
AF22 = 20,
AF23 = 22,
AF41 = 34,
AF42 =36,
AF43 = 38
CS0 = 0,
CS1 = 8,
CS2 =16,
CS3 = 24,
CS4 =32,
CS5 = 40,
CS6 = 48,
CS7 = 56,
DF = 0,
EF = 46.

The first item in each pair above is a Per Hop Behavior designation identified in one of following IETF standards: RFC 2764 (“DiffServ Field Definition in IPv4 and IPv6 Headers”), RFC 2597 (“Assured Forwarding PHB Group”) or RFC 3246 (“An Expedited Forwarding PHB”). The the second item in each pair is the IETF recommended Differentiated Services Code Point (DSCP) value.

Each *PerHopBehavior* subcomponent of the *DifferentiatedServicesDomain* must have a unique instance value. A *PerHopBehavior* subcomponent whose instance value is equal to 0 must exist.

A set of *PerHopBehavior* subcomponents is added automatically when the *DifferentiatedServicesDomain* component is created. The members of this set is a function of the *DifferentiatedServicesDomain* component instance as indicated below.

ATTRIBUTE Vr Dsd Phb dropPrecedence (dp)

Access — Read and write

Description — This attribute specifies the drop precedence value given to a packet that uses the *PerHopBehavior* component instance. This value is used to select a congestion threshold when the packet is placed on a queue that supports multiple congestion thresholds.

A drop precedence is assigned to a packet to control its loss sensitivity relative to other packets when the packets are placed into the same queue. Generally, the ***low*** value indicates the packet is less likely to be discarded when the queue is congested. This traffic has a higher probability of being forwarded. The ***high*** value indicates the packet is more likely to be discarded when the queue is congested. This traffic has a lower probability of being forwarded. The actual loss sensitivity of packets depends on the discarding mechanism at the queue.

ATTRIBUTE Vr Dsd Phb schedulingClass8Queues (sc8q)

Access	Read only
Description	This attribute indicates a logical scheduling class value in the range from ***0*** to ***7*** given to a packet that uses the *PerHopBehavior* component instance. This value is used to select a queue when the packet is transmitted at an interface that supports eight queues per connection. A scheduling class is assigned to a packet to control its scheduling behavior relative to other packets at the interface where the packets are transmitted. Generally, a numerically higher value indicates the packet is less likely to be delayed. This traffic is considered more urgent and less delay tolerant. A numerically lower value indicates the packet is more likely to be delayed. This traffic is considered less urgent and more delay tolerant. The actual scheduling behavior of packets depends on the scheduling mechanism at the interface. The value of this attribute is equal to value of the *schedulingClass8Queues* provisioned attribute of the *TrafficClass* component whose instance is equal to the *PerHopBehavior trafficClass* provisioned attribute value.

ATTRIBUTE Vr Dsd Phb schedulingClass3Queues (sc3q)

Access	Read only
Description	This attribute indicates a logical scheduling class value in the range from ***0*** to ***2*** given to a packet that uses the *PerHopBehavior* component.instance. This value is used to select a queue when the packet is transmitted at an interface that supports three queues per connection. A scheduling class is assigned to a packet to control its scheduling behavior relative to other packets at the interface where the packets are transmitted. Generally, a numerically higher value indicates the packet is less likely to be delayed. This traffic is considered more urgent and less delay tolerant. A numerically lower value indicates the packet is more likely to be delayed. This traffic is considered less urgent and more delay tolerant. The actual scheduling behavior of packets depends on the scheduling mechanism at the interface. The value of this attribute is equal to value of the *schedulingClass3Queues* operational attribute of the *TrafficClass*

Copyright © 2006, Nortel Nortel Confidential

component whose instance is equal to the *PerHopBehavior trafficClass* provisioned attribute value.

Mib VirtualRouter

Values Decimal (0..2)

Default No default

ATTRIBUTE Vr Dsd Phb schedulingClass2Queues (sc2q)

Access Read only

Description This attribute indicates a logical scheduling class value in the range from ***0*** to ***1*** given to a packet that uses the *PerHopBehavior* component.instance. This value is used to select a queue when the packet is transmitted at an interface that supports two queues per connection.

A scheduling class is assigned to a packet to control its scheduling behavior relative to other packets at the interface where the packets are transmitted. Generally, a numerically higher value indicates the packet is less likely to be delayed. This traffic is considered more urgent and less delay tolerant. A numerically lower value indicates the packet is more likely to be delayed. This traffic is considered less urgent and more delay tolerant. The actual scheduling behavior of packets depends on the scheduling mechanism at the interface.

The value of this attribute is equal to value of the *schedulingClass2Queues* operational attribute of the *TrafficClass* component whose instance is equal to the *PerHopBehavior trafficClass* provisioned attribute value.

Mib VirtualRouter

Values Decimal (0..1)

Default No default

ATTRIBUTE Vr Dsd Phb connectionClass (cos)

Access Read only

Description This attribute indicates the connection class value in the range from ***0*** to ***3*** that is associated with the Layer 2 connection used to forward a packet that uses the *PerHopBehavior* component instance when it is transmitted at an ATM or Frame Relay interface that has four Layer 2 connections, each with a different connection class value, to the next hop router.

See the description of the *TrafficClass schedulingClass4Queues* provisioned attribute for more information per-packet selection of egress connections.

The value of this attribute is equal to value of the *schedulingClass4Queues* provisioned attribute of the *TrafficClass*

component whose instance is equal to the *PerHopBehavior trafficClass* provisioned attribute value.

Mib VirtualRouter

Values Decimal (0..3)

Default No default

ATTRIBUTE Vr Dsd Phb operDropPrecedence (operDp)

Access Read only

Description This attribute indicates the drop precedence value given to a packet that uses the *PerHopBehavior* component instance. This value is used to select a congestion threshold when the packet is placed on a queue that supports multiple congestion thresholds.

A drop precedence is assigned to a packet to control its loss sensitivity relative to other packets when the packets are placed into the same queue. Generally, the ***low*** value indicates the packet is less likely to be discarded when the queue is congested. This traffic has a higher probability of being forwarded. The ***high*** value indicates the packet is more likely to be discarded when the queue is congested. This traffic has a lower probability of being forwarded. The actual loss sensitivity of packets depends on the discarding mechanism at the queue.

The value of this attribute is equal to value of the *dropPrecedence* provisioned attribute of the *PerHopBehavior* component.

Mib — VirtualRouter

Values — Decimal (0..7)

Default — No default

ATTRIBUTE Vr Dsd Tc schedulingClass4Queues (sc4q)

Access — Read and write

Description — This attribute specifies a logical scheduling class value in the range from ***0*** to ***3*** given to a packet that uses the *TrafficClass* component instance. This value is used to select a queue when the packet is transmitted at an interface that supports four queues per connection. It may also be used to select one of up to four link layer connections at interfaces where per-packet selection of egress connections is supported.

A scheduling class is assigned to a packet to control its scheduling behavior relative to other packets at the interface where the packets are transmitted. Generally, a numerically higher value indicates the packet is less likely to be delayed. This traffic is considered more urgent and less delay tolerant. A numerically lower value indicates the packet is more likely to be delayed. This traffic is considered less urgent and more delay tolerant. The actual scheduling behavior of packets depends on the scheduling mechanism at the interface.

This value is also used to select a one of up to four Layer 2 connections at the interface where the packet is transmitted. Per-packet selection of egress connections is supported only if these conditions are all true:

i) for the *Vr* component, the value of the associated *mediaType* attribute under the *IpPort* component is ***frameRelay***, ***atmMpeLlcEncap***, or

Copyright © 2006, Nortel Nortel Confidential

atmMpeVcEncap; for *Router* and *Vrf*, the media associated with the interface is *AtmMpe* or *IpoDlci*.
ii) more than one Layer 2 connection is configured to the next hop IP router, and
iii) each connection is configured with a different connection class value.

Normally the packet is transmitted on the connection whose connection class is equal to the *schedulingClass4Queues* value given to the packet. If that connection does not exist, then the connection having the next lower connection class is used. If that connection does not exist also, then the connection having the next higher connection class is used.

Locally generated IP multicast and IP broadcast packets are not eligible for per-packet selection of egress connections. Each of these packets is copied and transmitted individually on each of the available connections to the next hop IP router.

For *AtmMpe*, the connection class is specified by the *ipCos* attribute of the *AtmConnection* subcomponent. For *FrDte* the connection class is specified by the *ipCos* attribute of the *StaticDlci* and *DynamicDlciDef* subcomponents. For *IpDlciGroup* and *IpoDlci* the connection class is specified by the *ipCos* attribute of the *FrConnection* subcomponent.

If each Layer 2 connection is configured to provide different policing and scheduling characteristics, then the forwarding behaviors of IP and MPLS packets are differentiated as they transit through the Layer 2 network. In general, the scheduling characteristics of the connections should be configured to be better for numerically greater connection class values. For example, if four *AtmConnection* components are associated with *AtmIf* components configured for ATM service classes ***UBR***, ***nrtVBR***, ***rtVBR***, and ***CBR***, then the *ipCos* attributes of the *AtmConnection* components should be either ***0***,***1***,***2***, and ***3***, respectively, or ***0***,***1***,***3***, and ***2*** respectively.

The *schedulingClass4Queues* attribute is set automatically to a default value according to a function of the *TrafficClass*component instance value when the *TrafficClass* component is created. The default values are listed below. If the *TrafficClass* component instance is ***standard***, then this attribute must be set to ***0***.

Default values for all domains, except *assuredForwarding (af)*:

TrafficClass	*schedulingClass4Queues*
critical	***2***
premium	***3***
network	***2***
platinum	***1***
gold	***1***
silver	***1***
bronze	***1***
standard	***0***

Default	off

ATTRIBUTE Vr Pp Tbcl portNum (pNum)

Access	Read only
Criticality	Component
Description	This attribute indicates the unique number assigned to the bridge port. It is used for SNMP management of this bridge port and in spanning tree as an identifier for this bridge port. Notes: Escape routines exist for initializing, copying, and deleting port numbers. This is necessary because SNMP requires a unique port instance identifier. The initPortNum escape routine sets the port number to a value in the range 1-255 for this purpose. The setCopiedPortNum escape

Copyright © 2006, Nortel Nortel Confidential

	routine exists to maintain the uniqueness of the port number in cases when one port is copied to another. When a bridge port is deleted, the releasePortNum escape routine places the port number being released into a pending deletion state. This is because the port number cannot be re-allocated until the port is truly deleted in the current view. This is necessary since there is no guarantee of order when processing changes to multiple protocol ports so without the pending deletion state, the same port number could be temporarily assigned to two ports for a short period of time. The portNum is set as component critical since bridging also uses the port number as a key for indexing into its data structures. If a port is deleted then re-added under the same protocol port, CAS treats the change as a SET to the portNum attribute.
Mib	Bridge
Values	Decimal (0..255)
Default	0

GROUP Vr Pp Tbcl TbProvisioned (TbProv)

Properties	Provisioned
Description	This group contains all the port specific provisionable attributes that belong to the Tb group. These attributes in part influence the working of a bridge port operating in the transparent bridge mode.
Mib	Bridge

ATTRIBUTE Vr Pp Tbcl secureOption (sos)

Access	Read and write
Description	This attribute specifies whether the port secure feature is enabled. The secure feature, if enabled causes the following things to happen: a) disallows dynamic learning, b) disallows frames to be forwarded that do not satisfy the following condition: the MAC address of the source should be found in the forwarding table and the destination MAC address of the frame should also be found in the forwarding table. In addition to this, the port the frame was received on should figure as the in port, given the destination MAC address found in the frame. c) disallows frames to be forwarded if the allowed to go port map for the destination MAC address is empty. This feature in effect allows the user to choose the hosts that can generate traffic and the hosts that can receive traffic through this bridge unit.
Mib	Bridge
Values	disabled enabled
Default	disabled

Mib	Bridge

ATTRIBUTE Vr Pp Tbcl adminStatus (as)

Access	Read and write
Description	This attribute defines the current administrative state for this component. ***enabled*** indicates that the component is available for operation. ***disabled*** indicates the component is unavailable for operation.
Mib	Bridge
Values	up down
Default	up

ATTRIBUTE Vr Pp Tbcl portStateStpControl (psstpc)

Access	Read and write
Description	This attribute specifies whether or not stp state for this bridge port is controlled by the stp. In essence it indicates the participation of this bridge port in the stp by accepting and acting on received bridge protocol data units and by sending out the same. ***on*** signifies that this bridge port's spanning tree port state is controlled by the stp. A value of ***off*** signifies that the spanning tree port state of this bridge port is unaffected by the stp. This in effect puts the bridge port out of reach of the stp decisions. Its stp state will be always ***forwarding***. Care should be taken while assigning a value of ***off*** to this attribute, as this might cause network loops. Please do not set this attribute to ***off*** unless you are absolutely sure about the effect of such an action on your network topology.
Mib	Bridge
Values	off on
Default	on

ATTRIBUTE Vr Pp Tbcl stpTypeProv (stptProv)

Access	Read and write
Description	This attribute specifies the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. If

Copyright © 2006, Nortel Nortel Confidential

	the value of the attribute *protocolSpec* in the *SpanningTreeProtocol* component is in conflict with the value of this attribute, the value of the *protocolSpec* attribute will prevail. Prevailing stp type is reflected in the value of the attribute *stpTypeOper.*
Mib	Bridge
Values	dec ieee8021
Default	ieee8021

ATTRIBUTE Vr Pp Tbcl portPriority (ppr)

Access	Read and write
Description	This attribute specifies the value for this bridge port priority which is contained in the first octet of the port identifier. Valid values are as follows: 1) 0-255 for stp type DEC and 2) 0-65535 for stp type IEEE.
Mib	Bridge
Values	Decimal (0..65535)
Default	128

ATTRIBUTE Vr Pp Tbcl pathCost (pc)

Access	Read and write
Description	This attribute specifies the contribution of this port to all the paths to the root bridge that include this port. Please note that the value of the attribute *pathCost* is applied only when the value of the attribute *pathCostMethod* is set to ***on*** and is ignored if otherwise.
Mib	Bridge
Values	Decimal (1..65535)
Default	10

ATTRIBUTE Vr Pp Tbcl pathCostMethod (pcm)

Access	Read and write
Description	This attribute specifies the method used by the bridging logic to calculate the path cost to the bridge considered to be the root bridge in the spanning tree topology. This attribute should be set to ***off*** before attempting to provision a value for *pathCost.*
Mib	Bridge
Values	off dec ieee8021
Default	ieee8021

Copyright © 2006, Nortel Nortel Confidential

GROUP Vr Pp Tbcl DomainInfoProvisioned (DIProv)

Properties	Provisioned
Description	This group contains all the provisionable, domain specific attributes for a non-encapsulating bridge port.
Mib	Bridge

ATTRIBUTE Vr Pp Tbcl domainNum (dn)

Access	Read and write
Description	This attribute specifies the domain number associated with this bridge port. Domain numbers are used for confining frames to a domain. Domain based filtering provides a complete segregation of traffic based on domain number associated with frames. There can exist only sixteen domains when a spanning tree is desired specific to each domain. When there is only a single spanning tree spanning all the domains the maximum number of domains possible are 4294967293. This attribute is of no relevance when associated with backbone bridge port. Its value is ignored in such a situation.
Mib	Bridge
Values	Decimal (1..4294967293)
Default	1

ATTRIBUTE Vr Pp Tbcl preserveDomain (pds)

Access	Read and write
Criticality	Component
Description	This attribute specifies if the domain information should be preserved or embedded in the frame header. This attribute applies only to ***backbone*** ports and does not affect the ***access*** bridge ports. By setting this attribute to a value of ***on***, domain information could be preserved in frames being tunnelled across the backbone, so that this information can be deciphered at the other end of the backbone tunnel. This preserves the integrity of the domains thus preventing domain breaches while tunnelling frames across backbone network. If the value of this attribute is set to ***off*** then domain information is not preserved in the header of the frames tunnelling through the backbone. This eliminates the overhead incurred to preserve domain information across the backbone while tunnelling frames across it. Preserve domain is relevant only when used in conjunction with ATM MPE.
Mib	Bridge
Values	off on
Default	No default

GROUP Vr Pp Tbcl OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Bridge

ATTRIBUTE Vr Pp Tbcl adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Bridge
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Vr Pp Tbcl operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

Mib	Bridge
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Vr Pp Tbcl usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Bridge
Values	idle active (activ) busy
Default	idle

GROUP Vr Pp Tbcl OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	Bridge

ATTRIBUTE Vr Pp Tbcl snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	Bridge
Values	up down testing
Default	up

Copyright © 2006, Nortel Nortel Confidential

GROUP Vr Pp Tbcl Operational (Oper)

Properties	Operational
Description	This group contains all the operational attributes belonging to the base group. These attributes in part, reflect the state of a bridge port.
Mib	Bridge

ATTRIBUTE Vr Pp Tbcl portName (pn)

Access	Read only
Description	The attribute *portName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/ETH100A* would have a name ***TBP-ETH100A.***
Mib	Bridge
Values	String (4..29, ASCII)
Default	No default

ATTRIBUTE Vr Pp Tbcl upTime (ut)

Access	Read only
Description	This attribute indicates the accumulated up time of this bridge port since the last reset occurred.
Mib	Bridge
Values	Decimal (0..4294967295)
Units	seconds
Default	0

ATTRIBUTE Vr Pp Tbcl downTime (dt)

Access	Read only
Description	This attribute indicates the accumulated down time of this bridge port since the last reset occurred.
Mib	Bridge
Values	Decimal (0..4294967295)
Units	seconds
Default	0

ATTRIBUTE Vr Pp Tbcl bridgingMode (bm)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the mode of bridging this port can support. The transparent bridge mode is the only mode supported.
Mib	Bridge
Values	unknown tb sr srt
Default	No default

ATTRIBUTE Vr Pp Tbcl bridgePortConfig (bpc)

Access	Read only
Description	This attribute indicates the bridge port's configuration. It indicates if the bridge port is operating as an ***access*** port or as a ***backbone*** port. An ***access*** bridge port does not encapsulate a MAC frame and does not preserve domain information in the encapsulation, whereas a ***backbone*** bridge port encapsulates the MAC frame and optionally preserves domain information in the encapsulated frame.A ***backbone*** bridge port is typically used to transport frames across a high bandwidth backbone network to another bridge unit for further processing/forwarding of the frame.
Mib	Bridge
Values	access backbone
Default	No default

ATTRIBUTE Vr Pp Tbcl bridgePortType (bpt)

Access	Read only
Description	This attribute indicates the type of the bridge port that was provisioned. It takes into consideration the *bridgingMode*, *bridgePortConfig* and the media the bridge port is linked to before branding a bridge port.
Mib	Bridge
Values	ethernetBridgePort tokenRingBridgePort fddiBridgePort tokenBusBridgePort lanEmulationClientEthernet fddiEncapsulatingBridgePort vnsBridgePort frameRelayBridgePort pppBridgePort smdsBridgePort vcpBridgePort x25BridgePort atmMpeBridgePort

Default — No default

ATTRIBUTE Vr Pp Tbcl ifIndex (ifin)

Access — Read only

Description — This attribute indicates the index into the Interface Table where information about the media interface corresponding to this bridge port is maintained.

Mib — Bridge

Values — Decimal (1..65535)

Default — No default

ATTRIBUTE Vr Pp Tbcl mtuExceededDiscards (med)

Access — Read only

Description — This attribute counts the number of frames discarded because the size of the outbound frame exceeded the message transfer unit (mtu) allowed for the bridge port. Note that this counter only refers to the outbound frames for this bridge port. This counter wraps around its maximum value of 4294967295.
This counter is influenced by the attribute *fragmentIp.* This counter is incremented when a frame larger than the mtu allowed is encountered and cannot be fragmented. If this counter is increasing steadily, it might be useful to set the value of the attribute *fragmentIp* to a value of ***on***.

Mib — Bridge

Values — Decimal (0..4294967295)

Default — 0

GROUP Vr Pp Tbcl TbOperational (TbOper)

Properties — Operational

Description — This group contains all the port specific operational attributes that belong to the Tb group. This group also contains all the port specific statistical attributes that belong to the Tb group. These attributes reflect the state of a bridge port operating in the transparent bridge mode

Mib — Bridge

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Pp Tbcl maxInfo (mi)

Access	Read only
Description	This attribute indicates the maximum size of the information field in a transparent bridge frame. This excludes the header field.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbcl badVerifyDiscards (bvd)

Access	Read only
Description	This attribute counts the number of incoming frames that were discarded because the value of the *secureOption* attribute was set to ***on*** and: a) it is not allowed to receive frames originating from the MAC address found in the source address field of the frame (source MAC address lookup in the forwarding table failed) on this bridge port, or b) for the destination MAC address found in the frame the port the frame was received on does not appear as in port in the corresponding static table entry. Permission to receive frames from a MAC address is granted via the static table entries. This attribute, *badVerifyDiscards*, is directly influenced by: 1. *secureOption* and 2. the static table entries. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbcl staticEntryDiscards (sed)

Access	Read only
Description	This attribute counts the number of frames that were discarded because of the following three reasons: a) there was no entry for the “allowed to go” field in the static table entry, where the input port is this bridge port. b) the MAC destination address in the frame was not found in the forwarding table but the frame cannot be flooded because this bridge has not other ports in forwarding state. c) for spanning tree bpdus that are locally processed. This counter wraps around its maximum value of 4294967295. It might prove useful to check the static table entry corresponding to the bridge port in question, if this counter consistently displays a high value. Ideally this counter should be as low as possible.

Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbcl dynamicEntryDiscards (dend)

Access	Read only
Description	This attribute counts the number of incoming frames that: a) were discarded because of the fact that the bridge port, the frame is to go out of matches the bridge port it came in from, or b) if the stp port state of the out port is not ***forwarding***. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbcl learningDiscards (ld)

Access	Read only
Description	This attribute counts the number of frames that were discarded while this bridge port was in a state other than the ***forwarding*** state. While in ***learning*** state the frame is discarded after the information from its header is learnt. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbcl inDiscards (id)

Access	Read only
Description	This attribute counts the number of frames that were received by this bridge port and were discarded by the forwarding process. This includes frames that could have been discarded due to filtering. A rapidly increasing value for this attribute could indicate a shortage of resource in terms of memory needed to process the incoming frames. More memory can be provisioned through the *VirtualRouter*'s memory manager.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbcl inFrames (if)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of frames that have been received by this port from its segment. Note that a frame received on this bridge port is counted if and only if it can be processed by the bridge logic contained in this bridge unit. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbcl outFrames (of)

Access	Read only
Description	This attribute counts the number of frames that have been transmitted out this bridge port. This also includes management frames.This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)

Groups	GROUP Vr Pp FddiETB Provisioned (Prov) GROUP Vr Pp FddiETB TbProvisioned (TbProv) GROUP Vr Pp FddiETB StpProvisioned (StpProv) GROUP Vr Pp FddiETB DomainInfoProvisioned (DIProv) GROUP Vr Pp FddiETB OsiState (State) GROUP Vr Pp FddiETB OperationalStatus (OperStatus) GROUP Vr Pp FddiETB Operational (Oper) GROUP Vr Pp FddiETB TbOperational (TbOper) GROUP Vr Pp FddiETB StpOperational (StpOper) GROUP Vr Pp FddiETB Statistics (Stats)
Scope	Application
Description	*Vr/<string> Pp/<string> FddiEncapTbPort* This component represents a FDDI encapsulated port, working in the TB mode. It contains all the attribute groups (provisionable and operational) necessary for the working of this bridge port. In this mode the domain information can optionally be preserved in the frames. This bridge port is characterized as a backbone port and can be used to tunnel TB frames, through the backbone. It participates in the transparent bridge (man) spanning tree protocol. Backbone ports are not associated with any domain as multiple domains should be able to multiplex traffic through them and thus share the backbone's bandwidth. Please note that when this bridge port is provisioned multiple instances of the component *SpanningTreeProtocol* exist, there should exist exactly one instance of the *SpanningTreeProtocol* component with its attribute *stpMode* set to a value of ***backbone***.

Mib	Bridge

ATTRIBUTE Vr Pp FddiETB fragmentIp (fIp)

Access	Read and write
Description	This attribute specifies if outbound frames carrying IP datagrams should be fragmented to conform to message transfer unit (*mtu*) sizes dictated by the media.
Mib	Bridge
Values	off on
Default	off

ATTRIBUTE Vr Pp FddiETB portNum (pNum)

Access	Read only
Criticality	Component
Description	This attribute indicates the unique number assigned to the bridge port. It is used for SNMP management of this bridge port and in spanning tree as an identifier for this bridge port. Notes: Escape routines exist for initializing, copying, and deleting port numbers. This is necessary because SNMP requires a unique port instance identifier. The initPortNum escape routine sets the port number to a value in the range 1-255 for this purpose. The setCopiedPortNum escape routine exists to maintain the uniqueness of the port number in cases when one port is copied to another. When a bridge port is deleted, the releasePortNum escape routine places the port number being released into a pending deletion state. This is because the port number cannot be re-allocated until the port is truly deleted in the current view. This is necessary since there is no guarantee of order when processing changes to multiple protocol ports so without the pending deletion state, the same port number could be temporarily assigned to two ports for a short period of time. The portNum is set as component critical since bridging also uses the port number as a key for indexing into its data structures. If a port is deleted then re-added under the same protocol port, CAS treats the change as a SET to the portNum attribute.
Mib	Bridge
Values	Decimal (0..255)

GROUP Vr Pp FddiETB TbProvisioned (TbProv)

Properties	Provisioned
Description	This group contains all the port specific provisionable attributes that belong to the Tb group. These attributes in part influence the working of a bridge port operating in the transparent bridge mode.
Mib	Bridge

ATTRIBUTE Vr Pp FddiETB secureOption (sos)

Access	Read and write
Description	This attribute specifies whether the port secure feature is enabled. The secure feature, if enabled causes the following things to happen: a) disallows dynamic learning, b) disallows frames to be forwarded that do not satisfy the following condition: the MAC address of the source should be found in the forwarding table and the destination MAC address of the frame should also be found in the forwarding table. In addition to this, the port the frame was received on should figure as the in port, given the destination MAC address found in the frame. c) disallows frames to be forwarded if the allowed to go port map for the destination MAC address is empty. This feature in effect allows the user to choose the hosts that can generate traffic and the hosts that can receive traffic through this bridge unit.
Mib	Bridge
Values	disabled enabled
Default	disabled

GROUP Vr Pp FddiETB StpProvisioned (StpProv)

Properties	Provisioned
Description	This group contains all port specific provisionable attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes influence the participation of the bridge port in the stp.
Mib	Bridge

ATTRIBUTE Vr Pp FddiETB adminStatus (as)

Access	Read and write
Description	This attribute defines the current administrative state for this component. ***enabled*** indicates that the component is available for operation. ***disabled*** indicates the component is unavailable for operation.
Mib	Bridge

Copyright © 2006, Nortel Nortel Confidential

Values	up down
Default	up

ATTRIBUTE Vr Pp FddiETB portStateStpControl (psstpc)

Access	Read and write
Description	This attribute specifies whether or not stp state for this bridge port is controlled by the stp. In essence it indicates the participation of this bridge port in the stp by accepting and acting on received bridge protocol data units and by sending out the same. ***on*** signifies that this bridge port's spanning tree port state is controlled by the stp. A value of ***off*** signifies that the spanning tree port state of this bridge port is unaffected by the stp. This in effect puts the bridge port out of reach of the stp decisions. Its stp state will be always ***forwarding***. Care should be taken while assigning a value of ***off*** to this attribute, as this might cause network loops. Please do not set this attribute to ***off*** unless you are absolutely sure about the effect of such an action on your network topology.
Mib	Bridge
Values	off on
Default	on

ATTRIBUTE Vr Pp FddiETB stpTypeProv (stptProv)

Access	Read and write
Description	This attribute specifies the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. If the value of the attribute *protocolSpec* in the *SpanningTreeProtocol* component is in conflict with the value of this attribute, the value of the *protocolSpec* attribute will prevail. Prevailing stp type is reflected in the value of the attribute *stpTypeOper.*
Mib	Bridge
Values	dec ieee8021
Default	ieee8021

ATTRIBUTE Vr Pp FddiETB portPriority (ppr)

Access	Read and write
Description	This attribute specifies the value for this bridge port priority which is contained in the first octet of the port identifier. Valid values are as follows: 1) 0-255 for stp type DEC and 2) 0-65535 for stp type IEEE.

ATTRIBUTE Vr Pp FddiETB preserveDomain (pds)

Access — Read and write

Criticality — Component

Description — This attribute specifies if the domain information should be preserved or embedded in the frame header. This attribute applies only to ***backbone*** ports and does not affect the ***access*** bridge ports. By setting this attribute to a value of ***on***, domain information could be preserved in frames being tunnelled across the backbone, so that this information can be deciphered at the other end of the backbone tunnel. This preserves the integrity of the domains thus preventing domain breaches while tunnelling frames across backbone network.
If the value of this attribute is set to ***off*** then domain information is not preserved in the header of the frames tunnelling through the backbone. This eliminates the overhead incurred to preserve domain information across the backbone while tunnelling frames across it.
Preserve domain is relevant only when used in conjunction with ATM MPE.

Mib — Bridge

Values — off
on

Default — No default

GROUP Vr Pp FddiETB OsiState (State)

Properties — Operational

Description — This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib — Bridge

ATTRIBUTE Vr Pp FddiETB adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — Bridge

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Vr Pp FddiETB operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — Bridge

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Vr Pp FddiETB usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib	Bridge
Values	idle active (activ) busy
Default	idle

GROUP Vr Pp FddiETB OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	Bridge

ATTRIBUTE Vr Pp FddiETB snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	Bridge
Values	up down testing
Default	up

GROUP Vr Pp FddiETB Operational (Oper)

Properties	Operational
Description	This group contains all the operational attributes belonging to the base group. These attributes in part, reflect the state of a bridge port.
Mib	Bridge

ATTRIBUTE Vr Pp FddiETB portName (pn)

Access	Read only
Description	The attribute *portName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/ETH100A* would have a name ***TBP-ETH100A.***
Mib	Bridge
Values	String (4..29, ASCII)
Default	No default

ATTRIBUTE Vr Pp FddiETB upTime (ut)

Access	Read only
Description	This attribute indicates the accumulated up time of this bridge port since the last reset occurred.
Mib	Bridge
Values	Decimal (0..4294967295)
Units	seconds
Default	0

ATTRIBUTE Vr Pp FddiETB downTime (dt)

Access	Read only
Description	This attribute indicates the accumulated down time of this bridge port since the last reset occurred.
Mib	Bridge
Values	Decimal (0..4294967295)
Units	seconds
Default	0

ATTRIBUTE Vr Pp FddiETB bridgingMode (bm)

Access	Read only
Description	This attribute indicates the mode of bridging this port can support. The transparent bridge mode is the only mode supported.
Mib	Bridge
Values	unknown tb sr srt
Default	No default

ATTRIBUTE Vr Pp FddiETB bridgePortConfig (bpc)

Access	Read only
Description	This attribute indicates the bridge port's configuration. It indicates if the bridge port is operating as an ***access*** port or as a ***backbone*** port. An ***access*** bridge port does not encapsulate a MAC frame and does not preserve domain information in the encapsulation, whereas a ***backbone*** bridge port encapsulates the MAC frame and optionally preserves domain information in the encapsulated frame.A ***backbone*** bridge port is typically used to transport frames across a high bandwidth backbone network to another bridge unit for further processing/forwarding of the frame.

Mib	Bridge
Values	access backbone
Default	No default

ATTRIBUTE Vr Pp FddiETB bridgePortType (bpt)

Access	Read only
Description	This attribute indicates the type of the bridge port that was provisioned. It takes into consideration the *bridgingMode*, *bridgePortConfig* and the media the bridge port is linked to before branding a bridge port.
Mib	Bridge
Values	ethernetBridgePort tokenRingBridgePort fddiBridgePort tokenBusBridgePort lanEmulationClientEthernet fddiEncapsulatingBridgePort vnsBridgePort frameRelayBridgePort pppBridgePort smdsBridgePort vcpBridgePort x25BridgePort atmMpeBridgePort srEncapSrBridgePort srEncapTbBridgePort sourceGateSrBridgePort sourceGateTbBridgePort srtbBridgePort tbsrBridgePort clusterSrBridgePort clusterTbBridgePort snaDlrBridgePort unknown
Default	No default

ATTRIBUTE Vr Pp FddiETB ifIndex (ifin)

Access	Read only
Description	This attribute indicates the index into the Interface Table where information about the media interface corresponding to this bridge port is maintained.
Mib	Bridge
Values	Decimal (1..65535)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Pp FddiETB mtuExceededDiscards (med)

Access	Read only
Description	This attribute counts the number of frames discarded because the size of the outbound frame exceeded the message transfer unit (mtu) allowed for the bridge port. Note that this counter only refers to the outbound frames for this bridge port. This counter wraps around its maximum value of 4294967295. This counter is influenced by the attribute *fragmentIp.* This counter is incremented when a frame larger than the mtu allowed is encountered and cannot be fragmented. If this counter is increasing steadily, it might be useful to set the value of the attribute *fragmentIp* to a value of ***on***.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

GROUP Vr Pp FddiETB TbOperational (TbOper)

Properties	Operational
Description	This group contains all the port specific operational attributes that belong to the Tb group. This group also contains all the port specific statistical attributes that belong to the Tb group. These attributes reflect the state of a bridge port operating in the transparent bridge mode
Mib	Bridge

ATTRIBUTE Vr Pp FddiETB maxInfo (mi)

Access	Read only
Description	This attribute indicates the maximum size of the information field in a transparent bridge frame. This excludes the header field.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp FddiETB badVerifyDiscards (bvd)

Access	Read only
Description	This attribute counts the number of incoming frames that were discarded because the value of the *secureOption* attribute was set to ***on*** and: a) it is not allowed to receive frames originating from the MAC address found in the source address field of the frame (source MAC address lookup in the forwarding table failed) on this bridge port, or b) for the destination MAC address found in the frame the port the frame was received on does not appear as in port in the corresponding static table entry. Permission to receive frames from a MAC address is granted via the static

Copyright © 2006, Nortel Nortel Confidential

table entries.
This attribute, *badVerifyDiscards*, is directly influenced by:
1. *secureOption* and
2. the static table entries.
This counter wraps around its maximum value of 4294967295.

Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp FddiETB staticEntryDiscards (sed)

Access	Read only
Description	This attribute counts the number of frames that were discarded because of the following three reasons: a) there was no entry for the “allowed to go” field in the static table entry, where the input port is this bridge port. b) the MAC destination address in the frame was not found in the forwarding table but the frame cannot be flooded because this bridge has not other ports in forwarding state. c) for spanning tree bpdus that are locally processed. This counter wraps around its maximum value of 4294967295. It might prove useful to check the static table entry corresponding to the bridge port in question, if this counter consistently displays a high value. Ideally this counter should be as low as possible.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp FddiETB dynamicEntryDiscards (dend)

Access	Read only
Description	This attribute counts the number of incoming frames that: a) were discarded because of the fact that the bridge port, the frame is to go out of matches the bridge port it came in from, or b) if the stp port state of the out port is not ***forwarding***. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp FddiETB learningDiscards (ld)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of frames that were discarded while this bridge port was in a state other than the ***forwarding*** state. While in ***learning*** state the frame is discarded after the information from its header is learnt. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp FddiETB inDiscards (id)

Access	Read only
Description	This attribute counts the number of frames that were received by this bridge port and were discarded by the forwarding process. This includes frames that could have been discarded due to filtering. A rapidly increasing value for this attribute could indicate a shortage of resource in terms of memory needed to process the incoming frames. More memory can be provisioned through the *VirtualRouter*'s memory manager.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp FddiETB inFrames (if)

Access	Read only
Description	This attribute counts the number of frames that have been received by this port from its segment. Note that a frame received on this bridge port is counted if and only if it can be processed by the bridge logic contained in this bridge unit. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp FddiETB outFrames (of)

Access	Read only
Description	This attribute counts the number of frames that have been transmitted out this bridge port. This also includes management frames.This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

GROUP Vr Pp FddiETB StpOperational (StpOper)

Properties	Operational
Description	This group contains all port specific operational attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes reflect the state of the bridge port's participation in the stp.
Mib	Bridge

ATTRIBUTE Vr Pp FddiETB stpPortState (sps)

Access	Read only
Description	This attribute indicates the stp state of the bridge port.
Mib	Bridge
Values	disabled blocking listening learning forwarding broken
Default	disabled

ATTRIBUTE Vr Pp FddiETB stpTypeOper (stptOper)

Access	Read only
Description	This attribute indicates the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp.
Mib	Bridge
Values	none dec ieee8021
Default	ieee8021

ATTRIBUTE Vr Pp FddiETB designatedCost (dc)

Access	Read only
Description	This attribute indicates the path cost of the designated port of the lan segment the designated port is connected to.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Pp FddiETB pathCostOper (pco)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the contribution of this port to all the paths to the root bridge that include this port. This attribute *pathCostOper* will track the value of the attribute *pathCost* when the value of the attribute *pathCostMethod* is set of ***off***.
Mib	Bridge
Values	Decimal (1..65535)
Default	No default

ATTRIBUTE Vr Pp FddiETB designatedBridge (db)

Access	Read only
Description	This attribute indicates the identifier of the bridge that this port considers to be the designated bridge.
Mib	Bridge
Values	String (8, Dashed Hex)
Default	No default

ATTRIBUTE Vr Pp FddiETB designatedPort (dp)

Access	Read only
Description	This attribute indicates the port identifier of the port on the designated bridge attached to the same LAN segment as this port is attached to.
Mib	Bridge
Values	Hex (H.0..H.ffff)
Default	No default

ATTRIBUTE Vr Pp FddiETB forwardTransitions (ft)

Access	Read only
Description	This attribute counts the number of times this bridge port transitioned from the ***learning*** state to the ***forwarding*** state. This counter wraps around its maximum value of 4294967295. A rapidly increasing value might be indicative of an unstable spanning tree topology.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp FddiETB blockingDiscards (bd)

Access	Read only

GROUP Vr Pp Tbp StpOperational (StpOper)
GROUP Vr Pp Tbp Statistics (Stats)

Scope: Application

Description: *Vr/<string> Pp/<string> TransparentBridgePort*
This component represents a transparent bridge port. It contains all the attribute groups (provisionable and operational) that are required for the operation of such a port. Transparent bridge ports participate in the transparent bridging spanning tree protocol. They also have associated with them a domain number. Domains are logical partitions of an extended network and each partition is completely segregated in terms of traffic. Each domain has an identifier that identifies it uniquely, called the domain number.

GROUP Vr Pp Tbp Provisioned (Prov)

Properties: Provisioned

Description: This group contains all the provisionable attributes that belong to this group. This group of attributes is applicable to all types of bridge ports and represent the common factor between them. These attributes influence the working of a bridge port.

Mib: Bridge

ATTRIBUTE Vr Pp Tbp fragmentIp (fIp)

Access: Read and write

Description: This attribute specifies if outbound frames carrying IP datagrams should be fragmented to conform to message transfer unit (*mtu*) sizes dictated by the media.

Mib: Bridge

Values:
off
on

Default: off

ATTRIBUTE Vr Pp Tbp portNum (pNum)

Copyright © 2006, Nortel
Nortel Confidential

Access	Read only
Criticality	Component
Description	This attribute indicates the unique number assigned to the bridge port. It is used for SNMP management of this bridge port and in spanning tree as an identifier for this bridge port. Notes: Escape routines exist for initializing, copying, and deleting port numbers. This is necessary because SNMP requires a unique port instance identifier. The initPortNum escape routine sets the port number to a value in the range 1-255 for this purpose. The setCopiedPortNum escape routine exists to maintain the uniqueness of the port number in cases when one port is copied to another. When a bridge port is deleted, the releasePortNum escape routine places the port number being released into a pending deletion state. This is because the port number cannot be re-allocated until the port is truly deleted in the current view. This is necessary since there is no guarantee of order when processing changes to multiple protocol ports so without the pending deletion state, the same port number could be temporarily assigned to two ports for a short period of time. The portNum is set as component critical since bridging also uses the port number as a key for indexing into its data structures. If a port is deleted then re-added under the same protocol port, CAS treats the change as a SET to the portNum attribute.
Mib	Bridge
Values	Decimal (0..255)
Default	0

GROUP Vr Pp Tbp TbProvisioned (TbProv)

Properties	Provisioned
Description	This group contains all the port specific provisionable attributes that belong to the Tb group. These attributes in part influence the working of a bridge port operating in the transparent bridge mode.
Mib	Bridge

ATTRIBUTE Vr Pp Tbp secureOption (sos)

Access	Read and write
Description	This attribute specifies whether the port secure feature is enabled. The secure feature, if enabled causes the following things to happen: a) disallows dynamic learning, b) disallows frames to be forwarded that do not satisfy the following condition: the MAC address of the source should be found in the forwarding table and the destination MAC address of the frame should also be found in the forwarding table. In addition to this, the port the frame was received on should figure as the in port, given the destination MAC

Copyright © 2006, Nortel Nortel Confidential

address found in the frame.
c) disallows frames to be forwarded if the allowed to go port map for the destination MAC address is empty.
This feature in effect allows the user to choose the hosts that can generate traffic and the hosts that can receive traffic through this bridge unit.

Mib	Bridge
Values	disabled enabled
Default	disabled

GROUP Vr Pp Tbp StpProvisioned (StpProv)

Properties	Provisioned
Description	This group contains all port specific provisionable attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes influence the participation of the bridge port in the stp.
Mib	Bridge

ATTRIBUTE Vr Pp Tbp adminStatus (as)

Access	Read and write
Description	This attribute defines the current administrative state for this component. ***enabled*** indicates that the component is available for operation. ***disabled*** indicates the component is unavailable for operation.
Mib	Bridge
Values	up down
Default	up

ATTRIBUTE Vr Pp Tbp portStateStpControl (psstpc)

Access	Read and write
Description	This attribute specifies whether or not stp state for this bridge port is controlled by the stp. In essence it indicates the participation of this bridge port in the stp by accepting and acting on received bridge protocol data units and by sending out the same. ***on*** signifies that this bridge port's spanning tree port state is controlled by the stp. A value of ***off*** signifies that the spanning tree port state of this bridge port is unaffected by the stp. This in effect puts the bridge port out of reach of the stp decisions. Its stp state will be always ***forwarding***. Care should be taken while assigning a value of ***off*** to this attribute, as this might cause network loops. Please do not set this attribute to ***off*** unless you are absolutely sure about the effect of such an action on your network topology.

Copyright © 2006, Nortel Nortel Confidential

Mib	Bridge
Values	off on
Default	on

ATTRIBUTE Vr Pp Tbp stpTypeProv (stptProv)

Access	Read and write
Description	This attribute specifies the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. If the value of the attribute *protocolSpec* in the *SpanningTreeProtocol* component is in conflict with the value of this attribute, the value of the *protocolSpec* attribute will prevail. Prevailing stp type is reflected in the value of the attribute *stpTypeOper.*
Mib	Bridge
Values	dec ieee8021
Default	ieee8021

ATTRIBUTE Vr Pp Tbp portPriority (ppr)

Access	Read and write
Description	This attribute specifies the value for this bridge port priority which is contained in the first octet of the port identifier. Valid values are as follows: 1) 0-255 for stp type DEC and 2) 0-65535 for stp type IEEE.
Mib	Bridge
Values	Decimal (0..65535)
Default	128

ATTRIBUTE Vr Pp Tbp pathCost (pc)

Access	Read and write
Description	This attribute specifies the contribution of this port to all the paths to the root bridge that include this port. Please note that the value of the attribute *pathCost* is applied only when the value of the attribute *pathCostMethod* is set to ***on*** and is ignored if otherwise.
Mib	Bridge
Values	Decimal (1..65535)
Default	10

ATTRIBUTE Vr Pp Tbp pathCostMethod (pcm)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the method used by the bridging logic to calculate the path cost to the bridge considered to be the root bridge in the spanning tree topology. This attribute should be set to ***off*** before attempting to provision a value for *pathCost.*
Mib	Bridge
Values	off dec ieee8021
Default	ieee8021

GROUP Vr Pp Tbp DomainInfoProvisioned (DIProv)

Properties	Provisioned
Description	This group contains all the provisionable, domain specific attributes for a non-encapsulating bridge port.
Mib	Bridge

ATTRIBUTE Vr Pp Tbp domainNum (dn)

Access	Read and write
Description	This attribute specifies the domain number associated with this bridge port. Domain numbers are used for confining frames to a domain. Domain based filtering provides a complete segregation of traffic based on domain number associated with frames. There can exist only sixteen domains when a spanning tree is desired specific to each domain. When there is only a single spanning tree spanning all the domains the maximum number of domains possible are 4294967293. This attribute is of no relevance when associated with backbone bridge port. Its value is ignored in such a situation.
Mib	Bridge
Values	Decimal (1..4294967293)
Default	1

ATTRIBUTE Vr Pp Tbp preserveDomain (pds)

Access	Read and write
Criticality	Component
Description	This attribute specifies if the domain information should be preserved or embedded in the frame header. This attribute applies only to ***backbone*** ports and does not affect the ***access*** bridge ports. By setting this attribute to a value of ***on***, domain information could be preserved in frames being tunnelled across the backbone, so that this information can be deciphered at the other end of the backbone tunnel. This preserves the integrity of the domains thus preventing domain breaches while tunnelling frames across backbone network.

Copyright © 2006, Nortel Nortel Confidential

If the value of this attribute is set to ***off*** then domain information is not preserved in the header of the frames tunnelling through the backbone. This eliminates the overhead incurred to preserve domain information across the backbone while tunnelling frames across it.
Preserve domain is relevant only when used in conjunction with ATM MPE.

Mib	Bridge
Values	off on
Default	No default

GROUP Vr Pp Tbp OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Bridge

ATTRIBUTE Vr Pp Tbp adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Bridge
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Vr Pp Tbp operationalState (osiOper)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Bridge
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Vr Pp Tbp usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Bridge
Values	idle active (activ) busy
Default	idle

GROUP Vr Pp Tbp OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	Bridge

ATTRIBUTE Vr Pp Tbp snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates

Copyright © 2006, Nortel Nortel Confidential

	the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	Bridge
Values	up down testing
Default	up

GROUP Vr Pp Tbp Operational (Oper)

Properties	Operational
Description	This group contains all the operational attributes belonging to the base group. These attributes in part, reflect the state of a bridge port.
Mib	Bridge

ATTRIBUTE Vr Pp Tbp portName (pn)

Access	Read only
Description	The attribute *portName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/ETH100A* would have a name ***TBP-ETH100A.***
Mib	Bridge
Values	String (4..29, ASCII)
Default	No default

ATTRIBUTE Vr Pp Tbp upTime (ut)

Access	Read only
Description	This attribute indicates the accumulated up time of this bridge port since the last reset occurred.
Mib	Bridge
Values	Decimal (0..4294967295)
Units	seconds
Default	0

ATTRIBUTE Vr Pp Tbp downTime (dt)

Access	Read only
Description	This attribute indicates the accumulated down time of this bridge port since the last reset occurred.
Mib	Bridge

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Units	seconds
Default	0

ATTRIBUTE Vr Pp Tbp bridgingMode (bm)

Access	Read only
Description	This attribute indicates the mode of bridging this port can support. The transparent bridge mode is the only mode supported.
Mib	Bridge
Values	unknown tb sr srt
Default	No default

ATTRIBUTE Vr Pp Tbp bridgePortConfig (bpc)

Access	Read only
Description	This attribute indicates the bridge port's configuration. It indicates if the bridge port is operating as an ***access*** port or as a ***backbone*** port. An ***access*** bridge port does not encapsulate a MAC frame and does not preserve domain information in the encapsulation, whereas a ***backbone*** bridge port encapsulates the MAC frame and optionally preserves domain information in the encapsulated frame.A ***backbone*** bridge port is typically used to transport frames across a high bandwidth backbone network to another bridge unit for further processing/forwarding of the frame.
Mib	Bridge
Values	access backbone
Default	No default

ATTRIBUTE Vr Pp Tbp bridgePortType (bpt)

Access	Read only
Description	This attribute indicates the type of the bridge port that was provisioned. It takes into consideration the *bridgingMode*, *bridgePortConfig* and the media the bridge port is linked to before branding a bridge port.
Mib	Bridge
Values	ethernetBridgePort tokenRingBridgePort fddiBridgePort tokenBusBridgePort lanEmulationClientEthernet

unknown

Default — No default

ATTRIBUTE Vr Pp Tbp ifIndex (ifin)

Access — Read only

Description — This attribute indicates the index into the Interface Table where information about the media interface corresponding to this bridge port is maintained.

Mib — Bridge

Values — Decimal (1..65535)

Default — No default

ATTRIBUTE Vr Pp Tbp mtuExceededDiscards (med)

Access — Read only

Description — This attribute counts the number of frames discarded because the size of the outbound frame exceeded the message transfer unit (mtu) allowed for the bridge port. Note that this counter only refers to the outbound frames for this bridge port. This counter wraps around its maximum value of 4294967295.
This counter is influenced by the attribute *fragmentIp.* This counter is incremented when a frame larger than the mtu allowed is encountered and cannot be fragmented. If this counter is increasing steadily, it might be useful to set the value of the attribute *fragmentIp* to a value of ***on***.

Mib — Bridge

Values — Decimal (0..4294967295)

Default — 0

GROUP Vr Pp Tbp TbOperational (TbOper)

Properties	Operational
Description	This group contains all the port specific operational attributes that belong to the Tb group. This group also contains all the port specific statistical attributes that belong to the Tb group. These attributes reflect the state of a bridge port operating in the transparent bridge mode
Mib	Bridge

ATTRIBUTE Vr Pp Tbp maxInfo (mi)

Access	Read only
Description	This attribute indicates the maximum size of the information field in a transparent bridge frame. This excludes the header field.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbp badVerifyDiscards (bvd)

Access	Read only
Description	This attribute counts the number of incoming frames that were discarded because the value of the *secureOption* attribute was set to ***on*** and: a) it is not allowed to receive frames originating from the MAC address found in the source address field of the frame (source MAC address lookup in the forwarding table failed) on this bridge port, or b) for the destination MAC address found in the frame the port the frame was received on does not appear as in port in the corresponding static table entry. Permission to receive frames from a MAC address is granted via the static table entries. This attribute, *badVerifyDiscards*, is directly influenced by: 1. *secureOption* and 2. the static table entries. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbp staticEntryDiscards (sed)

Access	Read only
Description	This attribute counts the number of frames that were discarded because of the following three reasons: a) there was no entry for the “allowed to go” field in the static table entry,

Copyright © 2006, Nortel Nortel Confidential

where the input port is this bridge port.
b) the MAC destination address in the frame was not found in the forwarding table but the frame cannot be flooded because this bridge has not other ports in forwarding state.
c) for spanning tree bpdus that are locally processed.
This counter wraps around its maximum value of 4294967295.
It might prove useful to check the static table entry corresponding to the bridge port in question, if this counter consistently displays a high value. Ideally this counter should be as low as possible.

Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbp dynamicEntryDiscards (dend)

Access	Read only
Description	This attribute counts the number of incoming frames that: a) were discarded because of the fact that the bridge port, the frame is to go out of matches the bridge port it came in from, or b) if the stp port state of the out port is not ***forwarding***. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbp learningDiscards (ld)

Access	Read only
Description	This attribute counts the number of frames that were discarded while this bridge port was in a state other than the ***forwarding*** state. While in ***learning*** state the frame is discarded after the information from its header is learnt. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbp inDiscards (id)

Access	Read only
Description	This attribute counts the number of frames that were received by this bridge port and were discarded by the forwarding process. This includes frames that could have been discarded due to filtering. A rapidly increasing value for this attribute could indicate a shortage of resource in terms of memory needed to process the incoming frames. More memory can be provisioned through the *VirtualRouter*'s memory manager.

Copyright © 2006, Nortel Nortel Confidential

Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbp inFrames (if)

Access	Read only
Description	This attribute counts the number of frames that have been received by this port from its segment. Note that a frame received on this bridge port is counted if and only if it can be processed by the bridge logic contained in this bridge unit. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbp outFrames (of)

Access	Read only
Description	This attribute counts the number of frames that have been transmitted out this bridge port. This also includes management frames.This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

GROUP Vr Pp Tbp StpOperational (StpOper)

Properties	Operational
Description	This group contains all port specific operational attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes reflect the state of the bridge port's participation in the stp.
Mib	Bridge

ATTRIBUTE Vr Pp Tbp stpPortState (sps)

Access	Read only
Description	This attribute indicates the stp state of the bridge port.
Mib	Bridge
Values	disabled blocking listening

Copyright © 2006, Nortel Nortel Confidential

	learning forwarding broken
Default	disabled

ATTRIBUTE Vr Pp Tbp stpTypeOper (stptOper)

Access	Read only
Description	This attribute indicates the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp.
Mib	Bridge
Values	none dec ieee8021
Default	ieee8021

ATTRIBUTE Vr Pp Tbp designatedCost (dc)

Access	Read only
Description	This attribute indicates the path cost of the designated port of the lan segment the designated port is connected to.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Pp Tbp pathCostOper (pco)

Access	Read only
Description	This attribute indicates the contribution of this port to all the paths to the root bridge that include this port. This attribute *pathCostOper* will track the value of the attribute *pathCost* when the value of the attribute *pathCostMethod* is set of ***off***.
Mib	Bridge
Values	Decimal (1..65535)
Default	No default

ATTRIBUTE Vr Pp Tbp designatedBridge (db)

Access	Read only
Description	This attribute indicates the identifier of the bridge that this port considers to be the designated bridge.
Mib	Bridge
Values	String (8, Dashed Hex)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Vr Pp Tbp designatedPort (dp)

Access	Read only
Description	This attribute indicates the port identifier of the port on the designated bridge attached to the same LAN segment as this port is attached to.
Mib	Bridge
Values	Hex (H.0..H.ffff)
Default	No default

ATTRIBUTE Vr Pp Tbp forwardTransitions (ft)

Access	Read only
Description	This attribute counts the number of times this bridge port transitioned from the ***learning*** state to the ***forwarding*** state. This counter wraps around its maximum value of 4294967295. A rapidly increasing value might be indicative of an unstable spanning tree topology.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbp blockingDiscards (bd)

Access	Read only
Description	This attribute counts the number of the incoming frames that were discarded because the bridge port was in the ***blocking*** state. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbp designatedRoot (dr)

Access	Read only
Description	This attribute indicates the bridge identifier of the bridge recorded as the root bridge in the configuration BPDUs sent out by the designated bridge on the segment this port is attached to.
Mib	Bridge
Values	String (8, Dashed Hex)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

GROUP Vr Pp Tbp Statistics (Stats)

Properties	Operational
Description	This group contains all the statistical attributes applicable to all types of bridge ports and represents the common factor between them. These attributes in part reflect the state of the bridge port.
Mib	Bridge

ATTRIBUTE Vr Pp Tbp badAbstractDiscards (bad)

Access	Read only
Description	This attribute counts the number of frames that were discarded because the data abstracted from the frames coming in through this bridge port did not conform to the format expected by the bridge logic.This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbp tinygramFramesIn (tfi)

Access	Read only
Description	This attribute counts the number of frames received on this bridge port that used the tinygram compression scheme.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbp tinygramFramesOut (tfo)

Access	Read only
Description	This attribute counts the number of frames transmitted out this bridge port that used the tinygram compression scheme.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbp inFilterDiscards (ifd)

Access	Read only
Description	This attribute counts the number of frames discarded due to domain based filtering at the in filter point. This counter wraps around its maximum value of 4294967295.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Pp Tbp outFilterDiscards (ofd)

Access	Read only
Description	This attribute counts the number of frames discarded due to domain based filtering at the out filter point. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

COMPONENT Vr Pp Tbp NetSentry (Ns)

Groups	GROUP Vr Pp Tbp Ns Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Pp/<string> TransparentBridgePort NetSentry* This component represents the *Ns* functionality that can be applied to a bridge port. It contains all the attribute groups (provisionable) that are necessary for the application of Ns functionality to a bridge port. In essence, it allows for the definition of filters, at the incoming and outgoing points, specific to the interface represented by this bridge port.
Mib	Bridge
Common Verbs	Help List Display Add DELete

GROUP Vr Pp Tbp Ns Provisioned (Prov)

Properties	Provisioned
Description	This group houses all the port specific provisionable attributes associated with Ns. These attributes influence the application of filters to incoming and outgoing frames.
Mib	Bridge

ATTRIBUTE Vr Pp Tbp Ns incomingFilter (if)

Access	Read and write
Description	This attribute specifies the name of the filter to be applied at the incoming filter point.

Copyright © 2006, Nortel Nortel Confidential

Mib	Bridge
Values	String (0..32, ASCII)
Default	No default

ATTRIBUTE Vr Pp Tbp Ns outgoingFilter (of)

Access	Read and write
Description	This attribute specifies the name of the filter to be applied at the out going filter point.
Mib	Bridge
Values	String (0..32, ASCII)
Default	No default

GROUP Vr Pp IpPort Provisioned (Prov)

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains provisionable attributes for IP ports.
Mib	Ip

ATTRIBUTE Vr Pp IpPort maxTxUnit (mtu)

Access	Read and write
Description	This attribute specifies the IP MTU (Maximum Transmission Unit) supported by this *IpPort*. The specified MTU must be within the valid range for the *IpPort* media type.
Mib	Ip
Values	Decimal (0..0; 80..18944)
Default	0

ATTRIBUTE Vr Pp IpPort arpStatus

Access	Read and write
Description	This attribute specifies whether ARP is enabled or disabled on this *IpPort*. If ***auto*** is specified, an appropriate value will be selected based on the *IpPort* media type.
Mib	Ip
Values	enabled disabled auto
Default	auto

ATTRIBUTE Vr Pp IpPort proxyArpStatus

Access	Read and write
Description	This attribute specifies whether Proxy ARP is enabled or disabled for this *IpPort*.
Mib	Ip
Values	enabled disabled
Default	disabled

ATTRIBUTE Vr Pp IpPort arpNoLearn

Access	Read and write
Description	This attribute specifies whether or not dynamic host entries will be installed in the ARP table when ARP packets are received on this *IpPort*.
Mib	Ip
Values	enabled disabled

Copyright © 2006, Nortel Nortel Confidential

Default	disabled

ATTRIBUTE Vr Pp IpPort sendRedirect

Access	Read and write
Description	This attribute specifies whether or not ICMP host redirects will be sent out this *IpPort*.
Mib	Ip
Values	enabled disabled
Default	enabled

ATTRIBUTE Vr Pp IpPort multicastStatus

Access	Read and write
Description	This attribute specifies whether or not IP multicast packets can be sent out this *IpPort*. If ***auto*** is specified, an appropriate value will be selected based on the *IpPort* media type.
Mib	Ip
Values	enabled disabled auto
Default	auto

ATTRIBUTE Vr Pp IpPort relayAddress

Access	Read and write
Description	This attribute specifies a relay broadcast address for this *IpPort*. Each packet, received on this *IpPort*, meeting the relay broadcast criteria will be forwarded to the specified relay broadcast address. An relay address of all zero's indicates no relay broadcast address.
Mib	Ip
Values	IP address
Default	0.0.0.0

ATTRIBUTE Vr Pp IpPort relayBroadcast

Access	Read and write
Description	This attribute specifies how packets, received on other *IpPort*s, meeting the relay broadcast criteria, will be forwarded out this *IpPort*. The three options are described as follows: ***enabled***: packets will be forwarded out this *IpPort*. ***disabled***: packets will not be forwarded out this *IpPort*. ***auto***: packets will be forwarded out this *IpPort* only when the bridge state is forwarding.

Copyright © 2006, Nortel Nortel Confidential

Mib	Ip
Values	enabled disabled auto
Default	disabled

ATTRIBUTE Vr Pp IpPort linkModel

Access	Read and write
Criticality	Component
Description	This attribute specifies the link model to use when the media type for this *IpPort* is ***PPP*** (Point to Point Protocol). A value of ***localAreaNetwork*** causes IP to treat this *IpPort* like a LAN. A value of ***pointToPoint*** causes IP to treat this *IpPort* like two directly connected IP hosts.
Mib	Ip
Values	localAreaNetwork (lan) pointToPoint (ptop)
Default	localAreaNetwork

ATTRIBUTE Vr Pp IpPort lanModel

Access	Read and write
Criticality	Component
Description	This attribute specifies the lan model to use for this *IpPort*.
Mib	Ip
Values	localAreaNetwork (lan) nonBroadcastMultipleAccess (nbma)
Default	localAreaNetwork

ATTRIBUTE Vr Pp IpPort encap

Access	Read and write
Description	This attribute specifies the encapsulation type to be used when sending packets out this *IpPort*. If ***auto*** is specified, an appropriate value is selected based on the *IpPort* media type. The values ***ieee8023*** and ***ethernet*** can only be specified if the media type is ethernet. Otherwise, ***auto*** must be specified. For ethernet media type, the default encapsulation is ***ethernet***.
Mib	Ip
Values	ieee8023 ethernet auto

Copyright © 2006, Nortel Nortel Confidential

Default	auto

ATTRIBUTE Vr Pp IpPort icmpMaskReply

Access	Read and write
Description	This attribute specifies whether or not replies will be generated in response to ICMP Address Mask Requests received on this *IpPort.*
Mib	Ip
Values	enabled disabled
Default	enabled

ATTRIBUTE Vr Pp IpPort directedBroadcast

Access	Read and write
Description	This attribute specifies whether or not directed broadcast to physical broadcast translation is enabled for incoming traffic on this *IpPort.* The IP router requirement (RFC1812) says this translation should be ***enabled***; however, in some network environments, setting this attribute to ***disabled*** may prevent operational problem such as broadcast storms. Note that in some configuration, setting this attribute to ***disabled*** may cause Bootp to fail.
Mib	Ip
Values	enabled disabled
Default	enabled

ATTRIBUTE Vr Pp IpPort allowMcastMacDest (ammd)

Access	Read and write
Description	This attribute specifies whether a multicast destination MAC address is valid on this *IpPort* or not. Setting this attribute to ***enabled*** results in non-standard behavior and is intended for applications such as transparent server backup. Multicast destination MAC address is only supported on LAN media.
Mib	Ip
Values	enabled disabled
Default	disabled

ATTRIBUTE Vr Pp IpPort cosPolicyAssignment (policy)

Access	Read and write
Description	This attribute specifies the *CosPolicyGroup* the *IpPort* is using.

Copyright © 2006, Nortel Nortel Confidential

If this attribute is not set, then the *cosPolicyAssignment* attribute of the *Ip* specifies the *CosPolicyGroup* in use.

The assigned *CosPolicyGroup* controls the forwarding behavior of IP packets recieved and transmitted at the *IpPort*. See the description of *Vr Ip CosPolicyGroup* for more information.

If the *VirtualRouter* has a *DifferentiatedServicesDomain* subcomponent, then this attribute cannot be set.

The assigned *CosPolicyGroup* must be a subcomponent of the same *VirtualRouter*.

Mib	Ip
Values	Link (Service, linkToPolicyUsers)
Default	No default

ATTRIBUTE Vr Pp IpPort filterAssignment (filtAss)

Access	Read and write
Description	This attribute specifies the *Filter* the *IpPort* is using. If this attribute is not set, then the *filterAssignment* attribute of the *Ip* specifies the *Filter* in use. This attribute cannot be set if the *linkToMedia* attribute of the parent *ProtocolPort* is linked to *Vr Ip Tunnel Sep* or *Vr Ip Tunnel Msep*. The assigned *Filter* must be a subcomponent of the same *Virtual Router*.
Mib	Ip
Values	Link (Service, linkToFilterUsers)
Default	No default

ATTRIBUTE Vr Pp IpPort ipCos

Access	Read and write
Description	This attribute specifies the IP connection class value of the link layer connection used by the *IpPort* if the media linked to the *ProtocolPort* is not *AtmMpe*, *FrDte* or *IpDlciGroup*. If the *VirtualRouter* does not have a *DifferentiatedServicesDomain* subcomponent, then *ipCos* specifies the initial Class of Service (CoS) value assigned to an IP packet received at the *IpPort* if the media linked to the *ProtocolPort* is not *AtmMpe*, *FrDte* or *IpDlciGroup*. See the description of *Vr Ip CosPolicyGroup* for more information.

Copyright © 2006, Nortel Nortel Confidential

Mib	Ip
Values	Decimal (0..3)
Default	0

ATTRIBUTE Vr Pp IpPort mcastDomain (mDomain)

Access	Read and write
Criticality	Component
Description	This attribute specifies the multicast domain index which all traffic coming in from this *IpPort* use. The numerical value of this attribute selects *Vr/<string> Ip Mcast Domain/n*.
Mib	Ip
Values	Decimal (0..3)
Default	0

ATTRIBUTE Vr Pp IpPort mcastPolicyAssignment (mPolicy)

Access	Read and write
Description	This attribute specifies the policyGroup component that this IpPort component is using.
Mib	Ip
Values	Link (Service, linkToPolicyUser)
Default	No default

GROUP Vr Pp IpPort SresProvisioned (SresProv)

Properties	Provisioned
Description	This group contains the provisioned attributes for *SourceRouteEndStation* support.
Mib	Ip

ATTRIBUTE Vr Pp IpPort sourceRouteEndStationSupport (sresSupport)

Access	Read and write
Description	This attribute is used to ***enable*** or ***disable*** support for *SourceRouteEndStation (Sres)*. If set to ***enable***, *Sres* will be supported on this protocol on this *ProtocolPort (Pp)*. If set to ***disable***, it will not be supported. An *Sres* component must be provisioned under the VirtualRouter if this attribute is set to ***enable***. If this attribute is set to ***enable*** and this *Pp* has its *linkToMedia* attribute set, it must be linked to a *LanApplication* (*La*) that has its *Framer interfaceName* linked to a *Fddi* or *TokenRing* component.
Mib	Ip

Copyright © 2006, Nortel Nortel Confidential

Values	enable disable
Default	disable

GROUP Vr Pp IpPort AdministrativeControl (AdminControl)

Properties	Provisioned
Description	This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component.
Mib	Ip

ATTRIBUTE Vr Pp IpPort snmpAdminStatus

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed.
Mib	Ip
Values	up down testing
Default	up

GROUP Vr Pp IpPort Operational (Oper)

Properties	Operational
Description	This group contains operational attributes for an *IpPort*.
Mib	Ip

ATTRIBUTE Vr Pp IpPort mediaType

Access	Read only
Description	This attribute indicates the media type of this *IpPort*.

Default	invalid

ATTRIBUTE Vr Pp IpPort operMtu

Access	Read only
Description	This attribute indicates the current operational IP MTU for this *IpPort*. Note that this value may be different than the provisioned *maxTxUnit*.
Mib	Ip
Values	Decimal (0..0; 80..18944)
Default	0

ATTRIBUTE Vr Pp IpPort operArpStatus

Access	Read only
Description	This attribute indicates the current operational ARP status. If the provisioned *arpStatus* is set to ***auto***, then the IP application automatically determines the *operArpStatus* based on the *IpPort* media type.
Mib	Ip
Values	enabled disabled
Default	disabled

ATTRIBUTE Vr Pp IpPort operMulticastStatus

Access	Read only
Description	This attribute indicates the current operational Multicast status. If the provisioned *multicastStatus* is set to ***auto***, then the IP application automatically determines the *operMulticastStatus* based on the *IpPort* media type.
Mib	Ip
Values	enabled disabled
Default	disabled

ATTRIBUTE Vr Pp IpPort operEncap

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the current operational encapsulation type. If the provisioned *encap* is set to auto, then the IP application automatically determines the *operEncap* based on the *IpPort* media type.
Mib	Ip
Values	ieee8023 ethernet notApplicable
Default	notApplicable

ATTRIBUTE Vr Pp IpPort operCosPolicyAssignment

Access	Read only
Description	This attribute indicates the *CosPolicyGroup* the *IpPort* is using.
Mib	Ip
Values	The name of the component
Default	No default

ATTRIBUTE Vr Pp IpPort operDiffServAssignment

Access	Read only
Description	This attribute indicates the *DifferentiatedServices* interface configuration the *IpPort* is using. **This attribute is OBSOLETE because the d*iffServAssignment* attribute is obsolete.**
Mib	Ip
Values	The name of the component
Default	No default

ATTRIBUTE Vr Pp IpPort operFilterAssignment

Access	Read only
Description	This attribute indicates the *Filter* the *IpPort* is using.
Mib	Ip
Values	The name of the component
Default	No default

GROUP Vr Pp IpPort RelayBcOperational (RelayBcOper)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains operational attributes for an *Interface*'s or *IpPort*'s RelayBc counters.
Mib	Ip

ATTRIBUTE Vr Pp IpPort relayAddressCount

Access	Read only
Description	This attribute indicates the number of frames received on this *Interface* or *IpPort* which were forwarded to the provisioned *relayAddress* for this port. This counter wraps to zero when it reaches it's maximum.
Mib	Ip
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp IpPort relayBcCount

Access	Read only
Description	This attribute indicates the number of frames received on this port which were forwarded to the *broadcastAddress* on other *IpPorts* or *Interfaces*. This counter is incremented once for every frame received on this port regardless of how many other ports it was sent on. This counter wraps to zero when it reaches it's maximum.
Mib	Ip
Values	Decimal (0..4294967295)
Default	0

GROUP Vr Pp IpPort OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Ip

ATTRIBUTE Vr Pp IpPort adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value

Copyright © 2006, Nortel Nortel Confidential

is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — Ip

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Vr Pp IpPort operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — Ip

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Vr Pp IpPort usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — Ip

Values	idle active (activ) busy
Default	idle

GROUP Vr Pp IpPort OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	Ip

ATTRIBUTE Vr Pp IpPort snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	Ip
Values	up down testing
Default	up

COMPONENT Vr Pp IpPort IngressServices (IS)

Groups	GROUP Vr Pp IpPort IS IngressServicesLinks (IsLinks) GROUP Vr Pp IpPort IS ServiceSpecification (Sp) GROUP Vr Pp IpPort IS InterfaceServices (IntServ)
Scope	Application
Description	*Vr/<string> Pp/<string> Ip IngressServices* *Rtr/<string> Vrf/<string> If/<x.x.x.x> IngressServices* This component and its subcomponents represent various traffic management services applied to IP traffic entering an interface.

GROUP Vr Pp IpPort IS IngressServicesLinks (IsLinks)

Properties	Provisioned
Description	This group contains links to various components for traffic management services applied to IP traffic entering an interface.
Mib	Ip

ATTRIBUTE Vr Pp IpPort IS linkToDiffServProfile (dsLink)

Access	Read and write
Description	This attribute specifies the *DiffServProfile* component applied to IP traffic entering an interface.
Mib	Ip
Values	Link (Service, linkToDiffServUsers)
Default	No default

ATTRIBUTE Vr Pp IpPort IS linkToPolicerProfile (policerLink)

Access	Read and write
Description	This attribute specifies the *PolicerProfile* component applied to IP traffic entering an interface.
Mib	Ip
Values	Link (Service, linkToPolicerUsers)
Default	No default

GROUP Vr Pp IpPort IS ServiceSpecification (Sp)

Properties	Provisioned
Description	This group contains provisionable attributes of the *IngressServices* component.
Mib	Ip

ATTRIBUTE Vr Pp IpPort IS discardPriorityMode (dpMode)

Access	Read and write
Description	This attribute specifies how drop precedence is assigned to IP traffic entering an interface. If this attribute is set to ***mapPhbToDp*** then drop precedence is assigned to IP traffic entering the interface as explained in the description of the *DifferentiatedServicesDomain* component. If this attribute is set to ***mapLayer2ToDp*** then the drop precedence assigned to IP traffic entering the interface is determined by the ingress Layer 2 media. For an IP packet arriving on *AtmMpe* the cell loss priority (CLP) bit in the ingress cell header is mapped to drop precedence value

Copyright © 2006, Nortel Nortel Confidential

according to ATM traffic management provisioning. For an IP packet arriving on *FrDte or IpDlciGroup* the discard eligible (DE) bit in the ingress frame header is mapped to drop precedence value according to Frame Relay traffic management provisioning. For IP traffic arriving on other media ***high*** drop precedence is assigned.

The *Rtr Interface IngressServices dpMode* and *Rtr Vrf Interface IngressServices dpMode* attributes must be set to ***mapPhbToDp***.

The *IpPort IngressServices dpMode* attribute must be set to ***mapPhbToDp*** if the *linkToPolicerProfile* attribute is set or if the *IpPort* is associated with IP tunnel media.

The *IpPort IngressServices dpMode* attribute has no effect if either of the following two conditions is true:
1) the *VirtualRouter* component does not have *DifferentiatedServicesDomain* subcomponent (see the description of the *CosPolicyGroup* component for more information about drop precedence in this case);
2) the IP packet leaves an interface where the *IpPort EgressServices linkToPolicerProfile* attribute is set (see the description of the *PolicerProfile Meter PolicedPhb outOfProfile* attribute for more information about drop precedence in this case).

Mib — Ip

Values — mapPhbToDp
mapLayer2ToDp

Default — mapPhbToDp

GROUP Vr Pp IpPort IS **InterfaceServices (IntServ)**

Properties — Provisioned

Description — This group contains provisionable attributes that are common to both *IngressServices* and *EgressServices* components..

Mib — Ip

ATTRIBUTE Vr Pp IpPort IS **policerStatsSpooling (spool)**

Access — Read and write

Description — This attribute specifies whether spooling of IP traffic meter statistics at an interface is enabled or disabled.

This attribute is applicable at at an ingress interface only if the *IngressServices linkToPolicerProfile* attribute is set.

This attribute is applicable at at an egress interface only if the *EgressServices linkToPolicerProfile* attribute is set.

Description	This attribute specifies the subnet mask for this *IpLogicalInterface*. This attribute must be specified because the IP application will not automatically provide a default value. The value must be ***255.255.255.255*** if *linkModel* attribute of *IpPort* component is set to ***pointToPoint***. For example, when *linkToMedia* attribute is set to ***alwaysUpInterface*** *mode VirtualMedia Interface* or *PPP* (Point to Point Protocol), *linkModel* attribute of *IpPort* component will be ***pointToPoint***. The value must be one of classA, classB or classC if the *linkModel* attribute of *ipPort* component is set to ***localAreaNetwork***.
Mib	Ip
Values	IP address
Default	0.0.0.0

ATTRIBUTE Vr Pp IpPort LogicalIf broadcastAddress

Access	Read and write
Description	This attribute specifies the broadcast address for this *IpLogicalInterface*. This attribute is ignored if the *IpPort mediaType* is ***ppp*** (Point to Point Protocol). If the value is 0.0.0.0, the actual broadcast address will be derived from the IP address of this *LogicalIf* and the *netmask* attribute.
Mib	Ip
Values	IP address
Default	0.0.0.0

ATTRIBUTE Vr Pp IpPort LogicalIf linkDestinationAddress

Access	Read and write
Description	This attribute specifies the address for the link destination for this *IpLogicalInterface*. This attribute is only required if the *IpPort* media type is ***PPP*** (Point to Point Protocol).
Mib	Ip
Values	IP address
Default	0.0.0.0

ATTRIBUTE Vr Pp IpPort LogicalIf linkToPimSmCandidateRp

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies a link to the *CandidateRendezvousPoint* component which uses this logicalIf as it's RendezvousPoint (*CRp*).
Mib	Ip
Values	Link (Service, address)
Default	No default

ATTRIBUTE Vr Pp IpPort LogicalIf linkToPimSmCandidateBsr

Access	Read and write
Description	This attribute specifies a link to the *CandidateBootstrapRouter* component which uses this logicalIf as it's BootstrapRouter Interface.
Mib	Ip
Values	Link (Service, address)
Default	No default

ATTRIBUTE Vr Pp IpPort LogicalIf linkToMulticastStaticGroup

Access	Read and write
Description	This attribute specifies a link to the component *RouteEntry* which uses this *LogicalIf* as its *outInterface*. There is a limit of up to 1000 *RouteEntry's* that could reference this *LogicalIf* as its *outInterface*.
Mib	Ip
List of	Link (Service, outInterfaces)
List Size	1000
Default	No default

Default	up

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf **passive**

Access	Read: All Write: All
Description	This attribute specifies whether the *IsisInterface* should be passive. A passive interface is one whose IP address is advertised in the LSP, but is not involved in ISIS protocol activities (for example, transmitting LSPs and establishing adjacencies).
Mib	Ip
Values	no yes
Default	no

ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf **lspInterval**

Access	Read: All Write: All
Description	This attribute specifies, in milliseconds, the minimum time between transmission of successive LSPs on this interface. This minimum time applies to any LSP, whether it is the LSP of this *Router*, or another router's LSP that is being retransmitted.
Mib	Ip
Values	Decimal (33..65535)
Units	msec
Default	100

ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf **lspRetransmitInterval**

Access	Read: All Write: All
Description	This attribute specifies, in seconds, the minimum time to wait before retransmitting this *Router's* LSP on this interface. An LSP retransmission occurs if a previously transmitted LSP is not acknowledged. Retransmissions only occur on point-to-point links.
Mib	Ip
Values	Decimal (1..300)
Units	seconds
Default	5

GROUP Vr Pp IpPort LogicalIf IsisIf **Operational (Oper)**

Properties	Operational
Description	This group contains the operational attributes associated with the ISIS protocol running on this interface.

Access Read: All
Write: All

Description This attribute specifies the cost of this interface, which is used by the SPF algorithm in this and other routers. This value is advertised in the LSP.

Mib lp

Values Decimal (0..63)

Default 10

ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf Level helloInterval

Access Read: All
Write: All

Description This attribute specifies the time, in seconds, between transmission of successive hello messages (IIH PDU).

Mib lp

Values Decimal (1..20000)

Units seconds

Default 10

ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf Level helloMultiplier

Access Read: All
Write: All

Description This attribute specifies the factor by which the *helloInterval* attribute is multiplied in order to create the hold time value transmitted in the hello packets (IIH PDU). The hold time value is used by the receiving router to

Copyright © 2006, Nortel Nortel Confidential

	determine how long it should maintain the adjacency if a subsequent hello packet is not received.
Mib	Ip
Values	Decimal (2..100)
Default	3

ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf Level **csnpInterval**

Access	Read: All Write: All
Description	This attribute specifies the time interval, in seconds, between successive transmissions of the CSNP PDUs.
Mib	Ip
Values	Decimal (1..600)
Units	seconds
Default	10

ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf Level **priority**

Access	Read: All Write: All
Description	This attribute specifies the DIS priority for this router. On a multi-access LAN, the router with the highest DIS priority is elected to represent the LAN. The elected router transmits an LSP for the pseudonode representing the LAN.
Mib	Ip
Values	Decimal (0..127)
Default	64

GROUP Vr Pp IpPort LogicalIf IsisIf Level **Operational (Oper)**

Properties	Operational
Description	This group contains attributes representing the operational state of this *IsisIf Level* component.
Mib	Ip

ATTRIBUTE Vr Pp IpPort LogicalIf IsisIf Level **disId**

Access	Read: All Write: Illegal
Description	This attribute indicates the system ID of the ISIS router acting as DIS for the LAN to which this interface is attached. For non-LAN interfaces, the value of this attribute is ***N/A***.
Mib	Ip

Copyright © 2006, Nortel Nortel Confidential

Values	String (1..14, ASCII)
Default	No default

ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf **snmpAdminStatus**

Access	Read and write
Description	The administrative status of this Ospf interface.
Mib	Ip
Values	up down
Default	up

ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf **rtrPriority (rtrPri)**

Access	Read and write
Description	The priority of this interface. Used in multi-access networks, this field is used in the designated router election algorithm. The value 0 signifies that the router is not eligible to become the designated router on this particular protocol port. In the event of a tie in this value, routers will use their *routerId* as a tie breaker.
Mib	Ip
Values	Decimal (0..255)
Default	1

ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf **transitDelay**

Access	Read and write
Description	The estimated number of seconds it takes to transmit a link-state update packet over this interface.
Mib	Ip
Values	Decimal (1..3600)
Units	seconds
Default	1

ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf **retransInterval (retransInt)**

Access	Read and write
Description	The number of seconds between link-state advertisements retransmissions, for adjacencies belonging to this interface. This value is also used when retransmitting database description and link-state request packets.
Mib	Ip
Values	Decimal (1..3600)
Units	seconds
Default	5

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf **helloInterval (helloInt)**

Access	Read and write
Description	The length of time, in seconds, between the Hello packets that the router sends on the interface. This value must be the same for all routers attached to a common network.
Mib	Ip
Values	Decimal (1..3600)
Units	seconds
Default	10

ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf **rtrDeadInterval (rtrDeadInt)**

Access	Read and write
Description	The number of seconds that a router's hello packets have not been seen before it's neighbors declare the router down. This should be some multiple of the *helloIntereval*. This value must be the same for all routers attached to a common network.
Mib	Ip
Values	Decimal (1..3600)
Units	seconds
Default	40

ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf **pollInterval (pollInt)**

Access	Read and write
Description	The largest time interval, in seconds, between the hello packets sent to an inactive non-broadcast multi-access neighbor.
Mib	Ip
Values	Decimal (1..3600)
Units	seconds
Default	120

ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf **authKey**

Access	Write only
Description	The Authentication Key. If the value of the attribute *authType* of an *AreaEntry* is ***simplePassword***, and the *authKey* length is shorter than 8 octets, then the value of *authKey* will be left adjusted zero-filled to 8 octets.
Mib	Ip
Values	String (1..8, Hex)
Default	0000000000000000

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf **multicastForwarding (multicastFwd)**

Access	Read and write
Description	The way multicasts should be forwarded on this interface; non forwarded, forwarded as data-link multicasts, or forwarded as data-link unicasts. Data-link multicasting is not meaningful on point-to-point and NBMA(No Broadcast Multi Access) interfaces, and setting this attribute to blocked effectively disables all multicast forwarding.
Mib	Ip
Values	blocked
Default	blocked

ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf **pointToMultiPointMode (ptmpmode)**

Access	Read and write
Description	This attribute specifies the Point-to-Multipoint mode to use when the *ifType* of this *OspfInterface* is ***pointToMultipoint***. A value of ***nonBroadcast*** restricts this interface to only send unicast packets, Hence, a *Neighbor* component must be configured. A value of ***broadcast*** enables sending multicast OSPF Hello packets to dynamically discover neighbors.
Mib	Ip
Values	nonBroadcast (nbc) broadcast (bc)
Default	nonBroadcast

ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf **authType**

Access	Read and write
Description	The authentication type specified for this *Ospf* interface.
Mib	Ip
Values	none simplePassword md5 SameAsArea
Default	SameAsArea

GROUP Vr Pp IpPort LogicalIf OspfIf **Operational (Oper)**

GROUP Vr Pp IpPort LogicalIf OspfIf **Metric**

Properties	Operational
Description	This group contains the operational metric attribute of this interface.
Mib	Ip

ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf **metric**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the metric being used by this *OspfIf*. The metric is derived in one of two ways: 1. If there is a *TypeOfService* component provisioned under this *OspfIf* component, then the value of the *metric* attribute is copied from the provisionable attribute *tosMetric*. 2. Otherwise, the metric is computed based on the interface speed. If the interface speed is greater than 100 Mbit/s, then the *metric* is 1. If the interface speed is less than 100 Mbit/s, then the metric is 100 Mbit/s divided by the interface speed. If the interface speed is unknown, then it is treated as 1.54 Mbit/s during the calculation. The value of interface speed is available by displaying the *ifSpeed* attribute of the corresponding *IfTableEntry* component.
Mib	Ip
Values	Decimal (0..4294967295)

ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf Nbr options

Access: Read only

Copyright © 2006, Nortel Nortel Confidential

Description	A bit mask corresponding to the neighbor's options field. Bit 0, if set, indicates that the area accepts and operates on external information, if zero, it is a stub area. Bit 1, if set, indicates that the system will operate on Type of Service metrics other than TOS 0. If zero, the neighbor will ignore all metrics except the TOS 0 metric. Bit 2, if set, indicates that the system is Network Multicast capable; i.e., that it implements OSPF Multicast Routing.
Mib	Ip
Values	Decimal (0..15)
Default	No default

ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf Nbr **state**

Access	Read only
Description	The state of the relationship with this neighbor.
Mib	Ip
Values	down attempt init twoWay exchangeStart exchange loading full
Default	No default

ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf Nbr **events**

Access	Read only
Description	The number of times this neighbor relationship has changed state, or an error has occurred.
Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf Nbr **lsRetransQlen**

Access	Read only
Description	The current length of the Retransmission queue.
Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf Nbr **exchangeStatus**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	Indicates the exchange status for a neighbor Entry.
Mib	Ip
Values	master slave
Default	No default

ATTRIBUTE Vr Pp IpPort LogicalIf OspfIf Nbr **permanance**

Access	Read only
Description	This attribute displays how the neighbor became an entry.
Mib	Ip
Values	permanent dynamic
Default	permanent

Description	This group contains the provisionable attributes of the *RipIf* component.
Mib	Ip

ATTRIBUTE Vr Pp IpPort LogicalIf RipIf **snmpAdminStatus**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	Identifies the administrative status of this *RipInterface*. Setting this value to ***disabled*** will have the effect of rendering it inactive.
Mib	Ip
Values	up down
Default	up

ATTRIBUTE Vr Pp IpPort LogicalIf RipIf metric

Access	Read and write
Description	This attribute is the RIP metric for this logical interface.
Mib	Ip
Values	Decimal (1..16)
Default	1

ATTRIBUTE Vr Pp IpPort LogicalIf RipIf poisonReverseFlag (poison)

Access	Read and write
Description	If the value of this attribute is set to ***true***, then poison reverse algorithm is used when sending out the updates otherwise use split horizon only.
Mib	Ip
Values	true false
Default	false

ATTRIBUTE Vr Pp IpPort LogicalIf RipIf flashUpdateFlag

Access	Read and write
Description	This attribute when set to ***true*** will send updates when updates are received; otherwise RIP will wait till the next update period.
Mib	Ip
Values	true false
Default	true

ATTRIBUTE Vr Pp IpPort LogicalIf RipIf networkRouteStatus

Access	Read and write
Description	This attribute determines what type of network routes will be sent and whether a default route will be generated for this *RipInterface*. Generated default routes will not go into the routing table, but are sent in the updates going out on the interface. The possible values for this attribute are:

Copyright © 2006, Nortel Nortel Confidential

naturalNetWithOutDefaultRoute - This value will cause normal RIP network routes to be put in the update. This means that the address of *logicalIf* or *Interface* pertaining to this *RipInterface* knowledge is taken into account in determining if the subnetted network or the natural network is sent for any route going into this update.

naturalNetWithDefaultRoute - Selecting this value will cause a default route to be generated with the value of the metric selected for the attribute *defaultRouteMetric*.

defaultRouteOnly - Selection of this value causes the default route to be generated with the value of the metric selected for the attribute *defaultRouteMetric*.
NOTE: No other routes will go in the update.

subnetsOnly - selection of this value will cause only subnet information to be put in the update. No default routes will be generated or passed on. Only subnetted routes that are part of the same subnetted network that this *logicalInterface* or *Interface* is on will be put in the update.
NOTE: this also effects receiving of updates on this interface. Only subnetted routes that are part of the same subnetted network that this *logicalInterface* or *Interface* is on will be accepted on a received RIP update on this *RipInterface*.

Mib	Ip
Values	naturalNetWithOutDefaultRoute (noDefault) naturalNetWithDefaultRoute (withDefault) defaultRouteOnly (defaultOnly) subnetsOnly (subnets)
Default	naturalNetWithOutDefaultRoute

ATTRIBUTE Vr Pp IpPort LogicalIf RipIf **defaultRouteMetric**

Access	Read and write
Description	This attribute identifies the metric value for the default route. This value is only used if the attribute *networkRouteStatus* is configured with a value of either ***naturalNetWithDefaultRoute*** or ***defaultRouteOnly***
Mib	Ip
Values	Decimal (1..16)
Default	1

ATTRIBUTE Vr Pp IpPort LogicalIf RipIf **acceptDefault**

Access	Read and write
Description	If this attribute is set to true, then accept the default route from this interface.
Mib	Ip

Copyright © 2006, Nortel Nortel Confidential

Values	true false
Default	true

ATTRIBUTE Vr Pp IpPort LogicalIf RipIf **ifConfSend**

Access	Read and write
Description	This attribute identifies what the router sends on this *RipIf*. ***ripVersion1*** implies sending RIP updates compliant with RFC 1058. ***rip1Compatible*** implies broadcasting RIP-2 updates according to RFC 1058. ***ripVersion2*** implies multicasting RIP-2 updates.
Mib	Ip
Values	doNotSend (silent) ripVersion1 (v1) rip1Compatible (v2b) ripVersion2 (v2)
Default	rip1Compatible

ATTRIBUTE Vr Pp IpPort LogicalIf RipIf **ifConfReceive**

Access	Read and write
Description	This attribute identifies which version of RIP updates are to be accepted on this *RipIf*. Note that ***rip2*** and ***rip1OrRip2*** implies reception of multicast packets.
Mib	Ip
Values	rip1 (v1) rip2 (v2) rip1OrRip2 (both) doNotReceive (reject)
Default	rip1OrRip2

GROUP Vr Pp IpPort LogicalIf RipIf **Operational (Stat)**

Properties	Provisioned
Description	This group contains the provisionable attributes for the *IpIgmpIf* component.
Mib	IpMcast

ATTRIBUTE Vr Pp IpPort LogicalIf IgmpIf version (ver)

Access	Read and write
Description	This attribute specifies the IGMP protocol version running on this interface. v2 is the only supported version at this time.
Mib	IpMcast

Copyright © 2006, Nortel Nortel Confidential

Values	v2
Default	v2

ATTRIBUTE Vr Pp IpPort LogicalIf IgmpIf **queryInterval**

Access	Read and write
Description	This attribute specifies the frequency at which IGMP Host-Query packets are transmitted on this interface.
Mib	IpMcast
Values	Decimal (1..3600)
Units	seconds
Default	125

ATTRIBUTE Vr Pp IpPort LogicalIf IgmpIf **queryMaxRespTime**

Access	Read and write
Description	This attribute specifies the maximum query response time advertised in IGMPv2 queries on this interface. The number of seconds represented by the *queryMaxRespTime* must be less than the Query Interval.
Mib	IpMcast
Values	Decimal (1..3600)
Units	seconds
Default	10

GROUP Vr Pp IpPort LogicalIf IgmpIf **Operational (Oper)**

Properties	Operational
Description	This group contains the operational attributes of *IpIgmpIf* component.
Mib	IpMcast

ATTRIBUTE Vr Pp IpPort LogicalIf IgmpIf **querier**

Access	Read only
Description	This attribute indicates the address of the IGMP Querier on the IP subnet to which this interface is attached.
Mib	IpMcast
Values	IP address
Default	0.0.0.0

ATTRIBUTE Vr Pp IpPort LogicalIf IgmpIf **wrongVersionQuery (wvq)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the number of queries received whose IGMP version does not match that configured for this interface. IGMP requires that all routers on a LAN be configured to run the same version of IGMP.
Mib	IpMcast
Values	Decimal (0..4292967295)
Default	0

ATTRIBUTE Vr Pp IpPort LogicalIf IgmpIf **joins**

Access	Read only
Description	This attribute indicates the number of times a group membership has been added on this interface.
Mib	IpMcast
Values	Decimal (0..4292967295)
Default	0

ATTRIBUTE Vr Pp IpPort LogicalIf IgmpIf **groups**

Access	Read only
Description	This attribute indicates the current number of entries for this interface in the cache table.
Mib	IpMcast
Values	Decimal (0..4292967295)
Default	0

ATTRIBUTE Vr Pp IpPort LogicalIf IgmpIf **querierExpiryTime (qet)**

Access	Read only
Description	This attribute indicates the amount of time remaining before the other querier present timer expires. If the local system is the querier, the value of this attribute is zero.
Mib	IpMcast
Values	Decimal (0..3600)
Units	seconds
Default	0

Copyright © 2006, Nortel Nortel Confidential

GROUP Vr Pp IpPort BootpP OsiState (State)
GROUP Vr Pp IpPort BootpP Statistics (Stats)

Scope: Application

Description: *Vr/<string> Pp/<string> IpPort BootpPort*
Rtr/<string> Interface/<string> BootpPort
Rtr/<string> Vrf/<string> Interface/<string> BootpPort
An *BootpPort* component must be provisioned for each *IpPort* or *Interface* where BOOTP request messages will be received. Each *BootpPort* component can be provisioned with a set of relay addresses. Each BOOTP request message received on this port will be sent to the provisioned set of relay addresses.

