Access	Read only
Description	If the value of the *unitsCounted* attribute in *moduleData* component is ***segments***, this attribute counts the number of segments in frames with the Discard Eligibility (DE) bit set sent to the interface since the start of the interval period. If the value of the *unitsCounted* attribute in *moduleData* component is ***frames***, this attribute counts the number of frames with the Discard Eligibility (DE) bit set sent to the interface since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci discardedSegFrm

Access	Read only
Description	If the value of the *unitsCounted* attribute in *moduleData* component is ***segments***, this attribute counts the number of segments in invalid frames received from the interface and discarded at the DLCI. If the value of the *unitsCounted* attribute in *moduleData* component is ***frames***, this attribute counts the number of invalid frames received from the interface and discarded at the DLCI. Segments of frames are counted since the start of the interval period. The count is reset to zero when an accounting record is generated. The count is a sum of segments in frames or frames discarded due to the number of octets in the information field greater than the subscribed maximum or equal to 0, due to aBit turned off, or due to rate enforcement.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci localRateAdaptOccurred

Access	Read only
Description	This attribute indicates whether rate adaptation has occurred on this user Data Link Connection on this Frame Relay interface. The value is set to ***no*** when an accounting record is generated.
Mib	FrameRelayNni
Values	yes no

Copyright © 2006, Nortel Nortel Confidential

Default	no

ATTRIBUTE FrNni Dlci elapsedDifference

Access	Read only
Description	This attribute indicates the elapsed time representing the period of this interval data. It is elapsed time in 0.1 second increments since the call started.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci egressProtocol (ep)

Access	Read only
Description	This attribute indicates whether the egress protocol is active at this DLCI. The activation of the egress protocol is negotiated at the call setup and it depends on the remote end supporting OAM frame exchanges and the record generation mode.
Mib	FrameRelayNni
Values	off on
Default	No default

ATTRIBUTE FrNni Dlci callRefNumber

Access	Read only
Description	This attribute indicates the call reference number which is a unique number generated by the switch. The same Call Reference Number is stored in the interval data (accounting record) at both ends of the call. It can be used as one of the attributes in matching duplicate records generated at each end of the connection.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

GROUP FrNni Dlci CallData (CallId)

ATTRIBUTE FrNni Dlci callType (ct)

Access	Read only
Description	This attribute indicates whether this DLCI is a permanent virtual circuit (PVC), a switched virtual circuit (SVC), or a switched permanent virtual circuit (SPVC).
Mib	FrameRelayNni
Values	pvc svc spvc
Default	No default

ATTRIBUTE FrNni Dlci callState

Access	Read only
Description	This attribute indicates the FRF.10 state of a switched call. The value of this attribute for a permanent (PVC and P-SPVC) DLCI is always ***notApplicable***. In the description that follows, “calling STE” refers to the network who has initiated the SETUP request, and “called STE” refers to the network that receives the request. State description: In the ***null*** state, the network has neither received nor sent call setup requests for this DLCI. In the ***callInitiated*** state, the called STE has received a SETUP message from the calling STE. In the ***callProceedingSent*** state, the called STE has sent a CALL PROCEEDING message to the calling STE in response to the SETUP message. In the ***callPresent*** state, the calling STE has sent a SETUP message to the called STE but has not received a response. In the ***callProceedingReceived*** state, the calling STE has received a CALL PROCEEDING message from the called STE in response to a SETUP message. In the ***active*** state, either the called STE has sent a CONNECT message to the calling STE, or the calling STE has received a CONNECT from the called STE. In the ***releaseRequest*** state, the STE has sent a RELEASE message to release the call and is waiting for a RELEASE COMPLETE message. In the ***releaseIndication*** state, the STE has received a RELEASE and sends a RELEASE COMPLETE message after releasing the relevant call

Copyright © 2006, Nortel Nortel Confidential

resources.

In the ***restartRequest*** state, the STE has sent a RESTART request to the other STE and is waiting for an acknowledgement.

In the ***restart*** state, the STE has received a request for a restart from the other STE and this STE has not returned an acknowledgement.

COMPONENT FrNni Dlci DirectCall (Dc)

Groups — GROUP FrNni Dlci Dc Options

Scope — Application

Description — *FrUni/n Dlci/n DirectCall*
FrNni/n Dlci/n DirectCall
This component defines direct call options for calls issued without operator intervention. Connection is complete and can be initiated automatically. Frequency of connection tries is controlled by retry timer.

If no BnxProtocol component is provisioned under a FrUni or FrNni, a DirectCall component is automatically added to all the Dlci components added to the FrUni or FrNni.

Copyright © 2006, Nortel Nortel Confidential

If a BnxProtocol component is provisioned under a FrUni or FrNni, no DirectCall is automatically added under the Dlci component.

Mib	FrameRelayNni
Common Verbs	Help List Display Add DELete

GROUP FrNni Dlci Dc Options

Properties	Provisioned
Description	This group defines attributes associated with a direct call. It defines connection in terms of path and call option parameters. This connection can be permanent (PVC), switched (SVC), or switched permanent (SPVC). It can have four facilities: - CCITT Facilities - DTE Facilities - National Facilities - International Facilities The total number of bytes of facilities including the facility codes and all of the facility data from all of the four classes of facilities must not exceed 512 bytes.
Mib	FrameRelayNni

ATTRIBUTE FrNni Dlci Dc remoteNpi (rnpi)

Access	Read and write
Description	This attribute specifies the Numbering Plan Indicator (NPI) of the *remoteDna.*
Mib	FrameRelayNni
Values	x121 e164
Default	x121

ATTRIBUTE FrNni Dlci Dc remoteDna (rdna)

Access	Read and write
Description	This attribute specifies the Data Network Address (DNA) of the service at the remote end of the DLCI. This is the called (destination) DCE address (DNA) of this PVC.
Mib	FrameRelayNni
Values	BCD (1..15)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrNni Dlci Dc remoteDlci (rdlci)

Access	Read and write
Description	This attribute specifies the remote DLCI of the PVC connection.
Mib	FrameRelayNni
Values	Decimal (16..1007)
Default	No default

ATTRIBUTE FrNni Dlci Dc type

Access	Read and write
Description	This attribute specifies the type of VC call. If the value is set to ***permanentMaster,*** then a permanent connection will be established between two ends. The remote end must be defined as a ***permanentSlave***, ***permanentBackupSlave,*** or ***permanentSlaveWithBackup***. The connection cannot be established if the remote end is defined as anything else. The end defined as ***permanentMaster*** always initiates the calls. It attempts to call once per minute. If the value is set to ***permanentSlave*** then a permanent connection will be established between two ends. The remote end must be defined as a ***permanentMaster.*** The connection cannot be established if the remote end is defined as anything else. The ***permanentSlave*** end attempts to call once per minute. If the value is set to ***permanentSlaveWithBackup*** then a permanent connection will be established between the two ends. The remote end must be defined as a ***permanentMaster.*** The connection cannot be established if the remote interface is defined as anything else. The ***permanentSlaveWithBackup*** attempts to call once per minute. When *type* is set to ***permanentSlaveWithBackup,*** the connection is cleared if the interface becomes unavailable. This enables a retry of the connection which can be redirected to the ***permanentBackupSlave***. If the value is set to ***permanentBackupSlave*** then a permanent connection is established between the two ends only if the ***permanentMaster*** end is disconnected from the ***permanentSlaveWithBackup*** end and a backup call is established by the call redirection system. If the ***permanentSlaveWithBackup*** interface becomes available again, the ***permanentBackupSlave*** end is disconnected and the ***permanentSlaveWithBackup*** end is reconnected to the ***permanentMaster*** end. The ***permanentBackupSlave*** end does not try to establish a call.
Mib	FrameRelayNni

Copyright © 2006, Nortel Nortel Confidential

Values	permanentMaster (master) permanentSlave (slave) permanentBackupSlave (backSl) permanentSlaveWithBackup (slavWB) spvcMaster (spvcM) spvcSlave (spvcS) spvcBackupSlave (spvcBackS) spvcSlaveWithBackup (spvcSWBack)
Default	permanentMaster

ATTRIBUTE FrNni Dlci Dc **transferPriority (tp)**

Access	Read and write
Description	This attribute specifies the transfer priority to the local network for the outgoing calls using this particular DLCI. It overrides the *defaultTransferPriority* provisioned in its associated *Dna* component. The transfer priority is a preference configured for an application according to its delay-sensitivity requirement. Frames with higher transfer priority are served by the network before the frames with lower priority. The transfer priority standard is defined to have 16 levels from 0 to 15. Each transfer priority n, where n is the transfer priority index, has a default setting for routing class of service (multimedia, delay, or throughput) and Frame Relay egress queue (depending on the number of supported egress queues on the remote end interface). These settings are specified by the *routingClassOfServic*e and *emissionPriority* attributes provisioned under the *Mod Frs DprsNet Tpm/n* component. Specifying ***useDnaDefTP*** means using the value given by *defaultTransferPriority* in the associated *Dna* for this DLCI.

15
useDnaDefTP

Default useDnaDefTP

ATTRIBUTE FrNni Dlci Dc discardPriority (dp)

Access Read and write

Description This attribute specifies the discard priority for outgoing call using this DLCI.

The discard priority has three provisioning values: ***normal***, ***high***, and ***useDnaDefPriority***. Under congestion conditions, traffic with ***normal*** priority is discarded before traffic with ***high*** priority. The *Dna* default value (provisioned by *outDefaultPriority*) is taken if this attribute is set to the value ***useDnaDefPriority***.

Mib FrameRelayNni

Values normal
high
useDnaDefPriority

Default useDnaDefPriority

ATTRIBUTE FrNni Dlci Dc deDiscardPriority (ddp)

Access Read and write

Description This attribute specifies whether the *discardPriority* applies to DE frames for this DLCI.

When set to ***determinedByDiscardPriority***, traffic with DE bit set will be discarded according to the setting of the *discardPriority*.

When set to ***lowest***, all traffic with DE bit set is treated the same and is sent to the subnet at the lowest discard priority.

Mib FrameRelayNni

Values lowest
determinedByDiscardPriority

Default determinedByDiscardPriority

ATTRIBUTE FrNni Dlci Dc dataPath (dpa)

Access Read and write

Description

This attribute specifies the data path to be used by Virtual Circuits on this interface. The value of the *dataPath* attribute in the *Dna* component is overridden by this attribute if the value is not ***useDnaValue***.

This value applies to the connection after data transfer state is reached. All

Copyright © 2006, Nortel Nortel Confidential

the data and control traffic will be sent using this data path. If the provisioned *dataPath* is not available the connection is not established.

The value of the *dataPath* is signaled by both ends of the connection. If this value is not the same at both ends ***dprsOnly*** is used for the duration of the connection.

A virtual circuit connection is always established using ***dprsOnly*** even if this attribute is provisioned as some other value.

dprsOnly - The dynamic packet routing system is used.

dprsMcsOnly - The DPRS Multi-Service Cut-Through Switching path is used.

dprsMcsFirst - The DPRS Multi-Service Cut-Through Switching path is used if it is available. If it is not available, ***dprsOnly*** is used.

useDnaValue - The routing system used is based on the value provisioned in the *Dna* component.

Mib: FrameRelayNni

Values:
dprsOnly (dpOnly)
dprsMcsOnly (mcOnly)
dprsMcsFirst (mcFrst)
useDnaValue (dnaVal)

Default: useDnaValue

ATTRIBUTE FrNni Dlci Dc cugIndex (ci)

Access: Read and write

Description

This attribute specifies the CUG index which is to be signaled in PVC and SPVC call requests to the remote end.

The type of CUG signaling is defined in attribute *cugType* in this component.

Mib: FrameRelayNni

Values: Decimal (0..255)

Default: 0

ATTRIBUTE FrNni Dlci Dc cugType (ct)

Access: Read and write

Description

This attribute specifies the type of CUG signaling to be used in PVC and SPVC call requests. Index of CUG to be used is defined in attribute *cugIndex* in this component.

Copyright © 2006, Nortel Nortel Confidential

Possible values are:
cug - signal CUG
cugOa - signal CUG with outgoing access
doNotSignal - no CUG in call request

Mib	FrameRelayNni
Values	cug cugOa doNotSignal
Default	doNotSignal

ATTRIBUTE FrNni Dlci Dc mapIpCosToFrQos (mapctof)

Access	Read and write
Description	This attribute specifies whether an IP TOS value is mapped to an FR QOS. The mapping used is provisioned in the *Mod Frs IpCosToFrQos* component. When this attribute is set to ***yes***, at Frame Relay egress, the IP TOS byte in each frame is checked. The TOS value determines the egress emission queue and the discard priority for that frame. When this attribute is set to ***no***, FR QOS is determined by the provisioned discard priority and transfer priority. When this attribute is set to ***protocolDependent*** at Frame Relay egress, the IP version field in each frame is checked. If the IP version is IP version Four, the TOS value determines the egress emission queue and the discard priority for that frame. If not, the FR QOS is determined by the provisioned discard priority and transfer priority. A semantic check error is generated when this attribute is set to either ***yes*** or ***protocolDependent***, and a *FrUni DirectConnection* component is provisioned under the same *FrUni* component.
Mib	FrameRelayNni
Values	no yes protocolDependent
Default	no

VERB Ping **FrNni Dlci Vc**

Impact	Passive
Description	Ping *[-roundTripDelay] [-sendPktDataSize(octets)] [-returnPktDataSize(octets)]* FrUni/*<n>* Dlci/*<n>* Vc

Ping causes a query packet to be sent to the destination module where the Frame Relay DLCI VC terminates. It can be used to either display the path of the VC being used by the Frame Relay DLCI or to measure the round trip delay of the Frame Relay DLCI connection. Since the query packet carries the same path selector as the Frame Relay data packets and the Frame Relay VC's transfer priority (TP) is used to set the RCOS, reliability and emission priority of the query packet, the path taken by the ping query packet will be the same as that of the Frame Relay data except at the source and destination module. The ping packets originate from the CP rather than the Frame Relay DLCI's FP. At the far end, it is also the CP that receives the ping packets and returns them, rather than the Frame Relay FP.

Note that this command does not provide any information regarding the status of the far end VC process. If, however, the destination module is unreachable or the VC path is congested, the operator will be notified.

The ping command can be issued with or without options. If no options are specified, the command reports the path of the VC associated with the Frame Relay DLCI. When the command is used to find the VC path, it displays the RID and MID of each module that the query packet passes through on its way to the destination. If the roundTripDelay option is specified, the command reports the time taken to reach the destination and back. For the roundTripDelay option, the path taken by the query packets in both directions (from the source to the destination and from the destination back to the source) is the same as that of the Frame Relay data except at the source and destination where the ping packets are generated and bounced back by the CP rather than the Frame Relay DLCI's FP.

The ping command supports the following options:

-roundTripDelay (-rtd): If this option is selected, the round trip delay time to reach the destination and back will be reported. The round trip delay is calculated by timing how long it takes to send five packets to the destination node and back. The packet size can be specified using the

Copyright © 2006, Nortel Nortel Confidential

sendPktSize and returnPktSize options. The minimum, maximum and average time taken by the returned packets are reported. If this option is not selected, the path taken to the destination is displayed.

-sendPktDataSize: This option specifies the number of data octets to be included in the round trip delay query packet. The rtd query packet consists of the Nortel Networks proprietary common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are sent to the destination. The actual number of data octets sent is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default value is 64 octets if *transferPriority* of the *Frame Relay DLCI Dc* is 11, and 128 octets otherwise. This option is ignored if the -rtd option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

-returnPktDataSize: This option specifies the number of data octets to be included in the round trip delay acknowledge packet. The rtd acknowledge packet consists of the Nortel Networks proprietary common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are returned to the source. The actual number of data octets returned is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default value is 64 octets if *transferPriority* of the *Frame Relay DLCI Dc* is 11, and 128 octets otherwise. This option is ignored if the -rtd option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

GROUP FrNni Dlci Vc CallData (Cad)

ATTRIBUTE FrNni Dlci Vc segmentsSent

Access	Read only
Description	This attribute displays the number of segments sent at the time command was issued. This is the segment sent count maintained by accounting at the source *Vc*. *Vc* only counts packets that *Vc* thinks can be delivered successfully into the subnet. In reality, these packets may be dropped by trunking, for instance. This counter is not updated when splitting fails,

Copyright © 2006, Nortel Nortel Confidential

when *Vc* is in a path recovery state, when packet forwarding fails to forward this packet and when subsequent packets have to be discarded as we want to minimize the chance of out-of-sequence and do not intentionally send out-of-sequenced packets into the subnet.

Mib	FrameRelayNni
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE FrNni Dlci Vc startTime

Access	Read only
Description	This attribute displays the start time of this interval period. If *Vc* spans 12 hour time or time of day change *startTime* reflects new time as recorded at 12 hour periods or time of day changes.
Mib	FrameRelayNni
Values	Time (DHMS)
Default	No default

ATTRIBUTE FrNni Dlci Vc callReferenceNumber

Access	Read only
Description	This attribute displays the call reference number which is a unique number generated by the switch.The same Call Reference Number is stored in the interval data (accounting record) at both ends of the call. It can be used as one of the attributes in matching duplicate records generated at each end of the call.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	No default

GROUP FrNni Dlci Vc FrameRelayData (Frd)

Properties	Operational
Description	This group defines Frame Relay attributes collected by Frame Relay *Vc*. The purpose of *Vc* attributes is to aid end users and verification people to understand the *Vc* internal behavior. This is particularly useful when the network has experienced abnormality and we want to isolate problems and pinpoint trouble spots. Attributes are collected on a per *Vc* basis. Until a need is identified, statistics are not collected at a processor level. Each attribute is stored in a 32 bit field and is initialized to zero when a *Vc* enters into the data transfer state. When a PVC is disconnected and then connected again, the attributes will be reset. Attributes cannot be reset through other methods. Frame Relay *Vc* uses a best effort data packet delivery protocol and a

Copyright © 2006, Nortel Nortel Confidential

different packet segmentation and combination methods from the General *Vc*. The Frame Relay *Vc* uses the same call setup and control mechanism (e.g. the support of non-flow control data packets) as in a General *Vc*. Most General *Vc* statistics and internal variables are used in a Frame Relay *Vc* and are displayed by software developers

Mib	FrameRelayNni

ATTRIBUTE FrNni Dlci Vc frmCongestedToSubnet

Access	Read only
Description	This attribute displays the number of frames from link discarded due to lack of resources. It keeps track of the number of frames from link that have to be discarded. The discard reasons include insufficient memory for splitting the frame into smaller subnet packet size.
Mib	FrameRelayNni
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE FrNni Dlci Vc cannotForwardToSubnet

Access	Read only
Description	This attribute displays the number of discarded packets that can not be forwarded into the subnet because of subnet congestion. Number of frames from link discarded due to failure in forwarding a packet from *Vc* into the subnet.- This attribute is increased when packet forwarding fails to forward a packet into the subnet. If a frame is split into multiple subnet packets and a partial packet has to be discarded, all subsequent partial packets that have not yet been delivered to the subnet will be discarded as well.
Mib	FrameRelayNni
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE FrNni Dlci Vc notDataXferToSubnet

Access	Read only
Description	This attribute records the number of frames from link discarded when the *Vc* tries to recover from internal path failure.
Mib	FrameRelayNni
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE FrNni Dlci Vc outOfRangeFrmFromSubnet

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute displays the number of frames from subnet discarded due to out of sequence range for arriving too late.
Mib	FrameRelayNni
Values	Decimal (0..255)
Default	No default

ATTRIBUTE FrNni Dlci Vc combErrorsFromSubnet

Access	Read only
Description	This attribute records the number of subnet packets discarded at the sink *Vc* due to the *Vc* segmentation and combination protocol error. Usually, this occurs when the subnet discards packets and thus this statistics can be used to guest the number of subnet packets that are not delivered to the *Vc*. It cannot be used as an actual measure because some subnet packets may have been delivered to *Vc* but have to be discarded because these are partial packets to a frame in which some other partial packets have not been properly delivered to *Vc*
Mib	FrameRelayNni
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE FrNni Dlci Vc duplicatesFromSubnet

Access	Read only
Description	This attribute displays the number of subnet packets discarded due to duplication. Although packets are not retransmitted by the Frame Relay *Vc*, it is possible for the subnet to retransmit packets. When packets are out-of-sequenced and copies of the same packets arrive, then this attribute is increased.
Mib	FrameRelayNni
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE FrNni Dlci Vc notDataXferFromSubnet

Access	Read only
Description	This attribute displays the number of subnet packets discarded when data transfer is suspended in *Vc* recovery.
Mib	FrameRelayNni
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE FrNni Dlci Vc frmLossTimeouts

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute displays the number of lost frame timer expiries. When this count is excessive, the network is very congested and packets have been discarded in the subnet.
Mib	FrameRelayNni
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE FrNni Dlci Vc ooSeqByteCntExceeded

Access	Read only
Description	This attribute displays the number times that the out of sequence byte threshold is exceeded. When the threshold is exceeded, this condition is treated as if the loss frame timer has expired and all frames queued at the sink *Vc* are delivered to the AP. We need to keep this count to examine if the threshold is engineered properly. This should be used in conjunction with the peak value of out-of-sequenced queue and the number of times the loss frame timer has expired. This count should be relatively small when compared with loss frame timer expiry count.
Mib	FrameRelayNni
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE FrNni Dlci Vc peakOoSeqPktCount

Access	Read only
Description	This attribute displays the frame relay peak packet count of the out of sequence queue. This attribute records the maximum queue length of the out-of-sequenced queue. The counter can be used to deduce the message buffer requirement on a *Vc*.
Mib	FrameRelayNni
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE FrNni Dlci Vc peakOoSeqFrmForwarded

Access	Read only
Description	This attribute displays the frame relay peak size of the sequence packet queue. The subnet may deliver packets out-of-sequenced. These packets are then queued in an out-of-sequenced queue, waiting for a packet with the expected sequence number to come. When that packet arrives, this attribute records the maximum number of packets that were out-of-sequenced, but now have become in-sequenced. The statistics is used to measure expected queue size due to normal

Copyright © 2006, Nortel Nortel Confidential

	subnet packet disorder (not due to subnet packet discard). Current implementation also uses this statistics to set a maximum size for the out-of-sequenced queue.
Mib	FrameRelayNni
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE FrNni Dlci Vc sendSequenceNumber

Access	Read only
Description	This attribute displays the Vc internal packet's send sequence number. Note that a "packet" in this context, may be either a user data packet, or an OAM frame.
Mib	FrameRelayNni
Values	Decimal (0..1048575)
Default	No default

ATTRIBUTE FrNni Dlci Vc pktRetryTimeouts

Access	Read only
Description	This attribute displays the number of packets which have retransmission time-outs. When this count is excessive, the network is very congested and packets have been discarded in the subnet.
Mib	FrameRelayNni
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE FrNni Dlci Vc peakRetryQueueSize

Access	Read only
Description	This attribute displays the peak size of retransmission queue. This attribute is used as an indicator of the acknowledgment behavior across the subnet. Records the largest body of unacknowledged packets.
Mib	FrameRelayNni
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE FrNni Dlci Vc subnetRecoveries

Access	Read only
Description	This attribute displays the number of successful *Vc* recovery attempts.