Mib: Ip

Common Verbs:
Help
List
Display
Add
DELete
LOCK
Unlock

GROUP Vr Pp IpPort BootpP Provisioned (Prov)

Properties: Provisioned

Description: This group contains provisionable attributes for the *BootpPort* component.

Mib: Ip

ATTRIBUTE Vr Pp IpPort BootpP relayForwardStatus (status)

Access: Read and write

Description: This attribute controls how BOOTP request packets, received on another port, will be flooded out this port. If *relayForwardStatus* is ***enabled***, BOOTP requests received on another port will be broadcast out this port. When *relayForwardStatus* is ***disabled***, BOOTP requests will not be broadcast out this port. If ***auto*** is used, the bridge spanning tree database is used to determine if BOOTP requests should be broadcast out this port.

Note that when using ***enabled***, it is possible to create misconfigurations which will result in broadcast storms. When using this feature with multiple routers, make sure there are no broadcast forwarding loops. Using ***auto*** with bridge spanning tree is safer to use if the network is running bridge spanning tree.

Note that for ***auto*** to have effect, bridge spanning tree must be running on the corresponding *VirtualRouter ProtocolPort* or *Rtr Interface* or *Rtr Vrf Interface*.

Mib: Ip

Copyright © 2006, Nortel Nortel Confidential

Values	enabled disabled auto
Default	disabled

ATTRIBUTE Vr Pp IpPort BootpP **bootpLogicalInterface (portIf)**

Access	Read and write
Description	This attribute identifies the logical interface whose address is to be the GIADDR of this BOOTP port. If not set, the address of the first logical port or Interface is chosen.
Mib	Ip
Values	IP address
Default	0.0.0.0

ATTRIBUTE Vr Pp IpPort BootpP **relayAddress (addr)**

Access	Read and write
Description	This attribute identifies a list of relay addresses. When a BOOTP request message is received on this port, the request will be forwarded to the IP addresses provisioned in *relayAddress*. Note that BOOTP requests are also broadcast out all other *BootpPort*'s according to the *relayForwardStatus* of the outgoing port.
Mib	Ip
List of	IP address
List Size	3
Default	No default

GROUP Vr Pp IpPort BootpP **AdministrativeControl (AdminControl)**

Properties	Provisioned
Description	This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component.
Mib	Ip

ATTRIBUTE Vr Pp IpPort BootpP **snmpAdminStatus**

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed.
Mib	Ip

Values	up down testing
Default	up

GROUP Vr Pp IpPort BootpP OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	Ip

ATTRIBUTE Vr Pp IpPort BootpP snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	Ip
Values	up down testing
Default	up

GROUP Vr Pp IpPort BootpP OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Ip

ATTRIBUTE Vr Pp IpPort BootpP adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib: Ip

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Vr Pp IpPort BootpP operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib: Ip

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Vr Pp IpPort BootpP usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib: Ip

Values:
idle
active (activ)
busy

Copyright © 2006, Nortel Nortel Confidential

Default	idle

GROUP Vr Pp IpPort BootpP Statistics (Stats)

Properties	Operational
Description	This group contains *BootpPortEntry* component statistics.
Mib	Ip

ATTRIBUTE Vr Pp IpPort BootpP inRequests

Access	Read only
Description	This attribute counts the total number of BOOTP Request messages received on this port.
Mib	Ip

GROUP Vr Pp IpPort VrrpPort Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the VrrpPort component.
Mib	IpVrrp

ATTRIBUTE Vr Pp IpPort VrrpPort priority

Access	Read and write
Description	This attribute specifies the priority of *VrrpPort* during election of a master VRRP virtual router. A priority of 0 (zero) is reserved for the master to indicate it is releasing responsibility for the VRRP virtual router. A priority of 255 is reserved for the VRRP virtual router that owns (has as real interfaces) the IP addresses associated with this *VrrpPort*.
Mib	IpVrrp
Values	Decimal (1..255)
Default	100

ATTRIBUTE Vr Pp IpPort VrrpPort advertisementInterval

Access	Read and write
Description	This attribute specifies the time interval between VRRP advertisements which will be sent by the master VRRP virtual router.
Mib	IpVrrp
Values	Decimal (1..255)
Units	seconds
Default	1

ATTRIBUTE Vr Pp IpPort VrrpPort listLinkToCriticalIp (listLinkToCIp)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the *CriticalIp* instance to which the *VrrpPort* instance is linked. If the *IpPort* associated with this *CriticalIp* instance becomes disabled, the *VrrpPort* becomes disabled..
Mib	IpVrrp
Values	Link (Service, listLinkToVrrp)
Default	No default

ATTRIBUTE Vr Pp IpPort VrrpPort **holdDownTime (hdt)**

Access	Read and write
Description	This attribute specifies the length of time that a VrrpPort instance is prevented from participating in a VRRP Master virtual router election, if it has given up Mastership due to a failure, once the failure has been corrected. This allows the network routing protocol to re-establish a route to this VrrpPort instance when it becomes available. When the length of the holdDownTime is reached, a VRRP Master virtual router election occurs and the highest priority VrrpPort instance will become the VRRP Master virtual router. A holdDownTime attribute value of notApplicable disables the holdDownTime functionality. Any other value should be calculated based on an estimate of the time requiredfor the network routing protocol to establish a route to a VrrpPort instance, that has been disabled by a failure, once it has recovered. If the new VRRP Master virtual router fails within the holdDownTime interval and no other VRRP Backup virtual router is available, the holdDownTime functionality is canceled and the highest priority VrrpPort instance will become the VRRP Master virtual router. In a situation where both the VRRP Master and Backup virtual routers are on the same MSS, and both are affected by the same failure, the holdDownTime functionality doesn't add any value since the network routes to both VrrpPort instances are affected.
Mib	IpVrrp
Values	Decimal (1..3600) notApplicable (na)
Units	seconds
Default	notApplicable

ATTRIBUTE Vr Pp IpPort VrrpPort **ipAddresses**

Access	Read and write
Description	This attribute specifies one or more IP addresses associated with this *VrrpPort* instance (VRID). All VRRP virtual routers with this VRID must have the same set of IP addresses configured. Each of the IP addresses

Copyright © 2006, Nortel Nortel Confidential

	in the list must be on the same subnet as an *IpLogicalInterface* for the *IpPort*. All the IP addresses in the list must be owned by this VRRP virtual router or by other VRRP virtual routers but not a combination.
Mib	IpVrrp
List of	IP address
Default	No default

GROUP Vr Pp IpPort VrrpPort Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *VrrpPort* component.
Mib	IpVrrp

ATTRIBUTE Vr Pp IpPort VrrpPort virtualRouterState

Access	Read only
Description	This attribute indicates the state of this *VrrpPort* instance. It will be one of three states: initialize, backup and master.
Mib	IpVrrp
Values	initialize backup master
Default	initialize

ATTRIBUTE Vr Pp IpPort VrrpPort virtualRouterPhysicalAddress

Access	Read only
Description	This attributes indicates the physcial address of the *VrrpPort*. The address is a virtual physical address of the form “00-00-5e-00-01-VRID” where the VRID is the instance value of the *VrrpPort*.
Mib	IpVrrp
Values	String (6, Dashed Hex)

Description	This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component.
Mib	IpVrrp

ATTRIBUTE Vr Pp IpPort VrrpPort snmpAdminStatus

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed.
Mib	IpVrrp
Values	up down testing
Default	up

GROUP Vr Pp IpPort VrrpPort **OperationalStatus (OperStatus)**

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	IpVrrp

ATTRIBUTE Vr Pp IpPort VrrpPort **snmpOperStatus**

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	IpVrrp
Values	up down testing
Default	up

GROUP Vr Pp IpPort VrrpPort **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	IpVrrp

ATTRIBUTE Vr Pp IpPort VrrpPort **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — IpVrrp

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Vr Pp IpPort VrrpPort operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — IpVrrp

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Vr Pp IpPort VrrpPort usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

Copyright © 2006, Nortel Nortel Confidential

	The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	IpVrrp
Values	idle active (activ) busy
Default	idle

COMPONENT Vr Pp IpPort CriticalIp

Instance	Decimal (1..255)
Groups	GROUP Vr Pp IpPort CriticalIp Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Pp/<string> IpPort CriticalIp/n* The *CriticalIp* component defines a critical *IpPort* for use by the VRRP virtual router with the same instance (VRID) as the *CriticalIp* instance. If the *IpPort* associated with this *CriticalIp* instance becomes disabled the *VrrpPort* linked to this *CriticalIp* is disabled.

Properties	Provisioned
Description	This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component.
Mib	Ipx

ATTRIBUTE Vr Pp IpxP snmpAdminStatus

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates

Copyright © 2006, Nortel Nortel Confidential

	the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed.
Mib	Ipx
Values	up down testing
Default	up

GROUP Vr Pp IpxP Provisioned (Prov)

Properties	Provisioned
Description	The Provisionable group for the *IpxPort* component.
Mib	Ipx

ATTRIBUTE Vr Pp IpxP networkNumberProv (netP)

Access	Read and write
Description	The Ipx network number of the network directly connected to this port.
Mib	Ipx
Values	String (0..4, Dashed Hex)
Default	No default

ATTRIBUTE Vr Pp IpxP defaultType (defType)

Access	Read and write
Description	This attribute indicates which protocol is to run on a protocol port. In the case of a lan media it is to be set to broadcast. In the case of WAN media the following choices are to be exercised: For running Pre-IPXWAN RIP set value to *other*. For running numbered RIP set value to *wanRip*. For running un-numbered RIP set value to *unnumberedRip*. Setting this value to *ppp* will signify unnumbered Rip running on a ppp port.
Mib	Ipx
Values	other broadcast ppp wanRip unnumberedRip
Default	No default

ATTRIBUTE Vr Pp IpxP broadcastInhibit (bInh)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	If this attribute is set, all outgoing periodic and triggered updates for RIP and SAP will be inhibited for the port. However the port will still accept incoming RIP and SAP packets on the port. This may be useful for ports with only a bank of servers on its network in order to limit the routing traffic, assuming that servers don't require routing information or other server information.
Mib	Ipx
Values	enabled disabled
Default	disabled

GROUP Vr Pp IpxP SresProvisioned (SresProv)

Values	off on
Default	off

ATTRIBUTE Vr Pp SrBp portNum (pNum)

Access	Read only
Criticality	Component
Description	This attribute indicates the unique number assigned to the bridge port. It is used for SNMP management of this bridge port and in spanning tree as an identifier for this bridge port. Notes: Escape routines exist for initializing, copying, and deleting port numbers. This is necessary because SNMP requires a unique port instance identifier. The initPortNum escape routine sets the port number to a value in the range 1-255 for this purpose. The setCopiedPortNum escape routine exists to maintain the uniqueness of the port number in cases when one port is copied to another. When a bridge port is deleted, the releasePortNum escape routine places the port number being released into a pending deletion state. This is because the port number cannot be re-allocated until the port is truly deleted in the current view. This is necessary since there is no guarantee of order when processing changes to multiple protocol ports so without the pending deletion state, the same port number could be temporarily assigned to two ports for a short period of time. The portNum is set as component critical since bridging also uses the port number as a key for indexing into its data structures. If a port is deleted then re-added under the same protocol port, CAS treats the change as a SET to the portNum attribute.
Mib	Bridge
Values	Decimal (0..255)
Default	0

GROUP Vr Pp SrBp StpProvisioned (StpProv)

Properties	Provisioned
Description	This group contains all port specific provisionable attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes influence the participation of the bridge port in the stp.
Mib	Bridge

ATTRIBUTE Vr Pp SrBp adminStatus (as)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute defines the current administrative state for this component. ***enabled*** indicates that the component is available for operation. ***disabled*** indicates the component is unavailable for operation.
Mib	Bridge
Values	up down
Default	up

ATTRIBUTE Vr Pp SrBp portStateStpControl (psstpc)

Access	Read and write
Description	This attribute specifies whether or not stp state for this bridge port is controlled by the stp. In essence it indicates the participation of this bridge port in the stp by accepting and acting on received bridge protocol data units and by sending out the same. ***on*** signifies that this bridge port's spanning tree port state is controlled by the stp. A value of ***off*** signifies that the spanning tree port state of this bridge port is unaffected by the stp. This in effect puts the bridge port out of reach of the stp decisions. Its stp state will be always ***forwarding***. Care should be taken while assigning a value of ***off*** to this attribute, as this might cause network loops. Please do not set this attribute to ***off*** unless you are absolutely sure about the effect of such an action on your network topology.
Mib	Bridge
Values	off on
Default	on

ATTRIBUTE Vr Pp SrBp stpTypeProv (stptProv)

Access	Read and write
Description	This attribute specifies the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. If the value of the attribute *protocolSpec* in the *SpanningTreeProtocol* component is in conflict with the value of this attribute, the value of the *protocolSpec* attribute will prevail. Prevailing stp type is reflected in the value of the attribute *stpTypeOper.*
Mib	Bridge
Values	dec ieee8021
Default	ieee8021

ATTRIBUTE Vr Pp SrBp portPriority (ppr)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the value for this bridge port priority which is contained in the first octet of the port identifier. Valid values are as follows: 1) 0-255 for stp type DEC and 2) 0-65535 for stp type IEEE.
Mib	Bridge
Values	Decimal (0..65535)
Default	128

ATTRIBUTE Vr Pp SrBp pathCost (pc)

Access	Read and write
Description	This attribute specifies the contribution of this port to all the paths to the root bridge that include this port. Please note that the value of the attribute *pathCost* is applied only when the value of the attribute *pathCostMethod* is set to ***on*** and is ignored if otherwise.
Mib	Bridge
Values	Decimal (1..65535)
Default	10

ATTRIBUTE Vr Pp SrBp pathCostMethod (pcm)

Access	Read and write
Description	This attribute specifies the method used by the bridging logic to calculate the path cost to the bridge considered to be the root bridge in the spanning tree topology. This attribute should be set to ***off*** before attempting to provision a value for *pathCost.*
Mib	Bridge
Values	off dec ieee8021
Default	ieee8021

GROUP Vr Pp SrBp DomainInfoProvisioned (DIProv)

Properties	Provisioned
Description	This group contains all the provisionable, domain specific attributes for a non-encapsulating bridge port.
Mib	Bridge

ATTRIBUTE Vr Pp SrBp domainNum (dn)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the domain number associated with this bridge port. Domain numbers are used for confining frames to a domain. Domain based filtering provides a complete segregation of traffic based on domain number associated with frames. There can exist only sixteen domains when a spanning tree is desired specific to each domain. When there is only a single spanning tree spanning all the domains the maximum number of domains possible are 4294967293. This attribute is of no relevance when associated with backbone bridge port. Its value is ignored in such a situation.
Mib	Bridge
Values	Decimal (1..4294967293)
Default	1

ATTRIBUTE Vr Pp SrBp preserveDomain (pds)

Access	Read and write
Criticality	Component
Description	This attribute specifies if the domain information should be preserved or embedded in the frame header. This attribute applies only to ***backbone*** ports and does not affect the ***access*** bridge ports. By setting this attribute to a value of ***on***, domain information could be preserved in frames being tunnelled across the backbone, so that this information can be deciphered at the other end of the backbone tunnel. This preserves the integrity of the domains thus preventing domain breaches while tunnelling frames across backbone network. If the value of this attribute is set to ***off*** then domain information is not preserved in the header of the frames tunnelling through the backbone. This eliminates the overhead incurred to preserve domain information across the backbone while tunnelling frames across it. Preserve domain is relevant only when used in conjunction with ATM MPE.
Mib	Bridge
Values	off on
Default	No default

GROUP Vr Pp SrBp OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Bridge

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Pp SrBp adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Bridge
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Vr Pp SrBp operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Bridge
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Vr Pp SrBp usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib	Bridge
Values	idle active (activ) busy
Default	idle

GROUP Vr Pp SrBp OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	Bridge

ATTRIBUTE Vr Pp SrBp snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	Bridge
Values	up down testing
Default	up

GROUP Vr Pp SrBp Operational (Oper)

Properties	Operational
Description	This group contains all the operational attributes belonging to the base group. These attributes in part, reflect the state of a bridge port.
Mib	Bridge

ATTRIBUTE Vr Pp SrBp portName (pn)

Access	Read only
Description	The attribute *portName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and

Copyright © 2006, Nortel Nortel Confidential

i is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/ETH100A* would have a name ***TBP-ETH100A.***

Mib	Bridge
Values	String (4..29, ASCII)
Default	No default

ATTRIBUTE Vr Pp SrBp upTime (ut)

Access	Read only
Description	This attribute indicates the accumulated up time of this bridge port since the last reset occurred.
Mib	Bridge
Values	Decimal (0..4294967295)
Units	seconds
Default	0

ATTRIBUTE Vr Pp SrBp downTime (dt)

Access	Read only
Description	This attribute indicates the accumulated down time of this bridge port since the last reset occurred.
Mib	Bridge
Values	Decimal (0..4294967295)
Units	seconds
Default	0

ATTRIBUTE Vr Pp SrBp bridgingMode (bm)

Access	Read only
Description	This attribute indicates the mode of bridging this port can support. The transparent bridge mode is the only mode supported.
Mib	Bridge
Values	unknown tb sr srt
Default	No default

ATTRIBUTE Vr Pp SrBp bridgePortConfig (bpc)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the bridge port's configuration. It indicates if the bridge port is operating as an ***access*** port or as a ***backbone*** port. An ***access*** bridge port does not encapsulate a MAC frame and does not preserve domain information in the encapsulation, whereas a ***backbone*** bridge port encapsulates the MAC frame and optionally preserves domain information in the encapsulated frame.A ***backbone*** bridge port is typically used to transport frames across a high bandwidth backbone network to another bridge unit for further processing/forwarding of the frame.
Mib	Bridge
Values	access backbone
Default	No default

ATTRIBUTE Vr Pp SrBp bridgePortType (bpt)

Access	Read only
Description	This attribute indicates the type of the bridge port that was provisioned. It takes into consideration the *bridgingMode*, *bridgePortConfig* and the media the bridge port is linked to before branding a bridge port.
Mib	Bridge
Values	ethernetBridgePort tokenRingBridgePort fddiBridgePort tokenBusBridgePort lanEmulationClientEthernet fddiEncapsulatingBridgePort vnsBridgePort frameRelayBridgePort pppBridgePort smdsBridgePort vcpBridgePort x25BridgePort atmMpeBridgePort srEncapSrBridgePort srEncapTbBridgePort sourceGateSrBridgePort sourceGateTbBridgePort srtbBridgePort tbsrBridgePort clusterSrBridgePort clusterTbBridgePort snaDlrBridgePort unknown
Default	No default

ATTRIBUTE Vr Pp SrBp ifIndex (ifin)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the index into the Interface Table where information about the media interface corresponding to this bridge port is maintained.
Mib	Bridge
Values	Decimal (1..65535)
Default	No default

ATTRIBUTE Vr Pp SrBp mtuExceededDiscards (med)

Access	Read only
Description	This attribute counts the number of frames discarded because the size of the outbound frame exceeded the message transfer unit (mtu) allowed for the bridge port. Note that this counter only refers to the outbound frames for this bridge port. This counter wraps around its maximum value of 4294967295. This counter is influenced by the attribute *fragmentIp.* This counter is incremented when a frame larger than the mtu allowed is encountered and cannot be fragmented. If this counter is increasing steadily, it might be useful to set the value of the attribute *fragmentIp* to a value of ***on***.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

GROUP Vr Pp SrBp StpOperational (StpOper)

Properties	Operational
Description	This group contains all port specific operational attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes reflect the state of the bridge port's participation in the stp.
Mib	Bridge

ATTRIBUTE Vr Pp SrBp stpPortState (sps)

Access	Read only
Description	This attribute indicates the stp state of the bridge port.
Mib	Bridge
Values	disabled blocking listening learning forwarding broken

Copyright © 2006, Nortel Nortel Confidential

Default	disabled

ATTRIBUTE Vr Pp SrBp stpTypeOper (stptOper)

Access	Read only
Description	This attribute indicates the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp.
Mib	Bridge
Values	none dec ieee8021
Default	ieee8021

ATTRIBUTE Vr Pp SrBp designatedCost (dc)

Access	Read only
Description	This attribute indicates the path cost of the designated port of the lan segment the designated port is connected to.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Pp SrBp pathCostOper (pco)

Access	Read only
Description	This attribute indicates the contribution of this port to all the paths to the root bridge that include this port. This attribute *pathCostOper* will track the value of the attribute *pathCost* when the value of the attribute *pathCostMethod* is set of ***off***.
Mib	Bridge
Values	Decimal (1..65535)
Default	No default

ATTRIBUTE Vr Pp SrBp designatedBridge (db)

Access	Read only
Description	This attribute indicates the identifier of the bridge that this port considers to be the designated bridge.
Mib	Bridge
Values	String (8, Dashed Hex)
Default	No default

ATTRIBUTE Vr Pp SrBp designatedPort (dp)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the port identifier of the port on the designated bridge attached to the same LAN segment as this port is attached to.
Mib	Bridge
Values	Hex (H.0..H.ffff)
Default	No default

ATTRIBUTE Vr Pp SrBp forwardTransitions (ft)

Access	Read only
Description	This attribute counts the number of times this bridge port transitioned from the ***learning*** state to the ***forwarding*** state. This counter wraps around its maximum value of 4294967295. A rapidly increasing value might be indicative of an unstable spanning tree topology.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrBp blockingDiscards (bd)

Access	Read only
Description	This attribute counts the number of the incoming frames that were discarded because the bridge port was in the ***blocking*** state. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrBp designatedRoot (dr)

Access	Read only
Description	This attribute indicates the bridge identifier of the bridge recorded as the root bridge in the configuration BPDUs sent out by the designated bridge on the segment this port is attached to.
Mib	Bridge
Values	String (8, Dashed Hex)
Default	No default

GROUP Vr Pp SrBp Statistics (Stats)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains all the statistical attributes applicable to all types of bridge ports and represents the common factor between them. These attributes in part reflect the state of the bridge port.
Mib	Bridge

ATTRIBUTE Vr Pp SrBp badAbstractDiscards (bad)

Access	Read only
Description	This attribute counts the number of frames that were discarded because the data abstracted from the frames coming in through this bridge port did not conform to the format expected by the bridge logic.This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrBp tinygramFramesIn (tfi)

Access	Read only
Description	This attribute counts the number of frames received on this bridge port that used the tinygram compression scheme.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrBp tinygramFramesOut (tfo)

Access	Read only
Description	This attribute counts the number of frames transmitted out this bridge port that used the tinygram compression scheme.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrBp inFilterDiscards (ifd)

Access	Read only
Description	This attribute counts the number of frames discarded due to domain based filtering at the in filter point. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Vr Pp SrBp outFilterDiscards (ofd)

Access	Read only
Description	This attribute counts the number of frames discarded due to domain based filtering at the out filter point. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

GROUP Vr Pp SrBp SrProvisioned (SrProv)

Properties	Provisioned
Description	This group contains all port specific, provisionable attributes associated with *SourceRouteBridge* ports.
Mib	Bridge

ATTRIBUTE Vr Pp SrBp hopCount (hc)

Access	Read and write
Description	This attribute specifies the maximum number of hops allowed in Spanning Tree Explore and All Routes Explore frames. This value is one less than the maximum number of route descriptors allowed in a source route frame
Mib	Bridge
Values	Decimal (1..7)
Default	7

ATTRIBUTE Vr Pp SrBp exploreFrameTreatment (eft)

Access	Read and write
Description	This attribute specifies whether or not explore frames received from *SourceRouteBridge* ports will be sent to the SRTB-8209 translation or the encapsulated *SourceRouteBridge* logic. This option is used only when both the *TbsrBridgePort* and the *SrtbBridgePort* are provisioned and enabled. A value of ***Xlate*** implies that the explore frames will be sent to the Srtb translation logic and a value of ***Encap*** implies that the frames will be sent to the Encapsulated source route bridging logic.
Mib	Bridge
Values	encap xlate
Default	encap

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Pp SrBp lanId (lid)

Access	Read and write
Description	This attribute specifies the identifier for the physical LAN that this port is attached. All *SourceRouteBridge* ports are assigned to a physical LAN and a logical internal LAN. Current source route bridge implementations limit the lanId to a value in the range 0 to 4095.
Mib	Bridge
Values	Decimal (0..4095)
Default	0

ATTRIBUTE Vr Pp SrBp internalLanId (ilid)

Access	Read and write
Description	This attribute specifies the identifier for the internal logical LAN this port is attached. All *SourceRouteBridge* ports are assigned to a physical LAN and a logical internal LAN. Current source route bridge implementations limit the lanId to a value in the range 0 to 4095.
Mib	Bridge
Values	Decimal (0..4095)
Default	0

ATTRIBUTE Vr Pp SrBp bridgeNum (bid)

Access	Read and write
Description	This attribute specifies the value that is used to identify this bridge when more than one bridge is used to span the same two LAN segments.
Mib	Bridge
Values	Decimal (0..15)
Default	7

ATTRIBUTE Vr Pp SrBp largestFrame (lf)

Access	Read and write
Description	This attribute specifies the maximum frame size (LLC and above) in octets, allowed by this *SourceRouteBridge* port. This field is used to determine whether a modification of the largest frame field of the routing control field of the routing information field is warranted.
Mib	Bridge
Values	Decimal (516; 1470; 2052; 4399; 8130; 11407; 17749)

Copyright © 2006, Nortel Nortel Confidential

Units	octets
Default	No default

ATTRIBUTE Vr Pp SrBp steSpanMode (steSm)

Access	Read and write
Description	This attribute determines how this bridge port will react when presented with a Spanning Tree Explore frame. If ***disabled,*** the Spanning Tree Explore frame is discarded regardless of the value of *stpPortState.* If the value of this attribute is ***forced***, the Spanning Tree Explore frame is forwarded regardless of the value of *stpPortState.* ***autoSpan*** uses the *stpPortState* value to decide whether or not Spanning Tree Explore frames should be forwarded out this bridge port. If the port is in the ***forwarding*** state, the frame is received and transmitted otherwise the frame is discarded.
Mib	Bridge
Values	autoSpan disabled forced
Default	autoSpan

ATTRIBUTE Vr Pp SrBp areRdLimit (arl)

Access	Read and write
Description	This attribute specifies the number of route descriptors allowed in an All Routes Explore frame received on a *SourceRouteBridgePort* or *SourceRouteTransparentBridgePort*. Current source route bridge implementations limit the *areRdLimit* to a value in the range 0 to 8.
Mib	Bridge
Values	Decimal (0..8)
Default	8

ATTRIBUTE Vr Pp SrBp steRdLimit (srl)

Access	Read and write
Description	This attribute specifies the number of route descriptors allowed in a Spanning Tree Explore frame received on a *SourceRouteBridgePort* or *SourceRouteTransparentBridgePort*. Current source route bridge implementations limit the *steRdLimit* to a value in the range 0 to 8.
Mib	Bridge
Values	Decimal (0..8)
Default	8

Copyright © 2006, Nortel Nortel Confidential

GROUP Vr Pp SrBp SrStatistics (SrStats)

Properties	Operational
Description	This group contains all port specific statistical attributes associated with *SourceRouteBridge* ports.
Mib	Bridge

ATTRIBUTE Vr Pp SrBp specInFrames (sif)

Access	Read only
Description	This attribute specifies the number of specifically routed frames that were received by this bridge port. A specifically routed frame has a route descriptor, constructed by the originating host which details an explicit route to the destination host. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrBp specOutFrames (srfof)

Access	Read only
Description	This attribute specifies the number of specifically routed frames that were transmitted from this bridge port. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrBp apeInFrames (apeif)

Access	Read only
Description	This attribute specifies the number of All Path Explore frames received on this bridge port. The All Path Explore frames are forwarded to all *SourceRouteBridge* ports assigned to this bridge regardless of the port's *portStpState*s. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrBp apeOutFrames (apeof)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the number of All Path Explore frames transmitted on this bridge port. The All Path Explore frames are forwarded to all *SourceRouteBridge* ports assigned to this bridge regardless of the port's *portStpState* state. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrBp steInFrames (steif)

Access	Read only
Description	This attribute specifies the number of Spanning Tree Explore frames received on this bridge port. The Spanning Tree Explore frames are only forwarded through bridge ports whose *portStpState* has a value of ***forwarding.*** This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrBp steOutFrames (steof)

Access	Read only
Description	This attribute specifies the number of Spanning Tree Frames transmitted on this bridge port. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrBp segmentMismatchDiscards (lidmd)

Access	Read only
Description	This attribute specifies the number of All Routes Explore and Spanning Tree Explore frames that were discarded due to an invalid next segment value in the routing information field. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrBp dupSegmentDiscards (dsd)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute specifies the number of frames discarded due to the presence of a duplicate segment identifier in the route descriptor field which may indicate a loop in the network topology. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrBp hopCountExceededDiscards (hced)

Access	Read only
Description	This attribute specifies the number of All Routes Explore and Spanning Tree Explore frames discarded by this bridge port due to a frame exceeding the maximum size allowed for a route descriptor length. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrBp dupLanIdOrTreeErrors (dlte)

Access	Read only
Description	This attribute specifies the number frames received which contain duplicate LAN IDs or Tree errors. This attribute is helpful in debugging problems in networks which contain older IBM-SR bridges. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrBp lanIdMismatches

Access	Read only
Description	This attributes counts the number of All Routes Explore or Spanning Tree Explore frames that were discarded because the last LAN ID in the routing information field did not equal the LAN ID. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Pp SrBp staticDiscards (sd)

Access	Read only
Description	This attribute is indicative of the number of explorer frames discarded due to fact that the outbound *SourceRouteBridge* port was disabled or deleted. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrBp dynamicDiscards (dd)

Access	Read only
Description	This attribute specifies the number of frames discarded due to receiving a frame with a target LAN ID which did not match the internal LAN ID of the receiving bridge port. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

COMPONENT Vr Pp SrBp NetSentry (Ns)

Groups	GROUP Vr Pp SrBp Ns Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Pp/<string> TransparentBridgePort NetSentry* This component represents the *Ns* functionality that can be applied to a bridge port. It contains all the attribute groups (provisionable) that are necessary for the application of Ns functionality to a bridge port. In essence, it allows for the definition of filters, at the incoming and outgoing points, specific to the interface represented by this bridge port.
Mib	Bridge
Common Verbs	Help List Display Add DELete

GROUP Vr Pp SrBp Ns Provisioned (Prov)

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group houses all the port specific provisionable attributes associated with Ns. These attributes influence the application of filters to incoming and outgoing frames.
Mib	Bridge

ATTRIBUTE Vr Pp SrBp Ns incomingFilter (if)

Access	Read and write
Description	This attribute specifies the name of the filter to be applied at the incoming filter point.
Mib	Bridge
Values	String (0..32, ASCII)
Default	No default

ATTRIBUTE Vr Pp SrBp Ns outgoingFilter (of)

Access	Read and write
Description	This attribute specifies the name of the filter to be applied at the out going filter point.
Mib	Bridge

Groups	GROUP Vr Pp SrtBp Provisioned (Prov) GROUP Vr Pp SrtBp TbProvisioned (TbProv) GROUP Vr Pp SrtBp StpProvisioned (StpProv) GROUP Vr Pp SrtBp DomainInfoProvisioned (DIProv) GROUP Vr Pp SrtBp OsiState (State) GROUP Vr Pp SrtBp OperationalStatus (OperStatus) GROUP Vr Pp SrtBp Operational (Oper) GROUP Vr Pp SrtBp TbOperational (TbOper) GROUP Vr Pp SrtBp StpOperational (StpOper) GROUP Vr Pp SrtBp Statistics (Stats) GROUP Vr Pp SrtBp SrProvisioned (SrProv) GROUP Vr Pp SrtBp SrStatistics (SrStats)
Scope	Application
Description	Vr/*<string>* Pp/*<string>* *SourceRouteTransparentBridgePort* This component represents a Source Route Transparent (SRT) bridge port. It contains all the attributes (provisionable and operational attributes) necessary for the operation of the bridge port. The SRT bridge port provides a mechanism to transmit and receive both source route and transparent bridge frames. In essence, the SRT bridging scheme defines a

Copyright © 2006, Nortel Nortel Confidential

method for TB bridges to handle SR frames. SRT bridge ports participate in the transparent bridging spanning tree protocol.

Mib	Bridge
Opt. Subcomp.	COMPONENT Vr Pp SrtBp NetSentry (Ns)
Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP Vr Pp SrtBp Provisioned (Prov)

Properties	Provisioned
Description	This group contains all the provisionable attributes that belong to this group. This group of attributes is applicable to all types of bridge ports and represent the common factor between them. These attributes influence the working of a bridge port.
Mib	Bridge

ATTRIBUTE Vr Pp SrtBp fragmentIp (fIp)

Access	Read and write
Description	This attribute specifies if outbound frames carrying IP datagrams should be fragmented to conform to message transfer unit (*mtu*) sizes dictated by the media.
Mib	Bridge
Values	off on
Default	off

ATTRIBUTE Vr Pp SrtBp portNum (pNum)

Access	Read only
Criticality	Component
Description	This attribute indicates the unique number assigned to the bridge port. It is used for SNMP management of this bridge port and in spanning tree as an identifier for this bridge port. Notes: Escape routines exist for initializing, copying, and deleting port numbers. This is necessary because SNMP requires a unique port instance identifier. The initPortNum escape routine sets the port number to a value in the range 1-255 for this purpose. The setCopiedPortNum escape

Copyright © 2006, Nortel Nortel Confidential

routine exists to maintain the uniqueness of the port number in cases when one port is copied to another. When a bridge port is deleted, the releasePortNum escape routine places the port number being released into a pending deletion state. This is because the port number cannot be re-allocated until the port is truly deleted in the current view. This is necessary since there is no guarantee of order when processing changes to multiple protocol ports so without the pending deletion state, the same port number could be temporarily assigned to two ports for a short period of time.

The portNum is set as component critical since bridging also uses the port number as a key for indexing into its data structures. If a port is deleted then re-added under the same protocol port, CAS treats the change as a SET to the portNum attribute.

Mib	Bridge
Values	Decimal (0..255)
Default	0

GROUP Vr Pp SrtBp TbProvisioned (TbProv)

Properties	Provisioned
Description	This group contains all the port specific provisionable attributes that belong to the Tb group. These attributes in part influence the working of a bridge port operating in the transparent bridge mode.
Mib	Bridge

ATTRIBUTE Vr Pp SrtBp secureOption (sos)

Access	Read and write
Description	This attribute specifies whether the port secure feature is enabled. The secure feature, if enabled causes the following things to happen: a) disallows dynamic learning, b) disallows frames to be forwarded that do not satisfy the following condition: the MAC address of the source should be found in the forwarding table and the destination MAC address of the frame should also be found in the forwarding table. In addition to this, the port the frame was received on should figure as the in port, given the destination MAC address found in the frame. c) disallows frames to be forwarded if the allowed to go port map for the destination MAC address is empty. This feature in effect allows the user to choose the hosts that can generate traffic and the hosts that can receive traffic through this bridge unit.
Mib	Bridge
Values	disabled enabled
Default	disabled

Copyright © 2006, Nortel Nortel Confidential

GROUP Vr Pp SrtBp StpProvisioned (StpProv)

Properties	Provisioned
Description	This group contains all port specific provisionable attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes influence the participation of the bridge port in the stp.
Mib	Bridge

ATTRIBUTE Vr Pp SrtBp adminStatus (as)

Access	Read and write
Description	This attribute defines the current administrative state for this component. ***enabled*** indicates that the component is available for operation. ***disabled*** indicates the component is unavailable for operation.
Mib	Bridge
Values	up down
Default	up

ATTRIBUTE Vr Pp SrtBp portStateStpControl (psstpc)

Access	Read and write
Description	This attribute specifies whether or not stp state for this bridge port is controlled by the stp. In essence it indicates the participation of this bridge port in the stp by accepting and acting on received bridge protocol data units and by sending out the same. ***on*** signifies that this bridge port's spanning tree port state is controlled by the stp. A value of ***off*** signifies that the spanning tree port state of this bridge port is unaffected by the stp. This in effect puts the bridge port out of reach of the stp decisions. Its stp state will be always ***forwarding***. Care should be taken while assigning a value of ***off*** to this attribute, as this might cause network loops. Please do not set this attribute to ***off*** unless you are absolutely sure about the effect of such an action on your network topology.
Mib	Bridge
Values	off on
Default	on

ATTRIBUTE Vr Pp SrtBp stpTypeProv (stptProv)

Access	Read and write
Description	This attribute specifies the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. If

Copyright © 2006, Nortel Nortel Confidential

the value of the attribute *protocolSpec* in the *SpanningTreeProtocol* component is in conflict with the value of this attribute, the value of the *protocolSpec* attribute will prevail. Prevailing stp type is reflected in the value of the attribute *stpTypeOper.*

Mib	Bridge
Values	dec ieee8021
Default	ieee8021

ATTRIBUTE Vr Pp SrtBp portPriority (ppr)

Access	Read and write
Description	This attribute specifies the value for this bridge port priority which is contained in the first octet of the port identifier. Valid values are as follows: 1) 0-255 for stp type DEC and 2) 0-65535 for stp type IEEE.
Mib	Bridge
Values	Decimal (0..65535)
Default	128

ATTRIBUTE Vr Pp SrtBp pathCost (pc)

Access	Read and write
Description	This attribute specifies the contribution of this port to all the paths to the root bridge that include this port. Please note that the value of the attribute *pathCost* is applied only when the value of the attribute *pathCostMethod* is set to ***on*** and is ignored if otherwise.
Mib	Bridge
Values	Decimal (1..65535)
Default	10

ATTRIBUTE Vr Pp SrtBp pathCostMethod (pcm)

Access	Read and write
Description	This attribute specifies the method used by the bridging logic to calculate the path cost to the bridge considered to be the root bridge in the spanning tree topology. This attribute should be set to ***off*** before attempting to provision a value for *pathCost.*
Mib	Bridge
Values	off dec ieee8021
Default	ieee8021

GROUP Vr Pp SrtBp DomainInfoProvisioned (DIProv)

Properties	Provisioned
Description	This group contains all the provisionable, domain specific attributes for a non-encapsulating bridge port.
Mib	Bridge

ATTRIBUTE Vr Pp SrtBp domainNum (dn)

Access	Read and write
Description	This attribute specifies the domain number associated with this bridge port. Domain numbers are used for confining frames to a domain. Domain based filtering provides a complete segregation of traffic based on domain number associated with frames. There can exist only sixteen domains when a spanning tree is desired specific to each domain. When there is only a single spanning tree spanning all the domains the maximum number of domains possible are 4294967293. This attribute is of no relevance when associated with backbone bridge port. Its value is ignored in such a situation.
Mib	Bridge
Values	Decimal (1..4294967293)
Default	1

ATTRIBUTE Vr Pp SrtBp preserveDomain (pds)

Access	Read and write
Criticality	Component
Description	This attribute specifies if the domain information should be preserved or embedded in the frame header. This attribute applies only to ***backbone*** ports and does not affect the ***access*** bridge ports. By setting this attribute to a value of ***on***, domain information could be preserved in frames being tunnelled across the backbone, so that this information can be deciphered at the other end of the backbone tunnel. This preserves the integrity of the domains thus preventing domain breaches while tunnelling frames across backbone network. If the value of this attribute is set to ***off*** then domain information is not preserved in the header of the frames tunnelling through the backbone. This eliminates the overhead incurred to preserve domain information across the backbone while tunnelling frames across it. Preserve domain is relevant only when used in conjunction with ATM MPE.
Mib	Bridge
Values	off on
Default	No default

GROUP Vr Pp SrtBp OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Bridge

ATTRIBUTE Vr Pp SrtBp adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Bridge
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Vr Pp SrtBp operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

Mib	Bridge
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Vr Pp SrtBp usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Bridge
Values	idle active (activ) busy
Default	idle

GROUP Vr Pp SrtBp OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	Bridge

ATTRIBUTE Vr Pp SrtBp snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	Bridge
Values	up down testing
Default	up

Copyright © 2006, Nortel Nortel Confidential

GROUP Vr Pp SrtBp Operational (Oper)

Properties	Operational
Description	This group contains all the operational attributes belonging to the base group. These attributes in part, reflect the state of a bridge port.
Mib	Bridge

ATTRIBUTE Vr Pp SrtBp portName (pn)

Access	Read only
Description	The attribute *portName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/ETH100A* would have a name ***TBP-ETH100A.***
Mib	Bridge
Values	String (4..29, ASCII)
Default	No default

ATTRIBUTE Vr Pp SrtBp upTime (ut)

Access	Read only
Description	This attribute indicates the accumulated up time of this bridge port since the last reset occurred.
Mib	Bridge
Values	Decimal (0..4294967295)
Units	seconds
Default	0

ATTRIBUTE Vr Pp SrtBp downTime (dt)

Access	Read only
Description	This attribute indicates the accumulated down time of this bridge port since the last reset occurred.
Mib	Bridge
Values	Decimal (0..4294967295)
Units	seconds
Default	0

ATTRIBUTE Vr Pp SrtBp bridgingMode (bm)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the mode of bridging this port can support. The transparent bridge mode is the only mode supported.
Mib	Bridge
Values	unknown tb sr srt
Default	No default

ATTRIBUTE Vr Pp SrtBp bridgePortConfig (bpc)

Access	Read only
Description	This attribute indicates the bridge port's configuration. It indicates if the bridge port is operating as an ***access*** port or as a ***backbone*** port. An ***access*** bridge port does not encapsulate a MAC frame and does not preserve domain information in the encapsulation, whereas a ***backbone*** bridge port encapsulates the MAC frame and optionally preserves domain information in the encapsulated frame.A ***backbone*** bridge port is typically used to transport frames across a high bandwidth backbone network to another bridge unit for further processing/forwarding of the frame.
Mib	Bridge
Values	access backbone
Default	No default

ATTRIBUTE Vr Pp SrtBp bridgePortType (bpt)

Access	Read only
Description	This attribute indicates the type of the bridge port that was provisioned. It takes into consideration the *bridgingMode*, *bridgePortConfig* and the media the bridge port is linked to before branding a bridge port.
Mib	Bridge
Values	ethernetBridgePort tokenRingBridgePort fddiBridgePort tokenBusBridgePort lanEmulationClientEthernet fddiEncapsulatingBridgePort vnsBridgePort frameRelayBridgePort pppBridgePort smdsBridgePort vcpBridgePort x25BridgePort atmMpeBridgePort

unknown

Default — No default

ATTRIBUTE Vr Pp SrtBp ifIndex (ifin)

Access — Read only

Description — This attribute indicates the index into the Interface Table where information about the media interface corresponding to this bridge port is maintained.

Mib — Bridge

Values — Decimal (1..65535)

Default — No default

ATTRIBUTE Vr Pp SrtBp mtuExceededDiscards (med)

Access — Read only

Description — This attribute counts the number of frames discarded because the size of the outbound frame exceeded the message transfer unit (mtu) allowed for the bridge port. Note that this counter only refers to the outbound frames for this bridge port. This counter wraps around its maximum value of 4294967295.
This counter is influenced by the attribute *fragmentIp.* This counter is incremented when a frame larger than the mtu allowed is encountered and cannot be fragmented. If this counter is increasing steadily, it might be useful to set the value of the attribute *fragmentIp* to a value of ***on***.

Mib — Bridge

Values — Decimal (0..4294967295)

Default — 0

GROUP Vr Pp SrtBp TbOperational (TbOper)

Properties — Operational

Description — This group contains all the port specific operational attributes that belong to the Tb group. This group also contains all the port specific statistical attributes that belong to the Tb group. These attributes reflect the state of a bridge port operating in the transparent bridge mode

Mib — Bridge

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Pp SrtBp maxInfo (mi)

Access	Read only
Description	This attribute indicates the maximum size of the information field in a transparent bridge frame. This excludes the header field.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrtBp badVerifyDiscards (bvd)

Access	Read only
Description	This attribute counts the number of incoming frames that were discarded because the value of the *secureOption* attribute was set to ***on*** and: a) it is not allowed to receive frames originating from the MAC address found in the source address field of the frame (source MAC address lookup in the forwarding table failed) on this bridge port, or b) for the destination MAC address found in the frame the port the frame was received on does not appear as in port in the corresponding static table entry. Permission to receive frames from a MAC address is granted via the static table entries. This attribute, *badVerifyDiscards*, is directly influenced by: 1. *secureOption* and 2. the static table entries. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrtBp staticEntryDiscards (sed)

Access	Read only
Description	This attribute counts the number of frames that were discarded because of the following three reasons: a) there was no entry for the “allowed to go” field in the static table entry, where the input port is this bridge port. b) the MAC destination address in the frame was not found in the forwarding table but the frame cannot be flooded because this bridge has not other ports in forwarding state. c) for spanning tree bpdus that are locally processed. This counter wraps around its maximum value of 4294967295. It might prove useful to check the static table entry corresponding to the bridge port in question, if this counter consistently displays a high value. Ideally this counter should be as low as possible.

Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrtBp dynamicEntryDiscards (dend)

Access	Read only
Description	This attribute counts the number of incoming frames that: a) were discarded because of the fact that the bridge port, the frame is to go out of matches the bridge port it came in from, or b) if the stp port state of the out port is not ***forwarding***. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrtBp learningDiscards (ld)

Access	Read only
Description	This attribute counts the number of frames that were discarded while this bridge port was in a state other than the ***forwarding*** state. While in ***learning*** state the frame is discarded after the information from its header is learnt. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrtBp inDiscards (id)

Access	Read only
Description	This attribute counts the number of frames that were received by this bridge port and were discarded by the forwarding process. This includes frames that could have been discarded due to filtering. A rapidly increasing value for this attribute could indicate a shortage of resource in terms of memory needed to process the incoming frames. More memory can be provisioned through the *VirtualRouter*'s memory manager.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrtBp inFrames (if)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of frames that have been received by this port from its segment. Note that a frame received on this bridge port is counted if and only if it can be processed by the bridge logic contained in this bridge unit. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrtBp outFrames (of)

Access	Read only
Description	This attribute counts the number of frames that have been transmitted out this bridge port. This also includes management frames.This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

GROUP Vr Pp SrtBp StpOperational (StpOper)

Properties	Operational
Description	This group contains all port specific operational attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes reflect the state of the bridge port's participation in the stp.
Mib	Bridge

ATTRIBUTE Vr Pp SrtBp stpPortState (sps)

Access	Read only
Description	This attribute indicates the stp state of the bridge port.
Mib	Bridge
Values	disabled blocking listening learning forwarding broken
Default	disabled

ATTRIBUTE Vr Pp SrtBp stpTypeOper (stptOper)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp.
Mib	Bridge
Values	none dec ieee8021
Default	ieee8021

ATTRIBUTE Vr Pp SrtBp designatedCost (dc)

Access	Read only
Description	This attribute indicates the path cost of the designated port of the lan segment the designated port is connected to.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Pp SrtBp pathCostOper (pco)

Access	Read only
Description	This attribute indicates the contribution of this port to all the paths to the root bridge that include this port. This attribute *pathCostOper* will track the value of the attribute *pathCost* when the value of the attribute *pathCostMethod* is set of ***off***.
Mib	Bridge
Values	Decimal (1..65535)
Default	No default

ATTRIBUTE Vr Pp SrtBp designatedBridge (db)

Access	Read only
Description	This attribute indicates the identifier of the bridge that this port considers to be the designated bridge.
Mib	Bridge
Values	String (8, Dashed Hex)
Default	No default

ATTRIBUTE Vr Pp SrtBp designatedPort (dp)

Access	Read only
Description	This attribute indicates the port identifier of the port on the designated bridge attached to the same LAN segment as this port is attached to.

Copyright © 2006, Nortel Nortel Confidential

Mib	Bridge
Values	Hex (H.0..H.ffff)
Default	No default

ATTRIBUTE Vr Pp SrtBp forwardTransitions (ft)

Access	Read only
Description	This attribute counts the number of times this bridge port transitioned from the ***learning*** state to the ***forwarding*** state. This counter wraps around its maximum value of 4294967295. A rapidly increasing value might be indicative of an unstable spanning tree topology.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrtBp blockingDiscards (bd)

Access	Read only
Description	This attribute counts the number of the incoming frames that were discarded because the bridge port was in the ***blocking*** state. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrtBp designatedRoot (dr)

Access	Read only
Description	This attribute indicates the bridge identifier of the bridge recorded as the root bridge in the configuration BPDUs sent out by the designated bridge on the segment this port is attached to.
Mib	Bridge
Values	String (8, Dashed Hex)
Default	No default

GROUP Vr Pp SrtBp Statistics (Stats)

Properties	Operational
Description	This group contains all the statistical attributes applicable to all types of bridge ports and represents the common factor between them. These attributes in part reflect the state of the bridge port.
Mib	Bridge

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Pp SrtBp badAbstractDiscards (bad)

Access	Read only
Description	This attribute counts the number of frames that were discarded because the data abstracted from the frames coming in through this bridge port did not conform to the format expected by the bridge logic.This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrtBp tinygramFramesIn (tfi)

Access	Read only
Description	This attribute counts the number of frames received on this bridge port that used the tinygram compression scheme.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrtBp tinygramFramesOut (tfo)

Access	Read only
Description	This attribute counts the number of frames transmitted out this bridge port that used the tinygram compression scheme.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrtBp inFilterDiscards (ifd)

Access	Read only
Description	This attribute counts the number of frames discarded due to domain based filtering at the in filter point. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrtBp outFilterDiscards (ofd)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of frames discarded due to domain based filtering at the out filter point. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

GROUP Vr Pp SrtBp SrProvisioned (SrProv)

Properties	Provisioned
Description	This group contains all port specific, provisionable attributes associated with *SourceRouteBridge* ports.
Mib	Bridge

ATTRIBUTE Vr Pp SrtBp hopCount (hc)

Access	Read and write
Description	This attribute specifies the maximum number of hops allowed in Spanning Tree Explore and All Routes Explore frames. This value is one less than the maximum number of route descriptors allowed in a source route frame
Mib	Bridge
Values	Decimal (1..7)
Default	7

ATTRIBUTE Vr Pp SrtBp exploreFrameTreatment (eft)

Access	Read and write
Description	This attribute specifies whether or not explore frames received from *SourceRouteBridge* ports will be sent to the SRTB-8209 translation or the encapsulated *SourceRouteBridge* logic. This option is used only when both the *TbsrBridgePort* and the *SrtbBridgePort* are provisioned and enabled. A value of ***Xlate*** implies that the explore frames will be sent to the Srtb translation logic and a value of ***Encap*** implies that the frames will be sent to the Encapsulated source route bridging logic.
Mib	Bridge
Values	encap xlate
Default	encap

ATTRIBUTE Vr Pp SrtBp lanId (lid)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the identifier for the physical LAN that this port is attached. All *SourceRouteBridge* ports are assigned to a physical LAN and a logical internal LAN. Current source route bridge implementations limit the lanId to a value in the range 0 to 4095.
Mib	Bridge
Values	Decimal (0..4095)
Default	0

ATTRIBUTE Vr Pp SrtBp internalLanId (ilid)

Access	Read and write
Description	This attribute specifies the identifier for the internal logical LAN this port is attached. All *SourceRouteBridge* ports are assigned to a physical LAN and a logical internal LAN. Current source route bridge implementations limit the lanId to a value in the range 0 to 4095.
Mib	Bridge
Values	Decimal (0..4095)
Default	0

ATTRIBUTE Vr Pp SrtBp bridgeNum (bid)

Access	Read and write
Description	This attribute specifies the value that is used to identify this bridge when more than one bridge is used to span the same two LAN segments.
Mib	Bridge
Values	Decimal (0..15)
Default	7

ATTRIBUTE Vr Pp SrtBp largestFrame (lf)

Access	Read and write
Description	This attribute specifies the maximum frame size (LLC and above) in octets, allowed by this *SourceRouteBridge* port. This field is used to determine whether a modification of the largest frame field of the routing control field of the routing information field is warranted.
Mib	Bridge
Values	Decimal (516; 1470; 2052; 4399; 8130; 11407; 17749)
Units	octets
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Pp SrtBp steSpanMode (steSm)

Access	Read and write
Description	This attribute determines how this bridge port will react when presented with a Spanning Tree Explore frame. If ***disabled,*** the Spanning Tree Explore frame is discarded regardless of the value of *stpPortState.* If the value of this attribute is ***forced***, the Spanning Tree Explore frame is forwarded regardless of the value of *stpPortState.* ***autoSpan*** uses the *stpPortState* value to decide whether or not Spanning Tree Explore frames should be forwarded out this bridge port. If the port is in the ***forwarding*** state, the frame is received and transmitted otherwise the frame is discarded.
Mib	Bridge
Values	autoSpan disabled forced
Default	autoSpan

ATTRIBUTE Vr Pp SrtBp areRdLimit (arl)

Access	Read and write
Description	This attribute specifies the number of route descriptors allowed in an All Routes Explore frame received on a *SourceRouteBridgePort* or *SourceRouteTransparentBridgePort*. Current source route bridge implementations limit the *areRdLimit* to a value in the range 0 to 8.
Mib	Bridge
Values	Decimal (0..8)
Default	8

ATTRIBUTE Vr Pp SrtBp steRdLimit (srl)

Access	Read and write
Description	This attribute specifies the number of route descriptors allowed in a Spanning Tree Explore frame received on a *SourceRouteBridgePort* or *SourceRouteTransparentBridgePort*. Current source route bridge implementations limit the *steRdLimit* to a value in the range 0 to 8.
Mib	Bridge
Values	Decimal (0..8)
Default	8

GROUP Vr Pp SrtBp SrStatistics (SrStats)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains all port specific statistical attributes associated with *SourceRouteBridge* ports.
Mib	Bridge

ATTRIBUTE Vr Pp SrtBp specInFrames (sif)

Access	Read only
Description	This attribute specifies the number of specifically routed frames that were received by this bridge port. A specifically routed frame has a route descriptor, constructed by the originating host which details an explicit route to the destination host. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrtBp specOutFrames (srfof)

Access	Read only
Description	This attribute specifies the number of specifically routed frames that were transmitted from this bridge port. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrtBp apeInFrames (apeif)

Access	Read only
Description	This attribute specifies the number of All Path Explore frames received on this bridge port. The All Path Explore frames are forwarded to all *SourceRouteBridge* ports assigned to this bridge regardless of the port's *portStpState*s. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrtBp apeOutFrames (apeof)

Access	Read only
Description	This attribute specifies the number of All Path Explore frames transmitted on this bridge port. The All Path Explore frames are forwarded to all *SourceRouteBridge* ports assigned to this bridge regardless of the port's

portStpState state. This counter will wrap to zero when it exceeds its maximum.

Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrtBp steInFrames (steif)

Access	Read only
Description	This attribute specifies the number of Spanning Tree Explore frames received on this bridge port. The Spanning Tree Explore frames are only forwarded through bridge ports whose *portStpState* has a value of ***forwarding.*** This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrtBp steOutFrames (steof)

Access	Read only
Description	This attribute specifies the number of Spanning Tree Frames transmitted on this bridge port. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrtBp segmentMismatchDiscards (lidmd)

Access	Read only
Description	This attribute specifies the number of All Routes Explore and Spanning Tree Explore frames that were discarded due to an invalid next segment value in the routing information field. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrtBp dupSegmentDiscards (dsd)

Access	Read only
Description	This attribute specifies the number of frames discarded due to the presence of a duplicate segment identifier in the route descriptor field

Copyright © 2006, Nortel Nortel Confidential

	which may indicate a loop in the network topology. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrtBp hopCountExceededDiscards (hced)

Access	Read only
Description	This attribute specifies the number of All Routes Explore and Spanning Tree Explore frames discarded by this bridge port due to a frame exceeding the maximum size allowed for a route descriptor length. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrtBp dupLanIdOrTreeErrors (dlte)

Access	Read only
Description	This attribute specifies the number frames received which contain duplicate LAN IDs or Tree errors. This attribute is helpful in debugging problems in networks which contain older IBM-SR bridges. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrtBp lanIdMismatches

Access	Read only
Description	This attributes counts the number of All Routes Explore or Spanning Tree Explore frames that were discarded because the last LAN ID in the routing information field did not equal the LAN ID. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrtBp staticDiscards (sd)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute is indicative of the number of explorer frames discarded due to fact that the outbound *SourceRouteBridge* port was disabled or deleted. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp SrtBp dynamicDiscards (dd)

Access	Read only
Description	This attribute specifies the number of frames discarded due to receiving a frame with a target LAN ID which did not match the internal LAN ID of the receiving bridge port. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

COMPONENT Vr Pp SrtBp NetSentry (Ns)

Groups	GROUP Vr Pp SrtBp Ns Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Pp/<string> TransparentBridgePort NetSentry* This component represents the *Ns* functionality that can be applied to a bridge port. It contains all the attribute groups (provisionable) that are necessary for the application of Ns functionality to a bridge port. In essence, it allows for the definition of filters, at the incoming and outgoing points, specific to the interface represented by this bridge port.
Mib	Bridge
Common Verbs	Help List Display Add DELete

GROUP Vr Pp SrtBp Ns Provisioned (Prov)

Properties	Provisioned
Description	This group houses all the port specific provisionable attributes associated with Ns. These attributes influence the application of filters to incoming and outgoing frames.
Mib	Bridge

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Pp SrtBp Ns incomingFilter (if)

Access	Read and write
Description	This attribute specifies the name of the filter to be applied at the incoming filter point.
Mib	Bridge
Values	String (0..32, ASCII)
Default	No default

ATTRIBUTE Vr Pp SrtBp Ns outgoingFilter (of)

Access	Read and write
Description	This attribute specifies the name of the filter to be applied at the out going filter point.
Mib	Bridge
Values	String (0..32, ASCII)

Scope	Application
Description	Vr/*<string>* Pp/*<string>* *SrseBridgePort* This component represents the access point for source route frames destined for the source route encapsulating logic. Source route encapsulated bridging enables source routed frames to be tunneled through a transparent bridge/source route transparent cloud in order to reach a remote source route network. This mechanism provides for virtual connectivity of source route networks across non source route networks. The *SrseBridgePort* essentially provides an access point for source route frames into this virtual connectivity. Note that the *SrseBridgePort* and the *TbseBridgePort* must be provisioned in the same provisioning session.

Copyright © 2006, Nortel Nortel Confidential

Enabling/disabling the *SrseBridgePort* automatically enables/disables the *TbseBridgePort*.

GROUP Vr Pp Srse Provisioned (Prov)

Properties: Provisioned

Description: This group contains all the provisionable attributes that belong to this group. This group of attributes is applicable to all types of bridge ports and represent the common factor between them. These attributes influence the working of a bridge port.

Mib: Bridge

ATTRIBUTE Vr Pp Srse fragmentIp (fIp)

Access: Read and write

Description: This attribute specifies if outbound frames carrying IP datagrams should be fragmented to conform to message transfer unit (*mtu*) sizes dictated by the media.

Mib: Bridge

Values:
off
on

Default: off

ATTRIBUTE Vr Pp Srse portNum (pNum)

Access: Read only

Criticality: Component

Description: This attribute indicates the unique number assigned to the bridge port. It is used for SNMP management of this bridge port and in spanning tree as an identifier for this bridge port.
Notes:
Escape routines exist for initializing, copying, and deleting port numbers. This is necessary because SNMP requires a unique port instance identifier. The initPortNum escape routine sets the port number to a value in the range 1-255 for this purpose. The setCopiedPortNum escape routine exists to maintain the uniqueness of the port number in cases when one port is copied to another. When a bridge port is deleted, the

Copyright © 2006, Nortel Nortel Confidential

releasePortNum escape routine places the port number being released into a pending deletion state. This is because the port number cannot be re-allocated until the port is truly deleted in the current view. This is necessary since there is no guarantee of order when processing changes to multiple protocol ports so without the pending deletion state, the same port number could be temporarily assigned to two ports for a short period of time.

The portNum is set as component critical since bridging also uses the port number as a key for indexing into its data structures. If a port is deleted then re-added under the same protocol port, CAS treats the change as a SET to the portNum attribute.

Mib	Bridge
Values	Decimal (0..255)
Default	0

GROUP Vr Pp Srse StpProvisioned (StpProv)

Properties	Provisioned
Description	This group contains all port specific provisionable attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes influence the participation of the bridge port in the stp.
Mib	Bridge

ATTRIBUTE Vr Pp Srse adminStatus (as)

Access	Read and write
Description	This attribute defines the current administrative state for this component. ***enabled*** indicates that the component is available for operation. ***disabled*** indicates the component is unavailable for operation.
Mib	Bridge
Values	up down
Default	up

ATTRIBUTE Vr Pp Srse portStateStpControl (psstpc)

Access	Read and write
Description	This attribute specifies whether or not stp state for this bridge port is controlled by the stp. In essence it indicates the participation of this bridge port in the stp by accepting and acting on received bridge protocol data units and by sending out the same. ***on*** signifies that this bridge port's spanning tree port state is controlled by the stp. A value of ***off*** signifies that the spanning tree port state of this bridge port

Copyright © 2006, Nortel Nortel Confidential

is unaffected by the stp. This in effect puts the bridge port out of reach of the stp decisions. Its stp state will be always ***forwarding***. Care should be taken while assigning a value of ***off*** to this attribute, as this might cause network loops. Please do not set this attribute to ***off*** unless you are absolutely sure about the effect of such an action on your network topology.

Mib	Bridge
Values	off on
Default	on

ATTRIBUTE Vr Pp Srse stpTypeProv (stptProv)

Access	Read and write
Description	This attribute specifies the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. If the value of the attribute *protocolSpec* in the *SpanningTreeProtocol* component is in conflict with the value of this attribute, the value of the *protocolSpec* attribute will prevail. Prevailing stp type is reflected in the value of the attribute *stpTypeOper.*
Mib	Bridge
Values	dec ieee8021
Default	ieee8021

ATTRIBUTE Vr Pp Srse portPriority (ppr)

Access	Read and write
Description	This attribute specifies the value for this bridge port priority which is contained in the first octet of the port identifier. Valid values are as follows: 1) 0-255 for stp type DEC and 2) 0-65535 for stp type IEEE.
Mib	Bridge
Values	Decimal (0..65535)
Default	128

ATTRIBUTE Vr Pp Srse pathCost (pc)

Access	Read and write
Description	This attribute specifies the contribution of this port to all the paths to the root bridge that include this port. Please note that the value of the attribute *pathCost* is applied only when the value of the attribute *pathCostMethod* is set to ***on*** and is ignored if otherwise.
Mib	Bridge

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (1..65535)
Default	10

ATTRIBUTE Vr Pp Srse pathCostMethod (pcm)

Access	Read and write
Description	This attribute specifies the method used by the bridging logic to calculate the path cost to the bridge considered to be the root bridge in the spanning tree topology. This attribute should be set to ***off*** before attempting to provision a value for *pathCost.*
Mib	Bridge
Values	off dec ieee8021
Default	ieee8021

GROUP Vr Pp Srse DomainInfoProvisioned (DIProv)

Properties	Provisioned
Description	This group contains all the provisionable, domain specific attributes for a non-encapsulating bridge port.
Mib	Bridge

ATTRIBUTE Vr Pp Srse domainNum (dn)

Access	Read and write
Description	This attribute specifies the domain number associated with this bridge port. Domain numbers are used for confining frames to a domain. Domain based filtering provides a complete segregation of traffic based on domain number associated with frames. There can exist only sixteen domains when a spanning tree is desired specific to each domain. When there is only a single spanning tree spanning all the domains the maximum number of domains possible are 4294967293. This attribute is of no relevance when associated with backbone bridge port. Its value is ignored in such a situation.
Mib	Bridge
Values	Decimal (1..4294967293)
Default	1

ATTRIBUTE Vr Pp Srse preserveDomain (pds)

Access	Read and write
Criticality	Component
Description	This attribute specifies if the domain information should be preserved or embedded in the frame header. This attribute applies only to ***backbone***

Copyright © 2006, Nortel Nortel Confidential

ports and does not affect the ***access*** bridge ports. By setting this attribute to a value of ***on***, domain information could be preserved in frames being tunnelled across the backbone, so that this information can be deciphered at the other end of the backbone tunnel. This preserves the integrity of the domains thus preventing domain breaches while tunnelling frames across backbone network.
If the value of this attribute is set to ***off*** then domain information is not preserved in the header of the frames tunnelling through the backbone. This eliminates the overhead incurred to preserve domain information across the backbone while tunnelling frames across it.
Preserve domain is relevant only when used in conjunction with ATM MPE.

Mib	Bridge
Values	off on
Default	No default

GROUP Vr Pp Srse OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Bridge

ATTRIBUTE Vr Pp Srse adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Bridge

Copyright © 2006, Nortel Nortel Confidential

Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Vr Pp Srse operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Bridge
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Vr Pp Srse usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Bridge
Values	idle active (activ) busy
Default	idle

GROUP Vr Pp Srse OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

Copyright © 2006, Nortel Nortel Confidential

Mib	Bridge

ATTRIBUTE Vr Pp Srse snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	Bridge
Values	up down testing
Default	up

GROUP Vr Pp Srse Operational (Oper)

Properties	Operational
Description	This group contains all the operational attributes belonging to the base group. These attributes in part, reflect the state of a bridge port.
Mib	Bridge

ATTRIBUTE Vr Pp Srse portName (pn)

Access	Read only
Description	The attribute *portName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/ETH100A* would have a name ***TBP-ETH100A.***
Mib	Bridge
Values	String (4..29, ASCII)
Default	No default

ATTRIBUTE Vr Pp Srse upTime (ut)

Access	Read only
Description	This attribute indicates the accumulated up time of this bridge port since the last reset occurred.
Mib	Bridge
Values	Decimal (0..4294967295)
Units	seconds
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Pp Srse downTime (dt)

Access	Read only
Description	This attribute indicates the accumulated down time of this bridge port since the last reset occurred.
Mib	Bridge
Values	Decimal (0..4294967295)
Units	seconds
Default	0

ATTRIBUTE Vr Pp Srse bridgingMode (bm)

Access	Read only
Description	This attribute indicates the mode of bridging this port can support. The transparent bridge mode is the only mode supported.
Mib	Bridge
Values	unknown tb sr srt
Default	No default

ATTRIBUTE Vr Pp Srse bridgePortConfig (bpc)

Access	Read only
Description	This attribute indicates the bridge port's configuration. It indicates if the bridge port is operating as an ***access*** port or as a ***backbone*** port. An ***access*** bridge port does not encapsulate a MAC frame and does not preserve domain information in the encapsulation, whereas a ***backbone*** bridge port encapsulates the MAC frame and optionally preserves domain information in the encapsulated frame.A ***backbone*** bridge port is typically used to transport frames across a high bandwidth backbone network to another bridge unit for further processing/forwarding of the frame.
Mib	Bridge
Values	access backbone
Default	No default

ATTRIBUTE Vr Pp Srse bridgePortType (bpt)

Access	Read only
Description	This attribute indicates the type of the bridge port that was provisioned. It takes into consideration the *bridgingMode*, *bridgePortConfig* and the media the bridge port is linked to before branding a bridge port.

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Vr Pp Srse ifIndex (ifin)

Access	Read only
Description	This attribute indicates the index into the Interface Table where information about the media interface corresponding to this bridge port is maintained.
Mib	Bridge
Values	Decimal (1..65535)
Default	No default

ATTRIBUTE Vr Pp Srse mtuExceededDiscards (med)

Access	Read only
Description	This attribute counts the number of frames discarded because the size of the outbound frame exceeded the message transfer unit (mtu) allowed for the bridge port. Note that this counter only refers to the outbound frames for this bridge port. This counter wraps around its maximum value of 4294967295. This counter is influenced by the attribute *fragmentIp.* This counter is incremented when a frame larger than the mtu allowed is encountered and cannot be fragmented. If this counter is increasing steadily, it might be useful to set the value of the attribute *fragmentIp* to a value of ***on***.

Copyright © 2006, Nortel Nortel Confidential

Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

GROUP Vr Pp Srse StpOperational (StpOper)

Properties	Operational
Description	This group contains all port specific operational attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes reflect the state of the bridge port's participation in the stp.
Mib	Bridge

ATTRIBUTE Vr Pp Srse stpPortState (sps)

Access	Read only
Description	This attribute indicates the stp state of the bridge port.
Mib	Bridge
Values	disabled blocking listening learning forwarding broken
Default	disabled

ATTRIBUTE Vr Pp Srse stpTypeOper (stptOper)

Access	Read only
Description	This attribute indicates the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp.
Mib	Bridge
Values	none dec ieee8021
Default	ieee8021

ATTRIBUTE Vr Pp Srse designatedCost (dc)

Access	Read only
Description	This attribute indicates the path cost of the designated port of the lan segment the designated port is connected to.
Mib	Bridge

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Pp Srse pathCostOper (pco)

Access	Read only
Description	This attribute indicates the contribution of this port to all the paths to the root bridge that include this port. This attribute *pathCostOper* will track the value of the attribute *pathCost* when the value of the attribute *pathCostMethod* is set of ***off***.
Mib	Bridge
Values	Decimal (1..65535)
Default	No default

ATTRIBUTE Vr Pp Srse designatedBridge (db)

Access	Read only
Description	This attribute indicates the identifier of the bridge that this port considers to be the designated bridge.
Mib	Bridge
Values	String (8, Dashed Hex)
Default	No default

ATTRIBUTE Vr Pp Srse designatedPort (dp)

Access	Read only
Description	This attribute indicates the port identifier of the port on the designated bridge attached to the same LAN segment as this port is attached to.
Mib	Bridge
Values	Hex (H.0..H.ffff)
Default	No default

ATTRIBUTE Vr Pp Srse forwardTransitions (ft)

Access	Read only
Description	This attribute counts the number of times this bridge port transitioned from the ***learning*** state to the ***forwarding*** state. This counter wraps around its maximum value of 4294967295. A rapidly increasing value might be indicative of an unstable spanning tree topology.
Mib	Bridge
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Vr Pp Srse blockingDiscards (bd)

Access	Read only
Description	This attribute counts the number of the incoming frames that were discarded because the bridge port was in the ***blocking*** state. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srse designatedRoot (dr)

Access	Read only
Description	This attribute indicates the bridge identifier of the bridge recorded as the root bridge in the configuration BPDUs sent out by the designated bridge on the segment this port is attached to.
Mib	Bridge
Values	String (8, Dashed Hex)
Default	No default

GROUP Vr Pp Srse Statistics (Stats)

Properties	Operational
Description	This group contains all the statistical attributes applicable to all types of bridge ports and represents the common factor between them. These attributes in part reflect the state of the bridge port.
Mib	Bridge

ATTRIBUTE Vr Pp Srse badAbstractDiscards (bad)

Access	Read only
Description	This attribute counts the number of frames that were discarded because the data abstracted from the frames coming in through this bridge port did not conform to the format expected by the bridge logic.This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srse tinygramFramesIn (tfi)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of frames received on this bridge port that used the tinygram compression scheme.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srse tinygramFramesOut (tfo)

Access	Read only
Description	This attribute counts the number of frames transmitted out this bridge port that used the tinygram compression scheme.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srse inFilterDiscards (ifd)

Access	Read only
Description	This attribute counts the number of frames discarded due to domain based filtering at the in filter point. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srse outFilterDiscards (ofd)

Access	Read only
Description	This attribute counts the number of frames discarded due to domain based filtering at the out filter point. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

GROUP Vr Pp Srse SrProvisioned (SrProv)

Properties	Provisioned
Description	This group contains all port specific, provisionable attributes associated with *SourceRouteBridge* ports.
Mib	Bridge

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Pp Srse hopCount (hc)

Access	Read and write
Description	This attribute specifies the maximum number of hops allowed in Spanning Tree Explore and All Routes Explore frames. This value is one less than the maximum number of route descriptors allowed in a source route frame
Mib	Bridge
Values	Decimal (1..7)
Default	7

ATTRIBUTE Vr Pp Srse exploreFrameTreatment (eft)

Access	Read and write
Description	This attribute specifies whether or not explore frames received from *SourceRouteBridge* ports will be sent to the SRTB-8209 translation or the encapsulated *SourceRouteBridge* logic. This option is used only when both the *TbsrBridgePort* and the *SrtbBridgePort* are provisioned and enabled. A value of ***Xlate*** implies that the explore frames will be sent to the Srtb translation logic and a value of ***Encap*** implies that the frames will be sent to the Encapsulated source route bridging logic.
Mib	Bridge
Values	encap xlate
Default	encap

ATTRIBUTE Vr Pp Srse lanId (lid)

Access	Read and write
Description	This attribute specifies the identifier for the physical LAN that this port is attached. All *SourceRouteBridge* ports are assigned to a physical LAN and a logical internal LAN. Current source route bridge implementations limit the lanId to a value in the range 0 to 4095.
Mib	Bridge
Values	Decimal (0..4095)
Default	0

ATTRIBUTE Vr Pp Srse internalLanId (ilid)

Access	Read and write
Description	This attribute specifies the identifier for the internal logical LAN this port is attached. All *SourceRouteBridge* ports are assigned to a physical LAN and a logical internal LAN.

Copyright © 2006, Nortel Nortel Confidential

	Current source route bridge implementations limit the lanId to a value in the range 0 to 4095.
Mib	Bridge
Values	Decimal (0..4095)
Default	0

ATTRIBUTE Vr Pp Srse bridgeNum (bid)

Access	Read and write
Description	This attribute specifies the value that is used to identify this bridge when more than one bridge is used to span the same two LAN segments.
Mib	Bridge
Values	Decimal (0..15)
Default	7

ATTRIBUTE Vr Pp Srse largestFrame (lf)

Access	Read and write
Description	This attribute specifies the maximum frame size (LLC and above) in octets, allowed by this *SourceRouteBridge* port. This field is used to determine whether a modification of the largest frame field of the routing control field of the routing information field is warranted.
Mib	Bridge
Values	Decimal (516; 1470; 2052; 4399; 8130; 11407; 17749)
Units	octets
Default	No default

ATTRIBUTE Vr Pp Srse steSpanMode (steSm)

Access	Read and write
Description	This attribute determines how this bridge port will react when presented with a Spanning Tree Explore frame. If ***disabled,*** the Spanning Tree Explore frame is discarded regardless of the value of *stpPortState.* If the value of this attribute is ***forced***, the Spanning Tree Explore frame is forwarded regardless of the value of *stpPortState.* ***autoSpan*** uses the *stpPortState* value to decide whether or not Spanning Tree Explore frames should be forwarded out this bridge port. If the port is in the ***forwarding*** state, the frame is received and transmitted otherwise the frame is discarded.
Mib	Bridge

Copyright © 2006, Nortel Nortel Confidential

Values	autoSpan disabled forced
Default	autoSpan

ATTRIBUTE Vr Pp Srse areRdLimit (arl)

Access	Read and write
Description	This attribute specifies the number of route descriptors allowed in an All Routes Explore frame received on a *SourceRouteBridgePort* or *SourceRouteTransparentBridgePort*. Current source route bridge implementations limit the *areRdLimit* to a value in the range 0 to 8.
Mib	Bridge
Values	Decimal (0..8)
Default	8

ATTRIBUTE Vr Pp Srse steRdLimit (srl)

Access	Read and write
Description	This attribute specifies the number of route descriptors allowed in a Spanning Tree Explore frame received on a *SourceRouteBridgePort* or *SourceRouteTransparentBridgePort*. Current source route bridge implementations limit the *steRdLimit* to a value in the range 0 to 8.
Mib	Bridge
Values	Decimal (0..8)
Default	8

GROUP Vr Pp Srse SrStatistics (SrStats)

Properties	Operational
Description	This group contains all port specific statistical attributes associated with *SourceRouteBridge* ports.
Mib	Bridge

ATTRIBUTE Vr Pp Srse specInFrames (sif)

Access	Read only
Description	This attribute specifies the number of specifically routed frames that were received by this bridge port. A specifically routed frame has a route descriptor, constructed by the originating host which details an explicit route to the destination host. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Vr Pp Srse specOutFrames (srfof)

Access	Read only
Description	This attribute specifies the number of specifically routed frames that were transmitted from this bridge port. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srse apeInFrames (apeif)

Access	Read only
Description	This attribute specifies the number of All Path Explore frames received on this bridge port. The All Path Explore frames are forwarded to all *SourceRouteBridge* ports assigned to this bridge regardless of the port's *portStpState*s. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srse apeOutFrames (apeof)

Access	Read only
Description	This attribute specifies the number of All Path Explore frames transmitted on this bridge port. The All Path Explore frames are forwarded to all *SourceRouteBridge* ports assigned to this bridge regardless of the port's *portStpState* state. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srse steInFrames (steif)

Access	Read only
Description	This attribute specifies the number of Spanning Tree Explore frames received on this bridge port. The Spanning Tree Explore frames are only forwarded through bridge ports whose *portStpState* has a value of ***forwarding.*** This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srse steOutFrames (steof)

Access	Read only
Description	This attribute specifies the number of Spanning Tree Frames transmitted on this bridge port. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srse segmentMismatchDiscards (lidmd)

Access	Read only
Description	This attribute specifies the number of All Routes Explore and Spanning Tree Explore frames that were discarded due to an invalid next segment value in the routing information field. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srse dupSegmentDiscards (dsd)

Access	Read only
Description	This attribute specifies the number of frames discarded due to the presence of a duplicate segment identifier in the route descriptor field which may indicate a loop in the network topology. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srse hopCountExceededDiscards (hced)

Access	Read only
Description	This attribute specifies the number of All Routes Explore and Spanning Tree Explore frames discarded by this bridge port due to a frame exceeding the maximum size allowed for a route descriptor length. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srse dupLanIdOrTreeErrors (dlte)

Access	Read only
Description	This attribute specifies the number frames received which contain duplicate LAN IDs or Tree errors. This attribute is helpful in debugging problems in networks which contain older IBM-SR bridges. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srse lanIdMismatches

Access	Read only
Description	This attributes counts the number of All Routes Explore or Spanning Tree Explore frames that were discarded because the last LAN ID in the routing information field did not equal the LAN ID. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srse staticDiscards (sd)

Access	Read only
Description	This attribute is indicative of the number of explorer frames discarded due to fact that the outbound *SourceRouteBridge* port was disabled or deleted. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srse dynamicDiscards (dd)

Access	Read only
Description	This attribute specifies the number of frames discarded due to receiving a frame with a target LAN ID which did not match the internal LAN ID of the receiving bridge port. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)

COMPONENT Vr Pp TbseBridgePort (Tbse)

Groups	GROUP Vr Pp Tbse Provisioned (Prov) GROUP Vr Pp Tbse TbProvisioned (TbProv) GROUP Vr Pp Tbse StpProvisioned (StpProv) GROUP Vr Pp Tbse DomainInfoProvisioned (DIProv) GROUP Vr Pp Tbse OsiState (State) GROUP Vr Pp Tbse OperationalStatus (OperStatus) GROUP Vr Pp Tbse Operational (Oper) GROUP Vr Pp Tbse TbOperational (TbOper) GROUP Vr Pp Tbse StpOperational (StpOper) GROUP Vr Pp Tbse Statistics (Stats)
Scope	Application
Description	Vr/*<string>* Pp/*<string>* *TbseBridgePort* This component represents the access point or TB/SRT frames carrying a payload of a SR frame, into the SR encapsulation logic. After the encapsulated frame is stripped and the SR frame extracted, the extracted frame is handed down to regular SR bridging logic for further forwarding. The *TbseBridgePort* is the end point in the remote bridge unit with a MAC address, the TB/SRT encapsulated SR frames are directed to. This MAC address of a *TbseBridgePort* in the remote bridge unit, is learned and stored in the Lan Id Table (*peerMACAddress)* of the local bridge unit. Please note that the *SrseBridgePort* and the *TbseBridgePort* are always to be provisioned together. Enabling/disabling the *SrseBridgePort* automatically enables/disables the *TbseBridgePort*.
Mib	Bridge

GROUP Vr Pp Tbse Provisioned (Prov)

Properties	Provisioned
Description	This group contains all the provisionable attributes that belong to this group. This group of attributes is applicable to all types of bridge ports and represent the common factor between them. These attributes influence the working of a bridge port.
Mib	Bridge

ATTRIBUTE Vr Pp Tbse fragmentIp (fIp)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies if outbound frames carrying IP datagrams should be fragmented to conform to message transfer unit (*mtu*) sizes dictated by the media.
Mib	Bridge
Values	off on
Default	off

ATTRIBUTE Vr Pp Tbse portNum (pNum)

Access	Read only
Criticality	Component
Description	This attribute indicates the unique number assigned to the bridge port. It is used for SNMP management of this bridge port and in spanning tree as an identifier for this bridge port. Notes: Escape routines exist for initializing, copying, and deleting port numbers. This is necessary because SNMP requires a unique port instance identifier. The initPortNum escape routine sets the port number to a value in the range 1-255 for this purpose. The setCopiedPortNum escape routine exists to maintain the uniqueness of the port number in cases when one port is copied to another. When a bridge port is deleted, the releasePortNum escape routine places the port number being released into a pending deletion state. This is because the port number cannot be re-allocated until the port is truly deleted in the current view. This is necessary since there is no guarantee of order when processing changes to multiple protocol ports so without the pending deletion state, the same port number could be temporarily assigned to two ports for a short period of time. The portNum is set as component critical since bridging also uses the port number as a key for indexing into its data structures. If a port is deleted then re-added under the same protocol port, CAS treats the change as a SET to the portNum attribute.
Mib	Bridge
Values	Decimal (0..255)
Default	0

GROUP Vr Pp Tbse TbProvisioned (TbProv)

Properties	Provisioned
Description	This group contains all the port specific provisionable attributes that belong to the Tb group. These attributes in part influence the working of a bridge port operating in the transparent bridge mode.

Copyright © 2006, Nortel Nortel Confidential

Mib	Bridge

ATTRIBUTE Vr Pp Tbse secureOption (sos)

Access	Read and write
Description	This attribute specifies whether the port secure feature is enabled. The secure feature, if enabled causes the following things to happen: a) disallows dynamic learning, b) disallows frames to be forwarded that do not satisfy the following condition: the MAC address of the source should be found in the forwarding table and the destination MAC address of the frame should also be found in the forwarding table. In addition to this, the port the frame was received on should figure as the in port, given the destination MAC address found in the frame. c) disallows frames to be forwarded if the allowed to go port map for the destination MAC address is empty. This feature in effect allows the user to choose the hosts that can generate traffic and the hosts that can receive traffic through this bridge unit.
Mib	Bridge
Values	disabled enabled
Default	disabled

GROUP Vr Pp Tbse StpProvisioned (StpProv)

Properties	Provisioned
Description	This group contains all port specific provisionable attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes influence the participation of the bridge port in the stp.
Mib	Bridge

ATTRIBUTE Vr Pp Tbse adminStatus (as)

Access	Read and write
Description	This attribute defines the current administrative state for this component. ***enabled*** indicates that the component is available for operation. ***disabled*** indicates the component is unavailable for operation.
Mib	Bridge
Values	up down
Default	up

ATTRIBUTE Vr Pp Tbse portStateStpControl (psstpc)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies whether or not stp state for this bridge port is controlled by the stp. In essence it indicates the participation of this bridge port in the stp by accepting and acting on received bridge protocol data units and by sending out the same. ***on*** signifies that this bridge port's spanning tree port state is controlled by the stp. A value of ***off*** signifies that the spanning tree port state of this bridge port is unaffected by the stp. This in effect puts the bridge port out of reach of the stp decisions. Its stp state will be always ***forwarding***. Care should be taken while assigning a value of ***off*** to this attribute, as this might cause network loops. Please do not set this attribute to ***off*** unless you are absolutely sure about the effect of such an action on your network topology.
Mib	Bridge
Values	off on
Default	on

ATTRIBUTE Vr Pp Tbse stpTypeProv (stptProv)

Access	Read and write
Description	This attribute specifies the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. If the value of the attribute *protocolSpec* in the *SpanningTreeProtocol* component is in conflict with the value of this attribute, the value of the *protocolSpec* attribute will prevail. Prevailing stp type is reflected in the value of the attribute *stpTypeOper.*
Mib	Bridge
Values	dec ieee8021
Default	ieee8021

ATTRIBUTE Vr Pp Tbse portPriority (ppr)

Access	Read and write
Description	This attribute specifies the value for this bridge port priority which is contained in the first octet of the port identifier. Valid values are as follows: 1) 0-255 for stp type DEC and 2) 0-65535 for stp type IEEE.
Mib	Bridge
Values	Decimal (0..65535)
Default	128

ATTRIBUTE Vr Pp Tbse pathCost (pc)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the contribution of this port to all the paths to the root bridge that include this port. Please note that the value of the attribute *pathCost* is applied only when the value of the attribute *pathCostMethod* is set to ***on*** and is ignored if otherwise.
Mib	Bridge
Values	Decimal (1..65535)
Default	10

ATTRIBUTE Vr Pp Tbse pathCostMethod (pcm)

Access	Read and write
Description	This attribute specifies the method used by the bridging logic to calculate the path cost to the bridge considered to be the root bridge in the spanning tree topology. This attribute should be set to ***off*** before attempting to provision a value for *pathCost.*
Mib	Bridge
Values	off dec ieee8021
Default	ieee8021

GROUP Vr Pp Tbse DomainInfoProvisioned (DIProv)

Properties	Provisioned
Description	This group contains all the provisionable, domain specific attributes for a non-encapsulating bridge port.
Mib	Bridge

ATTRIBUTE Vr Pp Tbse domainNum (dn)

Access	Read and write
Description	This attribute specifies the domain number associated with this bridge port. Domain numbers are used for confining frames to a domain. Domain based filtering provides a complete segregation of traffic based on domain number associated with frames. There can exist only sixteen domains when a spanning tree is desired specific to each domain. When there is only a single spanning tree spanning all the domains the maximum number of domains possible are 4294967293. This attribute is of no relevance when associated with backbone bridge port. Its value is ignored in such a situation.
Mib	Bridge
Values	Decimal (1..4294967293)

Copyright © 2006, Nortel Nortel Confidential

Default	1

ATTRIBUTE Vr Pp Tbse preserveDomain (pds)

Access	Read and write
Criticality	Component
Description	This attribute specifies if the domain information should be preserved or embedded in the frame header. This attribute applies only to ***backbone*** ports and does not affect the ***access*** bridge ports. By setting this attribute to a value of ***on***, domain information could be preserved in frames being tunnelled across the backbone, so that this information can be deciphered at the other end of the backbone tunnel. This preserves the integrity of the domains thus preventing domain breaches while tunnelling frames across backbone network. If the value of this attribute is set to ***off*** then domain information is not preserved in the header of the frames tunnelling through the backbone. This eliminates the overhead incurred to preserve domain information across the backbone while tunnelling frames across it. Preserve domain is relevant only when used in conjunction with ATM MPE.
Mib	Bridge
Values	off on
Default	No default

GROUP Vr Pp Tbse OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Bridge

ATTRIBUTE Vr Pp Tbse adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command

Copyright © 2006, Nortel Nortel Confidential

was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — Bridge

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Vr Pp Tbse operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — Bridge

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Vr Pp Tbse usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — Bridge

Values — idle
active (activ)
busy

Default	idle

GROUP Vr Pp Tbse OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	Bridge

ATTRIBUTE Vr Pp Tbse snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	Bridge
Values	up down testing
Default	up

GROUP Vr Pp Tbse Operational (Oper)

Properties	Operational
Description	This group contains all the operational attributes belonging to the base group. These attributes in part, reflect the state of a bridge port.
Mib	Bridge

ATTRIBUTE Vr Pp Tbse portName (pn)

Access	Read only
Description	The attribute *portName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/ETH100A* would have a name ***TBP-ETH100A.***
Mib	Bridge
Values	String (4..29, ASCII)
Default	No default

ATTRIBUTE Vr Pp Tbse upTime (ut)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the accumulated up time of this bridge port since the last reset occurred.
Mib	Bridge
Values	Decimal (0..4294967295)
Units	seconds
Default	0

ATTRIBUTE Vr Pp Tbse downTime (dt)

Access	Read only
Description	This attribute indicates the accumulated down time of this bridge port since the last reset occurred.
Mib	Bridge
Values	Decimal (0..4294967295)
Units	seconds
Default	0

ATTRIBUTE Vr Pp Tbse bridgingMode (bm)

Access	Read only
Description	This attribute indicates the mode of bridging this port can support. The transparent bridge mode is the only mode supported.
Mib	Bridge
Values	unknown tb sr srt
Default	No default

ATTRIBUTE Vr Pp Tbse bridgePortConfig (bpc)

Access	Read only
Description	This attribute indicates the bridge port's configuration. It indicates if the bridge port is operating as an ***access*** port or as a ***backbone*** port. An ***access*** bridge port does not encapsulate a MAC frame and does not preserve domain information in the encapsulation, whereas a ***backbone*** bridge port encapsulates the MAC frame and optionally preserves domain information in the encapsulated frame.A ***backbone*** bridge port is typically used to transport frames across a high bandwidth backbone network to another bridge unit for further processing/forwarding of the frame.
Mib	Bridge

Copyright © 2006, Nortel Nortel Confidential

Values	access backbone
Default	No default

ATTRIBUTE Vr Pp Tbse bridgePortType (bpt)

Access	Read only
Description	This attribute indicates the type of the bridge port that was provisioned. It takes into consideration the *bridgingMode*, *bridgePortConfig* and the media the bridge port is linked to before branding a bridge port.
Mib	Bridge

Default	No default

ATTRIBUTE Vr Pp Tbse ifIndex (ifin)

Access	Read only
Description	This attribute indicates the index into the Interface Table where information about the media interface corresponding to this bridge port is maintained.
Mib	Bridge
Values	Decimal (1..65535)
Default	No default

ATTRIBUTE Vr Pp Tbse mtuExceededDiscards (med)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute counts the number of frames discarded because the size of the outbound frame exceeded the message transfer unit (mtu) allowed for the bridge port. Note that this counter only refers to the outbound frames for this bridge port. This counter wraps around its maximum value of 4294967295. This counter is influenced by the attribute *fragmentIp.* This counter is incremented when a frame larger than the mtu allowed is encountered and cannot be fragmented. If this counter is increasing steadily, it might be useful to set the value of the attribute *fragmentIp* to a value of ***on***.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

GROUP Vr Pp Tbse TbOperational (TbOper)

Properties	Operational
Description	This group contains all the port specific operational attributes that belong to the Tb group. This group also contains all the port specific statistical attributes that belong to the Tb group. These attributes reflect the state of a bridge port operating in the transparent bridge mode
Mib	Bridge

ATTRIBUTE Vr Pp Tbse maxInfo (mi)

Access	Read only
Description	This attribute indicates the maximum size of the information field in a transparent bridge frame. This excludes the header field.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbse badVerifyDiscards (bvd)

Access	Read only
Description	This attribute counts the number of incoming frames that were discarded because the value of the *secureOption* attribute was set to ***on*** and: a) it is not allowed to receive frames originating from the MAC address found in the source address field of the frame (source MAC address lookup in the forwarding table failed) on this bridge port, or b) for the destination MAC address found in the frame the port the frame was received on does not appear as in port in the corresponding static table entry. Permission to receive frames from a MAC address is granted via the static table entries.

Copyright © 2006, Nortel Nortel Confidential

This attribute, *badVerifyDiscards*, is directly influenced by:
1. *secureOption* and
2. the static table entries.
This counter wraps around its maximum value of 4294967295.

Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbse staticEntryDiscards (sed)

Access	Read only
Description	This attribute counts the number of frames that were discarded because of the following three reasons: a) there was no entry for the “allowed to go” field in the static table entry, where the input port is this bridge port. b) the MAC destination address in the frame was not found in the forwarding table but the frame cannot be flooded because this bridge has not other ports in forwarding state. c) for spanning tree bpdus that are locally processed. This counter wraps around its maximum value of 4294967295. It might prove useful to check the static table entry corresponding to the bridge port in question, if this counter consistently displays a high value. Ideally this counter should be as low as possible.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbse dynamicEntryDiscards (dend)

Access	Read only
Description	This attribute counts the number of incoming frames that: a) were discarded because of the fact that the bridge port, the frame is to go out of matches the bridge port it came in from, or b) if the stp port state of the out port is not ***forwarding***. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbse learningDiscards (ld)

Access	Read only
Description	This attribute counts the number of frames that were discarded while this bridge port was in a state other than the ***forwarding*** state. While in

Copyright © 2006, Nortel Nortel Confidential

learning state the frame is discarded after the information from its header is learnt. This counter wraps around its maximum value of 4294967295.

Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbse inDiscards (id)

Access	Read only
Description	This attribute counts the number of frames that were received by this bridge port and were discarded by the forwarding process. This includes frames that could have been discarded due to filtering. A rapidly increasing value for this attribute could indicate a shortage of resource in terms of memory needed to process the incoming frames. More memory can be provisioned through the *VirtualRouter*'s memory manager.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbse inFrames (if)

Access	Read only
Description	This attribute counts the number of frames that have been received by this port from its segment. Note that a frame received on this bridge port is counted if and only if it can be processed by the bridge logic contained in this bridge unit. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbse outFrames (of)

Access	Read only
Description	This attribute counts the number of frames that have been transmitted out this bridge port. This also includes management frames.This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)

Scope	Application

Copyright © 2006, Nortel Nortel Confidential

Description	Vr/*<string>* *Pp/<string>* *SrsgBridgePort* This component represents a controlled method to allow exchange of explorer frames between source route (SR) and source route transparent (SRT) networks.The *SrsgBridgePort* provides a cross over point for explorer frames from the source route network into the source route gating logic and vice-versa. The source route gating performs required verification before forwarding the frames into the source route transparent network. The *SrsgBridgePort* participates in the source route spanning tree to eliminate possible loops caused by multiple active cross over points on multiple bridges and to provide for fault tolerance of these cross over points. While enabled, source route spanning tree BPDUs are sent across the source route transparent network, through this cross over point and the gating logic. Note that these explorer frames cross over based on the port's *stpPortState.* All route explorer frames (ARE) are exchanged regardless of the *stpPortState*. Spanning tree explorer frames (STE) are exchanged only if *stpPortState* has a value of ***Forwarding.*** If *stpPortState* has a value of ***Blocking*** STE frames will be sent out on bridge ports that are operating in the same mode, i.e. no exchange across SR and SRT networks takes place. Nevertheless, SR spanning tree BPDUs are still sent across the SRT network. Note that the *SrsgBridgePort* and the *TbsgBridgePort* must be provisioned during the same provisioning session as one cannot function without the other.

Mib	Bridge
Values	off on
Default	off

ATTRIBUTE Vr Pp Srsg portNum (pNum)

Access	Read only
Criticality	Component
Description	This attribute indicates the unique number assigned to the bridge port. It is used for SNMP management of this bridge port and in spanning tree as an identifier for this bridge port. Notes: Escape routines exist for initializing, copying, and deleting port numbers. This is necessary because SNMP requires a unique port instance identifier. The initPortNum escape routine sets the port number to a value in the range 1-255 for this purpose. The setCopiedPortNum escape routine exists to maintain the uniqueness of the port number in cases when one port is copied to another. When a bridge port is deleted, the releasePortNum escape routine places the port number being released into a pending deletion state. This is because the port number cannot be re-allocated until the port is truly deleted in the current view. This is necessary since there is no guarantee of order when processing changes to multiple protocol ports so without the pending deletion state, the same port number could be temporarily assigned to two ports for a short period of time. The portNum is set as component critical since bridging also uses the port number as a key for indexing into its data structures. If a port is deleted then re-added under the same protocol port, CAS treats the change as a SET to the portNum attribute.
Mib	Bridge
Values	Decimal (0..255)
Default	0

GROUP Vr Pp Srsg StpProvisioned (StpProv)

Properties	Provisioned

ATTRIBUTE Vr Pp Srsg portStateStpControl (psstpc)

Access	Read and write
Description	This attribute specifies whether or not stp state for this bridge port is controlled by the stp. In essence it indicates the participation of this bridge port in the stp by accepting and acting on received bridge protocol data units and by sending out the same. ***on*** signifies that this bridge port's spanning tree port state is controlled by the stp. A value of ***off*** signifies that the spanning tree port state of this bridge port is unaffected by the stp. This in effect puts the bridge port out of reach of the stp decisions. Its stp state will be always ***forwarding***. Care should be taken while assigning a value of ***off*** to this attribute, as this might cause network loops. Please do not set this attribute to ***off*** unless you are absolutely sure about the effect of such an action on your network topology.
Mib	Bridge
Values	off on
Default	on

ATTRIBUTE Vr Pp Srsg stpTypeProv (stptProv)

Access	Read and write
Description	This attribute specifies the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. If the value of the attribute *protocolSpec* in the *SpanningTreeProtocol* component is in conflict with the value of this attribute, the value of the *protocolSpec* attribute will prevail. Prevailing stp type is reflected in the value of the attribute *stpTypeOper.*
Mib	Bridge

Copyright © 2006, Nortel Nortel Confidential

Values	dec ieee8021
Default	ieee8021

ATTRIBUTE Vr Pp Srsg portPriority (ppr)

Access	Read and write
Description	This attribute specifies the value for this bridge port priority which is contained in the first octet of the port identifier. Valid values are as follows: 1) 0-255 for stp type DEC and 2) 0-65535 for stp type IEEE.
Mib	Bridge
Values	Decimal (0..65535)
Default	128

ATTRIBUTE Vr Pp Srsg pathCost (pc)

Access	Read and write
Description	This attribute specifies the contribution of this port to all the paths to the root bridge that include this port. Please note that the value of the attribute *pathCost* is applied only when the value of the attribute *pathCostMethod* is set to ***on*** and is ignored if otherwise.
Mib	Bridge
Values	Decimal (1..65535)
Default	10

ATTRIBUTE Vr Pp Srsg pathCostMethod (pcm)

Access	Read and write
Description	This attribute specifies the method used by the bridging logic to calculate the path cost to the bridge considered to be the root bridge in the spanning tree topology. This attribute should be set to ***off*** before attempting to provision a value for *pathCost.*
Mib	Bridge
Values	off dec ieee8021
Default	ieee8021

GROUP Vr Pp Srsg DomainInfoProvisioned (DIProv)

Properties	Provisioned
Description	This group contains all the provisionable, domain specific attributes for a non-encapsulating bridge port.

Copyright © 2006, Nortel Nortel Confidential

Mib	Bridge

ATTRIBUTE Vr Pp Srsg domainNum (dn)

Access	Read and write
Description	This attribute specifies the domain number associated with this bridge port. Domain numbers are used for confining frames to a domain. Domain based filtering provides a complete segregation of traffic based on domain number associated with frames. There can exist only sixteen domains when a spanning tree is desired specific to each domain. When there is only a single spanning tree spanning all the domains the maximum number of domains possible are 4294967293. This attribute is of no relevance when associated with backbone bridge port. Its value is ignored in such a situation.
Mib	Bridge
Values	Decimal (1..4294967293)
Default	1

ATTRIBUTE Vr Pp Srsg preserveDomain (pds)

Access	Read and write
Criticality	Component
Description	This attribute specifies if the domain information should be preserved or embedded in the frame header. This attribute applies only to ***backbone*** ports and does not affect the ***access*** bridge ports. By setting this attribute to a value of ***on***, domain information could be preserved in frames being tunnelled across the backbone, so that this information can be deciphered at the other end of the backbone tunnel. This preserves the integrity of the domains thus preventing domain breaches while tunnelling frames across backbone network. If the value of this attribute is set to ***off*** then domain information is not preserved in the header of the frames tunnelling through the backbone. This eliminates the overhead incurred to preserve domain information across the backbone while tunnelling frames across it. Preserve domain is relevant only when used in conjunction with ATM MPE.
Mib	Bridge
Values	off on
Default	No default

GROUP Vr Pp Srsg OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described

Copyright © 2006, Nortel Nortel Confidential

here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib Bridge

ATTRIBUTE Vr Pp Srsg adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib Bridge

Values locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

ATTRIBUTE Vr Pp Srsg operationalState (osiOper)

Access Read only

Description This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib Bridge

Values enabled (ena)
disabled (dis)

Default disabled

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Pp Srsg usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Bridge
Values	idle active (activ) busy
Default	idle

GROUP Vr Pp Srsg OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	Bridge

ATTRIBUTE Vr Pp Srsg snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	Bridge
Values	up down testing
Default	up

GROUP Vr Pp Srsg Operational (Oper)

Properties	Operational
Description	This group contains all the operational attributes belonging to the base group. These attributes in part, reflect the state of a bridge port.
Mib	Bridge

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Pp Srsg portName (pn)

Access	Read only
Description	The attribute *portName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/ETH100A* would have a name ***TBP-ETH100A.***
Mib	Bridge
Values	String (4..29, ASCII)
Default	No default

ATTRIBUTE Vr Pp Srsg upTime (ut)

Access	Read only
Description	This attribute indicates the accumulated up time of this bridge port since the last reset occurred.
Mib	Bridge
Values	Decimal (0..4294967295)
Units	seconds
Default	0

ATTRIBUTE Vr Pp Srsg downTime (dt)

Access	Read only
Description	This attribute indicates the accumulated down time of this bridge port since the last reset occurred.
Mib	Bridge
Values	Decimal (0..4294967295)
Units	seconds
Default	0

ATTRIBUTE Vr Pp Srsg bridgingMode (bm)

Access	Read only
Description	This attribute indicates the mode of bridging this port can support. The transparent bridge mode is the only mode supported.
Mib	Bridge
Values	unknown tb sr srt

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Vr Pp Srsg bridgePortConfig (bpc)

Access	Read only
Description	This attribute indicates the bridge port's configuration. It indicates if the bridge port is operating as an ***access*** port or as a ***backbone*** port. An ***access*** bridge port does not encapsulate a MAC frame and does not preserve domain information in the encapsulation, whereas a ***backbone*** bridge port encapsulates the MAC frame and optionally preserves domain information in the encapsulated frame.A ***backbone*** bridge port is typically used to transport frames across a high bandwidth backbone network to another bridge unit for further processing/forwarding of the frame.
Mib	Bridge
Values	access backbone
Default	No default

ATTRIBUTE Vr Pp Srsg bridgePortType (bpt)

Access	Read only
Description	This attribute indicates the type of the bridge port that was provisioned. It takes into consideration the *bridgingMode*, *bridgePortConfig* and the media the bridge port is linked to before branding a bridge port.
Mib	Bridge
Values	ethernetBridgePort tokenRingBridgePort fddiBridgePort tokenBusBridgePort lanEmulationClientEthernet fddiEncapsulatingBridgePort vnsBridgePort frameRelayBridgePort pppBridgePort smdsBridgePort vcpBridgePort x25BridgePort atmMpeBridgePort srEncapSrBridgePort srEncapTbBridgePort sourceGateSrBridgePort sourceGateTbBridgePort srtbBridgePort tbsrBridgePort clusterSrBridgePort clusterTbBridgePort

Copyright © 2006, Nortel Nortel Confidential

	snaDlrBridgePort unknown
Default	No default

ATTRIBUTE Vr Pp Srsg ifIndex (ifin)

Access	Read only
Description	This attribute indicates the index into the Interface Table where information about the media interface corresponding to this bridge port is maintained.
Mib	Bridge
Values	Decimal (1..65535)
Default	No default

ATTRIBUTE Vr Pp Srsg mtuExceededDiscards (med)

Access	Read only
Description	This attribute counts the number of frames discarded because the size of the outbound frame exceeded the message transfer unit (mtu) allowed for the bridge port. Note that this counter only refers to the outbound frames for this bridge port. This counter wraps around its maximum value of 4294967295. This counter is influenced by the attribute *fragmentIp.* This counter is incremented when a frame larger than the mtu allowed is encountered and cannot be fragmented. If this counter is increasing steadily, it might be useful to set the value of the attribute *fragmentIp* to a value of ***on***.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

GROUP Vr Pp Srsg StpOperational (StpOper)

Properties	Operational
Description	This group contains all port specific operational attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes reflect the state of the bridge port's participation in the stp.
Mib	Bridge

ATTRIBUTE Vr Pp Srsg stpPortState (sps)

Access	Read only
Description	This attribute indicates the stp state of the bridge port.
Mib	Bridge

Copyright © 2006, Nortel Nortel Confidential

Values	disabled blocking listening learning forwarding broken
Default	disabled

ATTRIBUTE Vr Pp Srsg stpTypeOper (stptOper)

Access	Read only
Description	This attribute indicates the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp.
Mib	Bridge
Values	none dec ieee8021
Default	ieee8021

ATTRIBUTE Vr Pp Srsg designatedCost (dc)

Access	Read only
Description	This attribute indicates the path cost of the designated port of the lan segment the designated port is connected to.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Pp Srsg pathCostOper (pco)

Access	Read only
Description	This attribute indicates the contribution of this port to all the paths to the root bridge that include this port. This attribute *pathCostOper* will track the value of the attribute *pathCost* when the value of the attribute *pathCostMethod* is set of ***off***.
Mib	Bridge
Values	Decimal (1..65535)
Default	No default

ATTRIBUTE Vr Pp Srsg designatedBridge (db)

Access	Read only
Description	This attribute indicates the identifier of the bridge that this port considers to be the designated bridge.

Copyright © 2006, Nortel Nortel Confidential

Mib	Bridge
Values	String (8, Dashed Hex)
Default	No default

ATTRIBUTE Vr Pp Srsg designatedPort (dp)

Access	Read only
Description	This attribute indicates the port identifier of the port on the designated bridge attached to the same LAN segment as this port is attached to.
Mib	Bridge
Values	Hex (H.0..H.ffff)
Default	No default

ATTRIBUTE Vr Pp Srsg forwardTransitions (ft)

Access	Read only
Description	This attribute counts the number of times this bridge port transitioned from the ***learning*** state to the ***forwarding*** state. This counter wraps around its maximum value of 4294967295. A rapidly increasing value might be indicative of an unstable spanning tree topology.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srsg blockingDiscards (bd)

Access	Read only
Description	This attribute counts the number of the incoming frames that were discarded because the bridge port was in the ***blocking*** state. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srsg designatedRoot (dr)

Access	Read only
Description	This attribute indicates the bridge identifier of the bridge recorded as the root bridge in the configuration BPDUs sent out by the designated bridge on the segment this port is attached to.
Mib	Bridge

Copyright © 2006, Nortel Nortel Confidential

Values	String (8, Dashed Hex)
Default	No default

GROUP Vr Pp Srsg Statistics (Stats)

Properties	Operational
Description	This group contains all the statistical attributes applicable to all types of bridge ports and represents the common factor between them. These attributes in part reflect the state of the bridge port.
Mib	Bridge

ATTRIBUTE Vr Pp Srsg badAbstractDiscards (bad)

Access	Read only
Description	This attribute counts the number of frames that were discarded because the data abstracted from the frames coming in through this bridge port did not conform to the format expected by the bridge logic.This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srsg tinygramFramesIn (tfi)

Access	Read only
Description	This attribute counts the number of frames received on this bridge port that used the tinygram compression scheme.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srsg tinygramFramesOut (tfo)

Access	Read only
Description	This attribute counts the number of frames transmitted out this bridge port that used the tinygram compression scheme.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srsg inFilterDiscards (ifd)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of frames discarded due to domain based filtering at the in filter point. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srsg outFilterDiscards (ofd)

Access	Read only
Description	This attribute counts the number of frames discarded due to domain based filtering at the out filter point. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

GROUP Vr Pp Srsg SrProvisioned (SrProv)

Properties	Provisioned
Description	This group contains all port specific, provisionable attributes associated with *SourceRouteBridge* ports.
Mib	Bridge

ATTRIBUTE Vr Pp Srsg hopCount (hc)

Access	Read and write
Description	This attribute specifies the maximum number of hops allowed in Spanning Tree Explore and All Routes Explore frames. This value is one less than the maximum number of route descriptors allowed in a source route frame
Mib	Bridge
Values	Decimal (1..7)
Default	7

ATTRIBUTE Vr Pp Srsg exploreFrameTreatment (eft)

Access	Read and write
Description	This attribute specifies whether or not explore frames received from *SourceRouteBridge* ports will be sent to the SRTB-8209 translation or the encapsulated *SourceRouteBridge* logic. This option is used only when both the *TbsrBridgePort* and the *SrtbBridgePort* are provisioned and enabled. A value of ***Xlate*** implies that the explore frames will be sent to the Srtb

Copyright © 2006, Nortel Nortel Confidential

translation logic and a value of ***Encap*** implies that the frames will be sent to the Encapsulated source route bridging logic.

Mib	Bridge
Values	encap xlate
Default	encap

ATTRIBUTE Vr Pp Srsg lanId (lid)

Access	Read and write
Description	This attribute specifies the identifier for the physical LAN that this port is attached. All *SourceRouteBridge* ports are assigned to a physical LAN and a logical internal LAN. Current source route bridge implementations limit the lanId to a value in the range 0 to 4095.
Mib	Bridge
Values	Decimal (0..4095)
Default	0

ATTRIBUTE Vr Pp Srsg internalLanId (ilid)

Access	Read and write
Description	This attribute specifies the identifier for the internal logical LAN this port is attached. All *SourceRouteBridge* ports are assigned to a physical LAN and a logical internal LAN. Current source route bridge implementations limit the lanId to a value in the range 0 to 4095.
Mib	Bridge
Values	Decimal (0..4095)
Default	0

ATTRIBUTE Vr Pp Srsg bridgeNum (bid)

Access	Read and write
Description	This attribute specifies the value that is used to identify this bridge when more than one bridge is used to span the same two LAN segments.
Mib	Bridge
Values	Decimal (0..15)
Default	7

ATTRIBUTE Vr Pp Srsg largestFrame (lf)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the maximum frame size (LLC and above) in octets, allowed by this *SourceRouteBridge* port. This field is used to determine whether a modification of the largest frame field of the routing control field of the routing information field is warranted.
Mib	Bridge
Values	Decimal (516; 1470; 2052; 4399; 8130; 11407; 17749)
Units	octets
Default	No default

ATTRIBUTE Vr Pp Srsg steSpanMode (steSm)

Access	Read and write
Description	This attribute determines how this bridge port will react when presented with a Spanning Tree Explore frame. If ***disabled,*** the Spanning Tree Explore frame is discarded regardless of the value of *stpPortState.* If the value of this attribute is ***forced***, the Spanning Tree Explore frame is forwarded regardless of the value of *stpPortState.* ***autoSpan*** uses the *stpPortState* value to decide whether or not Spanning Tree Explore frames should be forwarded out this bridge port. If the port is in the ***forwarding*** state, the frame is received and transmitted otherwise the frame is discarded.
Mib	Bridge
Values	autoSpan disabled forced
Default	autoSpan

ATTRIBUTE Vr Pp Srsg areRdLimit (arl)

Access	Read and write
Description	This attribute specifies the number of route descriptors allowed in an All Routes Explore frame received on a *SourceRouteBridgePort* or *SourceRouteTransparentBridgePort*. Current source route bridge implementations limit the *areRdLimit* to a value in the range 0 to 8.
Mib	Bridge
Values	Decimal (0..8)
Default	8

ATTRIBUTE Vr Pp Srsg steRdLimit (srl)

Access	Read and write
Description	This attribute specifies the number of route descriptors allowed in a Spanning Tree Explore frame received on a *SourceRouteBridgePort* or

Copyright © 2006, Nortel Nortel Confidential

SourceRouteTransparentBridgePort. Current source route bridge implementations limit the *steRdLimit* to a value in the range 0 to 8.

Mib	Bridge
Values	Decimal (0..8)
Default	8

GROUP Vr Pp Srsg SrStatistics (SrStats)

Properties	Operational
Description	This group contains all port specific statistical attributes associated with *SourceRouteBridge* ports.
Mib	Bridge

ATTRIBUTE Vr Pp Srsg specInFrames (sif)

Access	Read only
Description	This attribute specifies the number of specifically routed frames that were received by this bridge port. A specifically routed frame has a route descriptor, constructed by the originating host which details an explicit route to the destination host. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srsg specOutFrames (srfof)

Access	Read only
Description	This attribute specifies the number of specifically routed frames that were transmitted from this bridge port. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srsg apeInFrames (apeif)

Access	Read only
Description	This attribute specifies the number of All Path Explore frames received on this bridge port. The All Path Explore frames are forwarded to all *SourceRouteBridge* ports assigned to this bridge regardless of the port's *portStpState*s. This counter will wrap to zero when it exceeds its maximum.

Copyright © 2006, Nortel Nortel Confidential

Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srsg apeOutFrames (apeof)

Access	Read only
Description	This attribute specifies the number of All Path Explore frames transmitted on this bridge port. The All Path Explore frames are forwarded to all *SourceRouteBridge* ports assigned to this bridge regardless of the port's *portStpState* state. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srsg steInFrames (steif)

Access	Read only
Description	This attribute specifies the number of Spanning Tree Explore frames received on this bridge port. The Spanning Tree Explore frames are only forwarded through bridge ports whose *portStpState* has a value of ***forwarding.*** This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srsg steOutFrames (steof)

Access	Read only
Description	This attribute specifies the number of Spanning Tree Frames transmitted on this bridge port. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srsg segmentMismatchDiscards (lidmd)

Access	Read only
Description	This attribute specifies the number of All Routes Explore and Spanning Tree Explore frames that were discarded due to an invalid next segment

Copyright © 2006, Nortel Nortel Confidential

value in the routing information field. This counter will wrap to zero when it exceeds its maximum.

Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srsg dupSegmentDiscards (dsd)

Access	Read only
Description	This attribute specifies the number of frames discarded due to the presence of a duplicate segment identifier in the route descriptor field which may indicate a loop in the network topology. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srsg hopCountExceededDiscards (hced)

Access	Read only
Description	This attribute specifies the number of All Routes Explore and Spanning Tree Explore frames discarded by this bridge port due to a frame exceeding the maximum size allowed for a route descriptor length. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srsg dupLanIdOrTreeErrors (dlte)

Access	Read only
Description	This attribute specifies the number frames received which contain duplicate LAN IDs or Tree errors. This attribute is helpful in debugging problems in networks which contain older IBM-SR bridges. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srsg lanIdMismatches

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attributes counts the number of All Routes Explore or Spanning Tree Explore frames that were discarded because the last LAN ID in the routing information field did not equal the LAN ID. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srsg staticDiscards (sd)

Access	Read only
Description	This attribute is indicative of the number of explorer frames discarded due to fact that the outbound *SourceRouteBridge* port was disabled or deleted. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srsg dynamicDiscards (dd)

Access	Read only
Description	This attribute specifies the number of frames discarded due to receiving a frame with a target LAN ID which did not match the internal LAN ID of the receiving bridge port. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

frames between SR and SRT networks.The *TbsgBridgePort* provides a cross over point for explorer frames from the source route gating logic into a SRT network and vice-versa. This port can and should be enabled / disabled through the *SrsgBridgePort*. This bridge port does not participate in the SR spanning tree protocol. Nevertheless, SR spanning tree BPDUs are still sent out across into the SRT network. Note that the *SrsgBridgePort* and the *TbsgBridgePort* should always be provisioned together, as one of these bridge ports cannot function without the other.

GROUP Vr Pp Tbsg Provisioned (Prov)

Properties: Provisioned

Description: This group contains all the provisionable attributes that belong to this group. This group of attributes is applicable to all types of bridge ports and represent the common factor between them. These attributes influence the working of a bridge port.

Mib: Bridge

ATTRIBUTE Vr Pp Tbsg fragmentIp (fIp)

Access: Read and write

Description: This attribute specifies if outbound frames carrying IP datagrams should be fragmented to conform to message transfer unit (*mtu*) sizes dictated by the media.

Mib: Bridge

Values:
off
on

Default: off

ATTRIBUTE Vr Pp Tbsg portNum (pNum)

Access: Read only

Criticality: Component

Description: This attribute indicates the unique number assigned to the bridge port. It is used for SNMP management of this bridge port and in spanning tree as an identifier for this bridge port.
Notes:

Copyright © 2006, Nortel Nortel Confidential

Escape routines exist for initializing, copying, and deleting port numbers. This is necessary because SNMP requires a unique port instance identifier. The initPortNum escape routine sets the port number to a value in the range 1-255 for this purpose. The setCopiedPortNum escape routine exists to maintain the uniqueness of the port number in cases when one port is copied to another. When a bridge port is deleted, the releasePortNum escape routine places the port number being released into a pending deletion state. This is because the port number cannot be re-allocated until the port is truly deleted in the current view. This is necessary since there is no guarantee of order when processing changes to multiple protocol ports so without the pending deletion state, the same port number could be temporarily assigned to two ports for a short period of time.

The portNum is set as component critical since bridging also uses the port number as a key for indexing into its data structures. If a port is deleted then re-added under the same protocol port, CAS treats the change as a SET to the portNum attribute.

Mib	Bridge
Values	Decimal (0..255)
Default	0

GROUP Vr Pp Tbsg TbProvisioned (TbProv)

Properties	Provisioned
Description	This group contains all the port specific provisionable attributes that belong to the Tb group. These attributes in part influence the working of a bridge port operating in the transparent bridge mode.
Mib	Bridge

ATTRIBUTE Vr Pp Tbsg secureOption (sos)

Access	Read and write
Description	This attribute specifies whether the port secure feature is enabled. The secure feature, if enabled causes the following things to happen: a) disallows dynamic learning, b) disallows frames to be forwarded that do not satisfy the following condition: the MAC address of the source should be found in the forwarding table and the destination MAC address of the frame should also be found in the forwarding table. In addition to this, the port the frame was received on should figure as the in port, given the destination MAC address found in the frame. c) disallows frames to be forwarded if the allowed to go port map for the destination MAC address is empty. This feature in effect allows the user to choose the hosts that can generate traffic and the hosts that can receive traffic through this bridge unit.

GROUP Vr Pp Tbsg StpProvisioned (StpProv)

Properties	Provisioned
Description	This group contains all port specific provisionable attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes influence the participation of the bridge port in the stp.
Mib	Bridge

ATTRIBUTE Vr Pp Tbsg adminStatus (as)

Access	Read and write
Description	This attribute defines the current administrative state for this component. ***enabled*** indicates that the component is available for operation. ***disabled*** indicates the component is unavailable for operation.
Mib	Bridge
Values	up down
Default	up

ATTRIBUTE Vr Pp Tbsg portStateStpControl (psstpc)

Access	Read and write
Description	This attribute specifies whether or not stp state for this bridge port is controlled by the stp. In essence it indicates the participation of this bridge port in the stp by accepting and acting on received bridge protocol data units and by sending out the same. ***on*** signifies that this bridge port's spanning tree port state is controlled by the stp. A value of ***off*** signifies that the spanning tree port state of this bridge port is unaffected by the stp. This in effect puts the bridge port out of reach of the stp decisions. Its stp state will be always ***forwarding***. Care should be taken while assigning a value of ***off*** to this attribute, as this might cause network loops. Please do not set this attribute to ***off*** unless you are absolutely sure about the effect of such an action on your network topology.
Mib	Bridge
Values	off on
Default	on

ATTRIBUTE Vr Pp Tbsg stpTypeProv (stptProv)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp. If the value of the attribute *protocolSpec* in the *SpanningTreeProtocol* component is in conflict with the value of this attribute, the value of the *protocolSpec* attribute will prevail. Prevailing stp type is reflected in the value of the attribute *stpTypeOper.*
Mib	Bridge
Values	dec ieee8021
Default	ieee8021

ATTRIBUTE Vr Pp Tbsg portPriority (ppr)

Access	Read and write
Description	This attribute specifies the value for this bridge port priority which is contained in the first octet of the port identifier. Valid values are as follows: 1) 0-255 for stp type DEC and 2) 0-65535 for stp type IEEE.
Mib	Bridge
Values	Decimal (0..65535)
Default	128

ATTRIBUTE Vr Pp Tbsg pathCost (pc)

Access	Read and write
Description	This attribute specifies the contribution of this port to all the paths to the root bridge that include this port. Please note that the value of the attribute *pathCost* is applied only when the value of the attribute *pathCostMethod* is set to ***on*** and is ignored if otherwise*.*
Mib	Bridge
Values	Decimal (1..65535)
Default	10

ATTRIBUTE Vr Pp Tbsg pathCostMethod (pcm)

Access	Read and write
Description	This attribute specifies the method used by the bridging logic to calculate the path cost to the bridge considered to be the root bridge in the spanning tree topology. This attribute should be set to ***off*** before attempting to provision a value for *pathCost.*
Mib	Bridge

Copyright © 2006, Nortel Nortel Confidential

Values	off dec ieee8021
Default	ieee8021

GROUP Vr Pp Tbsg DomainInfoProvisioned (DIProv)

Properties	Provisioned
Description	This group contains all the provisionable, domain specific attributes for a non-encapsulating bridge port.
Mib	Bridge

ATTRIBUTE Vr Pp Tbsg domainNum (dn)

Access	Read and write
Description	This attribute specifies the domain number associated with this bridge port. Domain numbers are used for confining frames to a domain. Domain based filtering provides a complete segregation of traffic based on domain number associated with frames. There can exist only sixteen domains when a spanning tree is desired specific to each domain. When there is only a single spanning tree spanning all the domains the maximum number of domains possible are 4294967293. This attribute is of no relevance when associated with backbone bridge port. Its value is ignored in such a situation.
Mib	Bridge
Values	Decimal (1..4294967293)
Default	1

ATTRIBUTE Vr Pp Tbsg preserveDomain (pds)

Access	Read and write
Criticality	Component
Description	This attribute specifies if the domain information should be preserved or embedded in the frame header. This attribute applies only to ***backbone*** ports and does not affect the ***access*** bridge ports. By setting this attribute to a value of ***on***, domain information could be preserved in frames being tunnelled across the backbone, so that this information can be deciphered at the other end of the backbone tunnel. This preserves the integrity of the domains thus preventing domain breaches while tunnelling frames across backbone network. If the value of this attribute is set to ***off*** then domain information is not preserved in the header of the frames tunnelling through the backbone. This eliminates the overhead incurred to preserve domain information across the backbone while tunnelling frames across it. Preserve domain is relevant only when used in conjunction with ATM MPE.

Default	No default

GROUP Vr Pp Tbsg OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Bridge

ATTRIBUTE Vr Pp Tbsg adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Bridge
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Vr Pp Tbsg operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

Copyright © 2006, Nortel Nortel Confidential

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — Bridge

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Vr Pp Tbsg usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — Bridge

Values — idle
active (activ)
busy

Default — idle

GROUP Vr Pp Tbsg OperationalStatus (OperStatus)

Properties — Operational

Description — This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

Mib — Bridge

ATTRIBUTE Vr Pp Tbsg snmpOperStatus

Access — Read only

Description — The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Mib — Bridge

Values — up
down
testing

Default	up

GROUP Vr Pp Tbsg Operational (Oper)

Properties	Operational
Description	This group contains all the operational attributes belonging to the base group. These attributes in part, reflect the state of a bridge port.
Mib	Bridge

ATTRIBUTE Vr Pp Tbsg portName (pn)

Access	Read only
Description	The attribute *portName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/ETH100A* would have a name ***TBP-ETH100A.***
Mib	Bridge
Values	String (4..29, ASCII)
Default	No default

ATTRIBUTE Vr Pp Tbsg upTime (ut)

Access	Read only
Description	This attribute indicates the accumulated up time of this bridge port since the last reset occurred.
Mib	Bridge
Values	Decimal (0..4294967295)
Units	seconds
Default	0

ATTRIBUTE Vr Pp Tbsg downTime (dt)

Access	Read only
Description	This attribute indicates the accumulated down time of this bridge port since the last reset occurred.
Mib	Bridge
Values	Decimal (0..4294967295)
Units	seconds
Default	0

ATTRIBUTE Vr Pp Tbsg bridgingMode (bm)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the mode of bridging this port can support. The transparent bridge mode is the only mode supported.
Mib	Bridge
Values	unknown tb sr srt
Default	No default

ATTRIBUTE Vr Pp Tbsg bridgePortConfig (bpc)

Access	Read only
Description	This attribute indicates the bridge port's configuration. It indicates if the bridge port is operating as an ***access*** port or as a ***backbone*** port. An ***access*** bridge port does not encapsulate a MAC frame and does not preserve domain information in the encapsulation, whereas a ***backbone*** bridge port encapsulates the MAC frame and optionally preserves domain information in the encapsulated frame.A ***backbone*** bridge port is typically used to transport frames across a high bandwidth backbone network to another bridge unit for further processing/forwarding of the frame.
Mib	Bridge
Values	access backbone
Default	No default

ATTRIBUTE Vr Pp Tbsg bridgePortType (bpt)

Access	Read only
Description	This attribute indicates the type of the bridge port that was provisioned. It takes into consideration the *bridgingMode*, *bridgePortConfig* and the media the bridge port is linked to before branding a bridge port.
Mib	Bridge
Values	ethernetBridgePort tokenRingBridgePort fddiBridgePort tokenBusBridgePort lanEmulationClientEthernet fddiEncapsulatingBridgePort vnsBridgePort frameRelayBridgePort pppBridgePort smdsBridgePort vcpBridgePort x25BridgePort

ATTRIBUTE Vr Pp Tbsg ifIndex (ifin)

Access — Read only

Description — This attribute indicates the index into the Interface Table where information about the media interface corresponding to this bridge port is maintained.

Mib — Bridge

Values — Decimal (1..65535)

Default — No default

ATTRIBUTE Vr Pp Tbsg mtuExceededDiscards (med)

Access — Read only

Description — This attribute counts the number of frames discarded because the size of the outbound frame exceeded the message transfer unit (mtu) allowed for the bridge port. Note that this counter only refers to the outbound frames for this bridge port. This counter wraps around its maximum value of 4294967295.
This counter is influenced by the attribute *fragmentIp.* This counter is incremented when a frame larger than the mtu allowed is encountered and cannot be fragmented. If this counter is increasing steadily, it might be useful to set the value of the attribute *fragmentIp* to a value of ***on***.

Mib — Bridge

Values — Decimal (0..4294967295)

Default — 0

GROUP Vr Pp Tbsg TbOperational (TbOper)

Properties — Operational

Description — This group contains all the port specific operational attributes that belong to the Tb group. This group also contains all the port specific statistical attributes that belong to the Tb group. These attributes reflect the state of a bridge port operating in the transparent bridge mode

Copyright © 2006, Nortel Nortel Confidential

Mib	Bridge

ATTRIBUTE Vr Pp Tbsg maxInfo (mi)

Access	Read only
Description	This attribute indicates the maximum size of the information field in a transparent bridge frame. This excludes the header field.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbsg badVerifyDiscards (bvd)

Access	Read only
Description	This attribute counts the number of incoming frames that were discarded because the value of the *secureOption* attribute was set to ***on*** and: a) it is not allowed to receive frames originating from the MAC address found in the source address field of the frame (source MAC address lookup in the forwarding table failed) on this bridge port, or b) for the destination MAC address found in the frame the port the frame was received on does not appear as in port in the corresponding static table entry. Permission to receive frames from a MAC address is granted via the static table entries. This attribute, *badVerifyDiscards*, is directly influenced by: 1. *secureOption* and 2. the static table entries. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbsg staticEntryDiscards (sed)

Access	Read only
Description	This attribute counts the number of frames that were discarded because of the following three reasons: a) there was no entry for the “allowed to go” field in the static table entry, where the input port is this bridge port. b) the MAC destination address in the frame was not found in the forwarding table but the frame cannot be flooded because this bridge has not other ports in forwarding state. c) for spanning tree bpdus that are locally processed. This counter wraps around its maximum value of 4294967295. It might prove useful to check the static table entry corresponding to the

Copyright © 2006, Nortel Nortel Confidential

bridge port in question, if this counter consistently displays a high value. Ideally this counter should be as low as possible.

Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbsg dynamicEntryDiscards (dend)

Access	Read only
Description	This attribute counts the number of incoming frames that: a) were discarded because of the fact that the bridge port, the frame is to go out of matches the bridge port it came in from, or b) if the stp port state of the out port is not ***forwarding***. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbsg learningDiscards (ld)

Access	Read only
Description	This attribute counts the number of frames that were discarded while this bridge port was in a state other than the ***forwarding*** state. While in ***learning*** state the frame is discarded after the information from its header is learnt. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbsg inDiscards (id)

Access	Read only
Description	This attribute counts the number of frames that were received by this bridge port and were discarded by the forwarding process. This includes frames that could have been discarded due to filtering. A rapidly increasing value for this attribute could indicate a shortage of resource in terms of memory needed to process the incoming frames. More memory can be provisioned through the *VirtualRouter*'s memory manager.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbsg inFrames (if)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute counts the number of frames that have been received by this port from its segment. Note that a frame received on this bridge port is counted if and only if it can be processed by the bridge logic contained in this bridge unit. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Tbsg outFrames (of)

Access	Read only
Description	This attribute counts the number of frames that have been transmitted out this bridge port. This also includes management frames.This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

GROUP Vr Pp Tbsg StpOperational (StpOper)

Properties	Operational
Description	This group contains all port specific operational attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes reflect the state of the bridge port's participation in the stp.
Mib	Bridge

ATTRIBUTE Vr Pp Tbsg stpPortState (sps)

Access	Read only
Description	This attribute indicates the stp state of the bridge port.
Mib	Bridge
Values	disabled blocking listening learning forwarding broken

Scope	Application
Description	*Vr/<string> Pp/<string> ClusterSrBridgePort* This component represents the functionality called Cluster Bridging. Cluster Bridging allows for MAC frames, carrying packets belonging a certain network protocol, to be bridged and routed at the same time. Also, it provides for a convenient way to manage the entire cluster of LANs, using a single attachment point to the cluster of LANs, the Cluster Bridge Port. To realize these features, the network protocol(s) should also be provisioned on same port as the Cluster Bridge Port. *ClusterSrBridgePort* represents a cluster of Sr LANs.

Mib	Bridge

ATTRIBUTE Vr Pp Srcl fragmentIp (fIp)

Access	Read and write
Description	This attribute specifies if outbound frames carrying IP datagrams should be fragmented to conform to message transfer unit (*mtu*) sizes dictated by the media.
Mib	Bridge
Values	off on
Default	off

ATTRIBUTE Vr Pp Srcl portNum (pNum)

Access	Read only
Criticality	Component
Description	This attribute indicates the unique number assigned to the bridge port. It is used for SNMP management of this bridge port and in spanning tree as an identifier for this bridge port. Notes: Escape routines exist for initializing, copying, and deleting port numbers. This is necessary because SNMP requires a unique port instance identifier. The initPortNum escape routine sets the port number to a value in the range 1-255 for this purpose. The setCopiedPortNum escape routine exists to maintain the uniqueness of the port number in cases when one port is copied to another. When a bridge port is deleted, the releasePortNum escape routine places the port number being released into a pending deletion state. This is because the port number cannot be re-allocated until the port is truly deleted in the current view. This is necessary since there is no guarantee of order when processing changes to multiple protocol ports so without the pending deletion state, the same port number could be temporarily assigned to two ports for a short period of time. The portNum is set as component critical since bridging also uses the port number as a key for indexing into its data structures. If a port is deleted then re-added under the same protocol port, CAS treats the change as a SET to the portNum attribute.

GROUP Vr Pp Srcl OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Bridge

ATTRIBUTE Vr Pp Srcl adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Bridge
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Vr Pp Srcl operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

Copyright © 2006, Nortel Nortel Confidential

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — Bridge

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Vr Pp Srcl usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — Bridge

Values — idle
active (activ)
busy

Default — idle

GROUP Vr Pp Srcl OperationalStatus (OperStatus)

Properties — Operational

Description — This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

Mib — Bridge

ATTRIBUTE Vr Pp Srcl snmpOperStatus

Access — Read only

Description — The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Mib — Bridge

Values — up
down
testing

Copyright © 2006, Nortel Nortel Confidential

Default	up

GROUP Vr Pp Srcl Operational (Oper)

Properties	Operational
Description	This group contains all the operational attributes belonging to the base group. These attributes in part, reflect the state of a bridge port.
Mib	Bridge

ATTRIBUTE Vr Pp Srcl portName (pn)

Access	Read only
Description	The attribute *portName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/ETH100A* would have a name ***TBP-ETH100A.***
Mib	Bridge
Values	String (4..29, ASCII)
Default	No default

ATTRIBUTE Vr Pp Srcl upTime (ut)

Access	Read only
Description	This attribute indicates the accumulated up time of this bridge port since the last reset occurred.
Mib	Bridge
Values	Decimal (0..4294967295)
Units	seconds
Default	0

ATTRIBUTE Vr Pp Srcl downTime (dt)

Access	Read only
Description	This attribute indicates the accumulated down time of this bridge port since the last reset occurred.
Mib	Bridge
Values	Decimal (0..4294967295)
Units	seconds
Default	0

ATTRIBUTE Vr Pp Srcl bridgingMode (bm)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the mode of bridging this port can support. The transparent bridge mode is the only mode supported.
Mib	Bridge
Values	unknown tb sr srt
Default	No default

ATTRIBUTE Vr Pp Srcl bridgePortConfig (bpc)

Access	Read only
Description	This attribute indicates the bridge port's configuration. It indicates if the bridge port is operating as an ***access*** port or as a ***backbone*** port. An ***access*** bridge port does not encapsulate a MAC frame and does not preserve domain information in the encapsulation, whereas a ***backbone*** bridge port encapsulates the MAC frame and optionally preserves domain information in the encapsulated frame.A ***backbone*** bridge port is typically used to transport frames across a high bandwidth backbone network to another bridge unit for further processing/forwarding of the frame.
Mib	Bridge
Values	access backbone
Default	No default

ATTRIBUTE Vr Pp Srcl bridgePortType (bpt)

Access	Read only
Description	This attribute indicates the type of the bridge port that was provisioned. It takes into consideration the *bridgingMode*, *bridgePortConfig* and the media the bridge port is linked to before branding a bridge port.
Mib	Bridge
Values	ethernetBridgePort tokenRingBridgePort fddiBridgePort tokenBusBridgePort lanEmulationClientEthernet fddiEncapsulatingBridgePort vnsBridgePort frameRelayBridgePort pppBridgePort smdsBridgePort vcpBridgePort x25BridgePort

clusterSrBridgePort
clusterTbBridgePort
snaDlrBridgePort
unknown

Default — No default

ATTRIBUTE Vr Pp Srcl ifIndex (ifin)

Access — Read only

Description — This attribute indicates the index into the Interface Table where information about the media interface corresponding to this bridge port is maintained.

Mib — Bridge

Values — Decimal (1..65535)

Default — No default

ATTRIBUTE Vr Pp Srcl mtuExceededDiscards (med)

Access — Read only

Description — This attribute counts the number of frames discarded because the size of the outbound frame exceeded the message transfer unit (mtu) allowed for the bridge port. Note that this counter only refers to the outbound frames for this bridge port. This counter wraps around its maximum value of 4294967295.
This counter is influenced by the attribute *fragmentIp.* This counter is incremented when a frame larger than the mtu allowed is encountered and cannot be fragmented. If this counter is increasing steadily, it might be useful to set the value of the attribute *fragmentIp* to a value of ***on***.

Mib — Bridge

Values — Decimal (0..4294967295)

Default — 0

GROUP Vr Pp Srcl StpOperational (StpOper)

Properties — Operational

Description — This group contains all port specific operational attributes that belong to the Stp group. The Stp group is applicable to all bridge ports that participate in the stp. These attributes reflect the state of the bridge port's participation in the stp.

Copyright © 2006, Nortel Nortel Confidential

Mib	Bridge

ATTRIBUTE Vr Pp Srcl stpPortState (sps)

Access	Read only
Description	This attribute indicates the stp state of the bridge port.
Mib	Bridge
Values	disabled blocking listening learning forwarding broken
Default	disabled

ATTRIBUTE Vr Pp Srcl stpTypeOper (stptOper)

Access	Read only
Description	This attribute indicates the type of the stp the port is participating in. A bridge port could participate in either the ***ieee8021*** stp or the ***dec*** stp.
Mib	Bridge
Values	none dec ieee8021
Default	ieee8021

ATTRIBUTE Vr Pp Srcl designatedCost (dc)

Access	Read only
Description	This attribute indicates the path cost of the designated port of the lan segment the designated port is connected to.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Pp Srcl pathCostOper (pco)

Access	Read only
Description	This attribute indicates the contribution of this port to all the paths to the root bridge that include this port. This attribute *pathCostOper* will track the value of the attribute *pathCost* when the value of the attribute *pathCostMethod* is set of ***off***.
Mib	Bridge

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (1..65535)
Default	No default

ATTRIBUTE Vr Pp Srcl designatedBridge (db)

Access	Read only
Description	This attribute indicates the identifier of the bridge that this port considers to be the designated bridge.
Mib	Bridge
Values	String (8, Dashed Hex)
Default	No default

ATTRIBUTE Vr Pp Srcl designatedPort (dp)

Access	Read only
Description	This attribute indicates the port identifier of the port on the designated bridge attached to the same LAN segment as this port is attached to.
Mib	Bridge
Values	Hex (H.0..H.ffff)
Default	No default

ATTRIBUTE Vr Pp Srcl forwardTransitions (ft)

Access	Read only
Description	This attribute counts the number of times this bridge port transitioned from the ***learning*** state to the ***forwarding*** state. This counter wraps around its maximum value of 4294967295. A rapidly increasing value might be indicative of an unstable spanning tree topology.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srcl blockingDiscards (bd)

Access	Read only
Description	This attribute counts the number of the incoming frames that were discarded because the bridge port was in the ***blocking*** state. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Pp Srcl designatedRoot (dr)

Access	Read only
Description	This attribute indicates the bridge identifier of the bridge recorded as the root bridge in the configuration BPDUs sent out by the designated bridge on the segment this port is attached to.
Mib	Bridge
Values	String (8, Dashed Hex)
Default	No default

GROUP Vr Pp Srcl Statistics (Stats)

Properties	Operational
Description	This group contains all the statistical attributes applicable to all types of bridge ports and represents the common factor between them. These attributes in part reflect the state of the bridge port.
Mib	Bridge

ATTRIBUTE Vr Pp Srcl badAbstractDiscards (bad)

Access	Read only
Description	This attribute counts the number of frames that were discarded because the data abstracted from the frames coming in through this bridge port did not conform to the format expected by the bridge logic.This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srcl tinygramFramesIn (tfi)

Access	Read only
Description	This attribute counts the number of frames received on this bridge port that used the tinygram compression scheme.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srcl tinygramFramesOut (tfo)

Access	Read only
Description	This attribute counts the number of frames transmitted out this bridge port that used the tinygram compression scheme.

Copyright © 2006, Nortel Nortel Confidential

Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srcl inFilterDiscards (ifd)

Access	Read only
Description	This attribute counts the number of frames discarded due to domain based filtering at the in filter point. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srcl outFilterDiscards (ofd)

Access	Read only
Description	This attribute counts the number of frames discarded due to domain based filtering at the out filter point. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

GROUP Vr Pp Srcl SrProvisioned (SrProv)

Properties	Provisioned
Description	This group contains all port specific, provisionable attributes associated with *SourceRouteBridge* ports.
Mib	Bridge

ATTRIBUTE Vr Pp Srcl hopCount (hc)

Access	Read and write
Description	This attribute specifies the maximum number of hops allowed in Spanning Tree Explore and All Routes Explore frames. This value is one less than the maximum number of route descriptors allowed in a source route frame
Mib	Bridge
Values	Decimal (1..7)
Default	7

ATTRIBUTE Vr Pp Srcl exploreFrameTreatment (eft)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies whether or not explore frames received from *SourceRouteBridge* ports will be sent to the SRTB-8209 translation or the encapsulated *SourceRouteBridge* logic. This option is used only when both the *TbsrBridgePort* and the *SrtbBridgePort* are provisioned and enabled. A value of ***Xlate*** implies that the explore frames will be sent to the Srtb translation logic and a value of ***Encap*** implies that the frames will be sent to the Encapsulated source route bridging logic.
Mib	Bridge
Values	encap xlate
Default	encap

ATTRIBUTE Vr Pp Srcl lanId (lid)

Access	Read and write
Description	This attribute specifies the identifier for the physical LAN that this port is attached. All *SourceRouteBridge* ports are assigned to a physical LAN and a logical internal LAN. Current source route bridge implementations limit the lanId to a value in the range 0 to 4095.
Mib	Bridge
Values	Decimal (0..4095)
Default	0

ATTRIBUTE Vr Pp Srcl internalLanId (ilid)

Access	Read and write
Description	This attribute specifies the identifier for the internal logical LAN this port is attached. All *SourceRouteBridge* ports are assigned to a physical LAN and a logical internal LAN. Current source route bridge implementations limit the lanId to a value in the range 0 to 4095.
Mib	Bridge
Values	Decimal (0..4095)
Default	0

ATTRIBUTE Vr Pp Srcl bridgeNum (bid)

Access	Read and write
Description	This attribute specifies the value that is used to identify this bridge when more than one bridge is used to span the same two LAN segments.

Copyright © 2006, Nortel Nortel Confidential

Mib	Bridge
Values	Decimal (0..15)
Default	7

ATTRIBUTE Vr Pp Srcl largestFrame (lf)

Access	Read and write
Description	This attribute specifies the maximum frame size (LLC and above) in octets, allowed by this *SourceRouteBridge* port. This field is used to determine whether a modification of the largest frame field of the routing control field of the routing information field is warranted.
Mib	Bridge
Values	Decimal (516; 1470; 2052; 4399; 8130; 11407; 17749)
Units	octets
Default	No default

ATTRIBUTE Vr Pp Srcl steSpanMode (steSm)

Access	Read and write
Description	This attribute determines how this bridge port will react when presented with a Spanning Tree Explore frame. If ***disabled,*** the Spanning Tree Explore frame is discarded regardless of the value of *stpPortState.* If the value of this attribute is ***forced***, the Spanning Tree Explore frame is forwarded regardless of the value of *stpPortState.* ***autoSpan*** uses the *stpPortState* value to decide whether or not Spanning Tree Explore frames should be forwarded out this bridge port. If the port is in the ***forwarding*** state, the frame is received and transmitted otherwise the frame is discarded.
Mib	Bridge
Values	autoSpan disabled forced
Default	autoSpan

ATTRIBUTE Vr Pp Srcl areRdLimit (arl)

Access	Read and write
Description	This attribute specifies the number of route descriptors allowed in an All Routes Explore frame received on a *SourceRouteBridgePort* or *SourceRouteTransparentBridgePort*. Current source route bridge implementations limit the *areRdLimit* to a value in the range 0 to 8.
Mib	Bridge

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..8)
Default	8

ATTRIBUTE Vr Pp Srcl steRdLimit (srl)

Access	Read and write
Description	This attribute specifies the number of route descriptors allowed in a Spanning Tree Explore frame received on a *SourceRouteBridgePort* or *SourceRouteTransparentBridgePort*. Current source route bridge implementations limit the *steRdLimit* to a value in the range 0 to 8.
Mib	Bridge
Values	Decimal (0..8)
Default	8

GROUP Vr Pp Srcl SrStatistics (SrStats)

Properties	Operational
Description	This group contains all port specific statistical attributes associated with *SourceRouteBridge* ports.
Mib	Bridge

ATTRIBUTE Vr Pp Srcl specInFrames (sif)

Access	Read only
Description	This attribute specifies the number of specifically routed frames that were received by this bridge port. A specifically routed frame has a route descriptor, constructed by the originating host which details an explicit route to the destination host. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srcl specOutFrames (srfof)

Access	Read only
Description	This attribute specifies the number of specifically routed frames that were transmitted from this bridge port. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srcl apeInFrames (apeif)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute specifies the number of All Path Explore frames received on this bridge port. The All Path Explore frames are forwarded to all *SourceRouteBridge* ports assigned to this bridge regardless of the port's *portStpState*s. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srcl apeOutFrames (apeof)

Access	Read only
Description	This attribute specifies the number of All Path Explore frames transmitted on this bridge port. The All Path Explore frames are forwarded to all *SourceRouteBridge* ports assigned to this bridge regardless of the port's *portStpState* state. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srcl steInFrames (steif)

Access	Read only
Description	This attribute specifies the number of Spanning Tree Explore frames received on this bridge port. The Spanning Tree Explore frames are only forwarded through bridge ports whose *portStpState* has a value of ***forwarding.*** This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srcl steOutFrames (steof)

Access	Read only
Description	This attribute specifies the number of Spanning Tree Frames transmitted on this bridge port. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Pp Srcl segmentMismatchDiscards (lidmd)

Access	Read only
Description	This attribute specifies the number of All Routes Explore and Spanning Tree Explore frames that were discarded due to an invalid next segment value in the routing information field. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srcl dupSegmentDiscards (dsd)

Access	Read only
Description	This attribute specifies the number of frames discarded due to the presence of a duplicate segment identifier in the route descriptor field which may indicate a loop in the network topology. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srcl hopCountExceededDiscards (hced)

Access	Read only
Description	This attribute specifies the number of All Routes Explore and Spanning Tree Explore frames discarded by this bridge port due to a frame exceeding the maximum size allowed for a route descriptor length. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srcl dupLanIdOrTreeErrors (dlte)

Access	Read only
Description	This attribute specifies the number frames received which contain duplicate LAN IDs or Tree errors. This attribute is helpful in debugging problems in networks which contain older IBM-SR bridges. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Vr Pp Srcl lanIdMismatches

Access	Read only
Description	This attributes counts the number of All Routes Explore or Spanning Tree Explore frames that were discarded because the last LAN ID in the routing information field did not equal the LAN ID. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srcl staticDiscards (sd)

Access	Read only
Description	This attribute is indicative of the number of explorer frames discarded due to fact that the outbound *SourceRouteBridge* port was disabled or deleted. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Pp Srcl dynamicDiscards (dd)

Access	Read only
Description	This attribute specifies the number of frames discarded due to receiving a frame with a target LAN ID which did not match the internal LAN ID of the receiving bridge port. This counter will wrap to zero when it exceeds its maximum.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

COMPONENT Vr Pp Srcl NetSentry (Ns)

Groups	GROUP Vr Pp Srcl Ns Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Pp/<string> TransparentBridgePort NetSentry* This component represents the *Ns* functionality that can be applied to a bridge port. It contains all the attribute groups (provisionable) that are necessary for the application of Ns functionality to a bridge port. In

Copyright © 2006, Nortel Nortel Confidential

essence, it allows for the definition of filters, at the incoming and outgoing points, specific to the interface represented by this bridge port.

Mib	Bridge
Common Verbs	Help List Display Add DELete

GROUP Vr Pp Srcl Ns Provisioned (Prov)

Properties	Provisioned
Description	This group houses all the port specific provisionable attributes associated with Ns. These attributes influence the application of filters to incoming and outgoing frames.
Mib	Bridge

ATTRIBUTE Vr Pp Srcl Ns incomingFilter (if)

Access	Read and write
Description	This attribute specifies the name of the filter to be applied at the incoming filter point.
Mib	Bridge
Values	String (0..32, ASCII)
Default	No default

ATTRIBUTE Vr Pp Srcl Ns outgoingFilter (of)

Access	Read and write
Description	This attribute specifies the name of the filter to be applied at the out going filter point.
Mib	Bridge
Values	String (0..32, ASCII)
Default	No default

COMPONENT Vr NetSentry (Ns)

Groups	GROUP Vr Ns Provisioned (Prov) GROUP Vr Ns Statistics (Stats)
Scope	Application

Common Verbs	Help List Display Add DELete

GROUP Vr Ns Provisioned (Prov)

Properties	Provisioned
Description	This contains the global *NetSentry* control flags.
Mib	NetSentry

ATTRIBUTE Vr Ns dropConditions

Access	Read and write
Description	This attribute controls under what circumstances *NetSentry* drops packets. It is possible for *NetSentry* to drop packets when: There is no memory to contain statistics for this packet (statsNoMem), it is for whatever reason impossible to clone, copy, or log a copy of the packet via the clone_to copy_to or log_to actions respectively (cantCloneTo, cantCopyTo and cantLogTo), and if the packet encounters a filter which is provisioned at a filter point within a protocol component, but not defined in any of the files defined by *File* components within *NetSentry* (this is a Null filter).
Mib	NetSentry
Set of	statsNoMem cantCloneTo cantLogTo cantCopyTo cantMacCloneTo nullFilter
Default	No default

Copyright © 2006, Nortel Nortel Confidential

GROUP Vr Ns Statistics (Stats)

Properties	Operational
Description	This contains the global *NetSentry* (in particular, non-protocol specific) statistics.
Mib	NetSentry

ATTRIBUTE Vr Ns packetsProcessed (packets)

Access	Read only
Description	This attribute counts the total number of packets processed through *NetSentry*. This counter will wrap around to zero when it exceeds its maximum value, 4294967295.
Mib	NetSentry
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ns packetsFailed (failed)

Access	Read only
Description	This attribute counts the total number of packets processed through *NetSentry* which ended with a fail disposition. This counter will wrap around to zero when it exceeds its maximum value, 4294967295.
Mib	NetSentry
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ns statsNoMem (mem)

Access	Read only
Description	This attribute counts the total number of packets processed through *NetSentry* for which statistic should have been gathered, but for which statistics were not gathered due to a failure to allocate memory. Such packets may or may not be dropped according to the values provisioned in *dropConditions* under the *NetSentry* component. If this attribute is being incremented, the system is suffering from memory shortfalls, and some operator action is advised. Perhaps memory allocations should be re-provisioned, *NetSentry* statistics gathering should be reduced, or *NetSentry* statistics tables should be cleared to temporarily free memory. This counter will wrap around to zero when it exceeds its maximum value, 4294967295.
Mib	NetSentry
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ns hsaOkayFailed (hsaokfailed)

Access	Read only
Description	This attribute counts the total number of packets processed through *NetSentry* which encountered, and did not match, an hsa_okay pattern. Such packets are likely to be generated from misconfigured hosts. Some operator action to track down these hosts is advised. This counter will wrap around to zero should it ever exceed its maximum value, 4294967295.
Mib	NetSentry
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ns depthExceeded (depth)

Access	Read only
Description	This attribute counts the total number of times a *NetSentry* filter was executed which referenced too many layers of indirect filters. If this count is non-zero, the filter definitions the unit is using are incorrect, and some operator action to track down the erroneous filter definitions is advised. Filters will not be behaving correctly if this counter is increasing, and security could be compromised. This count should always be zero, and it will wrap around to zero should it ever exceed its maximum value of 4294967295.
Mib	NetSentry
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ns droppedStatsNoMem (dropSNM)

Access	Read only
Description	This counts the total number of packets that were actually dropped due to an inability to allocate memory to hold statistics for the packet. Such a packet must have had a *NetSentry* statistics gathering action applied to it, in order for the attempt to gather statistics to be made, and the *dropConditions* attribute must include the ***statsNoMem*** value.
Mib	NetSentry
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ns droppedCantCloneTo (dropCCloneT)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This counts the total number of packets that were dropped due to the failure of a clone_to action applied to the packet. This counter will only increment if the *dropConditions* attribute includes the ***cantCloneTo*** value.
Mib	NetSentry
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ns droppedCantLogTo (dropCLogT)

Access	Read only
Description	This counts the total number of packets that were dropped due to the failure of a log_to action applied to the packet. This counter will only increment if the *dropConditions* attribute includes the ***cantLogTo*** value.
Mib	NetSentry
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ns droppedCantCopyTo (dropCCopyT)

Access	Read only
Description	This counts the total number of packets that were dropped due to the failure of a copy_to action applied to the packet. This counter will only increment if the *dropConditions* attribute includes the ***cantCopyTo*** value.
Mib	NetSentry
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ns droppedNullFilter (dropNF)

Access	Read only
Description	This counts the total number of packets that were dropped because the packet passed through a filter point into which was provisioned a filter which was never defined in a file loaded into *NetSentry.* Such filter points have atached to the the so-call Null Filter, which will either succeed or fail all packets passing through it, depending on whether or not the *dropConditions* attribute includes the ***nullFilter*** value.
Mib	NetSentry
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	0

COMPONENT Vr Ns File

Instance	String (1..64, ASCII)
Groups	GROUP Vr Ns File Operational (Oper)
Scope	Application
Description	*Vr/<string> NetSentry File/<filename>* This component's instance value is a single filename to be compiled. The file must reside in /provisioning/netsentry/prov in order to be compiled at provisioning activate time, but in /provisioning/netsentry/oper to be recompiled with the *ReLoad* verb. This is to provide the same sort of protections that the provisioning system gives with its activate-confirm-commit sequence.
Mib	NetSentry
Common Verbs	Help List Display Add DELete

VERB RELoad Vr Ns File

Impact	Configuration
Description	*RELoad VR/<string> NS File/<filename>* This verb compiles the file to which the *File* component the verb applies to refers, searching for the named file in the /provisioning /netsentry/oper subdirectory. This is in contrast to the provisioning-time load, which searches the /provisioning/netsentry/prov subdirectory. This provides some measure of safety in the event of misconfigured filters, since rebooting the unit will cause *NetSentry* to fall back to the filters defined in files in the prov subdirectory. Presently, the operator must manually 'commit' a file of filter definitions by moving or copying it from the oper subdirectory to the prov subdirectory. This verb will return either success or failure, with a detailed error message both returned in the failure, and set in the *File* component itself.

GROUP Vr Ns File Operational (Oper)

Properties	Operational
Description	This holds hold a single compiler error message.
Mib	NetSentry

ATTRIBUTE Vr Ns File compilerErrorMsg

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute contains a single string holding the compiler error which caused the compile to fail. In the event that the file is recompiled (using the *RELoad* verb), the value of this will change, to reflect the new error, if any was encountered, or no error, if the compile was successful.
Mib	NetSentry
Values	String (1..80, ASCII)
Default	"No Error"

COMPONENT Vr Ns Engine

Instance	Decimal (0..15)
Scope	Application
Description	*Vr/<string> NetSentry Engine/n* The existence of this component represents the presence of NetSentry on a particular Logical Processor. Each *Engine* component must correspond to a matching *Lp* component. If *NetSentry* filtering is needed on some *Lp*, a corresponding *Engine* must be provisioned.

GROUP Vr Br OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Bridge

ATTRIBUTE Vr Br adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Bridge
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Vr Br operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

Scope	Application
Description	*Vr/<string> Bridge NetSentry ApplyTableEntry/<Decimal>* This component, represents an entry in the filter apply table. The filter apply table is used to specifically filter frames, based on a frame's origin, its destination, and the domain associated with the frame. A filter name is specified in the entry, which is applied to a frame if the match criteria is satisfied. When the attribute *direction* has the value ***to***, a match in the filter table requires the *firstMACAddress* anded with the *firstMACAddressMask* to match the source MAC address in the frame, the *secondMACAddress* anded with the *secondMACAddressMask to* match the destination MAC address in the frame, and the *domainNum* to match the domain number associated with the frame. When the *direction* has the value ***from***, a match in the filter table requires the *firstMACAddress* anded with the *firstMACAddressMask* to match the destination MAC address in the frame, the *secondMACAddress* anded with the *secondMACAddressMask to* match the source MAC address in the frame, and the *domainNum* to match the domain number associated with the frame. When the *direction* has the value ***toFrom***, a match in the filter table requires the *firstMACAddress* anded with the *firstMACAddressMask* to match the source/destination MAC address in the frame, the *secondMACAddress* anded with the *secondMACAddressMask to* match the destination/source MAC address in the frame, and the *domainNum* to match the domain number associated with the frame.
Mib	Bridge
Common Verbs	Help List Display Add DELete

GROUP Vr Br Ns Ate Provisioned (Prov)

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group houses all the attributes that together form an apply table entry. These fields of an apply table entry are used as match criteria, which when satisfied results in the application of the named filter to the frame.
Mib	Bridge

ATTRIBUTE Vr Br Ns Ate **domainNum (dn)**

Access	Read and write
Description	This attribute specifies the domain number associated with a frame, that would qualify it partly, for a match in the apply table. The domain number provisioned will form a part of the match criteria only if it is not provisioned with a wild card value of ***0.*** If the wild card character is specified, any domain number will satisfy the match criteria, in effect loosing domain number as a qualifier in the match criteria.
Mib	Bridge
Values	Decimal (0..4294967293)
Default	0

ATTRIBUTE Vr Br Ns Ate **firstMacAddress (fma)**

Access	Read and write
Description	This attribute specifies the MAC address to be anded with the *firstMACAddressMask,* and the result compared with- a) The source MAC address in a frame when the attribute *direction* has a value of ***to***, b) The destination MAC address in a frame when the attribute *direction* has a value of ***from***, c) Source / Destination address in a frame when the attribute *direction* has a value of ***toFrom***, as a part of finding a match in the bridge filter apply table.
Mib	Bridge
Values	String (6, Dashed Hex)
Default	00-00-00-00-00-00

ATTRIBUTE Vr Br Ns Ate **firstMacAddressMask (fmam)**

Access	Read and write
Description	This attribute specifies the mask which is anded with the attribute *firstMACAddress.* The result is then compared with- a) The source MAC address in a frame when the attribute *direction* has a value of ***to***, b) The destination MAC address in a frame when the attribute *direction* has a value of ***from***, c) Source / Destination address in a frame when the attribute *direction* has a value of ***toFrom***, as a part of finding a match in the bridge filter apply table.

Copyright © 2006, Nortel Nortel Confidential

Mib	Bridge
Values	String (6, Dashed Hex)
Default	ff-ff-ff-ff-ff-ff

ATTRIBUTE Vr Br Ns Ate secondMacAddress (sma)

Access	Read and write
Description	This attribute specifies the MAC address to be anded with the *secondMACAddressMask,* and the result compared with- a) The destination MAC address in a frame when the attribute *direction* has a value of ***to***, b) The source MAC address in a frame when the attribute *direction* has a value of ***from***, c) Destination/Source address in a frame when the attribute *direction* has a value of ***toFrom***, as a part of finding a match in the bridge filter apply table.
Mib	Bridge
Values	String (6, Dashed Hex)
Default	00-00-00-00-00-00

ATTRIBUTE Vr Br Ns Ate secondMacAddressMask (smam)

Access	Read and write
Description	This attribute specifies the mask which is anded with the attribute *secondMACAddress.* The result is then compared with- a) The destination MAC address in a frame when the attribute *direction* has a value of ***to***, b) The source MAC address in a frame when the attribute *direction* has a value of ***from***, c) Destination/Source address in a frame when the attribute *direction* has a value of ***toFrom***, as a part of finding a match in the bridge filter apply table.
Mib	Bridge
Values	String (6, Dashed Hex)
Default	ff-ff-ff-ff-ff-ff

ATTRIBUTE Vr Br Ns Ate direction (dir)

Access	Read and write
Description	This attribute specifies the direction of frame flow. It is used to appropriately compare the result of logically anding MAC address, MACAddressMask pairs, with the source /destination MAC address fields in a frame, as a part of the match finding process. When this attribute has value of ***to***, the *firstMACAddress* is logically anded with the *firstMACAddressMask* and the result compared with the source MAC address in a frame and the *secondMACAddress* logically anded with

Copyright © 2006, Nortel Nortel Confidential

the *secondMACAddressMask* and compared with the destination MAC address.
When this attribute has a value of ***from***, the *firstMACAddress* is logically anded with the *firstMACAddressMask* and the result compared with the destinationMAC address in a frame and the *secondMACAddress* logically anded with the *secondMACAddressMask* and compared with the sourceMAC addressin the frame, as a part of finding a match in the bridge filter apply table entry.

Mib	Bridge
Values	to from toFrom
Default	toFrom

ATTRIBUTE Vr Br Ns Ate **filterName (fn)**

Access	Read and write
Description	This attribute specifies the name of the filter to be applied to the frame, if it satisfies the match criteria mentioned in the bridge filter apply table entry.
Mib	Bridge
Values	String (0..32, ASCII)
Default	No default

COMPONENT Vr Br **TransparentBridge (Tb)**

Groups	GROUP Vr Br Tb Provisioned (Prov) GROUP Vr Br Tb Statistics (Stats)
Scope	Application
Description	*Vr/<string> Bridge TransparentBridge* This component contains all the global bridge attribute groups necessary for the operation of a transparent bridge.
Mib	Bridge

Copyright © 2006, Nortel Nortel Confidential

GROUP Vr Br Tb Provisioned (Prov)

Properties	Provisioned
Description	This group contains all the provisionable attributes applicable to a transparent bridge, those attributes that are global and are not port specific.
Mib	Bridge

ATTRIBUTE Vr Br Tb fwdTableNumEntries (ftNe)

Access	Read and write
Description	This attribute specifies the number of entries that can exist in the transparent bridge forwarding table. This attribute provides a way to control the resources allocated to forwarding table. This attribute will prove to be very useful while attempting to fine tune the resource allocated to suit the network configuration. Please understand that this attribute *tbFwdTableNumEntries* is influenced by the memory management scheme provided by the *VirtualRouter* and is by no means independent of the same. It is important to understand the network configuration in terms of number and types of bridge ports provisioned before attempting to fine tune this attribute.The following attributes can be used as feedback to fine tune this attribute: a) attribute *totalForwardingTableEntries* under the *TransparentBridge component,* *b) attribute numFtEntriesFree under the TransparentBridge component,* *c) attribute numFtEntriesDenied under the TransparentBridge component*
Mib	Bridge
Values	Decimal (0..65535)
Default	500

ATTRIBUTE Vr Br Tb agingTime (at)

Access	Read and write
Description	This attribute specifies the time period used in seconds, to age out dynamically learned entries in the forwarding table. The aging time can change, triggered by a spanning tree topology change. The operational value of the aging time is reflected in the attribute *agingTimeOper* under the *SpanningTreeProtocol* component.
Mib	Bridge
Values	Decimal (10..1000000)
Units	seconds
Default	300

GROUP Vr Br Tb Statistics (Stats)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains all the statistical attributes for a transparent bridge, those attributes that are global in nature and are not port specific.
Mib	Bridge

ATTRIBUTE Vr Br Tb learnedEntryDiscards (led)

Access	Read only
Description	This attribute represents the number of dynamic entries that might have been learned but have been discarded due to a static entry already installed by provisioning in the forwarding table. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Br Tb totalForwardingTableEntries (tFtE)

Access	Read only
Description	This attribute indicates the total number of transparent bridge forwarding table entries. This includes static forwarding table entries and dynamic forwarding table entries. This attribute is influenced by the attribute *tbFwdTableNumEntries*, which is a provisionable attribute. If the value is consistently approaching the value of the attribute *tbFwdTableNumEntries*, it is advisable to increase the value provisioned for *tbFwdTableNumEntries*. It indicates a potential shortage of forwarding table entries in the future. This attribute is inversely proportional in value to the attribute *numFtEntriesFree.* This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Br Tb numFtEntriesFree (nFteF)

Access	Read only
Description	This attribute indicates the number of free transparent bridge forwarding table entries. These entries could be used by static entries or by dynamic entries. This counter wraps around its maximum value of 4294967295. A consistently high value for this attribute indicates that there is a resource surplus here, in terms of the memory requirements of the forwarding table. This surplus could be utilized elsewhere if need be. The value of this attributes directly influenced by the value of the attribute *tbFwdTableNumEntries.*

Copyright © 2006, Nortel Nortel Confidential

Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Br Tb numFtEntriesDenied (nFteD)

Access	Read only
Description	This attribute indicates the number of instances wherein transparent bridge table entry was unavailable. These entries could have been denied for static entries or for dynamic entries. This counter wraps around its maximum value of 4294967295. If this counter consistently shows a high value, it is indicative of a resource shortage in terms of memory required to support the increase in the number of forwarding table entries. To rectify this resource shortage, increase the number of forwarding table entries through the provisioned attribute *tbFwdTableEntries* under the *Bridge* component. This counter should ideally be as low as possible.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

COMPONENT Vr Br Tb SpanningTreeProtocol (Stp)

Instance	Decimal (1..4294967293)
Groups	GROUP Vr Br Tb Stp Provisioned (Prov) GROUP Vr Br Tb Stp Operational (Oper)
Scope	Application
Description	*Vr/<string> Br Tb Stp/<Decimal>* This component represents the Spanning Tree Protocol for the bridge. Bridges use the Spanning Tree Protocol to provide a loop free, fault tolerant network topology. Individual spanning tree instances are indexed using the domain number. Only 16 instances of this component are allowed including the backbone spanning tree instance. The instance identifier of the *SpanningTreeProtocol* component is significant as it indicates the domain that the spanning tree instance governs.
Mib	Bridge
Common Verbs	Help List Display Add DELete

Copyright © 2006, Nortel Nortel Confidential

GROUP Vr Br Tb Stp Provisioned (Prov)

Properties	Provisioned
Description	This group contains all the provisionable attributes that are applicable to the spanning tree protocol. These are global attributes and not port specific attributes. These attributes have a direct impact on the way this bridge participates in the stp.
Mib	Bridge

ATTRIBUTE Vr Br Tb Stp stpMode

Access	Read and write
Description	This attribute determines if this stp instance is to act as the stp instance for the backbone or an stp instance for a non-backbone media configuration. There can exist only one Backbone stp instance per virtual router. Please note that it is not permissible to assign the instance identifier of this stp instance as domain number of any access bridge port. In case of stp instances that are non-Backbone, the instance identifier is indicating the domain number the stp is operational in.
Mib	Bridge
Values	access backbone
Default	access

ATTRIBUTE Vr Br Tb Stp protocolSpec (pS)

Access	Read and write
Description	This attribute specifies the type of the spanning tree protocols that are in operation in the bridge. This means that this bridge participates in the types of stp indicated by this attribute.
Mib	Bridge
Values	both dec ieee8021d
Default	ieee8021d

ATTRIBUTE Vr Br Tb Stp priority

Access	Read and write
Description	This attribute is used to construct the *bridgeId*. It forms the first two octets of the *bridgeId* and the remaining 6 octets are made up of the *bridgeMACAddress*. The *priority* also determines the root bridge of the spanning tree topology. Manipulating this attribute might lead to a change in the spanning tree topology.
Mib	Bridge

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..65535)
Default	32768

ATTRIBUTE Vr Br Tb Stp bridgeMaxAge (bma)

Access	Read and write
Description	This attribute specifies the maximum age of the stp information learned from the network on any bridge port before it is discarded. This value is used by this bridge and all the other bridges when this bridge is the root bridge of the spanning tree topology. The following relationships are enforced as required by the IEEE 802.1d standards document. 2 *(*bridgeForwardDelay* -1.0seconds) >= *bridgeMaxAge*, *bridgeMaxAge* >= 2 * *bridgeHelloTime* + 1.0 seconds.
Mib	Bridge
Values	Decimal (600..4000)
Units	centiseconds
Default	2000

ATTRIBUTE Vr Br Tb Stp bridgeHelloTime (bht)

Access	Read and write
Description	This attribute specifies the time interval between the transmission of configuration BPDUs on any bridge port when this bridge becomes the root bridge. This attribute value is also used by all the other bridges in the Spanning Tree while this bridge is the root. The following relationship is enforced as required by the IEEE 802.1d standards document. *bridgeMaxAge* >= 2 * *bridgeHelloTime* + 1.0 seconds.
Mib	Bridge
Values	Decimal (100..1000)
Units	centiseconds
Default	200

ATTRIBUTE Vr Br Tb Stp bridgeForwardDelay (bfd)

Access	Read and write
Description	This attribute specifies how fast a bridge port changes its STP state while progressing towards the forwarding state. It is also used as *agingTime* to age dynamic entries in the forwarding table once a topology change is detected. This attribute is used by all the bridges participating in the stp when this bridge is the root bridge. The following relationship is enforced as required by the IEEE 802.1d standards document. 2 *(*bridgeForwardDelay* -1.0sconds) >= *bridgeMaxAge*.
Mib	Bridge

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (400..3000)
Units	centiseconds
Default	1500

GROUP Vr Br Tb Stp Operational (Oper)

Properties	Operational
Description	This group contains all the operational, stp attributes. These attributes are applicable in a global manner and are not specific to a bridge port.
Mib	Bridge

ATTRIBUTE Vr Br Tb Stp bridgeId (bid)

Access	Read only
Description	This attribute indicates the identifier value of this bridge, which serves to uniquely represent this bridge in the spanning tree topology. Thus, a *bridgeId* is unique only in the spanning tree instance the bridge is participating in. If multiple domain spanning trees exist then the same *bridgeId* can be re-used across these spanning tree instances.
Mib	Bridge
Values	String (8, Dashed Hex)
Default	No default

ATTRIBUTE Vr Br Tb Stp rootPortName (rpn)

Access	Read only
Description	This attribute indicates the name of the bridge port that offers the lowest cost route to the root bridge of the spanning tree topology.The attribute *rootPortName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/MyPort* would have a name ***TBP-MyPort.*** If multiple instances of spanning tree are operational then there will exist a *rootPortName* value for each instance of the running stp and is applicable to that instance alone.
Mib	Bridge
Values	String (4..29, ASCII)
Default	No default

ATTRIBUTE Vr Br Tb Stp timeSinceTopologyChange (tstc)

Access	Read only
Description	This attribute indicates the time since a spanning tree topology change was detected by this bridge.

Copyright © 2006, Nortel Nortel Confidential

Mib	Bridge
Values	Decimal (0..4294967295)
Units	centiseconds
Default	0

ATTRIBUTE Vr Br Tb Stp topologyChangeDetect (tcd)

Access	Read only
Description	This attribute indicates whether or not a topology change was detected. This flag is set when a bpdu with the topology detect flag set is received from the root bridge. If this bridge is the root bridge this flag is set on receipt of a topology change notification bpdu. It is reset after a fixed length of time.
Mib	Bridge
Values	false true
Default	false

ATTRIBUTE Vr Br Tb Stp topologyChanges (tc)

Access	Read only
Description	This attribute indicates the number of the topology change events detected by this bridge since the last bridge reset. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Br Tb Stp designatedRoot (dr)

Access	Read only
Description	This attribute indicates the identifier of the bridge that this bridge treats as the root of the spanning tree topology. The root of the spanning tree topology is chosen through exchange.
Mib	Bridge
Values	String (8, Dashed Hex)
Default	No default

ATTRIBUTE Vr Br Tb Stp rootCost (rc)

Access	Read only
Description	This attribute indicates the cost of the path to the root as seen by this bridge.

Copyright © 2006, Nortel Nortel Confidential

Mib	Bridge
Values	Decimal (1..65535)
Default	No default

ATTRIBUTE Vr Br Tb Stp maxAge (mAg)

Access	Read only
Description	This attribute indicates the maximum age of the stp info learnt from a port before it is discarded.
Mib	Bridge
Values	Decimal (600..4000)
Units	centiseconds
Default	2000

ATTRIBUTE Vr Br Tb Stp agingTimeOper (ato)

Access	Read only
Description	This attribute indicates the time period in seconds used to age out dynamically learned entries in the forwarding table. The aging time is specific to a running stp instance. A value for the aging time of the current instance of the stp can be provisioned through the attribute *agingTime* under the *InwBrTb* component. The *agingTimeOper* attribute assumes the value of the *bridgeForwardDelay* while a topology change is in progress. This is done to facilitate a quick aging out of the learned entries that might have become obsolete due to a spanning tree topology change.
Mib	Bridge
Values	Decimal (10..1000000)
Units	seconds
Default	300

ATTRIBUTE Vr Br Tb Stp helloTime (heT)

Access	Read only
Description	This attribute indicates the time interval between the transmission of the configuration BPDUs. This value is obtained from the root bridge of the spanning tree topology through bridge protocol data units. This value should be the value assigned to the attribute *bridgeHelloTime* of the root bridge.
Mib	Bridge
Values	Decimal (100..1000)
Units	centiseconds
Default	200

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Br Tb Stp holdTime (hoT)

Access	Read only
Description	This attribute indicates the minimum interval of time between the transmission of two BPDUs.
Mib	Bridge
Values	Decimal (100)
Units	centiseconds
Default	100

ATTRIBUTE Vr Br Tb Stp fwdDelay (fd)

Access	Read only
Description	This attribute indicates how much time a port spends in any state while progressing towards the ***forwarding*** state. It is also used to age out learned entries while a topology change is in progress.This value should be the value assigned to the attribute *bridgeFwdDelay* of the root bridge.
Mib	Bridge
Values	Decimal (400..3000)
Units	centiseconds
Default	1500

COMPONENT Vr Br Tb StaticTableEntry (Ste)

Instance	address [String (6, Dashed Hex)] receivePort [String (1..29, ASCII)]
Groups	GROUP Vr Br Tb Ste Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Br Tb StaticTableEntry/address, receivePort* This component represents an entry in the transparent bridge forwarding table. A collection of such entries form the static forwarding table. Entries in the static table indicate the output ports a frame is allowed to go out of if it was received on *receivePort* and if its destination MAC address field matched *address.*
Mib	Bridge
Common Verbs	Help List Display Add DELete

GROUP Vr Br Tb Ste Provisioned (Prov)

Copyright © 2006, Nortel Nortel Confidential

Properties	Provisioned
Description	This group contains all the fields of a static table entry. All these attributes can be provisioned by the user. Multiple such static table entries together form the static forwarding table.
Mib	Bridge

ATTRIBUTE Vr Br Tb Ste status

Access	Read and write
Description	This attribute specifies the longevity of an entry in the static table. Please note that currently only a value of ***permanent*** is supported.
Mib	Bridge
Values	permanent
Default	permanent

ATTRIBUTE Vr Br Tb Ste allowedToGoTo (atgt)

Access	Read and write
Description	This port map specifies the out bridge ports a MAC frame with *address* in its destination MAC address field, originating from *receivePort*, can go out of. The *allowedToGoTo* attribute is a set of strings. Each string is of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding transparent bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. Multiple strings can be specified on the same *set* command. Each string in the list is space separated. An ***"*"*** in place of the ***i*** indicates that regardless of the protocol port instance, all bridge ports with name ***BridgePortName*** should be included in the *allowedToGoTo.*
Mib	Bridge
List of	String (4..29, ASCII)
List Size	255
Default	No default

COMPONENT Vr Br Tb ForwardTableEntry (Fte)

Instance	address [String (6, Dashed Hex)] domainNum [Decimal (1..4294967293)]
Groups	GROUP Vr Br Tb Fte Operational (Oper)
Scope	Application
Description	*Vr/<string> Br Tb FowardTableEntry/address, domainNum* This component represents an entry in the transparent bridge forwarding table. Entries in this table serve to map a destination MAC address to a port in the bridge. Essentially, entries are learned and aged in this table.

Copyright © 2006, Nortel Nortel Confidential

This means that entries that are not frequently used, are purged. The *agingTime* is a provisionable attribute under the *TransparentBridge* component. Other fields in this table are informative in nature. A collection of such entries constitutes a transparent bridge forwarding table.

Mib	Bridge
Common Verbs	Help List Display

GROUP Vr Br Tb Fte **Operational (Oper)**

Properties	Operational
Description	This group contains all the attributes that form the fields of a forwarding table entry. These attributes reflect the state of the transparent bridge forwarding table.
Mib	Bridge

ATTRIBUTE Vr Br Tb Fte **port**

Access	Read only
Description	This attribute is the port name through which the *address* was learned. This implies that the frames that are destined for a station whose MAC address is the same as the *address,* will be forwarded through the bridge port indicated by the attribute *port*. The attribute *port* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort*, the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/MyPort* would have a name ***TBP-MyPort.***
Mib	Bridge
Values	String (4..29, ASCII)
Default	No default

ATTRIBUTE Vr Br Tb Fte **ageOfEntry (aoe)**

Access	Read only
Description	This attribute indicates the age of the forwarding table entry. This is used to purge entries that have not been used for a certain period of time. This feature is to ensure that only the recently used entries are kept in the forwarding table. The time period for aging entries can be provisioned through the attribute *agingTime* under the component *TransparentBridge*.
Mib	Bridge
Values	Decimal (0..1000000)
Units	seconds

Mib	Bridge

ATTRIBUTE Vr Br Srb lanIdTableNumEntries (lanIdtNe)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the maximum number of entries in the LAN ID table. This attribute provides a way to control the resources allocated to the LAN ID table. The *lanIdTableNumEntries* value depends upon the *VirtualRouter* attribute *bridgingMaxHeapSpace* and the number of source route bridge ports provisioned for this *SourceRouteBridge*. Consider the following attributes of the *SourceRouteBridge* component when adjusting this number: - *totalLanIdTableEntries* - *numLanIdTEntriesFree* - *numLanIdTEntriesDenied*
Mib	Bridge
Values	Decimal (500..65535)
Default	500

ATTRIBUTE Vr Br Srb agingTime (at)

Access	Read and write
Description	This attribute specifies the time period used in seconds, to age out dynamically learned entries in the forwarding table. The aging time can change, triggered by a spanning tree topology change. The operational value of the aging time is reflected in the attribute *agingTimeOper* under the *SpanningTreeProtocol* component.
Mib	Bridge
Values	Decimal (10..1000000)
Units	seconds
Default	300

ATTRIBUTE Vr Br Srb bridgeLfMode (blfMode)

Access	Read only
Description	This attribute indicates whether the bridge operates using the older 3-bit length negotiation field or the newer 6-bit length field in the routing information field. Only the 3-bit field is supported at this time.
Mib	Bridge
Values	mode3 mode6
Default	mode3

GROUP Vr Br Srb Statistics (Stats)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains all statistical attributes associated with the *SourceRouteBridge*. These attributes are global in nature as opposed to port specific.
Mib	Bridge

ATTRIBUTE Vr Br Srb totalLanIdTableEntries (tLIdTe)

Access	Read only
Description	This attribute specifies the total number of LAN ID Table entries. The total includes both static and dynamic entries. The value is limited by the attribute *lanIdTableNumEntries*, a provisionable attribute. If the value is consistently approaching the value of *lanIdTableNumEntries* it is advisable to increase the value provisioned for *lanIdTableNumEntries*.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Br Srb numLanIdtEntriesFree (nLIdTeF)

Access	Read only
Description	This attribute specifies the number of *LanIdTable* entries that are available for use. A consistently high value indicates a resource surplus in terms of memory requirements for the bridge. This surplus could be utilized elsewhere if need be. The value of this attribute is directly influenced by the value of the *lanIdTableNumEntries*.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Br Srb numLanIdtEntriesDenied (nLIdTeD)

Access	Read only
Description	This attribute indicates the number of instances where an entry was not placed in the *LanIdTable* due to the lack of free entries. A rapid increase indicates a shortage of free entries. To reduce the shortage increase the provisioned *lanIdTableNumEntries* value.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

COMPONENT Vr Br Srb SpanningTreeProtocol (Stp)

Instance	Decimal (1..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Groups	GROUP Vr Br Srb Stp Provisioned (Prov) GROUP Vr Br Srb Stp Operational (Oper)
Scope	Application
Description	*Vr/<string> Br Tb Stp/<Decimal>* This component represents the Spanning Tree Protocol for the bridge. Bridges use the Spanning Tree Protocol to provide a loop free, fault tolerant network topology. Individual spanning tree instances are indexed using the domain number. Only 16 instances of this component are allowed including the backbone spanning tree instance. The instance identifier of the *SpanningTreeProtocol* component is significant as it indicates the domain that the spanning tree instance governs.
Mib	Bridge
Common Verbs	Help List Display Add DELete

GROUP Vr Br Srb Stp Provisioned (Prov)

Properties	Provisioned
Description	This group contains all the provisionable attributes that are applicable to the spanning tree protocol. These are global attributes and not port specific attributes. These attributes have a direct impact on the way this bridge participates in the stp.
Mib	Bridge

ATTRIBUTE Vr Br Srb Stp stpMode

Access	Read and write
Description	This attribute determines if this stp instance is to act as the stp instance for the backbone or an stp instance for a non-backbone media configuration. There can exist only one Backbone stp instance per virtual router. Please note that it is not permissible to assign the instance identifier of this stp instance as domain number of any access bridge port. In case of stp instances that are non-Backbone, the instance identifier is indicating the domain number the stp is operational in.
Mib	Bridge
Values	access backbone
Default	access

ATTRIBUTE Vr Br Srb Stp protocolSpec (pS)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the type of the spanning tree protocols that are in operation in the bridge. This means that this bridge participates in the types of stp indicated by this attribute.
Mib	Bridge
Values	both dec ieee8021d
Default	ieee8021d

ATTRIBUTE Vr Br Srb Stp **priority**

Access	Read and write
Description	This attribute is used to construct the *bridgeId*. It forms the first two octets of the *bridgeId* and the remaining 6 octets are made up of the *bridgeMACAddress*. The *priority* also determines the root bridge of the spanning tree topology. Manipulating this attribute might lead to a change in the spanning tree topology.
Mib	Bridge
Values	Decimal (0..65535)
Default	32768

ATTRIBUTE Vr Br Srb Stp **bridgeMaxAge (bma)**

Access	Read and write
Description	This attribute specifies the maximum age of the stp information learned from the network on any bridge port before it is discarded. This value is used by this bridge and all the other bridges when this bridge is the root bridge of the spanning tree topology. The following relationships are enforced as required by the IEEE 802.1d standards document. 2 *(*bridgeForwardDelay* -1.0seconds) >= *bridgeMaxAge*, *bridgeMaxAge* >= 2 * *bridgeHelloTime* + 1.0 seconds.
Mib	Bridge
Values	Decimal (600..4000)
Units	centiseconds
Default	2000

ATTRIBUTE Vr Br Srb Stp **bridgeHelloTime (bht)**

Access	Read and write
Description	This attribute specifies the time interval between the transmission of configuration BPDUs on any bridge port when this bridge becomes the root bridge. This attribute value is also used by all the other bridges in the Spanning Tree while this bridge is the root.

Copyright © 2006, Nortel Nortel Confidential

	The following relationship is enforced as required by the IEEE 802.1d standards document. *bridgeMaxAge* >= 2 * *bridgeHelloTime* + 1.0 seconds.
Mib	Bridge
Values	Decimal (100..1000)
Units	centiseconds
Default	200

ATTRIBUTE Vr Br Srb Stp bridgeForwardDelay (bfd)

Access	Read and write
Description	This attribute specifies how fast a bridge port changes its STP state while progressing towards the forwarding state. It is also used as *agingTime* to age dynamic entries in the forwarding table once a topology change is detected. This attribute is used by all the bridges participating in the stp when this bridge is the root bridge. The following relationship is enforced as required by the IEEE 802.1d standards document. 2 *(*bridgeForwardDelay* -1.0sconds) >= *bridgeMaxAge*.
Mib	Bridge
Values	Decimal (400..3000)
Units	centiseconds
Default	1500

GROUP Vr Br Srb Stp Operational (Oper)

Properties	Operational
Description	This group contains all the operational, stp attributes. These attributes are applicable in a global manner and are not specific to a bridge port.
Mib	Bridge

ATTRIBUTE Vr Br Srb Stp bridgeId (bid)

Access	Read only
Description	This attribute indicates the identifier value of this bridge, which serves to uniquely represent this bridge in the spanning tree topology. Thus, a *bridgeId* is unique only in the spanning tree instance the bridge is participating in. If multiple domain spanning trees exist then the same *bridgeId* can be re-used across these spanning tree instances.
Mib	Bridge
Values	String (8, Dashed Hex)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Br Srb Stp rootPortName (rpn)

Access	Read only
Description	This attribute indicates the name of the bridge port that offers the lowest cost route to the root bridge of the spanning tree topology.The attribute *rootPortName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *TransparentBridgePort* provisioned under *ProtocolPort/MyPort* would have a name ***TBP-MyPort.*** If multiple instances of spanning tree are operational then there will exist a *rootPortName* value for each instance of the running stp and is applicable to that instance alone.
Mib	Bridge
Values	String (4..29, ASCII)
Default	No default

ATTRIBUTE Vr Br Srb Stp timeSinceTopologyChange (tstc)

Access	Read only
Description	This attribute indicates the time since a spanning tree topology change was detected by this bridge.
Mib	Bridge
Values	Decimal (0..4294967295)
Units	centiseconds
Default	0

ATTRIBUTE Vr Br Srb Stp topologyChangeDetect (tcd)

Access	Read only
Description	This attribute indicates whether or not a topology change was detected. This flag is set when a bpdu with the topology detect flag set is received from the root bridge. If this bridge is the root bridge this flag is set on receipt of a topology change notification bpdu. It is reset after a fixed length of time.
Mib	Bridge
Values	false true
Default	false

ATTRIBUTE Vr Br Srb Stp topologyChanges (tc)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the number of the topology change events detected by this bridge since the last bridge reset. This counter wraps around its maximum value of 4294967295.
Mib	Bridge
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Br Srb Stp designatedRoot (dr)

Access	Read only
Description	This attribute indicates the identifier of the bridge that this bridge treats as the root of the spanning tree topology. The root of the spanning tree topology is chosen through exchange.
Mib	Bridge
Values	String (8, Dashed Hex)
Default	No default

ATTRIBUTE Vr Br Srb Stp rootCost (rc)

Access	Read only
Description	This attribute indicates the cost of the path to the root as seen by this bridge.
Mib	Bridge
Values	Decimal (1..65535)
Default	No default

ATTRIBUTE Vr Br Srb Stp maxAge (mAg)

Access	Read only
Description	This attribute indicates the maximum age of the stp info learnt from a port before it is discarded.
Mib	Bridge
Values	Decimal (600..4000)
Units	centiseconds
Default	2000

ATTRIBUTE Vr Br Srb Stp agingTimeOper (ato)

Access	Read only
Description	This attribute indicates the time period in seconds used to age out dynamically learned entries in the forwarding table. The aging time is specific to a running stp instance. A value for the aging time of the current instance of the stp can be provisioned through the attribute *agingTime*

Copyright © 2006, Nortel Nortel Confidential

under the *InwBrTb* component. The *agingTimeOper* attribute assumes the value of the *bridgeForwardDelay* while a topology change is in progress. This is done to facilitate a quick aging out of the learned entries that might have become obsolete due to a spanning tree topology change.

Mib	Bridge
Values	Decimal (10..1000000)
Units	seconds
Default	300

ATTRIBUTE Vr Br Srb Stp helloTime (heT)

Access	Read only
Description	This attribute indicates the time interval between the transmission of the configuration BPDUs. This value is obtained from the root bridge of the spanning tree topology through bridge protocol data units. This value should be the value assigned to the attribute *bridgeHelloTime* of the root bridge.
Mib	Bridge
Values	Decimal (100..1000)
Units	centiseconds
Default	200

ATTRIBUTE Vr Br Srb Stp holdTime (hoT)

Access	Read only
Description	This attribute indicates the minimum interval of time between the transmission of two BPDUs.
Mib	Bridge
Values	Decimal (100)
Units	centiseconds
Default	100

ATTRIBUTE Vr Br Srb Stp fwdDelay (fd)

Access	Read only
Description	This attribute indicates how much time a port spends in any state while progressing towards the ***forwarding*** state. It is also used to age out learned entries while a topology change is in progress.This value should be the value assigned to the attribute *bridgeFwdDelay* of the root bridge.
Mib	Bridge
Values	Decimal (400..3000)

Copyright © 2006, Nortel Nortel Confidential

Units	centiseconds
Default	1500

COMPONENT Vr Br Srb LanIdTableEntry (Lte)

Instance	lanId [Decimal (0..4095; 65535)] domainNum (dn) [Decimal (1..4294967295)]
Groups	GROUP Vr Br Srb Lte Operational (Oper)
Scope	Application
Description	*Vr/<string> Br Srb LanIdTableEntry/lanId, domainNum* This component represents an entry in the LAN ID Table. The LAN ID Table is used by the *SourceRouteBridge* logic to associate a particular bridge port with a LAN ID found in the route descriptor field of a source route frame. Static entries reference bridge ports local to the bridge.
Mib	Bridge
Common Verbs	Help List Display

GROUP Vr Br Srb Lte Operational (Oper)

Properties	Operational
Description	This group contains all the fields of a LAN ID Table entry.
Mib	Bridge

ATTRIBUTE Vr Br Srb Lte portName (pn)

Access	Read only
Description	This attribute specifies the name of the bridge port the frame should be forwarded through to reach the desired Lan. In the case where the desired Lan is across a TB/SRT cloud, this entry would have the name of the *SrSeBridgePort.* The attribute *portName* is a string of the form ***"BridgePortName-i",*** where ***BridgePortName*** is the abbreviation of the corresponding bridge port and ***i*** is the instance identifier of the *ProtocolPort* the bridge port is provisioned under. For example a *SourceRouteBridgePort* provisioned under *ProtocolPort/MyPort* would have a name ***SrBP-MyPort.*** Please note that the attribute *portName* cannot have a value of ***TBP, FddiETb, Tbse, Tbcl, Tbsr, Srsg, Tbsg.***
Mib	Bridge
Values	String (4..29, ASCII)
Default	No default

ATTRIBUTE Vr Br Srb Lte ageOfEntry (aoe)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute specifies the age of this entry in seconds.
Mib	Bridge
Values	Decimal (0..4294967295)
Units	seconds
Default	No default

ATTRIBUTE Vr Br Srb Lte peerMACAddress (pma)

Access	Read only
Description	This attribute specifies the MAC address of a bridge unit found across an transparent bridge/source route transparent network whose LAN ID is referenced by the attribute *lanId.* The *peerMACAddress* for static entries will be all zeroes.
Mib	Bridge
Values	String (6, Dashed Hex)
Default	No default

ATTRIBUTE Vr Br Srb Lte typeOfEntry (toe)

Access	Read only
Description	This attribute specifies the type of the LAN ID table entry. LAN ID table entries may be either static or dynamic. Dynamic entries imply that to reach the desired LAN source route frames need to be tunneled through a TB/SRT network, to another bridge unit which is attached to the LAN. These entries have a *peerMACAddress* associated with them and may be removed through the aging mechanism of the LAN ID table. Static entries on the other hand contain information about LANs that may be reached directly through bridge ports attached to the bridge. They are not aged and do not have a *peerMACAddress* associated with them.
Mib	Bridge
Values	static dynamic
Default	No default

GROUP Vr Ip Provisioned (Prov)

Properties	Provisioned
Description	This group contains global attributes for IP.
Mib	Ip

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ip forwarding

Access	Read and write
Description	This attribute indicates whether this VR is acting as an IP gateway in respect to the forwarding of datagrams received by, but not addressed to, this VR.
Mib	Ip
Values	gateway
Default	gateway

ATTRIBUTE Vr Ip defaultTtl

Access	Read and write
Description	This attribute is the default value inserted into the Time-To-Live field of the IP header of datagrams originated at this entity, whenever a Time-To-Live value is not supplied by the transport layer protocol. The value of this attribute deviates from the MIB requirement that it will always have a value of 255.
Mib	Ip
Values	Decimal (255..255)
Default	255

ATTRIBUTE Vr Ip cosPolicyAssignment (cospolicy)

Access	Read and write
Description	This attribute specifies the *CosPolicyGroup* that each *IpPort* on the *VirtualRouter* uses if the *cosPolicyAssignment* attribute of the *IpPort* is not set. The assigned *CosPolicyGroup* controls the forwarding behavior of IP packets recieved and transmitted at each *IpPort* that use it. See the description of *Vr Ip CosPolicyGroup* for more information. If the *VirtualRouter* has a *DifferentiatedServicesDomain* subcomponent, then this attribute cannot be set. The assigned *CosPolicyGroup* must be a subcomponent of the same *Virtual Router*.
Mib	Ip
Values	Link (Service, linkToPolicyUsers)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ip sourceRoute

Access	Read and write
Description	This attribute indicates whether or not this VR allows processing of datagrams which have a source route IP option.
Mib	Ip
Values	enabled disabled
Default	disabled

ATTRIBUTE Vr Ip filterAssignment (filtAss)

Access	Read and write
Description	This attribute specifies the *Filter* that each *IpPort* on the *VirtualRouter* uses if the *filterAssignment* attribute of the *IpPort* is not set. The filtering of IP packets is controlled by the *filterAssignment* attribute of the *Ip* and *IpPort*. If no *Filter* is used, then all packets are permitted. If the *linkToMedia* attribute of the parent *ProtocolPort* of an *IpPort* is linked to *Vr Ip Tunnel Sep* or *Vr Ip Tunnel Msep*, then the *IpPort* operates as if no *Filter* is used. All packets are permitted. The assigned *Filter* must be a subcomponent of the same *Virtual Router*.
Mib	Ip
Values	Link (Service, linkToFilterUsers)
Default	No default

ATTRIBUTE Vr Ip preConfigFwdPath (pcfp)

Access	Read and write
Description	This attribute specifies IP forwarding behavior for the virtual router. When *preConfigFwdPath* is set to ***enabled***, all routes present in the *ForwardTable* are fully installed in hardware on the FPs, eliminating the potential outage due to packet software exceptions for the initial IP flow using an uninstalled route. When this attribute is set to ***disabled***, initial packets using a given route are forwarded via software until the route is installed in hardware. The ***disabled*** setting results in the most efficient use of forwarding hardware resources since these resources are only used for actual IP flows. Thus the attribute respresents a tradeoff between forwarding performance and scalability of hardware resources.
Mib	Ip
Values	enabled disabled

Copyright © 2006, Nortel Nortel Confidential

Default	disabled

ATTRIBUTE Vr Ip IcmCacheMissTrace

Access	Read and write
Description	This attribute indicates whether IcmCacheMissTrace is enabled or disabled
Mib	Ip
Values	enabled disabled
Default	disabled

ATTRIBUTE Vr Ip cacheTableSize (cts)

Access	Read and write
Description	This attribute specifies the maximum number of entries that can exist in the IP local cache table on each LP. This attribute provides a way to control the resources allocated to the IP cache tables. The default cache table size is *3000* for an FP and *100* for a CP, is used if this attribute is not specified explicitly. The attribute value must be multiple of 100.
Mib	Ip
Vector of	Decimal (100..8000)
Index	Decimal (0..15)
Default	([1] 100, [15] 3000)

GROUP Vr Ip Statistics (Stats)

Properties	Operational
Description	This is the GROUP holding the struct which contains statistical attributes for IP.
Mib	Ip

ATTRIBUTE Vr Ip inReceives

Access	Read only
Description	This is the number of input datagrams received from the interfaces, including those received in error. *inReceives* wraps to zero if reaches its maximum defined value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ip inHdrErrors

Access	Read only
Description	The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, etc. *inHdrErrors* wraps to zero if reaches its maximum defined value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip inAddrErrors

Access	Read only
Description	The number of input datagrams discarded due to errors such as invalid address, unsupported address class. *inAddrErrors* wraps to zero if reaches its maximum defined value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip forwDatagrams

Access	Read only
Description	The number of input datagrams for which this router was not their final IP destination, as a result of which an attempt was made to find a route to forward them to that final destination. *forwDatagrams* wraps to zero if reaches it's maximum defined value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip inUnknownProtos

Access	Read only
Description	The number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol *inUnknownProtos* wraps to zero if reaches its maximum defined value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ip inDiscards

Access	Read only
Description	The number of input datagrams for which no problems were encountered to prevent their continued processing, but which were discarded due to the lack of buffers. This does not include any datagram discarded while awaiting for re-assembly. *inDiscards* wraps to zero if reaches its maximum defined value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip inDelivers

Access	Read only
Description	The number of input datagrams successfully delivered to IP user-protocols (including ICMP). *inDelivers* wraps to zero if reaches its maximum defined value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip outRequests

Access	Read only
Description	The number of datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission. This sum does not include datagrams counted in *ForwDatagrams*. *outRequests* wraps to zero if reaches its maximum defined value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip outDiscards

Access	Read only
Description	The number of outbound datagrams that were discarded due to the lack of buffers. This sum also includes datagrams counted in *forwDatagrams* if any such packets met the discard criterion. *outDiscards* wraps to zero if reaches its maximum defined value.
Mib	Ip
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Vr Ip outNoRoutes

Access	Read only
Description	The number of outbound datagrams discarded because no route could be found to transmit them to their destination. This counter includes any datagrams counted in *forwDatagrams*. *outNoRoutes* wraps to zero if reaches its maximum defined value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip reasmTimeOut

Access	Read only
Description	The maximum number of seconds, which received fragments are held while they are awaiting reassembly at this gateway.
Mib	Ip
Values	Decimal (0..5)
Units	seconds
Default	5

ATTRIBUTE Vr Ip reasmReqds

Access	Read only
Description	The number of the IP fragments received by this gateway which needed to be reassembled. *reasmReqds* wraps to zero if reaches its maximum defined value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip reasmOks

Access	Read only
Description	The number of IP fragments successfully reassembled by this gateway. *reasmOks* wraps to zero if reaches its maximum defined value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ip reasmFails

Access	Read only
Description	The number of times this gateway is unabled to assemble IP-fragments for whatever reasons. *reasmFails* wraps to zero if reaches its maximum defined value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip fragOks

Access	Read only
Description	The number of IP datagrams that have been successfully fragmented by this gateway. *fragOks* wraps to zero if reaches its maximum defined value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip fragFails

Access	Read only
Description	The number of IP-fragments that have been discarded because they needed to be fragmented but could not be. For example, their Don't Fragment flag was set. *fragFails* wraps to zero if reaches its maximum defined value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip fragCreates

Access	Read only
Description	This number of IP fragments that have been generated as a result of fragmentation by this gateway. *fragCreates* wraps to zero if reaches its maximum defined value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip routingDiscards

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	The number of routing entries which were chosen to be discarded even though they are valid. One possible reason for discarding such an entry could be to free -up buffer space for other routing entries. In this implementation, this number is always zero because IP never deletes a valid routing entry.
Mib	Ip
Values	Decimal (0..0)
Default	0

ATTRIBUTE Vr Ip inSrcRouteDiscards

Access	Read only
Description	The number of input datagrams which had a source route IP option and were discarded because this functionality is not allowed for this Routing Component. *srcRouteDiscards* wraps to zero if reaches its maximum defined value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	0

GROUP Vr Ip AdministrativeControl (AdminControl)

Properties	Provisioned
Description	This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component.
Mib	Ip

ATTRIBUTE Vr Ip snmpAdminStatus

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed.
Mib	Ip
Values	up down testing
Default	up

GROUP Vr Ip OsiState (State)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Ip

ATTRIBUTE Vr Ip adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Ip
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Vr Ip operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Ip
Values	enabled (ena) disabled (dis)

Copyright © 2006, Nortel Nortel Confidential

Default	disabled

ATTRIBUTE Vr Ip usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Ip
Values	idle active (activ) busy
Default	idle

GROUP Vr Ip OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	Ip

ATTRIBUTE Vr Ip snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	Ip
Values	up down testing
Default	up

GROUP Vr Ip AcctProvisioned (AcctProv)

Properties	Provisioned
Description	This group contains the provisionable attributes for IP accounting.
Mib	Ip

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ip accountCollection (acl)

Access	Read: All Write: All
Description	This attribute specifies the reason(s) for which accounting data is collected: ***billing***, ***test***, ***study***, ***audit*** or ***force***. If the set of reasons is not empty then accounting records will be generated by this interface in the following situations: - on a TODA (time of day accounting) changeover, if TODA is enabled - every 12 hours per *ProtocolPort* if TODA is disabled If none of the above reasons are present IP accounting will be disabled on the VR. Accounting can be disabled on individual *ProtocolPort*s by disabling the attribute *accountingControl* in *Vr ProtocolPort*. The reason for collection is recorded in the accounting records, in the attribute *collectReason*.
Mib	Ip
Set of	bill test study audit force
Default	No default

COMPONENT Vr Ip Isis (Isis)

Groups	GROUP Vr Ip Isis Provisioned (Prov) GROUP Vr Ip Isis OsiState (State) GROUP Vr Ip Isis ErrorStatistics (Errors) GROUP Vr Ip Isis OperationalStatus (OperStatus)
Scope	Application
Description	*Router/<id> Isis* This component is configured to control the Intermediate System to Intermediate System (ISIS) routing protocol. This component requires at least one *Net* subcomponent and no more than 3 *Net* subcomponents to be provisioned. This component requires at least one *Level* subcomponent to be provisioned.

Copyright © 2006, Nortel Nortel Confidential

For ISIS routes to be entered into the routing table, at least one active *IsisIf* component must be provisioned.

Mib	Ip
Opt. Subcomp.	COMPONENT Vr Ip Isis NetworkEntityTitle (Net) COMPONENT Vr Ip Isis IsisLevel (Level)
Dyn. Subcomp.	COMPONENT Vr Ip Isis NeighborEntry (Nbr)
Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP Vr Ip Isis Provisioned (Prov)

Properties	Provisioned
Description	This group of attributes is used to configure the *Isis* component.
Mib	Ip

ATTRIBUTE Vr Ip Isis snmpAdminStatus (admin)

Access	Read: All Write: All
Description	This attribute specifies the administrative status of the *Isis* component in this *Router*.
Mib	Ip
Values	up down testing
Default	up

ATTRIBUTE Vr Ip Isis intermediateSystemType (isType)

Access	Read: All Write: All
Description	This attribute specifies the ISIS level functionality of this *Router* as defined in ISO specification 10589. In this release only level1 ISIS support exists and therefore the value ***level1*** is the only value supported by this attribute.
Mib	Ip
Values	level1
Default	level1

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ip Isis overloadBitControl

Access	Read: All Write: All
Description	This attribute specifies how the value of the overload bit in the *Router's* Link State PDU (LSP) should be derived. A value of ***on*** specifies that the overload bit is forced on in the LSP. A value of ***auto*** specifies that the overload bit value is fully controlled by system software. This means that system software, based on current operating conditions, may choose to set the overload bit as appropriate. Any other value specifies, in seconds, the time period after a software restart that the overload bit will be forced on.
Mib	Ip
Values	Decimal (60..1800) on auto
Default	auto

ATTRIBUTE Vr Ip Isis ignoreLspErrors

Access	Read: All Write: All
Description	This attribute specifies how the system behaves on receipt of a corrupted Link State PDU (LSP). If the attribute value is ***ignore***, the system will discard a corrupted LSP. If the attribute value is ***purge***, the system will purge the LSP.
Mib	Ip
Values	purge ignore
Default	purge

ATTRIBUTE Vr Ip Isis lspMaxLifetime

Access	Read: All Write: All
Description	This attribute specifies the time, in seconds, that an LSP generated by this *Router* may exist before being considered to be stale and therefore should be purged by other nodes in the network. A *Check Prov* error occurs if this attribute specifies a value less than or equeal to the value specified for the *lspRefreshInterval* attribute. A *Check*

Copyright © 2006, Nortel Nortel Confidential

	Prov warning is produced if the value of this attribute is not at least 300 seconds greater than the value of the *lspRefreshInterval* attribute.
Mib	lp
Values	Decimal (350..65535)
Units	seconds
Default	1200

ATTRIBUTE Vr Ip Isis lspRefreshInterval

Access	Read: All Write: All
Description	This attribute specifies the time, in seconds, between successive retransmissions of this *Router's* LSP. A *Check Prov* error occurs if this attribute specifies a value greater than the value specified for the *lspMaxLifetime* attribute. A *Check Prov* warning is produced if the value of this attribute is not at least 300 seconds less than the value of the *lspMaxLifetime* attribute.
Mib	lp
Values	Decimal (1..65535)
Units	seconds
Default	900

ATTRIBUTE Vr Ip Isis spfDelay

Access	Read: All Write: All
Description	This attribute specifies, in milliseconds, the delay between the detection of a network topology change and the execution of the ISIS Shortest Path First (SPF) route calculation algorithm.
Mib	lp
Values	Decimal (1..10000)
Units	msec
Default	2000

ATTRIBUTE Vr Ip Isis alarmGeneration

Access	Read and write
Description	This attribute specifies the level of alarm generation for this *Isis* instance. A value of ***all*** specifies that all ISIS alarms are made visible. A value of ***none*** specifies that no ISIS alarms are made visible.

Copyright © 2006, Nortel Nortel Confidential

Mib	Ip
Values	none all
Default	all

GROUP Vr Ip Isis OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Ip

ATTRIBUTE Vr Ip Isis adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Ip
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Vr Ip Isis operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

Copyright © 2006, Nortel Nortel Confidential

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib	Ip
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Vr Ip Isis usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Ip
Values	idle active (activ) busy
Default	idle

GROUP Vr Ip Isis ErrorStatistics (Errors)

Properties	Operational
Description	The attributes in this group are essentially statistics or counters. Each attribute counts each particular, abnormal event that has occurred since the *Isis* component was last enabled or unlocked.
Mib	Ip

ATTRIBUTE Vr Ip Isis rxCorruptedLsps

Access	Read: All Write: Illegal
Description	This attribute indicates the number of corrupted LSPs received on all ports for all levels since the last time the *Isis* component became enabled and/or was unlocked.
Mib	Ip
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Vr Ip Isis lsdbOverloads

Access	Read: All Write: Illegal
Description	This attribute indicates the number of occurrences of link state database overloads for all ports for all levels since the last time the *Isis* component became enabled and/or was unlocked.
Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Ip Isis attemptsToExceedMaxSeqNum

Access	Read: All Write: Illegal
Description	This attribute indicates the number of times that the maximum LSP sequence number has be reached for all ports for all levels since the last time the *Isis* component became enabled and/or was unlocked.
Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Ip Isis seqNumSkips

Access	Read: All Write: Illegal
Description	This attribute indicates the number of times that LSPs have been received where sequence numbers are nonsequential with respect to the previously received LSP. This attribute counts this event for all ports for all levels since the last time the *Isis* component became enabled and/or was unlocked.
Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Ip Isis ownLspPurges

Access	Read: All Write: Illegal
Description	This attribute indicates the number of times that this *Router* has purged its own LSP. This attribute counts this event for all ports for all levels since the last time the *Isis* component became enabled and/or was unlocked.

Copyright © 2006, Nortel Nortel Confidential

Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Ip Isis idFieldLenMismatches

Access	Read: All Write: Illegal
Description	This attribute indicates the number of times that this *Router* has received PDUs with ID Field lengths that do not match those used by this *Router*. This attribute counts this event for all ports for all levels since the last time the *Isis* component became enabled and/or was unlocked.
Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Ip Isis maxAreaAddrMismatches

Access	Read: All Write: Illegal
Description	This attribute indicates the number of times that this *Router* has received a PDU with the “maximum number of supported area addresses” field set to a value greater than the maximum number of area addresses supported by this *Router*. This attribute counts this event for all ports for all levels since the last time the *Isis* component became enabled and/or was unlocked.
Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

GROUP Vr Ip Isis OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	Ip

ATTRIBUTE Vr Ip Isis snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Mib	Ip
Values	up down testing
Default	up

COMPONENT Vr Ip Isis NetworkEntityTitle (Net)

Instance	String (1..46, ASCII)
Scope	Application
Description	*Rtr/id Isis NetworkEntityTitle/<net>* This component represents the *Router's* Network Entity Title (NET). A NET is an ISO address that uniquely identifies an ISIS router. The NET format is specified in ISO 8348. The *Net* instance ID must be formatted as follows: AA.aaaa.SSSS.SSSS.SSSS.NN where; "AA" represents the ISIS area number and is a two hex digit string. "aaaa" represents the ISIS area number and is a string of 0 to 24 hex digits and there must be an even number of digits in this field. "SSSS.SSSS.SSSS" represents this *Router's* ISIS system ID. The system ID is made up of 12 hex digits, grouped in 3 groups of 4 hex digits, separated by the "." character. Note that when more than one *Net* component is provisioned, all *Net* components must have the same system ID portion of the *Net* instance ID. "NN" represents the NSEL portion of the *Net* instance ID. This must always be "00" (zero zero). The sections of the *Net* instance ID are separated by the "." character.

Values	Decimal (0..4294967295)
Units	seconds
Default	No default

COMPONENT Vr Ip PolicerProfile (Policer)

Instance	String (1..20, ASCII)
Groups	GROUP Vr Ip Policer Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip PolicerProfile/<string>* *Rtr/<string> Vrf/<string> PolicerProfile/<string>* This component and its subcomponents represent traffic conditioning rules for metering and policing IP packets received or transmitted at an interface. The rules specify various conditioning actions to be applied to individual packets after they are determined to be in-profile or out-of-profile with respect to various traffic rates and burst sizes. A *PolicerProfile* component is used to condition inbound or outbound IP traffiic at a *VirtualRouter IpPort* or *VpnRouteForwarder Interface* by setting the *linkToPolicerProfile* attribute of the *IngressServices* or *EgressServices* subcomponent, respectively. At ingress interfaces the conditioning rules are applied to drop or re-mark the DSCP field of IP packets received at the interface after ingress classification and DSCP marking (if any), prior to VPN encapsulation (if any), and prior to selection of forwarding treatments. At egress interfaces the conditioning rules are applied to drop or re-mark the DSCP field of IP packets transmitted at the interface, after VPN decapsulation (if any), and prior to the selection of forwarding treatments. Egress classification and DSCP marking with a *DiffServProfile* component is not allowed when a *PolicerProfile* component is used to condition outbound traffic. See the description of the *DifferentiatedServicesDomain* component and its subcomponents for a explanation of how an IP packet is treated based on the value of the DSCP field in the IP packet header. Each *PolicerProfile* component must have at least one *Meter* subcomponent.

Copyright © 2006, Nortel Nortel Confidential

The *Vr Ip* component cannot have a *PolicerProfile* subcomponent unless the *Vr* has a *DiffServDomain* subcomponent and the *Vr virtualRouterProcessor* attribute is set to *Lp/0* or to a *LogicalProcessor* component instance where the *featureList* attribute of the *LogicalProcessorType* linked to the *LogicalProcessor* includes ***ipPolicing***.

The *Vrf* component cannot have *PolicerProfile* subcomponents unless the *Rtr* or *Vrf* has a *DiffServDomain* subcomponent and the *Rtr virtualRouterProcessor* attribute is set to *Lp/0* or to a *LogicalProcessor* component instance where the *featureList* attribute of the *LogicalProcessorType* linked to the *LogicalProcessor* includes ***ipPolicing***.

GROUP Vr Ip Policer Meter **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains the provisioned attributes of the *Meter* component.
Mib	Ip

ATTRIBUTE Vr Ip Policer Meter **committedInformationRate (cir)**

Access	Read and write
Description	This attribute specifies the committed information rate (cir) in bits per second (bits/s). This is the maximum rate at which the network agrees to transfer information under normal conditions. The rate is measured over a time interval that is calculated internally based on the *commitedInformationRate(cir)* and *commitedBurstSize(bc)* attribute values (t=*bc/cir*). The *commitedInformationRate(cir)* attribute must be zero if the *commitedBurstSize(bc)* attribute is zero.
Mib	Ip
Values	Decimal (0..600000000)
Units	bit/s
Default	64000

ATTRIBUTE Vr Ip Policer Meter **committedBurstSize (bc)**

Access	Read and write
Description	This attribute specifies the committed burst size in bits. This is the maximum burst size that the network agrees to transfer under normal

Copyright © 2006, Nortel Nortel Confidential

	conditions. The burst size is measured over a time interval that is calculated internally based on the *commitedInformationRate(cir)* and *commitedBurstSize(bc)* attribute values (t=*bc/cir*). The *commitedBurstSize(bc)* attribute must be zero if the *commitedInformationRate(cir)* attribute is zero.
Mib	Ip
Values	Decimal (0..600000000)
Units	bits
Default	64000

ATTRIBUTE Vr Ip Policer Meter excessBurstSize (be)

Access	Read and write
Description	This attribute specifies the excess burst size in bits. This is the amount of uncommitted data that the network will attempt to deliver over a specified time interval. The time interval is calculated internally based on the *commitedInformationRate(cir)* and *commitedBurstSize(bc)* attribute values (t=*bc/cir*); however, if the *commitedInformationRate(cir)* and *commitedBurstSize(bc)* attribute values are zero, then the time interval is specified by the *measurementInterval* (*t*) attribute. If the *be* attribute is set to ***0***, then packets that exceed the committed information rate are discarded.
Mib	Ip
Values	Decimal (0..50000000)
Units	bits
Default	64000

ATTRIBUTE Vr Ip Policer Meter measurementInterval (t)

Access	Read and write
Description	This attribute specifies the time interval (in milliseconds) over which traffic rates and burst sizes are measured. This attribute value must be non-zero if *cir* and *bc* attribute values are zero. If the *cir* and *bc* attributes are non-zero then the *measurmentInterval* attribute is ignored.
Mib	Ip
Values	Decimal (0..25500)
Units	msec
Default	0

Groups	GROUP Vr Ip Policer Meter Phb Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Policer/<string> Meter<string> PolicedPhb/<phb> Rtr/<string> Vrf<string> Policer/<string> Meter<string> PolicedPhb/<phb>* This component is used to identify the traffic that is conditioned by the *Meter*. An IP packet is assigned a PHB according to the value of DSCP field in the IP packet header and the set of existing *DiffServDomain PerHopBehavior* components. If the PHB assigned to the IP packet matches the *PolicedPhb* subcomponent instance, then the packet is conditioned by a policing mechanism that is established at the ingress or

Copyright © 2006, Nortel Nortel Confidential

egress interface according to the *Meter* component provisioning.

The instance of this component must match a *PerHopBehavior* subcomponent of the *DiffServDomain* component used by the *Vr* or *Vrf*.

Each *Meter* component must have at least one *PolicedPhb* subcomponent.

Two *Meter* subcomponents of one *PolicerProfile* component cannot have *PolicedPhb* subcomponents with equal component instance values.

Mib: Ip

Common Verbs: Help, List, Display, Add, DELete

GROUP Vr Ip Policer Meter Phb Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisioned attributes of the *PolicedPhb* component.

Mib: Ip

ATTRIBUTE Vr Ip Policer Meter Phb initialBucket

Access: Read and write

Description: This attribute specifies whether or not traffic entering the *Meter* with this PHB contributes to the committed information rate.

If this attribute is set to ***committed*** then IP traffic entering the meter with this PHB is directed to the bucket tracking the committed information rate. The traffic is policed in a dual rate mode where both committed and excess information rates are enforced.

If this attribute is set to ***excess*** then IP traffic entering the meter with this PHB is directed to bucket the tracking the excess information rate. The traffic is policed in a single rate mode where only the excess information rate is enforced.

Mib: Ip

Values: committed, excess

Default: excess

ATTRIBUTE Vr Ip Policer Meter Phb outOfProfilePhb

Access: Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies a new PHB that is assigned to any packet that has exceeded the committed information rate. This attribute will have effect only if the *initialBucket* attribute is set to ***committed***. The DSCP field of an IP packet that exceeds the committed information rate will be modifed to match this attribute value. The value of this attribute must match a *PerHopBehavior* subcomponent of the *DiffServDomain* component used by the *Vr* or *Vrf*. The default value of this attribute is equal to the *PolicedPhb* component instance for all PHBs except ***AF41***, ***AF42***, ***AF31***, ***AF32***, ***AF21***, ***AF22***, ***AF11***, ***AF12*** where the default value is ***AF42***, ***AF43***, ***AF32***, ***AF33***, ***AF22***, ***AF23***, ***AF12***, ***AF13***, respectively. The traffic class associated with the new PHB assigned to the packet must be equal to the traffic class associated with the original PHB assigned to the packet prior to policing. The traffic class associated with a PHB is identified by the *DiffServDomain PerHopBehavior trafficClass* attribute. Normally the drop precedence associated with the new PHB assigned to the packet is greater than the drop precedence associated with the original PHB assigned to the packet prior to policing. The drop precedence associated with a PHB is identified by the *DiffServDomain PerHopBehaviour dropPrecedence* attribute.

medium
high

Default — high

COMPONENT Vr Ip DiffServProfile (DiffServProf)

Instance — String (1..20, ASCII)

Groups — GROUP Vr Ip DiffServProf Provisioned (Prov)

Scope — Application

Description — *Vr/<string> Ip DiffServProfile/<string>*
Rtr/<string> Vrf/<string> DiffServProfile/<string>

This component and its subcomponents represent mapping rules for classifying and marking IP packets received or transmitted at an interface.

At ingress interfaces the mapping rules are applied to mark the DSCP field of IP packets received at the interface, prior to policing (if any), prior to VPN encapsulation (if any), and prior to selection of forwarding treatments.

At egress interfaces the mapping rules are applied to mark the DSCP field of IP packets transmitted at the interface, after VPN decapsulation (if any) and after selection of forwarding treatments. Egress traffic conditioning with a *PolicerProfile* component is not allowed when a *DiffServProfile* component is used to classify and mark outbound traffic.

See the description of the *DifferentiatedServicesDomain* component and its subcomponents for a explanation of how an IP packet is treated based on the value of the DSCP field in the IP packet header.

Copyright © 2006, Nortel Nortel Confidential

A *DiffServProfile* component is used to mark the DSCP field of inbound or outbound IP traffiic at a *VirtualRouter IpPort* or *VpnRouteForwarder Interface* by setting the *linkToDiffServProfile* attribute of the *IngressServices* or *EgressServices* subcomponent, respectively.

Each *DiffServProfile* component used at an ingress interface must have a *DscpMap* subcomponent, or a *LinkMap* subcomponent, or at least one *MfMap* subcomponent. The *LinkMap* subcomponent and *DscpMap* subcomponent are not allowed to co-exist. The *LinkMap* subcomponent and *MfMap* subcomponents are not allowed to co-exist.

Multifield classification at an ingress interface using *MfMap* subcomponents overrides DSCP classification using the *DscpMap* subcomponent. This means that DSCP classification, which is controlled by *the DscpMap* component, is performed only if the packet does not match any *MfMap IpAddrLayer4Flow* component. If *MfMap* subcomponents are used without the *DscpMap* subcomponent and the packet does not match any *MfMap IpAddrLayer4Flow* component, then the packet is marked with DSCP 0.

Each *DiffServProfile* component used at an egress interface must have a *DscpMap* subcomponent. It cannot have a *LinkMap* subcomponent nor a *MfMap* subcomponent.

The *Vr Ip* component cannot have *DiffServProfile* subcomponents if the *Vr vpnMode* attribute is set to ***carrier***.

The *Vr Ip* component cannot have *DiffServProfile* subcomponents if the *Vr* has does not have a *DiffServDomain* subcomponent.

The *Vr Ip* component cannot have *DiffServProfile* subcomponents unless the *Vr virtualRouterProcessor* attribute is set to *Lp/0* or to a *LogicalProcessor* component instance where the *featureList* attribute of the *LogicalProcessorType* linked to the *LogicalProcessor* includes ***ipDiffServ***.

The *Vrf* component cannot have *PolicerProfile* subcomponents if neither the *Rtr* nor *Vrf* has a *DiffServDomain* subcomponent.

The *Vrf* component cannot have *PolicerProfile* subcomponents if the *Rtr virtualRouterProcessor* attribute is set to *Lp/0* or to a *LogicalProcessor* component instance where the *featureList* attribute of the

Copyright © 2006, Nortel Nortel Confidential

LogicalProcessorType linked to the *LogicalProcessor* includes ***ipDiffServ***.

Instance Decimal (0..1023)

Groups GROUP Vr Ip DiffServProf Mf IpAddrLayer4Flow Provisioned (Prov)
GROUP Vr Ip DiffServProf Mf IpAddrLayer4Flow ProtoProvisioned
GROUP Vr Ip DiffServProf Mf IpAddrLayer4Flow Operational (Oper)

Scope Application

Description *Vr/<string> Ip DiffServProfile/<string> MultiFieldMap/<string> IpAddrLayer4Flow/<string>*

Rtr/<string> Vrf/<string> DiffServProfile/<string> MultiFieldMap/<string> IpAddrLayer4Flow/<string>

The *IpAddrLayer4Flow* component is used to specify multi-field (MF) Layer 3 and Layer 4 criteria.

The IP packet is checked to see if it matches the criteria specified by each *IpAddrLayer4Flow* component, if any, under the *DiffServProfile* component. The PHB assigned to the packet is the value of the *assignedPhb* attribute on the parent *MultiFieldMap* component of the *IpAddrLayer4Flow* whose criteria best match the packet. The DSCP field of the IP packet is marked accordingly.

For example, to assign PHB value ***AF41*** to FTP packets destined to subnet 123.123.123.0, an *IpAddrLayer4Flow* subcomponent is added to the *MultiFieldMap* component where the *assignedPhb* attribute is set to ***AF41***. The *prefix, prefixLength, protocol,* and *portNumberRange* attributes of the *IpAddrLayer4Flow* component are set to ***123.123.123.0***, ***24***, ***tcp***, and ***20***, ***21***, respectively. This criteria also applies to each FTP packet

Copyright © 2006, Nortel Nortel Confidential

that originates from subnet 123.123.123.0, but only if the source address and port number of the packet do not match any *IpAddrLayer4Flow* subcomponents of the *DiffServProfile.*

The packet matching algorithm for MF classification is explained in more detail as follows.

A match can be found only if the IP header protocol field is one of ICMP, TCP, or UDP. The *prefix*, *prefixLength*, and *portNumberRange* attributes are checked only if the protocol field in the header is TCP or UDP.

The destination IP address and destination port number information from the packet is first compared against the *prefix* attribute in conjunction with the *prefixLength* and *portNumberRange* attributes. If the *prefixLength* is ***0*** and the *prefix* is ***0.0.0.0***, then any value in the packet's IP destination address fields is a match. If *portNumberRange* is ***0***, then any value in the packet's destination port number fields is a match.

If more than one *IpAddrLayer4Flow* component matches a packet (for instance one component specifies a range of IP addresses and a second specifies a single IP address in the range), then the component with the more precise match is used (the one which specifies the single address in this case). Precedence is always given to the IP address over the port number. For example, if one *IpAddrLayer4Flow* component specifies an range of IP addresses that includes the IP address from the packet and any port number, while a second *IpAddrLayer4Flow* component specifies an exact port number but a wider range of addresses, the first *IpAddrLayer4Flow* component is used.

If no match is found using the packet's destination IP address and destination port number information, then a second search is performed using the packet's source IP address and source port number information. This means that an *IpAddrLayer4Flow* component where the *protocol* is ***udp*** or ***tcp***, the *prefixLength* is ***0*** and the *portNumberRange* is ***0***, always matches some destination address and port number. This prevents the source address and port number check from being performed.

An ICMP packet matches any *IpAddrLayer4Flow* component whose *protocol* attribute is set to ***icmp***.

No attempt is made to match any packets where the options or fragment bits are set.

The *DiffServProfile* is not allowed to have more than 100 *IpAddressLayer4Flow* subcomponents.

Impact: Service

Description: clear Vr/<string> Ip Cpp
clear Rtr/<string> Cpp
clear Rtr/<string> Vrf/<string> Cpp
This command is intended for manually clearing all isolated addresses from the current *Cpp* component, and resume traffic to the locally destined addresses on all the FPs.

GROUP Vr Ip Cpp **Provisioned (Prov)**

Properties: Provisioned

Description: This group contains the provisionable attributes for the *Cpp* component.

Mib: Ip

ATTRIBUTE Vr Ip Cpp **packetsPerSecond (pps)**

Access: Read and write

Description: This attribute specifies the maximum number of packets per second a locally destined address on the VR/VRF can receive before being monitored by the *CPP* feature.

Mib: Ip

Values: Decimal (100; 200; 300; 400; 500; 600; 700; 800; 900; 1000; 1100; 1200)

Default: 1200

ATTRIBUTE Vr Ip Cpp **isolationTime (isolation)**

Access: Read and write

Description: This attribute specifies the amount of time a locally destined address will remain in isolation after exceeding the *packetsPerSecond* rate.

If *gracePeriod* is non-zero, isolation will not occur until the conclusion of

Copyright © 2006, Nortel Nortel Confidential

the grace period.

A value of 0 indicates that a locally destined address which is isolated can only be cleared using the *CLEAR* command.

If the traffic to the address is still excessive after the isolationTime expires, this locally destined address will remain in isolation for *IsolationTime* * 2 period. If the traffic to the address is still excessive after 3 times of the above step, the address will be permanently isolated until it is cleared by the *CLEAR* verb.

The minimum value of *IsolationTime* other than zero is 30.

Mib	Ip
Values	Decimal (0; 30..3600)
Units	seconds
Default	30

ATTRIBUTE Vr Ip Cpp gracePeriod (grace)

Access	Read and write
Description	This attribute specifies period of time used to sample the flow rate before the packets are discarded. The intent of the grace period is to measure the average flow rate during this period to ensure that the exceeded traffic flow rate was not due to bursty traffic. If *mode* is ***study***, a list of static record are generated every 15 minutes including a list of locally-destined addresses having excessive flow and its avarage flow rates during the gracePeriod. If *gracePeriod* is non-zero, isolation will not occur until the conclusion of the grace period. A value of 0 of this attribute when *mode* is ***protected*** indicates that no monitoring of the address will be performed after an excessive flow is detected and isolation occurs immediately. It is an error to have *mode* set to ***study*** and *gracePeriod* set to zero.
Mib	Ip
Values	Decimal (0..300)
Units	seconds

Mib	Ip
Values	Decimal (0..65535)
Default	No default

COMPONENT Vr Ip ForwardTable (Fwd)

Instance	destAddress (addr) [IP address] destMask (mask) [IP address] typeOfService (tos) [Decimal (0..31)] gateway (gateway) [IP address]
Groups	GROUP Vr Ip Fwd Operational (Oper)
Scope	Application
Description	*Vr/<string> Ip ForwardTable/<Ip Address>,<Ip Address>,<Decimal>,<IP Address>* *Rtr/<string> ForwardTable/<Ip Address>,<Ip Address>,<Decimal>,<IP Address* *Rtr/<string> Vrf/<string> ForwardTable/<Ip Address>,<Ip Address>,<Decimal>,<IP Address* This component contains the information to forward data.This table holds the best route information sent from Routing table.
Mib	Ip
Common Verbs	Help List Display

GROUP Vr Ip Fwd Operational (Oper)

Properties	Operational
Description	Identifies a group of operational attributes associated with each entry in the Forward Table.
Mib	Ip

ATTRIBUTE Vr Ip Fwd ifIndex

Access	Read only
Description	This attribute specifies the SNMP index associated with the protocol port or interface represented by the attribute *protocolPortName* or *interfaceName,* which identifies the local interface through which the next hop of this route should be reached.
Mib	Ip
Values	Decimal (1..65535)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ip Fwd type

Access	Read only
Description	This attribute specifies the type of route. Note that ***localInterface*** refers to a route for which the next hop is the final destination; ***remoteDestination*** refers to a route for which the next hop is not the final destination.
Mib	Ip
Values	notDefined invalid localInterface remoteDestination
Default	No default

ATTRIBUTE Vr Ip Fwd protocol

Access	Read only
Description	This Attribute identifies the routing mechanism by which this route was learned.
Mib	Ip
Values	other local netmgmt icmp egp ggp hello rip isIs esIs ciscoIgrp bbnSpfIgp ospf bgp idpr mpls mbgp bgpMplsInternal ebgpLabel
Default	No default

ATTRIBUTE Vr Ip Fwd age

Access	Read only
Description	This attribute specifies the number of seconds since this route was last updated or otherwise determined to be correct.
Mib	Ip

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Ip Fwd protocolPortName (pPName)

Access	Read only
Description	For a *Vr*, this attribute indicates the name of the protocol port by which the next hop of this route should be reached.
Mib	Ip
Values	The name of the component
Default	No default

ATTRIBUTE Vr Ip Fwd nextHopAs

Access	Read only
Description	This attribute specifies the Autonomous System number of the Next Hop. If unknown or not relevant to the protocol indicated by the attribute *protocol*, the value should be zero.
Mib	Ip
Values	Decimal (0..429467295)
Default	No default

ATTRIBUTE Vr Ip Fwd metric

Access	Read only
Description	This attribute specifies the primary routing metric for this route. The semantics of this metric are determined by the routing protocol specified by the value of the attribute *protocol*. If this metric is not used, its value should be set to -1.
Mib	Ip
Values	Signed (-1..65535)
Default	-1

ATTRIBUTE Vr Ip Fwd interfaceName

Access	Read only
Description	For a *Rtr* or *Rtr Vrf*, this attribute indicates the name of the interface by which the next hop of this route should be reached.
Mib	Ip
Values	The name of the component
Default	No default

Copyright © 2006, Nortel Nortel Confidential

COMPONENT Vr Ip RouteDataBaseEntry (Rdb)

Instance	destAddress (addr) [IP address] destMask (mask) [IP address] protocol (proto) [bogus local remote special ospf ospfExternal ospfType3Discard ospfType7Discard rip ripDiscard egp bgpExternal bgpInternal bgpAggrDiscard redistrib mpls mbgp bgpMplsInternal isis ebgpLabel] gateway [IP address]
Groups	GROUP Vr Ip Rdb Operational (Oper)
Scope	Application
Description	*Vr/<string> Ip RouteDataBaseEntry/ <destAddress>,<destMask>,<protocol> Rtr/<string> RouteDatabaseEntry/<destAddress>,<destMask>,<protocol> Rtr/<string> Vrf/<string> RouteDatabaseEntry/ <destAddress>,<destMask>,<protocol>* This component is used to display the information in the Ip routing database. *destAddress* and *destMask* indicates the address and mask of the route in the RoutingDatabase. *protocol* indicates the protocol this entry is learned from. *gateway* indicates the nextHop address for remote routes. The value of *gateway* for the localInterface routes will be the same value as the *destAddress*.
Mib	Ip
Common Verbs	Help List Display

GROUP Vr Ip Rdb Operational (Oper)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	Identifies a group of operational attributes associated with each entry in the routing database.
Mib	Ip

ATTRIBUTE Vr Ip Rdb metric

Access	Read only
Description	This attribute specifies the primary routing metric for this route. The semantics of this metric are determined by the routing protocol specified by the value of the index to this entry *protocol*. If this metric is not used, its value should be set to -1.
Mib	Ip
Values	Signed (-1..65535)
Default	-1

ATTRIBUTE Vr Ip Rdb preference (pref)

Access	Read only
Description	This attribute specifies the the preference value of this particular entry. The value of this attribute affects the way the routeEntries in this database are selected for installing it in the *ForwardTable*. The lower the preference value of this entry, the higher are the chances that this entry will be selected to install in the *ForwardTable*.
Mib	Ip
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Vr Ip Rdb age

Access	Read only
Description	This attribute specifies the number of seconds since this route was last updated or otherwise determined to be correct.
Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

COMPONENT Vr Ip IpInterfaceEntry (If)

Instance	IP address
Groups	GROUP Vr Ip If Operational (Oper)
Scope	Application
Description	*Vr/<string> Ip InterfaceEntry/<IpAddr>*

Copyright © 2006, Nortel Nortel Confidential

This component contains information about all the provisioned *logicalIf* entries under all *ipPort* components.

Mib	Ip
Common Verbs	Help List Display

GROUP Vr Ip If Operational (Oper)

Properties	Operational
Description	Identifies a group of operational attributes associated with each entry in the Ip interface table.
Mib	Ip

ATTRIBUTE Vr Ip If interfaceMask (mask)

Access	Read only
Description	This attribute indicates the mask for this interface entry.
Mib	Ip
Values	IP address
Default	No default

ATTRIBUTE Vr Ip If status

Access	Read only
Description	This attribute specifies the status of the provisioned Ip logicalInterface entry. A value of ***disabled*** is used when the parent components *Vr*, *Ip* or *ipPort* is in a disabled state. A value of ***up*** is used when the interface is in an operational state. A state of ***down*** is used if the media associated with this interface is not ready or disabled.
Mib	Ip
Values	up down disabled
Default	No default

ATTRIBUTE Vr Ip If pPName

Access	Read only
Description	Indicates the name of the protocol port this logicalIfEntry belongs to.
Mib	Ip
Values	String (1..23, ASCII)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Vr Ip If mediaType (type)

Access	Read only
Description	This attribute indicates the media type of interface. When the interface is down, a value of none indicates the media stays down from the beginning. When the interface is down, a value of some valid media type indicates the media is brought down after it was up. Otherwise, when the interface is up or disabled, this attribute should reflect the proper media type of the interface.
Mib	Ip
Values	none tokenRing ethernet fddi x25 frameRelay ppp bnx clusterBridge virtualLink vcpEther vcpToken smds atmMpeVcEncap atmMpeLlcEncap lecEther lecToken tunnel virtual localMedia
Default	No default

ATTRIBUTE Vr Ip If hardwareAddress

Access	Read only
Description	This attribute specifies the hardware address of the media in canonical form if applicable. The non-canonical version of this address is indicated in *ncHardwareAddress*.
Mib	Ip
Values	String (0..8, Dashed Hex)
Default	No default

ATTRIBUTE Vr Ip If mtu

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the maximum transmission unit applicable for this *logicalInterface*. A value of ***0*** is used for the interfaces where all the necessary information is not available to compute the mtu applicable for this interface.
Mib	Ip
Values	Decimal (0..0; 80..18944)
Default	No default

ATTRIBUTE Vr Ip If broadcastAddress

Access	Read only
Description	This attribute indicates the destination IP address to be used by any application which needs to broadcast on this interface. The value is determined by the corresponding *LogicalIf* component's *broadcastAddress* attribute.
Mib	Ip
Values	IP address
Default	No default

ATTRIBUTE Vr Ip If ncHardwareAddress

Access	Read only
Description	This attribute is the non-canonical version of *hardwareAddress*. This attribute is not displayed for interfaces on non-LAN media.
Mib	Ip
Values	String (0..8, Dashed Hex)
Default	No default

GROUP Vr Ip Egp Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the EGP component
Mib	Ip

ATTRIBUTE Vr Ip Egp asId (as)

Access	Read and write
Description	The autonomous system identifier for this EGP entity. The value of this *asId* can not be equal to the value of *EgpNeighborEntry asId.*
Mib	Ip
Values	Decimal (1..65535)
Default	No default

ATTRIBUTE Vr Ip Egp defaultHelloInterval (hello)

Access	Read and write
Description	This attribute is used to configure the default hello interval for each neighbor. This attribute's value is used by the application for each *EgpNeighbor* whose *helloInterval* has not been set.
Mib	Ip
Values	Decimal (30..900)
Units	seconds
Default	30

ATTRIBUTE Vr Ip Egp defaultPollInterval (poll)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute is used to configure the default polling interval for the EGP Neighbor. This attribute's value is used by the application for each *EgpNeighbor* whose *pollInterval* has not been set.
Mib	Ip
Values	Decimal (120..3600)
Units	seconds
Default	120

ATTRIBUTE Vr Ip Egp maxNatNets (maxNets)

Access	Read and write
Description	This attribute is used to configure the maximum number of external natural networks this virtual router will be advertising via EGP.
Mib	Ip
Values	Decimal (1..65535)
Default	500

ATTRIBUTE Vr Ip Egp maxBufferSize (maxBuf)

Access	Read and write
Description	This attribute specifies the maximum buffer size (in 1024 byte memory blocks) to be used for an EGP update to be sent.
Mib	Ip
Values	Decimal (2..16)
Units	Kbyte
Default	4

GROUP Vr Ip Egp Statistics (Stats)

Properties	Operational
Description	These set of attributes identifies the statistics for the EGP component.
Mib	Ip

ATTRIBUTE Vr Ip Egp inMsgs

Access	Read only
Description	Identifies the number of EGP messages received without error. This counter will wraparound once the value reaches the maximum value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ip Egp inErrorMsgs

Access	Read only
Description	Identifies the sum of EGP error messages from all the neighbors. This counter will wraparound once the value reaches the maximum value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Ip Egp outErrorMsgs

Access	Read only
Description	Indicates the sum of EGP error messages sent to all the neighbors. This counter will wraparound once the value reaches the maximum value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Ip Egp inErrors

Access	Read only
Description	Identifies the number of EGP messages that proved to be in error. This counter will wraparound once the value reaches the maximum value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Ip Egp outMsgs

Access	Read only
Description	The total number of locally generated EGP messages. This counter will wraparound once the value reaches the maximum value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Ip Egp outErrors

Access	Read only
Description	The number of EGP messages that were locally generated but were not sent out due to resource limitations within an EGP entity.This counter will wraparound once the value reaches the maximum value.

Copyright © 2006, Nortel Nortel Confidential

Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

GROUP Vr Ip Egp OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Ip

ATTRIBUTE Vr Ip Egp adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Ip
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Vr Ip Egp operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

Copyright © 2006, Nortel Nortel Confidential

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib	Ip
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Vr Ip Egp usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Ip
Values	idle active (activ) busy
Default	idle

GROUP Vr Ip Egp AdministrativeControl (AdminControl)

Properties	Provisioned
Description	This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component.
Mib	Ip

ATTRIBUTE Vr Ip Egp snmpAdminStatus

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed.
Mib	Ip
Values	up down testing

Copyright © 2006, Nortel Nortel Confidential

Default	up

GROUP Vr Ip Egp OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	Ip

ATTRIBUTE Vr Ip Egp snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	Ip
Values	up down testing
Default	up

COMPONENT Vr Ip Egp NeighborEntry (Nbr)

Instance	IP address
Groups	GROUP Vr Ip Egp Nbr Provisioned (Prov) GROUP Vr Ip Egp Nbr Operational (Oper)
Scope	Application
Description	*Vr/<string> Ip Egp NeighborEntry/<Ip Address>* This component identifies the properties of each EGP neighbor. The index value of this entry should belong to one of the subnets provisioned as *logicalIfEntry* under one of the *IpPort.*
Mib	Ip
Common Verbs	Help List Display Add DELete

GROUP Vr Ip Egp Nbr Provisioned (Prov)

Properties	Provisioned
Description	This group of attributes identify the provisionable attributes for this EGP neighbor.

Copyright © 2006, Nortel Nortel Confidential

Mib	Ip

ATTRIBUTE Vr Ip Egp Nbr asId (as)

Access	Read and write
Description	The autonomous system identifier of this EGP peer. The value of this neighbor's *asId* should not be equal to the *asId* value of *Egp* entity
Mib	Ip
Values	Decimal (1..65535)
Default	No default

ATTRIBUTE Vr Ip Egp Nbr mode

Access	Read and write
Description	This attribute will indicate whether this neighbor is being configured as an active or passive neighbor.
Mib	Ip
Values	active passive
Default	active

ATTRIBUTE Vr Ip Egp Nbr generateDefaultRoute (default)

Access	Read and write
Description	This attribute distinguishes whether or not the default route should be generated. This route is put in the EGP update along with the normal EGP update routes when updates are sent to this EGP neighbor
Mib	Ip
Values	yes no
Default	no

ATTRIBUTE Vr Ip Egp Nbr defaultRouteMetric

Access	Read and write
Description	This attribute identifies the Metric to be used for propagating the "Default Route". The value of *defaultRouteMetric* is used only in the case where the value of the attribute *generateDefaultRoute* is set to ***yes***.
Mib	Ip
Values	Decimal (0..255)
Default	128

ATTRIBUTE Vr Ip Egp Nbr defaultMetric (metric)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute identifies the default metric value for routes that are exported to this *EgpNeighbor*. This value is used when exporting routes to this neighbor and no *Export* policy applies a different metric.
Mib	Ip
Values	Decimal (0..255)
Default	128

ATTRIBUTE Vr Ip Egp Nbr helloInterval (helloInt)

Access	Read and write
Description	This attribute identifies the interval in seconds, between EGP hello command retransmissions. This is the P1 timer in the RFC904. This value may change in operation due to negotiations.
Mib	Ip
Values	Decimal (30..120)
Units	seconds
Default	30

ATTRIBUTE Vr Ip Egp Nbr pollInterval (pollInt)

Access	Read and write
Description	This attribute identifies the interval in seconds, between EGP poll command retransmissions. This is the P2 timer in the RFC904. This value may change in operation due to negotiations.
Mib	Ip
Values	Decimal (120..480)
Units	seconds
Default	120

GROUP Vr Ip Egp Nbr Operational (Oper)

Properties	Operational
Description	This group of attributes identifies the operational set of attributes for the *NeighborEntry* component.
Mib	Ip

ATTRIBUTE Vr Ip Egp Nbr state

Access	Read only
Description	This attribute describes the state of the local system with respect to this entry's EGP Neighbor.

Copyright © 2006, Nortel Nortel Confidential

Mib	Ip
Values	idle acquisition down up cease
Default	No default

ATTRIBUTE Vr Ip Egp Nbr inMsgs

Access	Read only
Description	The number of EGP messages received without error from the EGP peer. This counter will wraparound once the value reaches the maximum value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Ip Egp Nbr inErrors

Access	Read only
Description	The number of messages received from this EGP peer that proved to be in error. This counter will wraparound once the value reaches the maximum value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Ip Egp Nbr outMsgs

Access	Read only
Description	The number of locally generated EGP messages for this EGP peer. This counter will wraparound once the value reaches the maximum value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Ip Egp Nbr outErrors

Access	Read only
Description	The number of locally generated EGP messages not sent to this EGP peer due to resource limitations within an EGP entity.This counter will wraparound once the value reaches the maximum value.
Mib	Ip

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Ip Egp Nbr inErrorMsgs

Access	Read only
Description	The number of EGP-defined error messages received from this EGP peer.This counter will wraparound once the value reaches the maximum value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Ip Egp Nbr outErrorMsgs

Access	Read only
Description	The number of EGP-defined error messages sent to this EGP peer.This counter will wraparound once the value reaches the maximum value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Ip Egp Nbr stateUps

Access	Read only
Description	The number of EGP state transitions to the UP state with this EGP peer. This counter will wraparound once the value reaches the maximum value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Ip Egp Nbr stateDowns

Access	Read only
Description	The number of EGP state transitions from the UP state to any other state with this EGP peer. This counter will wraparound once the value reaches the maximum value.
Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Ip Egp Nbr eventTrigger

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute is used to control the state of the Neighbor. It is not allowed to change. This attribute from SNMP perspective deviates from MIB that it is made READONLY.
Mib	Ip
Values	start stop
Default	start

COMPONENT Vr Ip Egp Import

Instance	Decimal (0..65535)
Groups	GROUP Vr Ip Egp Import Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Egp Import/n* This component controls the functionality of route leaking. In other words, this component will determine what routes are used by EGP.
Mib	Ip
Opt. Subcomp.	COMPONENT Vr Ip Egp Import Network (Net)
Common Verbs	Help List Display Add DELete

GROUP Vr Ip Egp Import Provisioned (Prov)

Properties	Provisioned
Description	These set of attributes describe the provisionable attributes for the import component.
Mib	Ip

ATTRIBUTE Vr Ip Egp Import usageFlag (usage)

Access	Read and write
Description	This flag will determine whether or not EGP will use or ignore information in updates received. If the attribute *nbrAsId* is not specified or any of the *NetworkList* components are not added, then this attribute when set to ***ignore*** will ignore all incoming information.
Mib	Ip
Values	use ignore

Copyright © 2006, Nortel Nortel Confidential

Default	use

ATTRIBUTE Vr Ip Egp Import **importMetric (metric)**

Access	Read and write
Description	This attribute specifies the metric value to be included in the routing table for any routes sent because this particular import instance was it's "best match" policy. However this attribute is not a selection key. It should not ***use*** or ***ignore*** a particular metric value. If the value for this attribute is not specified, then the metric value received in an EGP update is used. Note: When setting this value, caution should be taken to set the metric value in all relevant *Import* components to make sure that all matching policies for a given route have the same metric set. This will insure that there are no situations where a specific metric was desired, but doesn't get used in the update because the "best match" policy for that situation did not set the metric parameter. If the attribute *usageFlag* for this import policy is set to ***ignore***, then the *importMetric* value will be ignored by the application. The *importMetric* value is not used to select which routes to use or ignore but is used to set the metric value for the routes being imported. A value of zero specifies that the metric received in the update is to be used.
Mib	Ip
Values	Decimal (0..255)
Default	0

ATTRIBUTE Vr Ip Egp Import **nbrAsId (nbrAs)**

Access	Read and write
Description	The autonomous system Id this import policy will apply to. Note: The Valid value of an *asId* is from 1 to 65,535. This attribute's value when set to 0 will be ignored.
Mib	Ip
Values	Decimal (0..65535)
Default	No default

COMPONENT Vr Ip Egp Import **Network (Net)**

Instance	Decimal (0..65535)
Groups	GROUP Vr Ip Egp Import Net Provisioned (Prov)
Scope	Application

Copyright © 2006, Nortel Nortel Confidential

Description	*Vr/<string> Ip Egp Import/<Decimal> NetworkList/<Decimal>* This is an optional subcomponent of Import and identifies a set of networks that this import policy will apply to.
Mib	Ip
Common Verbs	Help List Display Add DELete

GROUP Vr Ip Egp Import Net Provisioned (Prov)

Properties	Provisioned
Description	This group identifies attributes for the NetworkList component for which the import policy will be applied to
Mib	Ip

ATTRIBUTE Vr Ip Egp Import Net ipAddress (addr)

Access	Read and write
Description	This attribute identifies the IP address that needs to be matched against in this network list for the Import policy to be applied to.
Mib	Ip
Values	IP address
Default	No default

COMPONENT Vr Ip Egp Export

Instance	Decimal (0..65535)
Groups	GROUP Vr Ip Egp Export Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Egp Export/n* Each instance of this component specifies an EGP export policy. An EGP export policy is used to decide if a route in the IP forwarding table should be blocked or advertised as EGP routes onto one or all attached EGP autonomous systems of the virtual router. The Nortel Networks Multiservice Switch IP EGP by default advertises all

Copyright © 2006, Nortel Nortel Confidential

	local routes to all attached EGP autonomous systems using the metric 128.
Mib	Ip
Opt. Subcomp.	COMPONENT Vr Ip Egp Export Network (Net)
Common Verbs	Help List Display Add DELete

GROUP Vr Ip Egp Export Provisioned (Prov)

Properties	Provisioned
Description	This group contains all the provisioned attributes for the *Export* component.
Mib	Ip

ATTRIBUTE Vr Ip Egp Export advertiseStatus (advertise)

Access	Read and write
Description	This attribute specifies if the routes that match this export policy are advertised (***send***) or not advertised (***block***).
Mib	Ip
Values	send block
Default	send

ATTRIBUTE Vr Ip Egp Export exportMetric (metric)

Access	Read and write
Description	This attribute specifies the metric to be used on the routes being exported as a result of matching this export policy. If the attribute *advertiseStatus* is set to ***block***, then the value of *exportMetric* is ignored. The *exportMetric* value is not used to select which routes to block or send, but rather the metric value advertised for the routes. A value of 0 indicates that the metric associated with the route in the forwarding table is used.
Mib	Ip
Values	Decimal (0..255)
Default	0

ATTRIBUTE Vr Ip Egp Export protocol

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the routes to which this export policy applies based on the routing protocol of how the routes are learned. If it is set to ***all***, this export policy applies to all routes in the forwarding table.
Mib	Ip
Values	all egp rip ospfInternal ospfExternal staticLocal staticRemote
Default	all

ATTRIBUTE Vr Ip Egp Export ripInterface (ripIf)

Access	Read and write
Description	This attribute specifies the RIP learned routes to which this export policy applies, based on the RIP interface from which the routes are learned. This attribute can only be non zero when the *protocol* is set to ***rip***. The value of 0.0.0.0 implies any RIP interface on the same virtual router; otherwise the value of this attribute must match the interface address of a *LogicalIf* that has a *RipIf* on the same virtual router.
Mib	Ip
Values	IP address
Default	0.0.0.0

ATTRIBUTE Vr Ip Egp Export ripNeighbor (ripNbr)

Access	Read and write
Description	This attribute specifies the RIP learned routes to which this export policy applies, based on the RIP neighbor of which the routes are learned from. This attribute can only be non zero when the *protocol* is set to ***rip***. The value of 0.0.0.0 implies any RIP neighbor.
Mib	Ip
Values	IP address
Default	0.0.0.0

ATTRIBUTE Vr Ip Egp Export inEgpAsId (inAs)

Access	Read and write
Description	This attribute specifies the EGP learned routes to which this export policy applies, based on the EGP autonomous system identifier of which the routes are learned from. This attribute can only be non zero when *protocol* is set to ***egp***. The value

Copyright © 2006, Nortel Nortel Confidential

	of 0 implies any EGP autonomous system; otherwise the value of this attribute must match the *asId* of an EGP neighbor on the same virtual router.
Mib	Ip
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Vr Ip Egp Export ospfTag (tag)

Access	Read and write
Description	This attribute specifies the OSPF learned external routes to which this export policy applies, based on the learned OSPF tag of the routes. This attribute can only be set to a non default value when *protocol* is set to ***ospfExternal***. The value of 4294967295 implies any tag.
Mib	Ip
Values	Decimal (0..4294967295)
Default	4294967295

ATTRIBUTE Vr Ip Egp Export outAutonomousSystem (outAs)

Access	Read and write
Description	This attribute specifies the EGP autonomous system to which routes are exported to as a result of matching this export policy. If the attribute *advertiseStatus* is set to ***block***, then the value of *outAutonomousSystem* is ignored. The *outAutonomousSystem* value is not used to select which routes to block or send but where to export the routes. A value of 0 indicates that the routes are exported to all EGP autonomous systems of which the virtual router is a neighbor. Otherwise, the value of this attribute must match the *asId* of an EGP neighbor on the same virtual router.
Mib	Ip
Values	Decimal (0..65535)
Default	0

COMPONENT Vr Ip Egp Export Network (Net)

Instance	Decimal (0..65535)

GROUP Vr Ip Ospf Provisioned (Prov)

Properties: Provisioned

Description: This group of attributes are used to configure the OSPF component.

Mib: Ip

ATTRIBUTE Vr Ip Ospf routerId (id)

Access: Read and write

Description: This attribute is an Ip Address that uniquely identifies the router in the autonomous system.

Mib: Ip

Values: IP address

Default: No default

ATTRIBUTE Vr Ip Ospf snmpAdminStatus

Access: Read and write

Description: The administrative status of the OSPF Component in this routing component (*Vr*, *Rtr* or *Vrf*).

Mib: Ip

Copyright © 2006, Nortel Nortel Confidential

Values	up down testing
Default	up

ATTRIBUTE Vr Ip Ospf asBdrRtrStatus (asBr)

Access	Read and write
Description	This attribute is a flag to note whether this router is an autonomous system border router. If this router is configured to export any routes learned from other than OSPF-internal protocol, this attribute should be configured as autonomous system border router.
Mib	Ip
Values	true false
Default	false

ATTRIBUTE Vr Ip Ospf tosSupport

Access	Read and write
Description	The router's support for type-of-service routing. Only one value will be allowed. This is a deviation from supporting the MIB.
Mib	Ip
Values	false
Default	false

ATTRIBUTE Vr Ip Ospf multicastForward

Access	Read and write
Description	A bit mask indicating the limits on Network Layer Multicast (class D) forwarding. It is represented as a sum of the following: if intra-Area forwarding is permitted, 1; else 0 if inter-Area forwarding is permitted 2; else 0 if inter-AS forwarding is permitted, 4; else 0 Only the value of 0 is being supported and this is a MIB deviation.
Mib	Ip
Values	Decimal (0..0)
Default	0

ATTRIBUTE Vr Ip Ospf migrateRip

Access	Read and write
Description	This Attribute sets the preference level of OSPF-internal routes to be less preferred than RIP.

Copyright © 2006, Nortel Nortel Confidential

This attribute should only be used when starting a migration of a network from RIP to OSPF. When ready to cut over to OSPF, set this attribute to a value of ***disabled*** and run under normal preferences. All OSPF routers in the Autonomous System should be running with the *migrateRip* attribute set to a value of ***enabled*** or with *migrateRip* ***disabled*** to prevent routing loops. It is important that the changeover period from RIP to OSPF be performed quickly on all OSPF routers so that no routing loops are formed. These routing loops could be caused by conflicts in the internal RIP and OSPF databases.

Mib	Ip
Values	enabled disabled
Default	disabled

ATTRIBUTE Vr Ip Ospf generateDefaultRouteMetric (genDefaultMetric)

Access	Read and write
Description	If this router is configured as an autonomous system border router, then this attribute causes the default route to be generated with a metric value equal to *generateDefaultRouteMetric* value. This route is put in the OSPF update along with the normal update routes when updates are sent to the neighbors. No default route will be generated if the value is 0.
Mib	Ip
Values	Signed (-1..65535)
Default	0

ATTRIBUTE Vr Ip Ospf redistributeIbgp (ribgp)

Access	Read and write
Description	This attribute specifies whether the export policies of this *Ospf* instance can match routes learned from internal BGP (IBGP) peers when their *protocol* attribute value is ***all***. If *redistributeIbgp* is ***true***, a *protocol* value of ***all*** allows routes learned from IBGP peers to be included in the matching routes. If *redistributeIbgp* is ***false***, routes learned from IBGP peers are excluded when the *protocol* value is ***all***. To cause IBGP routes to be considered in this case, the *protocol* value must be set to ***bgpInternal***.
Mib	Ip
Values	true false
Default	false

ATTRIBUTE Vr Ip Ospf estimatedNumberOfInternalOSPFRoutes

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the average estimated number of routes in the autonomous system that this OSPF instance will have to keep track of. If this value is provisioned too low it will cause increased CPU utilization due to dynamic memory allocation. If this value is provisioned too high the result is wasted memory.
Mib	Ip
Values	Decimal (0..65535)
Default	500

ATTRIBUTE Vr Ip Ospf estimatedNumberOfExternalOSPFRoutes

Access	Read and write
Description	This attribute specifies the average estimated number of routes external to the autonomous system that this OSPF instance will have to keep track of. If this value is provisioned too low it will cause increased CPU utilization due to dynamic memory allocation. If this value is provisioned too high the result is wasted memory.
Mib	Ip
Values	Decimal (0..65535)
Default	500

ATTRIBUTE Vr Ip Ospf estimatedNumberOfAreas

Access	Read and write
Description	This attribute specifies the average estimated number of areas in the autonomous system that this OSPF instance will have to keep track of.
Mib	Ip
Values	Decimal (0..65535)
Default	2

ATTRIBUTE Vr Ip Ospf estimatedNumberOfInterfacesPerArea

Access	Read and write
Description	This attribute specifies the average estimated number of interfaces in a given area that this OSPF instance will have to keep track of.
Mib	Ip
Values	Decimal (0..65535)
Default	10

ATTRIBUTE Vr Ip Ospf estimatedNumberOfNeighborsPerInterface

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the average estimated number of neighbors that a given interface will have on it in this OSPF interface.
Mib	Ip
Values	Decimal (0..65535)
Default	3

ATTRIBUTE Vr Ip Ospf defaultOspfIntRtePreference (ospfIntPref)

Access	Read and write
Description	This attribute specifies this *OSPF* component instance's default routing preference assigned to the OSPF internal routes. A lower value indicates a more preferred route.
Mib	Ip
Values	Decimal (1..254)
Default	30

ATTRIBUTE Vr Ip Ospf defaultOspfExt1RtePreference (ospfExt1Pref)

Access	Read and write
Description	This attribute specifies this *OSPF* component instance's default routing preference assigned to the OSPF external type 1 routes. A lower value indicates a more preferred route.
Mib	Ip
Values	Decimal (1..254)
Default	80

ATTRIBUTE Vr Ip Ospf defaultOspfExt2RtePreference (ospfExt2Pref)

Access	Read and write
Description	This attribute specifies this *OSPF* component instance's default routing preference assigned to the OSPF external type 2 routes. A lower value indicates a more preferred route.
Mib	Ip
Values	Decimal (1..254)
Default	120

ATTRIBUTE Vr Ip Ospf opaqueCapability (opcap)

Access	Read and write
Description	This attribute specifies whether the OSPF instance is allowed to participate in flooding Opaque LSAs. Such LSAs are also stored in the InwOspfLsdbEntry. Applications, such as MPLS Traffic Engineering, use this mechanism to flood their information throughout a network. Of the

Copyright © 2006, Nortel Nortel Confidential

three Opaque LSA types (9,10,11), only type 10 LSAs (area scope) are supported.The OSPF instance remains fully inter-operable with non-opaque-capable neighbors.
Opaque capability is not fully supported. When the ***mplsTeEmulation*** feature is provisioned, setting this attribute to ***true*** activates hooks to emulate TE capability by flooding hard-coded type 10 TE LSAs to opaque-capable neighbors. This emulated TE functionality is not standards compliant and is strictly provided for MPLS RSVP-TE inter-operability with vendors that are dependent on MPLS TE to establish LSPs.

Mib: lp

Values: true
false

Default: false

ATTRIBUTE Vr Ip Ospf spareInstance (spInst)

Access: Read and write

Description: This attribute specifies whether to maintain a copy of the link state database on the standby card. When this attribute is set to ***disable***, OSPF does not maintain a copy of the link state database.

If the *virtualRouterProcessor* attribute of this *VirtualRouter* is set to ***Lp/0***, then the following conditions must both be true for a copy of the link-state database to be maintained on the standby CP:

- This attribute must be set to ***enable***, and

- The *Shelf cpEquipmentProtection* attribute must be set to ***hot***.

Mib: lp

Values: enable
disable

Default: disable

ATTRIBUTE Vr Ip Ospf spfHoldTime (spfTime)

Access: Read and write

Description: This attribute specifies the minimum time interval between SPF calculations. If a link state change in the autonomous system is detected and the time since the last SPF calculation is greater than *spfHoldTime*, then the SPF calculation starts immediately. Otherwise, the SPF calculation waits until a time of at least *spfHoldTime* has elapsed since the previous SPF calculation.

Setting this attribute to a lower value decreases convergence time in the OSPF autonomous system, but uses more CPU resource more frequently. Setting this attribute to a higher value increases convergence time but

Copyright © 2006, Nortel Nortel Confidential

provides for a more scalable node configuration, especially if there are many *Ospf* components configured on the node.

Mib	Ip
Values	Decimal (1..60)
Units	seconds
Default	1

ATTRIBUTE Vr Ip Ospf alarmGeneration (alarms)

Access	Read and write
Description	This attribute specifies the level of alarm generation for this *Ospf* instance. A value of ***all*** specifies that all OSPF alarms are made visible. A value of ***normal*** specifies that all existing OSPF alarms are made visible, except *Ospf NeighborEntry* state change alarms. A value of ***none*** specifies that no OSPF alarms are made visible. It is recommended that *VirtualRouter* components with the *vpnMode* attribute set to ***carrier*** should have the *alarmGeneration* attribute set to ***all***. *VirtualRouter* components with the *vpnMode* attribute set to ***customer*** should have the *alarmGeneration* attribute set to either ***normal*** or ***none***, for scalability reasons. Similarly, the *alarmGeneration* attribute should be set to ***all*** for *Router*. The *alarmGeneration* attribute should be set to either ***normal*** or ***none*** for *Vrf* for scalability reasons.
Mib	Ip
Values	none normal all
Default	all

ATTRIBUTE Vr Ip Ospf ecmpStatus

Access	Read and write
Description	This attribute specifies whether the Equal Cost Multi-Path (ECMP) functionality is enabled or not in the network meaning that the number of next hops for one route learned through OSPF depend on the value of *ecmpStatus*. If *ecmpStatus* is ***enabled*****,** a maximum of three next hops are kept for one route. If it is ***disabled***, one next hop is kept for that route.
Mib	Ip
Values	enabled disabled
Default	enabled

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ip Ospf attachAsTag (asTag)

Access	Read and write
Description	This attribute specifies the treatment of the OSPF tag when routes are redistributed between BGP and OSPF. If this attribute is set to ***enabled***, an AS number is encoded as OSPF tag when routes are redistributed from BGP into OSPF. When routes are redistributed from OSPF into BGP, the OSPF tag is checked against the AS number to avoid routing loops. If this attribute is set to ***disabled***, an AS number is not encoded as OSPF tag when routes are redistributed from BGP into OSPF. When routes are redistributed from OSPF into BGP, the OSPF tag is not checked against the AS number.
Mib	Ip
Values	disabled enabled
Default	enabled

GROUP Vr Ip Ospf Operational (Oper)

Properties	Operational
Description	These group of attributes identifies the operational attributes for this OSPF Component.
Mib	Ip

ATTRIBUTE Vr Ip Ospf versionNumber (ver)

Access	Read only
Description	The Current Version number of the OSPF Protocol. (2).
Mib	Ip
Values	Decimal (2..2)
Default	2

ATTRIBUTE Vr Ip Ospf areaBdrRtrStatus

Access	Read only
Description	This attribute is used to specify whether this router is configured as an area border router.
Mib	Ip
Values	true false
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ip Ospf externLsaCount

Access	Read only
Description	The number of external (LS type 5) link-state advertisements in the link-state database.
Mib	Ip
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip Ospf externLsaChecksumSum

Access	Read only
Description	The 32-bit unsigned sum of the LS checksums of the external link-state database. This sum can be used to determine if there has been a change in a router's link state database, and to compare the link-state database of two routers.
Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Ip Ospf originateNewLsas

Access	Read only
Description	The number of new link-state advertisements that have been originated. This number is incremented each time the router originates a new LSA.
Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Ip Ospf rxNewLsas

Access	Read only
Description	The number of link-state advertisements received determined to be new instantiations. This number does not include newer instantiations of self-originated link-state advertisements.
Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

GROUP Vr Ip Ospf OsiState (State)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Ip

ATTRIBUTE Vr Ip Ospf adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Ip
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Vr Ip Ospf operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Ip
Values	enabled (ena) disabled (dis)

Copyright © 2006, Nortel Nortel Confidential

Default	disabled

ATTRIBUTE Vr Ip Ospf usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Ip
Values	idle active (activ) busy
Default	idle

GROUP Vr Ip Ospf OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	Ip

ATTRIBUTE Vr Ip Ospf snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	Ip
Values	up down testing
Default	up

COMPONENT Vr Ip Ospf AreaEntry (Area)

Instance	IP address
Groups	GROUP Vr Ip Ospf Area Provisioned (Prov) GROUP Vr Ip Ospf Area Operational (Oper)

Copyright © 2006, Nortel Nortel Confidential

Description	*Vr/<string> Ip Ospf AreaEntry/<Ip Address>* *Rtr/<string> Ospf AreaEntry/<Ip Address>* *Rtr/<string> Vrf/<string> Ospf AreaEntry/<Ip Address>* This component contains the information about various areas that the router is connected to.
Mib	Ip
Common Verbs	Help List Display Add DELete

GROUP Vr Ip Ospf Area Provisioned (Prov)

Properties	Provisioned
Description	This group describes the set of provisionable attributes for the AreaEntry Component.
Mib	Ip

ATTRIBUTE Vr Ip Ospf Area authType

Access	Read and write
Description	The authentication type specified for this area.
Mib	Ip
Values	none simplePassword md5
Default	none

ATTRIBUTE Vr Ip Ospf Area importAsExtern

Access	Read and write
Description	The area's support for importing AS external link-state advertisements. For backbone area (that is, areaId 0.0.0.0), this attribute must be set to ***importExternal***.
Mib	Ip
Values	importExternal (external) importNoExternal (noExternal) importNssa (nssa)
Default	importExternal

ATTRIBUTE Vr Ip Ospf Area areaSummary

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This variable controls the import of summary LSAs into stub areas. If it is ***noAreaSummary***, the router will neither originate nor propagate summary LSAs into the stub areas. It will rely entirely on its default route. If it is ***sendAreaSummary***, the router will both summarize and propagate summary LSAs.
Mib	Ip
Values	noAreaSummary sendAreaSummary
Default	noAreaSummary

GROUP Vr Ip Ospf Area Operational (Oper)

Properties	Operational
Description	This group of attributes describes the Operational set of attributes for the AreaEntry component.
Mib	Ip

ATTRIBUTE Vr Ip Ospf Area spfRuns

Access	Read only
Description	The number of times that the intra-area route table has been calculated using this area's link-state database since the protocol became operational.
Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Ip Ospf Area areaBdrRtrCount

Access	Read only
Description	The total number of area border routers reachable within this area. This is initially zero, and is calculated in each Shortest Path First Pass.
Mib	Ip
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Ip Ospf Area asBdrRtrCount

Access	Read only
Description	The total number of Autonomous System border routers reachable within this area. This is initially zero, and is calculated in each Shortest Path First Pass.

GROUP Vr Ip Ospf VirtIf Provisioned (Prov)

Properties	Provisioned
Description	This group of attributes provide provisioning data for the *VirtIfEntry*.
Mib	Ip

ATTRIBUTE Vr Ip Ospf VirtIf transitDelay (transDelay)

Access	Read and write
Description	The estimated number of seconds it takes to transmit a link-state update packet over this interface.
Mib	Ip
Values	Decimal (1..3600)
Units	seconds
Default	1

ATTRIBUTE Vr Ip Ospf VirtIf retransInterval (retransInt)

Access	Read and write
Description	The number of seconds between link-state advertisement retransmissions, for adjacencies belonging to this interface. This value is also used when retransmitting database description

Copyright © 2006, Nortel Nortel Confidential

	and link-state request packets. This value would be well over the expected round-trip time.
Mib	Ip
Values	Decimal (1..3600)
Units	seconds
Default	5

ATTRIBUTE Vr Ip Ospf VirtIf helloInterval (helloInt)

Access	Read and write
Description	The length of time, in seconds, between the Hello packets that the router sends on the interface. This value must be the same for the virtual neighbor.
Mib	Ip
Values	Decimal (1..3600)
Units	seconds
Default	10

ATTRIBUTE Vr Ip Ospf VirtIf rtrDeadInterval (rtrDeadInt)

Access	Read and write
Description	The number of seconds that a router's Hello packets have not been seen before its neighbors declare the router down. This should be some multiple of the Hello interval. This value must be the same for the virtual neighbor.
Mib	Ip
Values	Decimal (1..3600)
Units	seconds
Default	60

ATTRIBUTE Vr Ip Ospf VirtIf authKey

Access	Write only
Description	If authentication type is simple password, the password for this virtual circuit. If the value of the attribute is not set, then this attribute is ignored by the application. If the value of this attribute is set, then the value of the attribute *authType* under this particular *Area* should be set to ***simplePassword***, otherwise the application will ignore this authentication key.
Mib	Ip
Values	String (1..8, Hex)

COMPONENT Vr Ip Ospf Export

Instance	Decimal (0..65535)
Groups	GROUP Vr Ip Ospf Export Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Ospf Export/n* *Rtr/<string> Ospf Export/n* *Rtr/<string> Vrf/<string> Ospf Export/n* Each instance of this component specifies an OSPF export policy. An OSPF export policy is used to decide if a route in the IP forwarding table should be blocked or advertised as OSPF external routes onto attached OSPF areas of the routing component (*Vr*, *Rtr* or *Vrf*). The *Ospf* component by default advertises all OSPF external routes based on the metric and tag in the IP forwarding table.
Mib	Ip
Opt. Subcomp.	COMPONENT Vr Ip Ospf Export NetworkList (NetList)
Common Verbs	Help List Display Add DELete

GROUP Vr Ip Ospf Export Provisioned (Prov)

Properties	Provisioned
Description	This Group contains all the Provisioned attributes for the Export Component.
Mib	Ip

ATTRIBUTE Vr Ip Ospf Export advertiseStatus (advertise)

Access	Read and write
Description	This attribute specifies if the routes that match this export policy are advertised (***send***) or not advertised (***block***).
Mib	Ip
Values	send block
Default	send

ATTRIBUTE Vr Ip Ospf Export metric (metric)

Access	Read and write
Description	This attribute specifies the metric to be used on the routes being exported as a result of matching this export policy.

Copyright © 2006, Nortel Nortel Confidential

If the attribute *advertiseStatus* is set to ***block***, then the value of *metric* is ignored. The *metric* value is not used to select which routes to block or send, but rather the metric value advertised for the routes.
A value of -1 indicates that the metric associated with the route in the forwarding table is used.

Mib	Ip
Values	Signed (-1..16777215)
Default	-1

ATTRIBUTE Vr Ip Ospf Export protocol

Access	Read and write
Description	This attribute specifies the routes to which this export policy applies based on the routing protocol of how the routes are learned. If the value is ***all***, the policy applies to all routes in the forwarding table, with the following exceptions: external BGP routes are always excluded and internal BGP routes are excluded if the parent *Ospf* component's *reDistributeIBGP* attribute has the value ***false***.
Mib	Ip
Values	all egp rip staticLocal staticRemote bgpInternal bgpExternal mbgp bgpMplsInternal
Default	all

ATTRIBUTE Vr Ip Ospf Export ripInterface (ripIf)

Access	Read and write
Description	This attribute specifies the RIP learned routes to which this export policy applies, based on the RIP interface from which the routes are learned. This attribute can only be non zero when the *protocol* is set to ***rip***. The value of 0.0.0.0 implies any RIP interface on the same routing component (*Vr*, *Rtr* or *Vrf*); otherwise the value of this attribute must match the interface address of an *Interface* or a *LogicalIf* that has a *RipIf* on the same routing component.
Mib	Ip
Values	IP address
Default	0.0.0.0

ATTRIBUTE Vr Ip Ospf Export ripNeighbor (ripNbr)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the RIP learned routes to which this export policy applies, based on the RIP neighbor of which the routes are learned from. This attribute can only be non zero when the *protocol* is set to ***rip***. The value of 0.0.0.0 implies any RIP neighbor.
Mib	Ip
Values	IP address
Default	0.0.0.0

ATTRIBUTE Vr Ip Ospf Export **egpAsId (egpAs)**

Access	Read and write
Description	This attribute specifies the EGP learned routes to which this export policy applies, based on the EGP autonomous system identifier of which the routes are learned from. This attribute can only be non zero when *protocol* is set to ***egp***. The value of 0 implies any EGP autonomous system; otherwise the value of this attribute must match the *asId* of an EGP neighbor on the same virtual router.
Mib	Ip
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Vr Ip Ospf Export **tag**

Access	Read and write
Description	This attribute specifies the OSPF tag to be used on the routes being exported as a result of matching this export policy. If the attribute *advertiseStatus* is set to ***block***, then the value of *tag* is ignored. The *tag* value is not used to select which routes to block or send, but rather the tag value advertised for the routes. A value of 4294967295 indicates that the tag associated with the route in the forwarding table is used.
Mib	Ip
Values	Decimal (0..4294967295)
Default	4294967295

ATTRIBUTE Vr Ip Ospf Export **extLsaMetricType**

Access	Read and write
Description	This attribute specifies the metric type in the OSPF external link state advertisement of the routes being exported as a result of matching this export policy. If the attribute *advertiseStatus* is set to ***block***, then the value of *extLsaMetricType* is ignored. The *extLsaMetricType* value is not used to

Copyright © 2006, Nortel Nortel Confidential

select which routes to block or send, but rather the metric value advertised for the routes.
The value ***useProtocolDefault*** indicates the metric type is automatically chosen based on the routing protocol which the route was learned from.

Mib	Ip
Values	useProtocolDefault type1 type2
Default	useProtocolDefault

ATTRIBUTE Vr Ip Ospf Export **bgpAsId (bgpAs)**

Access	Read and write
Description	This attribute specifies the BGP AS from which a BGP route is learned from. This key is used only if the *protocol* is ***bgpExternal***. *bgpAsId* of value ***0*** matches all ASs.
Mib	Ip
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Vr Ip Ospf Export **bgpPeerIp (peerIp)**

Access	Read and write
Description	This attribute specifies the BGP peer where the routes were learned from. *bgpPeerIp* of ***0*** matches all BGP peers. This attribute is used as a key when *protocol* is set to ***bgpInternal*** or ***bgpExternal***.
Mib	Ip
Values	IP address
Default	0.0.0.0

ATTRIBUTE Vr Ip Ospf Export **description (desc)**

Access	Read and write
Description	This attribute describes the policy. For example, ‘to export OSPF routes to MCI’.
Mib	Ip
Values	String (0..255, ASCII)
Default	No default

GROUP Vr Ip Ospf Nbr Operational (Oper)

Properties Operational

Description This group identifies the operational set of attributes for the *NeighborEntry*.

Mib lp

ATTRIBUTE Vr Ip Ospf Nbr rtrId

Access Read only

Description An Ip Address that uniquely identifies the neighboring router in the autonomous system.

Mib lp

Values IP address

Default No default

ATTRIBUTE Vr Ip Ospf Nbr options

Access Read only

Description A bit mask corresponding to the neighbor's options field. Bit 0, if set, indicates that the area accepts and operates on external information, if zero, it is a stub area. Bit 1, if set, indicates that the system will operate on Type of Service metrics other than TOS 0. If zero, the neighbor will ignore all metrics except the TOS 0 metric. Bit 2, if set, indicates that the system is Network Multicast capable; i.e., that it implements OSPF Multicast Routing.

Mib lp

Values Decimal (0..7)

Default No default

ATTRIBUTE Vr Ip Ospf Nbr priority

Access Read only

Description The priority of this neighbor in the designated router election algorithm. The value 0 signifies that the neighbor is not eligible to become the designated router on this particular network.

Mib lp

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..255)

There should be at least one *RipInterface* provisioned below an *Interface* or below a *LogicalIf* under an *IpPort*.

Mib: Ip

Opt. Subcomp.: COMPONENT Vr Ip Rip Import (Import)
COMPONENT Vr Ip Rip Export

Common Verbs: Help, List, Display, Add, DELete, LOCK, Unlock

GROUP Vr Ip Rip Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisionable attributes for the RIP component

Mib: Ip

ATTRIBUTE Vr Ip Rip migrateRip

Access: Read and write

Description: This attribute sets the preference level of OSPF-internal routes to be less preferred than RIP.
Note:
This parameter should only be used when starting migration of network from RIP to OSPF. When ready to cut over to OSPF, set this attribute value to ***disabled*** and run under normal preferences. All OSPF routers in the Autonomous System should be running with *migrateRip* ***enabled*** or with *migrateRip* ***disabled*** to prevent routing loops. It is important that the changeover period from RIP to OSPF be performed quickly on all OSPF routers so that no routing loops are formed. These routing loops could be caused by conflicts in the internal RIP and OSPF databases.

Mib: Ip

Values: enabled
disabled

Default: disabled

ATTRIBUTE Vr Ip Rip rfc1058MetricUsage (rfc1058)

Access: Read and write

Description: This attribute determines the metric usage for this RIP instance.

This flag is used to determine the way metrics are incremented.

Copyright © 2006, Nortel Nortel Confidential

RFC 1058 way:
Sending Update: This is to use the metric for the route from the routing table as the advertised metric to be sent for that route. Nothing is ever added to this value from the sending side. The only special case handling is that if the route being advertised is the network route of a directly connected network, the metric in the routing table will be zero. Then the RipIf interface metric for the interface being advertised is used as the advertise metric. If the interface being advertised is not a Rip interface, then metric value of 1 is used.
Receiving Update: Add receiving interface's RIP metric to the metric for the route in the received advertisement and install the result in the receiver's routing table as the metric for that route.
Older way:
Sending Updates: Add the out going interfaces rip metric to the metric for a route in the routing table to form the metric to be advertised for that route.
Receiving Updates: The metric received in the advertisement for a route is put directly in the routing table as the metric for that route.

Note: It is recommended that, all the routers in this autonomous system should be following the rfc1058 metric system.
Setting this flag to ***disabled*** will have the effect of running the RIP with old metric incrementing system.