Copyright © 2006, Nortel Nortel Confidential

GROUP FrNni Dlci Sp ServiceParametersProv (Parms)

Properties	Provisioned
Description	This group contains the provisionable attributes for the Data Link Connection Identifier. These attributes reflect the service parameters specific to this instance of DLCI . The congestion control attributes in this group are defined in T1.606 Addendum 1.
Mib	FrameRelayNni

ATTRIBUTE FrNni Dlci Sp maximumFrameSize (n203)

Access	Read and write
Description	This attribute specifies the maximum number of octets which may be included in the information field. The frame relay header and CRC octets are not included in this definition. This attribute corresponds to the dN1 parameter described in the Vendor Forum Specification.
Mib	FrameRelayNni
Values	Decimal (1..8187)
Units	octets
Default	2100

ATTRIBUTE FrNni Dlci Sp rateEnforcement (re)

Access	Read and write
Description	This attribute specifies whether rate enforcement is in effect for this user Data Link Connection on this Frame Relay interface. Turning on rate enforcement means that CIR and DE=1 traffic will be measured and enforced. Turning off rate enforcement means that all frames from the user will be accepted and no modifications to the frame with respect to the DE bit will be made.
Mib	FrameRelayNni
Values	off on
Default	off

ATTRIBUTE FrNni Dlci Sp committedInformationRate (cir)

Access	Read and write
Description	This attribute specifies the committed information rate (CIR) in bits per second (bit/s). When *rateEnforcement* is set to ***on***, *cir* is the rate at which the network agrees to transfer information under normal conditions. This

Copyright © 2006, Nortel Nortel Confidential

rate is measured over a measurement interval (*t*) that is determined internally based on CIR and the committed burst size (Bc). An exception to this occurs when CIR is provisioned to be zero, in which case the measurement interval (*t*) must be provisioned explicitly.

This attribute is ignored when *rateEnforcement* is ***off***. If *rateEnforcement* is ***on*** and this attribute is ***0***, *Bc* must also be ***0***.

Mib	FrameRelayNni
Values	Decimal (0..50000000)
Units	bit/s
Default	64000

ATTRIBUTE FrNni Dlci Sp committedBurstSize (bc)

Access	Read and write

Description

This attribute specifies the committed burst size (Bc) in bits. *bc* is the amount of data that a network agrees to transfer under normal conditions over a measurement interval (*t*). Data marked DE=1 is not accounted for in Bc.

This attribute is ignored when *rateEnforcement* is ***off***. If *rateEnforcement* is ***on*** and this attribute is ***0***, *cir* must also be ***0***.

Mib	FrameRelayNni
Values	Decimal (0..50000000)
Units	bits
Default	64000

ATTRIBUTE FrNni Dlci Sp excessBurstSize (be)

Access	Read and write

Description

This attribute specifies the excess burst size (Be) in bits. Be is the amount of uncommitted data that the network will attempt to deliver over measurement interval T. Data marked DE=1 by the user or by the network is accounted for here.

CIR, Bc, and Be cannot all be zero when rateEnforcement is on.

Mib	FrameRelayNni
Values	Decimal (0..50000000)
Units	bits
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrNni Dlci Sp measurementInterval (t)

Access	Read and write
Description	When *cir* and *bc* are zero and *rateEnforcement* is on, this attribute must be provisioned to specify the time interval (in milliseconds) over which rates and burst sizes are measured. When *cir* and *bc* are non-zero, the time interval is internally calculated and is *not shown*. In that situation, this field is ignored, and is not representative of the time interval. This attribute is ignored when *rateEnforcement* is ***off***, or when *cir* and *bc* are ***non-zero***. If *rateEnforcement* is ***on*** and both *cir* and *bc* are ***zero***, this field must be ***non-zero***.
Mib	FrameRelayNni
Values	Decimal (0..25500)
Units	msec
Default	0

ATTRIBUTE FrNni Dlci Sp rateAdaptation (ra)

Access	Read and write
Description	This attribute specifies whether rate adaptation is in effect for this user Data Link Connection on this Frame Relay interface. Rate adaptation is a feature that, in periods of congestion, adapts the rate at which the user is allowed to send data into the network to that which the network is able to handle at that time. This pro-active measure of handling congestion optimizes network resources by causing the ingress to discard frames that would otherwise be discarded in the network. If this attribute is set to ***on***, then, at the onset of congestion, the excess information rate (EIR) is reduced to a very low rate. If congestion persists, then the allowed CIR is reduced geometrically by 25% of the current value at that time. The minimum to which CIR can be reduced is 1/16th (6.25%) of the provisioned value. As congestion alleviates, CIR is increased linearly by 6.25% of the provisioned value specified in *committedInformationRate*. If set to ***eirOnly***, then rate adaptation will only apply to the excess information rate (EIR). At the onset of congestion, the allowed EIR is reduced by 25% of its provisioned value. If congestion persists, EIR is reduced geometrically by 25% of the current value at that time. As congestion alleviates, EIR is gradually increased linearly by 6.25% of the provisioned EIR. If set to ***cirProportionate***, then rate adaptation will also only apply to the excess information rate (EIR). At the onset of congestion the initial allowed

Copyright © 2006, Nortel Nortel Confidential

EIR is set to a multiple of the provisioned CIR. If congestion persists, the allowed EIR is reduced geometrically by 25% of the current value at that time. As congestion alleviates, EIR is gradually increased linearly by 6.25% of the provisioned EIR. Note that the allowed EIR may be set higher than the provisioned EIR, since it is calculated initially using another parameter, the provisioned CIR. If the allowed EIR at the moment is higher than the provisioned EIR, then the provisioned EIR is used instead.

This attribute can only be set to ***on eirOnly*** or ***cirProportionate*** if *rateEnforcement* is turned ***on***.

This attribute must be set to ***off*** if the *BnxIwf* component is provisioned under this *Dlci*.

Mib — FrameRelayNni

Values
off
on
eirOnly
cirProportionate

Default — off

ATTRIBUTE FrNni Dlci Sp accounting (ac)

Access — Read and write

Description

This attribute specifies whether accounting data collection and record generation is turned on at this DLCI. For accounting data collection and record generation to be turned on, the ***accountingOn*** bit and at least one of the ***accountCollection*** bits in the ***DataNetworkAddress*** component must be set to on.

Mib — FrameRelayNni

Values
off
on

Default — on

ATTRIBUTE FrNni Dlci Sp raSensitivity (rasens)

Access — Read and write

Description — This attribute specifies the sensitivity of the rate adaptation system. A higher number indicates a higher sensitivity and therefore a quicker reaction time to network conditions. A quicker reaction time allows the network to discard frames at the access and protect network resources, but can lead to false alarms and a greater fluctuation of the allowed rate. A higher setting therefore tends to favour the protection of the network over the allowed throughput of the user.

A lower number indicates a lower sensitivity and therefore a slower reaction to network conditions. A slower reaction time results in a greater

Copyright © 2006, Nortel Nortel Confidential

amount of user traffic allowed into the network, but can lead to a waste of network bandwidth since the traffic may be discarded at the congested resource. A lower setting therefore tends to favour the allowed throughput of the user over the protection of the network.

This attribute is applicable for adapting EIR when *rateAdaptation* is ***eirOnly*** or ***cirProportionate***, or CIR when *rateAdaptation* is ***on***.

This attribute is ignored if *rateAdaptation* is turned ***off***.

Mib FrameRelayNni

Values Decimal (1..20)

Default 7

ATTRIBUTE FrNni Dlci Sp updateBCI (updBCI)

Access Read and write

Description

This attribute specifies whether internal Backward Congestion Indication (BCI) bits will report congestion external to the network, as communicated through incoming BECN bits.

If *updateBCI* is set to ***on***, then BCI bits for incoming frames will be set if the BECN on the frame is set. If *updatBCI* is set to ***off***, then incoming BECN bits have no effect.

Setting *updateBCI* ***on*** for a DLCI means that the remote end of the DLCI, that is specified by the *remoteDna* and *remoteDlci* attributes of the *dc* component of the *dlci*, may perform Rate Adaptation using the flow of incoming BECN bits, in addition to internal congestion management systems.

If the *rateAdaptation* attribute of the remote DLCI is provisioned as ***eirOnly***, ***cirProportionate***, or ***on***, then congestion from another network may trigger dynamic congestion management. If the *rateAdaptation* attribute of the remote DLCI is provisioned to ***off***, then the setting of *updateBCI* attribute here has no effect.

Mib FrameRelayNni

Values off
on

Default off

ATTRIBUTE FrNni Dlci Sp correlationTag (ctag)

Access Read and write

Description This attribute specifies the unique string which identifies each end of a connection.

Copyright © 2006, Nortel Nortel Confidential

If required for correlation purposes, the attribute must be provisioned with the same value at both ends of the connection.This attribute can be left as an empty string when the functionality is not required, or when the user requires an empty circuit identifier string against the DLCI.

This attribute can be used for off-switch data correlation purposes. Downstream processing uses this attribute to correlate data records (accounting etc.) issued at different nodes in the network. In the accounting record, the value for the *correlationTag* attribute appears as the attribute *circuitId* (circuit identifier) for the endpoint.

VERB Redirect FrNni Dlci Bnxlwf

Impact — Service

Description

*Redirect [-**force**] -**destination**(<**destination**>) FrUni/n Dlci/n BnxInterworkingFunction*
or
*Redirect [-**force**] -**destination**(<**destination**>) FrNni/n Dlci/n BnxInterworkingFunction*

This verb is used to manually select the PVC destination between the primary and backup destinations, or to enable the automatic redirection. The primary destination and the backup destination are specified by the *BnxInterworkingFunction* component.

The ***-destination*** option indicates the destination of PVC redirection. The value of this option can be ***primary***, ***backup,*** or ***onDemand***.

The value ***primary*** means that the destination for this PVC has been manually selected to be the primary destination, automatic redirection is disabled. This redirect action corresponds to the “Redirect to Primary” redirect action in the BNX implementation.

The value ***backup*** means that the destination for this PVC has been manually selected to be the backup destination, and automatic redirection is disabled. The backup destination must be provisioned. This redirect action corresponds to the “Redirect to Backup” redirect action in the BNX implementation.

Copyright © 2006, Nortel
Nortel Confidential

The value ***onDemand*** means this PVC is redirected automatically to either the primary destination or the backup destination based on the cross-net status of the primary destination. This automatic switch-over mechanism is revertive to the primary destination. The *crossNetListenEnabled* attribute of the *BnxProtocol* component must be ***yes*** and the backup destination must be provisioned. This redirect action corresponds to the “Switch on Demand” redirect action in the BNX implementation.

The ***-force*** option specifies that the PVC is redirected to either the primary destination or the backup destination indicated by the ***-destination*** option even if the destination is not active. When the value of ***-destination*** is ***onDemand***, this option is ignored.

GROUP FrNni Dlci Bnxlwf **Provisioned (Prov)**

Properties	Provisioned
Description	This group defines the provisioning attributes associated with a PVC using BNX frame relay interworking.
Mib	FrNniPvcBnx

ATTRIBUTE FrNni Dlci Bnxlwf **calledIpAddress (cia)**

Access	Read and write
Description	This attribute specifies the IP address of the primary destination which receives the datagrams.
Mib	FrNniPvcBnx
Values	IP address
Default	0.0.0.0

ATTRIBUTE FrNni Dlci Bnxlwf **calledDlci (cdlci)**

Access	Read and write
Description	This attribute specifies the DLCI of the primary destination which receives the datagrams.
Mib	FrNniPvcBnx
Values	Decimal (16..1007)
Default	No default

ATTRIBUTE FrNni Dlci Bnxlwf **trafficPriority (tp)**

Access	Read and write
Description	This attribute specifies the user control on traffic priority. The value is transmitted in the traffic priority field of the BNX header. Possible values are: ***1*** - High Priority ***2*** - Normal Priority

Copyright © 2006, Nortel Nortel Confidential

	3 - Low Priority ***useBpDefault*** - use the *defaultTrafficPriority* attribute value from the *BnxProtocol* component.
Mib	FrNniPvcBnx
Values	1 2 3 useBpDefault
Default	useBpDefault

ATTRIBUTE FrNni Dlci Bnxlwf backupCalledIpAddress (bcia)

Access	Read and write
Description	This attribute specifies the IP address of the backup destination which receives the datagrams. A value of ***0.0.0.0*** for this attribute and a value of ***undefined*** for the *backupCalledDlci* attribute specify that there is no backup destination.
Mib	FrNniPvcBnx
Values	IP address
Default	0.0.0.0

ATTRIBUTE FrNni Dlci Bnxlwf backupCalledDlci (bcdlci)

Access	Read and write
Description	This attribute specifies the DLCI of the backup destination which receives the datagrams. A value of ***undefined*** for this attribute and a value of ***0.0.0.0*** for the *backupCalledIpAddress* attribute specify that there is no backup destination.
Mib	FrNniPvcBnx
Values	Decimal (16..1007) undefined
Default	undefined

ATTRIBUTE FrNni Dlci Bnxlwf redirectType (rtype)

Access	Read and write
Description	This attribute indicates the type of DTE notification when a PVC redirection between primary and backup destinations occurs. ***transparent*** means no notification is sent to the DTE. ***aIntrusive*** means that an asynchronous update with the A-bit not set is sent to the DTE.

Copyright © 2006, Nortel Nortel Confidential

nIntrusive means that an asynchronous update with the N-bit set is sent to the DTE.

Mib	FrNniPvcBnx
Values	transparent aIntrusive nIntrusive
Default	aIntrusive

ATTRIBUTE FrNni Dlci Bnxlwf minActiveIntervals (mai)

Access	Read and write
Description	This attribute specifies the minimum number of consecutive time intervals for which the primary destination must be active before the PVC is redirected back to the primary destination from the backup destination in ***switchOnDemand*** mode. The interval duration is controlled by the *crossNetPollingInterval* attribute of the *BnxProtocol* component. This attribute is ignored if the *BnxProtocol* attribute *crossNetListenEnabled* is set to ***no***. If the value of this attribute is ***0***, the PVC is redirected back to the primary destination as soon as an active cross-net message is received from the primary destination.
Mib	FrNniPvcBnx
Values	Decimal (0..4)
Default	0

ATTRIBUTE FrNni Dlci Bnxlwf redirectAction (ra)

Access	Read and write
Description	This attribute indicates the redirect action for a PVC. The Redirect command can be used to override this redirect action. ***switchOnDemand*** means this PVC is redirected automatically to either the primary destination or the backup destination based on the cross-net status of the primary destination. This automatic switch-over mechanism is revertive to the primary destination. The *crossNetListenEnabled* attribute of the *BnxProtocol* component must be ***yes*** and the backup destination must be provisioned. This redirect action corresponds to the “Switch on Demand” redirect action in the BNX implementation. ***manualPrimary*** means that the destination for this PVC has been manually selected to be the primary destination, automatic redirection is disabled. This redirect action corresponds to the “Redirect to Primary” redirect action in the BNX implementation. ***manualBackup*** means that the destination for this PVC has been manually selected to be the backup destination, and automatic redirection

Copyright © 2006, Nortel Nortel Confidential

is disabled. The backup destination must be provisioned. This redirect action corresponds to the “Redirect to Backup” redirect action in the BNX implementation.

Mib	FrNniPvcBnx
Values	switchOnDemand manualPrimary manualBackup
Default	manualPrimary

GROUP FrNni Dlci Bnxlwf Operational (Op)

Properties	Operational
Description	This attribute group contains the operational status of the BNX frame relay interworking functionality.
Mib	FrNniPvcBnx

ATTRIBUTE FrNni Dlci Bnxlwf timeOfLastStateChange (tlsc)

Access	Read only
Description	This attribute indicates the time at which the state of the DLCI last changed.
Mib	FrNniPvcBnx
Values	Time (DHMS)
Default	No default

ATTRIBUTE FrNni Dlci Bnxlwf crossNetSent (cnsent)

Access	Read only
Description	This attribute indicates if a cross-net status message was sent to the primary destination during the current polling interval. The interval duration is controlled by the *crossNetPollingInterval* attribute of the *BnxProtocol* component.
Mib	FrNniPvcBnx
Values	unsent sent
Default	No default

ATTRIBUTE FrNni Dlci Bnxlwf crossNetStatus (cns)

Access	Read only
Description	This attribute indicates the state of the PVC when the remote end is the primary destination. If the *crossNetListenEnabled* attribute of the *BnxProtocol* component is set to ***yes***, this attribute reflects the state as

Copyright © 2006, Nortel Nortel Confidential

reported by the remote end. If the *crossNetListenEnabled* attribute is set to ***no***, the PVC is assumed to be up and this attribute has a value of ***active***.

Mib	FrNniPvcBnx
Values	inactive active
Default	inactive

ATTRIBUTE FrNni Dlci Bnxlwf **crossNetReceived (cnr)**

Access	Read only
Description	This attribute indicates if the DLCI has received a cross-net status message from the primary destination during the current polling interval. The interval duration is controlled by the *crossNetPollingInterval* attribute of the *BnxProtocol* component. This attribute is ignored if the *BnxProtocol* attribute *crossNetListenEnabled* is set to ***no***.
Mib	FrNniPvcBnx
Values	unrecv recv
Default	unrecv

ATTRIBUTE FrNni Dlci Bnxlwf **crossNetErrors (cne)**

Access	Read only
Description	This attribute counts how many polling intervals have elapsed without receiving an error free cross-net status message from the primary destination of the PVC. Errors are generally caused by time-outs. The value of this attribute wraps to zero when it exceeds the maximum value.
Mib	FrNniPvcBnx
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci Bnxlwf **ipAddressMismatches (iam)**

Access	Read only
Description	This attribute counts the received datagrams which were dropped because the source IP address in the IP header did not match the value of *calledIpAddress* or *backupCalledIpAddress* attribute. The value of this attribute wraps to zero when it exceeds the maximum value.
Mib	FrNniPvcBnx
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrNni Dlci Bnxlwf **lastMismatchedIpAddress (lmia)**

Access	Read only
Description	This attribute indicates the source IP address in the IP header of the most recently received datagram which was dropped because this IP address did not match the value of *calledIpAddress* or *backupCalledIpAddress* attribute.
Mib	FrNniPvcBnx
Values	IP address
Default	0.0.0.0

ATTRIBUTE FrNni Dlci Bnxlwf **backupCrossNetSent (bcnsent)**

Access	Read only
Description	This attribute indicates if a cross-net status message was sent to the backup destination during the current polling interval. The interval duration is controlled by the *crossNetPollingInterval* attribute of the *BnxProtocol* component.
Mib	FrNniPvcBnx
Values	unsent sent
Default	No default

ATTRIBUTE FrNni Dlci Bnxlwf **backupCrossNetStatus (bcns)**

Access	Read only
Description	This attribute indicates the state of the PVC when the remote end is the backup destination. If the *crossNetListenEnabled* attribute of the *BnxProtocol* component is set to ***yes***, this attribute reflects the state as reported by the remote end. If the *crossNetListenEnabled* attribute is set to ***no***, the PVC is assumed to be up and this attribute has a value of ***active***.
Mib	FrNniPvcBnx
Values	inactive active
Default	inactive

ATTRIBUTE FrNni Dlci Bnxlwf **backupCrossNetReceived (bcnr)**

Access	Read only
Description	This attribute indicates if the DLCI has received a cross-net status message from the backup destination of the PVC during the current polling interval. The interval duration is controlled by the *crossNetPollingInterval*

Copyright © 2006, Nortel Nortel Confidential

attribute of the *BnxProtocol*. This attribute is ignored if the *BnxProtocol* attribute *crossNetListenEnabled* is set to ***no***.

Mib	FrNniPvcBnx
Values	unrecv recv
Default	unrecv

ATTRIBUTE FrNni Dlci Bnxlwf **backupCrossNetErrors (bcne)**

Access	Read only
Description	This attribute counts how many polling intervals have elapsed without receiving an error free cross-net status message from the backup destination of the PVC. Errors are generally caused by time-outs. The value of this attribute wraps to zero when it exceeds the maximum value.
Mib	FrNniPvcBnx
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci Bnxlwf **redirectMode (rmode)**

Access	Read only
Description	This attribute indicates the mode of the PVC redirection. The value ***switchOnDemand*** means this PVC is redirected automatically to either the primary destination or the backup destination based on the cross-net status of the primary destination. This automatic switch-over mechanism is revertive to the primary destination. The value ***manual*** means that the destination for this PVC has been manually selected and automatic redirection is disabled. When the value is ***noBackup***, the PVC does not have a backup destination provisioned.
Mib	FrNniPvcBnx
Values	switchOnDemand manual noBackup
Default	No default

ATTRIBUTE FrNni Dlci Bnxlwf **currentDestination (cdest)**

Access	Read only
Description	This attribute indicates if the current destination is the primary destination or the backup destination.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrNniPvcBnx
Values	primary backup
Default	No default

ATTRIBUTE FrNni Dlci BnxIwf remoteIpAddress (ria)

Access	Read only
Description	This attribute indicates the IP address of the current destination.
Mib	FrNniPvcBnx
Values	IP address
Default	No default

ATTRIBUTE FrNni Dlci BnxIwf remoteDlci (rdlci)

Access	Read only
Description	This attribute indicates the DLCI of the current destination.
Mib	FrNniPvcBnx
Values	Decimal (16..1007)
Default	No default

ATTRIBUTE FrNni Dlci BnxIwf ipFragFromSubnet (fragfs)

Access	Read only
Description	This attribute counts the IP fragments received from subnet by this Dlci. The value of this attribute wraps to zero when it exceeds the maximum value.
Mib	FrNniPvcBnx
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci BnxIwf discardedIpFragments (discFrag)

Access	Read only
Description	This attribute counts the IP fragments that are dropped by this Dlci. The value of this attribute wraps to zero when it exceeds the maximum value.
Mib	FrNniPvcBnx
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci BnxIwf discMisorderedFrm (dmfrm)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute counts the frames from subnet that are dropped due to misordered fragments. A misordered fragment occurs when the offset in the IP header is not equal to the expected offset, or the timer expires before the last fragment is received. The value of this attribute wraps to zero when it exceeds the maximum value.
Mib	FrNniPvcBnx
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci Bnxlwf lastDroppedIpFragmentId (lastid)

Access	Read only
Description	This attribute indicates the Id of the last misordered frame that was dropped.
Mib	FrNniPvcBnx
Values	Decimal (0..4294967295)
Default	0

COMPONENT FrNni VirtualFramer (VFramer)

Groups	GROUP FrNni VFramer Provisioned (Prov) GROUP FrNni VFramer OsiState (State) GROUP FrNni VFramer Statistics (Stats)
Scope	Application
Description	*FrUni/n VirtualFramer* *FrDte/n VirtualFramer* The *VirtualFramer* component binds two services together to provide data transfer between them. It is mutually exclusive from *Framer* component.
Mib	FrameRelayNni
Common Verbs	Help List Display Add DELete

GROUP FrNni VFramer Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisionable attributes for the *VirtualFramer* component.
Mib	FrameRelayNni

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrNni VFramer **otherVirtualFramer (ovf)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the other *VirtualFramer* to which the service is linked, for example, *FrUni/n VirtualFramer*, *FrDte/n VirtualFramer.*
Mib	FrameRelayNni
Values	Link (Service, otherVirtualFramer)
Default	No default

ATTRIBUTE FrNni VFramer **logicalProcessor (lp)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the logical processor on which the service component will reside.
Mib	FrameRelayNni
Values	Link (Hardware, linkToApplications)
Default	No default

GROUP FrNni VFramer **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	FrameRelayNni

ATTRIBUTE FrNni VFramer **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting

Copyright © 2006, Nortel Nortel Confidential

	down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	FrameRelayNni
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE FrNni VFramer operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	FrameRelayNni
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE FrNni VFramer usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	FrameRelayNni
Values	idle active (activ) busy
Default	idle

Copyright © 2006, Nortel Nortel Confidential

GROUP FrNni VFramer Statistics (Stats)

Properties	Operational
Description	This group contains the operational statistics data for a *VirtualFramer* component.
Mib	FrameRelayNni

ATTRIBUTE FrNni VFramer frmToOtherVFramer

Access	Read only
Description	This attribute counts the frames transmitted to the *otherVirtualFramer*.
Mib	FrameRelayNni
Values	Long Integer
Default	No default

ATTRIBUTE FrNni VFramer frmFromOtherVFramer

Access	Read only
Description	This attribute counts the frames received from the *otherVirtualFramer*.
Mib	FrameRelayNni
Values	Long Integer
Default	No default

ATTRIBUTE FrNni VFramer octetFromOtherVFramer

Access	Read only
Description	This attribute counts the octets received from the *otherVirtualFramer*.
Mib	FrameRelayNni
Values	Long Integer
Default	No default

ATTRIBUTE FrNni VFramer discFrmFromOtherVFramer (discFrmFromOvf)

Access	Read only
Description	This attribute counts the discarded frames from the *otherVirtualFramer*. Incrementing of this counter indicates that some incoming traffic cannot be handled by the FP.
Mib	FrameRelayNni
Values	Long Integer
Default	No default

COMPONENT FrNni Signaling (Sig)

Groups	GROUP FrNni Sig Prov GROUP FrNni Sig ServiceParameters (ServParms) GROUP FrNni Sig SystemParameters (SysParms) GROUP FrNni Sig LapfSystemParameters (LapfSys) GROUP FrNni Sig LastSvcClearCodes (Codes) GROUP FrNni Sig OsiState (State) GROUP FrNni Sig Statistics (Stats) GROUP FrNni Sig LapfStatus GROUP FrNni Sig LapfStatistics (LapfStats) GROUP FrNni Sig FrsSvcAcc (Svcacc)
Scope	Application
Description	*FrNni/n Signaling* This component defines the FRF.10 and Q.922 (LAPF) parameters for Frame Relay switched virtual circuits at the Network-Network interface. This component must be provisioned for the *FrNni* interface to support switched connections.
Mib	FriNniSig
Common Verbs	Help List Display Add DELete

GROUP FrNni Sig Prov

Properties	Provisioned
Description	This group contains common provisionable attributes for signaling at the interface.
Mib	FriNniSig

ATTRIBUTE FrNni Sig dlciAllocation

Access	Read and write
Criticality	Process
Description	This attribute specifies the order in which DLCIs are dynamically allocated for SVCs. The purpose of this attribute is to prevent DLCI collisions between SVCs initiated by two FrNni interfaces talking to each other. This is achieved by provisioning a different value for this attribute at each end of the NNI link. A value of ***fromLowEnd*** specifies that the DLCI number assignment for SVC connections is initiated from the lowest value of the range (that is, *highestPvcDlci*+1 up to 1007).

Copyright © 2006, Nortel Nortel Confidential

	A value of ***fromHighEnd*** specifies that the DLCI number assignment for SVC connections is initiated from the highest value of the range (that is, 1007 down to *highestPvcDlci*+1).
Mib	FriNniSig
Values	fromLowEnd fromHighEnd
Default	fromLowEnd

ATTRIBUTE FrNni Sig highestPvcDlci

Access	Read and write
Criticality	Process
Description	This attribute specifies the highest DLCI value that can be provisioned for a permanent connection. It partitions the DLCI space into permanent and switched connections. Permanent DLCI numbers higher than this value cannot be provisioned. The value ***0*** is used to indicate that no permanent connections are allowed on this interface. The value ***1007*** indicates that no switched connections are allowed on this interface.
Mib	FriNniSig
Values	Decimal (0; 16..1007)
Default	500

GROUP FrNni Sig ServiceParameters (ServParms)

Properties	Provisioned
Description	This group contains the provisionable service parameters.
Mib	FriNniSig

ATTRIBUTE FrNni Sig maximumFrameSize (dn1)

Access	Read and write
Description	This attribute specifies the maximum number of octets that may be included in the information field of the user DLCI of any switched connections using this interface. Its value must not be smaller than the value of *defaultMaximumFrameSize*.
Mib	FriNniSig
Values	Decimal (1..8187)
Units	octets
Default	4096

ATTRIBUTE FrNni Sig defaultMaximumFrameSize (defaultdn1)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the default maximum number of octets that may be included in the information field of the user DLCI assigned for any switched connections using this interface. This value is used during call parameter negotiation for switched calls on this interface when the maximum frame size is not specified in the user's SETUP message. The value of this attribute must not exceed the value of the *maximumFrameSize* attribute.
Mib	FriNniSig
Values	Decimal (1..8187)
Units	octets
Default	2100

ATTRIBUTE FrNni Sig defaultCommittedInformationRate (defaultCir)

Access	Read and write
Description	This attribute specifies the default user to network direction CIR. This value is used during call parameter negotiation for switched calls on this interface when the CIR is not specified in the user's SETUP message.
Mib	FriNniSig
Values	Decimal (0..52000000)
Units	bit/s
Default	64000

ATTRIBUTE FrNni Sig defaultCommittedBurstSize (defaultBc)

Access	Read and write
Description	This attribute specifies the default user to network direction Bc. This value is used during call parameter negotiation for switched calls on this interface when the Bc is not specified in the user's SETUP message.
Mib	FriNniSig
Values	Decimal (0..52000000)
Units	bits
Default	64000

ATTRIBUTE FrNni Sig defaultExcessBurstSize (defaultBe)

Access	Read and write
Description	This attribute specifies the default user to network direction Be. This value is used during call parameter negotiation for switched calls on this interface when the Be is not specified in the user's SETUP message.
Mib	FriNniSig

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..52000000)
Units	bits
Default	0

ATTRIBUTE FrNni Sig rateEnforcement (re)

Access	Read and write
Description	This attribute specifies whether rate enforcement is in effect for SVCs on this interface.
Mib	FriNniSig
Values	off on
Default	on

ATTRIBUTE FrNni Sig rateAdaptation (ra)

Access	Read and write
Description	This attribute specifies whether closed-loop rate adaptation is in effect for SVCs on this interface. Rate adaptation is a feature that, in periods of congestion, adapts the rate at which the user is allowed to send data into the network to that which the network is able to handle at that time. This proactive measure of handling congestion optimizes network resources by causing the ingress to discard frames that would otherwise be discarded in the network. If this attribute is set to ***on***, then, at the onset of congestion, the excess information rate (EIR) is reduced to a very low rate. If congestion persists, then the allowed CIR is reduced geometrically by 25% of the current value at that time. The minimum to which CIR can be reduced is 1/16th (6.25%) of the provisioned value. As congestion alleviates, CIR is increased linearly by 6.25% of the provisioned value specified in *committedInformationRate*. If set to ***eirOnly***, then rate adaptation will only apply to the excess information rate (EIR). At the onset of congestion, the allowed EIR is reduced by 25% of its provisioned value. If congestion persists, EIR is reduced geometrically by 25% of the current value at that time. As congestion alleviates, EIR is gradually increased linearly by 6.25% of the provisioned EIR. If set to ***cirProportionate***, then rate adaptation will also only apply to the excess information rate (EIR). At the onset of congestion the initial allowed EIR is set to a multiple of the provisioned CIR. If congestion persists, the allowed EIR is reduced geometrically by 25% of the current value at that time. As congestion alleviates, EIR is gradually increased linearly by 6.25% of the provisioned EIR. Note that the allowed EIR may be set higher than the provisioned EIR, since it is calculated initially using another

Copyright © 2006, Nortel Nortel Confidential

parameter, the provisioned CIR. If the allowed EIR at the moment is higher than the provisioned EIR, then the provisioned EIR is used instead.

This attribute can only be set to ***on*** or ***eirOnly*** if *rateEnforcement* is set to ***on***.

Mib: FriNniSig

Values:
off
on
eirOnly
cirProportionate

Default: off

ATTRIBUTE FrNni Sig raSensitivity (rasens)

Access: Read and write

Description: This attribute specifies the sensitivity of the rate adaptation system for all switched connections on this interface.

A higher number indicates a higher sensitivity and therefore a quicker reaction time to network conditions. A quicker reaction time allows the network to discard frames at the access and protect network resources, but can lead to false alarms and a greater fluctuation of the allowed rate. A higher setting therefore tends to favor the protection of the network over the allowed throughput of the user.

A lower number indicates a lower sensitivity and therefore a slower reaction to network conditions. A slower reaction time results in a greater amount of user traffic allowed into the network, but can lead to a waste of network bandwidth since the traffic may be discarded at the congested resource. A lower setting therefore tends to favour the allowed throughput of the user over the protection of the network.

This attribute is applicable for adapting EIR when *rateAdaptation* is ***eirOnly*** or ***cirProportionate***, or CIR when *rateAdaptation* is ***on***.

This attribute is ignored if *rateAdaptation* is ***off***.

Mib: FriNniSig

Values: Decimal (1..20)

Default: 7

ATTRIBUTE FrNni Sig updateBCI (updBCI)

Access: Read and write

Description: This attribute specifies whether internal Backward Congestion Indication (BCI) bits will report congestion external to the network, as communicated through incoming BECN bits.

Copyright © 2006, Nortel Nortel Confidential

If *updateBCI* is set to ***on***, then BCI bits for incoming frames will be set if the BECN on the frame is set. If *updateBCI* is set to ***off***, then incoming BECN bits has no effect.

Setting *updateBCI* ***on*** for a DLCI means that the remote end of the DLCI, which is specified by the *remoteDna* and *remoteDlci* attributes of the *Dc* component of the *Dlci*, may perform Rate Adaptation using the flow of incoming BECN bits, in addition to internal congestion management systems.

If the *rateAdaptation* attribute of the remote DLCI is provisioned as ***eirOnly***, ***cirProportionate***, or ***on***, then congestion from another network may trigger dynamic congestion management. If there is no rate adaptation at the other end, then the setting of *updateBCI* attribute here has no effect.

Mib	FriNniSig
Values	off on
Default	off

GROUP FrNni Sig SystemParameters (SysParms)

Properties	Provisioned
Description	This group contains the provisionable FRF.10 system parameters.
Mib	FriNniSig

ATTRIBUTE FrNni Sig callSetupTimer (t303)

Access	Read and write
Description	This attribute specifies the time this interface waits for a response to the SETUP message sent to the adjacent network. Upon timer expiry, the SETUP message is retransmitted. The second expiry of this timer causes the call to be cleared.
Mib	FriNniSig
Values	Decimal (1..255)
Units	seconds
Default	4

ATTRIBUTE FrNni Sig releaseTimer (t308)

Access	Read and write
Description	This attribute specifies the time this interface waits for a response to the RELEASE message sent to the adjacent network. Upon timer expiry, the RELEASE message is retransmitted. The second expiry of the timer causes the call to be released.

Copyright © 2006, Nortel Nortel Confidential

Mib	FriNniSig
Values	Decimal (1..255)
Units	seconds
Default	4

ATTRIBUTE FrNni Sig callProceedingTimer (t310)

Access	Read and write
Description	This attribute specifies the time this interface waits for the CONNECT message from the adjacent network after the network has received the optional CALL PROCEEDING message from the adjacent network. Upon timer expiry, the call is cleared.
Mib	FriNniSig
Values	Decimal (1..255)
Units	seconds
Default	30

ATTRIBUTE FrNni Sig restartReqTimer (t316)

Access	Read and write
Description	This attribute specifies the time this interface waits for the RESTART ACKNOWLEDGE message from the adjacent network after sending a first RESTART message. Upon timer expiry, another RESTART message is sent. After the second expiry, the interface is treated as idle. If the *restartReqTimer* attribute is set to the default value, then the interface is treated as idle when it receives an indication that the link is up and does not send a RESTART message.
Mib	FriNniSig
Values	Decimal (0..255)
Units	seconds
Default	0

ATTRIBUTE FrNni Sig restartRcvTimer (t317)

Access	Read and write
Description	This attribute specifies the time this interface waits for the processing of a RESTART message received by the interface. Upon expiry of this timer, an alarm will be displayed to report the problem. The timer value must be less than the *restartReqTimer* provisioned value at the adjacent node.
Mib	FriNniSig
Values	Decimal (1..255)

Copyright © 2006, Nortel Nortel Confidential

Units	seconds
Default	110

ATTRIBUTE FrNni Sig statusEnqTimer (t322)

Access	Read and write
Description	This attribute specifies the time the network waits for the requested STATUS message from the adjacent network. Upon expiry of this timer, another STATUS ENQUIRY message will be sent.
Mib	FriNniSig
Values	Decimal (1..255)
Units	seconds
Default	4

ATTRIBUTE FrNni Sig networkType (type)

Access	Read and write
Description	This attribute specifies whether this Frame Relay service is running on a public or a private network. This value is used solely in populating applicable information elements within those signaling messages that require a public or private network indication.
Mib	FriNniSig
Values	private public
Default	private

GROUP FrNni Sig LapfSystemParameters (LapfSys)

Properties	Provisioned
Description	This group contains the provisionable attributes for the SVC data link layer. The data link layer is governed primarily through ITU specification Q.922, and operates over DLCI 0.
Mib	FriNniSig

ATTRIBUTE FrNni Sig windowSize (ws)

Access	Read and write
Description	This attribute specifies the window size. This is the maximum number of unacknowledged sequenced frames that may be outstanding from or to this interface at any one time.
Mib	FriNniSig
Values	Decimal (1..127)
Default	7

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrNni Sig retransmitLimit (rtl)

Access	Read and write
Description	This attribute specifies the number of times a frame can be retransmitted by the SVC data link layer before appropriate recovery action is taken.
Mib	FriNniSig
Values	Decimal (0..20)
Default	3

ATTRIBUTE FrNni Sig ackTimer (at)

Access	Read and write
Description	This attribute specifies how long the layer 2 protocol waits for an acknowledgment to a sent frame. The value set for *ackTimer* must be less than the value set for *idleProbeTimer*.
Mib	FriNniSig
Values	Decimal (1000..10000)
Units	msec
Default	1500

ATTRIBUTE FrNni Sig ackDelayTimer (adt)

Access	Read and write
Description	This attribute specifies how long the network waits before sending an acknowledgment for a received in-sequence I-frame. A value of 0 means that every frame is acknowledged and there will be no delay in acknowledgment. A non-zero value means that one acknowledgement is sent for a number of frames.
Mib	FriNniSig
Values	Decimal (0..10000)
Units	msec
Default	0

ATTRIBUTE FrNni Sig idleProbeTimer (ipt)

Access	Read and write
Description	This attribute specifies how long the link is permitted to remain idle (that is, no frames are exchanged on the data link). Upon expiry of this timer, the network side's link layer polls its peer for status. The value set for *idleProbeTimer* must be greater than the value set for *ackTimer*.
Mib	FriNniSig
Values	Decimal (1000..65535000)

Copyright © 2006, Nortel Nortel Confidential

Units	msec
Default	30000

GROUP FrNni Sig LastSvcClearCodes (Codes)

Properties	Operational
Description	This group contains the remote data network address, the last SVC clear cause and the last SVC diagnostic code coming from the subnet or the local VC.
Mib	FriNniSig

ATTRIBUTE FrNni Sig lastClearRemoteDataNetworkAddress

Access	Read only
Description	This attribute indicates the Data Network Address (DNA) of the remote (the other end of the SVC connection) of the call which cleared last and whose clear and diagnostic codes were recorded.
Mib	FriNniSig
Values	BCD (0..15)
Default	No default

ATTRIBUTE FrNni Sig lastClearCause

Access	Read only
Description	This attribute indicates the last SVC clear cause signalled at the end of the connection or failure to connect. It is updated only if the clear request comes from the subnet or the call is rejected locally by the VC. The same set of possible values provides the clear cause field in the accounting record.
Mib	FriNniSig
Values	Decimal (0..255)
Default	0

ATTRIBUTE FrNni Sig lastDiagnosticCode

Access	Read only
Description	This attribute indicates the last SVC diagnostic code signalled at the end of the connection or failure to connect. It is updated if the clear request comes from the subnet or the call is rejected locally by the VC. The same set of possible values provides the diagnostic code field in the accounting record.
Mib	FriNniSig
Values	Decimal (0..255)

Copyright © 2006, Nortel Nortel Confidential

Default	0

GROUP FrNni Sig OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	FriNniSig

ATTRIBUTE FrNni Sig adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	FriNniSig
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE FrNni Sig operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or

Copyright © 2006, Nortel Nortel Confidential

	with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	FriNniSig
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE FrNni Sig usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	FriNniSig
Values	idle active (activ) busy
Default	idle

GROUP FrNni Sig Statistics (Stats)

Properties	Operational
Description	This group contains the statistics related to the SVC signaling layer at the interface level.
Mib	FriNniSig

ATTRIBUTE FrNni Sig currentNumberOfSvcCalls (ncall)

Access	Read only
Description	This attribute indicates the number of Frame Relay SVCs currently existing on this interface.
Mib	FriNniSig
Values	Decimal (0..992)
Default	No default

ATTRIBUTE FrNni Sig inCalls (incall)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the current number of incoming SVCs on this interface (that is, the number of SVCs for which this interface represents the destination end of the call).
Mib	FriNniSig
Values	Decimal (0..992)
Default	No default

ATTRIBUTE FrNni Sig inCallsRefused (icr)

Access	Read only
Description	This attribute counts the incoming SVC call requests that are rejected by either this interface or by the called user. When this count exceeds the maximum, it wraps to zero.
Mib	FriNniSig
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrNni Sig outCalls (outcall)

Access	Read only
Description	This attribute indicates the current number of outgoing SVCs on this interface (that is, the number of SVCs for which this interface represents the source end of the call).
Mib	FriNniSig
Values	Decimal (0..992)
Default	No default

ATTRIBUTE FrNni Sig outCallsFailed (ocf)

Access	Read only
Description	This attribute counts the outgoing SVC call requests that are rejected by either this interface, or by the network side of the destination end, or by the called user. When this count exceeds the maximum, it wraps to zero.
Mib	FriNniSig
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrNni Sig protocolErrors (pe)

Access	Read only
Description	This attribute counts the number of times a FRF.10 protocol error has occurred. Any one of the following events constitutes a protocol error: 1. In the user-signaled *Link Layer Core Parameters* IE within the

Copyright © 2006, Nortel Nortel Confidential

	SETUP or CONNECT messages, *Cir*, *Bc* and *Be* are all zero; 2. In the user-signaled *Link Layer Core Parameters* IE within the SETUP or CONNECT messages, *Cir* is zero but *Bc* is non-zero, or *Bc* is zero but *Cir* is non-zero; 3. In the user-signaled *Link Layer Core Parameters* IE within the SETUP or CONNECT messages, the *Minimum Acceptable CIR* is greater than *Cir*; 4. At the destination end, any of the destination to source direction link layer core parameters has been increased in the CONNECT message from the called user; 5. At the destination end, the destination to source direction *Cir* in the CONNECT message is smaller than the corresponding *minimum acceptable Cir* signaled to the called user; 6. At the source end, any of the source to destination direction link layer core parameters in the CONNECT message from the destination end has been increased; 7. At the source end, the source to destination direction *Cir*, after negotiation, is smaller than the corresponding *minimum acceptable Cir*; 8. The network has received a STATUS message from the user with an incompatible FRF.10 state. When this count reaches maximum, it wraps to zero.
Mib	FriNniSig
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrNni Sig qualityOfServiceNotAvailable (qosna)

Access	Read only
Description	This attribute counts the number of incoming and outgoing SVCs that are rejected because the quality of service requested cannot be met by the network. When this count reaches maximum, it wraps to zero.
Mib	FriNniSig
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrNni Sig setupTimeout (setupt)

Access	Read only
Description	This attribute counts the number of times the T303 setup timer has expired. When this count reaches maximum, it wraps to zero.
Mib	FriNniSig
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrNni Sig lastCauseInStatusMsgReceived (lcis)

Access	Read only
Description	This attribute indicates the cause value in the last received user's STATUS message to an existing call. The DLCI to which this STATUS message applies is specified in the *lastDlciReceivedStatus* attribute. The initial value of this attribute is **0** which means that no STATUS message has been received for an existing call yet.
Mib	FriNniSig
Values	Decimal (0..255)
Default	0

ATTRIBUTE FrNni Sig lastStateInStatusMsgReceived (lsis)

Access	Read only
Description	This attribute indicates the state value in the last received user's STATUS message to an existing call. The DLCI to which this STATUS message applies is specified in the *lastDlciReceivedStatus* attribute. The initial value of this attribute is ***notApplicable***.
Mib	FriNniSig

ATTRIBUTE FrNni Sig lastDlciReceivedStatus (ldrs)

Access Read only

Description This attribute shows the value of the DLCI that has most recently received a STATUS message from the user.