Mib	Ip
Values	enabled disabled
Default	enabled

ATTRIBUTE Vr Ip Rip generateDiscardRoute (discard)

Access	Read and write
Description	This attribute specifies whether network discard routes should be added to the routing and forwarding table for the subnetted interfaces that are running RIP.
Mib	Ip
Values	yes no
Default	yes

ATTRIBUTE Vr Ip Rip redistributeIbgp (ribgp)

Access	Read and write
Description	This attribute specifies whether the export policies of this *Rip* instance can match routes learned from internal BGP (IBGP) peers when their *protocol* attribute value is ***all.*** If *redistributeIbgp* is ***true***, a *protocol* value of ***all*** allows routes learned from IBGP peers to be included in the matching routes. If *redistributeIbgp* is ***false,*** routes learned from IBGP peers are

Copyright © 2006, Nortel Nortel Confidential

	excluded when the *protocol* value is ***all***. To cause IBGP routes to be considered in this case, the *protocol* value must be set to ***bgpInternal***.
Mib	Ip
Values	true false
Default	false

ATTRIBUTE Vr Ip Rip defaultRipRtePreference (ripPref)

Access	Read and write
Description	This attribute specifies this RIP component instance's default routing preference assigned to the RIP routes. A lower value indicates a more preferred route.
Mib	Ip
Values	Decimal (1..254)
Default	82

GROUP Vr Ip Rip OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Ip

ATTRIBUTE Vr Ip Rip adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Copyright © 2006, Nortel Nortel Confidential

Mib	Ip
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Vr Ip Rip operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Ip
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Vr Ip Rip usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Ip
Values	idle active (activ) busy
Default	idle

GROUP Vr Ip Rip AdministrativeControl (AdminControl)

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component.
Mib	Ip

ATTRIBUTE Vr Ip Rip snmpAdminStatus

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed.
Mib	Ip
Values	up down testing
Default	up

GROUP Vr Ip Rip OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	Ip

ATTRIBUTE Vr Ip Rip snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	Ip
Values	up down testing
Default	up

GROUP Vr Ip Rip Operational (Oper)

Properties	Operational
Description	This group defines a set of operational attributes belonging to the *RIP* component. It corresponds to the rip2Globals table in the RIP-2 standard MIB.
Mib	Ip

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ip Rip routeChangesMade

Access	Read only
Description	This attribute counts the route changes made to the IP Route Database by Rip. This does not include the refresh of the route's age.
Mib	Ip
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip Rip queryResponses

Access	Read only
Description	This attribute counts the responses sent to RIP queries from other systems.
Mib	Ip
Values	Decimal (0..4294967295)
Default	0

COMPONENT Vr Ip Rip Import (Import)

ATTRIBUTE Vr Ip Rip Import usageFlag (usage)

Access	Read and write
Description	This flag when set to ***ignore*** indicates the routes that are not used and if set to ***use***, indicates the routes which are used.
Mib	Ip
Values	use ignore
Default	use

ATTRIBUTE Vr Ip Rip Import importMetric (metric)

Access	Read and write
Description	This attribute is used to override the default import metric for the RIP protocol. This value is not used to select which routes to use or ignore, rather it is the metric to be used in the routing table for the routes imported for this import policy. A value of zero indicates that the metric received in the update will be used.
Mib	Ip
Values	Decimal (0..16)
Default	0

ATTRIBUTE Vr Ip Rip Import neighbor (nbr)

Access	Read and write
Description	This attribute indicates the IP Address of the neighbor this policy will apply to.
Mib	Ip
Values	IP address
Default	0.0.0.0

ATTRIBUTE Vr Ip Rip Import interface (if)

Access	Read and write
Description	This attribute specifies the RIP interface to which this import policy applies. The value of 0.0.0.0 implies any RIP interface on the routing component (*Vr*, *Rtr* or *Vrf*); otherwise the value of this attribute must match the interface address of a *LogicalIf* or *Interface* that has a *RipIf* on the same routing component.
Mib	Ip
Values	IP address
Default	0.0.0.0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ip Rip Import **description (desc)**

Access	Read and write
Description	This attribute describes the policy. For example, 'to import RIP routes from MCI'.
Mib	Ip
Values	String (0..255, ASCII)
Default	No default

COMPONENT Vr Ip Rip Import **Network (Net)**

Instance	Decimal (0..65535)
Groups	GROUP Vr Ip Rip Import Net Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Rip Import/<Decimal> NetworkList/<Decimal>* *Rtr/<string> Rip Import/<Decimal> NetworkList/<Decimal>* *Rtr/<string> Vrf/<string> Rip Import/<Decimal> NetworkList/<Decimal>* This component identifies a set of networks that this Import policy will apply to.
Mib	Ip
Common Verbs	Help List Display Add DELete

GROUP Vr Ip Rip Import Net **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains attributes for the *Import NetworkList* component for the Import Policy to be applied to.
Mib	Ip

ATTRIBUTE Vr Ip Rip Import Net **ipAddress (addr)**

Access	Read and write
Description	This attribute specifies the IP address that needs to be matched against in this network list for the Import Policy to be applied to.
Mib	Ip
Values	IP address
Default	No default

ATTRIBUTE Vr Ip Rip Import Net **ipMask (mask)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the IP mask for the attribute *ipAddress*.
Mib	Ip
Values	IP address
Default	No default

COMPONENT Vr Ip Rip Export

Instance	Decimal (0..65535)
Groups	GROUP Vr Ip Rip Export Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Rip Export/<Decimal>* *Rtr/<string> Rip Export/<Decimal>* *Rtr/<string> Vrf/<string> Rip Export/<Decimal>* Each instance of this component specifies a RIP export policy. A RIP export policy is used to decide if a route in the IP forwarding table should be blocked or advertised as a RIP route on one or all RIP interfaces of the routing component (*Vr*, *Rtr* or *Vrf*). The *Rip* component by default advertises all local routes and all RIP learned routes to all RIP interfaces based on the metric in the IP forwarding table.
Mib	Ip
Opt. Subcomp.	COMPONENT Vr Ip Rip Export Network (Net)
Common Verbs	Help List Display Add DELete

GROUP Vr Ip Rip Export Provisioned (Prov)

Properties	Provisioned
Description	This group contains all the provisioned attributes for the *Export* component.
Mib	Ip

ATTRIBUTE Vr Ip Rip Export advertiseStatus (advertise)

Access	Read and write
Description	This attribute specifies if the routes that match this export policy are advertised (***send***) or not advertised (***block***).
Mib	Ip

Copyright © 2006, Nortel Nortel Confidential

Values	send block
Default	send

ATTRIBUTE Vr Ip Rip Export exportMetric (metric)

Access	Read and write
Description	This attribute specifies the metric to be used on the routes being exported as a result of matching this export policy. If the attribute *advertiseStatus* is set to ***block***, then the value of *exportMetric* is ignored. The *exportMetric* value is not used to select which routes to block or send, but rather the metric value advertised for the routes. A value of 0 indicates that the exported routes will be advertised with their original metric. When exporting routes from other protocols into RIP, an *exportMetric* value of 0 will distribute these routes with the metric of the original protocol. If the metric of the original protocol exceeds 15, the exported routes will be considered as unreachable by RIP. If an *exportMetric* value of 16 is specified, the exported routes will be advertised into RIP as unreachable.
Mib	Ip
Values	Decimal (0..16)
Default	0

ATTRIBUTE Vr Ip Rip Export protocol

Access	Read and write
Description	This attribute specifies the routes to which this export policy applies based on the routing protocol of how the routes are learned. If the value is ***all***, the policy applies to all routes in the forwarding table, with the following exceptions: external BGP routes are always excluded and internal BGP routes are excluded if the parent *Rip* component's *reDistributeIBGP* attribute has the value ***false***.
Mib	Ip
Values	all egp rip ospfInternal ospfExternal staticLocal staticRemote bgpInternal bgpExternal mbgp bgpMplsInternal
Default	all

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ip Rip Export **ripInterface (ripIf)**

Access	Read and write
Description	This attribute specifies the RIP learned routes to which this export policy applies, based on the RIP interface from which the routes are learned. This attribute can only be non zero when the *protocol* is set to ***rip***. The value of 0.0.0.0 implies any RIP interface on the same routing component (*Vr*, *Rtr* or *Vrf*); otherwise the value of this attribute must match the interface address of a *LogicalIf* or *Interface* that has a *RipIf* on the same routing component.
Mib	Ip
Values	IP address
Default	0.0.0.0

ATTRIBUTE Vr Ip Rip Export **egpAsId (egpAs)**

Access	Read and write
Description	Under the *Rtr* and *Rtr Vrf*, this attribute has no effect. Under the *Vr*, this attribute specifies the EGP learned routes to which this export policy applies, based on the EGP autonomous system identifier of which the routes are learned from. This attribute can only be non zero when *protocol* is set to ***egp***. The value of 0 implies any EGP autonomous system; otherwise the value of this attribute must match the *asId* of an EGP neighbor on the same virtual router.
Mib	Ip
Values	Decimal (0..65536)
Default	0

ATTRIBUTE Vr Ip Rip Export **ospfTag (tag)**

Access	Read and write
Description	This attribute specifies the OSPF learned external routes to which this export policy applies, based on the learned OSPF tag of the routes. This attribute can only be set to a non default value when *protocol* is set to ***ospfExternal***. The default value of 4294967295 implies any tag.
Mib	Ip
Values	Decimal (0..4294967295)
Default	4294967295

ATTRIBUTE Vr Ip Rip Export **outInterface (outIf)**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the RIP interface on the virtual router which routes are exported onto as a result of matching this export policy. If the attribute *advertiseStatus* is set to ***block***, then the value of *outInterface* is ignored. The *outInterface* value is not used to select which routes to block or send, but rather where to export the routes. A value of 0.0.0.0 indicates that the routes are exported to all RIP interfaces on the routing component (*Vr*, *Rtr* or *Vrf*). Otherwise, the value of this attribute must match the interface address of a *LogicalIf* or *Interface* that has a *RipIf* on the same routing component.
Mib	Ip
Values	IP address
Default	0.0.0.0

ATTRIBUTE Vr Ip Rip Export bgpAsId (bgpAs)

Access	Read and write
Description	This key attribute specifies the BGP AS from which the routes are learned. This key will be used only when the *protocol* is set to ***bgpExternal***. *bgpAsId* of ***0*** matches all BGP ASs.
Mib	Ip
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Vr Ip Rip Export description (desc)

Access	Read and write
Description	The attribute describes the policy. For example, 'to export RIP routes to AS 1'.
Mib	Ip
Values	String (0..255, ASCII)
Default	No default

COMPONENT Vr Ip Rip Export Network (Net)

GROUP Vr Ip Static OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib: Ip

ATTRIBUTE Vr Ip Static adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib: Ip

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Copyright © 2006, Nortel Nortel Confidential

Default	unlocked

ATTRIBUTE Vr Ip Static operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Ip
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Vr Ip Static usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Ip
Values	idle active (activ) busy
Default	idle

GROUP Vr Ip Static Provisioned (Prov)

Properties	Provisioned
Description	This group of attributes are used to configure the Static component.
Mib	Ip

ATTRIBUTE Vr Ip Static defaultStaticRemoteRtePreference (pref)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies this *Static* component instance's default routing preference assigned to the remote routes. A lower value indicates a more preferred route. Assigning a non-zero value to the *staticRemoteRtePreference* attribute in *RouteEntry* will override this default.
Mib	Ip
Values	Decimal (1..253)
Default	72

ATTRIBUTE Vr Ip Static defaultStaticDiscardRtePreference (discpref)

Access	Read and write
Description	This attribute specifies this *Static* component instance's default routing preference assigned to the discard routes. A lower value indicates a more preferred route. Assigning a non-zero value to the *staticDiscardRtePreference* attribute in *DiscardRouteEntry* will override this default.
Mib	Ip
Values	Decimal (0..253)
Default	0

ATTRIBUTE Vr Ip Static maxEcmpNextHops

Access	Read and write
Description	This attribute specifies the maximum number of Equal Cost Multi-Path (ECMP) *NextHop*s that are supported for *Static RouteEntry*s. If *maxEcmpNextHops* is ***1*** then only a single available *NextHop* is used, even if multiple *NextHops* are provisioned with the same *metric* value under a given *Static RouteEntry*. In other words ECMP is disabled for static routes. If *maxEcmpNextHops* is ***3*** the traffic will be loadshared over the available *NextHops* that have the same value set for the *metric* attribute under a given *Static RouteEntry*. When *protected Static RouteEntry*s are provisioned, *maxEcmpNextHops* must be ***1***.
Mib	Ip
Values	1 3
Default	3

ATTRIBUTE Vr Ip Static heartbeatDeadInterval (hbDeadInt)

Access	Read and write
Description	This attribute specifies the L3 *Static* heartbeat dead router interval for the *NextHop* Routers of *Static Route*s which have *heartbeat* ***enabled***. If no

Copyright © 2006, Nortel Nortel Confidential

heartbeat polling responses have been received in the last *heartbeatDeadInterval* seconds, then the *heartbeatState* of this *NextHop* is ***down***.
If *heartbeatDeadInterval* is ***disabled***, L3 heartbeat monitoring will not occur for any *Static Route NextHop*s and the *heartbeatState* of all *NextHop*s will be ***disabled***.

Mib	Ip
Values	Decimal (4..60) disabled
Default	disabled

COMPONENT Vr Ip Static RouteEntry (Route)

Instance	destAddress (addr) [IP address] destMask (mask) [IP address] typeOfService (tos) [Decimal (0..0)]
Groups	GROUP Vr Ip Static Route Provisioned (Prov) GROUP Vr Ip Static Route Operational (Oper) GROUP Vr Ip Static Route OsiState (State)
Scope	Application
Description	*Vr/<string> Ip Static RouteEntry/*<Ip Address>, <Ip Address>, <Decimal> *Rtr/<string> Static RouteEntry/*<Ip Address>, <Ip Address>, <Decimal> *Rtr/<string> Vrf/<string> Static RouteEntry/*<Ip Address>, <Ip Address>, <Decimal> This component describes the IP static routes. For a *RouteEntry* to be valid, there should be at least one *NextHop* provisioned. Up to three *NextHops* can be provisioned for each instance of a *RouteEntry*. The value of index *destMask* should be contiguous. Only the value zero is supported. Zero will be substituted for any value that is entered.
Mib	Ip
Opt. Subcomp.	COMPONENT Vr Ip Static Route NextHop (Nh)
Common Verbs	Help List Display Add DELete

GROUP Vr Ip Static Route Provisioned (Prov)

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains a provisionable set of attributes for the static route entry component.
Mib	Ip

ATTRIBUTE Vr Ip Static Route staticRemoteRtePreference (pref)

Access	Read and write
Criticality	Component
Description	This attribute specifies the route preference of the static remote route. A lower preference value means the route is more preferred. If ***sameAsStatic*** is specified, the value of *defaultStaticRemoteRtePreference* in the *Static* component is used.
Mib	Ip
Values	Decimal (1..253) sameAsStatic
Default	sameAsStatic

ATTRIBUTE Vr Ip Static Route protected

Access	Read and write
Description	This attribute specifies whether this route is protected or not. Note that *Vr Ip Static maxEcmpNextHops* must be ***1*** and *Vr Ip Ospf ecmpStatus* must be ***disabled*** when there is a *protected* static route under the *Vr*.
Mib	Ip
Values	yes no
Default	no

ATTRIBUTE Vr Ip Static Route protectedFailureBehavior (protFlrB)

Access	Read and write
Description	This attribute specifies the behavior when all *NextHops* of a *protected* static route fail. If ***discard*** is specified, the static route will not be removed, it will continue to be used to discard traffic.
Mib	Ip
Values	discard
Default	discard

ATTRIBUTE Vr Ip Static Route heartbeat

Access	Read and write
Description	This attribute specifies whether or not *heartbeat* is ***enabled*** for this route. In order for this attribute to have any effect, heartbeat must first be

Copyright © 2006, Nortel Nortel Confidential

permitted at the *Static* component level by configuring the *heartbeatDeadInterval* to a value different than ***disabled***.
If ***enabled*** is specified for *heartbeat*, an IP heartbeat is maintained for each of the *NextHops*. ICMP echo requests are sent every 1second and if an ICMP echo resply is received, the *heartbeatState* of the *NextHop* is declared ***up***. If at any point no ICMP response has been received for *heartbeatDeadInterval* seconds, the *heartbeatState* of the *NextHop* will be ***down***.
If ***disabled*** is specified, the *heartbeatState* of each *NextHop* under this *Static Route* will be ***disabled***.

Mib: Ip

Values: enabled
disabled

Default: disabled

GROUP Vr Ip Static Route Operational (Oper)

Properties: Operational

Description: This group contains a set of operational attributes for the static route entry component.

Mib: Ip

ATTRIBUTE Vr Ip Static Route protectionLevel (protL)

Access: Read only

Description: This attribute indicates the current protection level for a *Static RouteEntry*. A value of ***portProtected*** indicates that the only alternative enabled *NextHop*(s) for this protected route are on the same card as the active *NextHop*. When the value is ***cardProtected***, one or more alternative enabled ***NextHop***s exist on a different card than the active ***NextHop***. If the value is ***unprotected***, no alternative enabled *NextHop*s exist or this is an unprotected static route (that is, *protected* = ***no*** for this *Static RouteEntry*).

Mib: Ip

Values: portProtected
cardProtected
unprotected
notApplicable

Default: No default

GROUP Vr Ip Static Route OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described

Copyright © 2006, Nortel Nortel Confidential

here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Common Verbs	Help List Display Add DELete

GROUP Vr Ip Ns Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisionable attributes for the *NetSentry* component.
Mib	Ip

ATTRIBUTE Vr Ip Ns firstFilter

Access	Read and write
Description	The *firstFilter* is the first filter point which affects all IP packets before they have been examined in any way for their origin and destination. The most common use of a *firstFilter* point is to collect statistis for all packets arriving at the route on any interface, before any subsequent filter processing changes their direction or disposition.
Mib	Ip
Values	String (0..32, ASCII)
Default	No default

ATTRIBUTE Vr Ip Ns localInFilter

Access	Read and write
Description	The *localInFilter* is the second filter point which uses by network administrator to perform a common action on all IP packets that physically arrive over a specific logical interface, regardless of the packet's stated source or destination. Typical uses for a *localInFilter* include verifying that known Ethernet media source addresses match known IP addresses, or confirming that the IP packet source addresses of received IP packet fall within a narrow range.

Copyright © 2006, Nortel Nortel Confidential

Mib	Ip
Values	String (0..32, ASCII)
Default	No default

ATTRIBUTE Vr Ip Ns localOutFilter

Access	Read and write
Description	The *localOutFilter* is the third filter point which applies to any IP packet that will be transmitted from the router to the medium associated with the interface, regardless of its source, destination, or what type of decision was made to cause the datagram to be transmitted on this interface. *localOutFilter* generally used to ensure that certain paterns of traffic do not enter the network or reach a second IP router on that network. For example, *localOutFilter* can be used as the exclusion of all IP packets above a certain security classification, or collecting statistics on the amount of IP fragments performed on an outgoing interface.
Mib	Ip
Values	String (0..32, ASCII)
Default	No default

ATTRIBUTE Vr Ip Ns lastFilter

Access	Read and write
Description	*lastFilter* is the fourth and last filter point to be excecuted after all other routing and filtering decisions have been made on the IP packet, and transmission of the information is imminent. *lastFilter* is generally used to collect statistics on traffic after all previous control and routing decisions have been made.
Mib	Ip
Values	String (0..32, ASCII)
Default	No default

VERB Clear Vr Ip Arp

Impact	Passive
Description	*Clear [-logicalIf(Ip Address)] [-includeInverse] Vr/<string> Ip Arp* *Clear [-logicalIf(Ip Address)] [-includeInverse] Rtr/<string> Arp* The *Clear* verb is intended for manually flushing dynamically learned ARP entries. Without any options, *Clear* will flush all non-inverse dynamic ARP entries. The *Clear* verb does not affect static ARP host entries, that is, entries which correspond to *HostEntry* subcomponents of this component. These entries can be removed by deleting the corresponding provisioned *HostEntry* component. The *-logicalIf* or *-interface* option is used to flush dynamic ARP entries which were learned on a particular *IpPort LogicalInterface* or *Interface*. The option must specify the IP address of an existing *IpPort LogicalInterface* (which may be under any *ProtocolPort) or Interface*. The *-includeInverse* option is used to force the deletion of inverse ARP entries. Inverse ARP entries which are learned through inverse ARP (*FrDte*) and inverse ATM ARP (*AtmMpe*) are important and should not be cleared by the users accidentally. If the option is not present, inverse ARP entries are not cleared.

GROUP Vr Ip Arp **Provisioned (Prov)**

Properties	Provisioned
Description	The ARP refresh feature allows the router to periodically verify ARP table entries. Whenever the router updates an ARP entry, or creates a new entry, a timeout value is assigned to the entry. When the timeout for an entry expires, the router will send a unicast ARP request to the currently-known physical address. If an ARP response comes back, the entry will be assigned a new timeout. If, however, the host has gone away or been assigned a new physical address, the host will not respond to the unicast ARP, and the entry will be removed from the ARP table. The new physical address will be discovered through the normal ARP mechanism when the next communication is attempted to the host.
Mib	Ip

ATTRIBUTE Vr Ip Arp **autoRefresh**

Access	Read and write
Description	This attribute is used to enable or disable the ARP refresh feature.
Mib	Ip
Values	enabled disabled
Default	disabled

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ip Arp autoRefreshTimeout

Access	Read and write
Description	This attribute defines the timeout value, in minutes, which is assigned to updated ARP entries, or newly created ARP entries. The range for the timeout is 1 minute to 1440 minutes (24 hours).
Mib	Ip
Values	Decimal (1..1440)
Units	minutes
Default	5

ATTRIBUTE Vr Ip Arp retryTimes

Access	Read and write
Description	This attribute defines the number of times that an ARP request will be sent to a remote host if there is no reply received. This value is assigned when ARP entries are updated or created. The range of the value can be from 0 to 127.
Mib	Ip
Values	Decimal (0..127)
Units	times
Default	127

COMPONENT Vr Ip Arp DynHostEntry (DynHost)

Instance	hostAddress (addr) [IP address] cos [0 1 2 3 notApplicable (na)]
Groups	GROUP Vr Ip Arp DynHost Operational (Oper)
Scope	Application
Description	*Vr/<string> Ip Arp DynHostEntry/<Ip Address>* *Router/<string> Arp DynHostEntry/<Ip Address>* *Router/<string> Vrf/<string> DynHostEntry/<Ip Address>* This component is a table that contains all Arp host entries (both static and dynamic). Each IP ARP entry in the table is uniquely defined by its IP address and connection class (cos) value. For *Vr*, when associated *mediaType* under *IpPort* is ***frameRelay***, ***atmMpeLIcEncap,*** and ***atmMpeVcEncap***, the connection class value of the arp entry is ***0, 1, 2,*** or ***3*** . For all other media, the connection class value is ***notApplicable*** (not specified on a per virtual circuit basis).

Copyright © 2006, Nortel Nortel Confidential

For *Router* or *Vrf*, when the media associated with the interface is *atmMpe* or *IpoDlci*, the connection class value of the arp entry is ***0, 1, 2,*** or ***3***. For all other media, the connection class value is ***notApplicable*** (not specified on a per virtual circuit basis).

An IP packet that has been assigned a particular connection class value will be forwarded using the arp entry which corresponds to the next hop gateway IP address and matching connection class value where the next hop gateway IP address is determined via a forwarding table look up on the packet's destination IP address. When there are arp entries that match the next hop gateway IP address, but not the packet's connection class, then the packet will be forwarded using the arp entry that has the next lowest connection class value; failing this, the packet will be forwarded using the arp entry that has the next highest connection class value.

VERB Clear Vr Ip Arp DynHost

Impact: Passive

Description:

Clear [-inverse] Vr/<string> Ip Arp DynHostEntry/<Ip Address>
Clear [-inverse] Router/<string> Arp DynHostEntry/<Ip Address>
Clear [-inverse] Router/<string> Vrf/<string> Arp DynHostEntry/<Ip Address>

The *Clear* verb is used to delete the single dynamically learned ARP entry that is represented by this component.

The *Clear* command does not affect static ARP host entries, that is, entries whose *type* attribute has the value ***static***. These entries can be removed by deleting the corresponding provisioned *HostEntry* component under *Arp*.

The *-inverse* option deletes the ARP entry even if it was an inverse ARP entry. Inverse ARP entries are learned through inverse ARP (*FrDte* or *IpoDlci*) and inverse ATM ARP (*AtmMpe*), and should not be removed by the users accidentally. If the option is not present, an inverse ARP entry is not cleared.

GROUP Vr Ip Arp DynHost **Operational (Oper)**

Properties: Operational

Description: This group contains the operational attributes of the *DynHostEntry* component.

VERB Ping Vr Ip Icmp

Impact: Passive

Description:

Ping -ipAddr(Ip Address) [-srcAddr(Ip Address)]
[-netmask(Ip Address)] [-size(30..20000)] [-retry(0..9)]
[-traceRoute] [-continuous] [-dontFragment] [-noOp]
[-recordRoute(1..9)] [-timeStamp(1..4)]
[-looseSrcRoute(Ip Address...)][-strictSrcRoute(Ip Address...)]
[-cos(0..3)][-dscp(0..63)][-tos(0..FF)][-stop] Vr/<string> Ip Icmp

Ping -ipAddr(Ip Address) [-srcAddr(Ip Address)]
[-netmask(Ip Address)] [-size(30..20000)] [-retry(0..9)]
[-traceRoute] [-continuous] [-dontFragment] [-noOp]
[-recordRoute(1..9)] [-timeStamp(1..4)]
[-looseSrcRoute(Ip Address...)][-strictSrcRoute(Ip Address...)]
[-dscp(0..63)][-tos(0..FF)][-stop] Rtr/<string> Icmp

Ping -ipAddr(Ip Address) [-srcAddr(Ip Address)]
[-netmask(Ip Address)] [-size(30..20000)] [-retry(0..9)]
[-traceRoute] [-continuous] [-dontFragment] [-noOp]
[-recordRoute(1..9)] [-timeStamp(1..4)]
[-looseSrcRoute(Ip Address...)][-strictSrcRoute(Ip Address...)]
[-dscp(0..63)][-tos(0..FF)][-stop] Rtr/<string> Vrf/<string> Icmp

The *Ping* verb is intended for testing network connections at the IP level. The verb invokes ICMP to issue an echo request to the host specified by the *ipAddr* option and waits for its echo response.

If the *Ping* is successful, it outputs the following information:
- number of bytes received
- IP address of the responding host
- ICMP sequence number of the received packet
- elaspsed time from sending of the *Ping* to receiving of the response

The following options are supported:

-srcAddr is used to define the source IP address of the IP ICMP echo request packet. When not specified or specified as 0.0.0.0, the outgoing IP *Interface* or *LogicalIf* address is used as the source address.

-netmask when specified is used to define a range of IP host addresses to which echo requests are sent to (ping sweep). The netmask given must be contiguous. The *-retry* option is ignored if used together with this option. By default, the value is set to 255.255.255.255.

-*size* is used to define the size of the IP packet to be echoed including the IP and ICMP header. The default is 64 bytes. The maximum size is 4096.

-*retry* is used to define the number of times an echo request is resent if no echo reply is received. Default is 0.

Copyright © 2006, Nortel Nortel Confidential

-traceRoute is used to find the route the node would use to reach a particular destination IP address at the moment when the *Ping* command is executed with this option. The *-netmask*, *-size, -retry* and *-continuous* option are ignored if used together with this option. By default, the *traceRoute* option is not used.

-continuous causes ICMP to issue echo requests once per second to the host or hosts specified by the *-ipAddr* and the *-netmask* option. For every echo response ICMP receives, one line of output is printed. No output is produced if there is no response. The *-stop* option is used to stop ICMP from sending the echo requests. By default, the *-continuous* option is not used.

-dontFragment causes ICMP to set the Don't Fragment flag of the IP packet that carries the echo request. This is useful in determining path MTU. By default, the *dontFragment* option is not used.

-noOp causes a No Operation option to be inserted into the IP header of the packet that carries the echo request. By default, the *noOp* option is not used.

-recordRoute causes the route of the IP packet that carries the echo request to be recorded in the IP header. Up to 9 routes can be recorded. If the number of routes to record is not specified, 5 routes are recorded by default.

-timeStamp sets the Time Stamp option in the IP header of the packet that carries the echo request. The format used for the time stamps consists of both an IP Adress and a time field. The default number of time stamps is 3. A maximum of 4 time stamps can be recorded.

-looseSrcRoute is used to specify a loose set of routes for the packet carrying the echo request to go through along the path to the destination. Up to 9 routes can be specified.

-strictSrcRoute is used to specify a strict set of routes for the packet carrying the echo request to go through to get to the destination. Up to 9 routes can be specified.

-cos causes the echo request packet to be forwarded with the given Class Of Service. Default is 0. This option is not supported on a Router component, a VpnRouteForwarder component, nor on a VirtualRouter component that has a DifferentiatedServicesDomain subcomponent.

-dscp causes the six most significant bits of Type Of Service (TOS) byte of the echo request packet to be set to the given value. These six bits are know as the Differentiated Services Code Point (DSCP). Default is 0. This option cannot be used together with the *-tos* option.

Copyright © 2006, Nortel Nortel Confidential

-tos causes the Type Of Service (TOS) byte of the echo request packet to be set to the given value. Default is 0. This option cannot be used together with the *-dscp* option.

-stop is used to stop ICMP from sending echo requests due to a previously issued *Ping* command with the *-continuous* and/or *-netmask* option. Under any other situation, the *Ping* command with the *-stop* option has no effect.

Note: Only one *Ping* command per *VirtualRouter* or *Router* or *Router Vrf* is allowed to be in progress at any one time. Any in progress *Ping* command must be stopped before a new *Ping* command can be issued.

COMPONENT Vr Ip **BootpRelayAgent (Bootp)**

Groups	GROUP Vr Ip Bootp AdministrativeControl (AdminControl) GROUP Vr Ip Bootp Provisioned (Prov) GROUP Vr Ip Bootp OsiState (State) GROUP Vr Ip Bootp OperationalStatus (OperStatus)
Scope	Application
Description	*Vr/<string> Ip BootpRelayAgent* *Rtr/<string> BootpRelayAgent* *Rtr/<string> Vrf<string> BootpRelayAgent* The *BootpRelayAgent* component contains all the necessary attributes and components to provision a BOOTP relay agent. The BOOTP relay agent functionality conforms to that described in RFCs 951 and 1542. The purpose of the BOOTP relay agent is to forward BOOTP request packets from a client to a server, and also to deliver server BOOTP replies back to the client. When a BOOTP request is received on a port, the request will be sent to a provisioned list of IP addresses for that port. In

Copyright © 2006, Nortel Nortel Confidential

addition, the request will be broadcast out all other BOOTP ports which allow it.

ATTRIBUTE Vr Ip Tunnel optimization (opt)

Access	Read and write
Description	This attribute specifies whether tunnel optimization is enabled for the *Msep* subcomponents of this *Tunnel* instance. Tunnel optimization is not performed for any of the *Msep* subcomponents if either of the following is true: - The *VirtualRouter* has *ProtocolPort* components that are linked to components representing physical media on more than one access card. This includes the case when one of the cards is a standby card, or when the physical media is linked to a SONET or SDH port which is protected by

Copyright © 2006, Nortel Nortel Confidential

inter-card APS. This also includes if *AtmMultiprotocolEncapsulation SpvcTerminationPoint* is used and the *AtmConnection* components resides on more than one access card.

- The *VirtualMedia Interface* component corresponding to any of the *Msep* subcomponent of this *Tunnel* instance has its *mode* attribute set to a value other than ***alwaysUpSummaryInterface***.

This attribute must be set to ***disabled*** if the *VirtualRouter* has a *ProtocolPort* which is linked to an *AtmMpe* component whose *encapType* attribute is set to ***llcBridgeEncap***.

Mib	Ip
Values	disabled enabled
Default	disabled

COMPONENT Vr Ip Tunnel StaticEndPoint (Sep)

Instance	Decimal (0..63)
Groups	GROUP Vr Ip Tunnel Sep IfEntryProv (IfEntry) GROUP Vr Ip Tunnel Sep MediaProv (Mp) GROUP Vr Ip Tunnel Sep Provisioned (Prov) GROUP Vr Ip Tunnel Sep Operational (Oper)
Scope	Application
Description	*Vr/<string> Ip Tunnel StaticEndPoint/n* An IP tunnel allows two geographically separated networks to be connected over a shared IP network (for example the Internet), either because the networks at the end points are using private IP address or they are not running IP as the network protocol. This component represents a static IP Tunnel End Point. It is static in the sense that both the tunnel source and destination IP addresses are static configured. For proper operation of the tunnel, the exact source and destination IP addresses (in reverse order) must be used to provision the Tunnel End Point on the far end router. Two types of IP tunnel encapsulation are supported: IP in IP as specified in RFC 2003 and Generic Routing Encapsulation as specified in RFC 1701. Note: IP in IP tunnel encapsulation is not compliant with RFC 2003

GROUP Vr Ip Tunnel Sep Operational (Oper)

Properties	Operational
Description	This group contains the operational status attributes of the *StaticEndPoint* component.
Mib	Ip

ATTRIBUTE Vr Ip Tunnel Sep discoveredPathMtu (dmtu)

Access	Read only
Description	This attribute indicates the latest learned Path MTU of the tunnel. An MTU is the maximum transmission unit of an arbitrary internet path. When a large amount of IP datagrams are to be transmitted, it is usually preferable that the datagrams be of the largest size that does not require fragmentation anywhere along the path from the source to the destination. This datagram size is referred to as the Path MTU (PMTU). It is equal to the minimum of the MTUs of each hop in the path.
Mib	Ip

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0; 100..18944)
Default	0

COMPONENT Vr Ip Tunnel MultipointStaticEndPoint (Msep)

Instance	Decimal (0..1)
Groups	GROUP Vr Ip Tunnel Msep IfEntryProv (IfEntry) GROUP Vr Ip Tunnel Msep MediaProv (Mp) GROUP Vr Ip Tunnel Msep Provisioned (Prov) GROUP Vr Ip Tunnel Msep Operational (Oper) GROUP Vr Ip Tunnel Msep DestinationDiscovery (DstDisovery)
Scope	Application
Description	*Vr/<string> Ip Tunnel MultipointStaticEndPoint/n* An IP tunnel allows more than one geographically separated networks to be connected over a shared IP network (for example the Internet) because the networks at the end points are using private IP address. This component represents a static IP Tunnel End Point of a point-to-multipoint IP Tunneling configuration. It is static in the sense that both the tunnel source address and the list of destination IP addresses are statically configured. Only one type of IP tunnel encapsulation is supported: IP in IP as specified in RFC 2003. Note: IP in IP tunnel encapsulation is not compliant with RFC 2003 when using an ATM IP FP as a backbone FP.
Mib	Ip
Common Verbs	Help List Display Add DELete

GROUP Vr Ip Tunnel Msep IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	Ip

ATTRIBUTE Vr Ip Tunnel Msep ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.

Copyright © 2006, Nortel Nortel Confidential

Mib	Ip
Values	up down testing
Default	up

ATTRIBUTE Vr Ip Tunnel Msep ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	Ip
Values	Decimal (1..65535)
Default	No default

GROUP Vr Ip Tunnel Msep MediaProv (Mp)

Properties	Provisioned
Description	This group contains the base provisioning data for the media base component.
Mib	Ip

ATTRIBUTE Vr Ip Tunnel Msep linkToProtocolPort (pp)

Access	Read and write
Criticality	Component
Description	This attribute specifies the *ProtocolPort* to which this interface is linked to. The protocol port is the logical interface to the network. The protocol port component describes the logical characteristics of this interface.
Mib	Ip
Values	Link (Service, linkToMedia)
Default	No default

GROUP Vr Ip Tunnel Msep Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the *MultipointStaticEndPoint* component.
Mib	Ip

ATTRIBUTE Vr Ip Tunnel Msep pathMtu (mtu)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the Path Maximum Transmission Unit (PMTU) of the IP Tunnel. If this attribute is set to discovered, the lowest PMTU value for all tunnel endpoints will be discovered and used to forward IP datagrams. Otherwise, if this attribute is set to an actual value, the value must be less or equal to the PMTU of all tunnel endpoints. IP fragmentation will occur for IP datagrams larger than PMTU.
Mib	Ip
Values	Decimal (100..18944) discovered
Default	9180

ATTRIBUTE Vr Ip Tunnel Msep encapType

Access	Read and write
Description	This component only supports one type of encapsulation technique for IP tunnel: IP in IP (RFC 2003). ***ipInIp***: As defined in RFC 2003, it can be used to encapsulated IP and IP payload only. Note: IP in IP tunnel encapsulation is not compliant with RFC 2003 when using an ATM IP FP as a backbone FP.
Mib	Ip
Values	ipInIp
Default	ipInIp

ATTRIBUTE Vr Ip Tunnel Msep sharedDomainVirtualRouter (sdvr)

Access	Read and write
Criticality	Component
Description	This attribute specifies the virtual router at the source endpoint of the IP tunnel. The value must specify a *VirtualRouter* component whose *vpnMode* attribute is set to ***carrier***.
Mib	Ip
Values	The name of the component
Default	No default

ATTRIBUTE Vr Ip Tunnel Msep sourceAddress (src)

Access	Read and write
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the IP address of the local end of the IP tunnel in the shared domain. There must be a logical interface with this IP address under the virtual router instance specified in the *sharedDomainVirtualRouter* attribute. This interface IP address cannot be an IP address defined under this IP tunnel protocol port. The *sourceAddress* of *StaticEndPoint* or *MultipointStaticEndPoint* components within the same *sharedDomainVirtualRouter* must be unique.
Mib	Ip
Values	IP address
Default	0.0.0.0

ATTRIBUTE Vr Ip Tunnel Msep autoDiscovery (disc)

Access	Read and write
Description	This attribute specifies whether the IP VPN auto discovery feature is enabled or disabled on this MSEP instance. If the value is ***enabled*** the MSEP instance exchanges the tunnel source and destination addresses with the BGP-4 instance configured on the same customer VR.
Mib	Ip
Values	disabled enabled
Default	disabled

ATTRIBUTE Vr Ip Tunnel Msep destinationAddresses (dst)

Access	Read and write
Description	This attribute specifies the list of IP addresses mapping to each of the far end IP tunnel endpoints in the private domain. It must not match any of the IP interface addresses on the Virtual Router pointed to by the *sharedDomainVirtualRouter* attribute.
Mib	Ip
List of	IP address
Default	No default

GROUP Vr Ip Tunnel Msep Operational (Oper)

Properties	Operational
Description	This group contains the operational status attributes of the *StaticEndPoint* component.
Mib	Ip

ATTRIBUTE Vr Ip Tunnel Msep discoveredPathMtu (dmtu)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the latest learned Path MTU of the tunnel. An MTU is the maximum transmission unit of an arbitrary internet path. When a large amount of IP datagrams are to be transmitted, it is usually preferable that the datagrams be of the largest size that does not require fragmentation anywhere along the path from the source to the destination. This datagram size is referred to as the Path MTU (PMTU). It is equal to the minimum of the MTUs of each hop in the path.

Description	This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component.
Mib	IpNhrp

ATTRIBUTE Vr Ip Nhrp snmpAdminStatus

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed.
Mib	IpNhrp
Values	up down testing
Default	up

GROUP Vr Ip Nhrp Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes of the *Nhrp* component.
Mib	IpNhrp

ATTRIBUTE Vr Ip Nhrp maxResCacheEntries

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the maximum number of *ResCacheEntry* components which may exist under the *Nhrp* component at any one time. Reducing the value of this attribute will not clear existing entries.
Mib	IpNhrp
Values	Decimal (32..1024)
Default	512

ATTRIBUTE Vr Ip Nhrp fwdTransitRecord (ftr)

Access	Read and write
Description	This attribute specifies whether to attach a forward transit record extension to NHRP packets (Resolution and Purge requests) that originate from this node. This extension along with NHRP debug tracing set to “verbose” can be used in tracing the path the NHRP packet takes from source to destination.
Mib	IpNhrp
Values	enabled disabled
Default	disabled

ATTRIBUTE Vr Ip Nhrp revTransitRecord (rtr)

Access	Read and write
Description	This attribute specifies whether to attach a reverse transit record extension to Resolution Request packets that originate from this node. This extension along with NHRP debug tracing set to “verbose” can be used in tracing the path the NHRP packet takes from destination to source.
Mib	IpNhrp
Values	enabled disabled
Default	disabled

GROUP Vr Ip Nhrp OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	IpNhrp

ATTRIBUTE Vr Ip Nhrp adminState (osiAdmin)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	IpNhrp
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Vr Ip Nhrp operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	IpNhrp
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Vr Ip Nhrp usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use.

Copyright © 2006, Nortel Nortel Confidential

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

COMPONENT Vr Ip CosPolicyGroup (Pg)

Instance	String (1..20, ASCII)
Groups	GROUP Vr Ip Pg Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip CosPolicyGroup/<string>* This component and its subcomponents specify the IP Class of Service (CoS) capabilities of an *IpPort*. Up to four different forwarding and packet marking behaviors can be configured. For a greater range of forwarding and packet marking behaviors, the Differentiated Services capabilities of the *Vr DifferentiatedServicesDomain* and *Vr Ip DiffServProfile* components

Copyright © 2006, Nortel Nortel Confidential

is used. See the descriptions of those components for more information.

A *CosPolicyGroup* component is used by all *IpPort* subcomponents of a *VirtualRouter* by setting the *cosPolicyAssignment* attribute of the *Ip* component. It is used by one or more *IpPort* subcomponents directly by setting the *cosPolicyAssignment* attribute of the *IpPort*. The direct assignment to the *IpPort* completely overrides the assignment to the *Ip*.

Processing of IP packets with *CosPolicyGroup* components is based on a Class Of Service (CoS) value assigned to each IP packet as it processed by the *VirtualRouter*. CoS values vary over the range from 0 to 3 and have local significance only.

There are six logical stages in CoS processing on the *VirtualRouter.* These six stages are presented below, along with the behavior of locally generated packets, and the behavior of any *IpPort* that does not use a *CosPolicyGroup*, and exceptions for MS3 cards.

1. INGRESS CLASSIFICATION AND CoS ASSIGNMENT

The Class Of Service (CoS) value assigned to an IP packet is initialized to be equal to the connection class value associated with the ingress Layer 2 connection where the packet was received.

For *AtmMpe*, the connection class is specified by the *ipCos* attribute of the *AtmConnection* subcomponent. For *FrDte*, the connection class is specified by the *ipCoS* attribute of the *StaticDlci* or *DynamicDlciDef* subcomponent. For *IpDlciGroup*, the connection class is specified by the *ipCos* attribute of the *FrConnection* subcomponent. For all other media, the connection class is specified by the *ipCoS* attribute of the *IpPort.*

After classification is performed as described above, if one or more *TosMap* components exist under a *Policy* subcomponent of the *CosPolicyGroup* used by the *IpPort* where the packet was received, then the Class Of Service (CoS) assigned to the packet is updated according to these components if there is a match. A match occurs if selected bits of the Differentiated Services (DS) field, also known at the Type of Service (ToS) field, are equal to the same selected bits of one of the values specified by the *tos* attribute of a *TosMap* subcomponent of the *CosPolicyGroup* used by the *IpPort* where the packet was received. If a match occurs, then the CoS value assigned to the packet is set equal to the value of the *assignedCos* attribute of the parent *Policy* of the *TosMap* where the match occurred.

If one or more *IpAddrLayer4Flow* subcomponents exist under a *Policy* subcomponent of the *CosPolicyGroup* used by the *IpPort* where the packet was received, then the Class Of Service (CoS) assigned to the packet is updated according to these components if there is a match. This overrides any prior CoS assignment.

Copyright © 2006, Nortel Nortel Confidential

2. DROP PRECEDENCE ASSIGNMENT

The packet is assigned a logical drop precedence value according to the *IngressCosTreatment* subcomponents of the *CosPolicyGroup* used by the *IpPort* where the packet was received. The drop precedence is obtained from *discardPriority* attribute of the *IngressCosTreatment* component whose instance value matches the Class Of Service (CoS) value currently assigned to the packet. If the selected *IngressCosTreatment discardPriority* attribute specifies ***low***, ***medium***, or ***high***, then a drop precedence is assigned accordingly. If the selected *IngressCosTreatment* specifies ***unchanged***, then the drop precedence assigned to the packet is not modified.

A drop precedence is assigned to a packet to control its loss sensitivity relative to other packets when the packets are placed into the same queue, as explained in Step 6.

Generally, the ***low*** value indicates the packet is less likely to be discarded when the queue is congested. This traffic has a higher probability of being forwarded. The ***high*** value indicates the packet is more likely to be discarded when the queue is congested. This traffic has a lower probability of being forwarded. The actual loss sensitivity of packets depends on the discarding mechanism at the queue.

3. SCHEDULING CLASS ASSIGNMENT

The packet is assigned a scheduling class value for eight, four, three, and two queues in the range from 0 to 7, 0 to 3, 0 to 2, and 0 to 1, respectively. These values are derived from the *emissionPriority* attribute of the *EgressCosTreatment* subcomponents of the *CosPolicyGroup* used by the *IpPort* where the packet is transmitted. The *emissionPriority* attribute of the *EgressCosTreatment* subcomponent whose instance value matches the Class Of Service (CoS) value assigned to the packet is used.

The *emissionPriority* attribute of the *EgressCosTreatment* component is mapped to scheduling classes according to the following table:

Emission	Scheduling Class			
Priority	8 Queues	4Queues	3Queues	2 Queues
1	5	3	2	1
2	4	2	1	0
3	2	1	0	0
4	0	0	0	0
5	0	0	0	0
6	0	0	0	0
7	0	0	0	0
8	0	0	0	0

Copyright © 2006, Nortel
Nortel Confidential

Scheduling classes are assigned to a packet to control its scheduling behavior relative to other packets at the egress interface where the packets are transmitted, as explained in Step 6.

Generally, a numerically higher value of scheduling class (lower value of emission priority) indicates the packet is less likely to be delayed. This traffic is considered more urgent and less delay tolerant. A numerically lower value of scheduling class (higher value of emission priority) indicates the packet is more likely to be delayed. This traffic is considered less urgent and more delay tolerant. The actual scheduling behavior of packets depends on the scheduling mechanism and number of queues at the egress interface.

4. EGRESS DSCP MARKING

The DSCP field of the packet is marked according to the *EgressCosTreatment* subcomponents of the *CosPolicyGroup* used by the *IpPort* where the packet is transmitted. The DSCP value is obtained from *tos* attribute of the *EgressCosTreatment* component whose instance value matches the Class Of Service (CoS) value currently assigned to the packet. The new value of the DSCP field does not influence the forwarding behavior of the packet as it continues to be processed by the *VirtualRouter*, but it may have significance at the next hop.

5. MULTI-CONNECTION CONGESTION CONTROL

The CoS assigned to the packet is used to select one of up to four Layer 2 connections at the *IpPort* where the packet is transmitted. Per-packet selection of egress connections is supported only if these conditions are all true:

i) the egress media is *FrDte*, *AtmMpe*, *IpDlciGroup*, and
ii) more than one Layer 2 connection is configured to the next hop IP router, and
iii) each connection is provisioned with a different connection class.

Normally the packet is transmitted on the connection whose connection class is equal to the CoS assigned to the packet. If that connection does not exist, then the connection having the next lower connection class is used. If that connection does not exist also, then the connection having the next higher connection class is used.

For *AtmMpe* the connection class is specified by the *ipCos* attribute of the *AtmConnection* subcomponent. For *FrDte* the connection class is specified by the *ipCoS* attribute of the *StaticDlci* and *DynamicDlciDef* subcomponents. For *IpDlciGroup* the connection class is specified by the *ipCos* attribute of the *FrConnection* subcomponent.

If each Layer 2 connection is configured to provide different policing and scheduling characteristics, then the forwarding behaviors of IP packets are

Copyright © 2006, Nortel Nortel Confidential

differentiated as they transit through the Layer 2 network. In general, the scheduling characteristics of the connections should be configured to be better for numerically greater connection class values. For example, if four *AtmConnection* components are associated with *AtmIf* components configured for ATM service classes ***UBR***, ***nrtVBR***, ***rtVBR***, and ***CBR***, then the *ipCos* attributes of the *AtmConnection* components should be either ***0***, ***1***, ***2*** and ***3***, respectively, or ***0***, ***1***, ***3*** and ***2*** respectively.

6. SINGLE-CONNECTION CONGESTION CONTROL

The drop precedence and scheduling classes assigned to the packet are used by the egress interface where the packet is transmitted, but only if the egress interface supports these parameters on a per-connection basis.

Multiple drop precedences are supported on GQM cards at *AtmMpe* interfaces. On FQM interfaces they are supported at Gigabit Ethernet interfaces. On PQC cards with AQM they are supported at *AtmMpe*, *FrDte*, *IpDlciGroup*, and Ethernet interfaces. On PQC cards with APC the drop precedence of a packet is controlled by the outgoing ATM CLP or Frame Relay DE bit which is determined by by the drop precedence of the PHB and the Layer 2 configuration. On CQC cards multiple drop precedences are supported at *AtmMpe* interfaces. On SBIC cards they are supported at PPP and *FrDte* interfaces.

Eight queues per connection are supported on FQM cards at Gigabit ethernet interfaces. Four queues per connection are supported on PQC cards at PPP interfaces, at *FrDte* interfaces provisioned with *DirectConnection*, and at *IpDlciGroup* and *IpoDlci* interfaces where FRF.12 is disabled on the DLCI. Two queues per connection are supported on SBIC cards at PPP and *FrDte* interfaces.

Only one queue per connection is supported on ATM interfaces. This implies that multi-connection congestion control must be used to provide sheduling differentiation at ATM interfaces.

LOCALLY GENERATED PACKETS

Ingress classification is not performed on packets generated locally at the *VirtualRouter*. For a locally generated packet that used for network control the assigned Class Of Service (CoS) value and the assigned drop precedence, is initialized to ***3*** and ***low*** respectively. For any other locally generated packet, these values are initialized to ***0*** and ***medium*** respectively.

For a locally generated ICMP echo request packet, the assigned CoS is overridden by the *-cos* option of the *Ping* command. For a locally generated ICMP echo reply packet, the assigned CoS is set equal to the assigned CoS of the received request packet.

Copyright © 2006, Nortel Nortel Confidential

The DSCP field of locally generated packets that used for network control is always initialized to 48. The DSCP field of other packets is always initialized to 0. For a locally generated ICMP echo request packet, the initial value of the DSCP field is overridden by the *-tos* or *-dscp* option of the *Ping* command. For a locally generated ICMP echo reply packet, the DSCP field is set to the value contained in the IP header of the received request packet.

Locally generated IP multicast and IP broadcast packets are not subject to Multi-Connection Congestion Control as described above. Each of these packets is copied and transmitted individually on each of the available connections.

DEFAULT BEHAVIOR

The IP CoS behavior of any *IpPort* that does not use a *CosPolicyGroup* (by setting the *cosPolicyAssignment* attribute of the *Ip* or *IpPort* as explained above) is identical to an *IpPort* that uses the *CosPolicyGroup* described here: There are no *Policy* subcomponents. There are four *IngressCosTreatment* subcomponents with instance values ***0***, ***1***, ***2***, ***3*** where the *discardPriority* attribute of each instance is set to ***unchanged***. There are four *EgressCosTreatment* subcomponents with instance values ***0***, ***1***, ***2***, ***3*** where the *emissionPriority*, *setTosByte*, *tos*, and *tosMask* attributes of each instance are set to ***4***, ***no***, ***0***, and hexadecimal ***FC***, respectively.

EXCEPTIONS FOR GQM-BASED and FQM_BASED CARDS

The use of the *CosPolicyGroup* component at interfaces on a *VirtualRouter* that does not have a *DifferentiatedServicesDomain* subcomponent also applies as described above to Gigabit Ethernet on FQM-based cards and *AtmMpe* interfaces on GQM-based cards, with the following six exceptions:
1) The *TosMap* and *IpAddrLayer4Flow* components are always ignored at an ingress interface on one of these cards.
2) An IP packet received on a Gigabit Ethernet interface is always assigned ***high*** drop precedence.
3) An IP packet received on a ATM interface on one of these cards is always assigned ***unchanged*** drop precedence.
4) An IP packet received at an ingress interface on one of these cards is always assigned scheduling class 0.
5) An IP packet transmitted at egress Gigabit Ethernet interface is always assigned scheduling class ***0***.
6) An IP packet received at an ingress interface on one of these cards is

Copyright © 2006, Nortel Nortel Confidential

is not eligible for egress DSCP marking at any interface.

The *Policy* component defines IP packet classification rules that are applied when the *CosPolicyGroup* is used by an *IpPort*. The classification rules are defined by two sets of parameters:

1. The criteria to select IP packets. These criteria are defined by the *TosMap* and *IpAddrLayer4Flow* subcomponents.

2. The IP Class of Service (CoS) assigned to a packet when the policy is applied. The CoS is specified by the *assignedCos* attribute.

The component instance is an arbitrary text string to allow the operator to assign a meaningful name for easy reference.

Description	*Vr/<string> Ip Pg/<string> Policy/<string> TosMap*

Copyright © 2006, Nortel Nortel Confidential

This component is used to specify Behavior Aggregate (BA) criteria for assigning Class of Service (CoS) values to IP packets.

An IP packet matches the criteria specified by this component if the Differentiated Services (DS) field in the packet header (also known as the ToS field) and any element in the list of values specified by the *tos* attribute of this component satisfies the following equation:

(DS field & *tosMask*) = (element & *tosMask*)

This formula states that the two values must be identical after each one is individually bit-wise ANDed with the value of *tosMask* attribute of the *EgressCosTreatment* component. In other words, the two values must be identical but only those bits that are set to 1 in the *tosMask* are inspected.

For example, to assign Class of Service (CoS) value 3 to IP packets that have the DSCP field marked for Expedited Forwarding (EF) when the *tosMask* is set to ***FC***, a *TosMap* subcomponent is added to the *Policy* component whose *assignedCos* attribute is set to ***3***, and the *tos* attribute of the *TosMap* is set to include hexadecimal value ***B8***.

See the description of the *CosPolicyGroup* component for more information.

Instance	Decimal (0..1023)
Groups	GROUP Vr Ip Pg Policy IpAddrLayer4Flow Provisioned (Prov) GROUP Vr Ip Pg Policy IpAddrLayer4Flow ProtoProvisioned GROUP Vr Ip Pg Policy IpAddrLayer4Flow Operational (Oper)
Scope	Application
Description	*Vr/<string> Ip Pg/<string> Policy/<string> IpAddrLayer4Flow/n* The *IpAddrLayer4Flow* component is used to specify Multifield (MF) criteria for assigning Class of Service (CoS) values to IP packets. The IP packet is checked to see if it matches the criteria specified by each *IpAddrLayer4Flow* component, if any, under the *CosPolicyGroup* component. The CoS assigned to the packet is the value of the *assignedCos* attribute on the parent *Policy* component of the *IpAddrLayer4Flow* whose criteria best match the packet. For example, to assign Class of Service (CoS) value 1 to FTP packets destined to subnet 123.123.123.0, an *IpAddrLayer4Flow* subcomponent is added to the *Policy* component where the *assignedCos* attribute is set to ***1***. The *prefix, prefixLength, protocol,* and *portNumberRange* attributes of the *IpAddrLayer4Flow* component are set to ***123.123.123.0***, ***24***, ***tcp***, and

Copyright © 2006, Nortel Nortel Confidential

20, ***21***, respectively. This criteria also applies to each FTP packet that originates from subnet 123.123.123.0, but only if the source address and port number of the packet do not match any *IpAddrLayer4Flow* subcomponents of the *CosPolicyGroup.*

Multifield classification overrides Behavior Aggregate (BA) classification. This means that BA classification, which is controlled by *TosMap* components, is performed only if the packet does not match any *IpAddrLayer4Flow* component.

The packet matching algorithm for MF classification is explained in more detail as follows.

A match can be found only if the IP header protocol field is one of ICMP, TCP, or UDP. The *prefix*, *prefixLength*, and *portNumberRange* attributes are checked only if the protocol field in the header is TCP or UDP.

The destination IP address and destination port number information from the packet is first compared against the *prefix* attribute in conjunction with the *prefixLength* and *portNumberRange* attributes. If the *prefixLength* is ***0*** and the *prefix* is ***0.0.0.0***, then any value in the packet's IP destination address fields is a match. If *portNumberRange* is ***0***, then any value in the packet's destination port number fields is a match.

If more than one *IpAddrLayer4Flow* component matches a packet (for instance one component specifies a range of IP addresses and a second specifies a single IP address in the range), then the component with the more precise match is used (the one which specifies the single address in this case). Precedence is always given to the IP address over the port number. For example, if one *IpAddrLayer4Flow* component specifies an range of IP addresses that includes the IP address from the packet and any port number, while a second *IpAddrLayer4Flow* component specifies an exact port number but a wider range of addresses, the first *IpAddrLayer4Flow* component is used.

If no match is found using the packet's destination IP address and destination port number information, then a second search is performed using the packet's source IP address and source port number information. This means that an *IpAddrLayer4Flow* component where the *protocol* is ***udp*** or ***tcp***, the *prefixLength* is ***0*** and the *portNumberRange* is ***0***, always matches some destination address and port number. This prevents the source address and port number check from being performed.

An ICMP packet matches any *IpAddrLayer4Flow* component whose *protocol* attribute is set to ***icmp***.

No attempt is made to match any packets where the options or fragment bits are set.

COMPONENT Vr Ip Pg IngressCosTreatment (Ict)

Instance	Decimal (0..3)
Groups	GROUP Vr Ip Pg Ict Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Pg/<string> IngressCosTreatment/n* A set of *IngressCosTreatment* components specifies a mapping between Class of Service (CoS) values and drop precedence values for controlling forwarding behaviors. This mapping is applied to packets received at any *IpPort* that uses the *CosPolicyGroup*. See the description of the *CosPolicyGroup* for more information. Four instances of this component, with instance values *0*, *1*, *2*, and *3*, are created automatically when the *CosPolicyGroup* component is added.
Mib	IpCos
Common Verbs	Help List Display Add

GROUP Vr Ip Pg Ict Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioned attributes of the *IngressCosTreatment* component.
Mib	IpCos

ATTRIBUTE Vr Ip Pg Ict discardPriority (dp)

Access	Read and write
Description	This attribute specifies the drop precedence assigned to an IP packet when the Class of Service (CoS) assigned to the packet is equal to the instance value of the *IngressCosTreatment* component. Attribute values ***low***, ***medium***, and ***high*** indicate the packet is assigned drop precedence accordingly. A value of ***unchanged*** indicates the drop precedence assigned to the packet is not modified. It remains at the value provided by the ingress connection. A drop precedence is assigned to a packet to control its loss sensitivity

Copyright © 2006, Nortel Nortel Confidential

relative to other packets when the packets are placed into the same queue. Generally, the ***low*** value indicates the packet is less likely to be discarded when the queue is congested. This traffic has a higher probability of being forwarded. The ***high*** value indicates the packet is more likely to be discarded when the queue is congested. This traffic has a lower probability of being forwarded. The actual loss sensitivity of packets depends on the discarding mechanism at the queue.

A warning is issued if the *discardPriority* attribute of one or more, but not all, of the *IngressCosTreatment* subcomponents the *CosPolicyGroup* is set to ***unchanged***.

Another warning is issued if the *discardPriority* attribute of two *IngressCosTreatment* subcomponents with the same instance value under any two *CosPolicyGroup* subcomponents of the *Vr Ip* are not equal. This applies only to those *IngressCosTreatment* subcomponents where the *discardPriority* attribute is not set to ***unchanged***. If this rule is violated, then the Class of Service (CoS) to drop precedence mapping will not be consistent at all *IpPorts* on the *Vr*.

See the description of the *CosPolicyGroup* for more information.

Mib	IpCos
Values	unchanged low medium high
Default	unchanged

COMPONENT Vr Ip Pg EgressCosTreatment (Ect)

Instance	Decimal (0..3)
Groups	GROUP Vr Ip Pg Ect Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Pg/<string> EgressCosTreatment/n*

A set of *EgressCosTreatment* components specifies two mappings. One is a mapping between Class of Service (CoS) values and logical scheduling class values for controlling forwarding behaviors. The other is a mapping between Class of Service (CoS) values and Differentiated Services Code Point (DSCP) values for egress marking. These mappings are applied to packets transmitted at any *IpPort* that uses the parent *CosPolicyGroup*. See the description of the *CosPolicyGroup* for more information.

Copyright © 2006, Nortel Nortel Confidential

Four instances of this component, with instance values *0*, *1*, *2*, and *3*, are created automatically when the *CosPolicyGroup* component is added.

Mib — IpCos

Common Verbs — Help, List, Display, Add

GROUP Vr Ip Pg Ect Provisioned (Prov)

Properties — Provisioned

Description — This group contains the provisioned attributes of the *EgressCosTreatment* component.

Mib — IpCos

ATTRIBUTE Vr Ip Pg Ect setTosByte

Access — Read and write

Description — This attribute specifies whether the DSCP field of the packet should be marked at egress. If this attribute is set to ***yes*** and then the DSCP field is marked according to the values of the *tos* and *tosMask* attributes of the *EgressCosTreatment* component whose instance value is equal to the Class of Service (CoS) assigned to the packet.

A warning is issued if not all *EgressCosTreatment* subcomponents of the *CosPolicyGroup* have this attribute set to the same value.

Mib — IpCos

Values — no, yes

Default — no

ATTRIBUTE Vr Ip Pg Ect tos

Access — Read and write

Description — This attribute specifies the value used to mark the DSCP field of an IP packet at egress. This marking occurs only if the Class of Service (CoS) assigned to the packet is equal to the instance value of the *EgressCosTreatment* component and the *setTosByte* attribute is set to ***yes***.

Selected bits of the Differentiated Services (DS) field in IP packet header (also known as the ToS field) are updated according to the values of the *tos* and *tosMask* attributes using the following formula:

New value = (Original value & ~*tosMask*) | (*tos* & *tosMask*)

Copyright © 2006, Nortel Nortel Confidential

This formula states that the bits of the DS field which are modified are only those which are set to 1 in the *tosMask* attribute value. Of those bits, the bits that are set to 1 are only those which are set to 1 in the *tos* attribute value; the others being modified are set to 0.

For example, to mark the DSCP field for Expedited Forwarding (EF):

original value: hex A0 (binary 10100000) CS5
tos attribute: hex B8 (binary 10111000)
tosMask attribute: hex FC (binary 11111100)
new value: hex B8 (binary 10111000) EF

Mib — IpCos

Values — Hex (H.0..H.ff)

Default — H.0

ATTRIBUTE Vr Ip Pg Ect **tosMask**

Access — Read and write

Description — This attribute specifies the bit mask used to mark the DSCP field of an IP packet. This marking occurs only if the Class of Service (CoS) assigned to the packet is equal to the instance value of the *EgressCosTreatment* component and the *setTosByte* attribute is set to ***yes***. This attribute also specifies which bits are examined when *TosMap* components are used for IP packet classification.

By default, this attribute is set to the value of hex ***FC*** to correspond to the six bits of the Differentiated Services Code Point (DSCP) field.

The *tosMask* attribute in all *EgressCosTreatment* components under the same *CosPolicyGroup* must be set to the same value.

A warning is issued if *tosMask* is set to any value other than ***0xFC.*** On PQC cards, any other value is ignored; in other words, any setting is treated as ***0xFC*** to match the six bits of DSCP field in the IP header. On SBIC cards, including the ILS forwarder, ToS field mapping and marking of IP packets will not exactly match the six bits of the DSCP field.

See the description of the *tos* attribute of the *EgressCosTreatment* component for more information.

Mib — IpCos

Values — Hex (H.1..H.ff)

Default — H.fc

ATTRIBUTE Vr Ip Pg Ect **emissionPriority (ep)**

Access — Read and write

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute specifies the logical scheduling classes to be assigned to an IP packet when the Class of Service (CoS) assigned to the packet is equal to the instance value of the *IngressCosTreatment* component.

The *emissionPriority* attribute is mapped to scheduling classes according to the following table:

Emission *Priority*	Logical Scheduling Class 8 Queues	4Queues 3	2 Queues
1	5	3	1
2	4	2	0
3	2	1	0
4	0	0	0
5	0	0	0
6	0	0	0
7	0	0	0
8	0	0	0

Scheduling classes are assigned to a packet to control its scheduling behavior relative to other packets at the egress interface where the packets are transmitted.

Generally, a numerically higher value of scheduling class (lower value of emission priority) indicates the packet is less likely to be delayed. This traffic is considered more urgent and less delay tolerant. A numerically lower value of scheduling class (higher value of emission priority) indicates the packet is more likely to be delayed. This traffic is considered less urgent and more delay tolerant. The actual scheduling behavior of packets depends on the scheduling mechanism and number of queues at the egress interface.

A warning is issued if the *emissionPriority* attribute of two *EgressCosTreatment* subcomponents with the same instance value under any two *CosPolicyGroup* subcomponents of the *Vr Ip* are not equal. If this rule is violated, then the Class of Service (CoS) to *emissionPriority* mapping will not be consistent at all *IpPorts* on the *Vr*.

See the description of the *CosPolicyGroup* for more information.

Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Vr Ip Bgp defaultLocalPreference (locPrf)

Access	Read and write
Criticality	Component
Description	This attribute specifies this *Bgp* component instance's default degree of preference for routes. It can be overridden by the *localPreference* provisioned in *ImportPolicy*. A higher value indicates a more preferred route.
Mib	Bgp
Values	Decimal (0..4294967295)
Default	144

ATTRIBUTE Vr Ip Bgp defaultMultiExitDisc (med)

Access	Read and write
Criticality	Component
Description	This attribute specifies this *Bgp* component instance's default metric to discriminate between multiple exit points to the same adjacent autonomous system. It can be overridden by the s*endMultiExitDiscToEbgp* provisioned in *ExportPolicy*. A lower value indicates a more preferred route.
Mib	Bgp
Values	Decimal (0..4294967295)
Default	4294967294

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ip Bgp routeThrottleLimit (rtl)

Access	Read and write
Criticality	Component
Description	This attribute specifies the maximum number of routes in the IP forwarding table this *Bgp* component instance will process at one time to decide if a route in the IP forwarding table should be exported to a peer. This limit is used because the throttling requirements are different under different network configurations.
Mib	Bgp
Values	Decimal (1..1000)
Default	250

ATTRIBUTE Vr Ip Bgp routeThrottleInter (rti)

Access	Read and write
Criticality	Component
Description	This attribute specifies the interval between the processing of the routes in the IP forwarding table to decide if a route in the IP forwarding table should be exported to a peer. This interval is used because the throttling requirements is different under different network configurations.
Mib	Bgp
Values	Decimal (1..30)
Units	seconds
Default	5

ATTRIBUTE Vr Ip Bgp routeReflector (rr)

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this *Bgp* instance is a Route Reflector. If the value of this attribute is ***true***, *Bgp* redistributes routes it learns from an IBGP speaker to other IBGP speakers in the AS. The rule of redistribution depends on the peer type: 1) When a route is learned from a non-client peer, it is redistributed to all the client peers within the cluster. 2) When a route is learned from a client peer, it is redistributed to all the non-client peers and also to the client peers. If the value of this attribute is ***false***, *Bgp* does not redistribute routes it learns from one IBGP speaker to other IBGP speakers in the AS.
Mib	Bgp
Values	true false

Copyright © 2006, Nortel Nortel Confidential

Default	false

ATTRIBUTE Vr Ip Bgp routeReflectorCluster (rrCluster)

Access	Read and write
Criticality	Component
Description	This attribute identifies the cluster consisting of the Route Reflector and its peer clients. When *routeReflector* of *Bgp* is ***true***, value of 0.0.0.0 or 255.255.255.255 is invalid; the default value of this attribute is same as *bgpIdentifier*. For redundancy, a cluster may have more than one Route Reflector; in this case, the value of this attribute of all the Route Reflectors in the same cluster should be same. The value of this attribute is ignored when *routeReflector* of *Bgp* is ***false***
Mib	Bgp
Values	IP address
Default	No default

ATTRIBUTE Vr Ip Bgp redistributeIgpToIbgp (rigp)

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this *Bgp* instance allows exporting of IGP routes to internal Bgp peers. IGP routes include the routes learned from OSPF, RIP, local routes and static routes. If the value of this attribute is ***true***, and if *ExportPolicy* is specified to distribute, then *Bgp* allows IGP route to be distributed to internal Bgp peers. If the value of this attribute is ***false***, *Bgp* does not allow IGP routes to be distributed to internal *Bgp* peer, even if *ExportPolicy* is specified to distribute. This attribute is set to true if and only this Bgp is part of the Carrier Manage Service, otherwise, a routing loop may result.
Mib	Bgp
Values	true false
Default	false

ATTRIBUTE Vr Ip Bgp defaultIbgpRtePreference (ibgpPref)

Access	Read and write
Description	This attribute specifies this *Bgp* component instance's default routing preference for IBGP routes. It can be overridden by the *IbgpRtePreference* provisioned in *ImportPolicy*. A lower value indicates a more preferred route.
Mib	Bgp
Values	Decimal (1..253)

Copyright © 2006, Nortel Nortel Confidential

Default	122

ATTRIBUTE Vr Ip Bgp defaultEbgpRtePreference (ebgpPrf)

Access	Read and write
Description	This attribute specifies this *Bgp* component instance's default routing preference for EBGP routes. It can be overridden by the *ebgpRtePreference* provisioned in *ImportPolicy*. A lower value indicates a more preferred route.
Mib	Bgp
Values	Decimal (1..253)
Default	70

ATTRIBUTE Vr Ip Bgp vpnPeeringTopology (topology)

Access	Read and write
Description	Under the *Vr* component, this attribute specifies the peering mode that determines if a dynamic IBGP peer is to be instantiated between this *BGP* instance and a discovered IP Tunnel endpoint on the remote customer VR. This mode controls the distribution of IP routing information among VPN sites through dynamic BGP sessions after auto-discovery has taken place. A ***none*** value specifies that BGP never instantiate dynamic IBGP peers. Dynamic IBGP peer is instantiated between two customer VR in the same VPN if and only if at least one end is configured with a ***hub*** value and the other is either configured with a ***hub*** or a ***spoke*** value. In any case; static BGP peers may be configured and overwrite the dynamic ones after auto-discovery has taken place. If auto-discovery is enabled when static peers already present between VPN sites, no dynamic peers with the same provisioned peer instance will be instantiated regardless of the configured value of the attribute. Under the *Rtr* or *Rtr Vrf* component, this attribute is not used.
Mib	Bgp
Values	none hub spoke
Default	No default

ATTRIBUTE Vr Ip Bgp alarmGeneration (alarms)

Access	Read and write
Description	This attribute specifies the level of alarm generation for this *Bgp* instance. A value of ***all*** specifies that all BGP alarms are made visible.

Copyright © 2006, Nortel Nortel Confidential

A value of ***normal*** specifies that all BGP alarms are made visible, except for the following:
- *Bgp Peer* listening failure alarms,
- *Bgp Peer* connect failure alarms, and
- *Bgp* notification alarms.

Any listening failure or connect failure alarms which were previously set for a *Peer* component under this *Bgp* instance are cleared.

A value of ***none*** specifies that no BGP alarms are made visible. Any listening failure, connect failure, or “no auto discovery” alarms which were previously set for a *Peer* component under this *Bgp* instance are cleared.

Note that, because the listening failure, connect failure, and “no auto discovery” alarms are triggered by state changes in the *Peer* component, they are not automatically regenerated when previously disabled alarm generation is enabled. For example, consider the following:
- If the *Bgp alarmGeneration* attribute is set to ***all*** and a *Peer* enters a listening failure state, a listening failure alarm is set against that *Peer* subcomponent.
- If the *Bgp alarmGeneration* attribute is then set to ***normal*** or ***none***, the above listening failure alarm is cleared.
- If the *Bgp alarmGeneration* attribute is then set back to ***all***, no alarm is generated because the *Peer* subcomponent has not changed state.
- If the *Peer* then exits the listening failure state, a listening failure alarm clear is generated for the *Peer*, even though there is no alarm set for that component.

When the scope of alarm generation has been increased for a *Bgp* instance, previously existing alarms which had been suppressed can be regenerated by locking and unlocking the *Bgp Peer* subcomponents.

For a *VirtualRouter* with *vpnMode* attribute be set to ***carrier***, it is recommended that the *alarmGeneration* attribute be set to ***all***. For a *VirtualRouter* with the *vpnMode* attribute set to ***customer***, it is recommended that the *alarmGeneration* attribute be set to either ***normal*** or ***none***, for scalability reasons.

Similarly, for a *Router* component, it is recommended that the *alarmGeneration* attribute be set to ***all***. For a *Router Vrf* component, it is recommended that the *alarmGeneration* attribute be set to either ***normal*** or ***none***, for scalability reasons.

Mib	Bgp
Values	none normal all
Default	all

ATTRIBUTE Vr Ip Bgp keyTransitionDelay (keyDelay)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies a default delay period associated with a change of *md5Key* value event for the *Bgp* component. The *md5Key* is set under the *Bgp Peer Descriptor* component. This is the time that can elapse before the local router transitions to using the new key for transmission for all the Bgp Peer sessions' under this *Bgp* component. This time is not used to control when to accept the new key for reception, and the new key is immediately accepted for reception. This delay equates to the amount of time the operator has to provision both the local and remote ends with the new key, without losing service. This can be overridden by the *keyTransitionDelay* provisioned under the *Bgp Peer Descriptor* component.
Mib	Bgp
Values	Decimal (1..20160)

ATTRIBUTE Vr Ip Bgp adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Bgp
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Vr Ip Bgp operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or

Copyright © 2006, Nortel Nortel Confidential

	with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Bgp
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Vr Ip Bgp usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Bgp
Values	idle active (activ) busy
Default	idle

GROUP Vr Ip Bgp AdministrativeControl (AdminControl)

Properties	Provisioned
Description	This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component.
Mib	Bgp

ATTRIBUTE Vr Ip Bgp snmpAdminStatus

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed.
Mib	Bgp
Values	up down testing
Default	up

Copyright © 2006, Nortel Nortel Confidential

GROUP Vr Ip Bgp OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	Bgp

ATTRIBUTE Vr Ip Bgp snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	Bgp
Values	up down testing
Default	up

COMPONENT Vr Ip Bgp Peer

Instance	IP address
Groups	GROUP Vr Ip Bgp Peer OsiState (State) GROUP Vr Ip Bgp Peer Operational (Oper)
Scope	Application
Description	*Vr/<string> Ip Bgp Peer/<Ip Address>* *Rtr/<string> Bgp Peer/<Ip Address>* *Rtr/<string> Vrf/<string> Bgp Peer/<Ip Address>* This component identifies the properties of a BGP peer. The index value of this entry identifies the IP address of that peer. This component is required for BGP to set up a peer session with a

Copyright © 2006, Nortel Nortel Confidential

remote peer. Peers with discovered IP address are dynamic peers, where the provisioned ones are static peers.

GROUP Vr Ip Bgp Peer OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Bgp

ATTRIBUTE Vr Ip Bgp Peer adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Bgp

Copyright © 2006, Nortel Nortel Confidential

Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Vr Ip Bgp Peer operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Bgp
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Vr Ip Bgp Peer usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Bgp
Values	idle active (activ) busy
Default	idle

GROUP Vr Ip Bgp Peer Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *Peer* component.
Mib	Bgp

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ip Bgp Peer **connectionState**

Access	Read only
Description	This attribute indicates the current state of this BGP peer connection. The meaning of each state is as follows: ***idle*** - it is the initial state of the BGP peer connection. Error events will also cause BGP peer connection to transit to the idle state. ***connect*** - BGP has initiated a TCP connection request to this peer, and waiting for reply from that peer. ***active*** - BGP is not initiating a TCP connection request to this peer, because TCP connection failed and is waiting for connection retry time-out. ***openSent*** - a TCP connection to this peer has been established, but the OPEN message has not been successfully exchanged. ***openConfirm*** - OPEN message has been successfully exchanged with this peer, but the first KEEPALIVE message has not been received from that peer. ***established -*** the first KEEPALIVE message has been received from this peer, which means this BGP peer connection has been established. See RFC 1771 for a detailed description of BGP state transitions.
Mib	Bgp
Values	idle connect active openSent openConfirm established
Default	idle

ATTRIBUTE Vr Ip Bgp Peer **bgpIdentifier (bgpId)**

Access	Read only
Description	This attribute indicates the BGP Identifier of this *Bgp Peer* component. It is learned from the peer through the OPEN message.
Mib	Bgp
Values	IP address
Default	No default

ATTRIBUTE Vr Ip Bgp Peer **versionNegotiated (vn)**

Access	Read only
Description	This attribute indicates the BGP version number negotiated with this peer through the OPEN message. Currently, only BGP version 4 is supported. BGP will reject the peer connection if our peer proposes a BGP version other than 4.
Mib	Bgp

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4)
Default	No default

ATTRIBUTE Vr Ip Bgp Peer holdTimeNegotiated (htn)

Access	Read only
Description	This attribute indicates the maximum time in seconds, that may elapse without receiving a KEEPALIVE or UPDATE message before the connection is considered down. This is the negotiated value with peer through the OPEN message. The hold time must be either zero or at least three seconds. If the negotiated hold time is zero, then periodic KEEPALIVE messages are not expected from the peer.
Mib	Bgp
Values	Decimal (0; 3..65535)
Units	seconds
Default	No default

ATTRIBUTE Vr Ip Bgp Peer keepAliveNegotiated (kan)

Access	Read only
Description	This attribute indicates the interval in seconds, between BGP KEEPALIVE message retransmissions. This keepalive interval will have the same ratio to the hold time negotiated with the peer as that of the locally configured keepalive and hold time. This attribute will be zero if the *holdTimeNegotiated* attribute is zero, which means periodic KEEPALIVE messages will not be sent.
Mib	Bgp
Values	Decimal (0..21845)
Units	seconds
Default	No default

ATTRIBUTE Vr Ip Bgp Peer localAddressUsed (lau)

Access	Read only
Description	This attribute indicates the local IP address used for this BGP peer connection. If the *localAddressConfigured* attribute is non-zero, its value will be used. Otherwise, the local address will be assigned by TCP based on the remote IP address of this peer connection and the IP forwarding table.
Mib	Bgp
Values	IP address
Default	No default

ATTRIBUTE Vr Ip Bgp Peer localPort

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the local TCP port for the connection between the BGP peers.
Mib	Bgp
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Vr Ip Bgp Peer remotePort

Access	Read only
Description	This attribute indicates the remote TCP port for the connection between the BGP peers.
Mib	Bgp
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Vr Ip Bgp Peer lastError

Access	Read only
Description	This attribute indicates the last error code and subcode seen by this *Bgp* component instance on this peer connection. The first byte of this two byte OCTET STRING contains the error code, and the second byte contains the subcode. A value of zero means that no error has occurred. Check RFC 1771 for mappings of error codes and error subcodes.
Mib	Bgp
Values	String (2, Hex)
Default	No default

ATTRIBUTE Vr Ip Bgp Peer connectionEstablishedTime (ceTime)

Access	Read only
Description	This attribute indicates how long since this *Peer* component's last transition to or from the ***established*** state. It is set to zero when the *Peer* component is activated.
Mib	Bgp
Values	Decimal (0..4294967295)
Units	seconds
Default	0

ATTRIBUTE Vr Ip Bgp Peer connectionEstablishedTransitions (ceTrans)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the total number of times the BGP connection state transitioned into the ***established*** state.
Mib	Bgp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip Bgp Peer inUpdateElapsedTime (iuet)

Access	Read only
Description	This attribute indicates the elapsed time in seconds since the last BGP UPDATE message was received from the peer. Each time *inUpdates* attribute is incremented, the value of this attribute is set to zero.
Mib	Bgp
Values	Decimal (0..4294967295)
Units	seconds
Default	No default

ATTRIBUTE Vr Ip Bgp Peer inMsgs

Access	Read only
Description	This attribute counts the number of BGP messages received without error from the BGP peer. This counter will wrap to zero once the value exceeds the maximum value.
Mib	Bgp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip Bgp Peer inUpdates

Access	Read only
Description	This attribute counts the number of BGP UPDATE messages received on this peer connection. This counter will wrap to zero once the value exceeds the maximum value.
Mib	Bgp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip Bgp Peer inErrors

Access	Read only
Description	This attribute counts the number of messages received from this BGP peer that proved to be in error. This counter will wrap to zero once the value exceeds the maximum value.

Copyright © 2006, Nortel Nortel Confidential

Mib	Bgp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip Bgp Peer inErrorMsgs

Access	Read only
Description	This attribute counts the number of BGP NOTIFICATION messages received from this BGP peer. This counter will wrap to zero once the value exceeds the maximum value.
Mib	Bgp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip Bgp Peer outMsgs

Access	Read only
Description	This attribute counts the number of locally generated BGP messages sent to this BGP peer. It does not include discarded messages. This counter will wrap to zero once the value exceeds the maximum value.
Mib	Bgp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip Bgp Peer outUpdates

Access	Read only
Description	This attribute counts the number of BGP UPDATE messages sent to this peer. This counter will wrap to zero once the value exceeds the maximum value.
Mib	Bgp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip Bgp Peer outDiscards

Access	Read only
Description	This attribute counts the number of locally generated BGP messages not sent to this BGP peer due to resource limitations within a BGP entity. This counter will wrap to zero once the value exceeds the maximum value.
Mib	Bgp
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Vr Ip Bgp Peer **outErrorMsgs**

Access	Read only
Description	This attribute counts the number of BGP NOTIFICATION messages sent to this BGP peer. This counter will wrap to zero once the value exceeds the maximum value.
Mib	Bgp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip Bgp Peer **inRoutes**

Access	Read only
Description	This attribute indicates the number of routes received from this BGP peer.
Mib	Bgp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip Bgp Peer **peerType**

Access	Read only
Description	This attribute indicates the way this peer is created. Peer is **static,** if created through provisioning or **dynamic,** if created through IP VPN auto discovery. For *Router* and *Vrf*, all peers are statically created. So, this value will always be ***static***.
Mib	Bgp
Values	static dynamic
Default	No default

ATTRIBUTE Vr Ip Bgp Peer **authenticationType**

Access	Read only
Description	This attribute indicates the authentication type of this BGP peer. If the *md5Key* attribute under the *Bgp Peer Desc* component is set to a null string, this peer's authentication type is ***none***; otherwise, if the *md5Key* attribute is set to a valid non-null string, this peer's authentication type is ***md5***.

Copyright © 2006, Nortel Nortel Confidential

If this BGP peer's *peerType* is ***dynamic***, its authentication type is always ***none***.

Mib — Bgp

Values — none
md5

Default — No default

ATTRIBUTE Vr Ip Bgp Peer noAuthenticationPkts

Access — Read only

Description — This attribute indicates the number of packets received on this BGP peer session's underlying TCP connection, which do not contain the MD5 authentication information, but MD5 authentication is provisioned on the local BGP peer. This type of authentication failure occurs when the *md5Key* attribute under the local *Bgp Peer Desc* component is set to a valid non-null string, but the remote BGP peer does not use MD5 authentication, or when a hacker is spoofing packets from a legitimate peer. This counter will wrap to zero once the value exceeds the maximum value.

Mib — Bgp

Values — Decimal (0..4294967295)

Default — No default

ATTRIBUTE Vr Ip Bgp Peer badAuthenticationPkts

Access — Read only

Description — This attribute indicates the number of packets received on this BGP peer session's underlying TCP connection, which fail the MD5 authentication. This type of authentication failure occurs when the *md5Key* attribute set under the local *Bgp Peer Desc* component does not match the MD5 key used by the remote BGP peer, or when a hacker is spoofing packets from a legitimate peer. This counter will wrap to zero once the value exceeds the maximum value.

Mib — Bgp

Values — Decimal (0..4294967295)

Default — No default

ATTRIBUTE Vr Ip Bgp Peer unexpectedAuthenticationPkts

Access — Read only

Description — This attribute indicates the number of packets received on this BGP peer session's underlying TCP connection, which contain the MD5 authentication information, but MD5 authentication is not provisioned on the local BGP peer. This type of authentication failure occurs when the *md5Key* attribute under the local *Bgp Peer Desc* component is set to a null

Copyright © 2006, Nortel Nortel Confidential

string, but the remote BGP peer uses MD5 authentication, or when a hacker is spoofing packets from a legitimate peer. This counter will wrap to zero once the value exceeds the maximum value.

Mib: Bgp

Values: Decimal (0..4294967295)

Default: No default

ATTRIBUTE Vr Ip Bgp Peer addressFamilyNegotiated (afn)

Access: Read only

Description: The attribute indicates the list of multi-protocol extensions negotiated on this peer session. It consists of both the Address Family Identifier (AFI) and the Subsequent Address Family Identifier (SAFI).

To perform IP VPN auto discovery in a VPN, the value of ***ipv4Vpn*** must be in the *addressFamilyNegotiated* list of all the VCGs' peer instances.

To perform IP VPN multi-protocol BGP route distribution in a VPN, the value of ***mbgpVpn*** and ***ipv4Vpn*** must be in the *addressFamilyNegotiated* list of all the VCGs' peer instances.

To perform RFC 2547 VPN route distribution in a VPN using multi-protocol BGP extensions, the value of ***ipv4MplsVpn*** must be in the *addressFamilyNegotiated* list of all the VCGs' peer instances.

To distribute IPv4 Unicast routes with labels, using multi-protocol BGP extensions, the value of ***ipv4Label*** must be in the *addressFamilyNegotated* list of the peer instance.

ipv4Unicast represents AFI = 1 and SAFI = 1
ipv4Vpn represents AFI = 1 and SAFI = 140 (not for RFC 2547)
mbgpVpn represents AFI = 1 and SAFI = 141 (not for RFC 2547)
ipv4MplsVpn represents AFI = 1 and SAFI = 128
ipv4Label represents AFI = 1 and SAFI = 4

Mib: Bgp

List of:
ipv4Unicast
ipv4Vpn
mbgpVpn
ipv4MplsVpn
ipv4Label

Default: No default

ATTRIBUTE Vr Ip Bgp Peer capabilityNegotiated (cn)

Access: Read only

Description: The attribute indicates the list of capabilities negotiated on this peer session.

COMPONENT Vr Ip Bgp Peer Descriptor (Desc)

Groups	GROUP Vr Ip Bgp Peer Desc Provisioned (Prov)
Scope	Network
Description	*Vr/<string> Ip Bgp Peer/<Ip Address> Desc* *Rtr/<string> Bgp Peer/<Ip Address> Desc* *Rtr/<string> Vrf/<string> Bgp Peer/<Ip Address> Desc* This component contains provisioned attributes for BGP peers. Provisioned attributes are only used when the peer is a statically provisioned peer.
Mib	Bgp
Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP Vr Ip Bgp Peer Desc Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisional attributes for this BGP *Peer* component
Mib	Bgp

ATTRIBUTE Vr Ip Bgp Peer Desc peerAs

Access	Read and write
Description	This attribute specifies the autonomous system identifier of this BGP *Peer* component. It is used to verify the autonomous system identifier learned from the peer through the OPEN message. The peer connection is rejected and a NOTIFICATION message is sent to the peer if these two numbers don't match.
Mib	Bgp
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Vr Ip Bgp Peer Desc localAddressConfigured (lac)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the local IP address configured for this *Bgp Peer* connection. If this attribute is 0.0.0.0, TCP chooses a local IP interface based on the remote IP address of this peer connection and the IP forwarding table. The value chosen is stored in the *localAddressUsed* attribute under the same *Peer* component.
Mib	Bgp
Values	IP address
Default	0.0.0.0

ATTRIBUTE Vr Ip Bgp Peer Desc keepAliveConfigured (kac)

Access	Read and write
Description	This attribute specifies the configured interval between BGP KEEPALIVE message retransmissions. It is used to establish the ratio between keepalive interval and hold time. If this attribute is zero, then the *holdTimeConfigured* attribute must be zero, which means that periodic KEEPALIVE messages will not be sent.
Mib	Bgp
Values	Decimal (0..21845)
Units	seconds
Default	30

ATTRIBUTE Vr Ip Bgp Peer Desc holdTimeConfigured (htc)

Access	Read and write
Description	This attribute specifies the maximum time that may elapse without receiving a KEEPALIVE or UPDATE message before the connection is considered down. The hold time must be either zero or at least three seconds. If this attribute is zero, then the *keepAliveConfigured* attribute should also be zero, which means that periodic KEEPALIVE messages will not be sent.
Mib	Bgp
Values	Decimal (0; 3..65535)
Units	seconds
Default	90

ATTRIBUTE Vr Ip Bgp Peer Desc connectRetryTime (connectRetry)

Access	Read and write
Description	This attribute specifies the time interval for the ConnectRetry timer. It is the minimum amount of time that must elapse between successive TCP connection retries for establishing BGP peer connection.

Copyright © 2006, Nortel Nortel Confidential

Mib	Bgp
Values	Decimal (1..65535)
Units	seconds
Default	120

ATTRIBUTE Vr Ip Bgp Peer Desc minAsOrigTime (minAsOrig)

Access	Read and write
Description	This attribute specifies the time interval for the MinAsOriginationInterval timer. It is the minimum amount of time that must elapse between updates that advertise a change to a route within the local autonomous system to neighboring autonomous systems.
Mib	Bgp
Values	Decimal (1..65535)
Units	seconds
Default	15

ATTRIBUTE Vr Ip Bgp Peer Desc minRouteAdvTime (minRouteAdv)

Access	Read and write
Description	This attribute specifies the time interval for the MinRouteAdvertisementInterval timer. Feasible routes received from peers in other autonomous systems may only be re-advertised to peers in other autonomous systems at a rate no greater than MinRouteAdvertisementInterval.
Mib	Bgp
Values	Decimal (1..65535)
Units	seconds
Default	30

ATTRIBUTE Vr Ip Bgp Peer Desc defaultInAggMed (diaMed)

Access	Read and write
Description	This attribute specifies this *Bgp Peer* component instance's metric for generating a dynamic default route whenever this external BGP peer got established. It is used to prioritize between the dynamic default routes generated by BGP speakers. If this attribute is not set, BGP does not generate a dynamic default route. When this attribute is set, BGP automatically generates a dynamic default route when the connection established.
Mib	Bgp
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	4294967295

ATTRIBUTE Vr Ip Bgp Peer Desc **isRouteReflectorClient (isRrClient)**

Access	Read and write
Description	This attribute specifies whether the peer is a client peer or non-client peer of this *Bgp* instance. The attribute is ignored unless the value of the '*routeReflector'* attribute of the '*Bgp'* component is set to ***true***.
Mib	Bgp
Values	true false
Default	false

ATTRIBUTE Vr Ip Bgp Peer Desc **removePrivateAs (remPrivate)**

Access	Read and write
Description	This attribute specifies the treatment of the AS_PATH path attribute in routes sent to the peer. If this attribute is enabled, then BGP will remove private AS numbers from the AS_PATH. This attribute is meaningful only for external peers.
Mib	Bgp
Values	enabled disabled
Default	disabled

ATTRIBUTE Vr Ip Bgp Peer Desc **nextHopSelf (nhs)**

Access	Read and write
Description	This attribute controls the setting of the NEXT_HOP path attribute in routes advertised to the peer. If this attribute is enabled, BGP will advertise itself as the NEXT_HOP. This is useful when routes are propagated from an EBGP peer to an IBGP peer: the IBGP peer does not need to have a route to the EBGP peer.
Mib	Bgp
Values	enabled disabled
Default	disabled

ATTRIBUTE Vr Ip Bgp Peer Desc **md5Key**

Access	Write only
Description	This attribute specifies this *Bgp Peer* component instance's MD5 key value that is used by the MD5 authentication on this BGP Peer session's underlying TCP connection.

Copyright © 2006, Nortel Nortel Confidential

A null string indicates that the MD5 authentication is not to be used on the TCP connection to this Bgp Peer session.

Mib: Bgp

Values: String (0..255, ASCII)

Default: No default

ATTRIBUTE Vr Ip Bgp Peer Desc keyTransitionDelay (keyDelay)

Access: Read and write

Description: This attribute specifies a delay period associated with a change of *md5Key* value event of the *Peer* component.

This is the time that can elapse before the local router transitions to using the new key for transmission for this Bgp Peer session.This time is not used to control when to accept the new key for reception, and the new key is immediately accepted for reception.

This delay equates to the amount of time the operator has to provision both the local and remote ends with the new key, without losing service.

If ***sameAsBgp*** is specified, the value of *keyTransitionDelay* set under the parent *Bgp* component is used. Otherwise the value of this attribute will be used**.** The default is to use ***sameAsBgp***.