The initial value of this attribute is ***0***.

Mib FriNniSig

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0; 16..1007)
Default	0

ATTRIBUTE FrNni Sig lastStateReceivedStatus (lsrs)

Access	Read only
Description	This attribute shows the network FRF.10 state of the DLCI that has most recently received a STATUS message from the user. The DLCI to which this STATUS message applies is specified in the *lastDlciReceivedStatus* attribute. The initial value of this attribute is ***notApplicable***.
Mib	FriNniSig
Values	null callInitiated outgoingCallProceeding callPresent incomingCallProceeding active releaseRequest releaseIndication restartRequest restart notApplicable
Default	notApplicable

ATTRIBUTE FrNni Sig dlciCollisions

Access	Read only
Description	This attribute counts the number of call failures due to DLCI collisions.
Mib	FriNniSig
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrNni Sig bandwidthNotAvailable

Access	Read only
Description	This attribute counts the number of call failures for each bandwidth pool due to the requested bandwidth not being available.
Mib	FriNniSig
Vector of	Decimal (0..4294967295)
Index	Decimal (0..15)

GROUP FrNni Sig LapfStatus

Properties	Operational
Description	This group contains the Q.922 SVC data link layer status.
Mib	FriNniSig

ATTRIBUTE FrNni Sig currentState (currState)

Access	Read only
Description	This attribute shows the current state of the SVC data link layer interface.
Mib	FriNniSig
Values	disconnected linkSetup disconnectRequest informationTransfer waitingAck
Default	No default

ATTRIBUTE FrNni Sig lastStateChangeReason (lscr)

Access	Read only
Description	This attribute shows the reason for the most recent state change. ***notStarted*** - this is the default state after SVC data link has just been created. ***abmeEntered*** - SVC data link has entered Asynchronous Balanced Mode after SABME or UA has been received. ***abmeReset*** - the data link has been reset. ***dmReceived*** - DM response received. ***dmSent*** - DM sent. ***discReceived*** - DISC response received. ***discSent*** - DISC sent. ***frmrReceived*** - FRMR received. ***n200RetranTimeOut -*** *retransmitLimit* has been exceeded. ***other*** - unspecified state change reasons. The most likely reason for this is the transition from state ***waitingAck*** to state ***informationTransfer***.
Mib	FriNniSig
Values	notStarted abmeEntered abmeReset dmReceived dmSent discReceived discSent frmrReceived

Copyright © 2006, Nortel Nortel Confidential

	n200RetranTimeOut other
Default	notStarted

ATTRIBUTE FrNni Sig frmrReceive (frmrr)

Access	Read only
Description	This attribute shows the information field of the Frame Reject (FRMR) most recently received.
Mib	FriNniSig
Values	String (0..8, Hex)
Default	No default

ATTRIBUTE FrNni Sig currentQueueSize (queues)

Access	Read only
Description	This attribute shows the current number of frames in the SVC data link layer transmit queue.
Mib	FriNniSig
Values	Decimal (0..4294967295)
Default	No default

GROUP FrNni Sig LapfStatistics (LapfStats)

Properties	Operational
Description	This group contains the statistics for the SVC data link layer.
Mib	FriNniSig

ATTRIBUTE FrNni Sig remoteBusy

Access	Read only
Description	This attribute counts the number of times transmission of an I-frame was unsuccessful due to a perceived remote busy condition (window closed or remote busy). When this count reaches maximum, it wraps to zero.
Mib	FriNniSig
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrNni Sig receiveRejectFrame

Access	Read only
Description	This attribute counts the number of REJ frames received by the interface. When this count reaches maximum, it wraps to zero.

Copyright © 2006, Nortel Nortel Confidential

Mib	FriNniSig
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrNni Sig ackTimeout

Access	Read only
Description	This attribute counts the number of times the *ackTimer* has expired. Frequent increments of this counter indicate a problem at the link or improper values have been chosen for *ackTimer* and *ackDelayTimer* between the local and remote sides. When this count reaches maximum, it wraps to zero.
Mib	FriNniSig
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrNni Sig iFramesTransmitted

Access	Read only
Description	This attribute counts the number of SVC I-frames transmitted to the interface on DLCI 0. An I-frame may be counted more than once if there are retransmissions at the SVC data link layer. When this count reaches maximum, it wraps to zero.
Mib	FriNniSig
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrNni Sig iFramesTxDiscarded

Access	Read only
Description	This attribute counts the number of SVC I-frames that are bound for the link but have been discarded. Discard reasons may be one of the following: 1. the frame length is beyond the allowed limit. 2. the SVC data link layer is in ***disconnected*** state. 3. the transmit queue has been purged because the queue length has reached the reset threshold. 4. the transmit queue or the queue waiting for acknowledgment has been purged because the link cannot be re-established. When this count reaches maximum, it wraps to zero.
Mib	FriNniSig
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE FrNni Sig iFramesReceived

Access	Read only
Description	This attribute counts the number of SVC I-frames received from the interface. When this count reaches maximum, it wraps to zero.
Mib	FriNniSig
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrNni Sig iFramesRcvdDiscarded

Access	Read only
Description	This attribute counts the number of SVC I-frames received but have been discarded. The discard reasons are: 1. incorrect frame size 2. frame is out of sequence 3. frame received while the network side of the SVC data link layer is not in the ***informationTransfer*** or ***waitingAck*** state. When this count reaches maximum, it wraps to zero.
Mib	FriNniSig
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrNni Sig stateChange

Access	Read only
Description	This attribute counts the number of times the SVC data link layer interface has changed state. While the data link layer is in ***informationTransfer*** state, this counter will increment on each expiry of *idleProbeTimer* as its state goes from ***informationTransfer*** to ***waitingAck*** and back. When this count exceeds the maximum, it wraps to zero.
Mib	FriNniSig
Values	Decimal (0..4294967295)
Default	No default

GROUP FrNni Sig FrsSvcAcc (Svcacc)

Properties	Provisioned
Description	This group contains the provisionable attribute which controls accounting for this interface.
Mib	FriNniSig

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrNni Sig defaultAccounting (defAcc)

Access	Read and write
Criticality	Process
Description	This attribute specifies whether accounting data collection and record generation is turned on for switched connections at this interface. For accounting data collection and record generation to occur, this attribute must be ***on*** and at least one of the *accountCollection* reasons in the *Dna* component must be present.
Mib	FriNniSig
Values	off on
Default	on

COMPONENT FrNni LoadTestSystem (Lts)

Groups	GROUP FrNni Lts Setup (Setup) GROUP FrNni Lts OperationalState (State) GROUP FrNni Lts Results (Results)

Description	*RESET FrUni/n Lts* This verb clears the TestStatistics

GROUP FrNni Lts **Setup (Setup)**

Properties	Operational
Description	This attribute group contains the parameters used to configure the behavior of the Frame Relay Load Test System.
Mib	FrameRelayNni

ATTRIBUTE FrNni Lts **duration (dur)**

Access	Read and write
Description	This attribute specifies the duration of the test in milliseconds. The test will run until the duration expires or the STOP command is issued. A value of 0 is used to indicate infinity.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Units	msec
Default	0

ATTRIBUTE FrNni Lts **algorithm (alg)**

Access	Read and write
Description	This attribute specifies which algorithm is used to generate the frames. **ContinuousBurst** This mode of traffic generation creates traffic at the maximum rate possible until all of the frames have been sent. The generator then waits until the end of the timeInterval to begin again. **IntervalBurst** This algorithm attempts to generate 10 ms bursts of burstSize frames. It will generate as many of the burstSize frames as it can per sub-interval. **DelayedBurst** This algorithm generates bursts of burstSize frames separated by 10 ms delays.

Copyright © 2006, Nortel Nortel Confidential

FixedBurst
This aglorithm is similar to IntervalBurst, except a fixed burst size of 12 frames is used.

delayMeasurement
This algorithm is used to measure delay. The specified number of frames in the indicated pattern are generated, one at a time, with a maximum wait of maxDelay before sending the next frame.
This algorithm is not implemented yet.

Mib	FrameRelayNni
Values	continousBurst (cont) intervalBurst (int) delayBurst (delay) fixedBurst (fixed)
Default	continousBurst

ATTRIBUTE FrNni Lts burstSize (fpb)

Access	Read and write
Description	This attribute specifies the number of frames per burst under the delayedBurst and intervalBurst algorithms.
Mib	FrameRelayNni
Values	Decimal (1..250)
Default	50

ATTRIBUTE FrNni Lts timeInterval (tint)

Access	Read and write
Description	This attribute specifies the time interval to the specified number of seconds. Granuality is in centiseconds. Maximum is 1 minute.
Mib	FrameRelayNni
Values	Decimal (1..60000)
Units	csec
Default	100

GROUP FrNni Lts OperationalState (State)

Properties	Operational
Description	This group contains the operation statistics of the load generator.
Mib	FrameRelayNni

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrNni Lts generatorState (gstate)

Access	Read only
Description	This attribute indicates whether the Lts is generating traffic.
Mib	FrameRelayNni
Values	stopped running
Default	stopped

ATTRIBUTE FrNni Lts cycleIncomplete (cycle)

Access	Read only
Description	This attribute indicates whether the time required to generate all of the enabled patterns is more than timeInterval by a true value. Otherwise, this flag is set to false. Default is True.
Mib	FrameRelayNni
Values	false true
Default	true

ATTRIBUTE FrNni Lts lastActiveInterval (actInt)

Access	Read only
Description	This attribute indicates the actual time it took to generate all of the enabled patterns in the last cycle. If cycleIncomplete is true, this value should be zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Units	microsec
Default	No default

ATTRIBUTE FrNni Lts load

Access	Read only
Description	This attribute indicates the load being generated. This value represents that calculated using the set number of ticks. The actual burstTimeInterval may differ. One entire cycle of the patterns is completed in activeInterval and thus most of the load may be concentrated early in the set interval.
Mib	FrameRelayNni
Values	Decimal (0.000..4294967.295)
Units	kbit/s

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE FrNni Lts elapsedGenerationTime (etime)

Access	Read only
Description	This attribute indicates how many milliseconds have elapsed since the start of this test.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Units	msec
Default	No default

GROUP FrNni Lts Results (Results)

Properties	Operational
Description	This group contains the frame counting attributes for the LTS component.
Mib	FrameRelayNni

ATTRIBUTE FrNni Lts framesTx

Access	Read only
Description	This attribute specifies the number of frames send to the network since the last time these statistics were cleared. This is similar to the framesToIf attribute of the FRAMER component.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Lts bytesTx

Access	Read only
Description	This attribute indicates the number of bytes sent.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Units	bytes
Default	0

ATTRIBUTE FrNni Lts bitRateTx

Access	Read only
Description	This attribute indicates the bit rate being sent to the link. It should only differ from the load if the burstTimeInterval would be >= the timeInterval or burstSize frames cannot be generated in 10ms (intervalBurst algorithm).

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayNni
Values	Decimal (0.000..4294967.295)
Units	kbit/s
Default	0.000

ATTRIBUTE FrNni Lts frameRateTx

Access	Read only
Description	This attribute indicates the frame rate being sent to the link. It is calculated using the number of frames sent to the link in one cycle of the patterns.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Units	frame/s
Default	0

COMPONENT FrNni Lts Pattern (Pat)

GROUP FrNni Lts Pat Defaults (Defaults)

Properties	Provisioned
Description	This attribute group contains the specifications of the pattern.
Mib	FrameRelayNni

ATTRIBUTE FrNni Lts Pat defaultDlci (dDlci)

Access	Read and write
Description	This attribute specifies for which DLCI (on the local end) the frames are destined.
Mib	FrameRelayNni
Values	Decimal (16..1007)
Default	16

ATTRIBUTE FrNni Lts Pat defaultNumFrames (dNum)

Access	Read and write
Description	This attribute specifies the number of frames in this pattern. This is the number of frames of this type that are generated in one time interval.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	100

ATTRIBUTE FrNni Lts Pat defaultDataSize (dSize)

Access	Read and write
Description	This attribute specifies the payload size of each frame in bytes. This is in excess to the header.
Mib	FrameRelayNni
Values	Decimal (0..8200)
Units	octets
Default	512

ATTRIBUTE FrNni Lts Pat defaultHeaderBits (dBits)

Access	Read and write
Description	This attribute specifies whether specific bits are on/off in the header of each frame.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayNni
Set of	becn fecn cr de
Default	No default

ATTRIBUTE FrNni Lts Pat defaultHeaderLength (dLen)

Access	Read and write
Description	This attribute specifies the size of the frame relay header in bytes. Only 2-byte headers are supported at this time.
Mib	FrameRelayNni
Values	Decimal (0; 2..4)
Units	octets
Default	2

ATTRIBUTE FrNni Lts Pat defaultEABits (dEABits)

Access	Read and write
Description	This attribute specifies how the address field extension bits are set in the frame header. Consider the value to be a four bit binary number. For example, 4 = 0100. Only the first *headerLength* bits are used. For instance, suppose headerLength is 3, then the appropriate EABits is 2, or 0010. This attribute can be used to create a header of length greater than two bytes or to specify incorrect EABits in the header.
Mib	FrameRelayNni
Values	Hex (H.0..H.f)
Default	H.4

ATTRIBUTE FrNni Lts Pat defaultPayloadPattern (dPattern)

Access	Read and write
Description	This attribute specifies the payload of each frame. The value specified is in hexadecimal, where every two digits represent a byte. A maximum of 24 digits (12 bytes) may be set, after which the pattern will repeat in the payload (depending on the *repeatPattern* attribute). NOTE: If an RFC 1490 header is specified, via the 1490Header attribute, the specified pattern will begin following the header (that is, at the 9th byte in the payload).
Mib	FrameRelayNni
Values	String (1..12, Hex)

Copyright © 2006, Nortel Nortel Confidential

Default	55

ATTRIBUTE FrNni Lts Pat defaultRfc1490Header (d1490)

Access	Read and write
Description	This attribute specifies the appropriate RFC 1490 encapsulated header of the frame. A value of 0 indicates no 1490 header. NOTE: This header resides in the first 8 bytes of the payload. If the specified value is non-zero, then the payload pattern provisioned will begin at the 9th byte.
Mib	FrameRelayNni
Values	0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 none
Default	none

ATTRIBUTE FrNni Lts Pat defaultUseBadLrc (dBadLrc)

Access	Read and write
Description	This attribute specifies whether the frames from this pattern are to have a bad LRC prior to being sent to the framer. The LRC is checked while the frame is being put onto the link and the failure should cause an abort frame to be sent.
Mib	FrameRelayNni
Values	no yes
Default	no

GROUP FrNni Lts Pat Setup (Setup)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute group contains the specifications of the pattern.
Mib	FrameRelayNni

ATTRIBUTE FrNni Lts Pat dlci

Access	Read and write
Description	This attribute specifies for which DLCI (on the local end) the frames are destined.
Mib	FrameRelayNni
Values	Decimal (16..1007)
Default	16

ATTRIBUTE FrNni Lts Pat numFrames (num)

Access	Read and write
Description	This attribute specifies the number of frames in this pattern. This is the number of frames of this type that are generated in one time interval.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	100

ATTRIBUTE FrNni Lts Pat dataSize (size)

Access	Read and write
Description	This attribute specifies the payload size of each frame in bytes. This is in excess to the header.
Mib	FrameRelayNni
Values	Decimal (0..8200)
Units	octets
Default	512

ATTRIBUTE FrNni Lts Pat headerBits (bits)

Access	Read and write
Description	This attribute specifies whether the following bits are on/off in the header of each frame.
Mib	FrameRelayNni
Set of	becn fecn cr de

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE FrNni Lts Pat headerLength (len)

Access	Read and write
Description	This attribute specifies the size of the frame relay header in bytes. Only 2-byte headers are supported at this time. Valid values are 0, 2, 3, 4. 0 indicates to use no header. That is, the frame starts with either the payload or an RFC 1490 header.
Mib	FrameRelayNni
Values	Decimal (0; 2..4)
Units	octets
Default	2

ATTRIBUTE FrNni Lts Pat eaBits

Access	Read and write
Description	This attribute specifies how the address field extension bits are set in the frame header. Consider the value to be a four bit binary number. For example, 4 = 0100. Only the first headerLength bits are used. For instance, suppose headerLength is 3, then the appropriate eaBits is 2, or 0010. This attribute can be used to create a header of length greater than two bytes or to specify incorrect eaBits in the header.
Mib	FrameRelayNni
Values	Hex (H.0..H.f)
Default	H.4

ATTRIBUTE FrNni Lts Pat payloadPattern (pattern)

Access	Read and write
Description	This attribute specifies the payload of each frame. The value specified is in hexadecimal, where every two digits represent a byte. A maximum of 24 digits (12 bytes) may be set, after which the pattern repeats in the payload (depending on *repeatPattern* attribute). NOTE: If an RFC 1490 header is specified, via the *1490Header* attribute, the specified pattern begina following the header (that is, at the 9th byte in the payload).
Mib	FrameRelayNni
Values	String (1..12, Hex)
Default	55

ATTRIBUTE FrNni Lts Pat rfc1490Header (rfc)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the appropriate RFC 1490 encapsulated header of the frame. A value of 0 indicates no 1490 header. NOTE: This header resides in the first 8 bytes of the payload. If the specified value is non-zero, then the payload pattern provisioned will begin at the 9th byte.
Mib	FrameRelayNni
Values	0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 none
Default	none

ATTRIBUTE FrNni Lts Pat useBadLrc

Access	Read and write
Description	This attribute specifies whether the frames from this pattern are to have a bad LRC prior to being sent to the framer. The LRC is checked while the frame is being put onto the link and the failure should cause an abort frame to be sent.
Mib	FrameRelayNni
Values	no yes
Default	no

GROUP FrNni Lts Pat OperationalData (OpData)

Properties	Operational
Description	This group contains the operational attributes which allow changing the pattern outside of provisioning mode.
Mib	FrameRelayNni

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrNni Lts Pat **framePattern**

Access	Read only
Description	This attribute displays the first 20 to 24 bytes of the frame payload, depending on the frame relay header size selected. This attribute represents the frame if it were at least 20 to 24 bytes in size. That is, the actual frame may be smaller.
Mib	FrameRelayNni
Values	String (20..24, Hex)
Default	No default

ATTRIBUTE FrNni Lts Pat **hdlcBitsInserted (hdlc)**

Access	Read only
Description	This attribute displays how many times a zero bit will be inserted after 5 consecutive 1 bits when a frame from this pattern is sent out.
Mib	FrameRelayNni
Values	Decimal (0..65535)
Default	No default

GROUP FrNni Lts Pat **OperationalState (OpState)**

Properties	Operational
Description	This group contains the attributes containing the operational statistics of the pattern.
Mib	FrameRelayNni

ATTRIBUTE FrNni Lts Pat **load**

Access	Read only
Description	This attribute indicates the load due to this particular pattern. The loads associated with all of the provisioned patterns are summed to arrive at the FrLts load.
Mib	FrameRelayNni
Values	Decimal (0.000..4294967.295)
Units	kbit/s
Default	No default

ATTRIBUTE FrNni Lts Pat **status**

Access	Read and write
Description	This attributes specifies the administrative state of the pattern. A disabled pattern is not generated, although it can still be triggered.

Mib	FrameRelayNni
Values	disabled enabled
Default	enabled

COMPONENT FrNni ServiceTrace (SrvTrace)

Groups	GROUP FrNni SrvTrace Operational
Scope	Application
Description	*FrUni/n ServiceTrace* *FrNni/n ServiceTrace* The *ServiceTrace* component of the Frame Relay service determines if the trace capability is allowed on this interface. If it is not provisioned, then a service trace session cannot be started on this service. Frame Relay service trace is restricted to use FrameRelay, X25 or ATM service trace receiver. If the *SrvTrace rcvr* operational attribute is set to a string name of FrAtm service trace receiver, *Start* command will return a “Receiver Not Supported” response.
Mib	FrameRelayNniTrace

Common Verbs	Help List Display Add DELete

VERB Start FrNni SrvTrace

Impact	Service
Description	*Start FrUni/n ServiceTrace* *Start FrNni/n ServiceTrace* This command starts a Frame Relay service trace session.

VERB Stop FrNni SrvTrace

Impact	Service
Description	*Stop FrUni/n ServiceTrace* *Stop FrNni/n ServiceTrace* This command stops a Frame Relay service trace session.

GROUP FrNni SrvTrace Operational

Properties	Operational
Description	This group provides the operational attributes for the *SrvTrace* component.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayNniTrace

ATTRIBUTE FrNni SrvTrace **receiverName (rcvr)**

Access	Read and write
Description	This attribute should be set to the name of the desired trace receiver before starting a trace session. All available trace receivers are listed under the *SrvTrace Rcvr* component. This attribute cannot be set while the service trace is active. The receiver name is validated by the trace manager when the service *SrvTrace* is started.
Mib	FrameRelayNniTrace
Values	String (0..8, ASCII)
Default	No default

ATTRIBUTE FrNni SrvTrace **duration**

Access	Read and write
Description	This attribute specifies the duration, in minutes, of a trace session. A value of ***0*** indicates unlimited duration in which case a trace session remains active until a *Stop* command is issued. This attribute cannot be set while a trace is active.
Mib	FrameRelayNniTrace
Values	Decimal (0..9999)
Units	minutes
Default	60

ATTRIBUTE FrNni SrvTrace **queueLimit**

Access	Read and write
Description	This attribute specifies the total number of bytes of traced data which may be queued for transmission to the trace receiver. When this limit is exceeded, incoming traced frames are discarded. This attribute can be set while a trace is active and takes effect immediately.
Mib	FrameRelayNniTrace
Values	Decimal (1..100)
Units	Kbyte
Default	20

ATTRIBUTE FrNni SrvTrace **session**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the *SrvTrace Session* component that is forwarding the trace data. This attribute is set automatically, and is empty unless the service trace is active.
Mib	FrameRelayNniTrace
Values	The name of the component
Default	No default

COMPONENT FrNni SrvTrace Filter

Groups	GROUP FrNni SrvTrace Filter Operational
Scope	Application
Description	*FrUni/n SrvTrace Filter* *FrNni/n SrvTrace Filter* The *Filter* component defines the type of traced data that is sent to the receiver. The *Filter* component provides default values for all its attributes which are sufficient to start a trace session. If required, these attributes may be changed before or during a trace session.
Mib	FrameRelayNniTrace
Common Verbs	Help List Display

GROUP FrNni SrvTrace Filter Operational

Properties	Operational
Description	This group provides the operational attributes for the Frame Relay *SrvTrace Filter* component.
Mib	FrameRelayNniTrace

ATTRIBUTE FrNni SrvTrace Filter traceType (type)

Access	Read and write
Description	This attribute specifies the level of filtering required for this trace session. A value of ***lmi*** indicates that LMI frames are traced. A value of ***dlci*** indicates that frames from the *Dlci* specified by the *tracedDlci* attribute are traced. A value of ***badFrames*** indicates that bad received frames (overruns, CRC errors, aborts) are traced. The default is to trace all frames. This attribute can be set while a trace is active and takes effect immediately.
Mib	FrameRelayNniTrace
Set of	lmi dlci badFrames

Copyright © 2006, Nortel Nortel Confidential

Default	(lmi, dlci, badFrames)

ATTRIBUTE FrNni SrvTrace Filter **tracedDlci (dlci)**

Access	Read and write
Description	This attribute specifies a particular DLCI to trace. A value of ***0*** specifies that all DLCIs are to be traced. This attribute can be set while a trace is active and takes effect immediately.
Mib	FrameRelayNniTrace
Values	Decimal (0..1007)
Default	0

ATTRIBUTE FrNni SrvTrace Filter **direction (dir)**

Access	Read and write
Description	This attribute specifies the direction of the data to be traced as viewed by the service. The values can be ***egress*** and ***ingress***. An ***egress*** value indicates frames outbound from the service. An ***ingress*** value indicates frames inbound to the service. This attribute can be set while a trace is active and takes effect immediately.
Mib	FrameRelayNniTrace
Set of	egress ingress
Default	(egress, ingress)

ATTRIBUTE FrNni SrvTrace Filter **tracedLength (len)**

Access	Read and write
Description	This attribute specifies the maximum number of octets to trace per frame starting from the octet following the frame flag. If the frame length is longer than the value specified by this attribute, then the traced frame is truncated. If set to ***disabled***, the traced frame is not truncated. This attribute can be set while a trace is active and takes effect immediately. If the Frame Relay *SrvTrace* is started with an ATM service trace receiver, the *tracedLength* attribute of ATM service trace receiver is ignored.
Mib	FrameRelayNniTrace
Values	Decimal (1..4000) disabled
Units	octets
Default	2000

Default	120

ATTRIBUTE FrNni Bp crossNetAsyncUpdate (cnau)

Access	Read and write
Description	This attribute specifies when a cross-net status message is sent following a BNX DLCI state change. If set to ***enabled***, the status message is sent as soon as the state change occurs. If set to ***disabled***, the state of the BNX DLCI will be sent in a cross-net status message only at the next polling interval. The polling interval is determined by *crossNetPollingInterval* attribute. The *crossNetAsyncUpdate* attribute is ignored if *crossNetEnabled* is set to ***no***.
Mib	FrNniPvcBnx
Values	disabled enabled
Default	enabled

ATTRIBUTE FrNni Bp crossNetListenEnabled (cnle)

Access	Read and write
Description	This attribute specifies whether or not to expect cross-net status messages. When set to ***yes***, this interface wait for a cross-net status message from the remote end to declare the PVCs up or down. When set to ***no***, the interface assumes the PVCs are always up.
Mib	FrNniPvcBnx
Values	no yes
Default	yes

ATTRIBUTE FrNni Bp crossNetErrorThreshold (cnet)

Access	Read and write
Description	This attribute specifies how many *crossNetPollingIntervals* without receiving a status message from the remote end are permitted to elapse before declaring the PVC down.
Mib	FrNniPvcBnx
Values	Decimal (1..30)
Default	3

ATTRIBUTE FrNni Bp trafficPriorityEnabled (tpe)

Access	Read and write
Description	This attribute specifies how to set the "Priority Level" field of the BNX header. When set to ***no***, both the *defaultTrafficPriority* attribute of the *BnxProtocol* component and the *trafficPriority* attribute of the *BnxIwf*

Copyright © 2006, Nortel Nortel Confidential

component are ignored, and the "Priority Level" field is set to ***2***. When set to ***yes***, the "Priority Level" field is set to the value of the *trafficPriority* attribute of the *BnxIwf*, unless the *trafficPriority* attribute has a value of ***useDefault***. In this case the “Priority Level” field is set to the value of the *defaultTrafficPriority* attribute.

Mib	FrNniPvcBnx
Values	no yes
Default	no

ATTRIBUTE FrNni Bp defaultTrafficPriority (dtp)

Access	Read and write
Description	This attribute specifies the default traffic priority used to tag all the ingress traffic. This attribute is used when the *trafficPriority* attribute of the *BnxIwf* is set to ***useDefault***. A larger value denotes a lower priority. This attribute is ignored if the *trafficPriorityEnabled* is set to ***no***.
Mib	FrNniPvcBnx
Values	Decimal (1..3)
Default	2

ATTRIBUTE FrNni Bp trafficDiscardLevel (tdl)

Access	Read and write
Description	This attribute specifies the discard level used to tag ingress traffic.This value is ignored when the attribute *discardLevelEnabled* is set to ***no***. In this case, the "Discard Level" field of BNX header is set to ***2*** for DE=1 datagrams and to ***4*** for DE=0 datagrams. When *discardLevelEnabled* is set to ***yes***, the "Discard Level" field is tagged with the value of *trafficDiscardLevel* attribute. The "Discard Level" value is used as follows: Discard Level=***1***: drop datagrams when congestion level >= 1 Discard Level=***2***: drop datagrams when congestion level >= 2 Discard Level=***3***: drop datagrams when congestion level >= 3 Discard Level=***4***: drop datagrams when congestion level >= 4
Mib	FrNniPvcBnx
Values	Decimal (1..4)
Default	4

ATTRIBUTE FrNni Bp discardLevelEnabled (dle)

Access	Read and write
Description	This attribute specifies how to use discard level to tag ingress traffic. When set to ***yes***, the provisioned *trafficDiscardLevel* is used. Otherwise ingress DE=1 datagrams are tagged with discard level ***2*** and DE=0 datagrams are tagged with discard level ***4***.

Mib	FrNniPvcBnx
Values	no yes
Default	no

GROUP FrNni Bp OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	FrNniPvcBnx

ATTRIBUTE FrNni Bp adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	FrNniPvcBnx
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE FrNni Bp operationalState (osiOper)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	FrNniPvcBnx
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE FrNni Bp usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	FrNniPvcBnx
Values	idle active (activ) busy
Default	idle

ATTRIBUTE FrNni Bp availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Copyright © 2006, Nortel Nortel Confidential

Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE FrNni Bp proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib	FrNniPvcBnx
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE FrNni Bp controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.
Mib	FrNniPvcBnx
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE FrNni Bp alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib — FrNniPvcBnx

Set of — underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default — No default

ATTRIBUTE FrNni Bp standbyStatus (osiStby)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE FrNni Bp unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	FrNniPvcBnx
Values	false true
Default	false

GROUP FrNni Bp Operational (Op)

Properties	Operational
Description	This attribute group contains the operational status of the *BnxProtocol* component.
Mib	FrNniPvcBnx

ATTRIBUTE FrNni Bp invalidBnxHeader (ibh)

Access	Read only
Description	This attribute counts the datagrams dropped because the BNX header was invalid. It could be caused by a invalid header version, invalid protocol type, or that discard level or priority level is out of range.
Mib	FrNniPvcBnx
Values	Decimal (0..429496729)
Default	0

ATTRIBUTE FrNni Bp lastInvalidBnxHeader (libh)

Access	Read only
Description	This attribute indicates the BNX header of the datagram which was last dropped by the *BnxProtocol* because one or more fields of the BNX

Copyright © 2006, Nortel Nortel Confidential

	header are invalid. The invalid field could be any of the following: header version, protocol type, discard level out of range, priority level out of range.
Mib	FrNniPvcBnx
Values	Hex (H.0..H.ffffffff)
Default	No default

ATTRIBUTE FrNni Bp invalidIpProtocolId (ipid)

Access	Read only
Description	This attribute counts the datagrams dropped because the protocol ID in IP header was invalid.
Mib	FrNniPvcBnx
Values	Decimal (0..429496729)
Default	0

ATTRIBUTE FrNni Bp discardedIpFragment (dipf)

Access	Read only
Description	This attribute counts the total number of fragmented datagrams dropped by this interface. The case could be unknown Dlci, or unknown ID in IP header when misordering happened.
Mib	FrNniPvcBnx
Values	Decimal (0..429496729)
Default	0

ATTRIBUTE FrNni Bp sourceIpAddressLastDropped (ldsia)

Access	Read only
Description	This attribute indicates the source IP address of the datagram that was last dropped by the *BnxProtocol* because one or more fields of the IP header are invalid. The invalid field could be any of the following: header version, protocol ID, or Identification of a fragmented datagram.
Mib	FrNniPvcBnx
Values	IP address
Default	0.0.0.0

ATTRIBUTE FrNni Bp droppedUnknownDlci (dud)

Access	Read only
Description	This attribute counts the datagrams dropped because the DLCI was unknown.
Mib	FrNniPvcBnx

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..429496729)
Default	0

ATTRIBUTE FrNni Bp lastUnknownDlci (lud)

Access	Read only
Description	This attribute indicates the DLCI of datagram last dropped.
Mib	FrNniPvcBnx
Values	Decimal (0..429496729)
Default	0

ATTRIBUTE FrNni Bp droppedUnknownDlciXnet (dudx)

Access	Read only
Description	This attribute counts the received cross-net status messages that were dropped because the DLCI was unknown.
Mib	FrNniPvcBnx
Values	Decimal (0..429496729)
Default	0

ATTRIBUTE FrNni Bp lastUnknownDlciXnet (ludx)

Access	Read only
Description	This attribute indicates the DLCI of last received cross-net status message that was dropped because the DLCI was unknown.
Mib	FrNniPvcBnx
Values	Decimal (0..429496729)
Default	0

ATTRIBUTE FrNni Bp ipFragFromSubnet (fragfs)

Access	Read only
Description	This attribute counts the IP fragments received from subnet by this frame relay interface. The value of this attribute wraps to zero when it exceeds the maximum value.
Mib	FrNniPvcBnx
Values	Decimal (0..429496729)
Default	0

ATTRIBUTE FrNni Bp lastInvalidIpFragId (lastid)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the Id in the IP header of the last fragment dropped by the frame relay interface.
Mib	FrNniPvcBnx
Values	Decimal (0..429496729)
Default	0

ATTRIBUTE FrNni Bp lastDlciWithIpFragment (lfdlci)

Access	Read only
Description	This attribute indicates the Dlci which last received IP fragment. This attribute is used for tracking fragmented IP traffic.
Mib	FrNniPvcBnx
Values	Decimal (0..429496729)
Default	0

GROUP FrUni CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	FrameRelayUni

ATTRIBUTE FrUni customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to

Copyright © 2006, Nortel Nortel Confidential

as “NetMan” in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers.

Mib	FrameRelayUni
Values	Decimal (0; 1..8191)
Default	0

GROUP FrUni OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	FrameRelayUni

ATTRIBUTE FrUni adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	FrameRelayUni
Values	locked (lck) unlocked (unlck) shuttingDown (shut)

Mib	FrameRelayUni
Values	idle active (activ) busy
Default	idle

ATTRIBUTE FrUni availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-

Copyright © 2006, Nortel Nortel Confidential

valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib	FrameRelayUni
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE FrUni standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayUni
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE FrUni unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	FrameRelayUni
Values	false true
Default	false

GROUP FrUni Statistics (Stats)

Properties	Operational
Description	FrUni/n Statistics This group contains the statistics about the operational behavior of the service at the interface level.
Mib	FrameRelayUni

ATTRIBUTE FrUni lastUnknownDlci (ludlc)

Access	Read only
Description	This attribute identifies the most recent DLCI which user frames were received on for which a DLCI has not been provisioned on the port.
Mib	FrameRelayUni
Values	Decimal (0..1023)
Default	0

ATTRIBUTE FrUni unknownDlciFramesFromIf (unknown)

Access	Read only
Description	This attribute contains a count of the number of frames received from the

Copyright © 2006, Nortel Nortel Confidential

	interface with an unknown DLCI (DLCI which is not provisioned). When the maximum is reached the count wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni invalidHeaderFramesFromIf (invalid)

Access	Read only
Description	This attribute counts the number of frames received from the interface with an invalid header format. When the maximum is reached the count wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

GROUP FrUni IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	FrameRelayUni

ATTRIBUTE FrUni ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	FrameRelayUni
Values	up down testing
Default	up

ATTRIBUTE FrUni ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	FrameRelayUni

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (1..65535)
Default	No default

GROUP FrUni OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	FrameRelayUni

ATTRIBUTE FrUni snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	FrameRelayUni
Values	up down testing
Default	up

GROUP FrUni EmissionPriorityQs

Properties	Provisioned
Description	This group contains the provisionable attribute to specify the number of Frame Relay egress emission priority queues to be used on that Frame Relay Interface and the provisionable attribute to determine whether emission queue size is doubled.
Mib	FrameRelayUni

ATTRIBUTE FrUni numberOfEmissionQs

Access	Read and write
Criticality	Process
Description	This attribute specifies the number of egress emission priority queues that will be used for that Frame Relay interface. For V.35, V.11, HSSI, E1, DS1, E3, DS3 or 8pDS1 the possible values are: ***2*** (in which case they are hardware queues), or ***4*** (in which case they are software queues). For DS1C, E1C or DS3C the possible values are ***2, 4*** (in all cases they are software queues).

Copyright © 2006, Nortel Nortel Confidential

For 32 port Msa cards the possible values are ***2, 4*** (in all cases they are hardware queues).

For 4pDS3Ch, 1pSTM1ChSmIr PQC6v2 (also known as PQC2) the possible values are ***2, 4*** (in all cases they are hardware queues).

For 4pDS3Ch PQC12, setting this attribute has no effect on the number of egress emission priority queues, four hardware queues are always used.

Mib	FrameRelayUni
Values	Decimal (2; 4)
Default	2

ATTRIBUTE FrUni doubleEmissionQSize (deqs)

Access	Read and write
Criticality	Process
Description	This attribute specifies if the emission queue's size is doubled for the frame relay interface and it is only supported on *frUni*. When *doubleEmissionQSize* is set to ***yes***, the default frame relay interface emission queue size is doubled. This will reduce packets loss, but latency will be increased as the queue length grows. When the attribute is set to ***no***, the default emission queues size will be used. When frame relay interface is linked to a virtual framer, the *doubleEmissionQSize* must be set to ***no***, or a semantic check error will occur. For V11, E1 and E1C cards, the possible values of the *doubleEmissionQSize* attribute are ***yes*** and ***no***. For other cards, *doubleEmissionQSize* must always be set to ***no***, or a semantic check error will occur.
Mib	FrameRelayUni
Values	no yes
Default	no

GROUP FrUni TrafficStatistics (TrafficStats)

Properties	Operational
Description	This operational group provides the traffic statistics of the service at the interface level. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayUni

ATTRIBUTE FrUni frmTolfByQueue

Access	Read only
Description	This attribute counts the frames transmitted to the interface through each of the egress queues. The number of queues is determined by the attribute *numberOfEmissionQs*. Egress queue 0 has the lowest priority, and egress queue 3 has the highest priority. The attribute is displayed only on SBIC cards when *numberOfEmissionQs* is 4.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Replication	Decimal (0..3)
Default	No default

ATTRIBUTE FrUni octetTolfByQueue

Access	Read only
Description	This attribute counts the octets transmitted to the interface through each of the egress queues. The number of queues is determined by the attribute *numberOfEmissionQs*. Egress queue 0 has the lowest priority, and egress queue 3 has the highest priority. The attribute is displayed only on SBIC cards when *numberOfEmissionQs* is 4.

GROUP FrUni Dna Address

Properties	Provisioned
Description	This group contains attributes common to all DNAs. Every DNA used in the network is defined with this group of 2 attributes.
Mib	FrameRelayUni

ATTRIBUTE FrUni Dna numberingPlanIndicator (npi)

Access	Read and write
Criticality	Process
Description	This attribute indicates the Numbering Plan Indicator (NPI) of the DNA that is entered. Address may belong to X.121 or E.164 plans. X.121 is used in packet switched data networks.
Mib	FrameRelayUni
Values	x121 e164
Default	x121

ATTRIBUTE FrUni Dna dataNetworkAddress (dna)

Access	Read and write
Criticality	Process
Description	This attribute specifies digits which form the unique identifier of the customer interface. When a *SpareDna* component is provisioned this attribute specifies the main *dna*, that is the one on the *mainCard* supporting the interface. It is the equivalent of a telephone number in the telephone network.
Mib	FrameRelayUni

Copyright © 2006, Nortel Nortel Confidential

Values	BCD (1..15)
Default	No default

GROUP FrUni Dna OutgoingOptions

Properties	Provisioned
Description	This group defines DNA call options for calls made from the interface. These options are not used for calls arriving to the interface represented by this *DNA*.
Mib	FrameRelayUni

ATTRIBUTE FrUni Dna outDefaultPriority (odf)

Access	Read and write
Description	This attribute indicates the default priority of outgoing calls from the DTE to the network. It can be overridden by the *discardPriority* under *DLCI Direct Call* subcomponent. This option can be also included in X.25 signaling, in such case it will be overruled.
Mib	FrameRelayUni
Values	normal high
Default	normal

ATTRIBUTE FrUni Dna outDefaultPathReliability (opr)

Access	Read and write
Description	This attribute specifies the default class of routing for reliability routing for all outgoing calls (from the DTE to the network) using this particular DNA. The chosen default class of routing applies to all outgoing calls established using this DNA, and applies to the packets travelling in both directions on all outgoing calls (local to remote, and remote to local). For incoming calls, the default class of routing is chosen by the calling party (as opposed to DPN, where either end of the call can choose the default routing class). This attribute, if set to a value of *normal*, indicates that the default class of routing is normal reliability routing. If set to a value of *high*, then the default class of routing is high reliability routing. High reliability is the standard choice for most DPN and Nortel Networks Multiservice Switch services. It usually indicates that packets are overflowed or retransmitted at various routing levels. Typically high reliability results in duplication and disordering of packets in the network

Copyright © 2006, Nortel Nortel Confidential

when errors are detected or during link congestion. However, the VC handles the duplication and disordering to ensure that packets are delivered to the DTE properly.