Mib: Bgp

Values: Decimal (1..20160)
sameAsBgp

Units: minutes

Default: sameAsBgp

ATTRIBUTE Vr Ip Bgp Peer Desc multiHopEbgp (mhEbgp)

Access: Read and write

Description: This attribute specifies whether MultiHop EBGP (External BGP) route distribution is supported on this EBGP peer. MultiHop EBGP allows routes to be distributed between EBGP peers that are not directly connected and can span multiple hops

Mib: Bgp

Values: enabled
disabled

Default: disabled

ATTRIBUTE Vr Ip Bgp Peer Desc asPathCheck

Access: Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the treatment of the AS_PATH loop detection mechanism in routes received from the peer. If this attribute is set to ***disabled***, AS_PATH loop is not detected. If this attribute is set to ***enabled***, AS_PATH loop is detected.
Mib	Bgp
Values	enabled disabled
Default	enabled

ATTRIBUTE Vr Ip Bgp Peer Desc **attachSiteOfOrigin (attachSoo)**

Access	Read and write
Description	This attribute specifies the site of origin identifier to attach for this BGP Peer connection. If this attribute is set, a site of origin extended community path attribute is attached to the routes received from this peer unless the site of origin extended community path attribute is already included in the routes.
Mib	Bgp
Values	String (0..21, RFC2547RdRtSyntax)
Default	No default

ATTRIBUTE Vr Ip Bgp Peer Desc **checkSiteOfOrigin (checkSoo)**

Access	Read and write
Description	This attribute specifies the site of origin identifiers to check for this BGP Peer connection. If this attribute is set, a check is done when routes are received from this peer or advertised to this peer. If the site of origin extended community path attribute presents in received routes and matches any Site Of Origin in this attribute, the routes are not accepted. If the site of origin extended community path attribute presents in the advertised routes and matches any SOO in this attribute, the routes are not advertised to this peer. If this attribute is not set, no check and filtering is done.
Mib	Bgp
List of	String (3..21, RFC2547RdRtSyntax)
List Size	256
Default	No default

ATTRIBUTE Vr Ip Bgp Peer Desc **bgpPeerRouteLimit (bprl)**

Access	Read and write
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies a limit to control the maximum number of BGP Ipv4 Unicast routes that will be processed until an alarm is generated. The default value of zero implies no protection. This limit is set based on the requirements of the network configuration and is optional but critical under the peer.
Mib	Bgp
Values	Decimal (0..4000000000)
Default	0

ATTRIBUTE Vr Ip Bgp Peer Desc **bgpPeerRouteDiscard (bprd)**

Access	Read and write
Criticality	Component
Description	This attribute specifies a limit to control the number of BGP Ipv4 Unicast routes that will be processed until an alarm is generated and subsequent routes are discarded. The default value of zero signifies no protection. This limit is set based on the requirements of the network configuration and is optional but critical under the peer.
Mib	Bgp
Values	Decimal (0..4000000000)
Default	0

ATTRIBUTE Vr Ip Bgp Peer Desc **asOverride (asOr)**

Access	Read and write
Description	This attribute specifies the treatment of the AS_PATH path attribute in routes sent to the peer. If this attribute is ***enabled,*** then BGP will override all the AS numbers in the AS_PATH list, that match the AS number of the peer that we are sending to, with the local AS number. This attribute is meaningful only for external peers. This attribute is available for the *Bgp Peer Desc* component under the *Vr Ip*, *Vrf* and *Rtr* components. However, if it is set to ***enabled*** under the *Rtr Bgp Peer Desc* component, it has no impact. The behaviour is ***disabled*** regardless of the provisioned value in this case.
Mib	Bgp
Values	enabled disabled
Default	disabled

ATTRIBUTE Vr Ip Bgp Peer Desc **addressFamily**

Access	Read and write
Description	The attribute specifies the supported network layer protocols being carried in any BGP-4 UPDATE messages over this Peer session. It consists of

Copyright © 2006, Nortel Nortel Confidential

both the Address Family Identifier (AFI) and the Subsequent Address Family Identifier (SAFI).

To perform IP VPN auto discovery in a VPN, the value of ***ipv4Vpn*** must be added to this attribute on all VCGs' peer instances.

To perform IP VPN multi-protocol BGP route distribution in a VPN, the value of ***mbgpVpn*** and ***ipv4Vpn*** must be in the *addressFamily* list of all the VCGs' Peer instances.

To perform RFC 2547 VPN route distribution in a VPN using multi-protocol BGP extensions, the value of ***ipv4MplsVpn*** must be in the *addressFamily* list of all the VCGs' peer instances.

To distribute IPv4 Unicast routes with labels, using multi-protocol BGP extensions, the value of ***ipv4Label*** must be in the *addressFamily* list of the peer instance.

ipv4Unicast represents AFI = 1 and SAFI = 1
ipv4Vpn represents AFI = 1 and SAFI = 140 (not for RFC 2547)
mbgpVpn represents AFI = 1 and SAFI = 141 (not for RFC 2547)
ipv4MplsVpn represents AFI = 1 and SAFI = 128
ipv4Label represents AFI=1 and SAFI=4

COMPONENT Vr Ip Bgp Peer Vpn Ipv4

Instance	IP address
Groups	GROUP Vr Ip Bgp Peer Vpn Ipv4 Operational (Oper)
Scope	Application
Description	*Vr*/<string> *Ip Bgp Peer*/<Ip Address> *Vpn*/<Vpn id> *Ipv4* This component contains all IPv4 tunnel based VPN information gathered by this BGP peer for the specified VPN.
Mib	Bgp
Common Verbs	Help List Display

GROUP Vr Ip Bgp Peer Vpn Ipv4 Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes of the *Ipv4* component.
Mib	Bgp

ATTRIBUTE Vr Ip Bgp Peer Vpn Ipv4 publicIpAddress

Access	Read only
Description	This attribute indicates the public IP Address for the remote IP VPN tunnel endpoint. It is used to encapsulate IP packets from the local IP VPN site to the remote site.
Mib	Bgp
Values	IP address
Default	No default

ATTRIBUTE Vr Ip Bgp Peer Vpn Ipv4 asPath

Access	Read only
Description	This attribute indicates the sequence of AS path segments through which the IP VPN information arrives. The AS Path lists the ASs in reverse traversal order from the point of origin. This attribute is not applicable and is not displayed for locally -learned IP VPN information.
Mib	Bgp
Values	String (2..255, ASCII)
Default	No default

ATTRIBUTE Vr Ip Bgp Peer Vpn Ipv4 vpnPeeringTopology

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the peering mode of the remote customer BGP from which this VPN information is originated. This mode determines if a dynamic IBGP peer is instantiated between this *BGP* instance and the remote IP Tunnel endpoint on the remote customer VR. A ***none*** value specifies that BGP never instantiate dynamic IBGP peers. Dynamic IBGP peer is instantiated between two customer VR in the same VPN if and only if at least one end is configured with a ***hub*** value and the other is either configured with a ***hub*** or a ***spoke*** value. In any case; static BGP peers may be configured and overwrite the dynamic ones after auto-discovery has taken place. If auto-discovery is enabled when static peers already present between VPN sites, no dynamic peers with the same provisioned peer instance will be instantiated regardless of the configured value of the attribute.
Mib	Bgp
Values	none hub spoke
Default	No default

ATTRIBUTE Vr Ip Bgp Peer Vpn Ipv4 **asOriginatorId**

Access	Read only
Description	This attribute is associated with the Route Reflector. It indicates the router-id of the originator of this IP VPN information in the local AS. When the Route Reflector in the backbone distributes a discovered VPN information to other IBGP speakers, the value of this attribute in the discovered VPN information is used if one is present; otherwise, the Route Reflector's router-id is used. A value of 0.0.0.0 indicates this *Bgp* instance is not a Route Reflector. This attribute is not applicable and is not displayed for locally learned IP VPN information.
Mib	Bgp
Values	IP address
Default	No default

ATTRIBUTE Vr Ip Bgp Peer Vpn Ipv4 **redundant**

Access	Read only
Description	This attribute indicates that the IP VPN information entry learned from more than one BGP peers in the carrier backbone. This attribute is not applicable and is not displayed for locally learned IP VPN information.
Mib	Bgp

Copyright © 2006, Nortel Nortel Confidential

Values	no yes
Default	No default

ATTRIBUTE Vr Ip Bgp Peer Vpn Ipv4 rrClusterList

Access	Read only
Description	This attribute is associated with the Route Reflector. It indicates the sequence of cluster-ids that this discovered IP VPN information has traversed. When the Route Reflector in the backbone reflects a discovered VPN information to other non-client IBGP peers, the cluster ID of the Route Reflector is added to the cluster list of the received VPN information. A blank list indicates this attribute is not present in the received VPN information or if this *Bgp* instance is not a Route Reflector. This attribute is not applicable and is not displayed for locally learned IP VPN information.
Mib	Bgp
List of	IP address
List Size	256
Default	No default

COMPONENT Vr Ip Bgp ImportPolicy (Import)

Instance	Decimal (0..65535)
Groups	GROUP Vr Ip Bgp Import Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Bgp Import/n* *Rtr/<string> Bgp Import/n* *Rtr/<string> Vrf/<string> Bgp Import/n* Each instance of this component describes a BGP import policy. A BGP import policy is used to decide if certain routing information learned from its peer is to be ignored or used. If no import policy is provisioned, BGP will accept all routes received from its IBGP peers, but will not use any routing information received from its EBGP peers. If multiple import policies are provisioned, the one with the most specific match will apply. The keys are matched in the following order from the least specified to the most specified: *Network*, *peerAs*, *peerIpAddress*, *originAs*, *originProtocol*,

Copyright © 2006, Nortel Nortel Confidential

matchAsPath,
matchCommunity.

Example1:
There are 2 import policies defined:
vr/0 ip bgp import/1, originProtocol = ***any***, originAs = ***20***, usageFlag = ***use***
vr/0 ip bgp import/2, originProtocol = ***igp***, usageFlag = ***ignore***
If a BGP NLRI contains a route originally learned from an igp with origin AS 20, it will be used.
Example2:
There are 2 import policies defined:
vr/0 ip bgp import/1, originProtocol = ***any***, matchAsPath = ***"1 2 3"***, usageFlag = ***ignore***
vr/0 ip bgp import/2, originProtocol = ***any***, usageFlag = use
If a BGP NLRI contains a route originally learned from an igp with the AsPath "1 2 3 4", it will be ignored.

For Router and Vrf, the example is similar with 'Vr/0 Ip' replaced with 'Router/0' and 'Router/0 Vrf/1' respectively.

Mib	Bgp
Opt. Subcomp.	COMPONENT Vr Ip Bgp Import Network (Net)
Common Verbs	Help List Display Add DELete

GROUP Vr Ip Bgp Import Provisioned (Prov)

Properties	Provisioned
Description	This group contains all the provisionable attributes for the *Import* component.
Mib	Bgp

ATTRIBUTE Vr Ip Bgp Import peerAs

Access	Read and write
Description	This key attribute specifies the autonomous system number of the peer from which the routes are learned. A value of 0 for this attribute means that peer AS number will match any AS number.
Mib	Bgp
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Vr Ip Bgp Import peerIpAddress

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This key attribute specifies the IP address of the peer from which the routes are learned. A value of 0.0.0.0 for this attribute means that peer IP address will match any IP address.
Mib	Bgp
Values	IP address
Default	0.0.0.0

ATTRIBUTE Vr Ip Bgp Import **originAs**

Access	Read and write
Description	This key attribute specifies the autonomous system number where the routes were originated. A value of 0 for this attribute means origin AS number will match any AS number.
Mib	Bgp
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Vr Ip Bgp Import **originProtocol**

Access	Read and write
Description	This key attribute specifies the protocols that originated the routes. A value of ***incomplete*** for this attribute means this information is not available.
Mib	Bgp
Values	any igp egp incomplete
Default	any

ATTRIBUTE Vr Ip Bgp Import **usageFlag (usage)**

Access	Read and write
Description	This attribute specifies whether BGP will use or ignore information in received update if it meets criteria specified by the key attributes of this component.
Mib	Bgp
Values	use ignore
Default	use

ATTRIBUTE Vr Ip Bgp Import **localPreference (locPrf)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies this *Bgp* component instance's degree of preference for those routes that match the criteria of this import policy. A higher value indicates a more preferred route. A value of 0 for this attribute means that the default local preference value provisioned under the *Bgp* component should be used.
Mib	Bgp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip Bgp Import asPathExpression (asExpr)

Access	Read and write
Description	This key attribute allows the user to enter a regular expression to match the import AS Path Attribute of the received update message. Note: the AS Path Attribute lists the ASs in reverse traversal order. The syntax of the regular expression is a subset of the RFC 2280. The basic syntax of a regular expression is a list of AS number separated by a space which making up a AS path. The following characters has the special meaning: '.' - Matches any AS number. '^n' - Matches the first AS item (n) in the AS Path Attribute, or in order words, matches the last AS (n) traversed in the AS path. 'n$' - Matches the last AS item (n) in the AS Path Attribute, or in order words, matches the first AS (n) traversed in the AS path. '[n1... n2]' - Matches any AS number that appeared in the set n1... n2. 'n1 - n2' - Matches any AS number between the range of n1 and n2. '()' - is supported to change the order of evaluation. 'n*' - Matches 0 or more occurrences of n, where n can be a set, range or AS number. 'n+' - Matches 1 or more occurrences of n, where n can be a set, range or AS number. 'n?' - Matches 0 or 1 occurrences of n, where n can be a AS set, range or number. The following logical operators are evaluated in descending order: 'NOT' - Given a regular expression x, NOT x matches the AS number pattern that is not matched by x. 'AND'- Given two regular expressions x and y, x AND y matches the intersection of the AS path that are matched by x and those are matched by y. 'OR' - Given two regular expressions x and y, x OR y matches the union of the AS path that are matched by x and those are matched by y. For example: The AS path "5 4 3 2 1", where 1 is the origin AS, would be

Copyright © 2006, Nortel Nortel Confidential

match by any one of the following regular expressions:
1$,
^5,
4 3,
5 3 - 4*,
5 [4 3 2] not10 2 1,
not (6 7 8 9 10) and 5 4.* 1
Empty regular expression implies a match on all AS path.

Mib	Bgp
Values	String (0..255, ASCII)
Default	No default

ATTRIBUTE Vr Ip Bgp Import communityExpression (comExpr)

Access	Read and write
Description	This key attribute allows the user to enter a regular expression to match the import Community Attribute of the received update message. The syntax of the regular expression is a subset of the RFC 2280. The basic syntax of a regular expression is a list of Community number separated by a space which making up a Community attribute. The following characters have a special meaning: '[n1... n2]' - Matches any Community number that appeared in the set n1...n2. 'n1 - n2' - Matches any Community number between the range of n1 and n2. '()' - is supported to change the order of evaluation. 'n*' - Matches 0 or more occurrences of n, where n can be a set, range or Community number. 'n+' - Matches 1 or more occurrences of n, where n can be a set, range or Community number. 'n?' - Matches 0 or 1 occurrences of n, where n can be a set, range or number. The following logical operators are evaluated in descending order: 'NOT' - Given a regular expression x, NOT x matches the Community attribute that is not matched by x. 'AND'- Given two regular expressions x and y, x AND y matches the intersection of the Community attribute that are matched by x and those are matched by y. 'OR' - Given two regular expressions x and y, x OR y matches the union of the Community attribute that are matched by x and those are matched by y. For example: The Community path "1 2 3 4 5" would be match by any one of the following regular expression: ***1,*** ***5,*** ***4 3,*** ***2 3 - 4*,***

Copyright © 2006, Nortel Nortel Confidential

1 [3 4 2]+,
not (6 7 8 9 10) and 1 2
Empty regular expression implies a match on all Community path.

Mib	Bgp
Values	String (0..255, ASCII)
Default	No default

ATTRIBUTE Vr Ip Bgp Import expressPreference (exprPref)

Access	Read and write
Description	This attribute specifies the relative preference of the policy which use the keys *expressAsPath* and *expressCommunity*. This attribute is ignored if attributes *expressAsPath* and *expressCommunity* are both empty. This attribute is used to break the tie when two import policies' expression attributes match a specific AS Path or Community. A higher value indicates a more preferred policy.
Mib	Bgp
Values	Decimal (0..255)
Default	128

ATTRIBUTE Vr Ip Bgp Import appendCommunity (appCom)

Access	Read and write
Description	This attribute indicates which community number this import policy will send along with the Path Attribute. Refer to RFC 1997 for the detailed description of how this attribute may be used to pass additional information to BGP peers. If the value is set to 0, no community is appended to the Community attribute.
Mib	Bgp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip Bgp Import ibgpRtePreference (ibgpPref)

Access	Read and write
Description	This attribute specifies the routing preference of IBGP routes matching this import policy. A lower value means the route is more preferred. If ***sameAsBgp*** is specified, the value of *defaultIbgpRtePref* set under the *Bgp* component is used. Otherwise the value of this attribute will be used as the routing preference**.** The default is to use sameAsBgp.
Mib	Bgp
Values	Decimal (1..253) sameAsBgp

Copyright © 2006, Nortel Nortel Confidential

Default	sameAsBgp

ATTRIBUTE Vr Ip Bgp Import ebgpRtePreference (ebgpPref)

Access	Read and write
Description	This attribute specifies the routing preference of EBGP routes matching this import policy. A lower value specifies the route is more preferred. If ***sameAsBgp*** is specified, the value of *defaultEbgpRtePref* set under the *Bgp* component is used. Otherwise the value of this attribute will be used as the routing preference**.** The default is to use sameAsBgp.
Mib	Bgp
Values	Decimal (1..253) sameAsBgp
Default	sameAsBgp

ATTRIBUTE Vr Ip Bgp Import addressFamily (af)

Access	Read and write
Description	This attribute specifies the Address Family of the routes this import policy should apply to. It consists of both the Address Family Identifier (AFI) and the Subsequent Address Family Identifier (SAFI). It can contain one of the following: ***ipv4Unicast*** represents AFI = 1 and SAFI = 1 ***mbgpVpn*** represents AFI = 1 and SAFI = 141 (Not for RFC 2547) ***all***
Mib	Bgp
Values	all ipv4Unicast mbgpVpn ipv4Label
Default	all

ATTRIBUTE Vr Ip Bgp Import description (desc)

Access	Read and write
Description	This attribute specifies the policy. For example, ‘to import BGP routes from AS 1’.
Mib	Bgp
Values	String (0..255, ASCII)
Default	No default

COMPONENT Vr Ip Bgp Import Network (Net)

Instance	Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

Groups	GROUP Vr Ip Bgp Import Net Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Bgp Import/n Network/n* *Rtr/<string> Bgp Import/n Network/n* *Rtr/<string> Vrf/<string> Bgp Import/n Network/n* This is an optional subcomponent of *Import* component and identifies destination networks that this BGP import policy applies to. This component is used as a key for the import policy. If no network list is provisioned, the import policy applies to all networks.
Mib	Bgp
Common Verbs	Help List Display Add DELete

GROUP Vr Ip Bgp Import Net Provisioned (Prov)

Properties	Provisioned
Description	This group contains the set of provisionable attributes for the *Network* component.
Mib	Bgp

ATTRIBUTE Vr Ip Bgp Import Net prefix

Access	Read and write
Description	This attribute specifies the network prefix whose length is determined by the *length* attribute under the same *Network* component.
Mib	Bgp
Values	IP address
Default	No default

ATTRIBUTE Vr Ip Bgp Import Net length

Access	Read and write
Description	This attribute specifies the length of the network prefix.
Mib	Bgp
Values	Decimal (1..32)
Units	bits

Copyright © 2006, Nortel Nortel Confidential

COMPONENT Vr Ip Bgp ExportPolicy (Export)

Instance	Decimal (0..65535)
Groups	GROUP Vr Ip Bgp Export Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Bgp Export/n* *Rtr/<string> Bgp Export/n* *Rtr/<string> Vrf/<string> Bgp Export/n* Each instance of this component describes a BGP export policy. A BGP export policy is used to decide if certain routing information should be blocked or advertised to its peers. If no export policy is provisioned, BGP will advertise all external BGP learned routes to its internal peers, but not advertise any routing information to its external peers. If multiple export policies are provisioned, the one with the most specific match will apply. The keys are matched in the following order from the least specified to the most specified: *peerAs*, *peerIpAddress*, *protocol,* *ripInterface* (if applicable), *egpAs, bgpAs, ripNeighbour*, or *ospfTag* (whichever is applicable), *Network,* *matchAsPath,* *matchCommunity.* Example1: (for Router and Vrf, the examples are similar by replacing ‘vr/0 ip’ with ‘Router/a’ and ‘Router/a Vrf/b’ respectively) There are 2 export policies defined: vr/0 ip bgp export/1, protocol = ***all***, advertiseStatus = ***send*** vr/0 ip bgp export/2, protocol = ***rip***, advertiseStatus = ***block*** BGP will generate BGP updates for all routes except the routes learned from RIP. Example2: There are 2 export policies defined: vr/0 ip bgp export/1, protocol = all, matchCommunity = ***303***, advertiseStatus = ***send*** vr/0 ip bgp export/2, protocol = ***all***, advertiseStatus = ***block***

Copyright © 2006, Nortel Nortel Confidential

BGP will generate BGP updates for all routes that belongs to Community 303.

Mib — Bgp

Opt. Subcomp. — COMPONENT Vr Ip Bgp Export Network (Net)

Common Verbs — Help, List, Display, Add, DELete

GROUP Vr Ip Bgp Export Provisioned (Prov)

Properties — Provisioned

Description — This group contains all the provisioned attributes for the *Export* component.

Mib — Bgp

ATTRIBUTE Vr Ip Bgp Export peerAs

Access — Read and write

Description — This key attribute specifies the autonomous system number of the peer where the routes are advertised to. A value of 0 for this attribute means this export policy applies to all peer ASes.

Mib — Bgp

Values — Decimal (0..65535)

Default — 0

ATTRIBUTE Vr Ip Bgp Export peerIpAddress

Access — Read and write

Description — This key attribute specifies the IP address of the peer where the routes are advertised to. A value of 0.0.0.0 for this attribute means this export policy applies to all peers. This key attribute is used in export policies for AFI/SAFI = 1/128 only if the *addressFamily* attribute is set to ***ipv4MplsVpn***.

Mib — Bgp

Values — IP address

Default — 0.0.0.0

ATTRIBUTE Vr Ip Bgp Export protocol

Access — Read and write

Description — This key attribute specifies which protocol the export policy applies to. If it is set to ***all***, that means this export policy will apply all routes in the IP routing table.

Copyright © 2006, Nortel Nortel Confidential

	Example: vr/1 ip ospf export/1 with advertise Status = block protocol = bgpExternal bgpAsId = 3 peerAs = 5 This policy specifies that all routes learned from EBGP Peers that are originated from AS 3 should not be advertised to AS 5.
Mib	Bgp
Values	all egp rip ospfInternal ospfExternal staticLocal staticRemote bgpInternal bgpExternal bgpAggregate mbgp bgpMplsInternal
Default	all

ATTRIBUTE Vr Ip Bgp Export **egpAsId (egpAs)**

Access	Read and write
Description	This key attribute specifies the EGP autonomous system number that this export policy will apply to. When this value is non-zero, the *protocol* attribute must be set to ***egp***.
Mib	Bgp
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Vr Ip Bgp Export **bgpAsId (bgpAs)**

Access	Read and write
Description	This key attribute specifies the BGP autonomous system number that this export policy will apply to. When this value is non-zero, the *protocol* attribute must be set to either ***bgpInternal*** or ***bgpExternal***.
Mib	Bgp
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Vr Ip Bgp Export **ospfTag**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This key attribute specifies the OSPF tag when the *protocol* attribute is set to either ***ospfInternal*** or ***ospfExternal***. The default tag value 4294967295 (FFFFFFFF in hex) indicates that the tag not specified.
Mib	Bgp
Values	Hex (H.0..H.ffffffff)
Default	H.ffffffff

ATTRIBUTE Vr Ip Bgp Export ripInterface (ripIf)

Access	Read and write
Description	This key attribute specifies the local RIP interface where the routes are learned from. The *ripInterface* attribute when non-zero should be equal to one of the IP addresses provisioned as a *logicalIf* component under *IpPort*, or the IP address of an *Interface* component. Otherwise, this policy will be ignored. The value of the *protocol* attribute must be set to ***rip*** if a value for the *ripInterface* attribute is non-zero.
Mib	Bgp
Values	IP address
Default	0.0.0.0

ATTRIBUTE Vr Ip Bgp Export ripNeighbor (ripNbr)

Access	Read and write
Description	This key attribute specifies the RIP neighbor where the routes were learned from. The value of the *protocol* attribute must be set to ***rip*** if the *ripNeighbor* attribute is non-zero.
Mib	Bgp
Values	IP address
Default	0.0.0.0

ATTRIBUTE Vr Ip Bgp Export advertiseStatus (advertise)

Access	Read and write
Description	This attribute specifies whether data will be exported if it meets criteria specified by the other key attributes of this component.
Mib	Bgp
Values	send block
Default	send

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ip Bgp Export **multiExitDisc (med)**

Access	Read and write
Description	This attribute specifies this *Bgp* component instance's metric to discriminate between multiple exit points to an adjacent autonomous system if the route meets the criteria specified by the key attributes of this component. A lower value indicates a more preferred route. A value of 0 for this attribute means the default MED value provisioned under the *Bgp* component should be used.
Mib	Bgp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip Bgp Export **sendMultiExitDiscToEbgp (sendMed)**

Access	Read and write
Description	This attribute specifies whether the Multi Exit Discriminator (MED) attribute should be included in an update message sent to an EBGP peer.
Mib	Bgp
Values	false true
Default	false

ATTRIBUTE Vr Ip Bgp Export **asPathExpression (asExpr)**

Access	Read and write
Description	This key attribute allows the user to enter a regular expression to match the import AS Path Attribute of the export update message. Note: the AS Path Attribute lists the ASs in reverse traversal order. The syntax of the regular expression is a subset of the RFC 2280. The basic syntax of a regular expression is a list of AS number separated by a space which making up a AS path. The following characters have a special meaning: '.' - Matches any AS number. '^n' - Matches the first AS item (n) in the AS Path Attribute, or in order words, matches the last AS (n) traversed in the AS path. 'n$' - Matches the last AS item (n) in the AS Path Attribute, or in order words, matches the first AS (n) traversed in the AS path. '[n1... n2]' - Matches any AS number that appeared in the set n1... n2. 'n1 - n2' - Matches any AS number between the range of n1 and n2. '()' - is supported to change the order of evaluation. 'n*' - Matches 0 or more occurrences of n, where n can be a

Copyright © 2006, Nortel Nortel Confidential

set, range or AS number.
'n+' - Matches 1 or more occurrences of n, where n can be a set, range or AS number.
'n?' - Matches 0 or 1 occurrences of n, where n can be a set, range or number.
The following logical operators are evaluated in descending order:
'NOT' - Given a regular expression x, NOT x matches the AS number pattern that is not matched by x.
'AND'- Given two regular expressions x and y, x AND y matches the intersection of the AS path that are matched by x and those are matched by y.
'OR' - Given two regular expressions x and y, x OR y matches the union of the AS path that are matched by x and those are matched by y.
For example: The AS path "5 4 3 2 1", where 1 is the origin AS, would be match by any one of the following regular expressions:
1$,
^5,
4 3,
5 3 - 4*,
5 [4 3 2] not10 2 1,
not (6 7 8 9 10) and 5 4.* 1
Empty regular expression implies a match on all AS path.

Mib	Bgp
Values	String (0..255, ASCII)
Default	No default

ATTRIBUTE Vr Ip Bgp Export communityExpression (comExpr)

Access	Read and write
Description	This key attribute allows the user to enter a regular expression to match the import Community Attribute of the received update message. The syntax of the regular expression is a subset of the RFC 2280. The basic syntax of a regular expression is a list of Community number separated by a space which making up a Community attribute. The following characters have a special meaning: '[n1... n2]' - Matches any Community number that appeared in the set n1...n2. 'n1 - n2' - Matches any Community number between the range of n1 and n2. '()' - is supported to change the order of evaluation. 'n*' - Matches 0 or more occurrences of n, where n can be a set, range or Community number. 'n+' - Matches 1 or more occurrences of n, where n can be a set, range or Community number. 'n?' - Matches 0 or 1 occurrences of n, where n can be a set, range or number. The following logical operators are evaluated in descending order: 'NOT' - Given a regular expression x, NOT x matches the

Copyright © 2006, Nortel Nortel Confidential

Community attribute that is not matched by x.
'AND'- Given two regular expressions x and y, x AND y matches the intersection of the Community attribute that are matched by x and those are matched by y.
'OR' - Given two regular expressions x and y, x OR y matches the union of the Community attribute that are matched by x and those are matched by y.
For example: The Community path "1 2 3 4 5" would be match by any one of the following regular expression:
1,
5,
4 3,
2 3 - 4*,
1 [3 4 2]+,
not (6 7 8 9 10) and 1 2
Empty regular expression implies a match on all Community path.

ATTRIBUTE Vr Ip Bgp Export sendCommunity (sendCom)

Access	Read and write
Description	This attribute indicates which community number this export policy will send along with the Path Attribute. Refer to RFC 1997 for the detailed description of how this attribute may be used to pass additional information to BGP peers. If the value is set to 0, no community is added to the Community attribute.
Mib	Bgp
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ip Bgp Export localPreference (locPrf)

Access	Read and write
Description	This attribute specifies the value of the LOCAL_PREFERENCE path attribute in routes sent to internal peers. A value of 0 means that the value specified in the import policy (if any) or the default local preference value should be used.
Mib	Bgp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip Bgp Export virtualPrivateNetworkIdentifier (vpnId)

Access	Read and write
Description	This attribute specifies the Virtual Private Network (VPN) identifier of the routes this export policy should apply to. This attribute is only used if *addressFamily* has included ***mbgpVpn***. The value “00-00-00-00-00-00-00” identifies an unspecified VPN ID, meaning the VPN ID will not be used as a matching criteria in this export policy.
Mib	Bgp
Values	String (7, Dashed Hex)
Default	00-00-00-00-00-00-00

ATTRIBUTE Vr Ip Bgp Export addressFamily (af)

Access	Read and write
Description	This attribute specifies the Address Family of the routes this export policy should apply to. It consists of both the Address Family Identifier (AFI) and the Subsequent Address Family Identifier (SAFI). An export policy is applied for AFI/SAFI = 1/128 only when this attribute is set to ***ipv4MplsVpn***. In this case only *peerIpAddress*, *routeTarget*, and *advertiseStatus* attributes and *Network* component and its related attributes are used for export policies. It can contain one of the following: ***ipv4Unicast*** represents AFI = 1 and SAFI = 1 ***mbgpVpn*** represents AFI = 1 and SAFI = 141 ***ipv4MplsVpn*** represents AFI = 1 and SAFI = 128 ***all***
Mib	Bgp
Values	all ipv4Unicast mbgpVpn ipv4MplsVpn

Copyright © 2006, Nortel Nortel Confidential

Default	all

ATTRIBUTE Vr Ip Bgp Export **description (desc)**

Access	Read and write
Description	This attribute describes the policy. For example, ‘to export BGP routes to MCI’.
Mib	Bgp
Values	String (0..255, ASCII)
Default	No default

ATTRIBUTE Vr Ip Bgp Export **insertDummyAs (insertAs)**

Access	Read and write
Description	This attribute specifies the AS number(s) to be inserted into the AS Path Attribute. The value is a sequence of AS number separated by period(.). For example, if the value is ***20.20.30***, the AS numbers 20, 20 and 30 would be inserted at the end of the AS Path Attribute just before the local AS number.
Mib	Bgp
Values	Integer Sequence
Default	No default

ATTRIBUTE Vr Ip Bgp Export **routeTarget (rt)**

Access	Read and write
Description	This attribute specifies the Route Target of the routes this export policy should apply to.
Mib	Bgp
List of	String (3..21, RFC2547RdRtSyntax)
List Size	256
Default	No default

COMPONENT Vr Ip Bgp Export **Network (Net)**

Instance	Decimal (0..65535)
Groups	GROUP Vr Ip Bgp Export Net Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Bgp Export/n Network/n* *Rtr/<string> Bgp Export/n Network/n* *Rtr/<string> Vrf/<string> Export/n Network/n* This is an optional subcomponent of the *Export* component and identifies a destination network that this BGP export policy will apply to. This

Copyright © 2006, Nortel Nortel Confidential

component is used as a key for the export policy. If no network list is provisioned, the export policy applies to all networks. This component and its associated attributes are applied in an export policy for AFI/SAFI = 1/128 only if *addressFamily* attribute is set to ***ipv4MplsVpn***.

Mib: Bgp

Common Verbs: Help, List, Display, Add, DELete

GROUP Vr Ip Bgp Export Net **Provisioned (Prov)**

Properties: Provisioned

Description: This group contains the set of provisionable attributes for the *Network* component.

Mib: Bgp

ATTRIBUTE Vr Ip Bgp Export Net **prefix**

Access: Read and write

Description: This attribute specifies the network prefix whose length is determined by the *length* attribute under the same *Network* component.

Mib: Bgp

Values: IP address

Default: No default

ATTRIBUTE Vr Ip Bgp Export Net **length**

Access: Read and write

Description: This attribute specifies the length of the network prefix.

Mib: Bgp

Values: Decimal (1..32)

Units: bits

Default: No default

COMPONENT Vr Ip Bgp **As**

Instance: Decimal (0..65535)

Groups: GROUP Vr Ip Bgp As Provisioned (Prov)

Rtr/<string> Vrf/<string> Bgp As/n
This component associates attributes to an autonomous system.

Mib: Bgp

Common Verbs: Help, List, Display, Add, DELete

GROUP Vr Ip Bgp As Provisioned (Prov)

Properties: Provisioned

Description: This group contains the attributes associated to each autonomous system for this *Bgp* component instance.

Mib: Bgp

ATTRIBUTE Vr Ip Bgp As weight

Access: Read and write

Description: This attribute specifies the weight for an autonomous system. It allows users to prefer some ASes over others. It is used in route selection. Lowest weight is preferred. Setting the weight of an AS to 255 will make any route that traverses through that AS unpreferred.

Mib: Bgp

Values: Decimal (0..255)

Default: 128

COMPONENT Vr Ip Bgp AggregatePolicy (Aggregate)

Instance: prefix [IP address]
length [Decimal (0..32)]

Scope: Application

Description: *Vr/<string> Ip Bgp AggregatePolicy/<Ip Address>,<Decimal>*
Rtr/<string> Bgp AggregatePolicy/<Ip Address>,<Decimal>
Rtr/<string> Vrf/<string> Bgp AggregatePolicy/<Ip Address>,<Decimal>
This component is used to perform aggregation of BGP routes for exporting. Aggregation is the process of combining the characteristics of several different routes in such a way that a single route can be advertised. Aggregation reduces the amount of information that a BGP speaker must store and exchange with other BGP speakers. Refer to RFC1771 for the set of rules regarding which routes can be aggregated. A ***network*** subcomponent is automatically added with the same network range as the aggregation policy key and its action is set to ***aggregate***. So by default all subnets under the aggregation key range will be aggregated. Examples (For *Router* and *Vrf*, the examples are similar by replacing 'vr/0

Copyright © 2006, Nortel Nortel Confidential

ip' with 'Router/a' and 'Router/a Vrf/b' respectively):
Example #1: aggregate all the networks covered by A.0.0.0/8
add vr/0 ip bgp aggregate/A.0.0.0,8
(Note: the following subcomponent vr/0 ip bgp aggregate/A.0.0.0,8 network/0 prefix A.0.0.0, length 8, action aggregate will be automatically added)

Example #2: aggregate A.B.0.0/16 and A.C.0.0/16 as A.0.0.0/8 and advertise other networks
add vr/0 ip bgp aggregate/A.0.0.0,8
set vr/0 ip bgp aggregate/A.0.0.0,8 network/0 prefix A.B.0.0, length 16, action aggregate
(Note: this set command will overwrite the default network subcomponent vr/0 ip bgp aggregate/A.0.0.0,8 network/0 prefix A.0.0.0, length 8, action aggregate)
add vr/0 ip bgp aggregate/A.0.0.0,8 network/1
set vr/0 ip bgp aggregate/A.0.0.0,8 network/1 prefix A.C.0.0, length 16, action aggregate

Example #3: aggregate A.B.0.0/16 and A.C.0.0/16 as A.0.0.0/8 and advertise other networks; also advertise A.B.C.0/24
add vr/0 ip bgp aggregate/A.0.0.0,8
set vr/0 ip bgp aggregate/A.0.0.0,8 networkl/0 prefix A.B.0.0, length 16, action aggregate
add vr/0 ip bgp aggregate/A.0.0.0,8 network/1
set vr/0 ip bgp aggregate/A.0.0.0,8 network/1 prefix A.C.0.0, length 16, action aggregate
add vr/0 ip bgp aggregate/A.0.0.0,8 network/2
set vr/0 ip bgp aggregate/A.0.0.0,8 network/2 prefix A.B.C.0, length 24, action advertise

Example #4: aggregate all networks under A.0.0.0/8, meanwhile advertise A.B.0.0/16
add vr/0 ip bgp aggregate/A.0.0.0,8
add vr/0 ip bgp aggregate/A.0.0.0,8 network/1
set vr/0 ip bgp aggregate/A.0.0.0,8 network/1 prefix A.B.0.0, length 16, action advertise

GROUP Vr Ip Bgp Aggregate Net Provisioned (Prov)

Properties	Provisioned
Description	This group contains the set of provisionable attributes for the *Network* component.
Mib	Bgp

ATTRIBUTE Vr Ip Bgp Aggregate Net prefix

Access	Read and write
Description	This attribute specifies the network prefix whose length is determined by the *length* attribute under the same *Network* component.
Mib	Bgp
Values	IP address
Default	0.0.0.0

ATTRIBUTE Vr Ip Bgp Aggregate Net length

Access	Read and write
Description	This attribute specifies the length of the network prefix.
Mib	Bgp
Values	Decimal (0..32)
Units	bits
Default	0

ATTRIBUTE Vr Ip Bgp Aggregate Net protocol

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the IP protocols to which this route should belong.
Mib	Bgp
Values	all egp rip ospfInternal ospfExternal staticLocal staticRemote bgpInternal bgpExternal
Default	all

ATTRIBUTE Vr Ip Bgp Aggregate Net **egpAsId (egpAs)**

Access	Read and write
Description	This attribute specifies an EGP autonomous system number. When this value is non-zero, the *protocol* attribute must be set to either ***egp*** or to ***all***. And this more specific route will be advertised together with the aggregated route only if it is learned through egp and this attribute matches the EGP autonomous system number where the network is learned from. The default value 0 indicates that the EGP autonomous system number is not specified.
Mib	Bgp
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Vr Ip Bgp Aggregate Net **bgpAsId (bgpAs)**

Access	Read and write
Description	This attribute specifies the BGP autonomous system number. When this value is non-zero, the *protocol* attribute must be set to either ***bgp*** or to ***all***. And this more specific route will be advertised together with the aggregated route only if it is learned through BGP and this attribute matches the BGP autonomous system number where the network is learned from. The default value 0 indicates that the BGP autonomous system number is not specified.
Mib	Bgp
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Vr Ip Bgp Aggregate Net **ospfTag**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the OSPF tag. When this attribute is set to a value other than the default value FFFFFFFF in hex, the *protocol* attribute must be set to either ***ospf*** or to ***all***. And this more specific route will be advertised together with the aggregated route only if its OSPF tag matches this value. The default tag value 4294967295 (FFFFFFFF in hex) indicates that the tag is not specified.
Mib	Bgp
Values	Hex (H.0..H.ffffffff)
Default	H.ffffffff

ATTRIBUTE Vr Ip Bgp Aggregate Net **ripInterface (ripIf)**

Access	Read and write
Description	This attribute specifies a local RIP interface which should be equal to one of the IP addresses provisioned as a *logicalIf* component under *IpPort*, or one of the IP addresses provisioned as an *Interface* component. When this value is non-zero, the value of the *protocol* attribute must be either set to ***rip*** or to ***all.*** And this more specific route will be advertised together with the aggregated route only if it is learned through RIP and this RIP interface. The default value 0.0.0.0 indicates that the RIP interface is not specified.
Mib	Bgp
Values	IP address
Default	0.0.0.0

ATTRIBUTE Vr Ip Bgp Aggregate Net **action**

Access	Read and write
Description	This attribute specifies whether this network should be aggregated or advertised out.
Mib	Bgp
Values	aggregate advertise
Default	aggregate

ATTRIBUTE Vr Ip Bgp LocalVpn Ipv4 publicIpAddress

Access	Read only
Description	This attribute indicates the public IP Address for the remote IP VPN tunnel endpoint. It is used to encapsulate IP packets from the local IP VPN site to the remote site.
Mib	Bgp
Values	IP address
Default	No default

ATTRIBUTE Vr Ip Bgp LocalVpn Ipv4 vpnPeeringTopology

Access	Read only
Description	This attribute indicates the peering mode of the remote customer BGP from which this VPN information is originated. This mode determines if a dynamic IBGP peer is instantiated between this *BGP* instance and the remote IP Tunnel endpoint on the remote customer VR. A ***none*** value specifies that BGP never instantiate dynamic IBGP peers. Dynamic IBGP peer is instantiated between two customer VR in the same VPN if and only if at least one end is configured with a ***hub*** value and the other is either configured with a ***hub*** or a ***spoke*** value. In any case; static BGP peers may be configured and overwrite the dynamic ones after auto-discovery has taken place. If auto-discovery is enabled when static peers already present between VPN sites, no

Copyright © 2006, Nortel Nortel Confidential

dynamic peers with the same provisioned peer instance will be instantiated regardless of the configured value of the attribute.

Groups: GROUP Vr Ip Bgp MBgpRib Operational (Oper)

Scope: Application

Description:
Vr/<string> Ip Bgp MBgpRibEntry/ <vpnid>,<prefix>,<length>,<peer_ip_address>
This component represents a single MBGP routing database entry received from one of the BGP peers of this virtual router.

The instance values of this component have the following meanings:
- *vpnId:* the virtual private network identifier associated with the MBGP route.
- *prefix*: the destination IP address prefix of the MBGP route.
- *length:* the length of the IP address prefix of the MBGP route.
- *peer_ip_address:* the IP address prefix of the BGP peer that the MBGP route has been learned from. A value of 0.0.0.0 indicates that the MBGP route is learned from a locally attaching customer VR.

This component only appears under a *VirtualRouter* component whose *vpnMode* attribute is set to ***carrier***.

ATTRIBUTE Vr Ip Bgp MBgpRib origin

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the ultimate origin of the path information. A value of ***incomplete*** means this information is not available.
Mib	Bgp
Values	igp egp incomplete
Default	No default

ATTRIBUTE Vr Ip Bgp MBgpRib status

Access	Read only
Description	This attribute indicates whether the MBGP route has been distributed into the routing table of the customer VR corresponding to the VPN identifier value.
Mib	Bgp
Values	localVpnRoute inCvrRdb importBlocked importLimitExceeded unreachableNh
Default	No default

ATTRIBUTE Vr Ip Bgp MBgpRib nextHop

Access	Read only
Description	This attribute indicates the IP address of the router that should be used as the next hop to reach the destination address prefix given by the instance value of this component.
Mib	Bgp
Values	IP address
Default	No default

ATTRIBUTE Vr Ip Bgp MBgpRib localPreference

Access	Read only
Description	This attribute indicates the local IBGP peer's degree of preference for an advertised route. A higher value indicates a more preferred route.
Mib	Bgp
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Ip Bgp MBgpRib multiExitDiscriminator (med)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates a metric used to discriminate between multiple exit points to the same adjacent autonomous system. A lower value indicates a more preferred route.
Mib	Bgp
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Ip Bgp MBgpRib **atomicAggregate**

Access	Read only
Description	This attribute indicates whether or not the local system has selected a less specific route.
Mib	Bgp
Values	lessSpecificRouteNotSelected lessSpecificRouteSelected
Default	No default

ATTRIBUTE Vr Ip Bgp MBgpRib **aggregatorAs**

Access	Read only
Description	This attribute indicates the AS number of the last BGP4 speaker that performed route aggregation. A value of zero (0) indicates the absence of this path attribute.
Mib	Bgp
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Vr Ip Bgp MBgpRib **aggregatorAddr**

Access	Read only
Description	This attribute indicates the IP address of the last BGP4 speaker that performed route aggregation. A value of 0.0.0.0 indicates the absence of this path attribute.
Mib	Bgp
Values	IP address
Default	No default

ATTRIBUTE Vr Ip Bgp MBgpRib **asPath**

Access	Read only
Description	This attribute indicates the sequence of AS path segments. The AS Path Attribute lists the ASs in reverse traversal order.

Values	String (0..255, ASCII)
Default	No default

ATTRIBUTE Vr Ip Bgp MBgpRib unknownAttributes (unknown)

Access	Read only
Description	This attribute indicates all the path attributes not understood by this *Bgp* component instance.
Mib	Bgp
Values	String (0..255, ASCII)
Default	No default

COMPONENT Vr Ip Bgp MplsVpnRibEntry (MvRib)

Instance	routeDistinguisher [String (3..21, RFC2547RdRtSyntax)] prefix [IP address] length [Decimal (0..32)] peer [IP address]
Groups	GROUP Vr Ip Bgp MvRib Operational (Oper)
Scope	Application
Description	*Vr/<string> Ip Bgp MplsVpnRibEntry/* <routeDistinguisher>,<prefix>,<length>,<peerIpAddr> *Rtr/<string> Ip Bgp MplsVpnRibEntry/* <routeDistinguisher>,<prefix>,<length>,<peerIpAddr> The *MplsVpnRibEntry* component represents a single entry in the MPLS VPN routing information database.This component is used to maintain the MPLS VPN routes learned both locally and from the BGP peers. The instance values of this component have the following meaning: - *routeDistinguisher:* a string associated with the MPLS VPN route. The string is in the form of (1) AS:nn or (2) IPAddr:mm. where AS represents an autonomous system number, nn represents an index value, IPAddr represents an IP address,

Copyright © 2006, Nortel Nortel Confidential

mm represents an index value

- *prefix*: the destination IP address prefix of the MPLS VPN route. This is an IP address prefix as specified in the Network Layer Reachability Information field of the MP_REACH_NLRI path attribute.

- *length:* the length of the IP address prefix of the MPLS VPN route. This is the IP address prefix length as specified in the Network Layer Reachability Information field.

- peerIpAddr: the IP address prefix of the BGP peer that the MPLS VPN route has been learned from.

This component is only applicable to the *Router* component or a virtual router whose *vpnMode* attribute is set to ***carrier***.

GROUP Vr Ip Bgp MvRib Operational (Oper)

Properties: Operational

Description: This group contains the operational attributes of the *BgpMplsRibEntry* component.

Mib: Bgp

ATTRIBUTE Vr Ip Bgp MvRib serviceLabel (sl)

Access: Read only

Description: This attribute indicates the service label (the inner label in a two-level MPLS label stack) allocated by the Provider Edge (PE) node and distributed together with the routing information toward the remote end PE. The service label is then used by the remote PE node to encapsulate traffic of the same VPN to the local PE node. When the local PE node processes a received packet which has the service label at the top of the stack, the PE pops the stack, and sends the packet to the Customer Edge (CE) node from which the route leads. (See also transportLabel attribute description.)

Mib: Bgp

Values: Decimal (0..1048575)

Default: No default

ATTRIBUTE Vr Ip Bgp MvRib transportLabel (tl)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the transport label (the outer label in a two-level MPLS label stack) allocated by the Provider Edge (PE) node. The transport label identifies the MPLS tunnel (Labeled Switched Path) used to transport the service label encapsulated VPN traffic, between two PE nodes, through the backbone. The transport label is applied on top of the service label at the source PE node, and used to direct the VPN traffic (travelling through the network core) to the destination PE. At the destination PE node the transport label is stripped, leaving the service label encapsulated packet to be processed and forwarded to a CE node based on the service label. A value of ***awaitingLabel*** indicates the MPLS tunnel is currently not available and waiting to be established. A value of ***notApplicable*** indicates this is a local route and hence doesn't have a transport label.
Mib	Bgp
Values	Decimal (0..1048575) awaitingLabel notApplicable
Default	No default

ATTRIBUTE Vr Ip Bgp MvRib reachable (reach)

Access	Read only
Description	This attribute indicates whether a route is currently reachable through an LSP tunnel.
Mib	Bgp
Values	true false
Default	No default

ATTRIBUTE Vr Ip Bgp MvRib bgpNextHop (bgpNh)

Description	This attribute specifies whether an alarm is generated when a security violation is detected by this security policy database. Examples of security violations include policy mismatch and authentication failure.
Mib	IpSec
Values	enabled disabled
Default	enabled

GROUP Vr Ip Spd Statistics (Stats)

Properties	Operational
Description	This group contains statistics for the *SecurityPolicyDatabase* component. These counts cannot be associated with individual SAs, so they are aggregated under the *SecurityPolicyDatabase* component. Counts that can be associated with a particular SA are defined under the *Sa* component.
Mib	IpSec

ATTRIBUTE Vr Ip Spd outDiscards

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the packets discarded by an outbound security policy. This count includes packets that are discarded because they have no matching security policy; the default security policy action is always discard. The count wraps to zero when it reaches the value 2 to the power 64.
Mib	IpSec
Values	Long Integer
Default	No default

ATTRIBUTE Vr Ip Spd inSaLookupFailures

Access	Read: All Write: Illegal
Description	This attribute counts the inbound packets for which an SA could not be found. The count wraps to zero when it reaches the value 2 to the power 64.
Mib	IpSec
Values	Long Integer
Default	No default

ATTRIBUTE Vr Ip Spd inDiscards

Access	Read: All Write: Illegal
Description	This attribute counts the packets discarded because the Security Parameter Index (SPI) in the packet is unknown, or no SA is found with matching selectors. The count wraps to zero when it reaches the value 2 to the power 64.
Mib	IpSec
Values	Long Integer
Default	No default

ATTRIBUTE Vr Ip Spd inMismatch

Access	Read: All Write: Illegal
Description	This attribute counts the packets discarded due to a mismatch between the packet and what the security policy dictates. An example of a mismatch is when a packet is received on a security enabled management virtual router in the clear (no security services applied), but the security policy for that VR specifies that this packet should have an applied security service. The count wraps to zero when it reaches the value 2 to the power 64.

COMPONENT Vr Ip Spd Policy

Instance	Decimal (1..65535)
Groups	GROUP Vr Ip Spd Policy Selectors GROUP Vr Ip Spd Policy Provisioned (Prov) GROUP Vr Ip Spd Policy Operational (Oper)
Scope	Application
Description	*Vr/<string> Ip Spd/<string> Policy/n* The *Policy* component defines an IPSec policy to be applied for a virtual router. An IPSec policy is defined by the following parameters: 1. The selector criteria specifying packets to which the security policy is to be applied. 2. The action taken when a packet matches the security policy selectors. Up to 4096 policies are allowed for each instance of the *SecurityPolicyDatabase* component. The instance value of the *Policy* component specifies the policy's precedence. Policy lookup occurs in the order of increasing precedence value. If no match is found, the packet is discarded. It is recommended that the instance values of consecutive *Policy* components be separated by more than 1 (say 10). This allows a new *Policy* component to be added whose precedence value is intermediate between two existing policies. Each *Policy* component instance has an associated direction: inbound or outbound. - An inbound *Policy* instance corresponds to an entry in the inbound security policy database (SPD), as referred to in RFC 2401. IPSec traffic received on the management virtual router, is matched against inbound policies. - An outbound *Policy* instance corresponds to an entry in the outbound SPD, as referred to in RFC 2401. Locally generated traffic is matched against outbound policies. The *Policy* component allows the operator to distinguish a flow based on: 1. destination IP address, 2. source IP address,

Copyright © 2006, Nortel Nortel Confidential

3. layer 4 (transport) protocol, and
4. for TCP and UDP, the source and destination port numbers.

ATTRIBUTE Vr Ip Spd Policy Sa direction

Access	Read: All Write: Illegal
Description	This attribute indicates the traffic direction for which this *Sa* component is used.
Mib	IpSec
Values	inbound outbound
Default	No default

ATTRIBUTE Vr Ip Spd Policy Sa upTime

Access	Read: All Write: Illegal
Description	This attribute indicates the time elapsed since this *Sa* component was created.
Mib	IpSec
Values	Decimal (0..4294967295)
Units	seconds
Default	No default

ATTRIBUTE Vr Ip Spd Policy Sa state

Access	Read: All Write: Illegal
Description	This attribute indicates the operational state of this *SA*. - ***uninitialized*** - ***initialized*** ***- createSaSemt*** - ***established*** - ***deletedByPeer***
Mib	IpSec
Values	uninitialized initialized createSaSemt established deleted
Default	uninitialized

ATTRIBUTE Vr Ip Spd Policy Sa remainingTimeToLive (remTTL)

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the time, in seconds, that a fully established dynamic *SA* will continue to exist without renegotiation. For provisioned *SA* components, this attribute will be set to a value of ***forever***. For dynamic *SA* components that are not fully established, the attribute value will be set to a value of ***notEstablished***.
Mib	IpSec
Values	Decimal (0..4294967295)
Units	seconds
Default	No default

ATTRIBUTE Vr Ip Spd Policy Sa maxTimeToLive (maxTTL)

Access	Read: All Write: Illegal
Description	This attribute indicates the negotiated maximum time, in seconds, that a fully negotiated *SA* wil continue to exist without renegotiation. For provisioned *SA* components, this attribute will be set to a value of ***forever***. For dynamic *SA* components that are not fully established, the attribute value will be set to a value of ***notEstablished***.
Mib	IpSec
Values	Decimal (0..4294967295)
Units	seconds
Default	No default

ATTRIBUTE Vr Ip Spd Policy Sa perfectForwardSecrecy (pfs)

Access	Read: All Write: Illegal
Description	This attribute indicates if PFS has been negotiated.
Mib	IpSec
Values	off on
Default	No default

ATTRIBUTE Vr Ip Spd Policy Sa antiReplay

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates whether or not anti-replay protection has been enabled for this *SA* component..
Mib	IpSec
Values	off on
Default	No default

ATTRIBUTE Vr Ip Spd Policy Sa encryptionAlgorithm (encAlg)

Access	Read: All Write: Illegal
Description	This attribute indicates the encryption algorithm in use by this *SA*.
Mib	IpSec
Values	none des 3des aes
Default	No default

ATTRIBUTE Vr Ip Spd Policy Sa authenticationAlgorithm (authAlg)

Access	Read: All Write: Illegal
Description	This attribute indicates the authentication algorithm in use by this *SA*.
Mib	IpSec
Values	none sha1 md5
Default	No default

ATTRIBUTE Vr Ip Spd Policy Sa diffieHellmanGroup (dhg)

Access	Read: All Write: Illegal
Description	This attribute indicates the Diffie Hellman Group number in use on this *SA*.
Mib	IpSec
Values	none gp1 gp2
Default	No default

GROUP Vr Ip Spd Policy Sa Statistics (Stats)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the statistics attributes of this *Sa*.
Mib	IpSec

ATTRIBUTE Vr Ip Spd Policy Sa decryptErrors

Access	Read: All Write: Illegal
Description	This attribute counts the packets for which decryption errors were encountered for this *Sa* component. The count wraps to zero when it reaches the value 2 to the power 64.
Mib	IpSec
Values	Long Integer
Default	No default

ATTRIBUTE Vr Ip Spd Policy Sa authErrors

Access	Read: All Write: Illegal
Description	This attribute counts the authentication errors encountered for this *Sa* component. The count wraps to zero when it reaches the value 2 to the power 64.
Mib	IpSec
Values	Long Integer
Default	No default

ATTRIBUTE Vr Ip Spd Policy Sa byteCount

Access	Read: All Write: Illegal
Description	This attribute counts the bytes processed for this *Sa* component. The count wraps to zero when it reaches the value 2 to the power 64.
Mib	IpSec
Values	Long Integer
Units	bytes
Default	No default

ATTRIBUTE Vr Ip Spd Policy Sa policyErrors

Access	Read: All Write: Illegal
Description	This attribute counts the security packets received on this *Sa* component which do not match the defined Security Policy selectors. The count wraps to zero when it reaches the value 2 to the power 64.
Mib	IpSec

Copyright © 2006, Nortel Nortel Confidential

Values	Long Integer
Default	No default

ATTRIBUTE Vr Ip Spd Policy Sa otherErrors

Access	Read: All Write: Illegal
Description	This attribute counts the security packets received on this *Sa* component for which an error is encountered other than those described previously. The count wraps to zero when it reaches the value 2 to the power 64.
Mib	IpSec
Values	Long Integer
Default	No default

ATTRIBUTE Vr Ip Spd Policy Sa packetCount

Access	Read: All Write: Illegal
Description	This attribute counts the packets processed for this *Sa* component. The count wraps to zero when it reaches the value 2 to the power 64.
Mib	IpSec
Values	Long Integer
Default	No default

ATTRIBUTE Vr Ip Spd Policy Sa replayErrors (rerr)

Access	Read: All Write: Illegal
Description	This attribute counts duplicate sequence numbers, as defined in RFC 2046, for this *Sa* component. The count wraps to zero when it exceeds the maximum value.
Mib	IpSec
Values	Long Integer
Default	No default

COMPONENT Vr Ip Spd Policy Sa ManualEspSa (ManEspSa)

Groups	GROUP Vr Ip Spd Policy Sa ManEspSa Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Spd/<string> Policy/<string> Sa/<secDestination, secProtocol, spi> ManualEspSa* The *ManualEspSa* component specifies the security parameters for the ESP protocol, including keys, to use between two peers. No negotiation is performed between the peers.

Copyright © 2006, Nortel Nortel Confidential

When using manual keying, both ends of the IPsec session must be configured to match each other. The SPI value on one end must be the same as the SPI value on the other end. The *key* attributes on both ends must also be the same.

Properties Provisioned

Description This group contains the provisionable attributes for the *ManualEspSa* component.

Mib IpSec

ATTRIBUTE Vr Ip Spd Policy Sa ManEspSa **encAlgorithm (encAlg)**

Access
Read: All
Write: System_admin

Description This attribute specifies the encryption algorithm to be used for this Encryption Security Protocol (ESP) security association (SA).

The following encryption algorithms are supported:
- ***des***: data encryption standard (DES), which is the most widely used algorithm
- ***3des***: encryption using DES three times. This encryption algorithm is stronger than DES.
- ***aes***: Advanced Encryption Standard. This encryption algorithm is as strong as, and more efficient than, 3DES.

If no ESP encryption is desired, set this attribute to ***none***.

At least one of *encAlg* and *authAlg* attribute must be specified; they cannot both be set to ***none***.

Mib IpSec

Values
none
des
3des
aes

Default des

ATTRIBUTE Vr Ip Spd Policy Sa ManEspSa **authAlgorithm (authAlg)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: System_admin
Description	This attribute specifies the authentication algorithm to be used for this ESP security association (SA). The following authentication algorithms are supported: - ***md5***: message digest - ***sha1***: secure hash algorithm SHA-1 is considered stronger than MD5. If no ESP authentication is desired, set this attribute to ***none***. At least one of *encAlg* and *authAlg* attribute must be specified; they cannot both be set to ***none***.
Mib	IpSec
Values	none sha1 md5
Default	none

ATTRIBUTE Vr Ip Spd Policy Sa ManEspSa **encKey**

Access	Read: Illegal Write: System_admin
Description	This attribute specifies the symmetric encryption key to be used in the ESP protocol. When the *encAlgorithm* attribute is set to ***des***, the length of the key must be 16 hex digits. When the *encAlgorithm* attribute is set to ***3des***, the length of the key must be 48 hex digits. When the *encAlgorithm* attribute is set to ***aes***, the length of the key must be 32 hex digits. The key itself is stored in an encrypted form. A warning is issued when using the DES or 3DES algorithms if the key is weak as defined in RFC 2409 Appendix A. There are no known weak keys for AES according to RFC3602.
Mib	IpSec
Values	String (0..24, Hex)
Default	No default

ATTRIBUTE Vr Ip Spd Policy Sa ManEspSa **authKey**

Access	Read: Illegal Write: System_admin

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the symmetric key to use for the keyed-hash function of the ESP protocol. When the *authAlgorithm* attribute is set to ***md5***, the length of the key must be 32 hex digits. When *authAlgorithm* attribute is set to ***sha1***, the length of the key must be 40 hex digits. The key itself is stored in an encrypted form.
Mib	IpSec
Values	String (0..24, Hex)
Default	No default

ATTRIBUTE Vr Ip Spd Policy Sa ManEspSa **antiReplay**

Access	Read: All Write: System_admin
Description	This attribute specifies whether or not the antiReplay feature is enabled for the *SecurityAssociation* component instance. This attribute has no impact on the *SecurityAssociation* component instances under the *Policy* components which have the *direction* attribute set to ***outbound***.
Mib	IpSec
Values	off on

COMPONENT Vr Ip Filter (Filt)

Instance	String (1..20, ASCII)
Groups	GROUP Vr Ip Filt Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip* Filter/<string> The Filter component specifies which set of IP packet flows are admitted at a protocol port. A Filter component can be assigned to the Ip component and any number of the Pp IpPort components under the same Vr component. A Filter assigned to a Vr Ip component is associated by default with all of the

Copyright © 2006, Nortel Nortel Confidential

protocol ports on the virtual router. A Filter assigned to a Vr Pp IpPort component is associated with the protocol port only. A Filter assigned at the port overrides a Filter assigned at the virtual router.

A Filter associated with a protocol port is applied to all ingress IP traffic at that port; it is not applied to egress traffic at that port. Filtering is performed prior to making the forwarding decision that determines the egress port where the packet will be transmitted.
If no Filter component is associated with a port (because there is neither an assignment to the Vr Ip component, nor an assignment to the Vr Pp IpPort component) all IP packet flows are admitted at that port.

A Filter defined under one Vr cannot be assigned to components under another Vr.

A Filter component must have at least one *FilterFlow* subcomponent where the value of the *action* attribute is ***permit***.

COMPONENT Vr Ip Filt FilterFlow (Flow)

Instance	Decimal (0..1023)

Copyright © 2006, Nortel Nortel Confidential

Groups	GROUP Vr Ip Filt Flow Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Filter/<string> FilterFlow/n* This component specifies an IP packet flow and the filter action for that flow within an IP filter. A filter is defined by specifying one or more packet flows and the filter action for each flow. Each packet flow is defined in terms of source IP address and destination IP address. The filter action can be either ***permit*** or ***deny***. The filter action for any individual packet is determined by the flow which has the most specific match to the packet's header information. Any packet with header information that does not match any flow in the filter is dropped. If the filter action is ***permit*** the packet is processed and forwarded in the normal manner. If the filter action is ***deny*** the packet is dropped. When the source or destination address of an IP packet matches more than one of the specified flows under a filter, the following precedence rule is applied to determine which filter action to apply: Given a set of flows with overlapping source addresses, the match made with the most precise source address specification (that is the one with the greatest prefix length) is always given the highest precedence over all the others; once the source address specification is selected in this manner, if there exists several overlapping destination addresses, the match made with the most precise destination address specification (that is the one with the greatest prefix length) is used.
Mib	IpFilt
Common Verbs	Help List Display Add DELete

GROUP Vr Ip Filt Flow Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the *FilterFlow* component.
Mib	IpFilt

ATTRIBUTE Vr Ip Filt Flow saPrefix

Access	Read and write
Description	This attribute specifies the IP source address prefix for this flow. Matching an actual source address to the prefix is done in conjunction with the *saPrefixLength* attribute.

Copyright © 2006, Nortel Nortel Confidential

A source address prefix of 0.0.0.0 means any source IP address is a match regardless of the prefix length.

When the source or destination address of an IP packet matches more than one of the specified flows under a filter, the following precedence rule is applied to determine which filter action to apply:

Given a set of flows with overlapping source addresses, the match made with the most precise source address specification (that is the one with the greatest prefix length) is always given the highest precedence over all the others; once the source address specification is selected in this manner, if there exists several overlapping destination addresses, the match made with the most precise destination address specification (that is the one with the greatest prefix length) is used.

Mib	IpFilt
Values	IP address
Default	No default

ATTRIBUTE Vr Ip Filt Flow saPrefixLength (salen)

Access	Read and write
Description	This attribute specifies the number of most significant bits of the IP source address that are to be matched with the *saPrefix* attribute. A source prefix length of 0 means any IP source address is a match regardless of the prefix.
Mib	IpFilt
Values	Decimal (0..32)
Default	No default

ATTRIBUTE Vr Ip Filt Flow action

Access	Read and write
Description	This attribute specifies one of the following two filter actions to be taken for an IP packet that matches this flow: ***permit*** : the packet is processed normally ***deny*** : the packet is dropped. A *Filter* component must have at least one *FilterFlow* subcomponent where the filter action is ***permit***.
Mib	IpFilt
Values	deny permit
Default	permit

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ip Filt Flow daPrefix

Access	Read and write
Description	This attribute specifies the IP destination address prefix for this flow. Matching an actual destination address to the prefix is done in conjunction with the daPrefixLength attribute. A destination address prefix of 0.0.0.0 means any destination IP address is a match regardless of the prefix length. When the source or destination address of an IP packet matches more than one of the specified flows under a filter, the following precedence rule is applied to determine which filter action to apply: Given a set of flows with overlapping source addresses, the match made with the most precise source address specification (that is the one with the greatest prefix length) is always given the highest precedence over all the others; once the source address specification is selected in this manner, if there exists several overlapping destination addresses, the match made with the most precise destination address specification (that is the one with the greatest prefix length) is used.

GROUP Vr Ip Mcast Cache OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described

Copyright © 2006, Nortel Nortel Confidential

here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib IpMcast

ATTRIBUTE Vr Ip Mcast Cache adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib IpMcast

Values locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

ATTRIBUTE Vr Ip Mcast Cache operationalState (osiOper)

Access Read only

Description This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib IpMcast

Values enabled (ena)
disabled (dis)

Default disabled

ATTRIBUTE Vr Ip Mcast Cache usageState (osiUsage)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	IpMcast
Values	idle active (activ) busy
Default	idle

GROUP Vr Ip Mcast Cache Operational (Oper)

Properties	Operational
Description	This group houses all the operational attributes of an *Ip* cache table.
Mib	IpMcast

ATTRIBUTE Vr Ip Mcast Cache entriesFree (ef)

Access	Read only
Description	This attribute is indicative of the number of free *Ip* cache table entries. A consistently high value for this attribute indicates that there is a resource surplus of the memory requirements for cache table. This surplus could be utilized elsewhere if needed by adjusting the appropriate *cacheTableMaxEntries* attribute. For *Vr*, *cacheTableMaxEntries* is under the *Ip* component; for *Rtr* and *Vrf*, it is under the respective components.
Mib	IpMcast
Values	Decimal (0..8000)
Default	No default

ATTRIBUTE Vr Ip Mcast Cache totalLookups (tl)

Access	Read only
Description	This attribute indicates the total number of local cache lookups. It wraps around to zero when it exceeds its maximum value of 4294967295.
Mib	IpMcast
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ip Mcast Cache **lookupMisses (lm)**

Access	Read only
Description	This attribute indicates the total number of local cache lookup misses. It wraps around to zero when it exceeds its maximum value of 4294967295.
Mib	IpMcast
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr Ip Mcast Cache **cacheTableMaxEntries (ctme)**

Access	Read only
Description	This attribute indicates the current maximum number of entries that can exist in the IP local cache table on each LP.
Mib	IpMcast
Values	Decimal (0..8000)
Default	No default

COMPONENT Vr Ip Mcast **PimSparseMode (PimSm)**

Groups	GROUP Vr Ip Mcast PimSm AdministrativeControl (AdminControl) GROUP Vr Ip Mcast PimSm OsiState (State) GROUP Vr Ip Mcast PimSm OperationalStatus (OperStatus)
Scope	Application
Description	*Vr/<string> Ip Mcast PimSm* The Protocol Independent Multicast Sparse Mode (PIM-SM) component represents a multicast protocol which can be used to efficiently route multicast traffic to multicast groups that may span wide-area internets. The PIM-SM is referred as protocol independent multicast because it is not dependent on any particular unicast routing protocol and it is designed to support groups which are sparsely located.

Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP Vr Ip MBgp Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes of the *MBgp* component.
Mib	Ip

ATTRIBUTE Vr Ip MBgp defaultMBgpRtePreference (pref)

Access	Read and write
Description	This attribute specifies the default routing preference assigned to MBGP routes for this virtual router. A lower value indicates a more preferred route.
Mib	Ip
Values	Decimal (1..253)
Default	123

ATTRIBUTE Vr Ip MBgp importRoutesLimit (importl)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the maximum number of MBGP routes to be imported to this virtual router's routing table from the associated VCG virtual router.
Mib	Ip
Values	Decimal (1..65535)
Default	300

ATTRIBUTE Vr Ip MBgp exportRoutesLimit (exportl)

Access	Read and write
Description	This attribute specifies the maximum number of routes to be exported from this virtual router's routing table to the MBGP routing database of the associated VCG virtual router.
Mib	Ip
Values	Decimal (1..65535)
Default	50

GROUP Vr Ip MBgp Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *MBgp* component.
Mib	Ip

ATTRIBUTE Vr Ip MBgp importRoutes

Access	Read only
Description	This attribute indicates the number of MBGP routes that have been imported to this virtual router's routing table from the associated VCG virtual router.
Mib	Ip
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip MBgp exportRoutes

Access	Read only
Description	This attribute indicates the number of MBGP routes that have been exported from this virtual router's routing table to the MBGP routing database of the associated VCG virtual router. Only routes that are allowed to be exported by the export policies are included in this number.
Mib	Ip
Values	Decimal (0..4294967295)

Default	0

GROUP Vr Ip MBgp OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Ip

ATTRIBUTE Vr Ip MBgp adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Ip
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Vr Ip MBgp operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or

Copyright © 2006, Nortel Nortel Confidential

with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — Ip

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Vr Ip MBgp usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — Ip

Values — idle
active (activ)
busy

Default — idle

COMPONENT Vr Ip MBgp ImportPolicy (Import)

Instance — Decimal (0..65535)

Groups — GROUP Vr Ip MBgp Import Provisioned (Prov)

Scope — Application

Description — *Vr/<string> Ip MBgp ImportPolicy/n*
Each instance of this component defines a MBGP import policy. A MBGP import policy is used to decide whether certain routing information learned from the associated VCG BGP instance is to be used or ignored.

If no import policy is provisioned, MBGP accepts all routes received from the associated VCG BGP. If multiple import policies are provisioned, the policy with the most specific match to the received route is applied.

Example 1:
Two import policies are defined:
vr/0 ip mbgp import/1, *peer* = ***0.0.0.0***, *usageFlag* = ***use***
vr/0 ip mbgp import/2, *peer* = ***47.138.190.1***, *usageFlag* = ***ignore***
This example specifies that MBGP should import all routes from the MBGP routing database of the associated VCG virtual router, except

Copyright © 2006, Nortel Nortel Confidential

routes learned from the VCG peer 47.138.190.1.

Example 2:
Two import policies are defined:
vr/0 ip mbgp import/1, *peer* = ***0.0.0.0***, *usageFlag* = ***use***
vr/0 ip mbgp import/2, *peer* = ***47.138.190.1***, *usageFlag* = ***ignore***
vr/0 ip mbgp import/2 network/1, *prefix* = ***50.0.0.0***, *length* = ***8***
This example specifies that MBGP should import all routes from the MBGP routing database of the associated VCG virtual router, except routes learned from the VCG peer 47.138.190.1 which match the network prefix address 50.0.0.0/8.

Mib	Ip

GROUP **Vr Ip MBgp Import** **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains the provisionable attributes for the *ImportPolicy* component.
Mib	Ip

ATTRIBUTE **Vr Ip MBgp Import** **vcgPeerIpAddress (vcgPeer)**

Access	Read and write
Description	This attribute specifies the IP address of the peer from which MBGP routes are learned. A value of ***0.0.0.0*** matches any peer IP address.
Mib	Ip
Values	IP address
Default	0.0.0.0

ATTRIBUTE **Vr Ip MBgp Import** **usageFlag (usage)**

Access	Read and write
Description	This attribute specifies whether this virtual router uses or ignores MBGP routing entries which match the criteria for this import policy.
Mib	Ip
Values	use ignore

Copyright © 2006, Nortel Nortel Confidential

Default	use

ATTRIBUTE Vr Ip MBgp Import originAs

Access	Read and write
Description	This key attribute specifies the autonomous system number where the routes were originated. A value of 0 for this attribute means origin AS number will match any AS number.
Mib	Ip
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Vr Ip MBgp Import originProtocol

Access	Read and write
Description	This key attribute specifies the protocols that originated the routes. A value of ***incomplete*** for this attribute means this information is not available. A value of ***any*** for this attribute means that any originating protocol will match this import policy.
Mib	Ip
Values	any igp egp incomplete
Default	any

ATTRIBUTE Vr Ip MBgp Import asPathExpression (asExpr)

Access	Read and write
Description	This key attribute allows the user to enter a regular expression to match the import AS Path Attribute of the received update message. Note: the AS Path Attribute lists the ASs in reverse traversal order. The syntax of the regular expression is a subset of the RFC 2280. The basic syntax of a regular expression is a list of AS number separated by a space which make up a AS path. The following characters has the special meaning: '.' - Matches any AS number. '^n' - Matches the first AS item (n) in the AS Path Attribute, or in order words, matches the last AS (n) traversed in the AS path. 'n$' - Matches the last AS item (n) in the AS Path Attribute, or in order words, matches the first AS (n) traversed in the AS path. '[n1 ... n2]' - Matches any AS number that appeared in the set n1 ... n2. 'n1 - n2' - Matches any AS number between the range of n1 and n2.

Copyright © 2006, Nortel Nortel Confidential

'()' - is supported to change the order of evaluation.
'n*' - Matches 0 or more occurrences of n, where n can be a set, range or AS number.
'n+' - Matches 1 or more occurrences of n, where n can be a set, range or AS number.
'n?' - Matches 0 or 1 occurrences of n, where n can be a AS set, range or number.
The following logical operators are evaluated in decending order:
'NOT' - Given a regular expression x, NOT x matches the AS number pattern that is not matched by x.
'AND'- Given two regular expressions x and y, x AND y matches the intersection of the AS path that are matched by x and those are matched by y.
'OR' - Given two regular expressions x and y, x OR y matches the union of the AS path that are matched by x and those are matched by y.
For example: The AS path "5 4 3 2 1", where 1 is the origin AS, would be match by any one of the following regular expressions:
1$,
^5,
4 3,
5 3 - 4*,
5 [4 3 2] not10 2 1,
not (6 7 8 9 10) and 5 4 .* 1
Empty regular expression implies a match on all AS path.

Mib	Ip
Values	String (0..255, ASCII)
Default	No default

ATTRIBUTE Vr Ip MBgp Import **communityExpression (comExpr)**

Access	Read and write
Description	This key attribute allows the user to enter a regular expression to match the import Community Attribute of the received update message. The syntax of the regular expression is a subset of the RFC 2280. The basic syntax of a regular expression is a list of Community number seperated by a space which make up a Community attribute. The following characters has the special meaning: '[n1 ... n2]' - Matches any Community number that appeared in the set n1 ...n2. 'n1 - n2' - Matches any Community number between the range of n1 and n2. '()' - is supported to change the order of evaluation. 'n*' - Matches 0 or more occurrences of n, where n can be a set, range or Community number. 'n+' - Matches 1 or more occurrences of n, where n can be a set, range or Community number. 'n?' - Matches 0 or 1 occurrences of n, where n can be a set, range or number.

Copyright © 2006, Nortel Nortel Confidential

The following logical operators are evaluated in decending order:
'NOT' - Given a regular expression x, NOT x matches the Community attribute that is not matched by x.
'AND'- Given two regular expressions x and y, x AND y matches the intersection of the Community attribute that are matched by x and those are matched by y.
'OR' - Given two regular expressions x and y, x OR y matches the union of the Community attribute that are matched by x and those are matched by y.
For example: The Community path "1 2 3 4 5" would be match by any one of the following regular expression:
1,
5,
4 3,
2 3 - 4*,
1 [3 4 2]+,
not (6 7 8 9 10) and 1 2
Empty regular expression implies a match on all Community path.

Mib	Ip
Values	String (0..255, ASCII)
Default	No default

ATTRIBUTE Vr Ip MBgp Import matchPreference (matchPref)

Access	Read and write
Description	This attribute specifies the relative preference of the policy which use the keys *asPathExpression* and *communityExpression*. This attribute is ignored if attributes *asPathExpression* and *communityExpression* are both empty. This attribute is used to break the tie when two import policies' expression attributes match a specific AS Path or Community. A higher value indicates a more preferred policy. Two import policies having the same *matchPreference* are considered duplicate policies if the *asPathExpression* attribute and the *communityExpression* attribute are not both empty.
Mib	Ip
Values	Decimal (0..255)
Default	128

ATTRIBUTE Vr Ip MBgp Import localPreference (locPrf)

Access	Read and write
Description	This attribute specifies the degree of preference for those routes that match the criteria of this import policy. A higher value indicates a more preferred route. A value of 0 for this attribute means that the local preference value remains unchanged.
Mib	Ip

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ip MBgp Import mbgpRtePreference (mbgpPref)

Access	Read and write
Description	This attribute specifies the routing preference of MBGP routes matching this import policy. A lower value means the route is more preferred. If ***sameAsMBgp*** is specified, the value of *defaultMbgpRtePref* set under the *MBgp* component is used. Otherwise the value of this attribute will be used as the routing preference.
Mib	Ip
Values	Decimal (1..253) sameAsMBgp
Default	sameAsMBgp

COMPONENT Vr Ip MBgp Import Network (Net)

Instance	Decimal (0..65535)
Groups	GROUP Vr Ip MBgp Import Net Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip MBgp Import/n Network/n* *Vr/<string> Ip MBgp Export/n Network/n* Each *Network* component instance specifies a destination network address prefix that this MBGP import or export policy applies to. If no *Network* component is provisioned under the *Policy* component, the policy applies to all destination network address prefixes.

COMPONENT Vr Ip MBgp ExportPolicy (Export)

Instance	Decimal (0..65535)
Groups	GROUP Vr Ip MBgp Export Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip MBgp ExportPolicy/n* Each instance of this component defines a MBGP export policy. A MBGP export policy is used to decide whether locally learned routing information is to be sent or blocked. If no export policy is provisioned, MBGP exports all routes into the MBGP routing database of the associated VCG virtual router, except those learned from IBGP and MBGP. If multiple export policies are provisioned, the policy with the most specific match to the route is applied. Example 1: Two export policies are defined: *vr/0 ip mbgp export/1*, *protocol* = ***all,*** *advertiseStatus* = ***send*** *vr/0 ip mbgp export/2*, *protocol* = ***rip***, *advertiseStatus* = ***block*** This example specifies that MBGP should export all routes in this virtual router's routing table, except routes learned from RIP. Example 2: Two export policies are defined: *vr/0 ip mbgp export/2*, *protocol* = ***all***, *advertiseStatus* = ***send*** *vr/0 ip mbgp export/3, protocol* = ***rip***, *advertiseStatus* = ***block*** *vr/0 ip mbgp export/3 network/1*, *prefix* = ***47.0.0.0***, *length* = ***8*** This example specifies that MBGP exports all routes in this virtual router's

Copyright © 2006, Nortel Nortel Confidential

routing table except routes learned from RIP which match the network address prefix 47.0.0.0/8.

Properties	Provisioned
Description	This group contains the provisionable attributes for the *Export* component.
Mib	Ip

ATTRIBUTE Vr Ip MBgp Export protocol

Access	Read and write
Description	This attribute specifies which protocol the export policy applies to. If the value is ***all***, the export policy is applied to routes from all protocols in the IP routing table.
Mib	Ip
Values	all rip ospfInternal ospfExternal staticLocal staticRemote bgpInternal bgpExternal bgpAggregate
Default	all

ATTRIBUTE Vr Ip MBgp Export advertiseStatus (advertise)

Access	Read and write
Description	This attribute specifies whether routing data which match the criteria for this policy are exported.
Mib	Ip
Values	send block
Default	send

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ip MBgp Export **bgpAsId (bgpAs)**

Access	Read and write
Description	This key attribute specifies the adjacent autonomous system (AS) number of the routes as a matching criteria. This corresponds to the first AS number in the AS Path. When this value is non-zero, the *protocol* attribute must be set to either ***bgpInternal*** or ***bgpExternal***.
Mib	Ip
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Vr Ip MBgp Export **ospfTag**

Access	Read and write
Description	This key attribute specifies the OSPF tag when the *protocol* attribute is set to either ***ospfInternal*** or ***ospfExternal***. The default tag value 4294967295 (FFFFFFFF in hex) indicates that the tag is not specified.
Mib	Ip
Values	Hex (H.0..H.ffffffff)
Default	H.ffffffff

ATTRIBUTE Vr Ip MBgp Export **ripInterface (ripIf)**

Access	Read and write
Description	This key attribute specifies the local RIP interface where the routes are learned from. The *ripInterface* attribute when non-zero should be equal to one of the IP addresses provisioned as a *LogicalIf* component under *IpPort*. Otherwise, this attribute will be ignored. The value of the *protocol* attribute must be set to ***rip*** if the value for the *ripInterface* attribute is non-zero.
Mib	Ip
Values	IP address
Default	0.0.0.0

ATTRIBUTE Vr Ip MBgp Export **ripNeighbor (ripNbr)**

Access	Read and write
Description	This key attribute specifies the RIP neighbor where the routes were learned from.

Copyright © 2006, Nortel Nortel Confidential

The value of the *protocol* attribute must be set to ***rip*** if the value for the *ripNeighbor* attribute is non-zero.

Mib	Ip
Values	IP address
Default	0.0.0.0

ATTRIBUTE Vr Ip MBgp Export asPathExpression (asExpr)

Access	Read and write
Description	This key attribute allows the user to enter a regular expression to match the import AS Path Attribute of the export update message. Note: the AS Path Attribute lists the ASs in reverse traversal order. The syntax of the regular expression is a subset of the RFC 2280. The basic syntax of a regular expression is a list of AS number separated by a space which make up a AS path. The following characters has the special meaning: '.' - Matches any AS number. '^n' - Matches the first AS item (n) in the AS Path Attribute, or in order words, matches the last AS (n) traversed in the AS path. 'n$' - Matches the last AS item (n) in the AS Path Attribute, or in order words, matches the first AS (n) traversed in the AS path. '[n1 ... n2]' - Matches any AS number that appeared in the set n1 ... n2. 'n1 - n2' - Matches any AS number between the range of n1 and n2. '()' - is supported to change the order of evaluation. 'n*' - Matches 0 or more occurrences of n, where n can be a set, range or AS number. 'n+' - Matches 1 or more occurrences of n, where n can be a set, range or AS number. Values	up down testing
Default	up

GROUP Vr Ip Vrrp OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	IpVrrp

ATTRIBUTE Vr Ip Vrrp snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	IpVrrp
Values	up down testing
Default	up

GROUP Vr Ip Vrrp OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	IpVrrp

ATTRIBUTE Vr Ip Vrrp adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — IpVrrp

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Vr Ip Vrrp operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — IpVrrp

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Vr Ip Vrrp usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

VERB Ping Vr Ipx

Impact	Passive
Description	*Ping -network (<network number>) [-node (<node number>)]* The ping verb allows the user to test the ability of an interface to contact other nodes. The *-network* option is used to receive responses from all nodes on that network. The *-node* option is used to or specify a particular node to ping. The nodes are given two seconds to respond. All responses received within the two second wait period will be displayed to the user. Pinging a remote wan link or network will produce unexpected results. Pinging a local wan link or network is invalid.

GROUP Vr Ipx **AdministrativeControl (AdminControl)**

Properties	Provisioned
Description	This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component.
Mib	Ipx

ATTRIBUTE Vr Ipx **snmpAdminStatus**

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed.
Mib	Ipx
Values	up down testing
Default	up

GROUP Vr Ipx **Provisioned (Prov)**

Properties	Provisioned
Description	IPX system provisionable attributes.
Mib	Ipx

ATTRIBUTE Vr Ipx **networkNumber**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the internal network number portion of the IPX address. This network number must be unique within the internetwork and is necessary to determine master/slave relationships during IPXWAN negotiations.
Mib	Ipx
Values	String (1..4, Dashed Hex)
Default	No default

ATTRIBUTE Vr Ipx maxPathSplits (maxPaths)

Access	Read and write
Description	This attribute indicates the maximum number of paths with equal routing metric value which this instance of IPX may split between when forwarding packets.
Mib	Ipx
Values	Decimal (1..4)
Default	1

ATTRIBUTE Vr Ipx maxHops (hops)

Access	Read and write
Description	This attribute indicates the maximum number of hops a packet may take.
Mib	Ipx
Values	Decimal (1..64)
Default	16

ATTRIBUTE Vr Ipx ripUpdateInterval (rUpd)

Access	Read and write
Description	The RIP periodic update interval, in seconds.
Mib	Ipx
Values	Decimal (1..255)
Units	seconds
Default	60

ATTRIBUTE Vr Ipx sapUpdateInterval (sUpd)

Access	Read and write
Description	The SAP periodic update interval, in seconds.
Mib	Ipx
Values	Decimal (1..255)

Copyright © 2006, Nortel Nortel Confidential

Units	seconds
Default	60

ATTRIBUTE Vr Ipx controlDelay (ctrlDelay)

Access	Read and write
Description	The delay, in microsecs, between receiving a request from a client and sending a response. This router is significantly faster than some Ipx clients. If a problem is being experienced between a router and an Ipx client, it might be resolved by changing the *controlDelay*.
Mib	Ipx
Values	Decimal (1..30)
Units	microsec
Default	1

ATTRIBUTE Vr Ipx updateDelay (updDelay)

Access	Read and write
Description	The delay, in milliseconds, between sending consecutive (RIP and/or SAP) packets. 55 milliseconds is the minimum specified in the Ipx Router Specification.
Mib	Ipx
Values	Decimal (55..500)
Units	msec
Default	55

ATTRIBUTE Vr Ipx ripAgeMultiplier (rAge)

Access	Read and write
Description	After this many Rip Update intervals unrefreshed Rip information is considered expired.
Mib	Ipx
Values	Decimal (1..10)
Default	3

ATTRIBUTE Vr Ipx sapAgeMultiplier (sAge)

Access	Read and write
Description	After this many SAP Update intervals unrefreshed SAP information is considered expired.
Mib	Ipx

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (1..10)
Default	3

ATTRIBUTE Vr Ipx damping (damp)

Access	Read and write
Description	This attribute specifies whether damping is applied. Damping refers to the damping of incoming RIP and SAP requests. It handles cases where a rogue client or server is making an extraodinary number of requests. With *damping* set to ***disabled***, the switch will reply to all requests with no check for rogue nodes.With *damping* set to ***enabled***, the switch will not reply to a request if the same node made more than the allowable number of requests within 10 seconds. The maximum number of requests to damp at is specified by the following provisionable attributes: *ripMaxDampedGeneralRequest*, *ripMaxDampedSpecificRequests*, *sapMaxDampedGeneralRequests*, *sapMaxDampedSpecificRequests*.
Mib	Ipx
Values	enabled disabled
Default	enabled

ATTRIBUTE Vr Ipx ripMaxDampedGeneralRequests (rDampGenReqs)

Access	Read and write
Description	This attribute is only used when the attribute *damping* is ***enabled***. It is used to limit the average rate at which the switch responds to general RIP requests. If more than this number are received within a ten second interval, the first *ripMaxDampedGeneralRequests* are responded to and the remainder are ignored.
Mib	Ipx
Values	Decimal (1..100)
Default	1

ATTRIBUTE Vr Ipx ripMaxDampedSpecificRequests (rDampSpecReqs)

Access	Read and write
Description	This attribute is only used when the attribute *damping* is ***enabled***. It is used to limit the average rate at which the switch responds to specific RIP requests. If more than this number are received within a ten second interval, the first *ripMaxDampedSpecificRequests* are responded to and the remainder are ignored.
Mib	Ipx
Values	Decimal (1..100)
Default	4

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ipx sapMaxDampedGeneralRequests (sDampGenReqs)

Access	Read and write
Description	This attribute is only used when the attribute *damping* is ***enabled***. It is used to limit the average rate at which the switch responds to general SAP requests. If more than this number are received within a ten second interval, the first *sapMaxDampedGeneralRequests* are responded to and the remainder are ignored.
Mib	Ipx
Values	Decimal (1..100)
Default	1

ATTRIBUTE Vr Ipx sapMaxDampedSpecificRequests (sDampSpecReqs)

Access	Read and write
Description	This attribute is only used when the attribute *damping* is ***enabled***. It is used to limit the average rate at which the switch responds to specific SAP requests. If more than this number are received within a ten second interval, the first *sapMaxDampedSpecificRequests* are responded to and the remainder are ignored.
Mib	Ipx
Values	Decimal (1..100)
Default	4

ATTRIBUTE Vr Ipx initialGeneralRequests (genReqs)

Access	Read and write
Description	This attribute specifies whether the RIP and SAP general requests are sent out a port when the port first comes up. If this attribute is ***enabled*** the initial requests will be made; whereas if the attribute is ***disabled*** the initial requests will not be made. This attribute may be disabled in order to avoid the traffic resulting within the network from these initial requests and the ensuing responses. With the initial request ***disabled***, the switch will learn about other network segments off of the IPX ports via the periodic broadcasts which are received on those port.
Mib	Ipx
Values	enabled disabled
Default	enabled

ATTRIBUTE Vr Ipx holdDownInterval (hold)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies an interval, after a network is removed from the route table, during which other incoming route updates for the same network will be ignored. The use of this interval prevents the slow convergence which results when switches that receive late network down broadcasts advertise false routes.
Mib	Ipx
Values	Decimal (0..255)
Units	seconds
Default	10

GROUP Vr Ipx OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Ipx

ATTRIBUTE Vr Ipx adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Ipx
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ipx operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Ipx
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Vr Ipx usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Ipx
Values	idle active (activ) busy
Default	idle

GROUP Vr Ipx OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	Ipx

ATTRIBUTE Vr Ipx snmpOperStatus

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	Ipx
Values	up down testing
Default	up

GROUP Vr Ipx Operational (Oper)

Properties	Operational
Description	This group contains IPX related operational attributes.
Mib	Ipx

ATTRIBUTE Vr Ipx protocolPortCount (ppCnt)

Access	Read only
Description	The number of portsknown to this instance of Ipx.
Mib	Ipx
Values	Decimal (0..255)
Default	0

ATTRIBUTE Vr Ipx destinationCount (destCnt)

Access	Read only
Description	The number of currently reachable destinations known to Ipx.
Mib	Ipx
Values	Decimal (0..65535)
Default	65535

ATTRIBUTE Vr Ipx servicesCount (srvCnt)

Access	Read only
Description	The number of Services known to Ipx.
Mib	Ipx
Values	Decimal (0..65535)
Default	65535

GROUP Vr Ipx Statistics (Stats)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains IPX related statistics on the CP.
Mib	Ipx

ATTRIBUTE Vr Ipx inReceives

Access	Read only
Description	This attribute counts the total number of IPX packets received, including those received in error. This counter wraps around to zero after reaching the maximum value of 4294967295.
Mib	Ipx
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ipx inHeaderErrors

Access	Read only
Description	The number of IPX packets discarded due to errors in their headers, including any IPX packet with a size less than the minimum of 30 bytes. This counter wraps around to zero after reaching the maximum value of 4294967295.
Mib	Ipx
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ipx inUnknownSocket

Access	Read only
Description	The number of IPX packets discarded because the destination socket was not open. This counter wraps around to zero after reaching the maximum value of 4294967295.
Mib	Ipx
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ipx inDiscards

Access	Read only
Description	Number of packets received but discarded due to reasons other than those accounted for by *inHeaderErrors* and *inUnknownSocket*. This counter wraps around to zero after reaching the maximum value of 4294967295.
Mib	Ipx
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Vr Ipx inBadChecksums

Access	Read only
Description	Number of packets received with incorrect checksums. This counter wraps around to zero after reaching the maximum value of 4294967295.
Mib	Ipx
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ipx inDelivers

Access	Read only
Description	Number of IPX packets delivered locally, including packets from local applications. This counter wraps around to zero after reaching the maximum value of 4294967295.
Mib	Ipx
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ipx noRoutes

Access	Read only
Description	Number of times no route to a destination was found. This counter wraps around to zero after reaching the maximum value of 4294967295.
Mib	Ipx
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ipx outRequests

Access	Read only
Description	The number of IPX packets supplied locally for transmission, not including any packets counted in the *forwarded* attribute. This counter wraps around to zero after reaching the maximum value of 4294967295.
Mib	Ipx
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ipx outMalformedRequests

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	Number of outgoing packets supplied locally that contained errors in their structure. This counter wraps around to zero after reaching the maximum value of 4294967295.
Mib	Ipx
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ipx outDiscards

Access	Read only
Description	The number of outgoing IPX packets discarded due to reasons other than those accounted for in *outMalformedRequests* or *outFiltered*. This counter wraps around to zero after reaching the maximum value of 4294967295.
Mib	Ipx
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ipx outPackets

Access	Read only
Description	The total number of IPX packets transmitted. This counter wraps around to zero after reaching the maximum value of 4294967295.
Mib	Ipx
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ipx inTooManyHops

Access	Read only
Description	Number of packets discarded due to exceeding the *maxHops* value. This counter wraps around to zero after reaching the maximum value of 4294967295.
Mib	Ipx
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Vr Ipx inFiltered

Access	Read only
Description	The number of incoming IPX packets discarded due to filtering. This counter wraps around to zero after reaching the maximum value of 4294967295.

COMPONENT Vr Ipx Rip RipFilter (RFltr)

Instance	Decimal (1..4294967295)
Groups	GROUP Vr Ipx Rip RFltr Provisioned (Prov) GROUP Vr Ipx Rip RFltr Operational (Oper)
Scope	Application
Description	*Vr/<string> Ipx Rip RipFilter* RIP filters remove the specified service advertisements from RIP packets passing through this IPX router instance thereby filtering knowledge of those network routes. This is done by telling the router to ignore certain advertised networks present in incoming RIP packet tuples and/or omit certain networks from outgoing RIP packet advertisements. The networks are indicated by the attributes *hops, ticks*, *networkNumber*, *node* and *port*. For a given filter, networks matching all the attributes of that filter are filtered or passed depending on the *disposition* of the filter. RIP filters are applied as input or output filters via the *RipApplyEntry* component.
Mib	Ipx
Common Verbs	Help List Display Add DELete

GROUP Vr Ipx Rip RFltr Provisioned (Prov)

Properties	Provisioned
Description	This is the provisionable attribute group for *RipFilter*.
Mib	Ipx

ATTRIBUTE Vr Ipx Rip RFltr hops

Access	Read and write
Description	This attribute specifies the distance in terms of number of hops. Networks in RIP packets which are the specified distance away from the switch are filtered or passed depending on the *disposition* of the filter. A hops value preceded by an equality operator(=), less than operator(<) or greater than operator(>) should be interpreted as matching all RIP packet tuples which are an equal, smaller or greater distance, respectively, away from the switch than the hops value specified. For a given filter, only networks matching all the specified attributes of that filter are filtered or passed depending on the *disposition* of the filter. The number of hops is specified as a decimal number between 0 and 999.

Copyright © 2006, Nortel Nortel Confidential

Mib	Ipx
Values	String (0..4, ASCII)
Default	No default

ATTRIBUTE Vr Ipx Rip RFltr ticks

Access	Read and write
Description	This attribute specifies the distance in terms of delay in ticks. A tick is 1/18 of a second. Networks in RIP packets which are the specified distance away from the switch are filtered or passed depending on the *disposition* of the filter. A ticks value preceded by a equality operator(=), less than operator(<) or greater than operator(>) should be interpreted as matching all RIP packet tuples which are an equal, greater or lower delay, respectively, away from the switch than the ticks value specified. For a given filter, only networks matching all the specified attributes of that filter are filtered or passed depending on the *disposition* of the filter. The ticks value is specified as a decimal number between 0 and 999.
Mib	Ipx
Values	String (0..4, ASCII)
Default	No default

ATTRIBUTE Vr Ipx Rip RFltr networkNumber (net)

Access	Read and write
Description	This attribute specifies the network number of matching networks in RIP packets to be filtered or passed depending on the *disposition* of the filter. The network number can be entered either as a dashed hex string or a string of hex digits entered in pairs of hex digits up to a maximum length of 8 digits; in addition to hex digits, use of the character '?' to indicate wildcarding is allowed. (For example a valid network number would be ff-ff-ff-?? or ffffff??). Wildcard characters may be used only in pairs to replace a pair of hex digits. Filters with a network number preceded by a caret (^) should be interpreted as matching all RIP packet tuples except for the tuples with this network number. For a given filter, only networks matching all the specified attributes of that filter are filtered or passed depending on the *disposition* of the filter.
Mib	Ipx
Values	String (0..12, ASCII)
Default	No default

ATTRIBUTE Vr Ipx Rip RFltr node

Access	Read and write
Description	This attribute specifies the node portion in the source IPX address (that is, the MAC address or circuit ID) of received RIP packets for which the contained network tuples should be filtered or passed depending on the

Copyright © 2006, Nortel Nortel Confidential

disposition of the filter. This attribute is only valid for filters applied to a port in the ***input*** *direction* and will be ignored if the filter is applied in the ***output*** *direction*.The node number can be entered either as a dashed hex string or a string of hex digits entered in pairs of hex digits up to a maximum length of 12 digits; in addition to hex digits, use of the character '?' to indicate wildcarding is allowed. (For example a valid node number would be 00-20-??-??-??-?? or 0020????????). Wildcard characters may be used only in pairs to replace a pair of hex digits. A node number preceded by a caret (^) should be interpreted as matching all RIP packets' network tuples except for the RIP packets with this source node address. For a given filter, only networks matching all the specified attributes of that filter are filtered or passed depending on the *disposition* of the filter.

Mib	Ipx
Values	String (0..18, ASCII)
Default	No default

ATTRIBUTE Vr Ipx Rip RFltr port

Access	Read and write
Description	This attribute specifies the name of a *protocol port* whereby networks learned over this port are to be filtered or passed depending on the *disposition* of the filter. This attribute is only valid for filters applied to a port in the ***output*** *direction* and will be ignored if the filter is applied in the ***input*** *direction*. This attribute is entered as an ascii string and must correspond to a name of a provisioned *protocol port*. A port name preceded by a caret (^) should be interpreted as matching all RIP packet tuples except for those learned on this port. For a given filter, only networks matching all the specified attributes of that filter are filtered or passed depending on the *disposition* of the filter.
Mib	Ipx
Values	String (0..18, ASCII)
Default	No default

ATTRIBUTE Vr Ipx Rip RFltr disposition (disp)

Access	Read and write
Description	This attribute indicates a reversal of the filter pattern match. If the value is pass, then matching filters will cause the RIP packet tuple to be passed. If the value is filter, then matching filters will cause the RIP packet tuple to be filtered.
Mib	Ipx
Values	pass filter
Default	filter

ATTRIBUTE Vr Snmp supportedVersions

Access	Read: System_admin Write: System_admin
Description	This attribute specifies which SNMP message versions are accepted and sent by the SNMP agent. Messages with unsupported version are dropped and the corresponding statistics are incremented.
Mib	BaseSnmp
Set of	snmpV1 (v1) snmpV2c (v2c)
Default	No default

GROUP Vr Snmp OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	BaseSnmp

ATTRIBUTE Vr Snmp adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

Copyright © 2006, Nortel Nortel Confidential

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: BaseSnmp

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Vr Snmp operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: BaseSnmp

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Vr Snmp usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Copyright © 2006, Nortel Nortel Confidential

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	BaseSnmp
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Vr Snmp availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

Copyright © 2006, Nortel Nortel Confidential

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	BaseSnmp
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Vr Snmp proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib: BaseSnmp

Set of:
initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default: No default

ATTRIBUTE Vr Snmp controlStatus (osiCntrl)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib: BaseSnmp

Set of:
subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default: No default

ATTRIBUTE Vr Snmp alarmStatus (osiAlarm)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

Copyright © 2006, Nortel Nortel Confidential

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib — BaseSnmp

Set of —
underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default — No default

ATTRIBUTE Vr Snmp standbyStatus (osiStby)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

Copyright © 2006, Nortel Nortel Confidential

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib: BaseSnmp

Values:
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default: notSet

ATTRIBUTE Vr Snmp unknownStatus (osiUnknw)

Access: Read only

Description: This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Mib: BaseSnmp

Values:
false
true

Default: false

GROUP Vr Snmp Statistics (Stats)

Properties: Operational

Description: This attribute group contains miscellaneous SNMP management entity operational attributes which includes statistics for processing traps as well as attributes to assist with identifying authentication failures generated by SNMPv1 managers.

Mib: BaseSnmp

ATTRIBUTE Vr Snmp trapsProcessed (trapsPr)

Access: Read only

Description: This attribute indicates the number of Standard and Enterprise notifications (traps) processed by the SNMP Agent. This total includes the number discarded by the *Snmp* component when it is ***locked*** or ***disabled***.

This attribute wraps to zero when its maximum value is exceeded.

Mib: BaseSnmp

Values: Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Vr Snmp trapsDiscarded (trapsDisc)

Access	Read only
Description	This attribute indicates the number of notifications (traps) discarded since the processor last restarted. They are discarded when the *Snmp* component is ***locked*** or ***disabled***. This attribute wraps to zero when its maximum value is exceeded.
Mib	BaseSnmp
Values	Decimal (0..4294967295)
Default	0

COMPONENT Vr Snmp System (Sys)

Groups	GROUP Vr Snmp Sys Provisioned (Prov) GROUP Vr Snmp Sys Operational (Op)

Properties	Provisioned
Description	The group contains provisionable attributes relating to the SNMP System Group. The attributes are derived from RFC 1907.
Mib	BaseSnmp

ATTRIBUTE Vr Snmp Sys contact (con)

Access	Read and write
Description	This attribute identifies the contact person for this managed node, together with information on how to contact this person.
Mib	BaseSnmp
Values	String (0..255, ASCII)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Vr Snmp Sys **name**

Access	Read and write
Description	This attribute identifies the administratively assigned name for this managed node. By convention, it is the node's fully qualified domain name.
Mib	BaseSnmp
Values	String (0..255, ASCII)
Default	No default

ATTRIBUTE Vr Snmp Sys **location (loc)**

Access	Read and write
Description	This attribute identifies the physical location of this node. For example, 'telephone closet, third floor'.
Mib	BaseSnmp
Values	String (0..255, ASCII)
Default	No default

GROUP Vr Snmp Sys **Operational (Op)**

Properties	Operational
Description	The group contains operational attributes relating to the SNMP System Group. The attributes are derived from RFC 1907.
Mib	BaseSnmp

ATTRIBUTE Vr Snmp Sys **description (desc)**

Access	Read only
Description	This attribute presents a textual description of the entity. This value should include the full name and version identification of the system's hardware type, software operating-system, and networking software.
Mib	BaseSnmp
Values	String (0..255, ASCII)
Default	No default

ATTRIBUTE Vr Snmp Sys **objectId (oid)**

Access	Read only
Description	This attribute identifies the vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the Structure of Management Information (SMI)

Copyright © 2006, Nortel Nortel Confidential

	enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed.
Mib	BaseSnmp
Values	Integer Sequence
Default	No default

ATTRIBUTE Vr Snmp Sys upTime

Access	Read only
Description	This attribute represents the time (in hundredths of a second) since the network management portion of the system was last re-initialized.
Mib	BaseSnmp
Values	Decimal (0..4294967295)
Units	centiseconds
Default	No default

ATTRIBUTE Vr Snmp Sys services (serv)

Access	Read only
Description	This attribute indicates the set of services that this entity primarily offers. The value is a sum. This sum initially takes the value zero, then, for each layer, L, in the range 1 through 7, that this node performs transactions for, 2 raised to (L-1) is added to the sum. For example, a node which performs primarily routing functions would have a value of 4 (2^(3-1)). In contrast, a node which is a host offering application services would have a value of 72 ((2^4-1) + 2^(7-1)). Note that in the context of the Internet suite of protocols, values should be calculated accordingly: layer 1 - physical (for example, repeaters) layer 2 - datalink/subnetwork (for example, bridges) layer 3 - internet (for example, IP gateways) layer 4 - end-to-end (for example, IP hosts) layer 7 - applications (for example, mail relays) For systems including OSI protocols, layers 5 and 6 may also be counted.
Mib	BaseSnmp
Values	Decimal (0..127)
Default	6

ATTRIBUTE Vr Snmp Sys sysORLastChange

Access	Read only
Description	This attribute indicates the value of *sysUpTime* at the time of the most recent change to any *ObjectResource* component.

Mib	BaseSnmp
Values	Decimal (0..4294967295)
Default	No default

COMPONENT Vr Snmp Community (Com)

Instance	Decimal (1..1024)
Groups	GROUP Vr Snmp Com Provisioned (Prov)
Scope	Device
Description	*Vr/<string> Snmp Community/<decimal>* This component represents an SNMPv1 or SNMPv2c community. A community represents a pairing of an SNMP Agent with an arbitrary set of application entities. The combination of *communityString* and *tDomain* attributes must be unique across all *Community* components.
Mib	BaseSnmp
Opt. Subcomp.	COMPONENT Vr Snmp Com Manager (Man)
Common Verbs	Help List Display Add : System_admin DELete : System_admin

GROUP Vr Snmp Com Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisionable attributes relating to SNMPv1 or SNMPv2c communities. The *Check Prov* command verifies that *viewIndex* corresponds to the first index of one of the *View* components.
Mib	BaseSnmp

ATTRIBUTE Vr Snmp Com communityString (string)

Copyright © 2006, Nortel Nortel Confidential

Access	Read: System_admin Write: System_admin
Description	This attribute is the SNMPv1 or SNMPv2c community name. The value of this attribute is used to authenticate SNMP messages received from SNMPv1 or SNMPv2c management entities, and is placed in SNMP messages sent out by the SNMPv1 or SNMPv2c network management entity. The string “public” is commonly used. When an SNMPv1 or SNMPv2c message is received, the community name in the message is checked to ensure that it matches a *communityString*. If there are no *Manager* subcomponents for that *Community* then the level of access is determined by the *accessMode* attribute. If there are *Manager* subcomponents for the *Community* then the originating transport address in the message must match the *transportAddress* of one of the *Manager* subcomponents, and the level of access of the sending entity is determined by the *privileges* attribute for that *Manager*. The combination of *communityString* and *tDomain* attributes must be unique across all *Community* components.
Mib	BaseSnmp
Values	String (1..255, ASCII)
Default	public

ATTRIBUTE Vr Snmp Com accessMode (acMode)

Access	Read: System_admin Write: System_admin
Description	Once the sending SNMP entity is authenticated as a member of a community, the community access mode determines what level of access it has for each object in its view.
Mib	BaseSnmp
Values	readOnly readWrite
Default	readOnly

ATTRIBUTE Vr Snmp Com tDomain (tDom)

Access	Read: System_admin Write: System_admin
Description	This attribute indicates the kind of transport service by which the community receives and sends network management traffic. The combination of *communityString* and *tDomain* attributes must be unique across all *Communities.*
Mib	BaseSnmp
Values	snmpUdpDomain

Copyright © 2006, Nortel Nortel Confidential

Default	snmpUdpDomain

ATTRIBUTE Vr Snmp Com viewIndex (vIndex)

Access	Read: System_admin Write: System_admin
Description	This attribute specifies the *View* component for this community. This index must correspond to the first index of one of the *View* components.
Mib	BaseSnmp
Values	String (1..32, ASCII)
Default	No default

COMPONENT Vr Snmp Com Manager (Man)

Instance	Decimal (0..100)
Groups	GROUP Vr Snmp Com Man Provisioned (Prov)
Scope	Device
Description	*Vr/<string> Snmp Community/<decimal> Manager/<decimal>* This component defines the access privileges for an SNMPv1 or SNMPv2c Manager within the Community. If a *Community* has no *Manager* components, SNMPv1 or SNMPv2 messages are accepted from all source addresses using the proper *communityString*, and no Traps are sent out using the *communityString*. If at least one *Manager* component exists for a *Community* then SNMPv1 or SNMPv2 messages containing that *Community string* are only accepted if they originate from a transport address which matches the *transportAddress* of one of the *Manager* components. The value of *transportAddress* must be unique for all *Manager* components under the same *Community*.
Mib	BaseSnmp
Common Verbs	Help List Display Add : System_admin DELete : System_admin

GROUP Vr Snmp Com Man Provisioned (Prov)

Properties	Provisioned
Description	The group contains provisionable attributes relating to an SNMPv1 or SNMPv2c Community Manager. The *Check Prov* command verifies that the value of the *privileges* attribute is correctly set:

Copyright © 2006, Nortel Nortel Confidential

- Setting ***v1trap*** bit and setting ***v2trap*** bit are not allowed simultaneously.

- Setting ***set*** bit is allowed if the *Community accessMode* is ***readWrite***.

- Setting ***get*** bit is only allowed if the *Community accessMode* is ***readOnly*** or ***readWrite***.

Mib BaseSnmp

ATTRIBUTE Vr Snmp Com Man transportAddress (tAddress)

Access
Read: System_admin
Write: System_admin

Description
This attribute is the transport service address of the SNMPv1 or SNMPv2c Manager, formatted according to the value of *Community tDomain*.
The only currently supported format is that of a UDP Transport Address. It must be of the form “IpAddress-UDP Port”, where UDP Port = 162. For example, 23.45.67.89-162 is a suitable UDP Transport Address.

The value of *transportAddress* must be unique for all *Manager* components under the same *Community*.

Mib BaseSnmp

Values String (1..100, ASCII)

Default No default

ATTRIBUTE Vr Snmp Com Man privileges (priv)

Access
Read: System_admin
Write: System_admin

Description
This attribute identifies the access privileges which govern what management operations the SNMPv1/SNMPv2c Manager may perform.

set and ***get*** operations are allowed if the *Community accessMode* is ***readWrite***.

get operations are only allowed if the *Community accessMode* is ***readOnly*** or ***readWrite***.

The ***v1trap*** bit and ***v2trap*** bit can not be set at same time.

ATTRIBUTE Vr Snmp MibIIStats proxyDrops

Access	Read only
Description	This attribute indicates the total number of GetRequests, GetNextRequests, GetBulkRequests, SetRequests, and InformRequests delivered to the SNMP entity which were silently dropped because the transmission of the (possibly translated) message to a proxy target failed in a manner (other than a time-out) such that no Response-PDU could be returned. This attribute wraps to zero when its maximum value is exceeded.
Mib	BaseSnmp
Values	Decimal (0..4294967295)
Default	0

COMPONENT Vr Snmp View

Instance	name [String (1..32, ASCII)] subtree [Integer Sequence]
Groups	GROUP Vr Snmp View Provisioned (Prov)
Scope	Device
Description	*Vr/<string> Snmp View/<string, Int_Sequence>* This component represents an entry in the SNMP View Table of RFC 2575.

Copyright © 2006, Nortel Nortel Confidential

The indices of the *View* component are:

- *name* index that is used to identify a family (or a set) of *View* components

- *subTree* index that identifies a MIB subTree to be included or excluded in this view

The component attributes are derived from RFC 2575.

GROUP Vr Snmp View Provisioned (Prov)

Properties: Provisioned

Description: This group contains provisionable attributes relating to SNMP View Table subTrees. The attributes are derived from RFC 2575.

Mib: BaseSnmp

ATTRIBUTE Vr Snmp View mask

Access:
Read: System_admin
Write: System_admin

Description: This attribute in combination with the *subTree* replication value specifies a family of view subtrees.

Each bit of this bit mask corresponds to a sub-identifier of *subTree*. The most significant bit of the n-th octet of this octet string value (extended if necessary, see below) corresponds to the (8*n- 7)-th sub-identifier, and the least significant bit of the n-th octet of this octet string corresponds to the (8*n)-th sub-identifier, where n is in the range 1 through 16.

Each bit of this bit mask specifies whether or not the corresponding sub-identifiers must match when determining if an OBJECT IDENTIFIER is in this family of view subtrees; a ‘1’ indicates that an exact match must occur; a ‘0’ indicates ‘wild card’, meaning that any sub-identifier value matches.

Thus, the OBJECT IDENTIFIER X of an object instance is contained in a family of view subtrees if the following criteria are met:

For each sub-identifier of the value of *View subTree*, either the n-th bit of *mask* is 0, or the n-th sub-identifier of X is equal to the n-th sub-identifier of the value of *subTree.*

If the value of this bit mask is M bits long and there are more than M sub-

Copyright © 2006, Nortel Nortel Confidential

identifiers in the *subTree* value, then the bit mask is extended with 1's to be the required length.

Note that when the value of this object is the zero-length string, this extension rule results in a mask of all 1's being used (no wild card) and the family of *subTrees* is the one uniquely identified by the *subTree* value.

Mib	BaseSnmp
Values	String (0..16, Hex)
Default	""

ATTRIBUTE Vr Snmp View type

Access	Read: System_admin Write: System_admin
Description	This attribute specifies whether the particular family of view subtrees is included or excluded in the SNMPv1 or SNMPv2c community's MIB view. The value ***includedSubtree*** indicates that the corresponding instances of *subTree* and *mask* define a family of view subtrees included in the MIB view. The value ***excludedSubtree*** indicates that the corresponding instances of *subTree* and *mask* define a family of view subtrees excluded in the MIB view.
Mib	BaseSnmp
Values	includedSubtree excludedSubtree
Default	includedSubtree

COMPONENT Vr IfTableEntry

Instance	Decimal (1..65535)
Groups	GROUP Vr IfTableEntry IfTable (Ift) GROUP Vr IfTableEntry AdditionalInfo
Scope	Application
Description	*Vr/<string> IfTableEntry/n* Each instance of this component represents one row in the IfTable as defined in rfc1213. One entry will exist for each *ProtocolPort*

GROUP Vr IfTableEntry **IfTable (Ift)**

Properties	Operational
Description	This group represents the SNMP interface table entry.
Mib	VirtualRouter

ATTRIBUTE Vr IfTableEntry **ifAdminStatus (admStatus)**

Access	Read only
Description	This attribute provides the current administration status of the interface. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	VirtualRouter
Values	up down testing
Default	up

ATTRIBUTE Vr IfTableEntry **ifOperStatus (opStatus)**

Access	Read only
Description	This attribute provides the current operational status of the interface. The ***testing*** state indicates that no operational packets can be passed.
Mib	VirtualRouter
Values	up down testing
Default	down

ATTRIBUTE Vr IfTableEntry **ifLastChange (lastChange)**

Access	Read only
Description	This attribute provides the value of sysUpTime at the time the interface entered its current operational state. If the current state was entered prior to the last re- initialization of the local network management subsystem, then this object contains a zero value.
Mib	VirtualRouter
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr IfTableEntry **ifInOctets (inOctets)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute reports the total number of octets received on the interface, including framing characters. The 64-bit version may be available in the *ifHCInOctets* attribute.
Mib	VirtualRouter
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr IfTableEntry ifOutOctets (outOctets)

Access	Read only
Description	This attribute reports the total number of octets transmitted out of the interface, including framing characters. The 64-bit version may be available in the *ifHCOutOctets* attribute.
Mib	VirtualRouter
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr IfTableEntry ifInDiscards (inDiscard)

Access	Read only
Description	This attribute reports the number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher layer protocol. One possible reason for discarding such a packet could be to free up buffer space.
Mib	VirtualRouter
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr IfTableEntry ifOutDiscards (outDiscard)

Access	Read only
Description	This attribute reports the number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space.
Mib	VirtualRouter
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr IfTableEntry ifInErrors (inErr)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute reports the number of inbound packets that contained errors preventing them from being deliverable to a higher layer protocol.
Mib	VirtualRouter
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr IfTableEntry ifOutErrors (outErr)

Access	Read only
Description	This attribute reports the number of outbound packets that could not be transmitted because of errors.
Mib	VirtualRouter
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr IfTableEntry ifInUcastPkts (inUcast)

Access	Read only
Description	This attribute reports the number of packets, delivered by this sub-layer to a higher (sub-) layer, which were not addressed to a multicast or broadcast address at this sub-layer. The 64-bit version may be available in the *ifHCInUcastPkts* attribute.
Mib	VirtualRouter
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr IfTableEntry ifOutUcastPkts (outUcast)

Access	Read only
Description	This attribute reports the total number of packets that higher level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. The 64-bit version may be available in the *ifHCOutUcastPkts* attribute.
Mib	VirtualRouter
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr IfTableEntry ifInNuCastPkts (inNucast)

Access	Read only
Description	This attribute reports the number of non-unicast (i.e., subnetwork-broadcast or subnetwork-multicast) packets delivered to a higher-layer

Copyright © 2006, Nortel Nortel Confidential

	protocol. The corresponding 64-bit versions may be available in the *ifInMulticastPkts* attribute and the *ifInBroadcastPkts* attribute.
Mib	VirtualRouter
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr IfTableEntry ifOutNuCastPkts (outNuCast)

Access	Read only
Description	This attribute reports the total number of packets that higher level protocols request be transmitted to a non-unicast address, including those that were discarded or not sent. The corresponding 64-bit versions may be available in the *ifOutMulticastPkts* and *ifOutBroadcastPkts* attributes.
Mib	VirtualRouter
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr IfTableEntry ifInUnknownProtos (inUknownProt)

Access	Read only
Description	This attribute reports the number of packets received via the interface which were discarded because of an unknown or unsupported protocol.
Mib	VirtualRouter
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr IfTableEntry ifOutQlength (outQlen)

Access	Read only
Description	This attribute represents the length of the output packet queue (in packets).
Mib	VirtualRouter
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr IfTableEntry ifDescription (desc)

Access	Read only
Description	This attribute provides a textual string containing information about the interface. This string includes the name of the manufacturer, the product name and the version of the hardware interface.
Mib	VirtualRouter

Copyright © 2006, Nortel Nortel Confidential

Values	String (0..255, ASCII)
Default	No default

ATTRIBUTE Vr IfTableEntry ifType (type)

Access	Read only
Description	This attribute describes the type of interface, distinguished according to the physical/link protocol(s) immediately below the network layer in the protocol stack
Mib	VirtualRouter
Values	other ddnX25 rfc877x25 ethernetCsmacd ethernet8023 tokenBus8024 tokenring8025 man802 starLan hyperChannel fddi lapb sdlc ds1 e1 basicIsdn primaryIsdn propPointToPointSerial ppp bnx ds3 smds frameRelay sonetSdh frameRelayService v35 hssi sonetPath aflane8023 aflane8025 v11 channel pppIwf atmMpeVcEncap atmMpeLlcEncap ilsForwarder ipTunnel virtualMedia localMedia

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Vr IfTableEntry ifMtu (mtu)

Access	Read only
Description	This attribute represents the size of the largest datagram which can be sent/received on the interface, specified in octets. For interfaces that are used for transmitting network datagrams, this is the size of the largest network datagram that can be sent on the interface.
Mib	VirtualRouter
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr IfTableEntry ifSpeed (speed)

Access	Read only
Description	This attribute provides an estimate of the interface's current bandwidth in bits per second. For interfaces which do not vary in bandwidth or for those where no accurate estimation can be made, this object should contain the nominal bandwidth.
Mib	VirtualRouter
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vr IfTableEntry ifPhysicalAddress (phys)

Access	Read only
Description	This attribute represents the interface's address at the protocol layer immediately `below' the network layer in the protocol stack. For interfaces which do not have such an address (e.g., a serial line), this object should be an octet string of zero length.
Mib	VirtualRouter
Values	String (0..17, ASCII)
Default	No default

ATTRIBUTE Vr IfTableEntry ifSpecific (spec)

Access	Read only
Description	This attribute provides a reference to MIB definitions specific to the particular media being used to realize the interface. For example, if the interface is realized by an ethernet, then the value of this object refers to a document defining objects specific to ethernet. If this information is not present, its value should be set to the OBJECT IDENTIFIER 0.0, which is a syntactically valid object identifier, and any conformant implementation of ASN.1 and BER must be able to generate and recognize this value.

Copyright © 2006, Nortel Nortel Confidential

Mib	VirtualRouter
Values	Integer Sequence
Default	No default

GROUP Vr IfTableEntry AdditionalInfo

Properties	Operational
Description	This group contains additional information associated with this ifEntry, including SNMP ifXTable entry information.
Mib	VirtualRouter

ATTRIBUTE Vr IfTableEntry componentName (compName)

Access	Read only
Description	This attribute provides a component name associated with this ifEntry. This component is the source of the data stored in this entry. More data may be determined about this entry by looking at the component associated with this component name.
Mib	VirtualRouter
Values	The name of the component
Default	No default

ATTRIBUTE Vr IfTableEntry ifHCInOctets (inHCOctets)

Access	Read only
Description	This attribute reports the total number of octets received on the interface, including framing characters. This High Capacity counter is a 64-bit version of the *ifInOctets* attribute.
Mib	VirtualRouter
Values	Long Integer
Default	No default

ATTRIBUTE Vr IfTableEntry ifHCInUcastPkts (inHCUcast)

Access	Read only
Description	This attribute reports the number of packets, delivered by this sub-layer to a higher (sub-) layer, which were not addressed to a multicast or broadcast address at this sub-layer. This High Capacity counter is a 64-bit version of the *ifInUcastPkts* attribute.
Mib	VirtualRouter
Values	Long Integer
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr IfTableEntry ifHCOutOctets (outHCOctets)

Access	Read only
Description	This attribute reports the total number of octets transmitted out of the interface, including framing characters. This High Capacity counter is a 64-bit version of the *ifOutOctets* attribute.
Mib	VirtualRouter
Values	Long Integer
Default	No default

ATTRIBUTE Vr IfTableEntry ifHCOutUcastPkts (outHCUcast)

Access	Read only
Description	This attibutes reports the total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. This High Capacity counter is a 64-bit version of the *ifOutUcastPkts* attribute.
Mib	VirtualRouter
Values	Long Integer
Default	No default

COMPONENT Vr SourceRouteEndStation (Sres)

Groups	GROUP Vr Sres AdministrativeControl (AdminControl) GROUP Vr Sres Provisioned (Prov) GROUP Vr Sres OperationalStatus (OperStatus) GROUP Vr Sres OsiState (State) GROUP Vr Sres Operational (Oper)
Scope	Application
Description	*Vr/<string> SourceRouteEndStation* This component defines source routing for source routing end stations.
Mib	SourceRouteEndStation
Dyn. Subcomp.	COMPONENT Vr Sres RouteEntry (Re)
Common Verbs	Help List Display Add DELete

Copyright © 2006, Nortel Nortel Confidential

VERB Clear Vr Sres

Impact	Service
Description	*Clear Vr/<string> Sres* This clears all entries in the *RouteEntry* table. This will in effect delete all *RouteEntry* subcomponents of *Sres*. Routes will then be relearned and the *RouteEntry* subcomponents will be recreated.

GROUP Vr Sres **AdministrativeControl (AdminControl)**

Properties	Provisioned
Description	This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component.
Mib	SourceRouteEndStation

ATTRIBUTE Vr Sres **snmpAdminStatus**

Access	Read only
Description	This attribute is used to set the desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed. Changing this attribute from its default value of ***up*** is not allowed at this time.
Mib	SourceRouteEndStation
Values	up down testing
Default	up

GROUP Vr Sres **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains the provisioned attributes for the *SourceRouteEndStation* component.
Mib	SourceRouteEndStation

ATTRIBUTE Vr Sres **routeTableNumEntries (rtNe)**

Access	Read and write
Criticality	Component
Description	This attribute identifies the maximum number of entries in the *SourceRouteEndStation* routing table. Before you change it, check the network configuration to see how many protocol ports, such as *IpPort* or *IpxPort*, under *Vr Pp* have *endStationSupport* set to ***enable***. The value of *routeTableNumEntries* also depends on the *VirtualRouter* attribute

Copyright © 2006, Nortel Nortel Confidential

sresMaxHeapSpace.

Consider the following attributes of the *SourceRouteEndStation* component when adjusting this number:
- *rtEntriesUsed*
- *rtEntriesFree*
- *rtEntriesDenied*

Mib	SourceRouteEndStation
Values	Decimal (0..65535)
Default	5000

ATTRIBUTE Vr Sres agingTime (at)

Access	Read and write
Description	This attribute specifies the time period used in seconds, to age out learned entries in the routing table.
Mib	SourceRouteEndStation
Values	Decimal (200..1000000)
Units	seconds
Default	900

ATTRIBUTE Vr Sres routeDescriptorLength (rdLength)

Access	Read only
Description	This attribute indicates the maximum number of route descriptors supported by this implementation. The maximum number of hops will be one less because one route descriptor is always required for the destination. This attribute affects the amount of memory used by the route entry table. The larger this attribute is, the more memory the route entry table will use.
Mib	SourceRouteEndStation
Values	Decimal (8..14)
Default	14

GROUP Vr Sres OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	SourceRouteEndStation

ATTRIBUTE Vr Sres snmpOperStatus

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	SourceRouteEndStation
Values	up down testing
Default	up

GROUP Vr Sres OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	SourceRouteEndStation

ATTRIBUTE Vr Sres adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	SourceRouteEndStation
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Sres operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	SourceRouteEndStation
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Vr Sres usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	SourceRouteEndStation
Values	idle active (activ) busy
Default	idle

GROUP Vr Sres Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *SourceRouteEndStation* component.
Mib	SourceRouteEndStation

ATTRIBUTE Vr Sres rtEntriesUsed (rteU)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the total number of *SourceRouteEndStation* routing table entries. The value is limited by the attribute *routeTableNumEntries*, which is a provisionable attribute. If the value is consistently approaching the value of *routeTableNumEntries*, it is advisable to increase the value provisioned for *routeTableNumEntries*. It indicates a potential shortage of routing table entries in the future.
Mib	SourceRouteEndStation
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Vr Sres rtEntriesFree (rteF)

Access	Read only
Description	This attribute is indicative of the number of *Sres* routing table entries free. A consistently high value for this attribute indicates that there is a resource surplus here, in terms of the memory requirements of the routing table. This surplus could be utilized elsewhere if need be. The value of this attribute is directly influenced by the value of the attribute *routeTableNumEntries.*
Mib	SourceRouteEndStation
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Vr Sres rtEntriesDenied (rteD)

Access	Read only
Description	This attribute counts the number of times a *SourceRouteEndStation* routing table entry was unavailable. Each count indicates an instance of a new route which could not be learned because of a lack of routing table entries. A rapid increase indicates a shortage of routing table entries. To rectify this, increase the number of routing table entries through the provisioned attribute *routeTableNumEntries* under the *SourceRouteEndStation* component. This counter wraps around its maximum value of 4294967295.
Mib	SourceRouteEndStation
Values	Decimal (0..4294967295)
Default	0

COMPONENT Vr Sres RouteEntry (Re)

Instance	destMacAddress (dma) [String (6, Dashed Hex)] protocolPortName (port) [String (1..20, ASCII)]
Groups	GROUP Vr Sres Re Operational (Oper)

Copyright © 2006, Nortel Nortel Confidential

Scope	Application
Description	*Vr/<string> Sres RouteEntry/xx-xx-xx-xx-xx-xx,<string>* This component is used to contain the data associated with a source routing destination address. Each entry represents one row in the Route Table. The table is indexed by the route destination MAC address in canonical format and *ProtocolPort* name.
Mib	SourceRouteEndStation
Common Verbs	Help List Display

VERB Clear Vr Sres Re

Impact	Service
Description	*Clear Vr/<string> Sres RouteEntry/xx-xx-xx-xx-xx-xx,<string>* This clears this entry in the *RouteEntry* table. This will in effect delete this *RouteEntry* subcomponent of *Sres*. The route may then be relearned and the *RouteEntry* subcomponent will be recreated.

GROUP Vr Sres Re **Operational (Oper)**

Properties	Operational
Description	This group contains information relating to a source routing destination address.
Mib	SourceRouteEndStation

ATTRIBUTE Vr Sres Re **routeControl (rc)**

Access	Read only
Description	This is the value of the routing control field for this route.
Mib	SourceRouteEndStation
Values	String (2, Hex)
Default	No default

ATTRIBUTE Vr Sres Re **rifLength**

Access	Read only
Description	This attribute is used to display the length of the routing information field in the routing control field.
Mib	SourceRouteEndStation
Values	Decimal (2..30)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Sres Re rdDirection

Access	Read only
Description	This attribute indicates the direction to use routing descriptors (RDs). If set to ***leftToRight*** the routing descriptors, displayed in *routeDescr*, will be interpreted from left to right. If set to ***rightToLeft*** they will be interpreted from right to left. If *rifLength* is zero, this attribute will be set to ***noRif*** to indicate that there are no routing descriptors to be read.
Mib	SourceRouteEndStation
Values	leftToRight rightToLeft noRif
Default	No default

ATTRIBUTE Vr Sres Re routeDescr (rd)

Access	Read only
Description	This is the embedded sequence of bridge and ring IDs for this route. For destinations on the local ring, the value of this attribute is the zero-length string. Refer to *rdDirection* for the direction in which to read the route descriptors. The format of the hexadecimal data displayed is as follows: 12 bit Ring Number - 4 bit Bridge Number... XXX-X XXX-X XXX-X...
Mib	SourceRouteEndStation
Values	String (0..90, ASCII)
Default	No default

COMPONENT Vr CustomizationSpecification (CustSpec)

Groups	GROUP Vr CustSpec Provisioned (Prov)
Scope	Application
Description	*Vr/n CustomizationSpecification* This component represents the type of customized behavior which will be provided by the parent *VirtualRouter* component when this component is present. This component can only be provisioned when the ***ip*** feature is added to at least one of the following card types: ***Vsp2*** ***2pGeMmSrVsp3*** ***2pOC3ChSmlrVsp3*** ***2pVS***

Copyright © 2006, Nortel Nortel Confidential

2pOC3ChSmIrVsp4e

Mib	CustSpec
Common Verbs	Help List Display Add DELete

GROUP Vr CustSpec Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisioning data for the *CustSpec* component.
Mib	CustSpec

ATTRIBUTE Vr CustSpec customizationType (custType)

Access	Read and write
Description	This attribute specifies the type of customized behavior which will be provided by the parent *VirtualRouter* component. The following customizations are supported: ***pvg*** - It supports *IfTable* stats for the port linked to *VirtualMedia* and CG for *VirtualMedia* for a generic Packet Voice Gateway. ***cdma*** - It is customized for CDMA wireless application over a Packet Voice Gateway.
Mib	CustSpec
Values	pvg cdma
Default	pvg

ATTRIBUTE Vr CustSpec localHostDeviceTopology (lHDTopology)

Access	Read and write
Description	This attribute specifies how the MG15000 behaves in relation to the adjacent NextHop Routers when the customized behavior provided by the parent *VirtualRouter* component has the customizationType set to PVG. The following are the customized Topologies supported: ***noLHD***- MG15000 is not supported as a Local Host Device and functions as a Layer3 Router. ***layer2*** - MG15000 is supported as a Local Host Device to the NextHop Routers via Layer2 Switches.

Copyright © 2006, Nortel Nortel Confidential

layer3 - MG15000 is supported as a Local Host Device to the NextHop Routers directly.

undetermined- MG15000 is supported as a Local Host Device but cannot determine if connected to Layer2 or Layer3 devices.

Mib	CustSpec
Values	noLHD layer2 layer3 undetermined
Default	noLHD

Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP Vsr CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	VoiceNetworking

Copyright © 2006, Nortel

Nortel Confidential

ATTRIBUTE Vsr customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	VoiceNetworking
Values	Decimal (0; 1..8191)
Default	0

GROUP Vsr IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	VoiceNetworking

ATTRIBUTE Vsr ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	VoiceNetworking
Values	up down testing
Default	up

ATTRIBUTE Vsr ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	VoiceNetworking
Values	Decimal (1..65535)
Default	No default

GROUP Vsr Provisioned (Prov)

Properties	Provisioned
Description	This group represents the provisionable attributes of a *VoiceSubroute*.
Mib	VoiceNetworking

ATTRIBUTE Vsr commentText

Access	Read: All Write: All
Description	Use of this attribute is at the discretion of the system administrator. Typically, it specifies the name of the customer that is using this *VoiceSubroute*. Typical use of this attribute is to store customer name.
Mib	VoiceNetworking
Values	String (0..40, ASCII)
Default	No default

ATTRIBUTE Vsr voiceRoute (vRoute)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the *VoiceRoute* component that this *VoiceSubroute* belongs to.
Mib	VoiceNetworking
Values	Link (Service, subroutes)
Default	No default

ATTRIBUTE Vsr signallingChannel (sigChan)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the signalling channel to be used by the *VoiceSubroute*.
Mib	VoiceNetworking

Copyright © 2006, Nortel Nortel Confidential

Values	Link (Service, subroutes)
Default	No default

GROUP Vsr OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	VoiceNetworking

ATTRIBUTE Vsr adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	VoiceNetworking
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Vsr operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for

Copyright © 2006, Nortel Nortel Confidential

operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib	VoiceNetworking
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Vsr usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	VoiceNetworking
Values	idle active (activ) busy
Default	idle

GROUP Vsr OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	VoiceNetworking

ATTRIBUTE Vsr snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	VoiceNetworking
Values	up down testing

Copyright © 2006, Nortel Nortel Confidential

Default	up

GROUP Vsr Statistics (Stats)

Properties	Operational
Description	This group provides the operational statistics for the *VoiceSubroute* component.
Mib	VoiceNetworking

ATTRIBUTE Vsr totalCallsFromIf

Access	Read: All Write: Illegal
Description	This attribute indicates the total number of calls that have been received by this *VoiceSubroute* from the PBX. The value wraps to zero when it reaches its maximum.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vsr totalFailedCallsFromIf

Access	Read: All Write: Illegal
Description	This attribute counts indicates the total number of calls that have been received by this *VoiceSubroute* from the PBX which failed to be successfully routed through the subnet for various reasons. The value wraps to zero when it reaches its maximum.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vsr invalidNumberingPlanCalls

Access	Read: All Write: Illegal
Description	This attribute counts the calls from the interface for which the type of number and the numbering plan identification was not associated to an access code. The numbering plan types *noAccessCode*, *accessCode1* and *accessCode2* are provisioned in the *VoiceRoute*. The value wraps to zero when it reaches its maximum.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vsr addressResolutionFailedCalls

Access	Read: All Write: Illegal
Description	This attribute counts the calls from the interface which had dialled numbers that had no entry in the *VoiceNetworkingCallServer* data base. The value wraps to zero when it reaches its maximum.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vsr addressIncompleteCalls

Access	Read: All Write: Illegal
Description	This attribute counts the calls from the interface which had dialled numbers with insufficient digits to resolve to a unique entry in the *VoiceNetworkingCallServer* data base. The value wraps to zero when it reaches its maximum.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vsr pathAttributesNotMetCalls

Access	Read: All Write: Illegal
Description	This attribute counts the calls from the interface for which a path to the end point could not be established based on the attributes specified in the *VoiceProfile*. The value wraps to zero when it reaches its maximum.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vsr pathSetupTimeOutCalls

Access	Read: All Write: Illegal
Description	This attribute counts the calls from the interface for which a path to the end point could not be established due to a subnet path setup time-out. The value wraps to zero when it reaches its maximum.
Mib	VoiceNetworking

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vsr callsRejectedLocally

Access	Read: All Write: Illegal
Description	This attribute counts the calls from the interface which were rejected by the originating end because it was: 1) a data call on a voice only *VoiceRoute*, or 2) a voice call on a data only *VoiceRoute*, or 3) a data call to an end-point whose *VoiceProfile* prevents data calls from being made. The value wraps to zero when it reaches its maximum.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vsr callsRejectedByFarEnd

Access	Read: All Write: Illegal
Description	This attribute counts the calls from the interface which were rejected by the far-end. This rejection could be due to: 1) no free channels at the end-point, or 2) a voice call going to a data only *VoiceRoute*, or 3) a data call going to a voice only *VoiceRoute*, or 4) a signalling protocol incompatibility between end-points. The value wraps to zero when it reaches its maximum.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	No default

GROUP Vsr Operational (Oper)

Properties	Operational
Description	This group provides the operational attributes for the *VoiceSubroute* component.
Mib	VoiceNetworking

ATTRIBUTE Vsr activeChannels

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the total number of B-channels that currently have active calls.
Mib	VoiceNetworking
Values	Decimal (0..30)
Default	No default

ATTRIBUTE Vsr peakActiveChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the peak number of B-channels that were active.
Mib	VoiceNetworking
Values	Decimal (0..30)
Default	No default

ATTRIBUTE Vsr activeVoiceChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the number of B-channels that are currently carrying voice.
Mib	VoiceNetworking
Values	Decimal (0..30)
Default	No default

ATTRIBUTE Vsr activeModemChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the number of B-channels that are currently active, where a 2100Hz tone was detected.
Mib	VoiceNetworking
Values	Decimal (0..30)
Default	No default

ATTRIBUTE Vsr activeDataChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the number of B-channels that are currently active carrying data.
Mib	VoiceNetworking

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..30)
Default	No default

ATTRIBUTE Vsr peakActiveVoiceChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the peak number of B-channels that were active carrying voice traffic.
Mib	VoiceNetworking
Values	Decimal (0..30)
Default	No default

ATTRIBUTE Vsr peakActiveModemChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the peak number of active B-channels that a 2100Hz tone was detected during the previous polling period.
Mib	VoiceNetworking
Values	Decimal (0..30)
Default	No default

ATTRIBUTE Vsr peakActiveDataChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the maximum number of B-channels that were active carrying data during the previous polling period.
Mib	VoiceNetworking
Values	Decimal (0..30)
Default	No default

ATTRIBUTE Vsr activeFaxRelayChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the number of B-channels that are currently performing fax relay.
Mib	VoiceNetworking
Values	Decimal (0..30)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vsr activeTptChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the number of B-channels that are currently performing tandem pass through.
Mib	VoiceNetworking
Values	Decimal (0..32)
Default	No default

ATTRIBUTE Vsr peakActiveFaxRelayChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the peak number of B-channels that performed fax relay during the previous polling period.
Mib	VoiceNetworking
Values	Decimal (0..30)
Default	No default

ATTRIBUTE Vsr peakActiveTptChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the peak number of B-channels that performed tandem pass through during the previous polling period.
Mib	VoiceNetworking
Values	Decimal (0..30)
Default	No default

COLLECTED STATS VoiceSubroute

Description	The statistics record generated by the VoiceSubroute component.

ATTRIBUTE Vsr totalCallsFromIf

Description	This spooled statistic counts the number of calls that have been received by this *VoiceSubroute* from the PBX in the last statistics collection interval.
Values	Decimal (0..65535)

ATTRIBUTE Vsr totalFailedCallsFromIf

Description	This spooled statistic counts the number of calls that have been received by this *VoiceSubroute* from the PBX which failed to be successfully routed through the subnet in the last statistics collection interval.

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..65535)

ATTRIBUTE Vsr invalidNumberingPlanCalls

Description	This spooled statistic counts the calls from the interface for which the type of number and the numbering plan identification was not associated with a diallingPlan in the last statistics collection interval. The numbering plan types *diallingPlan0, diallingPlan1, diallingPlan2* are provisioned in the *VoiceRoute*.
Values	Decimal (0..65535)

ATTRIBUTE Vsr addressResolutionFailedCalls

Description	This spooled statistic counts the calls from the interface which had dialled numbers that had no entry in the *VoiceNetworkingCallServer* data base in the last statistics collection interval.
Values	Decimal (0..65535)

ATTRIBUTE Vsr addressIncompleteCalls

Description	This spooled statistic counts the calls from the interface which had dialled numbers with insufficient digits to resolve to a unique entry in the *VoiceNetworkingCallServer* data base in the last statistics collection interval.
Values	Decimal (0..65535)

ATTRIBUTE Vsr pathAttributesNotMetCalls

Description	This spooled statistic counts the calls from the interface for which a path to the end point could not be established based on the attribute specified in the *VoiceProfile* in the last statistics collection interval.
Values	Decimal (0..65535)

ATTRIBUTE Vsr pathSetupTimeOutCalls

Description	This spooled statistic counts the calls from the interface for which a path to the end point could not be established due to a subnet path setup time-out in the last statistics collection interval.
Values	Decimal (0..65535)

ATTRIBUTE Vsr callsRejectedLocally

Description	This spooled statistic counts the calls from the interface which were rejected by the originating end in the last statistics collection interval because it was: 1) a data call on a voice only *VoiceRoute*, or 2) a voice call on a data only *VoiceRoute*, or 3) a data call to an end-point whose *VoiceProfile* prevents data calls from being made.
Values	Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vsr callsRejectedByFarEnd

Description	This spooled statistic counts the calls from the interface which were rejected by the far-end in the last statistics collection interval.This rejection could be due to: 1) no free channels at the end-point, or 2) a voice call going to a data only *VoiceRoute*, or 3) a data call going to a voice only *VoiceRoute*, or 4) a signalling protocol incompatibility between end-points.
Values	Decimal (0..65535)

ATTRIBUTE Vsr peakActiveChannels

Description	This spooled statistic counts the peak number of B-channels that were active in the last statistics collection interval.
Values	Decimal (0..30)

ATTRIBUTE Vsr peakActiveVoiceChannels

Description	This spooled statistic counts the peak number of B-channels that were active carrying voice in the last statistics collection interval.
Values	Decimal (0..30)

ATTRIBUTE Vsr peakActiveModemChannels

Description	This spooled statistic counts the peak number of active B-channels that a 2100Hz tone was detected in the last statistics collection interval.
Values	Decimal (0..30)

ATTRIBUTE Vsr peakActiveDataChannels

Description	This spooled statistic counts the maximum number of B-channels that were active carrying data in the last statistics collection interval.
Values	Decimal (0..30)

ATTRIBUTE Vsr peakActiveFaxRelayChannels

Description	This spooled statistic counts the maximum number of B-channels that were active carrying fax relay calls in the last statistics collection interval.
Values	Decimal (0..30)

ATTRIBUTE Vsr totalCalls

Description	This spooled statistic counts the call attempts processed on this channel (in both directions) in the last statistics collection interval. This counter includes the number of unsuccessful as well as successful call attempts.
Vector of	Decimal (0..65535)
Index	Decimal (1..32)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vsr totalCallSeconds

Description	This spooled statistic counts the number of seconds that each channel is handling a call in the last statistics collection interval. This is regardless of whether the call is successful or not. In other words, this is the amount of time that the channel is not in the idle state.
Vector of	Decimal (0..65535)
Units	seconds
Index	Decimal (1..32)

ATTRIBUTE Vsr voiceRouteInstance

Description	This spooled statistic is the value of the *VoiceRoute* linked to this *VoiceSubRoute*.

GROUP Vsr Svs Operational (Oper)

Properties	Operational
Description	This group provides the operational attributes for the *SwitchedVoiceService* component.
Mib	VoiceNetworking

ATTRIBUTE Vsr Svs status

Access	Read: All Write: Illegal
Description	This attribute indicates the current state of the channel. ***idle*** means that there is no call currently active on this channel. ***seized*** means that the channel is currently setting up a call, but a connect message has not been received. ***answered*** means that a connect message has been received. ***clearing*** means that the call is being taken down. ***lockout*** means that due to glare or channel rejection, the channel is available for ingress calls only. That is, either the PBX and the node tried

Copyright © 2006, Nortel Nortel Confidential

to seize the channel for a call at the same time (glare), or the PBX rejected the node seizure.
idleMaintenance means that due to explicit channel maintenance messages, the channel is not available for egress calls. This can only happen when the protocol control places the channel into a maintenance state, and only happens if the node receives a message causing the channel state change such as the SERVICE maintenance message.

Mib	VoiceNetworking
Values	idle seized answered clearing lockout idleMaintenance (maint)
Default	No default

ATTRIBUTE Vsr Svs profileNumber (pn)

Access	Read: All Write: Illegal
Description	This attribute indicates the *VoiceProfile* number that is being used for this call. If no call is active, then it displays the value of the last profile used.
Mib	VoiceNetworking
Values	Decimal (0..128)
Default	0

ATTRIBUTE Vsr Svs callType (ct)

GROUP Vsr Svs Framer **Statistics (Stats)**

Properties	Operational
Description	This group contains the operational statistics data for a Framer component.
Mib	VoiceNetworking

ATTRIBUTE Vsr Svs Framer **totalCells**

Access	Read only
Description	This attribute counts the cells received from the interface. Each cell contains 44 bytes of data from the DS0 channel. Since a DS0 provides data at 64kbit/s, each cell contains 5.5 ms of audio data. This data flow is measured before compression is performed on the channel. The counter wraps to zero when it exceeds its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vsr Svs Framer **audioCells**

Access	Read only
Description	This attribute counts the total number of cells containing audio data received from the interface while the channel was seized. A CCS channel is always considered to be seized. Audio data includes cells containing voice as well modem audio, but not silence. A cell contains 44 bytes of data from the DS0 channel(5.5 ms). This flow is measured before compression is performed on the channel. This counter wraps to zero after reaching its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vsr Svs Framer **silenceCells**

Access	Read only
Description	This attribute counts the total number of cells containing silence data received from the interface which was not forwarded into the network, thus saving bandwidth. A channel may go into silence due to the operation of the silence suppression feature or for CAS channels when the ABCD

Copyright © 2006, Nortel Nortel Confidential

signalling bits go idle.
A cell contains 44 bytes of data from the DS0 channel(5.5 ms).
This flow is measured before compression is performed on the channel.
This counter wraps to zero after reaching its maximum value.

Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vsr Svs Framer **lrcErrors**

Access	Read only
Description	This attribute counts the number of frames received from the network with LRC errors.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vsr Svs Framer **frmLostInNetwork**

Access	Read only
Description	This attribute counts the number of frames which the service knows it did not receive from the network although they were sent in to the network from the far end.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vsr Svs Framer **frmUnderRuns**

Access	Read only
Description	This attribute counts the number of times that a frame was needed but was not available because it had been delayed too long in the network. This error may occur repeatedly if the interface clocks at the two access points to the network are operating at different rates.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vsr Svs Framer **frmDumped**

Access	Read only
Description	This attribute counts the number of frames which have been dumped because the output queue grew too large. This can occur if the clock rate

Copyright © 2006, Nortel Nortel Confidential

	on the incoming interface is faster than the clock rate on the outgoing interface and there are no silence periods to absorb the difference, or when a compression rate change occurs. This count wraps to zero after reaching its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vsr Svs Framer **faxRelayCells**

Access	Read only
Description	This attribute counts the total number of fax relay cells sent to the network. This counter wraps to zero after reaching its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vsr Svs Framer **modemFaxCells**

Access	Read only
Description	This attribute counts the total number of cells containing modem data received from the interface while the channel was seized. A CCS channel is always considered to be seized. Cells are considered to be modem data if a constant energy level above -25 dBmO is detected for more than 900 ms. An energy level below -36 dBmO for more than 650 ms is required to detect that the modem is no longer present. A cell contains 44 bytes of data from the DS0 channel (5.5 ms). This flow is measured before compression is performed on the channel. This counter wraps to zero after reaching its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vsr Svs Framer **faxIdleCells**

Access	Read only
Description	This attribute counts the total number of cells containing silent fax data received from the interface which were not forwarded into the network, thus saving bandwidth. A channel may go into silence due to the silence Suppression feature or for CAS channels when the ABCD signalling bits go idle. A cell contains 44 bytes of data from the DS0 channel (5.5 ms). This flow is measured before compression is performed on the channel.

GROUP Vsr Svs Framer **Negotiation (Neg)**

Properties	Operational
Description	This group contains the attributes indicating the results of voice networking end to end negotiation.
Mib	VoiceNetworking

ATTRIBUTE Vsr Svs Framer **negotiatedSilenceSuppression (nSilenceSuppression)**

Access	Read and write
Description	This attribute indicates the result of negotiating silence suppression with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *Vncs Vp silenceSuppression*. If *negotiatedSilenceSuppression* is ***off***, silence suppression is never performed. If *negotiatedSilenceSuppression* is ***on***, silence suppression is always performed. If *negotiatedSilenceSuppression* is ***congested***, silence suppression is performed only when the network is congested. If *negotiatedSilenceSuppression* is ***slow***, silence suppression begins after 10 to 20 seconds without any speech or audio being detected. If *negotiatedSilenceSuppression* is ***slowAndCongested***, both the ***slow*** and ***congested*** options are applied.
Mib	VoiceNetworking

Values	off on congested slow slowAndCongested
Default	No default

ATTRIBUTE Vsr Svs Framer negotiatedFisG711G726 (nFisG711G726)

Access	Read and write
Description	This attribute indicates the result of negotiating G.711/G.726 fax idle suppression with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *Vncs Vp faxIdleSuppressionG711G726*.
Mib	VoiceNetworking
Values	off on
Default	No default

ATTRIBUTE Vsr Svs Framer negotiatedDtmfRegeneration (nDtmfRegeneration)

Access	Read and write
Description	This attribute indicates the result of negotiating DTMF regeneration with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *Vncs Vp dtmfRegeneration*. If *negotiatedDtmfRegeneration* is ***on***, DTMF tones received from the link are first converted to digits before being sent to the subnet. When a digit is received from the subnet, its respective DTMF tone is generated before being sent to the link. If *negotiatedDtmfRegeneration* is ***off***, DTMF tones are transported transparently.
Mib	VoiceNetworking
Values	off on
Default	No default

ATTRIBUTE Vsr Svs Framer negotiatedV17AsG711G726 (nV17AsG711G726)

Access	Read only
Description	This attribute indicates how this *SwitchedVoiceService* negotiates with V.17 fax machines, as determined by negotiation with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *Vncs Vp v17EncodedAsG711G726*.

Copyright © 2006, Nortel Nortel Confidential

If *negotiatedV17AsG711G726* is ***no,*** V.17 fax machines are instructed to use V.29, and V.29 fax traffic sent by fax machines is demodulated and encoded using fax relay.

If *negotiatedV17AsG711G726* is ***yes***, V.17 fax machines are permitted to use V.17 and V.17 fax traffic sent by fax machines is encoded using G.711 or G.726, at the rates given in *negotiatedRates*.

Mib — VoiceNetworking

Values — enabled
disabled

Default — No default

ATTRIBUTE Vsr Svs Framer negotiatedEncoding (nEncoding)

Access — Read and write

Description — This attribute indicates the results of negotiating audio call encodings for ***voice***, ***modemFax*** and ***fax*** traffic with the remote end across the subnet. The parameters used for negotiating with the remote end are provisioned in *Vncs Vp voiceEncodingChoice* and *Vncs Vp modemFaxEncodingChoice*.

voice traffic is all traffic from the start of a call or speech until a 2100 Hz tone or call release. ***modemFax*** traffic is all traffic after a 2100 Hz tone but before a fax preamble, speech or call release. ***fax*** traffic is all traffic after a fax preamble but before speech or call release.

g711 indicates that pulse code modulation (PCM) defined by ITU-T G.711 is the negotiated encoding.
g726 indicates that Adaptive Differential Pulse Code Modulation (ADPCM) defined by ITU-T G.726 is the negotiated encoding. ***g711G726*** indicates that pulse code modulation (PCM) defined by ITU-T G.711 and Adaptive Differential Pulse Code Modulation (ADPCM) defined by ITU-T G.726 are both negotiated encodings. If *negotiatedEncoding* is ***g711G726***, the actual encoding performed can be either G.711 or G.726, depending on network congestion.
g728 indicates that Low Delay Coded Excited Linear Predictive Coder

Copyright © 2006, Nortel Nortel Confidential

	(CS-ACELP) defined by ITU-T G.728 is the negotiated encoding. ***g729*** indicates that Conjunctive Structure Algebraic Code Excited Linear Predictive Coder (CS-ACELP) defined by ITU-T G.729 is the negotiated encoding. ***v29V27Relay*** indicates that fax relay using ITU-T V.29 or ITU-T V.27 is the negotiated encoding. ***v17V29V27Relay*** indicates that fax relay using ITU-T V.17, ITU-T V.29, or ITU-T V.27 is the negotiated encoding. If all negotiated encodings are ***none***, the negotiation of audio call encodings is not complete.

Description	*...Lc* This component contains all of the operation attributes for a Path Oriented Logical Connection.
Mib	VoiceNetworking
Common Verbs	Help List Display

VERB RERoute Vsr Svs LCo

Impact	Service
Description	RERoute ..Lc This command is used to request a *LogicalConnection (LCo)* to attempt a reroute. A new path will be established if it is better than the current path. The current path will not be interrupted if the *RERoute* command is not completely successful. The connection must not be attempting rerouting at present. This command is only valid on components with the *PLC remoteName* specified. This command is intended to be used on the calling end of a connection. For a single region call, it may be used on the called end of a connection if all the *PLC* parameters match. Note that the calling end or the called end of a connection means the *end* attribute of an *LCo* is equal to the value of ***calling*** or ***called*** respectively. When used on an *LCo* with *pathType* attribute set to ***manual*** or ***forced,*** this command can be used to re-setup the path. If this command is attempted on a connection that is not up but its *state* attribute is equal to ***pathDownRetrying,*** an immediate route request is sent.

GROUP Vsr Svs LCo **PathData**

Properties	Operational
Description	This group contains all operational attributes for the path oriented LCo.
Mib	VoiceNetworking

ATTRIBUTE Vsr Svs LCo **state**

Access	Read only
Description	This attribute reflects the current state of the connection. The ***pathDown*** state indicates a connection that has no remote end provisioned or the application has not yet signaled for a path. The ***selectingRoute*** state occurs when a request has been sent to route selector and it has not yet responded. The ***connectingState*** occurs while a path is being established. The ***pathUp*** state is the normal operational state of a path. The ***pathDownRetrying*** state indicates a path that attempted route

Copyright © 2006, Nortel Nortel Confidential

	selection but received no route and is now waiting to retry route selection again.
Mib	VoiceNetworking
Values	pathDown selectingRoute connecting pathUp pathDownRetrying
Default	No default

ATTRIBUTE Vsr Svs LCo overrideRemoteName (orn)

Access	Read: All Write: All
Description	If set ***and*** the current PLC remoteName is blank this remoteName will override the blank PLC remoteName. Usually you would set this attribute and then lock/unlock the service component which will result in this new overrideRemoteName being used as if it had been provisioned into the PLC remoteName. The advantage of this attribute is that the connection's remoteName can be changed immediately without having to "activate prov" but the disadvantage is that the overrideRemoteName is not permanent and if the card or switch is reset the override will be lost.
Mib	VoiceNetworking
Values	String (0..40, ASCII)
Default	""

ATTRIBUTE Vsr Svs LCo end

Access	Read only
Description	This attribute identifies whether this is the calling or called end of the path.
Mib	VoiceNetworking
Values	calling called
Default	No default

ATTRIBUTE Vsr Svs LCo costMetric (cost)

Access	Read only
Description	This attribute gives the route's total cost metric. It is calculated as the sum of the cost metric of all trunks in the path at the time the connection was established. The cost metric of a trunk is defined by the *trunkCost* attribute of the Trunk component. The *costMetric* for an LCo that is originated and terminated on the same module is 0.
Mib	VoiceNetworking

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Vsr Svs LCo delayMetric (delay)

Access	Read only
Description	This attribute gives the total delay of the route as the one way delay for a 512 byte packet. It is calculated as the sum of the delays of all trunks in the path stored in topology at the time the connection was established. The delay for an LCo that is originated and terminated on the same module is 0.
Mib	VoiceNetworking
Values	Decimal (0..100000)
Units	msec
Default	No default

ATTRIBUTE Vsr Svs LCo roundTripDelay (rtd)

Access	Read only
Description	This attribute indicates the time taken for a packet (cell) of 44 bytes to be transmitted inband to the remote *LCo* and return to this LCo. The value reported is rounded to the nearest millisecond. For Unack PORS trunks and AAL5 MUX PORS trunks, the test packet is sent inband and receives the same treatment as regular data packets, giving a round trip delay which corresponds to regular data traffic. For SPO MUX PORS trunks and MAP PORS trunks, the test packet is sent along the parent trunk's VCC, giving a round trip delay which corresponds to the parent trunk's round trip delay. The round trip delay does not directly reflect the round trip delay of data packets travelling on the non-parent VCC. When the *LCo* is originated and terminated on the same module, a value of 1 millisecond is reported. The value of 1 millisecond is the minimum reported time even though the delay may be less than 1 millisecond.
Mib	VoiceNetworking
Values	Decimal (0..200000)
Units	msec
Default	No default

ATTRIBUTE Vsr Svs LCo setupPriority (spri)

Access	Read only
Description	This attribute gives the priority at which the current path is established. Zero is the highest priority and four is the lowest. The *holdingPriority*, a complementary attribute of this component, indicates the priority a path maintains once it is established.

Copyright © 2006, Nortel Nortel Confidential

Mib	VoiceNetworking
Values	Decimal (0..4)
Default	No default

ATTRIBUTE Vsr Svs LCo holdingPriority (hpri)

Access	Read only
Description	This attribute gives the priority at which a path holds its current path once the path is established. Zero is the highest priority and four is the lowest. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time.
Mib	VoiceNetworking
Values	Decimal (0..4)
Default	No default

ATTRIBUTE Vsr Svs LCo requiredTxBandwidth (tbw)

Access	Read only
Description	This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of the trunks of its route. This attribute represents the bandwidth for traffic outgoing to the remote end point. The originating end of the connection determines this value.
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Units	bit/s
Default	No default

ATTRIBUTE Vsr Svs LCo requiredRxBandwidth (rbw)

Access	Read only
Description	This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of trunks of its route. This attribute represents the bandwidth for traffic incoming from the remote end point. The originating end of the connection determines this value
Mib	VoiceNetworking
Values	Decimal (0..4294967295)
Units	bit/s
Default	No default

ATTRIBUTE Vsr Svs LCo requiredTrafficType (rttyp)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This operational attribute indicates the type of traffic transmitted over the path. There are eight possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. These are arbitrary designations for traffic type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1*** then only trunks that include ***trafficType1*** in *supportedTrafficType,* will be candidates for this connection.
Mib	VoiceNetworking
Values	voice data video trafficType1 (tt1) trafficType2 (tt2) trafficType3 (tt3) trafficType4 (tt4) trafficType5 (tt5)
Default	No default

ATTRIBUTE Vsr Svs LCo **permittedTrunkTypes (pttyp)**

Access	Read only
Description	This operational attribute lists up to eight types of trunk that can be used on the route. The originating end of the connection determines the types. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the Trunk component. When selecting a route, PORS only chooses trunks whose *trunkType* are in the *permittedTrunkTypes* for the path.
Mib	VoiceNetworking
Set of	terrestrial satellite trunkType1 (tt1) trunkType2 (tt2) trunkType3 (tt3) trunkType4 (tt4) trunkType5 (tt5) trunkType6 (tt6)
Default	No default

ATTRIBUTE Vsr Svs LCo **requiredSecurity (rsec)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the required minimum level of security of the trunks on the route. Zero represents the most secure and seven represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the Trunk component, and has values identical in range and meaning to the *requiredSecurity* attribute. PORS ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity*.
Mib	VoiceNetworking
Values	Decimal (0..7)
Default	No default

ATTRIBUTE Vsr Svs LCo **requiredCustomerParameter (rcparm)**

Access	Read only
Description	This attribute indicates the allowed customer defined parameter of the trunks on the route.The originating end of the connection determines the customer defined parameter. Its value, a number from zero to seven, is chosen by a network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path.
Mib	VoiceNetworking
Values	Decimal (0..7)
Default	No default

ATTRIBUTE Vsr Svs LCo **emissionPriority (epri)**

Access	Read only
Description	This attribute indicates the urgency with which packets on the path are emitted by the trunks on the route. The originating end of the connection selects the *emissionPriority*. *EmissionPriority* of zero indicates the highest emission priority, while two indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher).
Mib	VoiceNetworking
Values	Decimal (0..2)
Default	No default

ATTRIBUTE Vsr Svs LCo **discardPriority (dpri)**

Access	Read only
Description	This attribute indicates the importance of the packets on the path. The originating end of the connection sets *discardPriority*. One is used for

Copyright © 2006, Nortel Nortel Confidential

paths carrying the most important traffic, and three is used for paths carrying the least important traffic. Packets with lower *discardPriority*(numerically) are discarded after packets with a higher *discardPriority*(numerically).

Mib	VoiceNetworking
Values	Decimal (1..3)
Default	No default

ATTRIBUTE Vsr Svs LCo pathType (pType)

Access	Read only
Description	This attribute indicates whether the path for this PLC was determined automatically or by static provisioning. ***Normal*** *pathTypes* are selected automatically by Route Selector.The other *pathTypes* are both manual *pathTypes* where the operator must specify, through provisioning, a static route termed the *manualPath*. A manual *pathType* connection is nearly identical to a normal path type connection with the exception that the route is pre-provisioned. For a manual *pathType*, bandwidth reservations are respected along the path exactly as in a normal path. The last type, the ***forced*** *pathType*, is also a manual path but regardless of the bandwidth available the route is granted provided the trunks are operational and there are sufficient Logical Channels (LChs). The ***forced*** *pathType* could result in over committing the reserved bandwidth allowed on a trunk. A better way to achieve the effects of a ***forced*** *pathType* is to use a ***manual*** *pathType* with *setupPriority* = ***0*** and *holdingPriority* = ***0***. In this manner the path will reserve correct bandwidth and it will bump other paths if required while not being bumped itself.
Mib	VoiceNetworking
Values	normal manual forced
Default	No default

ATTRIBUTE Vsr Svs LCo retryCount (rcount)

Access	Read only
Description	This attribute is the count of the number of times the path chosen during route selection could not be instantiated. This count should be three or below if the network is performing adequately. A high value indicates that the route selection is often performed using an out-of-date view of available network bandwidth and/or topology. This attribute will only increase at the calling end of an un-segmented connection. The attribute should be ignored for segmented connections.This attribute is reset each time a path reconnects and stops counting when it reaches its maximum value.

Copyright © 2006, Nortel Nortel Confidential

Mib	VoiceNetworking
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Vsr Svs LCo pathFailureCount (pfcount)

Access	Read only
Description	This attribute is the count of the number of times the path has successfully connected. It is set to zero the first time the path is up. If a path fails anytime after connecting this count will be incremented when the path is up again. Failed route requests do not count in this statistic. See *retryCount* above. This attribute stops counting at its maximum value.
Mib	VoiceNetworking
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Vsr Svs LCo reasonForNoRoute (rnr)

Access	Read only
Description	This attribute is the route selection's *reasonForNoRoute* and provides a brief reason for which a route was not selected. The reasons are essentially self-explanatory. Perhaps two reasons for no route require some explanation. The reason ***unknownRemoteNodeName*** is issued when the remote node name is not in the topological database. The reason ***plcAttributesNotMet*** is issued when there is no network connectivity at a level specified by the PLC attributes. This reason is also issued when there is no physical connectivity between two end nodes.
Mib	VoiceNetworking

ATTRIBUTE Vsr Svs LCo lastTearDownReason

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute reflects the last tear down reason for a connection (LCo). In many cases this displays the reason for a momentary service interruption. This attribute applies to the last path failure only. If a path is no longer up, this may give an indication to the reason that the path has failed. In many cases an alarm will also be generated with more specific information. The following is a brief description of the reasons: ***none*** - This path has no information for the teardown this is typical of a path provisioned with no *remoteName* that has not been up. ***normalShutDown*** - This path has gone down due to normal call termination. ***insufficientTxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the transmit direction. ***insufficientRxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the receive direction. ***trunkFailure***- A trunk on the path has failed or has gone down due to a provisioning change of a critical attribute. ***trunkCardFailure***- A trunk FP card has failed along the path. ***accessCardFailure***- The FP on which the peer access service was running has failed. ***operatorForced***- The path has terminated due to the operator locking a trunk along the path. ***lostLcnClash***- The path has terminated because the PA's at both ends of an intermediate trunk have allocated the same LC to different calls. When this happens both calls must go down and then try to come up again a fraction of a second later (effectively ensuring that they will now be assigned different LC's). It is normal to get the odd clash especially when the PA's usedLC is approaching the PA's maxLC. ***networkCongestion*** - The path has failed due to control information being lost and not recoverable. ***trunkNotFound*** - Occurs on a ***manual*** path usually. Check for trunks not up or names provisioned incorrectly. ***farEndNotFound*** - The far end is not provisioned or is not up. Check remote Name. ***wrongModuleReached*** - This may occur on a ***manual*** path. Check provisioning for correct trunk and service names. For a ***normal*** path, the network Topology may be changing check *remoteName*. ***farEndBusy*** - The far end has been reached but it is busy. Check *remoteName* and remote end provisioning. ***callLoopedBack*** - This LCo is provisioned to call itself. Re-provision since this is invalid. ***unknownReason*** - The failure was not resolved. ***farEndNotReady*** - The remote end was reached but the connection was refused due to the remote end not being enabled. ***remoteNameMismatch*** - The remote end has alarmed and rejected this setup due to remoteName provisioning. ***serviceTypeMismatch*** - The remote Service Type does not match this service type. Check provisioning.

Copyright © 2006, Nortel Nortel Confidential

reconnectFromFarEnd - The remote end re-established this connection. Check the remote end *lastTearDownReason* to determine the real reason.
bumped - Another call bumped this path from a trunk to get bandwidth (or an LC) which it required to come up. This other path had a higher *setupPriority* than this path's *holdingPriority* hence it was allowed to steal the bandwidth (or LC) from this path.
optimized - This call has been rerouted due to the optimization feature. The call is still active this just indicates why the path changed.
trunkOrFarEndDidNotSupportMode - This call was unable to complete because a mode required by the service was not supported by one of the trunks the route went through or by the far end service it connected to. Currently the only mode that this applies to is the map/mux mode on TRUNK PA ATM component. Map mode was required by the application (CES/FrAtm etc.) but was not available on the TRUNK PA ATM component through which the call was routed or the far end CES/FrAtm component did not specify the same mode.

ATTRIBUTE Vsr Svs LCo pathFailureAction

Access — Read only

Description — This attribute displays whether the application is set to tolerate momentary interruption of a path while a new path is selected. If

Copyright © 2006, Nortel Nortel Confidential

disconnectConnection is displayed, the application is informed as soon as possible about a failure by disconnection. If the attribute displays ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails the application is informed of the failure.
With this option set to ***reRoutePath*** the LCo may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are different at both ends only the calling end is allowed to reconnect.

All *pathTypes* respect this attribute. Also on a *manualPath* with both ends provisioned with independent paths (at least with respect to the failure) this option will have the desired effect that the path is rerouted without complete disconnection at both ends

Mib	VoiceNetworking
Values	reRoutePath disconnectConnection
Default	No default

ATTRIBUTE Vsr Svs LCo bumpPreference (bpref)

Access	Read only
Description	This attribute specifies when bumping will occur during route selection process. Bumping may occur when necessary or always. It will be necessary for a connection to bump if there is not enough resources for the connection to be established and these resources are occupied by a connection whose *setupPriority* is lower (numerically higher) than the connection's *setupPriority.* A connection may also always bump in order to obtain the best route.
Mib	VoiceNetworking
Values	bumpWhenNecessary bumpToObtainBestRoute
Default	No default

ATTRIBUTE Vsr Svs LCo optimization (opt)

Access	Read only
Description	This attribute is used to specify whether this connection should attempt to optimize its path when requested by the routing PORS component. Every path is as optimal as it can be when it is established, but as network traffic patterns and configurations change this path may no longer be as optimal as it could be. The PORS connection manager on a module requests circuits to optimize at the optimization interval.

GROUP Vs CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	Voice

Copyright © 2006, Nortel

Nortel Confidential

ATTRIBUTE vs customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	Voice
Values	Decimal (0; 1..8191)
Default	0

GROUP vs IfEntryProv (IfEntry)

Default	No default

GROUP Vs OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	Voice

ATTRIBUTE Vs snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	Voice
Values	up down testing
Default	up

GROUP Vs OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Voice

ATTRIBUTE Vs adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value

Copyright © 2006, Nortel Nortel Confidential

is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	Voice
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Vs operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Voice
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Vs usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare

Copyright © 2006, Nortel Nortel Confidential

capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	Voice
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Vs availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is

Copyright © 2006, Nortel Nortel Confidential

	degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components. The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***. The value ***logFull*** is not used. The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.
Mib	Voice
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE vs proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib	Voice
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE vs controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.
Mib	Voice
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vs alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	Voice
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Vs standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service

Copyright © 2006, Nortel Nortel Confidential

but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib: Voice

Values:
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default: notSet

ATTRIBUTE vs unknownStatus (osiUnknw)

Access: Read only

Description: This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Mib: Voice

Values:
false
true

Default: false

GROUP vs Operational

Properties: Operational

Description: This group contains operational attributes related to a *Vs*.

Mib: Voice

ATTRIBUTE vs serviceFailureReason

Access:
Read: Passive
Write: Illegal

Description: This attribute indicates the result of end to end negotiation with the remote end across the subnet.

If *serviceFailureReason* is ***undetermined***, this *Vs* has not performed end

Copyright © 2006, Nortel Nortel Confidential

to end negotiation with the remote end, and may or may not be up.
serviceFailureReason is ***undetermined*** if this *Vs* just became enabled, if there is not enough available bandwidth to perform negotiation or if the remote end cannot perform negotiation with this *Vs*.
If *serviceFailureReason* is ***none***, end to end negotiation passed.
If *serviceFailureReason* is ***mismatchedService***, end to end negotiation failed because the remote end service is not a *Vs*.
If *serviceFailureReason* is ***mismatchedVoiceEncoding***, end to end negotiation failed because the local *Vs Framer voiceEncoding* does not match the remote *Vs Framer voiceEncoding*.
If *serviceFailureReason* is ***mismatchedVoiceRates***, end to end negotiation failed because the local provisioned ingress voice rates are not compatible with the remote end's egress capabilities or the remote provisioned ingress voice rates are not compatible with the local egress capabilities.
If *serviceFailureReason* is ***mismatchedModemFaxEncoding***, end to end negotiation failed because the local *Vs Framer modemFaxEncoding* does not match the remote *Vs Framer modemFaxEncoding*.
If *serviceFailureReason* is ***mismatchedModemFaxRates***, end to end negotiation failed because the local provisioned ingress modem and fax rates are not compatible with the remote end's egress capabilities or the remote provisioned ingress modem and fax rates are not compatible with the local egress capabilities.
If *serviceFailureReason* is ***mismatchedCasSignalling***, end to end negotiation failed because the local *Vs Framer casSignalling* does not match the remote *Vs Framer casSignalling*.
If *serviceFailureReason* is ***mismatchedSignalBits***, end to end negotiation failed because the local *Vs Framer signalBits* does not match the remote *Vs Framer signalBits*. *serviceFailureReason* is ***mismatchedSignalBits*** only if the local *Vs Framer casSignalling* is ***transparent***.
If *serviceFailureReason* is ***compDecodeFailed***, end to end negotiation failed because the information received from the remote end was not recognized as valid data
If *serviceFailureReason* is ***dspFailure***, the associated DSP is broken. This value is only applicable for 1pMVPe and 4pMVPe FPs.

Access: Read and write

Criticality: Process

Description: This attribute specifies the minimum desired ingress rate used during modemFax and/or fax traffic.

Voice traffic is all traffic from the start of a call or speech until a 2100 Hz tone or call release. ModemFax traffic is all traffic after a 2100 Hz tone but before a fax preamble, speech or call release. Fax traffic is all traffic after a fax preamble but before speech or call release.

If *modemFaxEncoding* is ***g711G726***, *minModemFaxG711G726Rate* specifies the minimum desired rate used during modemFax traffic and fax traffic.
If *modemFaxEncoding* is ***faxRelayG711G726***, *minModemFaxG711G726Rate* specifies the minimum desired rate used during modemFax traffic only.
If *modemFaxEncoding* is ***faxRelayOnly*** or ***useVoiceEncoding***, *minModemFaxG711G726Rate* is ignored.

The negotiated minimum ingress ***modemFax*** and ***fax*** rates are available in *negotiatedIgRates.*

minModemFaxG711G726Rate defaults to ***32*** if the ***voiceCompressor*** or ***vtds*** feature is present. Otherwise, *minModemFaxG711G726Rate* defaults to ***64***.

ATTRIBUTE Vs Framer silenceSuppression

Access	Read and write
Criticality	Process
Description	This attribute specifies when ingress silence suppression is desired during voice traffic. If *silenceSuppression* is ***off***, silence suppression is never desired. If *silenceSuppression* is ***on***, silence suppression is always desired. If *silenceSuppression* is ***congested***, silence suppression is desired only when the network is congested. If *silenceSuppression* is ***slow***, silence suppression is desired only after 20 seconds without audio. If *silenceSuppression* is ***slowAndCongested***, both the ***slow*** and ***congested*** options are desired. If *silenceSuppression* is ***casIdleCod***e, the silence suppression is only desired when the *idleCode* is active for 20 to 40 seconds. *casSignalling* must be set to ***interpret*** if *silenceSuppression* is set to ***casIdleCode***. *silenceSuppression* can be set to ***casIdleCode*** only if this *VoiceService* is running on a ***DS1V, E1V, 1pDS1V, 1pE1V*** or ***J2MV*** card. The negotiated ingress silence suppression is available in *negotiatedIgSilenceSuppression.* If the ***silenceSuppressor*** or ***vtds*** feature is present, *silenceSuppression* defaults to ***on***. Otherwise, *silenceSuppression* defaults to ***off***.
Mib	Voice
Values	off on congested slow slowAndCongested casIdleCode
Default	No default

ATTRIBUTE Vs Framer echoCancellation

Access	Read and write
Criticality	Process
Description	This attribute specifies whether echo cancellation is performed on this *VoiceService*. If *echoCancellation* is ***on***, the internal echo canceler is

Copyright © 2006, Nortel Nortel Confidential

enabled and echo cancellation is performed. If *echoCancellation* is ***off***, the internal echo canceler is placed in transparent bypass mode and echo cancellation is never performed. If the ***echoCancellor*** or ***vtds*** feature is present, *echoCancellation* defaults to ***on***. Otherwise *echoCancellation* defaults to ***off***.

Mib	Voice
Values	off on
Default	No default

ATTRIBUTE Vs Framer aLawConversion

Access	Read and write
Criticality	Process
Description	This attribute specifies whether mu-law to A-law PCM conversion is performed. *aLawConversion* only needs to be set to ***on*** when this voice service is running on a ***DS1V*** or ***1pDS1V*** FP and the *VoiceService* at the remote end of the connection is running on an ***E1V*** or ***1pE1V*** FP using a software release prior to 5.0. If the remote end software release is 5.0 or later, end to end negotiation determines the compander law to use at each end of the connection. In this case, the value of *aLawConversion* is ignored.
Mib	Voice
Values	off on
Default	off

ATTRIBUTE Vs Framer voiceEncoding

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies how ingress voice traffic is encoded. If *voiceEncoding* is ***g711G726***, ingress voice traffic is encoded using either pulse code modulation (PCM) defined by ITU-T G.711 or adaptive differential pulse code modulation (ADPCM) defined by ITU-T G.726. The actual encoding and rates performed depends on congestion in the network and the minimum and maximum negotiated ingress ***voice*** rates in *negotiatedIgRates*. If *voiceEncoding* is ***g728at16***, ingress voice traffic is encoded using the Low Delay Coded Excited Linear Predictive Coder (LD-CELP) algorithm defined by ITU-T G.728. If *voiceEncoding* is ***g728at16***, the bit rate of all voice traffic is fixed at 16 kbit/s. *minVoiceG711G726Rate* and

Copyright © 2006, Nortel Nortel Confidential

maxVoiceG711G726Rate do not apply if *voiceEncoding* is ***g728at16***.

If *voiceEncoding* is ***g729at8***, ingress voice traffic is encoded using the Conjugated Structure Algebraic Code Excited Linear Predictive Coder (CS-ACELP) algorithm defined by ITU-T G.729. If *voiceEncoding* is ***g729at8***, the bit rate of all voice traffic is fixed at 8 kbit/s. *minVoiceG711G726Rate* and *maxVoiceG711G726Rate* do not apply if *voiceEncoding* is ***g729at8***.

The current ingress encoding and encoding rate are available in *currentEncoding* and *currentRate*.

voiceEncoding cannot be set to ***g728at16*** or ***g729at8*** if this *VoiceService* is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** or ***J2MV*** card. Also, *voiceEncoding* can only be set to ***g728at16*** or ***g729at8*** if the corresponding feature exists in the *featureList* of the *Sw Lpt*.

The negotiated ingress ***voice*** encoding is available in *negotiatedIgEncoding.*

voiceEncoding must have the same value at both ends of a *VoiceService*. If *voiceEncoding* does not have the same value at both ends of a *VoiceService*, the *VoiceService* will be out of service. In this case, *serviceFailureReason* is ***mismatchedVoiceEncoding***.

Mib	Voice
Values	g711G726 g728at16 g729at8
Default	g711G726

ATTRIBUTE Vs Framer modemFaxEncoding (faxEncoding)

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies how ingress modemFax and fax traffic are encoded. Voice traffic is all traffic from the start of a call or speech until a 2100 Hz tone or call release. ModemFax traffic is all traffic after a 2100 Hz tone but before a fax preamble, speech or call release. Fax traffic is all traffic after a fax preamble but before speech or call release. If *modemFaxEncoding* is ***useVoiceEncoding***, all ingress traffic is treated like voice traffic and encoded according to *voiceEncoding*. If *voiceEncoding* is ***g728at16*** or ***g729at8***, modem and fax calls are not supported.

Copyright © 2006, Nortel Nortel Confidential

If *modemFaxEncoding* is ***g711G726***, ingress modemFax traffic and fax traffic are both encoded using pulse code modulation (PCM) defined by ITU-T G.711 or adaptive differential pulse code modulation (ADPCM) defined by ITU-T G.726. The actual encoding and rates performed depends on congestion in the network and the minimum and maximum ingress ***modemFax*** rates in *negotiatedIgRates*.

If *modemFaxEncoding* is ***faxRelayG711G726***, ingress modemFax traffic is encoding using G.711 or G.726, exactly as it is if *modemFaxEncoding* is ***g711G726***. Until a fax preamble is detected, the rate may fluctuate between the minimum and maximum ***modemFax*** rates in *negotiatedIgRates* due to network congestion, exactly as it does if *modemFaxEncoding* is ***g711G726***. If a fax preamble is detected, all subsequent traffic during a call is demodulated and sent through the network as cells at the base rate of the sending machine. Supported demodulation methods are V.29 (up to 9.6 kbit/s) and V.27 (up to 4.8 kbit/s). The modulation and demodulation of fax traffic is called “fax relay”.

If *modemFaxEncoding* is ***faxRelayOnly***, “fax relay” is entered immediately upon 2100 Hz tone detection and modemFax traffic is treated like fax traffic. If *modemFaxEncoding* is ***faxRelayOnly***, modem calls are not supported.

The negotiated ingress ***modemFax*** and ***fax*** encodings are available in *negotiatedIgEncoding*.

modemFaxEncoding cannot be set to ***faxRelayG711G726*** or ***faxRelayOnly*** if this voice service is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** or ***J2MV*** card. The ***faxRelay*** feature is required to set *modemFaxEncoding* to ***faxRelayG711G726*** or ***faxRelayOnly***.

modemFaxEncoding must have the same value at both ends of a *VoiceService*. If *modemFaxEncoding* does not have the same value at both ends of a *VoiceService*, the *VoiceService* will be out of service. In this case, *serviceFailureReason* is ***mismatchedModemFaxEncoding***.

Mib	Voice
Values	g711G726 faxRelayOnly faxRelayG711G726 useVoiceEncoding

ATTRIBUTE Vs Framer tandemPassThrough (tpt)

Access	Read: Passive Write: Service
Criticality	Process

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies whether tandem pass through is desired. If *tandemPassThrough* is ***enabled***, tandem pass through is used if possible. If *tandemPassThrough* is ***disabled***, tandem pass through is not used under any circumstances. The negotiated tandem pass through is available in *negotiatedTandemPassThrough.* The actual state of tandem pass through is available in *tptStatus*. *tandemPassThrough* can be set to ***enabled*** only if the *tandemPassThrough* feature exists in the *featureList* of the *Sw Lpt.*
Mib	Voice
Values	enabled disabled
Default	disabled

ATTRIBUTE Vs Framer insertedOutputDelay

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies the amount of added output delay used to compensate for cross network delay variations. It applies to voice, modem and fax traffic. It is required to add output delay so that the statistical variation in the transit time of cells crossing the network does not cause gaps in speech. Backbone networks where high priority traffic consumes a high percentage of trunk bandwidth will require a higher *insertedOutputDelay* to compensate for the greater cell delay variation (CDV). *insertedOutputDelay* must be ***default*** if this voice service is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** or ***J2MV*** card. On all other cards, *insertedOutputDelay* can be set to any value. On these cards, ***default*** is equivalent to ***22***.

ATTRIBUTE Vs Framer faxIdleSuppressionG711G726

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies whether ingress fax idle suppression is desired during G.711 and G.726 fax traffic. It applies only if *modemFaxEncoding* is ***g711G726*** or ***faxRelayG711G726.*** The negotiated ingress G.711/G.726 fax idle suppression is available in *negotiatedIgFisG711G726.* If the ***silenceSuppressor*** or ***vtds*** feature is present, *faxIdleSuppressionG711G726* defaults to ***on***. Otherwise, *faxIdleSuppressionG711G726* defaults to ***off***.
Mib	Voice
Values	off on
Default	No default

ATTRIBUTE Vs Framer endOfCallPattern

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies the pattern that indicates the end of CCS and CAS calls. The pattern is specified as a hexadecimal byte. If this pattern is detected for one second, the echo canceler is reset and prepares itself to start a new call. If 1000 consecutive samples consisting of the pattern defined by the *endOfCallPattern* attribute are detected, during a modem or fax call, this *VoiceService* assumes the call is over and switches to the encoding specified in *voiceEncoding*. When there is no call, this pattern replaces the PCM data that would normally be sent to the link. *endOfCallPattern* is not used if this *VoiceService* is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** and ***J2MV*** card. To determine the correct setting of *endOfCallPattern*, view the operational attribute *recentIngressLineSamples* while no calls are up. If *endOfCallPattern* is ***standard***, the actual pattern used depends on the

Copyright © 2006, Nortel Nortel Confidential

card this voice service is running on. If this voice service is running on a ***1pDs1Mvp***, ***1pDS1Mvpe***, ***1pTTC2mMvp*** or ***1pTTC2mMvpe*** card, the actual pattern used is ***7f***. If this voice service is running on a ***1pE1Mvp*** or ***1pE1Mvpe*** card, the actual pattern used is ***54***.

The default value for *endOfCallPattern* is ***standard***.

ATTRIBUTE Vs Framer ingressAudioGain

Access Read: Passive
Write: Service

Criticality Process

Description This attribute specifies the gain in dB that is applied to data coming from outside the network before it is transferred across the network. It applies to voice, modem and fax traffic. For example, ingress gain is applied to audio data coming from a PBX. If *ingressAudioGain* is negative, a loss is applied.

If this voice service is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** or ***J2MV*** card, *ingressAudioGain* must be set to ***0***. If this voice service is running on any other *cardtype*, *ingressAudioGain* can be set to any integral value from ***-12*** to ***+12***.

ingressAudioGain and *egressAudioGain* are used in loss planning, which is the configuration of the devices in the network to ensure that the signal level from any point in the network to any other point is correct.

Mib Voice

Values Signed (-12..12)

Units dB

Default 0

ATTRIBUTE Vs Framer egressAudioGain

Access Read and write

Criticality Process

Description This attribute specifies the gain in dB that is applied to data before it leaves the network. It applies to voice, modem and fax traffic. For example, egress gain is applied to audio data going to a PBX. If *egressAudioGain* is negative, a loss is applied.

If this voice service is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** or ***J2MV***

Copyright © 2006, Nortel Nortel Confidential

card, *egressAudioGain* can be set to ***-6***, ***-4***, ***-2***, ***0***, ***2***, ***4*** or ***6***. If this voice service is running on any other *cardType*, *egressAudioGain* can be set to any integral value from ***-12*** to ***+12***.

ingressAudioGain and *egressAudioGain* are used in loss planning, which is the configuration of the devices in the network to ensure that the signal level from any point in the network to any other point is correct.

Values	Signed (-78; -65; -60; -54; -52; -50; -48; -46; -44; -42; -40)
Units	dBm0
Default	-40

ATTRIBUTE Vs Framer echoTailDelay

Access	Read and write
Criticality	Process
Description	This attribute specifies the maximum echo canceler tail delay coverage. It should be selected higher than the summation of the round trip delay of echo and hybrid response time. A ***32*** msec setting is good for a radius of 2700 km, assuming that the signal is going through 4 exchanges and the hybrid response time is 6 msec. A ***64*** msec setting offers even greater coverage (more distance or more switches), with comparable convergence time. The recommended setting is ***64*** msec. This attribute is not used if this VoiceService is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V***, ***J2MV***, ***1pE1Mvp***, ***1pDS1Mvp,*** or ***1pTTC2mMvp*** cards.
Mib	Voice
Values	Decimal (32; 64)
Units	msec
Default	64

ATTRIBUTE Vs Framer echoReturnLoss

Access	Read and write
Criticality	Process
Description	This attribute specifies the echo return loss parameter of the echo canceler. If the line quality is poor, in terms of echo, selecting a higher value may allow the echo canceler to perform better. A side effect is that the voice level is attenuated by the same amount, which may not always be acceptable. This attribute is not used if this *VoiceService* is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V***, ***J2MV***, ***1pE1Mvp***, ***1pDS1Mvp***, or ***1pTTC2mMvp*** card.