For the Frame Relay service, duplication of packets is not desired, in which case, normal reliability may be chosen as the preferred class of routing.

Mib: FrameRelayUni

Values: normal
high

Default: normal

ATTRIBUTE FrUni Dna outAccess (oua)

Access: Read and write

Description: This attribute is an extension of the Closed User Group (CUG) facility, as follows:
This attribute, if set to a value of *allowed* indicates that outgoing calls (from the DTE to the network) to the open (non-CUG) part of the network are permitted. It also permits outgoing calls to DTEs that have Incoming Access capabilities. If set to a value of *disallowed*, then such calls cannot be made using this DNA. Such calls will be cleared by the local DCE.
This attribute corresponds to the CCITT 'Closed User Group with Outgoing Access' feature for DNAs in that outgoing access is granted if this attribute is set to a value of *allowed*.

Mib: FrameRelayUni

Values: disallowed
allowed

Default: disallowed

ATTRIBUTE FrUni Dna defaultTransferPriority (dtp)

Access: Read and write

Description: This attribute specifies the default transfer priority for all outgoing calls using this particular *DNA*. It can be overridden by the *transferPriority* provisioned in the *Dlci DirectCall* sub-component.

The transfer priority is a preference configured for an application according to its delay-sensitivity requirement. Frames with higher transfer priority are served by the network before the frames with lower priority. The transfer priority standard is defined to have 16 levels from 0 to 15.

Each transfer priority n, where n indicates the transfer priority index, contains a default setting for routing class of service (multimedia, delay or throughput) and frame relay egress queue (depending on the number of supported egress queues on the remote end interface) specified by the *routingClassOfServic*e and *emissionPriority* attributes provisioned in the

Copyright © 2006, Nortel Nortel Confidential

Mod Frs DprsNet Tpm/n component. The default mapping can be altered by a user if required.

The default *defaultTransferPriority* is ***0***.

ATTRIBUTE FrUni Dna transferPriorityOverRide (tpor)

Access: Read and write

Description: When this attribute is set to ***yes*** in the call request, the called end will use the calling end provisioning data on transfer priority to override its own provisioning data. If it is set ***no***, the called end will use its own provisioning data on transfer priority.

This attribute is not applicable for Frame Relay SVCs.

For more information about transfer priority, please refer to the previous attribute *defaultTransferPriority*.

The default of *transferPriorityOverRide* is ***yes***.

Mib: FrameRelayUni

Values:
yes
no

Default: yes

GROUP FrUni Dna IncomingOptions

Properties: Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group defines options for incoming calls. These options are used for calls arriving to the interface represented by this *DNA*. For calls originated from the interface, *IncomingOptions* attributes are not used.
Mib	FrameRelayUni

ATTRIBUTE FrUni Dna incAccess (ina)

Access	Read and write
Description	This attribute, if set to a value of *allowed* specifies that incoming calls (from the network to the DTE) from the open (non-CUG) part of the network are permitted. It also permits incoming calls from DTEs that have outgoing access capabilities. If set to a value of *disallowed*, such calls cannot be made to this DNA. They will be cleared by the local DCE. This attribute corresponds to the CCITT 'Closed User Group with Incoming Access' feature for DNAs in that incoming access is granted if this attribute is set to a value of *allowed*.
Mib	FrameRelayUni
Values	disallowed allowed
Default	disallowed

GROUP FrUni Dna CallOptions

Properties	Provisioned
Description	This group defines additional all options for not related to direction of the call.
Mib	FrameRelayUni

ATTRIBUTE FrUni Dna accountClass (acl)

Access	Read and write
Description	This attribute specifies the accounting class which is reserved for network operations usage. Its value is returned in the accounting record in the local and remote service type attributes. Use of this attribute is decided by network operator. This attribute is returned by the local VC in the accounting record for all calls that are set up using this particular DNA.
Mib	FrameRelayUni
Values	Decimal (0..255)
Default	0

ATTRIBUTE FrUni Dna accountCollection (aco)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates that accounting records are to be collected by the network for the various reasons: billing, test, study, auditing. The last of the parameters, force, indicates that accounting records are to be collected irrespective of other collection reasons. The force option is available for X.75 Gateways only. If none of these reasons are set, then accounting will be suppressed. To set a specific accounting collection reason, the reason is entered and the corresponding bit in the structure is set to a value of 1. To turn off a specific accounting collection reason, the reason is entered preceded with the '~' character, and the corresponding bit in the structure is set to a value of 0. The bit placement for the accounting collection reasons is as follows: Bit 0 - Bill Bit 1 - Test Bit 2 - Study Bit 3 - Audit Bit 4 - Force
Mib	FrameRelayUni
Set of	bill test study audit force
Default	(bill)

ATTRIBUTE FrUni Dna serviceExchange (sre)

Access	Read and write
Description	This attribute is an arbitrary number, Data Service Exchange, as entered by the network operator and reported in accounting record. It is converted into an internal 8-bit integer value for use in the accounting record as well as in various X.25 and X.75 Tariff utilities.
Mib	FrameRelayUni
Values	Decimal (0..255)
Default	0

ATTRIBUTE FrUni Dna egressAccounting (ega)

Access	Read and write
Description	This attribute specifies if egress accounting is enabled by the frame relay service. If egress accounting is disabled, only segment counts are collected by the VC. No frame relay counts appear in the accounting records for the frame relay service. If egress accounting is enabled, the accounting records for the frame relay service will contain frame relay specific counts.
Mib	FrameRelayUni

Copyright © 2006, Nortel Nortel Confidential

Values	yes no
Default	no

ATTRIBUTE FrUni Dna dataPath (dpa)

Access	Read and write
Description	This attribute specifies the data path to be used by Virtual Circuits on this interface. If the connection has a *DirectCall* component then the value can be overridden by the *dataPath* attribute of the *DirectCall* component. This value applies to the connection after data transfer state is reached. All the data and control traffic will be sent using this data path. If the provisioned *dataPath* is not available the connection is not established. The value of the *dataPath* is signaled by both ends of the connection. If this value is not the same at both ends ***dprsOnly*** is used for the duration of the connection. A virtual circuit connection is always established using ***dprsOnly*** even if this attribute is provisioned as some other value. ***dprsOnly*** - dynamic packet routing system is used ***dprsMcsOnly*** - dprs Multi-Service Cut-Through Switching path is used. ***dprsMcsFirst*** - dprs Multi-Service Cut-Through Switching path is used if it is available. If it is not available ***dprsOnly*** is used.
Mib	FrameRelayUni
Values	dprsOnly dprsMcsOnly dprsMcsFirst
Default	dprsOnly

COMPONENT FrUni Dna ClosedUserGroup (Cug)

Instance	Decimal (0..255)
Groups	GROUP FrUni Dna Cug CugOptions
Scope	Application
Description	*FrUni/n Dna ClosedUserGroup* This group defines options associated with national or international *CUG* Identifier. Other *DNAs* in the network can have *CUGs* defined which groups these *DNAs* by *CUG interlockCode*. If *DNAs* are defined with *CUGs*, calls from *DNAs* which do not have the same *interlockCode* defined are refused. Attributes *incAccess* and *outAccess* can override this

Copyright © 2006, Nortel Nortel Confidential

rule.

A CUG is provisioned by default as a SELECTABLE CUG. If a SELECTABLE CUG is provisioned, the DTE can include a CUG facility in the call request. If it does, the DTE selects a specific CUG by signaling the CUG's index. A DTE can subscribe to as many as 256 SELECTABLE CUGs.

A SIMPLE CUG is provisioned by setting a SELECTABLE CUG's preferential attribute to the value **yes**. There are two prerequisites: a single SELECTABLE CUG must exist; its attributes incCalls and outCalls must both be set to **allowed**. If a SIMPLE CUG is provisioned, it is the default CUG used to establish a call when the call request sent by the DTE does not include any CUG facility. If the DTE includes any CUG facility in the call request, the call is cleared. A DTE subscribing to a SIMPLE CUG cannot subscribe to any other CUG.

Mib FrameRelayUni

Common Verbs
Help
List
Display
Add
DELete

GROUP FrUni Dna Cug CugOptions

Properties Provisioned

Description Attributes in this group define *ClosedUserGroup* options associated with *interlockCode*. *DNA's* with the same *CUG* (*interlockCode*) can make calls within this group. Various combinations which permit or prevent calls in the same *CUG* group are defined here.

Mib FrameRelayUni

ATTRIBUTE FrUni Dna Cug type

Access Read and write

Description This attribute specifies the CUG type - the CUG is either a national CUG, or an international CUG. International closed user groups are usually established between DTEs for which there is an X.75 Gateway between; whereas national closed user groups are usually established between DTEs for which there is no X.75 Gateway between. (National CUGs cannot normally traverse an X.75 Gateway).
If this attribute is set to ***national***, then the *CUG* is a national *CUG*, in which case, the *dnic* should be left at its default value since it is not part of a national *CUG*. If this attribute is set to ***international***, then the *CUG* is an international *CUG*, in which case, the *dnic* should be set appropriately as part of the *CUG interlockCode*.

Mib FrameRelayUni

Copyright © 2006, Nortel Nortel Confidential

Values	national international
Default	national

ATTRIBUTE FrUni Dna Cug dnic

Access	Read and write
Description	This attribute specifies the *dnic* (Data Network ID Code) of the *CUG* by which packet networks are identified. This attribute is not applicable if the *CUG* is a ***national*** *CUG*, as specified by the CUG *type* attribute. There are usually 1 or 2 *dnics* assigned per country, for public networks. The U.S. is an exception where each BOC has a *dnic*. Also, a group of private networks can have its own *dnic*. *dnic* value is not an arbitrary number. It is assigned by international agreement and controlled by CCITT.
Mib	FrameRelayUni
Values	BCD (4)
Default	0000

ATTRIBUTE FrUni Dna Cug interlockCode (ilc)

Access	Read and write
Description	This attribute specifies the *CUG* identifier of a national or international *CUG* call. It is an arbitrary number and it also can be called CUG in some descriptions. Interfaces (*DNA's*) defined with this number can make calls to *DNA's* with the same *interlockCode*.
Mib	FrameRelayUni
Values	Decimal (0..65535)
Default	65535

ATTRIBUTE FrUni Dna Cug preferential (pre)

Access	Read and write
Description	The attribute "preferential", if set to ***yes*** indicates that this CUG is the SIMPLE CUG (as defined in ITU X.36 [10/96]), in which case it will be used during the call establishment phase if the DTE has not explicitly specified a CUG index in the call request packet. If set to ***no***, then this CUG is not the SIMPLE CUG, but an instance of the SELECTABLE CUG. The attribute "preferential" is set to ***no*** by CAS when a CUG instance is created. If only one CUG instance exists under a DNA, and if this CUG's attributes "incCalls" and "outCall" are both set to ***allowed*****, t**hen this CUG instance can be changed to a SIMPLE CUG by setting the attribute "preferential" to ***yes***. If more than one CUG instances exist under a DNA, none of the CUGs can be set by the user as "preferential". Essentially, the

Copyright © 2006, Nortel Nortel Confidential

attribute “preferential” distinguishes a SIMPLE CUG from a SELECTABLE CUG.

In the case of a FRUNI DNA with a single CUG instance, the CUG can be a SIMPLE CUG (preferential = ***yes***) or the only instance of a SELECTABLE CUG (preferential = ***no***).

Mib	FrameRelayUni
Values	no yes
Default	no

ATTRIBUTE FrUni Dna Cug outCalls (ouc)

Access	Read and write
Description	This attribute, if set to ***allowed*** indicates that outgoing calls (from the DTE into the network) can be made using this particular CUG. If set to a value of ***disallowed***, then outgoing calls cannot be made using this CUG - such calls will be cleared by the local DCE. This attribute corresponds to the CCITT 'Outgoing Calls Barred' feature for CUGs in that outgoing calls are barred if this attribute is set to a value of ***disallowed***.
Mib	FrameRelayUni
Values	disallowed allowed
Default	allowed

ATTRIBUTE FrUni Dna Cug incCalls (inc)

Access	Read and write
Description	This attribute, if set to ***allowed*** indicates that incoming calls (from the network to the DTE) can be made using this particular CUG. If set to ***disallowed***, then incoming calls cannot be made using this CUG - such calls will be cleared by the local DCE. This attribute corresponds to the CCITT 'Incoming Calls Barred' feature for CUGs in that incoming calls are barred if this attribute is set to a value of ***disallowed***.
Mib	FrameRelayUni
Values	disallowed allowed
Default	allowed

GROUP FrUni Dna SDna Address (Addr)

Properties	Provisioned
Description	This group contains attributes common to all DNAs. Every DNA used in the network is defined with this group of 2 attributes.
Mib	FrameRelayUni

ATTRIBUTE FrUni Dna SDna numberingPlanIndicator (npi)

Access	Read and write
Criticality	Process
Description	This attribute specifies the Numbering Plan Indicator (NPI) of the *dna*. The address may belong to X.121 or E.164 plans.
Mib	FrameRelayUni

Copyright © 2006, Nortel Nortel Confidential

Values	x121 e164
Default	x121

ATTRIBUTE FrUni Dna SDna dataNetworkAddress (dna)

Access	Read and write
Criticality	Process
Description	This attribute specifies digits which form the alternate identifier of the customer interface used for hot standby sparing. This spare *dna* is supported by the *spareCard*. It is the equivalent of a telephone number in the telephone network. DNA digits are selected and assigned by network operators.
Mib	FrameRelayUni
Values	BCD (1..15)
Default	No default

COMPONENT FrUni Framer

Groups	GROUP FrUni Framer Provisioned (Prov) GROUP FrUni Framer LinkOptions (Link) GROUP FrUni Framer OsiState (State) GROUP FrUni Framer Statistics (Stats) GROUP FrUni Framer LinkUtilization (Util)

COLLECTED STATS FrameRelayUni Framer

Scope	Application
Description	*FrUni/n Framer* *FrNni/n Framer* *FrAtm/n Framer* This component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface. The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length) rather than interface specific attributes (such as modem leads and clocking) which are associated with specific hardware components (such as *V35/n* or *DS1/n*). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component. The *Framer* component contains operational attributes for link interface

Copyright © 2006, Nortel Nortel Confidential

datapath statistics (such as frame counts and aborts).

Mib	FrameRelayUni
Common Verbs	Help List Display Add DELete

GROUP FrUni Framer Provisioned (Prov)

Properties	Provisioned
Description	This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.
Mib	FrameRelayUni

ATTRIBUTE FrUni Framer interfaceName

Access	Read and write
Criticality	Process
Description	This attribute contains a hardware component name. The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.
Mib	FrameRelayUni
Values	Link (Hardware, applicationFramerName)
Default	No default

GROUP FrUni Framer LinkOptions (Link)

Properties	Provisioned
Description	This group contains attributes defining the framing of data on the link interface.
Mib	FrameRelayUni

ATTRIBUTE FrUni Framer dataInversion

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute determines whether data bits are to be inverted (1 to 0 and 0 to 1) before transmission of frames to the interface. If the value of this attribute is On, the incoming data bits will also be inverted when frames are received from the link before being processed.

This option is typically used in ***hdlc*** framing mode when inversion is used to guarantee 1's density.

Note that aborts (in ***hdlc*** and ***interrupting*** modes) are corrupted when data is inverted.

This attribute may only take its default value for non-MSA cards.

Mib: FrameRelayUni

Values:
off
on

Default: off

ATTRIBUTE FrUni Framer frameCrcType

Access: Read and write

Description

This attribute defines the type of CRC used.

The CRC value calculated is appended to the end of the frames transmitted to the link. The CRC value is removed from the end of frames received from the link and checked for correctness.
NoCrc means that CRC is not used.

This attribute may take only its default value for non-MSA cards.

Mib: FrameRelayUni

Values:
crc16
crc32
noCrc

Default: crc16

ATTRIBUTE FrUni Framer flagsBetweenFrames

Access: Read and write

Description

This attribute defines the number of flags that are inserted between frames sent to the link interface. The flagBetweenFrames can be set to only 1, 2, 4, 8 or 16 for 4pDS3Ch FrameRelay FP.

Mib: FrameRelayUni

Values: Decimal (1..16)

Copyright © 2006, Nortel Nortel Confidential

Default	1

GROUP FrUni Framer OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	FrameRelayUni

ATTRIBUTE FrUni Framer adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	FrameRelayUni
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE FrUni Framer operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or

Copyright © 2006, Nortel Nortel Confidential

	with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	FrameRelayUni
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE FrUni Framer **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	FrameRelayUni
Values	idle active (activ) busy
Default	idle

GROUP FrUni Framer **Statistics (Stats)**

Properties	Operational
Description	This group contains the operational statistics data for a Framer component.
Mib	FrameRelayUni

ATTRIBUTE FrUni Framer **aborts**

Access	Read only
Description	This attribute is the total number of aborts received.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Framer **crcErrors**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute is the total number of frames with CRC errors, occurring in the receive direction from the link.

Mib FrameRelayUni

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE FrUni Framer lrcErrors

Access Read only

Description

This attribute is the total number of frames with LRC errors, occurring in the Tx link prior to transmission onto the link.

Mib FrameRelayUni

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE FrUni Framer nonOctetErrors

Access Read only

Description

This attribute is the total number of frames that were non octet aligned.

Mib FrameRelayUni

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE FrUni Framer overruns

Access Read only

Description

This attribute is the total number of frames received from the link for which overruns occurred.

Mib FrameRelayUni

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE FrUni Framer underruns

Access Read only

Description

This attribute is the total number of frames transmitted to the link for which underruns occurred.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Framer largeFrmErrors

Access	Read only
Description	This attribute is the total number of frames received which were too large. The frame exceeded the *maximumFrameLengthLimit* provisioned attribute or it contained more than the 255 block hardware limit.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Framer frmModeErrors

Access	Read only
Description	This attribute is the total number of frames detected with framing mode errors. A *framingModeError* is flagged when frames are inconsistent with the specified *framingType*, that is when interrupting frames are used while running in hdlc mode.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Framer frmToIf

Access	Read only
Description	The number of frames transmitted to the link interface by Framer. Note: This does not include the number of frames transmitted directly to the hardware queue, thus bypassing the Framer component.
Mib	FrameRelayUni
Values	Long Integer
Default	No default

ATTRIBUTE FrUni Framer frmFromIf

Access	Read only
Description	The number of frames received from the link interface by Framer.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayUni
Values	Long Integer
Default	No default

ATTRIBUTE FrUni Framer octetFromIf

Access	Read only
Description	The number of bytes received from the link interface by Framer.
Mib	FrameRelayUni
Values	Long Integer
Default	No default

ATTRIBUTE FrUni Framer ingressFrameDiscards

Access	Read only
Description	This attribute is the total number of frames discarded at ingress PQC.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

GROUP FrUni Framer LinkUtilization (Util)

Properties	Operational
Description	This group contains the link utilization operational data for a Framer component.
Mib	FrameRelayUni

ATTRIBUTE FrUni Framer normPrioLinkUtilToIf

Access	Read only
Description	This attribute is the utilization of the normal and high priority data traffic (interruptible traffic) sent to the link as a percentage of the available bandwidth on the link. Note that this includes traffic with Transfer Priorities (TP) of 0, 6 and 9 and/or Emission Priority of 2 and 3. The utilization is the average for the last minute.
Mib	FrameRelayUni
Values	Decimal (0..100)
Units	%
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrUni Framer **normPrioLinkUtilFromIf**

Access	Read only
Description	This attribute is the utilization of the normal and high priority data traffic (interruptible traffic) received from the link as a percentage of the available bandwidth on the link. Note that this includes traffic with Transfer Priorities (TP) of 0, 6 and 9 and/or Emission Priority of 2 and 3. The utilization is the average for the last minute.

GROUP FrUni Lmi ProtocolParameters (Parms)

Properties	Provisioned
Description	This group contains the provisionable attributes of the *LMI* component.
Mib	FrameRelayUni

ATTRIBUTE FrUni Lmi procedures (proc)

Access	Read and write
Criticality	Process
Description	This attribute selects the procedures to be used for the Local Management Interface. The following procedures are supported: ***none:*** no Local Management Interface procedures are running on this interface. This accommodates Frame Relay user equipment that has not implemented any LMI procedures. The remaining attributes of this group are ignored. For the ***4pDS3Ch*** card, when the *timeslot* of the *channel* component linked to this *FrUni* is set to ***none***, only ***none*** is permitted for the *procedures* attribute of this *Lmi* component. ***vendorForum***: Local Management Interface procedures from the Vendor Forum specification are supported on this interface. *DLCI 1023* is used for

Copyright © 2006, Nortel Nortel Confidential

the LMI protocol. This value cannot be used if the side attribute is both.

ansi: Local Management Interface procedures from the ANSI specification are supported. *DLCI 0* is used for the LMI protocol.

itu: Local Management Interface procedures from the ITU-T specification are supported. *DLCI 0* is used for the LMI protocol. Was previously ***ccitt***.

autoConfigure: The interface determines automatically which Local Management Interface procedures to use. This value cannot be used if the side attribute is user.

The procedures currently in use can be seen in the operational attribute *opProcedures*.

Mib: FrameRelayUni

Values:
none
vendorForum
ansi
itu (ccitt)
autoConfigure

Default: autoConfigure

ATTRIBUTE FrUni Lmi asyncStatusReport (asr)

Access: Read and write

Description

This attribute selects the use of asynchronous PVC status report procedures as specified in ANSI, CCITT, and Vendor Forum.