Values	Decimal (0; 3; 6)
Units	dB
Default	6

ATTRIBUTE Vs Framer dtmfRegeneration (detGen)

Access	Read: Passive Write: Service
Criticality	Process

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the DTMF regeneration parameter used during negotiation with the remote end across the subnet. If *dtmfRegeneration* is ***on***, it is desired that DTMF tones received from the link are first converted to digits before being sent to the subnet. When a digit is received from the subnet, its respective DTMF tone is desired to be generated before being sent to the link. If *dtmfRegeneration* is ***off***, DTMF tones are transported transparently. DTMF regeneration is not supported on ***1pDS1V***, ***1pE1V***, and ***J2MV*** cards. *dtmfRegeneration* must be ***off*** if this *VoiceService* is running on one of these cards. The negotiated DTMF regeneration is available in *negotiatedDtmfRegeneration*.
Mib	Voice
Values	off on
Default	off

ATTRIBUTE Vs Framer speechHangoverTime

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies the time after the end of speech before silence suppression starts. It applies only to voice traffic. It is not used unless *negotiatedIgSilenceSuppression* is ***on***, ***congested*** *or* ***slowAndCongested***. Higher values of *speechHangoverTime* reduce undesirable clipping but increase bandwidth usage. *speechHangoverTime* is not used if this *VoiceService* is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** or ***J2MV*** card.
Mib	Voice
Values	Signed (10..500)
Units	msec

ATTRIBUTE Vs Framer faxHangoverTimeG711G726

Access	Read: Passive Write: Service
Criticality	Process

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the time after the end of fax traffic before ingress G.711/G.726 fax idle suppression starts. It applies only if *modemFaxEncoding* is ***g711G726*** or ***faxRelayG711G726*** and *negotiatedIgFisG711G726* is ***on***. *faxHangoverTimeG711G726* is not used if this *VoiceService* is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** and ***J2MV*** card.
Mib	Voice
Values	Signed (300..20000)
Units	msec
Default	1000

ATTRIBUTE Vs Framer modemFaxSpeechDiscrim (fsd)

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies whether this *VoiceService* differentiates modemFax traffic and speech. If *modemFaxSpeechDiscrim* is ***on*** and a false 2100 Hz tone is detected, this *VoiceService* reverts to speech mode when speech is detected. *modemFaxSpeechDiscrim* is not used if this *VoiceService* is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** and ***J2MV*** card.
Mib	Voice
Values	on off
Default	on

ATTRIBUTE Vs Framer v17EncodedAsG711G726

Access	Read and write
Criticality	Process
Description	This attribute specifies the desired negotiation between this *VoiceService* and V.17 fax machines when *modemFaxEncoding* is ***faxRelayG711G726***. This attribute is not used unless *modemFaxEncoding* is ***faxRelayG711G726***. The actual negotiation between this *VoiceService* and V.17 fax machines is available in *negotiatedV17AsG711G726*. If *v17EncodedAsG711G726* is ***no,*** it is desired that V.17 fax machines be instructed to use V.29 so that V.29 fax traffic sent by fax machines can be demodulated and encoded using fax relay.

Copyright © 2006, Nortel Nortel Confidential

If *v17EncodedAsG711G726* is ***yes***, it is desired that V.17 fax machines be permitted to use V.17 so that V.17 fax traffic sent by fax machines can be encoded using G.711 or G.726. The actual encoding performed depends on network congestion and the negotiated ingress ***modemFax*** rates, available in *negotiatedIgRates*.

Mib: Voice

Values:
no
yes

Default: no

ATTRIBUTE Vs Framer ecanBypassMode

Access: Read and write

Criticality: Process

Description: This attribute specifies when version 2 internal echo cancelers are placed in bypass mode on this *VoiceService*. This attribute only applies if *echoCancellation* is ***on***. If *ecanBypassMode* is ***g165***, the internal echo canceler is placed in bypass mode as per ITU-T G.165. If *ecanBypassMode* is ***g164***, the internal echo canceler is placed in bypass mode as per ITU-T G.164. If *ecanBypassMode* is ***never***, the internal echo canceler is never placed in bypass mode. This mode should only be used for debugging.

This attribute does not apply to ***1pE1V***, ***1pDS1V***, ***J2MV***, ***1pE1Mvp***, ***1pDS1Mvp***, or ***1pTTC2mMvp*** cards.

Mib: Voice

Values:
g164
g165
never

Default: g165

ATTRIBUTE Vs Framer maxFaxRelayRate

Access:
Read: Passive
Write: Service

Criticality: Process

Description: This attribute specifies the maximum desired fax relay rate. This attribute only applies if *modemFaxEncoding* is ***faxRelayOnly*** or ***faxRelayG711G726***. The maximum fax relay rate is negotiated and depends on the setting of *maxFaxRelayRate* and the fax relay capabilities on the origination side and destination side. If the negotiated ***fax*** encoding in *negotiatedIgEncoding* is ***relay***, the negotiated maximum fax relay rate is available in the ***fax*** row of *negotiatedIgRates*.

Mib: Voice

GROUP Vs Framer SignalOptions (Signal)

Properties	Provisioned
Description	This group contains attributes which define the means for transporting channel associated signaling through the network.
Mib	Voice

ATTRIBUTE Vs Framer transmitBusyYellow

Access	Read and write
Criticality	Process
Description	When this attribute is set to ***yes*** and the DS1 or E1 line is set to Channel Associated Signaling (CAS) mode, a “busy-out” signaling condition is transmitted onto the voice timeslot associated with this Framer when its path across the network is down. The busy-out code transmitted is given by the *seizeCode* attribute. If *transmitBusyYellow* is set to ***yes*** on a CAS-based interface, *seizeCode* must be set. When *transmitBusyYellow* is set to ***yes*** and the DS1 or E1 line is set to Common Channel Signaling (CCS) mode, a yellow alarm condition is transmitted onto the DS1/E1 line when the path across the network associated with this Framer is down. Note that in CCS mode, a yellow alarm condition is transmitted when the path is down for **any** of the Framers with this attribute set to ***yes***.
Mib	Voice
Values	no yes
Default	no

ATTRIBUTE Vs Framer invertBits

Access	Read and write
Criticality	Process
Description	This attribute specifies whether the ABCD bits are inverted before being output onto the link.
Mib	Voice
Values	no yes
Default	no

ATTRIBUTE Vs Framer signalBits

Access	Read and write
Criticality	Process
Description	This attribute identifies the combination of ABCD bits used for channel associated signaling. If *casSignalling* is ***transparent***, *signalBits* must have the same value at both ends of a *Vs*. If *casSignalling* is ***transparent*** and *signalBits* does not have the same value at both ends of a *Vs*, the *Vs* will be out of service. In this case, *Vs serviceFailureReason* is ***mismatchedSignalBits***.
Mib	Voice
Values	A AB ABCD
Default	A

ATTRIBUTE Vs Framer transmitCasYellow

Access	Read and write
Criticality	Process
Description	When the associated DS1 or E1 line is operating in CCS mode, this attribute is not applicable, and must be set to ***no***. Normally, all the *VoiceService Framer*s associated with the same DS1 or E1 line should have the same value for this attribute. When the value is ***yes*** on all *VoiceService Framer*s, a yellow alarm will be asserted on the port whenever loss of subnet connectivity occurs for all these *VoiceService*s. This will prevent the external equipment from using this port for call attempts. If this attribute is set to ***no*** for all *VoiceService Framer*s associated with a DS1 or E1 line, a yellow alarm will never be asserted on the line for subnet connectivity reasons, agreeing with DS1/E1 port standards. If some *VoiceService Framer*s associated with the same DS1 or E1 line have this value set to ***yes***, and some ***no***, a yellow alarm will be asserted on the line only if there are subnet connectivity problems for all the *VoiceService Framer*s with the attribute *transmitCasYellow* set to ***yes***. The *VoiceService Framer*s with this attribute set to ***no*** will have no effect on whether a yellow alarm should be asserted on the line.
Mib	Voice
Values	no yes
Default	no

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vs Framer casSignalling

Access	Read and write
Criticality	Process
Description	This attribute specifies how channel associated signaling information is transported through the network. ***none*** specifies that channel associated signaling information is not transported through the network. ***transparent*** specifies signaling information is transported transparently through the network. ***transparent*** can be used when both sides are using equivalent signaling tables. ***interpret*** specifies signaling information is interpreted for idle and seize codes. ***interpret*** can be used when both sides are not using equivalent signaling tables but only require two unique codes (seize and idle) for signaling. Using a value of ***interpret*** requires correct *idleCode* and *seizeCode* attributes. ***interpret*** mode must be used if *silenceSuppression* is set to ***casIdleCode***.
Mib	Voice
Values	none transparent interpret
Default	none

ATTRIBUTE Vs Framer idleCode

Access	Read and write
Criticality	Process
Description	This attribute specifies the ABCD idle line signaling code. This attribute must be set correctly when *casSignalling* is ***interpret***.
Mib	Voice
Vector of	Decimal (0..1)
Index	A B C D
Default	(0, 0, 0, 0)

ATTRIBUTE Vs Framer seizeCode

Access	Read and write
Criticality	Process
Description	This attribute specifies the ABCD seized line signaling code. This attribute must be set correctly when *casSignalling* is ***interpret***.

Copyright © 2006, Nortel Nortel Confidential

Mib	Voice
Vector of	Decimal (0..1)
Index	A B C D
Default	(1, 1, 1, 1)

GROUP Vs Framer OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Voice

ATTRIBUTE Vs Framer adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Voice
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Vs Framer operationalState (osiOper)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Voice
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Vs Framer usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Voice
Values	idle active (activ) busy
Default	idle

GROUP Vs Framer Statistics (Stats)

Properties	Operational
Description	This group contains the operational statistics data for a Framer component.
Mib	Voice

ATTRIBUTE Vs Framer totalCells

Access	Read only
Description	This attribute counts total cells received from the interface. Each cell contains 44 bytes of data from the DS0 channel. Since a DS0 provides data at 64 kbit/s, each cell contains 5.5 ms of audio data. This data flow is measured before compression is performed on the

Copyright © 2006, Nortel Nortel Confidential

channel.
This counter wraps to zero after reaching its maximum value.

Mib	Voice
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vs Framer audioCells

Access	Read only
Description	This attribute counts total cells containing audio data received from the interface. Audio data includes cells containing voice as well as modem audio but not silence. A cell contains 44 bytes of data from the DS0 channel(5.5 ms). This flow is measured before compression is performed on the channel. This counter wraps to zero after reaching its maximum value.
Mib	Voice
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vs Framer silenceCells

Access	Read only
Description	This attribute counts total cells containing silence (speech or modem/fax) data received from the interface which was not forwarded into the network, thus saving bandwidth. A channel may go into silence due to the operation of the silence suppression feature (refer to the *silenceSuppression* attribute) or for CAS channels when the ABCD signaling bits go idle. A cell contains 44 bytes of data from the DS0 channel(5.5 ms). This flow is measured before compression is performed on the channel. This counter wraps to zero after reaching its maximum value.
Mib	Voice
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vs Framer lrcErrors

Access	Read only
Description	This attribute counts the number of frames with LRC errors that are received from the network.
Mib	Voice
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vs Framer frmLostInNetwork

Access	Read only
Description	This attribute counts the number of frames which the service knows it did not receive from the network although they were sent in to the network from the remote end.
Mib	Voice
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vs Framer frmUnderRuns

Access	Read only
Description	This attribute counts the number of times that a frame was needed but was not available because it had been delayed too long in the network. This error may occur repeatedly if the interface clocks at the two access points to the network are operating at different rates.
Mib	Voice
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vs Framer frmDumped

Access	Read only
Description	This attribute counts the number of frames which have been dumped because the output queue grew too large. This can occur if the clock rate on the incoming interface is faster than the clock rate on the outgoing interface and there are no silence periods to absorb the difference or when a compression rate change occurs. This count wraps to zero after reaching its maximum value.
Mib	Voice
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vs Framer faxRelayCells

Access	Read only
Description	This attribute counts total fax relay cells sent to the network.
Mib	Voice
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vs Framer modemFaxCells

Access	Read only
Description	This attribute counts total cells containing modem or fax data received from the interface. A cell contains 44 bytes of data from the DS0 channel (5.5 ms). This flow is measured before compression is performed on the channel. This counter wraps to zero after reaching its maximum value.
Mib	Voice
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vs Framer faxIdleCells

Access	Read only
Description	This attribute counts total cells containing silent modem or fax data received from the interface which was not forwarded into the network, thus saving bandwidth. A channel may go into silence due to the silence Suppression feature (refer to the *silenceSuppression* attribute) or for CAS channels when the ABCD signaling bits go idle. A cell contains 44 bytes of data from the DS0 channel (5.5 ms). This flow is measured before compression is performed on the channel. This counter wraps to zero after reaching its maximum value.
Mib	Voice
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Vs Framer frmToNetwork

Access	Read only
Description	This attribute counts the number of frames sent to the network at each encoding rate. Fax relay cells are not included.
Mib	Voice
Vector of	Decimal (0..4294967295)
Index	64 kbit/s 32 kbit/s 24 kbit/s 16 kbit/s 8 kbit/s

GROUP Vs Framer Negotiation (Neg)

Properties	Operational
Description	This group contains attributes indicating the results of end to end negotiation.
Mib	Voice

ATTRIBUTE Vs Framer negotiatedIgSilenceSuppression (nSilenceSuppression)

Access	Read only
Description	This attribute indicates the result of negotiating ingress silence suppression with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *silenceSuppression*. *negotiatedIgSilenceSuppression* can be different on either side of a *VoiceService*. If *negotiatedIgSilenceSuppression* is ***off***, ingress silence suppression is never performed. If *negotiatedIgSilenceSuppression* is ***on***, ingress silence suppression is always performed. If *negotiatedIgSilenceSuppression* is ***congested***, ingress silence suppression is performed only when the network is congested. If *negotiatedIgSilenceSuppression* is ***slow***, ingress silence suppression begins after 20 seconds without any speech or audio being detected. If *negotiatedIgSilenceSuppression* is ***slowAndCongested***, both the ***slow*** and ***congested*** options are applied. If *negotiatedIgSilenceSuppression* is ***casIdleCode***, ingress silence suppression is only performed when the *idleCode* is active for 20 to 40 seconds. Both *transportSignalling* and *interpretSignalling* must be set to ***yes*** if *silenceSuppression* is set to ***casIdleCode***.
Mib	Voice
Values	off on congested slow slowAndCongested casIdleCode
Default	No default

ATTRIBUTE Vs Framer negotiatedIgFisG711G726 (nFisG711G726)

Access	Read only
Description	This attribute indicates the result of negotiating ingress G.711/G.726 fax idle suppression with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *faxIdleSuppressionG711G726*.

Copyright © 2006, Nortel Nortel Confidential

The value of *negotiatedIgFisG711G726* can be different on either side of the connection.

Mib — Voice

Values — off
on

Default — No default

ATTRIBUTE Vs Framer negotiatedDtmfRegeneration (nDtmfRegeneration)

Access — Read only

Description — This attribute indicates the result of negotiating DTMF regeneration with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *dtmfRegeneration.*

If *negotiatedDtmfRegeneration* is ***on***, DTMF tones received from the link are first converted to digits before being sent to the subnet. When a digit is received from the subnet, its respective DTMF tone is generated before being sent to the link.

If *negotiatedDtmfRegeneration* is ***off***, DTMF tones are transported transparently.

Mib — Voice

Values — off
on

Default — No default

ATTRIBUTE Vs Framer negotiatedV17AsG711G726 (nV17AsG711G726)

Access — Read only

Description — This attribute indicates how this *VoiceService* negotiates with V.17 fax machines, as determined by negotiation with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *v17EncodedAsG711G726*. This attribute is irrelevant unless *modemFaxEncoding* is ***faxRelayG711G726***.

If *negotiatedV17AsG711G726* is ***no,*** V.17 fax machines are instructed to use V.29, and V.29 fax traffic sent by fax machines is demodulated and encoded using fax relay.

If *negotiatedV17AsG711G726* is ***yes***, V.17 fax machines are permitted to use V.17 and V.17 fax traffic sent by fax machines is encoded using G.711 or G.726, at the rates given in *negotiatedIgRates*.

Mib — Voice

Values — yes
no

Default	No default

ATTRIBUTE Vs Framer negotiatedTandemPassThrough (nTpt)

Access	Read only
Description	This attribute indicates the result of negotiating tandem pass through with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *tandemPassThrough*.
Mib	Voice
Values	enabled disabled
Default	No default

ATTRIBUTE Vs Framer negotiatedIgEncoding (nEncoding)

Access	Read only
Description	This attribute indicates the results of negotiating ingress audio call encodings for ***voice***, ***modemFax*** and ***fax*** traffic with the remote end across the subnet. The parameters used for negotiating with the remote end are provisioned in *voiceEncoding* and *modemFaxEncoding*. ***voice*** traffic is all traffic from the start of a call or speech until a 2100 Hz tone or call release. ***modemFax*** traffic is all traffic after a 2100 Hz tone but before a fax preamble, speech or call release. ***fax*** traffic is all traffic after a fax preamble but before speech or call release. ***g711*** indicates that pulse code modulation (PCM) defined by ITU-T G.711 is the negotiated encoding. ***g726*** indicates that Adaptive Differential Pulse Code Modulation (ADPCM) defined by ITU-T G.726 is the negotiated encoding. ***g711G726*** indicates that pulse code modulation (PCM) defined by ITU-T G.711 and Adaptive Differential Pulse Code Modulation (ADPCM) defined by ITU-T G.726 are both negotiated encodings. If *negotiatedIgEncoding* is ***g711G726***, the actual encoding performed can be either G.711 or G.726, depending on network congestion. ***g728*** indicates that Low Delay Coded Excited Linear Predictive Coder (CS-ACELP) defined by ITU-T G.728 is the negotiated encoding. ***g729*** indicates that Conjunctive Structure Algebraic Code Excited Linear Predictive Coder (CS-ACELP) defined by ITU-T G.729 is the negotiated encoding. ***v29V27Relay*** indicates that fax relay is performed using ITU-T V.29 or ITU-T V.27. ***v17V29V27Relay*** indicates that fax relay using ITU-T V.17, ITU-T V.29, or ITU-T V.27 is the negotiated encoding. If all negotiated encodings are ***none***, the negotiation of audio call encodings is not complete.

ATTRIBUTE Vs Framer tptStatus

Access	Read only
Description	This attribute indicates the current status of the tandem pass through algorithm. If *tptStatus* is ***operating,*** the tandem pass through algorithm is cutting through a voice switch. If *tptStatus* is ***monitoring***, *negotiatedTandemPassThrough* is ***enabled***, but the tandem pass through algorithm is not cutting through a voice switch. If *tptStatus* is ***disabled***, *negotiatedTandemPassThrough* is ***disabled***.
Mib	Voice
Values	operating monitoring disabled
Default	No default

ATTRIBUTE Vs Framer recentIngressLineSamples

Access	Read only
Description	This attribute indicates two recent ingress line samples, represented as four hex digits. The first two hex digits give one sample. The last two hex digits give the other sample. If no call is up on this voice service's channel, each sample indicates the idle pattern sent by the adjoining PBX. Therefore, the two samples should be the same if no call is up on this voice service's channel. These samples should also be consistent each

Copyright © 2006, Nortel Nortel Confidential

time *recentIngressLineSamples* is displayed, as long as no call is up on this voice service's channel. It indicates a fault on the PBX if the samples are not consistent when no call is up on this voice service's channel.

If no call is up on this *VoiceService*'s channel and the two samples are the same, each sample gives the correct setting of the provisionable attribute *endOfCallPattern*. Note that *endOfCallPattern* is not used if this *VoiceService* is running on a ***DS1V***, ***E1V***, ***1pDS1V***, ***1pE1V*** and ***J2MV*** card. On these cards, *recentIngressLineSamples* is always ***0000***.

Mib — Voice

COMPONENT Vs Framer PcmCapture (PcmCapture)

Scope	Application
Description	*Vs/n Framer PcmCapture* This component contains attributes for PCM data capture.
Mib	Voice
Common Verbs	Help List Display

COMPONENT Vs PermanentLogicalConnection (Plc)

Groups	GROUP Vs Plc Provisioning (Prov)
Scope	Application

Copyright © 2006, Nortel Nortel Confidential

Description	*Vs/n PLC* This is the description of the PLC Component for the voice service.
Mib	Voice
Common Verbs	Help List Display

GROUP Vs Plc Provisioning (Prov)

Properties	Provisioned
Description	This group contains all provisionable attributes for a permanent logical connection. Note that all of the attributes are valid and provisionable on both ends of a connection. However with the exception of *remoteName*, all operational attributes are derived from the originating end provisioning, which may be either end unless *remoteName* is not provisioned on one end.
Mib	Voice

ATTRIBUTE Vs Plc remoteName (rName)

Access	Read and write
Criticality	Process
Description	This attribute is the *PLC*'s remote end point's address in the format of a component name. The syntax of a component is: "em/node type/instance". For an alternative representation of end point's addresses, see *addressToCall* and l*ocalAddress PLC* attributes. When using component name representation, end points are identified using a node name and a service name. As an example, the end point component for a third voice service on node MoonBase is: "*EM/MoonBase VS/3*". If the *remoteName* is provisioned, it must match the name of the remote end or the connection will not be established even if the remote end is provisioned correctly. If no *remoteName* is provisioned, then this *LC* will accept connections from any other remote *LC* and it will not originate calls. Connections establish faster and are unique if both ends are provisioned with *remoteName*. *RemoteName* should be used when the remote end of the connection resides within the same topology region. If it resides in a different topology region, then *addressToCall* and *localAddress PLC* attributes should be used. When both *remoteName* and *addressToCall* are provisioned, *addressToCall* takes precedence. That is, connection will be established to the service specified by *addressToCall*. These strings are case insensitive, but the complete component name must be input.
Mib	Voice
Values	String (0..40, ASCII)

Default	""

ATTRIBUTE Vs Plc setupPriority (spri)

Access	Read and write
Criticality	Process
Description	This attribute gives the priority at which a path is established. Zero is the highest priority and four is the lowest. When PORS establishes a path through the network, it uses the *setupPriority* attribute to determine its potential for bumping established paths to acquire their bandwidth. The *holdingPriority*, a complementary attribute of this attribute, indicates the priority a path maintains once it is established. A new path can bump an existing path if the new path's *setupPriority* is higher (numerically less) than the existing path's *holdingPriority*.
Mib	Voice
Values	Decimal (0..4)
Default	2

ATTRIBUTE Vs Plc holdingPriority (hpri)

Access	Read and write
Criticality	Process
Description	This attribute gives the priority that a path holds once it is established. Zero is the highest priority and four is the lowest. A path's *holdingPriority* determines its likelihood of being bumped by a new path to acquire its bandwidth. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time. A new path can bump an existing path if the new path's *setupPriority* is higher (numerically less) than the existing path's *holdingPriority*.
Mib	Voice
Values	Decimal (0..4)
Default	2

ATTRIBUTE Vs Plc requiredTxBandwidth (tbw)

Access	Read and write
Criticality	Process
Description	This attribute gives the bandwidth (in bits per second) reserved by a path on each of the trunks of its route.This attribute represents the bandwidth for traffic outgoing to the remote end point. This value should be chosen to achieve the amount of statistical bandwidth sharing that is desired by the network administration. This reservation is not enforced and is used to determine how many paths can be supported on a trunk. Both ends should be provisioned with the correct values allowing for the fact that transmit at this end represents receive at the remote end. Note that when

Copyright © 2006, Nortel Nortel Confidential

	the values do not correspond, the originating end of the connection determines the value.
Mib	Voice
Values	Decimal (0..2048000)
Units	bit/s
Default	32000

ATTRIBUTE Vs Plc requiredRxBandwidth (rbw)

Access	Read and write
Criticality	Process
Description	This attribute gives the bandwidth (in bits per second) reserved by a path on each of trunks of its route. This attribute represents the bandwidth for traffic incoming from the remote end point. This value should be chosen to achieve the amount of statistical bandwidth sharing that is desired by the network administration. This reservation is not enforced and is used to determine how many paths can be supported on a trunk. Both ends should be provisioned with the correct values allowing for the fact that transmit at this end represents receive at the remote end. Note that when the values do not correspond, the originating end of the connection determines the value.
Mib	Voice
Values	Decimal (0..2048000)
Units	bit/s
Default	32000

ATTRIBUTE Vs Plc requiredTrafficType (rttyp)

Access	Read and write
Criticality	Process
Description	This attribute indicates the type of traffic transmitted over the path. There are eight possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. These are arbitrary designations for traffic type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1,*** then only trunks that include ***trafficType1*** in *supportedTrafficType* will be candidates for this connection.
Mib	Voice

Copyright © 2006, Nortel Nortel Confidential

Values	voice data video trafficType1 (tt1) trafficType2 (tt2) trafficType3 (tt3) trafficType4 (tt4) trafficType5 (tt5)
Default	voice

ATTRIBUTE Vs Plc permittedTrunkTypes (pttyp)

Access	Read and write
Criticality	Process
Description	This attribute lists up to eight(8) types of trunk that can be used on the route. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six(6) remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the Trunk component. When selecting a route, PORS only chooses trunks whose *trunkType* are in the *permittedTrunkTypes* for the path.
Mib	Voice
Set of	terrestrial satellite trunkType1 (tt1) trunkType2 (tt2) trunkType3 (tt3) trunkType4 (tt4) trunkType5 (tt5) trunkType6 (tt6)

ATTRIBUTE Vs Plc requiredSecurity (rsec)

Access	Read and write
Criticality	Process
Description	This attribute indicates the type of traffic transmitted over the path. There are eight possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. These are arbitrary designations for traffic type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1,*** then only trunks that include ***trafficType1*** in *supportedTrafficType* will be candidates for this connection.

Mib	Voice
Values	Decimal (0..7)
Default	4

ATTRIBUTE Vs Plc requiredCustomerParm (rcparm)

Access	Read and write
Criticality	Process
Description	This attribute indicates the allowed customer defined parameter of the trunks on the route. Its value, a number from zero to seven, is chosen by network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path.
Mib	Voice
Values	Decimal (0..7)
Default	4

ATTRIBUTE Vs Plc pathAttributeToMinimize (pamin)

Access	Read and write
Criticality	Process
Description	This attribute indicates whether a route is selected on the basis of minimizing the cost or the delay. Each trunk has a cost and a delay metric associated with it. The cost of a selected route is the sum of the trunk cost metrics for all trunks included in the route. The delay of a selected route is the sum of the trunk delay metric for all trunks included in the route.
Mib	Voice
Values	cost delay
Default	cost

ATTRIBUTE Vs Plc maximumAcceptableCost (maxCost)

Access	Read and write
Criticality	Process
Description	This attribute indicates an upper bound on the cost metric of a route, which is the sum of the cost metrics of all trunks on the route. The cost metric is the *trunkCost* attribute of the Trunk component. If for any trunk the *trunkCost* is larger than the *maximumAcceptableCost*, then that trunk is not considered during the route selection. While a shortest route is

Copyright © 2006, Nortel Nortel Confidential

being selected, the route cost is being compared with the *maximumAcceptableCost* attribute, and this is done for any minimization criterion. No route is selected if the cost metric of the shortest route is larger than the *maximumAcceptableCost*.

Mib	Voice
Values	Decimal (0..65535)
Default	1280

ATTRIBUTE Vs Plc maximumAcceptableDelay (maxDelay)

Access	Read and write
Criticality	Process
Description	This attribute indicates an upper bound on the delay of a route, which is the sum of the delay of all trunks on the route. It should be provisioned with a reasonable maximum acceptable delay for the end to end one way delay of a 512-byte packet. Remember, that the trunk during its staging measures a *measuredRoundTripDelay*. This delay is divided by two and truncated to an integer number of milliseconds to provide a one way delay which is used to populate the delay in this trunk object in the topological database. The value includes emission, propagation, and queuing delays. A 512-byte packet is used to perform the measurement. If for any trunk the half of the trunk's *measuredRoundTripDelay* is larger than the *maximumAcceptableDelay*, then that trunk is not considered during the route selection. While a shortest route is being selected, the route delay is being compared with the *maximumAcceptableDelay* attribute, and this is done for any minimization criterion. No route is selected if the delay metric of the shortest route is larger than the *maximumAcceptableDelay*.
Mib	Voice
Values	Decimal (0..100000)
Units	msec
Default	100000

ATTRIBUTE Vs Plc emissionPriority (epri)

Access	Read and write
Criticality	Process
Description	This attribute indicates the urgency with which packets on the path are emitted by the trunks on the route. *EmissionPriority* of Zero(0) indicates the highest emission priority, while two (2) indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher).
Mib	Voice

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..2)
Default	0

ATTRIBUTE Vs Plc discardPriority (dpri)

Access	Read and write
Criticality	Process
Description	This attribute indicates the importance of the packets on the path. One is used for paths carrying the most important traffic, and three is used for paths carrying the least important traffic. Packets with lower *discardPriority* (numerically) are discarded after packets with a higher *discardPriority* (numerically).
Mib	Voice
Values	Decimal (1..3)
Default	1

ATTRIBUTE Vs Plc pathType (pType)

Access	Read and write
Criticality	Process
Description	This attribute specifies if the path for this PLC is determined automatically or by static provisioning. The default (***normal***) is to automatically choose a route with Route Selection. ***Normal*** *pathTypes* require less provisioning and can dynamically handle path failures. The other *pathTypes* are both manual *pathTypes* where the operator must specify, through provisioning, a static route termed the *manualPath*. A manual *pathType* connection is nearly identical to a normal path type connection with the exception that the route is pre-provisioned. For a manual *pathType*, bandwidth reservations are respected along the path exactly as in a normal path. The last type, the ***forced*** *pathType*, is also a manual path but regardless of the bandwidth available the route is granted provided the trunks are operational and there are sufficient Logical Channels (LChs). The ***forced*** *pathType* could result in over committing the reserved bandwidth allowed on a trunk. A better way to achieve the effects of a ***forced*** *pathType* is to use a ***manual*** *pathType* with *setupPriority* = ***0*** and *holdingPriority* = ***0***. In this manner the path will reserve correct bandwidth and it will bump other paths if required while not being bumped itself.
Mib	Voice
Values	normal manual forced
Default	normal

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vs Plc pathFailureAction (pfa)

Access	Read and write
Criticality	Process
Description	This attribute is used to specify whether the application can tolerate momentary interruption of a path while a new path is selected. If ***disconnectConnection*** is chosen, the application is informed as soon as possible about a failure by disconnection. If the attribute is set to ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails the application is informed of the failure. With this option set to ***reRoutePath*** the LCo may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are different at both ends only the calling end is allowed to reconnect. All *pathTypes* respect this attribute. Also on a *manualPath* with both ends provisioned with independent paths (at least with respect to the failure) this option will have the desired effect that the path is rerouted without complete disconnection at both ends.
Mib	Voice
Values	reRoutePath disconnectConnection
Default	reRoutePath

ATTRIBUTE Vs Plc bumpPreference (bpref)

Access	Read and write
Criticality	Process
Description	This attribute controls when bumping occurs in the route selection process. A connection with higher (numerically less) *setupPriority* may bump a connection with lower (numerically higher) *holdingPriority* in order to acquire its bandwidth and be established. By default, bumping occurs only when it is necessary. That is, a connection will bump another connection only if there is no other way for the connection to be established. A connection may be set to always bump in order to find the best route it may have.
Mib	Voice
Values	bumpWhenNecessary bumpToObtainBestRoute
Default	bumpWhenNecessary

ATTRIBUTE Vs Plc optimization (opt)

Access	Read and write
Criticality	Process

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute is used to specify whether this connection should attempt to optimize its path when requested by the routing PORS component. Every path is as optimal as it can be when it is established, but as network traffic patterns and configurations change this path may no longer be as optimal as it could be. The PORS connection manager on a module requests circuits to optimize at the optimization interval.
Mib	Voice
Values	disabled enabled
Default	enabled

ATTRIBUTE Vs Plc addressToCall (addrToCall)

Access	Read and write
Criticality	Process
Description	This attribute is the *PLC*'s remote end point's address in the format of a NSAP address. As such it must consist of a string of hex digits although not all 40 digits must be specified. For an alternative representation of end point's addresses, see *remoteName* attribute. If the *addressToCall* is provisioned, it must match *localAddress* provisioned on the remote end or the connection will not be established. Connections establish faster and are unique if both ends are provisioned with *addressToCall*. *AddressToCall* must be used when the remote end of the connection resides in different topology region. If it resides in the same topology region, then *remoteName* may be used. When both *remoteName* and *addressToCall* are provisioned, *addressToCall* takes precedence. That is, connection will be established to the service specified by *addressToCall*.
Mib	Voice
Values	String (0..40, ASCII)
Default	""

ATTRIBUTE Vs Plc localAddress (localAddr)

Access	Read and write
Criticality	Process
Description	This attribute is the *PLC*'s end point address in the format of an NSAP address. As such it must consist of a string of hex digits although not all 40 digits must be specified. *LocalAddress* must share a prefix with MOD nodePrefix or one of MOD alternatePorsPrefixes for this node, otherwise PORS will not be able to route calls to this service. *LocalAddress* is used in conjunction with *addressToCall*. That is, the end responsible for originating calls must have *addressToCall* provisioned, while the end responsible for terminating calls must have *localAddress* provisioned. In such a case, *addressToCall* on the originating end must match exactly the *localAddress* of the terminating end. Note that both ends may be

Copyright © 2006, Nortel Nortel Confidential

	originating and terminating at the same time. That is, both ends may have *addressToCall* and *localAddress* provisioned as long as *addressToCall* and *localAddress* on different ends are identical.
Mib	Voice
Values	String (0..40, ASCII)
Default	""

ATTRIBUTE Vs Plc maximumAcceptableGatewayCost (maxGateCost)

Access	Read and write
Criticality	Process
Description	This attribute indicates an upper bound on the gateway cost metric of a route, which is the sum of the gateway cost metrics of all gateway links on the route. It has the same semantics as the *maximumAcceptableCost* except that gateway cost metrics are used instead of trunk cost metrics. Gateway cost metrics are provisioned under *Trunk Address* component of a gateway link specifying a gateway costs of reaching an address through the link.
Mib	Voice
Values	Decimal (0..65535)
Default	2048

ATTRIBUTE Vs Plc manualPath (mpath)

Access	Read and write
Criticality	Process
Description	This attribute is optional and specifies the sequence of trunks to be used as the route for the path, thus bypassing PORS' automatic route selection. If the path fails the validation, no other path can be selected[1]. This attribute should only be used in special cases since the route selection algorithm is able to find and maintain the best routes. A related path attribute, the *pathType*, determines if this route will be used as a manual or forced path type. As an example, the trunk component name for the third trunk on node MoonBase is "*EM/MoonBase Trk/3*". Note that only the first end of the trunk that the packet would encounter is provisioned. These strings are case insensitive but the complete component name must be input. Note 1: the trunk designation must be a 3-letter form, e.g., 'trk'. Note 2: only the outbound trunks component names are used to provision the ***manualPath***. Note 3: It is recommended to have two independent routes specified for a manual path by specifying a different ***manualPath*** (non-symmetric) for each end. In this case, there is no way to select which route will be used

Copyright © 2006, Nortel Nortel Confidential

(first up wins) but if one path is torn down due to a failure then the other ***manualPath*** may be used to reroute the path.

Mib	Voice
Vector of	String (0..40, ASCII)
Index	Decimal (0..9)
Default	([10] "")

COMPONENT Vs LogicalConnection (LCo)

Groups	GROUP Vs LCo PathData GROUP Vs LCo Statistics (Stats)
Scope	Application
Description	*...Lc* This component contains all of the operation attributes for a Path Oriented Logical Connection.
Mib	Voice
Common Verbs	Help List Display

VERB RERoute Vs LCo

Impact	Service
Description	RERoute ..Lc This command is used to request a *LogicalConnection (LCo)* to attempt a reroute. A new path will be established if it is better than the current path. The current path will not be interrupted if the *RERoute* command is not completely successful. The connection must not be attempting rerouting at present. This command is only valid on components with the *PLC remoteName* specified. This command is intended to be used on the calling end of a connection. For a single region call, it may be used on the called end of a connection if all the *PLC* parameters match. Note that the calling end or the called end of a connection means the *end* attribute of an *LCo* is equal to the value of ***calling*** or ***called*** respectively. When used on an *LCo* with *pathType* attribute set to ***manual*** or ***forced,*** this command can be used to re-setup the path. If this command is attempted on a connection that is not up but its *state* attribute is equal to ***pathDownRetrying,*** an immediate route request is sent.

GROUP Vs LCo PathData

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains all operational attributes for the path oriented LCo.
Mib	Voice

ATTRIBUTE Vs LCo state

Access	Read only
Description	This attribute reflects the current state of the connection. The ***pathDown*** state indicates a connection that has no remote end provisioned or the application has not yet signaled for a path. The ***selectingRoute*** state occurs when a request has been sent to route selector and it has not yet responded. The ***connectingState*** occurs while a path is being established. The ***pathUp*** state is the normal operational state of a path. The ***pathDownRetrying*** state indicates a path that attempted route selection but received no route and is now waiting to retry route selection again.
Mib	Voice
Values	pathDown selectingRoute connecting pathUp pathDownRetrying
Default	No default

ATTRIBUTE Vs LCo overrideRemoteName (orn)

Access	Read: All Write: All
Description	If set ***and*** the current PLC remoteName is blank this remoteName will override the blank PLC remoteName. Usually you would set this attribute and then lock/unlock the service component which will result in this new overrideRemoteName being used as if it had been provisioned into the PLC remoteName. The advantage of this attribute is that the connection's remoteName can be changed immediately without having to "activate prov" but the disadvantage is that the overrideRemoteName is not permanent and if the card or switch is reset the override will be lost.
Mib	Voice
Values	String (0..40, ASCII)
Default	""

ATTRIBUTE Vs LCo end

Access	Read only
Description	This attribute identifies whether this is the calling or called end of the path.
Mib	Voice

Values	calling called
Default	No default

ATTRIBUTE Vs LCo costMetric (cost)

Access	Read only
Description	This attribute gives the route's total cost metric. It is calculated as the sum of the cost metric of all trunks in the path at the time the connection was established. The cost metric of a trunk is defined by the *trunkCost* attribute of the Trunk component. The *costMetric* for an LCo that is originated and terminated on the same module is 0.
Mib	Voice
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Vs LCo delayMetric (delay)

Access	Read only
Description	This attribute gives the total delay of the route as the one way delay for a 512 byte packet. It is calculated as the sum of the delays of all trunks in the path stored in topology at the time the connection was established. The delay for an LCo that is originated and terminated on the same module is 0.
Mib	Voice
Values	Decimal (0..100000)
Units	msec
Default	No default

ATTRIBUTE Vs LCo roundTripDelay (rtd)

Access	Read only
Description	This attribute indicates the time taken for a packet (cell) of 44 bytes to be transmitted inband to the remote *LCo* and return to this LCo. The value reported is rounded to the nearest millisecond. For Unack PORS trunks and AAL5 MUX PORS trunks, the test packet is sent inband and receives the same treatment as regular data packets, giving a round trip delay which corresponds to regular data traffic. For SPO MUX PORS trunks and MAP PORS trunks, the test packet is sent along the parent trunk's VCC, giving a round trip delay which corresponds to the parent trunk's round trip delay. The round trip delay does not directly reflect the round trip delay of data packets travelling on the non-parent VCC. When the *LCo* is originated and terminated on the same module, a value

Copyright © 2006, Nortel Nortel Confidential

	of 1 millisecond is reported. The value of 1 millisecond is the minimum reported time even though the delay may be less than 1 millisecond.
Mib	Voice
Values	Decimal (0..200000)
Units	msec
Default	No default

ATTRIBUTE Vs LCo setupPriority (spri)

Access	Read only
Description	This attribute gives the priority at which the current path is established. Zero is the highest priority and four is the lowest. The *holdingPriority*, a complementary attribute of this component, indicates the priority a path maintains once it is established.
Mib	Voice
Values	Decimal (0..4)
Default	No default

ATTRIBUTE Vs LCo holdingPriority (hpri)

Access	Read only
Description	This attribute gives the priority at which a path holds its current path once the path is established. Zero is the highest priority and four is the lowest. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time.
Mib	Voice
Values	Decimal (0..4)
Default	No default

ATTRIBUTE Vs LCo requiredTxBandwidth (tbw)

Access	Read only
Description	This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of the trunks of its route. This attribute represents the bandwidth for traffic outgoing to the remote end point. The originating end of the connection determines this value.
Mib	Voice
Values	Decimal (0..4294967295)
Units	bit/s
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vs LCo requiredRxBandwidth (rbw)

Access	Read only
Description	This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of trunks of its route. This attribute represents the bandwidth for traffic incoming from the remote end point. The originating end of the connection determines this value
Mib	Voice
Values	Decimal (0..4294967295)
Units	bit/s
Default	No default

ATTRIBUTE Vs LCo requiredTrafficType (rttyp)

Access	Read only
Description	This operational attribute indicates the type of traffic transmitted over the path. There are eight possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. These are arbitrary designations for traffic type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1*** then only trunks that include ***trafficType1*** in *supportedTrafficType,* will be candidates for this connection.
Mib	Voice
Values	voice data video trafficType1 (tt1) trafficType2 (tt2) trafficType3 (tt3) trafficType4 (tt4) trafficType5 (tt5)
Default	No default

ATTRIBUTE Vs LCo permittedTrunkTypes (pttyp)

Access	Read only
Description	This operational attribute lists up to eight types of trunk that can be used on the route. The originating end of the connection determines the types. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of

Copyright © 2006, Nortel Nortel Confidential

	the Trunk component. When selecting a route, PORS only chooses trunks whose *trunkType* are in the *permittedTrunkTypes* for the path.
Mib	Voice
Set of	terrestrial satellite trunkType1 (tt1) trunkType2 (tt2) trunkType3 (tt3) trunkType4 (tt4) trunkType5 (tt5) trunkType6 (tt6)
Default	No default

ATTRIBUTE Vs LCo requiredSecurity (rsec)

Access	Read only
Description	This attribute indicates the required minimum level of security of the trunks on the route. Zero represents the most secure and seven represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the Trunk component, and has values identical in range and meaning to the *requiredSecurity* attribute. PORS ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity*.
Mib	Voice
Values	Decimal (0..7)
Default	No default

ATTRIBUTE Vs LCo requiredCustomerParameter (rcparm)

Access	Read only
Description	This attribute indicates the allowed customer defined parameter of the trunks on the route.The originating end of the connection determines the customer defined parameter. Its value, a number from zero to seven, is chosen by a network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path.
Mib	Voice
Values	Decimal (0..7)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vs LCo emissionPriority (epri)

Access	Read only
Description	This attribute indicates the urgency with which packets on the path are emitted by the trunks on the route. The originating end of the connection selects the *emissionPriority*. *EmissionPriority* of zero indicates the highest emission priority, while two indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher).
Mib	Voice
Values	Decimal (0..2)
Default	No default

ATTRIBUTE Vs LCo discardPriority (dpri)

Access	Read only
Description	This attribute indicates the importance of the packets on the path. The originating end of the connection sets *discardPriority*. One is used for paths carrying the most important traffic, and three is used for paths carrying the least important traffic. Packets with lower *discardPriority*(numerically) are discarded after packets with a higher *discardPriority*(numerically).
Mib	Voice
Values	Decimal (1..3)
Default	No default

ATTRIBUTE Vs LCo pathType (pType)

Access	Read only
Description	This attribute indicates whether the path for this PLC was determined automatically or by static provisioning. ***Normal*** *pathTypes* are selected automatically by Route Selector.The other *pathTypes* are both manual *pathTypes* where the operator must specify, through provisioning, a static route termed the *manualPath*. A manual *pathType* connection is nearly identical to a normal path type connection with the exception that the route is pre-provisioned. For a manual *pathType*, bandwidth reservations are respected along the path exactly as in a normal path. The last type, the ***forced*** *pathType*, is also a manual path but regardless of the bandwidth available the route is granted provided the trunks are operational and there are sufficient Logical Channels (LChs). The ***forced*** *pathType* could result in over committing the reserved bandwidth allowed on a trunk. A better way to achieve the effects of a ***forced*** *pathType* is to use a ***manual*** *pathType* with *setupPriority* = ***0*** and *holdingPriority* = ***0***. In this manner the path will reserve correct bandwidth and it will bump other paths if required while not being bumped itself.

Copyright © 2006, Nortel Nortel Confidential

Mib	Voice
Values	normal manual forced
Default	No default

ATTRIBUTE Vs LCo retryCount (rcount)

Access	Read only
Description	This attribute is the count of the number of times the path chosen during route selection could not be instantiated. This count should be three or below if the network is performing adequately. A high value indicates that the route selection is often performed using an out-of-date view of available network bandwidth and/or topology. This attribute will only increase at the calling end of an un-segmented connection. The attribute should be ignored for segmented connections.This attribute is reset each time a path reconnects and stops counting when it reaches its maximum value.
Mib	Voice
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Vs LCo pathFailureCount (pfcount)

Access	Read only
Description	This attribute is the count of the number of times the path has successfully connected. It is set to zero the first time the path is up. If a path fails anytime after connecting this count will be incremented when the path is up again. Failed route requests do not count in this statistic. See *retryCount* above. This attribute stops counting at its maximum value.
Mib	Voice
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Vs LCo reasonForNoRoute (rnr)

Access	Read only
Description	This attribute is the route selection's *reasonForNoRoute* and provides a brief reason for which a route was not selected. The reasons are essentially self-explanatory. Perhaps two reasons for no route require some explanation. The reason ***unknownRemoteNodeName*** is issued when the remote node name is not in the topological database. The reason ***plcAttributesNotMet*** is issued when there is no network connectivity at a level specified by the PLC attributes. This reason is also issued when there is no physical connectivity between two end nodes.

ATTRIBUTE Vs LCo lastTearDownReason

Access	Read only
Description	This attribute reflects the last tear down reason for a connection (LCo). In many cases this displays the reason for a momentary service interruption. This attribute applies to the last path failure only. If a path is no longer up, this may give an indication to the reason that the path has failed. In many cases an alarm will also be generated with more specific information. The following is a brief description of the reasons: ***none*** - This path has no information for the teardown this is typical of a path provisioned with no *remoteName* that has not been up. ***normalShutDown*** - This path has gone down due to normal call termination. ***insufficientTxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the transmit direction. ***insufficientRxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the receive direction. ***trunkFailure***- A trunk on the path has failed or has gone down due to a provisioning change of a critical attribute. ***trunkCardFailure***- A trunk FP card has failed along the path. ***accessCardFailure***- The FP on which the peer access service was running has failed. ***operatorForced***- The path has terminated due to the operator locking a trunk along the path. ***lostLcnClash***- The path has terminated because the PA's at both ends of an intermediate trunk have allocated the same LC to different calls. When this happens both calls must go down and then try to come up again a fraction of a second later (effectively ensuring that they will now be assigned different LC's). It is normal to get the odd clash especially when

Copyright © 2006, Nortel Nortel Confidential

the PA's usedLC is approaching the PA's maxLC.
networkCongestion - The path has failed due to control information being lost and not recoverable.
trunkNotFound - Occurs on a ***manual*** path usually. Check for trunks not up or names provisioned incorrectly.
farEndNotFound - The far end is not provisioned or is not up. Check remote Name.
wrongModuleReached - This may occur on a ***manual*** path. Check provisioning for correct trunk and service names. For a ***normal*** path, the network Topology may be changing check *remoteName*.
farEndBusy - The far end has been reached but it is busy. Check *remoteName* and remote end provisioning.
callLoopedBack - This LCo is provisioned to call itself. Re-provision since this is invalid.
unknownReason - The failure was not resolved.
farEndNotReady - The remote end was reached but the connection was refused due to the remote end not being enabled.
remoteNameMismatch - The remote end has alarmed and rejected this setup due to remoteName provisioning.
serviceTypeMismatch - The remote Service Type does not match this service type. Check provisioning.
reconnectFromFarEnd - The remote end re-established this connection. Check the remote end *lastTearDownReason* to determine the real reason.
bumped - Another call bumped this path from a trunk to get bandwidth (or an LC) which it required to come up. This other path had a higher *setupPriority* than this path's *holdingPriority* hence it was allowed to steal the bandwidth (or LC) from this path.
optimized - This call has been rerouted due to the optimization feature. The call is still active this just indicates why the path changed.
trunkOrFarEndDidNotSupportMode - This call was unable to complete because a mode required by the service was not supported by one of the trunks the route went through or by the far end service it connected to. Currently the only mode that this applies to is the map/mux mode on TRUNK PA ATM component. Map mode was required by the application (CES/FrAtm etc.) but was not available on the TRUNK PA ATM component through which the call was routed or the far end CES/FrAtm component did not specify the same mode.

ATTRIBUTE Vs LCo bumpPreference (bpref)

Access: Read only

Description: This attribute specifies when bumping will occur during route selection process. Bumping may occur when necessary or always. It will be necessary for a connection to bump if there is not enough resources for the connection to be established and these resources are occupied by a connection whose *setupPriority* is lower (numerically higher) than the

Copyright © 2006, Nortel Nortel Confidential

	connection's *setupPriority.* A connection may also always bump in order to obtain the best route.
Mib	Voice
Values	bumpWhenNecessary bumpToObtainBestRoute
Default	No default

ATTRIBUTE Vs LCo optimization (opt)

Access	Read only
Description	This attribute is used to specify whether this connection should attempt to optimize its path when requested by the routing PORS component. Every path is as optimal as it can be when it is established, but as network traffic patterns and configurations change this path may no longer be as optimal as it could be. The PORS connection manager on a module requests circuits to optimize at the optimization interval.
Mib	Voice
Values	disabled enabled
Default	No default

ATTRIBUTE Vs LCo pathUpDateTime

Access	Read: Service Write: Illegal
Description	This is the time stamp when the current path was established or reestablished.
Mib	Voice
Values	Time (DHMS)
Default	No default

ATTRIBUTE Vs LCo path

Access	Read only
Description	This attribute contains the trunk component names over which the path has been instantiated and the remote end point name terminating the path.
Mib	Voice
List of	String (0..40, ASCII)
List Size	21
Default	No default

Copyright © 2006, Nortel Nortel Confidential

GROUP Vs LCo Statistics (Stats)

Properties	Operational
Description	This group contains the operational statistics attributes for the path oriented LCo.
Mib	Voice

ATTRIBUTE Vs LCo pktsToNetwork

Access	Read only
Description	This attribute counts the number of packets transmitted to the network over this Logical Connection.
Mib	Voice
Values	Long Integer
Default	No default

ATTRIBUTE Vs LCo bytesToNetwork

Access	Read only
Description	This attribute counts the number of bytes sent to the network over this Logical Connection.
Mib	Voice
Values	Long Integer
Default	No default

ATTRIBUTE Vs LCo pktsFromNetwork

Access	Read only
Description	This attribute counts the number of packets received from the remote LCo via the network.
Mib	Voice
Values	Long Integer
Default	No default

ATTRIBUTE Vs LCo bytesFromNetwork

Access	Read only
Description	This attribute counts the number of bytes received from the remote LCo via the network.
Mib	Voice
Values	Long Integer
Default	No default

GROUP X25Dte CustomerIdentifierData (CidData)

Properties	Provisioned

Copyright © 2006, Nortel

Nortel Confidential

Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	X25Dte

ATTRIBUTE X25Dte customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	X25Dte
Values	Decimal (0; 1..8191)
Default	0

GROUP X25Dte Interface (If)

Properties	Provisioned
Description	This group provides the administrative set of parameters for the X.25 interface.
Mib	X25Dte

ATTRIBUTE X25Dte interfaceMode (ifM)

Access	Read only
Description	This attribute specifies the packet mode in which the X.25 interface operates. When this attribute is set to ***dte***, interface on the other side of the physical link must be configured as a ***dce***.
Mib	X25Dte
Values	dte dce

Copyright © 2006, Nortel Nortel Confidential

Default	dte

ATTRIBUTE X25Dte maxActiveChannels (maxAc)

Access	Read and write
Criticality	Process
Description	This attribute specifies the maximum number of channels that can be active on this interface including the Permanent Lcns and the Switched Lcns. In total *maxActiveChannel* will determine the maximum number of *Lcn* components which may exist at a given time. This should be set to a value greater or equal to the *numberOfPLcn* provisioned.
Mib	X25Dte
Values	Decimal (0..4095)
Default	10

ATTRIBUTE X25Dte numberOfPLcn (numOPLcn)

Access	Read and write
Criticality	Process
Description	This attribute specifies the number of Permanent Logical Channels that are supported on this X.25 interface (that is, the number of *PermLcn* components that may be provisioned at this interface). The *PermLcn* components use channel numbers starting from 1 and up to *lowestILChannelNumber*. A value of ***0*** for this attribute indicates that no Permanent Logical channels are supported on this X.25 interface.
Mib	X25Dte
Values	Decimal (0..4095)
Default	0

ATTRIBUTE X25Dte packetSequencing (pS)

Access	Read and write
Criticality	Process
Description	This attribute specifies the sequence numbering of packets for the X.25 interface. The value of this attribute must be the same as the packet sequencing configured at the X.25 interface on the other side of the physical link.
Mib	X25Dte

Copyright © 2006, Nortel Nortel Confidential

Values	modulo8 modulo128
Default	modulo8

ATTRIBUTE X25Dte t20RestartTimer (t20)

Access	Read and write
Description	This attribute provides the period in milliseconds within which a restart request packet should be confirmed.
Mib	X25Dte
Values	Decimal (1000..65536000)
Units	msec
Default	60000

ATTRIBUTE X25Dte t21CallTimer (t21)

Access	Read and write
Description	This attribute provides the period in milliseconds within which a call request packet should be confirmed.
Mib	X25Dte
Values	Decimal (1000..65536000)
Units	msec
Default	180000

ATTRIBUTE X25Dte t22ResetTimer (t22)

Access	Read and write
Description	This attribute provides the period in milliseconds within which a reset request packet should be confirmed.
Mib	X25Dte
Values	Decimal (1000..65536000)
Units	msec
Default	60000

ATTRIBUTE X25Dte t23ClearTimer (t23)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute provides the period in milliseconds within which a clear request packet should be confirmed.
Mib	X25Dte
Values	Decimal (1000..65536000)
Units	msec
Default	60000

GROUP X25Dte LcnConfig (LcnC)

Properties	Provisioned
Description	This group contains the provisionable attributes for the Logical Channel configuration of the X.25 Interface. The logical channel range table is ordered as follows: Permanent Logical Channels(PLC), One-way Incoming Channels (IC), Two-way Channels(TC) and One-way Outgoing Channels (OC), in a consecutive manner.
Mib	X25Dte

ATTRIBUTE X25Dte lowestILChannelNumber (lILcn)

Access	Read and write
Criticality	Process
Description	This attribute specifies the lowest Lcn number of the One-way Incoming Channel range for this X.25 interface. The value for this attribute must be greater than the *numberOfPLcn* attribute.
Mib	X25Dte
Values	Decimal (0..4095)
Default	0

ATTRIBUTE X25Dte highestILChannelNumber (hILcn)

Access	Read and write
Criticality	Process
Description	This attribute specifies the highest Lcn number of the One-way Incoming Channel range for this X.25 interface. A value of ***0*** indicates that there are no channels in this range.

Copyright © 2006, Nortel Nortel Confidential

Mib	X25Dte
Values	Decimal (0..4095)
Default	0

ATTRIBUTE X25Dte lowestTLChannelNumber (lTLcn)

Access	Read and write
Criticality	Process
Description	This attribute specifies the lowest Lcn number of the Two-way Channel range for this X.25 interface. The value for this attribute must be greater than the *highestILChannelNumber* attribute.
Mib	X25Dte
Values	Decimal (0..4095)
Default	1

ATTRIBUTE X25Dte highestTLChannelNumber (hTLcn)

Access	Read and write
Criticality	Process
Description	This attribute specifies the highest Lcn number of the Two-way Channel range for this X.25 interface. A value of ***0*** indicates that there are no channels in this range.
Mib	X25Dte
Values	Decimal (0..4095)
Default	20

ATTRIBUTE X25Dte lowestOLChannelNumber (lOLcn)

Access	Read and write
Criticality	Process
Description	This attribute specifies the lowest Lcn number of the One-way Outgoing Channel range for this X.25 interface. The value for this attribute must be greater than the *highestTLChannelNumber* attribute.
Mib	X25Dte
Values	Decimal (0..4095)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE X25Dte highestOLChannelNumber (hOLcn)

Access	Read and write
Criticality	Process
Description	This attribute specifies the highest Lcn number of the One-way Outgoing Channel range for this X.25 interface. A value of ***0*** indicates that there are no channels in this range.
Mib	X25Dte
Values	Decimal (0..4095)
Default	0

GROUP X25Dte DefaultCallParam (Dcp)

Properties	Provisioned
Description	This group contains the provisionable attributes giving the default call parameters used by all the logical channels during call setup. It is possible that different default call parameters will be used for a particular call, based on the *Peer* component for the given call. The actual call parameters operational for a given call are found in the *Lcn* component.
Mib	X25Dte

ATTRIBUTE X25Dte inPacketSize (iPktSz)

Access	Read and write
Description	This attribute specifies the maximum receive packet size in octets for the X.25 interface.
Mib	X25Dte
Values	Decimal (16; 32; 64; 128; 256; 512; 1024; 2048; 4096)
Default	128

ATTRIBUTE X25Dte outPacketSize (oPktSz)

Access	Read and write
Description	This attribute specifies the maximum transmit packet size in octets for the X.25 interface.
Mib	X25Dte
Values	Decimal (16; 32; 64; 128; 256; 512; 1024; 2048; 4096)
Default	128

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE X25Dte inWindowSize (iWdwSz)

Access	Read and write
Description	This attribute specifies the maximum receive window size for the X.25 interface. A window size greater than ***7*** is only valid when the *packetSequencing* attribute is set to ***modulo128***.
Mib	X25Dte
Values	Decimal (1..127)
Default	2

ATTRIBUTE X25Dte outWindowSize (oWdwSz)

Access	Read and write
Description	This attribute specifies the maximum transmit window size for the X.25 interface. A window size greater than ***7*** is only valid when the *packetSequencing* is set to ***modulo128***.
Mib	X25Dte
Values	Decimal (1..127)
Default	2

ATTRIBUTE X25Dte acceptReverseCharging (aRC)

Access	Read and write
Description	This attribute specifies whether local end will accept or refuse charges for a call. A value of ***neverAccept*** is only used at the X.25 interface level and indicates that this interface will never accept reverse charging (that is no *Peer* component can override this parameter, allowing reverse charged calls to be accepted).
Mib	X25Dte
Values	accept refuse neverAccept
Default	refuse

ATTRIBUTE X25Dte proposeReverseCharging (pRC)

Access	Read and write
Description	This attribute specifies whether ***local***/***reverse*** charging is signalled in the call request packet.
Mib	X25Dte

Copyright © 2006, Nortel Nortel Confidential

Values	reverse local
Default	local

ATTRIBUTE X25Dte outThroughputClassSize (oTpCSz)

Access	Read and write
Description	This attribute specifies the value of the transmit throughput class to be negotiated. A value of ***notSpecified*** means the facility is not signalled.
Mib	X25Dte
Values	75 150 300 600 1200 2400 4800 9600 19200 48000 64000 notSpecified
Default	notSpecified

ATTRIBUTE X25Dte inThroughputClassSize (iTpCSz)

Access	Read and write
Description	This attribute specifies the value of the receive throughput class to be negotiated. A value of ***notSpecified*** means the facility is not signalled.
Mib	X25Dte
Values	75 150 300 600 1200 2400 4800 9600 19200 48000 64000 notSpecified
Default	notSpecified

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE X25Dte cugIndex (cI)

Access	Read and write
Description	This attribute specifies the index of the Closed User Group facility to signal. The index consists of two or four octets each representing a digit in the range of 0 to 9. A value of null (empty string) at the X.25 interface means no CUG facility is signalled. If a *cugIndex* is provisioned to be signalled, the *cugoaIndex* attribute must be null.
Mib	X25Dte
Values	String (0..4, ASCII)
Default	""

ATTRIBUTE X25Dte cugoaIndex (coaI)

Access	Read and write
Description	This attribute specifies the index of the Close User Group with Outgoing Access facility to signal. The index consists of two or four octets each representing a digit in the range of 0 to 9. A value of null (empty string) at the X.25 interface means no CUGOA facility is signalled. If a *cugoaIndex* is provisioned to be signalled, the *cugIndex* attribute must be null.
Mib	X25Dte
Values	String (0..4, ASCII)
Default	""

ATTRIBUTE X25Dte chargingInformation (cInfo)

Access	Read and write
Description	This attribute specifies whether the charging information facility is to be signalled in a call request packet. A value of ***notSpecified*** means the facility is not signalled. A value of ***notRequested*** means the facility is signalled but charging information is not requested (that is, the charging info field of the facility is set Off). A value of ***requested*** means the facility is signalled to explicitly request charging information.
Mib	X25Dte
Values	notSpecified notRequested requested
Default	notSpecified

ATTRIBUTE X25Dte rpoa (rp)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the value of the RPOA facility to signal in a call request packet. The value of null (empty string) at the X.25 interface means no RPOA facility is signalled.
Mib	X25Dte
Values	String (0..108, ASCII)
Default	""

ATTRIBUTE X25Dte trnstDlySlctnAInd (tdsai)

Access	Read and write
Description	This attribute specifies the value of the Transit Delay Selection and Indication facility to signal in a call request packet. A value of ***65536*** at the X.25 interface level means no TDSAI facility is signalled.
Mib	X25Dte
Values	Decimal (0..65536)
Default	65536

ATTRIBUTE X25Dte callingNetworkFax (clgNFax)

Access	Read and write
Description	This attribute specifies the Calling Network facilities to be signalled in a call request packet. A value of null (empty string) at the X.25 interface means no facilities are signalled.
Mib	X25Dte
Values	String (0..108, Hex)
Default	""

ATTRIBUTE X25Dte calledNetworkFax (cldNFax)

Access	Read and write
Description	This attribute specifies the called network facilities to be signalled in a call request packet. A value of null (empty string) at the X.25 interface means no facilities are signalled.
Mib	X25Dte
Values	String (0..108, Hex)
Default	""

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE X25Dte callUserData (cud)

Access	Read only
Description	This attribute specifies the user data to be signalled in the call request packet. A value of null (empty string) means no user data is signalled.
Mib	X25Dte
Values	String (0..128, Hex)
Default	""

GROUP X25Dte IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	X25Dte

ATTRIBUTE X25Dte ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	X25Dte
Values	up down testing
Default	up

ATTRIBUTE X25Dte ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	X25Dte
Values	Decimal (1..65535)
Default	No default

GROUP X25Dte OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the

Copyright © 2006, Nortel Nortel Confidential

component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib X25Dte

ATTRIBUTE X25Dte adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib X25Dte

Values locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

ATTRIBUTE X25Dte operationalState (osiOper)

Access Read only

Description This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib X25Dte

Values enabled (ena)
disabled (dis)

Default disabled

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE X25Dte usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	X25Dte
Values	idle active (activ) busy
Default	idle

GROUP X25Dte OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	X25Dte

ATTRIBUTE X25Dte snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	X25Dte
Values	up down testing
Default	up

GROUP X25Dte Operational (Op)

Properties	Operational
Description	This group contains the operational status of the X.25 interface.
Mib	X25Dte

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE X25Dte interfaceState (intfState)

Access	Read only
Description	This attribute specifies the state of the interface. The ***notReady*** state, is the initial state of the service, when it is being initialized. The ***localRestarting*** state is entered when a Restart packet is sent to the link and the interface is waiting for a response. The ***remoteRestarting*** state is entered when a Restart packet is received from the link, and is being processed. In ***ready*** state, the service is operational and ready to provide service.
Mib	X25Dte
Values	notReady localRestarting remoteRestarting ready
Default	No default

GROUP X25Dte Statistics (Stats)

Properties	Operational
Description	This component contains the statistics for the X.25 interface.
Mib	X25Dte

ATTRIBUTE X25Dte inCalls (iC)

Access	Read only
Description	This attribute counts the number of call packets received from link.
Mib	X25Dte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE X25Dte inCallRefusals (iCR)

Access	Read only
Description	This attribute counts the number of calls received from the link which have been cleared. This includes calls cleared by the X.25 interface and calls cleared by the higher level.
Mib	X25Dte
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE X25Dte inPrvdrInitiatedClrs (iPIC)

Access	Read only
Description	This attribute counts the number of clear packets received from the link with a cause code other than DTE initiated.
Mib	X25Dte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE X25Dte inRmtInitiatedRsts (iRIRsts)

Access	Read only
Description	This attribute counts the number of reset packets received from the link with the cause code DTE initiated.
Mib	X25Dte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE X25Dte inPrvdrInitiatedRsts (iPIRsts)

Access	Read only
Description	This attribute counts the number of reset packets received from the link with the cause code other than DTE initiated.
Mib	X25Dte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE X25Dte inRestarts (iRstrts)

Access	Read only
Description	This attribute counts the number of restart packets received from the link while the service is in ready state.
Mib	X25Dte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE X25Dte inDataPackets (iDPkts)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of data packets received from link.
Mib	X25Dte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE X25Dte inPktsAcusdOfPrtclErr (iPktsPErr)

Access	Read only
Description	This attribute counts the number of clear, reset, restart and diagnostic packets received from link containing a procedure error cause code.
Mib	X25Dte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE X25Dte inInterruptPackets (iIntPkts)

Access	Read only
Description	This attributes counts the number of interrupt packets received from link.
Mib	X25Dte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE X25Dte outCallAttempts (oCAtt)

Access	Read only
Description	This attribute counts the number of call packets sent from this interface.
Mib	X25Dte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE X25Dte outCallFailures (oCFlrs)

Access	Read only
Description	This attribute counts the number of call attempts from this interface that failed. This includes calls that were cleared because of restrictive fast select.
Mib	X25Dte

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE X25Dte outInterruptPackets (oIntPkts)

Access	Read only
Description	This attribute counts the number of interrupt packets sent to the link.
Mib	X25Dte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE X25Dte outDataPackets (oDPkts)

Access	Read only
Description	This attribute counts the number of data packets sent to the link.
Mib	X25Dte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE X25Dte outActiveChannels (oActCh)

Access	Read only
Description	This attribute indicates the number of One-way Outgoing Channels that are currently in use. This counter includes the call requests that have not been accepted.
Mib	X25Dte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE X25Dte inActiveChannels (iActCh)

Access	Read only
Description	This attribute indicates number of One-way Incoming Channels that are currently active.
Mib	X25Dte
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE X25Dte twowayActiveChannels (tWActCh)

Access	Read only
Description	This attribute indicates the number of Two-way Channels that are in use. This includes call requests sent but not yet accepted.
Mib	X25Dte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE X25Dte t20RestartTimeouts (t20Tmo)

Access	Read only
Description	This attribute counts the number of times the T20 restart timer has expired.
Mib	X25Dte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE X25Dte t21CallTimeouts (t21Tmo)

Access	Read only
Description	This attribute counts the number of times the T21 call timer has expired.
Mib	X25Dte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE X25Dte t22ResetTimeouts (t22Tmo)

Access	Read only
Description	This attribute counts the number of times the T22 reset timer has expired.
Mib	X25Dte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE X25Dte t23ClearTimeouts (t23Tmo)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute counts the number of times the T23 clear timer has expired.

Mib X25Dte

Groups GROUP X25Dte Peer Interface (If)
GROUP X25Dte Peer Encapsulation (Enc)
GROUP X25Dte Peer CallParameter (Cp)
GROUP X25Dte Peer Operational (Op)

Scope Application

Description

X25Dte/n Peer/n

This optional component defines the parameters to be used in setting up a switched circuit call to a particular remote destination. Multiple instances of this component can co-exist under the same *X25Dte* component.
An instance of this component is needed for each remote host with which the X.25 Dte is to communicate (that is, each peer to which it may establish calls or from which it is to accept calls).

GROUP X25Dte Peer Interface (If)

Properties Provisioned

Description

This group provides the administrative set of parameters for the *Peer* interface.

Mib X25Dte

ATTRIBUTE X25Dte Peer encAddressType (eAddrT)

Access Read and write

Criticality Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the encapsulation type for the address of the remote host with which this *Peer* component allows communication.
Mib	X25Dte
Values	ip
Default	ip

ATTRIBUTE X25Dte Peer encAddress (eAddr)

Access	Read and write
Criticality	Component
Description	This attribute specifies the encapsulation address of the remote host with which this *Peer* component allows communication. This address must correspond with the encapsulation address type. Thus in the case of IP, it will contain a IP address.
Mib	X25Dte
Values	String (0..128, ASCII)
Default	No default

ATTRIBUTE X25Dte Peer x25Address (x25Addr)

Access	Read and write
Criticality	Component
Description	This attribute specifies the X.25 address that identifies the remote host with which this *Peer* component allows communication. The remote X.25 interface could be subdivided through the use of *RemoteGroup* components; in which case this *x25Address* is the X.25 address of the destination's *RemoteGroup* (not to be confused with the *RemoteGroup* indicated by the *linkToRemoteGroup* attribute of THIS *Peer* component).
Mib	X25Dte
Values	BCD (1..15)
Default	No default

ATTRIBUTE X25Dte Peer linkToRemoteGroup (lTRg)

Access	Read and write
Criticality	Component
Description	This is a link to a *RemoteGroup* component. The *RemoteGroup* components logically divide up the X.25 Interface such that a number of Protocol Ports (and consequently a number of Virtual Routers) may share

Copyright © 2006, Nortel Nortel Confidential

the same X.25 Interface into a Wide Area Network. In particular, the remote host identified by this *Peer* component is designated as belonging to the *RemoteGroup* linked by this attribute. The set of all *Peer* components and *PermLcn* components which link to a given *RemoteGroup* determine the subset of remote hosts which are accessible to a particular Protocol Port (and ultimately a Virtual Router).

Mib X25Dte

Values Link (Service, linkToPeer)

Default No default

GROUP X25Dte Peer Encapsulation (Enc)

Properties Provisioned

Description

This group contains the protocol encapsulation types supported for communicating over an lcn to the remote host identified by this *Peer* component. An lcn may be established to the remote host for each of the supported protocol encapsulation types. For each lcn an *Lcn* dynamic component is created under the *X25Dte*.

Mib X25Dte

ATTRIBUTE X25Dte Peer protocolEncType (pEnc)

Access Read and write

Description

Each instance of this replicated attribute describes an encapsulation method permitted for encapsulating the protocol data units (PDUs) of an upper layer protocol when communicating with the remote host identified by this *Peer* component. The index of a given replicated instance of this attribute represents the relative priority of the encapsulation method specified by the given attribute instance. An attribute with index “1” has the highest priority, so the encapsulation method described by it will be the first one attempted when signaling a call to the link. If the *protocolEncType* is set to ***IP*** to encapsulate IP traffic according to RFC1356, the *callUserData* for this *Peer* component and the *X25Dte* component must both be null, so that ***H.CC*** will be signaled as the call user data of the call request. This indicates that the protocol encapsulation type of IP is to be used for the channel.
A call received from the link will be accepted as long as the encapsulation method indicated in the call user data of the incoming call packet is included in one of these replicated attributes. (This presupposes that the incoming call has been directed to the *RemoteGroup* to which this *Peer* is linked through the *linkToRemoteGroup* attribute.)

Mib X25Dte

Values ip

Replication Decimal (1..1)

Default	No default

GROUP X25Dte Peer CallParameter (Cp)

Properties	Provisioned
Description	This group contains the call parameters used to establish a call to/from the remote host identified by this *Peer* component
Mib	X25Dte

ATTRIBUTE X25Dte Peer inPacketSize (iPktSz)

Access	Read and write
Description	This attribute specifies the default maximum receive packet size in octets. A setting of ***0*** indicates the *inPacketSize* setting for the X.25 interface (in *X25Dte* component) is used during call setup to the remote host identified by this *Peer* component.
Mib	X25Dte
Values	Decimal (0; 16; 32; 64; 128; 256; 512; 1024; 2048; 4096)
Default	128

ATTRIBUTE X25Dte Peer outPacketSize (oPktSz)

Access	Read and write
Description	This attribute specifies the default maximum transmit packet size in octets. A setting of ***0*** indicates the *outPacketSize* setting for the X.25 interface (in the *X25Dte* component) is used during call setup to the remote host identified by this *Peer* component.
Mib	X25Dte
Values	Decimal (0; 16; 32; 64; 128; 256; 512; 1024; 2048; 4096)
Default	128

ATTRIBUTE X25Dte Peer inWindowSize (iWdwSz)

Access	Read and write
Description	This attribute specifies the default receive window size. A window size of ***0*** indicates the *inWindowSize* setting for the X.25 interface (in the *X25Dte* component) is used during call setup to the remote host identified by this *Peer* component. A window size greater than ***7*** is only valid when the *packetSequencing* attribute of the *X25Dte* component is set to ***modulo128***.
Mib	X25Dte

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..127)
Default	2

ATTRIBUTE X25Dte Peer outWindowSize (oWdwSz)

Access	Read and write
Description	This attribute specifies the default transmit window size. A window size of 0 indicates the *outWindowSize* setting for the X.25 interface is used during call setup to the *Peer* identified by this component. A window size greater than ***7*** is only valid when the *packetSequencing* attribute of the *X25Dte* component is set to ***modulo128***.
Mib	X25Dte
Values	Decimal (0..127)
Default	2

ATTRIBUTE X25Dte Peer acceptReverseCharging (aRC)

Access	Read and write
Description	This attribute specifies whether the local end will ***accept*** or ***refuse*** charges for a call from the remote host identified by this *Peer* component. A value of ***default*** indicates the use of the *acceptReverseCharging* value from the *X25Dte* component. If the value at the *X25Dte* level is ***neverAccept***, a value of ***accept*** in this *Peer* component will be ignored because no reverse charge calls are to be accepted by this X.25 Dte.
Mib	X25Dte
Values	default accept refuse
Default	refuse

ATTRIBUTE X25Dte Peer proposeReverseCharging (pRC)

Access	Read and write
Description	This attribute specifies whether local/reverse charging is signaled in a call request packet. A value of ***default*** indicates the use of the value from the *proposeReverseCharging* attribute of the *X25Dte* component.
Mib	X25Dte
Values	default reverse local
Default	local

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE X25Dte Peer outThroughputClassSize (oTpCSz)

Access	Read and write
Description	This attribute specifies the value of the transmit throughput class to be negotiated. A value of ***default*** indicates the use of the value from the *outThroughputClassSize* attribute of the *X25Dte* component. A value of ***notSpecified*** means the facility is not signaled.
Mib	X25Dte
Values	75 150 300 600 1200 2400 4800 9600 19200 48000 64000 notSpecified default
Default	notSpecified

ATTRIBUTE X25Dte Peer inThroughputClassSize (iTpCSz)

Access	Read and write
Description	This attribute specifies the value of the receive throughput class to be negotiated. A value of ***default*** indicates the use of the value from the *inThroughputClassSize* attribute of the *X25Dte* component. A value of ***notSpecified*** means the facility is not signaled.
Mib	X25Dte

ATTRIBUTE X25Dte Peer rpoa (rp)

Access Read and write

Description

This attribute specifies the RPOA facility to signal in a call request packet. A value of "***DEF***" indicates the use of the value from the *rpoa* attribute of the *X25Dte* component. A value of null (empty string) indicates no RPOA facility is to be signaled.

Mib X25Dte

Values String (0..108, ASCII)

Default ""

ATTRIBUTE X25Dte Peer trnstDlySlctnAInd (tdsai)

Access Read and write

Description

This attribute specifies the value of the Transit Delay Selection and Indication facility to signal in a call request packet. A value of ***65536*** indicates no facility is signaled. A value of 65537 indicates the use of the value from the *trnstDlySlctnAInd* attribute of the *X25Dte* component.

Mib X25Dte

Values Decimal (0..65537)

Default 65536

ATTRIBUTE X25Dte Peer callingNetworkFax (clgNFax)

Access Read and write

Description

This attribute specifies the Calling Network facilities to signal in a call request packet. The facilities are encoded here exactly as they are encoded in the call packet. These facilities do not include the marker facility code. A value of null (empty string) indicates the *callingNetworkFax*

Copyright © 2006, Nortel Nortel Confidential

from the *X25Dte* are to be signaled. If that value is also null, no Calling Network Facilities are signaled.

Mib X25Dte

Values String (0..108, Hex)

Default ""

ATTRIBUTE X25Dte Peer calledNetworkFax (cldNFax)

Access Read and write

Description

This attribute specifies the Called Network facilities to signal in a call request packet. The facilities are encoded here exactly as they are encoded in the call packet. These facilities do not include the marker facility code. A value of null (empty string) indicates the *calledNetworkFax* from the *X25Dte* are to be signaled. If that value is also null, no Called Network Facilities are signaled.

Mib X25Dte

Values String (0..108, Hex)

Default ""

ATTRIBUTE X25Dte Peer callUserData (cud)

Access Read only

Description

This attribute specifies the user data to signal in a call request packet. A value of null (empty string) indicates that the *callUserData* from the *X25Dte* is to be signaled. If *callUserData* of the *X25Dte* component is also null and *protocolEncType* of this *Peer* has the value ***IP***, H.CC will be signaled as the call user data of a call request packet. Thus for IP encapsulation according to RFC1356, both the *callUserData* from the *Peer* and *X25Dte* components must be null and the *protocolEncType* set to ***IP***.

Mib X25Dte

Values String (0..128, Hex)

Default ""

GROUP X25Dte Peer Operational (Op)

Properties Operational

Description

This group provides the operational parameters for the *Peer* interface.

VERB CLEAR X25Dte Lcn

Impact	Service
Description	*CLEAR X25Dte/n Lcn/n* This verb will cause the specified logical channel to close by signaling a clear packet to the link. It only affects SVCs.

Copyright © 2006, Nortel Nortel Confidential

VERB RESET X25Dte Lcn

Impact	Service
Description	*RESET X25Dte/n Lcn/n* This verb will cause the specified logical channel to reset, by sending a reset packet to the link. A reset will cause the data path to be flushed, so data packets in transition will be lost.

GROUP X25Dte Lcn **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	X25Dte

ATTRIBUTE X25Dte Lcn **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	X25Dte
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE X25Dte Lcn **operationalState (osiOper)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	X25Dte
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE X25Dte Lcn usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	X25Dte
Values	idle active (activ) busy
Default	idle

GROUP X25Dte Lcn CallParameter (Cp)

Properties	Operational
Description	This group contains the call parameters that are in use for this logical channel. For a PVC only the packet size and the window size attributes are meaningful.
Mib	X25Dte

ATTRIBUTE X25Dte Lcn inPacketSize (iPktSz)

Access	Read only
Description	This attribute indicates the maximum receive packet size in octets.

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE X25Dte Lcn outWindowSize (oWdwSz)

Access	Read only
Description	This attribute indicates the transmit window size.
Mib	X25Dte
Values	Decimal (1..127)
Default	No default

ATTRIBUTE X25Dte Lcn proposeReverseCharging (pRC)

Access	Read only
Description	Specifies whether local/reverse charging was negotiated for this logical channel. To determine which end of the channel is paying for the call, this attribute must be examined in combination with the *callDirection* attribute. For example, if this attribute is set to ***reverse*** and the *callDirection* attribute indicates ***incoming***, it means the incoming call signaled reverse charging, so the local end of the channel is being charged. On the other, if the value of this attribute is ***reverse*** and the *callDirection* is ***outgoing***, it means that the call request sent to the link signaled reverse charging; so

Copyright © 2006, Nortel Nortel Confidential

the remote end is charged. Similarly, a value of ***local*** must also be interpreted in combination with the *callDirection* to determine which end is being charged. If the value of the *callDirection* attribute is ***plcn***, the *proposeReverseCharging* attribute is meaningless.

Mib X25Dte

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE X25Dte Lcn outInterruptPackets (oIntPkts)

Access	Read only
Description	This attribute counts the number of interrupt packets sent to link.
Mib	X25Dte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE X25Dte Lcn t22ResetTimeouts (t22Tmo)

Access	Read only
Description	This attribute counts the number of times the t22 reset timer has expired.
Mib	X25Dte
Values	Decimal (0..4294967295)
Default	0

COMPONENT X25Dte Lapb

Groups	GROUP X25Dte Lapb ControlParam (Cp) GROUP X25Dte Lapb OsiState (State) GROUP X25Dte Lapb Status GROUP X25Dte Lapb Statistics (Stats)
Scope	Application
Description	This component defines the LAPB protocol and its related service options.
Mib	X25Dte
Subcomponents	COMPONENT X25Dte Lapb Framer
Common Verbs	Help List Display

GROUP X25Dte Lapb ControlParam (Cp)

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	X25Dte/n Lapb This group contains the set of configuration parameters for the LAPB interface.
Mib	X25Dte

ATTRIBUTE X25Dte Lapb stationType (type)

Access	Read and write
Description	This attribute specifies the DCE or the DTE role of operation for the LAPB interface. Changing this attribute will cause the lapb link to Reset.
Mib	X25Dte
Values	dte dce
Default	dte

ATTRIBUTE X25Dte Lapb frameSequencing (fs)

Access	Read and write
Description	This attribute specifies the modulo of the frame sequence numbering of the LAPB interface. Changing this attribute will cause the lapb link to Reset.
Mib	X25Dte
Values	modulo8 modulo128
Default	modulo8

ATTRIBUTE X25Dte Lapb n1FrameSize (n1)

Access	Read and write
Description	This attribute specifies the maximum frame size in bits that can be transmitted or received. This value must be greater than or equal to the maximum packet size across the interface(in bits)+ max level 3 header size(in bits)+ max level 2 header size(in bits)+ crc in bits. (max Pkt size + ----------> 4096*8 max level 3 header size + ---> 4*8 level 2 header size + --------> 5*8 crc ----------> 2*8)
Mib	X25Dte
Values	Decimal (40..32856)
Units	bits

Copyright © 2006, Nortel Nortel Confidential

Default	32856

ATTRIBUTE X25Dte Lapb kWindowSize (k)

Access	Read and write
Description	This attribute specifies the window size. This is the maximum number of unacknowledged sequenced frames that may be outstanding from or to this interface at any one time. A window size of greater than 7 is only valid when the sequence numbering of frames is modulo 128.
Mib	X25Dte
Values	Decimal (1..127)
Default	7

ATTRIBUTE X25Dte Lapb n2TransmitLimit (n2)

Access	Read and write
Description	This attribute specifies the maximum number of times a frame can be transmitted before appropriate recovery action is taken.
Mib	X25Dte
Values	Decimal (1..20)
Default	10

ATTRIBUTE X25Dte Lapb t1AckTimer (t1)

Access	Read and write
Description	This attribute specifies the period in milliseconds within which an acknowledgment of a sent frame must be received. The value set for t1 ack timer must be less than the value set for the t4 idle probe timer.
Mib	X25Dte
Values	Decimal (1000..10000)
Units	msec
Default	3000

ATTRIBUTE X25Dte Lapb t2AckDelayTimer (t2)

Access	Read and write
Description	This attribute specifies the maximum period in milliseconds permissible to wait before sending an acknowledgment for a received in sequenced I-frame. A value of 0 means there will be no delay in acknowledgment.

Copyright © 2006, Nortel Nortel Confidential

Mib	X25Dte
Values	Decimal (0..10000)
Units	msec
Default	0

ATTRIBUTE X25Dte Lapb t4IdleProbeTimer (t4)

Access	Read and write
Description	This attribute specifies the time period in milliseconds the link will be permitted to remain idle (that is, no frames are exchanged on the data link). Upon expiry of this timer, LAPB will poll its peer for status. The value set for t4 idle probe timer must be greater than the value set for the t1 ack timer.
Mib	X25Dte
Values	Decimal (1000..65535000)
Units	msec
Default	60000

ATTRIBUTE X25Dte Lapb actionInitiate (ai)

Access	Read and write
Description	This attribute specifies the action to be taken by the LAPB interface to initiate link setup.
Mib	X25Dte
Values	sendSABM sendDM none
Default	sendSABM

ATTRIBUTE X25Dte Lapb actionRecvDM (ardm)

Access	Read and write
Description	This attribute specifies the action to be taken by the LAPB interface when it receives a DM response.
Mib	X25Dte
Values	sendSABM
Default	sendSABM

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE X25Dte Lapb txQDegradeThreshold (txdt)

Access	Read and write
Description	This attribute specifies the threshold of the number of higher layer packets queued, beyond which LAPB should initiate a service degrade alarm. A value of 65536 means no threshold.
Mib	X25Dte
Values	Decimal (1..65536)
Default	65536

ATTRIBUTE X25Dte Lapb txQResetThreshold (txrt)

Access	Read and write
Description	This attribute specifies the threshold of the number of higher layer packets queued, beyond which LAPB should initiate an overload alarm and reset the link. A value of 65536 means no threshold.
Mib	X25Dte
Values	Decimal (1..65536)
Default	65536

GROUP X25Dte Lapb OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	X25Dte

ATTRIBUTE X25Dte Lapb adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting

Copyright © 2006, Nortel Nortel Confidential

down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib X25Dte

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

ATTRIBUTE X25Dte Lapb operationalState (osiOper)

Access Read only

Description This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib X25Dte

Values
enabled (ena)
disabled (dis)

Default disabled

ATTRIBUTE X25Dte Lapb usageState (osiUsage)

Access Read only

Description This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib X25Dte

Values
idle
active (activ)
busy

Default idle

Copyright © 2006, Nortel Nortel Confidential

GROUP X25Dte Lapb Framer Statistics (Stats)
GROUP X25Dte Lapb Framer LinkUtilization (Util)

COLLECTED STATS X25Dte Lapb Framer

Scope: Application

Description:

X25Dte/n Lapb Framer

The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length) rather than interface specific attributes (such as modem leads and clocking) which are associated with specific hardware components (such as *V35/n* or *DS1/n*). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).

Description

This group contains the Operational attributes relevant to an interface used to carry Multiprotocol Interconnect traffic over X.25.

Mib X25Dte

ATTRIBUTE X25Dte Ple encAddrToX25LkupFlrs (enAddrTX25Flr)

Access Read only

Description This attribute indicates the number of times a translation attempt from an Encapsulation address to an X.25 address failed to find a corresponding X.25 address. Such a failure could occur when a Protocol Port, linked to a *RemoteGroup* via the *linkToProtocolPort* attribute of the *RemoteGroup*, requests through the software that a X.25 call be established to a particular Encapsulation address. If the *RemoteGroup* does not have a *Peer* component linked in its *linkToPeer* attribute list, with the *encAddress*

Copyright © 2006, Nortel Nortel Confidential

attribute equal to the Encapsulation address specified, this counter will be incremented, because the corresponding *Peer* component needed to establish an X.25 connection was not found.

Mib	X25Dte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE X25Dte PIe lastFailedEncAddr (lFEnaddr)

Access	Read only
Description	This attribute indicates the last Encapsulation address for which no corresponding X.25 address was found and thus caused *encAddressToX25LkupFlrs* to be incremented.
Mib	X25Dte
Values	String (2..128, Hex)
Default	No default

ATTRIBUTE X25Dte PIe x25AddrToEncLkupFlrs (x25AddrTEnFlr)

Access	Read only
Description	This attribute indicates the number of times a translation attempt from an X.25 address to an Encapsulation address failed to find a corresponding Encapsulation address. Such a failure could occur when a incoming call received from the link by the X.25 DTE is directed to a specific *RemoteGroup* because the called address matches the *localAddress* attribute of the *RemoteGroup* component. If the *RemoteGroup* component does not have a *Peer* component linked in its *linkToPeer* attribute list, with the *x25Address* attribute equal to the calling address from the incoming call packet, there is no appropriate *Peer* component, so the call is cleared and this counter is incremented.
Mib	X25Dte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE X25Dte PIe lastFailedX25Addr (lFX25Addr)

Groups	GROUP X25Dte Rg IfEntryProv (IfEntry) GROUP X25Dte Rg Provisioned (Prov) GROUP X25Dte Rg OsiState (State) GROUP X25Dte Rg OperationalStatus (OperStatus) GROUP X25Dte Rg Operational (Op)
Scope	Application
Description	*X25Dte/n RemoteGroup/n* At least one *RemoteGroup* is required for each *X25Dte* component. The *RemoteGroup* allows the X.25 DTE interface to be shared amongst a number of Protocol Ports. This allows separate Virtual Routers to share the same physical X.25 connection into a Wide Area Network.
Mib	X25Dte
Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP X25Dte Rg IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	X25Dte

ATTRIBUTE X25Dte Rg ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	X25Dte
Values	up down testing
Default	up

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE X25Dte Rg ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	X25Dte
Values	Decimal (1..65535)
Default	No default

GROUP X25Dte Rg Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes of the *RemoteGroup* component.
Mib	X25Dte

ATTRIBUTE X25Dte Rg linkToProtocolPort

Access	Read and write
Criticality	Component
Description	This attribute contains a protocol port component name. The attribute associates the application with a protocol port.
Mib	X25Dte
Values	Link (Service, linkToMedia)
Default	No default

ATTRIBUTE X25Dte Rg localAddress (lAddr)

Access	Read and write
Criticality	Component
Description	This attribute contains the unique X.25 address which identifies this *RemoteGroup*. It should correspond to the called address in X.25 incoming call packets which are to be directed to this *RemoteGroup*. This allows calls received from the link to be directed to the appropriate *RemoteGroup* based on the called address in the X.25 call packet. The *RemoteGroup* components allow the X.25 interface to be shared amongst a number of Protocol Ports (and ultimately Virtual Routers) because each *RemoteGroup* is coupled with a specific *ProtocolPort* through its *linkToProtocolPort* attribute.

Mib	X25Dte
Values	BCD (1..15)
Default	No default

ATTRIBUTE X25Dte Rg mtuSize (mtuSz)

Access	Read and write
Description	This attribute specifies the Maximum Transmit Unit (MTU); that is, the size of the largest datagram (in octets) which can be sent/received on the interface.
Mib	X25Dte
Values	Decimal (576..9188)
Units	octets
Default	1600

ATTRIBUTE X25Dte Rg linkToPermLcn (ltPlcn)

Access	Read and write
Description	This attribute is a list of links to *PermLcn* components. The set of all *Peer* and *PermLcn* components which link to a given *RemoteGroup* determine the subset of remote hosts which are accessible to a particular Protocol Port (and ultimately a Virtual Router).
Mib	X25Dte
List of	Link (Service, linkToRemoteGroup)
List Size	4095
Default	No default

ATTRIBUTE X25Dte Rg linkToPeer (ltPeer)

Access	Read and write
Description	This attribute gives a list of links to *Peer* components. The set of all *Peer* and *PermLcn* components which link to a given *RemoteGroup* determine the subset of remote hosts which are accessible to a particular Protocol Port (and ultimately a Virtual Router).
Mib	X25Dte
List of	Link (Service, linkToRemoteGroup)

GROUP X25Dte Rg OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	X25Dte

ATTRIBUTE X25Dte Rg adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	X25Dte
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE X25Dte Rg operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

Mib	X25Dte
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE X25Dte Rg usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	X25Dte
Values	idle active (activ) busy
Default	idle

GROUP X25Dte Rg OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	X25Dte

ATTRIBUTE X25Dte Rg snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	X25Dte
Values	up down testing
Default	up

GROUP X25Dte Rg Operational (Op)

Properties	Operational
Description	This group gives the operational attributes of the *RemoteGroup* component.
Mib	X25Dte

ATTRIBUTE X25Dte Rg IcnList (Icn)

Access	Read only
Description	This attribute lists the *Lcn* components for the *X25Dte*, which belong to this *RemoteGroup*. There is an *Lcn* component listed here for every lcn connection belonging to this *RemoteGroup*. The lcns were established using either a *Peer* component linked to this *RemoteGroup* (in response to a switched call) or using a *PermLcn* component linked to this *RemoteGroup* (a permanent connection).
Mib	X25Dte
List of	Decimal (1..4095)
List Size	4095
Default	No default