This attribute can be set to ***on*** or ***off***. If *procedure*s is set to ***none***, this attribute is ignored.

Mib: FrameRelayUni

Values:
off
on

Default: off

ATTRIBUTE FrUni Lmi errorEventThreshold (n392)

Access: Read and write

Description

An event is defined as follows: (1) receipt of a STATUS ENQUIRY message; or (2) expiration of timer T392. An error event is (1) nonreceipt of STATUS ENQUIRY in T392 seconds; (2) invalid contents of a LMI message; (3) invalid receive sequence number. This attribute specifies the number of error events which, if they occur within *eventCount* events, cause a protocol error condition. The condition is cleared after *eventCount* sequential correct events occur. This attribute corresponds to the nN2

Copyright © 2006, Nortel Nortel Confidential

parameter described in the Vendor Forum Specification.

It must be less than or equal to *eventCount*.

Mib FrameRelayUni

Values Decimal (1..10)

Default 3

ATTRIBUTE FrUni Lmi eventCount (n393)

Access Read and write

Description

This attribute specifies the number of contiguous events within which no more than *eventErrorThreshold* error events are allowed. This attribute corresponds to the nN3 parameter described in the Vendor Forum Specification.

It must be greater than or equal to *errorEventThreshold*.

Mib FrameRelayUni

Values Decimal (1..10)

Default 4

ATTRIBUTE FrUni Lmi checkPointTimer (t392)

Access Read and write

Description

This attribute selects the time (in seconds) within which a STATUS ENQUIRY message is expected. This attribute corresponds to the nT2 parameter described in the Vendor Forum Specification.

It must be less than *messageCountTimer*.

Mib FrameRelayUni

Values Decimal (1; 2; 3; 4; 5; 10; 15; 20; 25; 30)

Units seconds

Default 15

ATTRIBUTE FrUni Lmi messageCountTimer (nt3)

Access Read and write

Description

This attribute selects the time (in seconds) within which at most five (this is a fixed value and corresponds to maximum message count in VendorForum) STATUS ENQUIRY messages are expected. This attribute applies only when the *lmiProcedures* is set to ***vendorForum***.

Copyright © 2006, Nortel Nortel Confidential

messageCountTimer must always be greater than *checkPointTimer*.

Mib	FrameRelayUni
Values	Decimal (5; 10; 15; 20; 25; 30)
Units	seconds
Default	20

ATTRIBUTE FrUni Lmi ignoreActiveBit (inab)

Access	Read and write
Criticality	Process
Description	This attribute specifies whether the Frame Relay LMI Active Bit (A-bit) has a bearing on the transfer of user data across this Frame Relay interface for both directions of traffic flow. When this attribute is set to ***yes***, the A-bit status of a user DLCI connection does not affect data transfer. When this attribute is set to ***no,*** data received from the local interface will be discarded if an A-bit =0 condition exists towards the local user. Data being sent to the local interface is discarded if an A-bit = 0 condition exists towards the subnet.
Mib	FrameRelayUni
Values	no yes
Default	no

ATTRIBUTE FrUni Lmi side

Access	Read and write
Criticality	Process
Description	This attribute can be set to ***user, network,*** or ***both***. When this attribute is set to ***user***, USP LMI procedures are running. When this attribute is set to ***network***, NSP LMI procedures are running. When this attribute is set to ***both***, USPNSP LMI procedures are running. When the value is ***both***, the *procedures* attribute must not be set to ***vendorForum***. Setting the value to ***user*** when the *procedures* attribute is set to ***autoConfigure*** is disallowed semantically.
Mib	FrameRelayUni

Copyright © 2006, Nortel Nortel Confidential

Values	network user both
Default	network

ATTRIBUTE FrUni Lmi pvcConfigParmsInFsr (pvcConfig)

Access	Read and write
Description	When this attribute is set to ***yes***, additional Q.933 information elements are included in the LMI Full Status message to facilitate CPE PVC parameter configuring. When set to ***yes***, the *Check Prov* command fails if the *Lmi side* is not set to ***network***. When set to ***yes***, *Check Prov* fails if the number of DLCIs on the *FrUni* is greater than 300. Vendor Forum LMI Extensions will only be enabled if this attribute is set to ***vendorForumExtensions*** and both of the following conditions are met: 1. The value of the *Lmi procedures* attribute is ***vendorForum*** 2. The value of the *Lmi side* attribute is ***network*** If either of these conditions are not met, Vendor Forum Extensions will not be enabled, and this attribute is ignored. When Vendor Forum Extensions is enable the value of the *Dlci cirPresent* attribute will be included as the PVC Bandwidth in the LMI PVC Status IE. If Vendor Forum Extensions is enable and the value of the *asyncStatusReport* is ***yes***, when a DLCI is deleted the Delete Bit will be set to 1 in the LMI PVC Status IE in the asyncronous status report. If the service is not a *FrUni* this attribute is ignored.
Mib	FrameRelayUni
Values	no yes vendorForumExtensions
Default	no

ATTRIBUTE FrUni Lmi pvcAlarmsReporting (pvcAlarms)

Access	Read and write
Description	This attribute specifies if alarms are generated when PVCs change state in the local network, an adjacent network or in remote networks. When the value is ***internal***, PVCs operational status change in the local

Copyright © 2006, Nortel Nortel Confidential

network are reported in alarms. When the value is ***external***, PVCs operational status change in an adjacent or remote networks are reported in alarms. When the value is ***both***, PVCs status change in local and adjacent or remote networks are reported in alarms. When the value is ***none***, no alarms are issued for PVCs status change.

There are four kinds of alarms controlled by the attribute.
Alarm 7007 200x reports PVCs that have lost connectivity in an adjacent or remote networks.
Alarm 7007 201x reports PVCs that have reached the data transfer state in an adjacent or remote networks.
Alarm 7007 202x reports PVCs that have lost connectivity in the local network.
Alarm 7007 203x reports PVCs that have reached the data transfer state in the local network.

Each alarm can report a maximum of 112 DLCIs. Up to nine alarms of the same kind may be required to report all PVCs that have changed state if all these PVCs have experienced the same condition at the *FrUni* interface.

Mib	FrameRelayUni
Values	external internal both none
Default	external

GROUP FrUni Lmi OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	FrameRelayUni

ATTRIBUTE FrUni Lmi adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — FrameRelayUni

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE FrUni Lmi operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — FrameRelayUni

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE FrUni Lmi usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — FrameRelayUni

Copyright © 2006, Nortel Nortel Confidential

Values	idle active (activ) busy
Default	idle

GROUP FrUni Lmi ProtocolStatusInfo (Psi)

Properties	Operational
Description	This group provides the protocol status of the Local Management Interface.
Mib	FrameRelayUni

ATTRIBUTE FrUni Lmi protocolStatus

Access	Read only
Description	This attribute indicates whether the LMI is in an error condition or whether the LMI procedures are behaving normally. When operating with no LMI protocol, this attribute is always set to ***normalCondition***. When operating with LMI procedures, this attribute is set to ***errorCondition*** after n392 of the last n393 events are in error. The consequence of an ***errorCondition*** is that all DLCIs on this interface will become inactive in both directions. The ***errorCondition*** is cleared and a ***normalCondition*** is indicated when a sufficient number of events have occurred without error. In ANSI, this occurs when n393 consecutive good events take place. If the *procedures* attribute is set to ***autoConfigure***, this attribute is set to ***configuring*** while adaptive LMI determines which LMI procedures are running on the link. A single LMI error event during auto configuration causes the attribute value to change to ***errorCondition***. If during ***configuring*** no LMI message is received, an LMI ***errorCondition*** is raised after n392 x t392 seconds.
Mib	FrameRelayUni
Values	errorCondition normalCondition configuring
Default	No default

ATTRIBUTE FrUni Lmi opProcedures (opproc)

Access	Read only
Criticality	Process
Description	The *opProcedures* attribute indicates the procedures being used for the Local Management Interface. This attribute should be ignored if *protocolStatus* is not ***normalCondition***. The following procedures are

Copyright © 2006, Nortel Nortel Confidential

supported:

none: Local Management Interface procedures are not running on this interface. This accommodates Frame Relay user equipment that has not implemented any LMI procedures.

vendorForum: Local Management Interface procedures from the Vendor Forum specification are running on this interface. *DLCI 1023* is used for the LMI protocol.

ansi: Local Management Interface procedures from the ANSI specification are running. *DLCI 0* is used for the LMI protocol.

itu: Local Management Interface procedures from the ITU-T specification are running. *DLCI 0* is used for the LMI protocol. Was previously ***ccitt***.

unknown: Local Management Interface procedures have yet to be determined by Adaptive LMI.

Mib	FrameRelayUni
Values	none vendorForum ansi itu unknown
Default	No default

GROUP FrUni Lmi Statistics (Stats)

Properties	Operational
Description	This group contains the operational statistics for the Frame Relay Local Management Interface.
Mib	FrameRelayUni

ATTRIBUTE FrUni Lmi keepAliveStatusToIf (kasti)

Access	Read only
Description	This attribute counts the number of Local Management Interface keep alive status messages sent to the external user device in response to a status enquiry for keep alive status. When the maximum count is exceeded it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrUni Lmi fullStatusToIf (fsti)

Access	Read only
Description	This attribute counts the number of Local Management Interface full status messages sent to the external user device in response to a status enquiry for keep alive or full status. When the maximum count is reached it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Lmi keepAliveStatusEnqFromIf (kafi)

Access	Read only
Description	This attribute counts the number of Local Management Interface valid keep alive status enquiry messages received from the external user device. When the maximum count is reached it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Lmi fullStatusEnqFromIf (fsfi)

Access	Read only
Description	This attribute counts the number of Local Management Interface valid full status enquiry messages received from the external user device. When the maximum count is reached it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Lmi networkSideEventHistory (nsh)

Access	Read only
Description	This attribute displays the Local Management Interface network side procedure event history in order of occurrence. An event is represented by a single symbol. A '+' symbol indicates a good event. An 'X' symbol indicates a protocol error event. The leftmost event is the most recent to occur. The provisioned *eventCount* (nN3/N393) dictates the maximum number of events displayed. A good event is triggered by receipt of a valid status enquiry message. An error event is one of three possibilities, either

Copyright © 2006, Nortel Nortel Confidential

a nT2/T392 timer expiry, receipt of a status enquiry message with bad sequence numbers, or when *lmiProcedures* is provisioned to vendorForum and we receive more than nN4 status enquiry messages within the provisioned *messageCountTimer* (nT3).

Mib	FrameRelayUni
Values	String (1..10, ASCII)
Default	No default

ATTRIBUTE FrUni Lmi protocolErrors (proto)

Access	Read only

Description

This attribute counts the number of Local Management Interface protocol errors. It is the sum of the sequence (*sequenceErrors*), timeout (*pollingVerifTimeouts*) and too many status enquiry messages received within the *messageCountTimer* (nT3) errors. The too many status enquiries error only applies when *lmiProcedures* is set to ***vendorForum***. When the maximum count is exceeded it wraps to zero.

Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Lmi unexpectedIes (uie)

Access	Read only

Description

This attribute counts the number of Local Management Interface frames received with an Information Element identifier that is unknown or unexpected. An unexpected Information Element is not a protocol error. When the maximum count is reached, this counter wraps to zero.

Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Lmi sequenceErrors (seq)

Access	Read only

Description

This attribute counts the number of Local Management Interface Status Enquiry message sequence errors. A sequence error is receipt of a Status Enquiry message with a receive sequence number not equal to the last send sequence number. When the maximum count is reached the counter wraps to zero.

Mib	FrameRelayUni

ATTRIBUTE FrUni Lmi pollingVerifTimeouts (tmo)

Access	Read only
Description	This attribute counts the number of *checkPointTImer* (t392) timer expiries occurring on the Local Management Interface. When the maximum count is reached the counter wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Lmi keepAliveEnqTolf (kaeti)

Access	Read only
Description	This attribute counts the number of Local Management Interface keep alive enquiry status messages sent to the external user device for keep alive status. When the maximum count is reached it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Lmi fullStatusEnqTolf (fseti)

Access	Read only
Description	This attribute counts the number of Local Management Interface full status messages sent to the external user device in response to a status enquiry

Copyright © 2006, Nortel Nortel Confidential

for keep alive or full status. When the maximum count is reached it wraps to zero.

Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Lmi userSideEventHistory (ush)

Access	Read only
Description	This attribute displays the Local Management Interface user side procedure event history in order of occurrence. An event is represented by a single symbol. A '+' symbol indicates a good event. An 'X' symbol indicates a protocol error event. The left most event is the most recent to occur. The provisioned *eventCount* (nN3/N393) dictates the maximum number of events displayed. A good event is triggered by receipt of a valid status message. An error event is either a nT1/T391 timer expiry or receipt of a status message with bad sequence numbers.
Mib	FrameRelayUni
Values	String (1..10, ASCII)
Default	No default

ATTRIBUTE FrUni Lmi statusSequenceErrors (stseq)

Access	Read only
Description	This attribute counts the number of Local Management Interface Status message sequence errors. A sequence error is receipt of a Status message with a receive sequence number not equal to the last send sequence number. When the maximum count is reached the counter wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Lmi noStatusReportCount (nsrc)

Access	Read only
Description	This attribute counts the number of times when no status report or an invalid status report comes from the external network. This attribute is incremented in two cases: i) after a status enquiry is sent out and T391 timer expires without having a status report received. ii) an invalid status report is received.

Copyright © 2006, Nortel Nortel Confidential

When the maximum count is reached it wraps to zero.

Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

GROUP FrUni Lmi UspProtocolParameters (UspParms)

Properties	Provisioned
Description	This group contains the provisionable attributes of the Local Management Interface user side procedure.
Mib	FrameRelayUni

ATTRIBUTE FrUni Lmi fullStatusPollingCycles (n391)

Access	Read and write
Description	This attribute specifies how frequently the Frame Relay UNI service should initiate a Status Enquiry for a full PVC status report. A polling cycle is a Status Enquiry and Status Report exchange. This attribute is used only if the *side* attribute is either ***user*** or ***both***.
Mib	FrameRelayUni
Values	Decimal (1..255)
Default	6

ATTRIBUTE FrUni Lmi linkVerificationTimer (t391)

Access	Read and write
Description	This attribute specifies how frequently the Frame Relay UNI service should initiate a Status Enquiry for link integrity verification. It must be less than *checkPointTimer (t392)*. When the Lmi *side* is ***network***, this attribute is ignored.
Mib	FrameRelayUni
Values	Decimal (1; 2; 3; 4; 5; 10; 15; 20; 25; 30)
Units	seconds
Default	10

COMPONENT FrUni DataLinkConnectionIdentifier (Dlci)

Instance	Decimal (16..1007)

Copyright © 2006, Nortel Nortel Confidential

Groups	GROUP FrUni Dlci OsiState (State) GROUP FrUni Dlci ABitStatus (Abit) GROUP FrUni Dlci CallData (CalId) GROUP FrUni Dlci ServiceParametersOp (SpOp) GROUP FrUni Dlci Statistics (Stats) GROUP FrUni Dlci IntervalData (Int)
Scope	Application
Description	*FrUni/n DataLinkConnectionIdentifier/n* This component represents a Data Link Connection Identifier. It is responsible for the Frame Relay U-plane (User-plane) protocol for the specified instance. There can be many instances of *Dlci* for each *FrUni*. The instance value is used to identify the logical connection, multiplexed within the physical channel, with which a frame is associated. All frames carried within a particular physical channel and having the same DLCI value are associated with the same logical connection. A DLCI instance can be a permanent virtual circuit (PVC) or switched permanent virtual circuit (P-SPVC) added through provisioning, or a switched virtual circuit (SVC) which is created dynamically through signaling. The *lock* and *unlock* commands apply to permanent (PVC and P-SPVC) DLCIs. The *clear* command applies to switched (SVC) DLCIs. For the ***4pDS3Ch*** card, when the *timeslot* of the *channel* component linked to this *FrUni* is set to ***none***, no *Dlci* component is allowed under this *FrUni*. A *Dlci* must have one (and only one) instance of *DirectCall*, *IpConnection*, or *BnxInterworkingFunction* under it. A *DirectConnection* can not be provisioned on a *FrUni* with an

Copyright © 2006, Nortel Nortel Confidential

IpConnection or *BnxInterworkingFunction* component provisioned under any of its *Dlci subcomponents*.

Common Verbs	Help List Display Add DELete

VERB CLEAR **FrUni Dlci**

Impact	Service
Description	This command is used to clear a Frame Relay switched (SVC) connection.

VERB LOCK **FrUni Dlci**

Impact	Service
Description	*Lock [-force] <component name>* This verb will cause the specified component to enter the OSI ***shuttingDown*** administrative state. While shutting down, the component continues to provide service to existing clients but rejects any new requests for service. In some cases, locking a component causes all its subcomponents to shut down also. When the component is no longer providing service, it enters the OSI ***locked*** administrative state. **Options:** *-force* If this option is present, service to current clients is terminated and the ***locked*** state is entered immediately (that is, without first going through the ***shuttingDown*** state). Without this option, *Lock* behaves as described above.

Copyright © 2006, Nortel Nortel Confidential

VERB UNLOCK FrUni Dlci

Impact	Service
Description	This command is used to unlock a Frame Relay PVC DLCI.

GROUP FrUni Dlci **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	FrameRelayUni

ATTRIBUTE FrUni Dlci **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	FrameRelayUni
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE FrUni Dlci **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: FrameRelayUni

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE FrUni DIci usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: FrameRelayUni

Values:
idle
active (activ)
busy

Default: idle

ATTRIBUTE FrUni DIci availabilityStatus (osiAvail)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test

Copyright © 2006, Nortel Nortel Confidential

procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Default	No default

ATTRIBUTE FrUni Dlci proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

ATTRIBUTE FrUni DIci controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.
Mib	FrameRelayUni
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE FrUni DIci alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib — FrameRelayUni

Set of — underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default — No default

ATTRIBUTE FrUni DIci standbyStatus (osiStby)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

ATTRIBUTE FrUni Dlci unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	FrameRelayUni
Values	false true
Default	false

GROUP FrUni Dlci ABitStatus (Abit)

Properties	Operational
Description	This group contains the A-Bit status information for this Data Link Connection Identifier.
Mib	FrameRelayUni

ATTRIBUTE FrUni Dlci aBitStatusToIf (abti)

Access	Read only
Description	This attribute is the most recent A-bit status sent to the interface. The A-bit status is part of the LMI protocol, and indicates willingness to accept data from the local interface. ***inactive*** - the Frame Relay service discards all data offered from the local interface. ***active*** - the Frame Relay service tries to process all data offered from the local interface. ***notApplicable*** - the DLCI is switched, so this attribute is ignored.
Mib	FrameRelayUni

Copyright © 2006, Nortel Nortel Confidential

Values	inactive active notApplicable
Default	inactive

ATTRIBUTE FrUni Dlci aBitReasonToIf (abrti)

Access	Read only
Description	This attribute provides the reason (if any) for an ***inactive*** status to be sent to the interface. This reason is ***notApplicable*** for an ***active*** status.
Mib	FrameRelayUni
Values	notApplicable remoteUserSignaled localLmiError remoteLmiError localLinkDown remoteLinkDown pvcSpvcDown userNotAuthorized resourceNotAvailable dlciCollisionAtNni
Default	notApplicable

ATTRIBUTE FrUni Dlci aBitStatusFromIf (abfi)

Access	Read only
Description	This attribute is the most recent A-Bit status received from the interface. ***inactive*** - the Frame Relay service informs the remote DLCI not to send user data to this interface. ***active*** - the Frame Relay service informs the remote DLCI that it is okay to send user data to this interface. ***notApplicable*** - the DLCI is switched, so this attribute is ignored.
Mib	FrameRelayUni
Values	inactive active notApplicable
Default	inactive

ATTRIBUTE FrUni Dlci aBitReasonFromIf (abrfi)

Access	Read only
Description	This attribute provides the reason (if any) for an ***inactive*** status to be sent to the subnet. This reason is ***notApplicable*** for an ***active*** status.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayUni
Values	notApplicable remoteUserSignaled localLmiError localLinkDown missingFromLmiReport
Default	notApplicable

ATTRIBUTE FrUni Dlci loopbackState

Access	Read only
Description	This attribute has the value ***on*** when the DLCI is in loopback mode and ***off*** otherwise. The loopback command verbs *start* and *stop* are used to initiate and terminate the loopback mode for a DLCI. While *loopbackState* is ***on***, the local LMI will report to the interface the A-bit status as active. Also an active A-bit signal will be reliably propagated across the subnet to the remote DLCI.
Mib	FrameRelayUni
Values	off on
Default	off

GROUP FrUni Dlci CallData (CallId)

Properties	Operational
Description	This group of attributes describes the characteristics of the call such as call type and call state.
Mib	FrameRelayUni

ATTRIBUTE FrUni Dlci callType (ct)

Access	Read only
Description	This attribute indicates whether this DLCI is a permanent virtual circuit (PVC), a switched virtual circuit (SVC) or a switched permanent virtual circuit (SPVC).
Mib	FrameRelayUni
Values	pvc svc spvc
Default	No default

ATTRIBUTE FrUni Dlci callState

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the FRF.4 state of an SVC call. The value of this attribute for a permanent (PVC and P-SPVC) DLCI is always ***notApplicable***. In the description that follows, “local” refers to the user who has initiated the SETUP request, and “remote” refers to the user to whom the local user wishes to connect. State description: In the ***null*** state, the network has neither received nor sent call setup requests for this DLCI. In the ***callInitiated*** state, the network has received a SETUP message from the local user. In the ***outgoingCallProceeding*** state, the network has sent a CALL PROCEEDING message to the local user in response to the SETUP message. In the ***callPresent*** state, the network has sent a SETUP message to the remote user. In the ***incomingCallProceeding*** state, the network has received a CALL PROCEEDING message from the remote user in response to a SETUP message. In the ***active*** state, either the network has sent a CONNECT message to the local user, or the network has received a CONNECT from the remote user. In the ***disconnectRequest*** state, the network has received a DISCONNECT message from the local user. In the ***disconnectIndication*** state, the network has sent a DISCONNECT to the local user. In the ***releaseRequest*** state, the network has sent out a RELEASE message to the local user. In the ***restartRequest*** state, the network has sent a RESTART request to the local user and is waiting for an acknowledgement. In the ***restart*** state, the network has received a request for a restart from the local user and the network has not returned an acknowledgement.

ATTRIBUTE FrUni Dlci callReference (callref)

Access — Read only

Description — This attribute indicates the FRF.4 call reference number associated with this DLCI. The value of this attribute for a provisioned (PVC or P-SPVC) DLCI is always ***0***.

Mib — FrameRelayUni

Values — Decimal (0..32767)

Default — No default

GROUP FrUni Dlci ServiceParametersOp (SpOp)

Properties — Operational

Description — This group defines the service and traffic parameters specific to this instance of DLCI. For permanent (PVC and P-SPVC) DLCIs, the values of attributes with the exception of the *measurementInterval* should be identical to those in the group *FrsDataLinkConnectionProv* under the *FrsUniServiceParametersProv* component. For switched (SVC) DLCIs, the values of attributes may be different from the values provisioned under the *FrUni Sig* component, if signaling negotiations have occurred to alter the service parameters.

Mib — FrameRelayUni

ATTRIBUTE FrUni Dlci maximumFrameSize (n203)

Access — Read only

Description — This attribute indicates the maximum number of octets which may be included in the information field. The frame relay header and CRC octets are not included in this definition. This attribute corresponds to the dN1 parameter described in the Vendor Forum Specification.

Mib — FrameRelayUni

Values — Decimal (1..8187)

Units — octets

Default — No default

ATTRIBUTE FrUni Dlci committedInformationRate (cir)

Access	Read only
Description	This attribute indicates the committed information rate (CIR) in bits per second (bit/s). When *rateEnforcement* is set to ***on***, *cir* is the rate at which the network agrees to transfer information under normal conditions. This rate is measured over a measurement interval (*t*) that is determined internally based on CIR and the committed burst size (Bc). An exception to this occurs when CIR is provisioned to be zero, in which case the measurement interval (*t*) must be provisioned explicitly. This attribute should be ignored when *rateEnforcement* is ***off***.
Mib	FrameRelayUni
Values	Decimal (0..50000000)
Units	bit/s
Default	No default

ATTRIBUTE FrUni Dlci committedBurstSize (bc)

Access	Read only
Description	This attribute indicates the committed burst size (Bc) in bits. *bc* is the amount of data that a network agrees to transfer under normal conditions over a measurement interval (*t*). Data marked DE=1 is not accounted for in Bc. This attribute should be ignored when *rateEnforcement* is ***off***.
Mib	FrameRelayUni
Values	Decimal (0..50000000)
Units	bits
Default	No default

ATTRIBUTE FrUni Dlci excessBurstSize (be)

Access	Read only
Description	This attribute indicates the excess burst size (Be) in bits. Be is the amount of uncommitted data that the network will attempt to deliver over measurement interval T. Data marked DE=1 by the user or by the network is accounted for here. This attribute should be ignored when *rateEnforcement* is ***off***.
Mib	FrameRelayUni
Values	Decimal (0..50000000)
Units	bits

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE FrUni Dlci measurementInterval (t)

Access	Read only
Description	This attribute indicates the time interval (in milliseconds) over which rates and burst sizes are measured. This attribute should be ignored when *rateEnforcement* is ***off***.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Units	msec
Default	No default

ATTRIBUTE FrUni Dlci accounting (ac)

Access	Read only
Description	This attribute indicates whether accounting data collection and record generation is turned on at this DLCI. For accounting data collection and record generation to be turned on, the ***accountingOn*** bit and at least one of the ***accountCollection*** bits in the ***DataNetworkAddress*** component must be set to on.
Mib	FrameRelayUni
Values	off on
Default	No default

ATTRIBUTE FrUni Dlci emissionPriorityToIf (epToIf)

Access	Read only
Description	This attribute indicates the emission priority of frames sent to the interface. A larger value denotes a higher priority.
Mib	FrameRelayUni
Values	Decimal (0; 1; 2; 3)
Default	No default

ATTRIBUTE FrUni Dlci transferPriorityToNetwork (tpToNwk)

Access	Read only
Description	This attribute indicates the priority at which data is transferred to the network. The transfer priority is a preference configured for an application according to its delay-sensitivity requirement. Frames with higher

Copyright © 2006, Nortel Nortel Confidential

transfer priority are served by the network before the frames with lower priority. The transfer priority standard is defined to have 16 indices from 0 to 15.

Each transfer priority n, where n specifies the transfer priority index, contains a default setting for routing class of service (***multimedia***, ***delay***, or ***throughput***) and frame relay egress queue (depending on the number of supported egress queues on the remote end interface) specified by the *routingClassOfServic*e and *emissionPriority* attributes provisioned in the *Mod Frs DprsNet Tpm/n* component. The default mapping can be altered by a user if required.

Mib	FrameRelayUni
Values	Decimal (0..15)
Default	No default

ATTRIBUTE FrUni Dlci transferPriorityFromNetwork (tpFromNwk)

Access	Read only
Description	This attribute indicates the priority at which data is transferred from the network. The transfer priority is a preference configured for an application according to its delay-sensitivity requirement. Frames with higher transfer priority are served by the network before the frames with lower priority. The transfer priority standard is defined to have 16 indices from 0 to 15. Each transfer priority n, where n specifies the transfer priority index, contains a default setting for routing class of service (***multimedia***, ***delay***, or ***throughput***) and frame relay egress queue (depending on the number of supported egress queues on the remote end interface) specified by the *routingClassOfServic*e and *emissionPriority* attributes provisioned in the *Mod Frs DprsNet Tpm/n* component. The default mapping can be altered by a user if required.
Mib	FrameRelayUni
Values	Decimal (0..15)
Default	No default

ATTRIBUTE FrUni Dlci correlationTag (ctag)

Access	Read only
Description	This attribute indicates the unique string which identifies this connection. The value of this attribute is provisioned under the *correlationTag* attribute under *Service Parameters* subcomponent. If required for correlation purposes, the attribute is provisioned with the same value at both

Copyright © 2006, Nortel Nortel Confidential

endpoints of the connection.

An empty string value for this attribute indicates that the user either does not want to use the correlation tag functionality, or wants the correlation tag string to be an empty string.

This attribute can be used for off-switch data correlation purposes. Downstream processing uses this attribute to correlate data records (accounting etc.) issued at different nodes in the network. In accounting, the value of this attribute appears as the *circuitId* (circuit identifier) for the endpoint.

There is no system-generated value for the correlationTag. Therefore, this attribute does not appear for SVC DLCIs.

Mib	FrameRelayUni
Values	String (0..32, ASCII)
Default	""

GROUP FrUni Dlci Statistics (Stats)

Properties	Operational
Description	This group contains the operational statistics for the Frame Relay Data Link Connection Identifier. When the DLCI is in local loopback mode, the DLCI statistics do not increment.
Mib	FrameRelayUni

ATTRIBUTE FrUni Dlci frmToIf (fti)

Access	Read only
Description	This attribute counts the frames sent out the interface. When the maximum count is reached the count wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci fecnFrmToIf (fecnti)

Access	Read only
Description	This attribute counts the frames sent to the interface with the Forward Explicit Congestion Notification (FECN) bit set. When the count reaches maximum it wraps to zero.
Mib	FrameRelayUni

ATTRIBUTE FrUni Dlci bciToSubnet (bcits)

Access	Read only
Description	This attribute counts the frames sent into the local network with the Backward Congestion Indication (BCI) bit set. When the count reaches maximum it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci deFrmToIf (deti)

Access	Read only
Description	This attribute counts the frames sent to the interface with the Discard Eligibility (DE) bit set. When the count reaches maximum it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci discCongestedToIf (discardcti)

Access	Read only
Description	This attribute counts the number of frame discards at the Frame Relay service due to local congestion in the direction toward the interface. When this count reaches maximum, it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrUni Dlci discDeCongestedToIf (discarddecti)

Access	Read only
Description	This attribute counts the number of discarded frames, with the Discard Eligibility (DE) bit set, at the Frame Relay service, due to local congestion in the direction toward the interface. When this count reaches maximum, it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci frmFromIf (ffi)

Access	Read only
Description	This attribute counts the frames received from the interface. It includes the frames that are discarded due to error or excess. When the maximum count is reached the count wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci fecnFrmFromIf (fecnfi)

Access	Read only
Description	This attribute counts the frames received from the interface with the Forward Explicit Congestion Notification (FECN) bit set. When the count reaches maximum it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci becnFrmFromIf (becnfi)

Access	Read only
Description	This attribute counts the frames received from the interface with the Backward Explicit Congestion Notification (BECN) bit set. When the count reaches maximum it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrUni Dlci fciFromSubnet (fcifs)

Access	Read only
Description	This attribute counts the frames received from the network with the Forward Congestion Indication (FCI) bit set. When the count reaches maximum it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci bciFromSubnet (bcifsb)

Access	Read only
Description	This attribute counts the frames received from the network with the Backward Congestion Indication (BCI) bit set. When the count reaches maximum it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci deFrmFromIf (defi)

Access	Read only
Description	This attribute counts the frames received from the interface with the Discard Eligibility (DE) bit set. When the count reaches maximum it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci excessFrmFromIf (excess)

Access	Read only
Description	This attribute counts the frames received from the interface with the Discard Eligibility (DE) bit clear, but subsequently set by the network due to rate enforcement. When the count reaches maximum it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci discExcessFromIf (discardefi)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the frames which were discarded due to rate enforcement. When the count reaches maximum it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci discFrameAbit (discfab)

Access	Read only
Description	This attribute counts the number of frame discards at the Frame Relay Service, due to an inactive PVC status, in the direction toward the local network. When this count reaches maximum, it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci discCongestedFromIf (discardcfi)

Access	Read only
Description	This attribute counts the number of frame discards at the Frame Relay service due to local congestion in the direction toward the network. When this count reaches maximum, it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci discDeCongestedFromIf (discarddecfi)

Access	Read only
Description	This attribute counts the number of discarded frames, with the Discard Eligibility (DE) bit set, at the Frame Relay service, due to local congestion, in the direction toward the local network. When this count reaches maximum, it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci errorShortFrmFromIf (shortfi)

Access	Read only
Description	This attribute counts the frames received with 0 octets in the information field. When the count reaches maximum it wraps to zero.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci errorLongFrmFromIf (longfi)

Access	Read only
Description	This attribute counts the frames received with number of octets in the information field greater than the subscribed maximum. When the count reaches maximum it wraps to zero. Frames whose lengths are greater than the hardware receive buffer are ignored by the hardware and are therefore not included in this count.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci becnFrmSetByService (becnset)

Access	Read only
Description	This attribute counts the number of frames with BECN set by the Frame Relay service. It is incremented whenever the Frame Relay service sets BECN on a frame upon detecting local congestion. This count is incremented regardless of whether the frame already bears a set BECN bit since its use is to determine the place of congestion. When the count reaches maximum, it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci bytesToIf (bti)

Access	Read only
Description	This attribute counts the bytes sent out the interface. When the maximum count is reached the count wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci deBytesToIf (debti)

Access	Read only
Description	This attribute counts the bytes sent to the interface with the Discard Eligibility (DE) bit set. When the count reaches maximum it wraps to zero.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni DIci discCongestedToIfBytes (discardctib)

Access	Read only
Description	This attribute counts the number of byte discards at the Frame Relay service due to local congestion in the direction toward the link. When this count reaches maximum, it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni DIci discDeCongestedToIfBytes (discarddectib)

Access	Read only
Description	This attribute counts the number of discard eligible (DE=1) byte discards at the Frame Relay service due to local congestion in the direction toward the link. When the maximum count is reached the count wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni DIci bytesFromIf (bfi)

Access	Read only
Description	This attribute counts the number of bytes received from the interface. Bytes that are discarded by the interface due to framing errors (such as CRC errors for example) are not counted. However bytes that are discarded by the application due to rate enforcement or congestion are counted. When the maximum count is reached the count wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni DIci deBytesFromIf (debi)

Access	Read only
Description	This attribute counts the bytes received from the interface with the Discard Eligibility (DE) bit set. When the count reaches maximum it wraps to zero.
Mib	FrameRelayUni

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci excessBytesFromIf (excessb)

Access	Read only
Description	This attribute counts the bytes received from the interface with the Discard Eligibility (DE) bit clear, but subsequently set by the network due to rate enforcement. When the count reaches maximum it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci discExcessFromIfBytes (discardebi)

Access	Read only
Description	This attribute counts the bytes which were discarded due to rate enforcement. When the count reaches maximum it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci discByteAbit (discbab)

Access	Read only
Description	This attribute counts the bytes which were discarded due to aBit turned off.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci discCongestedFromIfBytes (discardcbib)

Access	Read only
Description	This attribute counts the number of byte discards at the Frame Relay service due to local congestion in the direction toward the network. When this count reaches maximum, it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrUni Dlci discDeCongestedFromIfBytes (discarddecbib)

Access	Read only
Description	This attribute counts the number of discard eligible (DE=1) byte discards at the Frame Relay service due to local congestion in the direction toward the network. When the maximum count is reached the count wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci errorShortBytesFromIf (shortbi)

Access	Read only
Description	This attribute counts the bytes received with 0 octets in the information field. When the count reaches maximum it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci errorLongBytesFromIf (longbi)

Access	Read only
Description	This attribute counts the bytes received with number of octets in the information field greater than the subscribed maximum. When the count reaches maximum it wraps to zero. Bytes whose lengths are greater than the hardware receive buffer are ignored by the hardware and are therefore not included in this count.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci rateAdaptReduct (rar)

Access	Read only
Description	This attribute counts the number of rate reductions due to rate adaptation. Rate adaptation causes the allowed rate to be reduced in steps. After each reduction, a period of time is awaited before further action is taken. At the end of this period, the allowed rate is further reduced if congestion is still prevalent. When this count reaches maximum, it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE FrUni Dlci rateAdaptReductPeriod (rarp)

Access	Read only
Description	This attribute provides a cumulative count of the amount of time that rate adaptation procedures have been in effect. When this count reaches maximum, it wraps to zero.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Units	msec
Default	0

ATTRIBUTE FrUni Dlci cirPresent

Access	Read only
Description	This attribute provides the actual Committed Information Rate (CIR) enforced for this DLCI. This number is in units of 800 bit/s, since that is the internal resolution of rate enforcement. If *rateEnforcement* is **off**, then this number does not have meaning. Normally, this attribute matches the provisioned CIR for the DLCI. But when Rate Adaptation is active, then this number will vary to represent the actual Allowed CIR at the moment that this attribute is collected.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Units	bit/s
Default	0

ATTRIBUTE FrUni Dlci eirPresent

Access	Read only
Description	This attribute provides the actual Excess Information Rate (EIR) enforced for this DLCI. This number is in units of 800 bit/s, since that is the internal resolution of rate enforcement. If *rateEnforcement* is **off**, then this number does not have meaning. Normally, this attribute matches the provisioned EIR for the DLCI. But when Rate Adaptation is active, then this number will vary to represent the actual Allowed EIR at the moment that this attribute is collected.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Units	bit/s
Default	0

GROUP FrUni Dlci IntervalData (Int)

Properties	Operational
Description	This group contains the operational statistics for the Frame Relay Data Link Connection Identifier interval data (accounting data).
Mib	FrameRelayUni

ATTRIBUTE FrUni Dlci startTime

Access	Read only
Description	This attribute indicates the start time of this interval period. If *Vc* spans 12 hour time or time of day change *startTime* reflects new time as recorded at 12 hour periods or time of day changes. A new interval period is started each time an accounting record is generated.
Mib	FrameRelayUni
Values	Time (DHMS)
Default	No default

ATTRIBUTE FrUni Dlci totalIngressBytes (tib)

Access	Read only
Description	This attribute counts the total bytes received from the interface since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated.
Mib	FrameRelayUni
Values	Long Integer
Default	No default

ATTRIBUTE FrUni Dlci totalEgressBytes

Access	Read only
Description	This attribute counts the total bytes sent to the interface since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated.
Mib	FrameRelayUni
Values	Long Integer
Default	No default

ATTRIBUTE FrUni Dlci eirIngressBytes

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the total bytes with the Discard Eligibility (DE) bit set sent to the subnet since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated.
Mib	FrameRelayUni
Values	Long Integer
Default	No default

ATTRIBUTE FrUni Dlci eirEgressBytes

Access	Read only
Description	This attribute counts the total bytes with the Discard Eligibility (DE) bit set sent to the interface since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated.
Mib	FrameRelayUni
Values	Long Integer
Default	No default

ATTRIBUTE FrUni Dlci discardedBytes

Access	Read only
Description	This attribute counts the total bytes in invalid frames received from the interface and discarded at the DLCI since the start of the interval period. This count is a sum of octets in frames discarded due to the number of octets in the information field greater than the subscribed maximum or equal to 0, due to aBit turned off, or due to rate enforcement. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated.
Mib	FrameRelayUni
Values	Long Integer
Default	No default

ATTRIBUTE FrUni Dlci totalIngressSegFrm

Access	Read only
Description	If the value of the *unitsCounted* attribute in *moduleData* component is ***segments***, this attribute counts the total number of segments in frames received from the interface since the start of the interval period. If the value of the *unitsCounted* attribute in *moduleData* component is ***frames***, this attribute counts the total number of frames received from the interface since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci totalEgressSegFrm

Access	Read only
Description	If the value of the *unitsCounted* attribute in *moduleData* component is ***segments***, this attribute counts the total number of segments in frames sent to the interface since the start of the interval period. If the value of the *unitsCounted* attribute in *moduleData* component is ***frames***, this attribute counts the total number of frames sent to the interface since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci eirIngressSegFrm

Access	Read only
Description	If the value of the *unitsCounted* attribute in *moduleData* component is ***segments***, this attribute counts the number of segments in frames with the Discard Eligibility (DE) bit set sent to the subnet since the start of the interval period. If the value of the *unitsCounted* attribute in *moduleData* component is ***frames***, this attribute counts the number of frames with the Discard Eligibility (DE) bit set sent to the subnet since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci eirEgressSegFrm

Access	Read only
Description	If the value of the *unitsCounted* attribute in *moduleData* component is ***segments***, this attribute counts the number of segments in frames with the Discard Eligibility (DE) bit set sent to the interface since the start of the interval period. If the value of the *unitsCounted* attribute in *moduleData* component is ***frames***, this attribute counts the number of frames with the Discard Eligibility (DE) bit set sent to the interface since the start of the interval period. The start of the interval period is captured in the *startTime*

attribute. The count is reset to zero when an accounting record is generated.

Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci discardedSegFrm

Access	Read only
Description	If the value of the *unitsCounted* attribute in *moduleData* component is ***segments***, this attribute counts the number of segments in invalid frames received from the interface and discarded at the DLCI. If the value of the *unitsCounted* attribute in *moduleData* component is ***frames***, this attribute counts the number of invalid frames received from the interface and discarded at the DLCI. Segments of frames are counted since the start of the interval period. The count is reset to zero when an accounting record is generated. The count is a sum of segments in frames or frames discarded due to the number of octets in the information field greater than the subscribed maximum or equal to 0, due to aBit turned off, or due to rate enforcement.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci localRateAdaptOccurred

Access	Read only
Description	This attribute indicates whether rate adaptation has occurred on this user Data Link Connection on this Frame Relay interface. The value is reset to ***no*** when an accounting record is generated.
Mib	FrameRelayUni
Values	yes no
Default	no

ATTRIBUTE FrUni Dlci elapsedDifference

Access	Read only
Description	This attribute indicates the elapsed time representing the period of this interval data. It is elapsed time in 0.1 second increments since the call started.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE FrUni Dlci egressProtocol (ep)

Access	Read only
Description	This attribute indicates whether the egress protocol is active at this DLCI. The activation of the egress protocol is negotiated at the call setup and it depends on the remote end supporting OAM frame exchanges and the record generation mode.
Mib	FrameRelayUni
Values	off on
Default	No default

ATTRIBUTE FrUni Dlci callRefNumber

Access	Read only
Description	This attribute indicates the call reference number which is a unique number generated by the switch.The same Call Reference Number is stored in the interval data (accounting record) at both ends of the call. It can be used as one of the attributes in matching duplicate records generated at each end of the call.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

COMPONENT FrUni Dlci DirectCall (Dc)

Groups	GROUP FrUni Dlci Dc Options
Scope	Application
Description	*FrUni/n Dlci/n DirectCall* *FrNni/n Dlci/n DirectCall* This component defines direct call options for calls issued without operator intervention. Connection is complete and can be initiated automatically. Frequency of connection tries is controlled by retry timer. If no BnxProtocol component is provisioned under a FrUni or FrNni, a DirectCall component is automatically added to all the Dlci components added to the FrUni or FrNni.

Copyright © 2006, Nortel Nortel Confidential

If a BnxProtocol component is provisioned under a FrUni or FrNni, no DirectCall is automatically added under the Dlci component.

DELete

GROUP FrUni Dlci Dc Options

Properties Provisioned

Description This group defines attributes associated with a direct call. It defines connection in terms of path and call option parameters. This connection can be permanent (PVC), switched (SVC), or switched permanent (SPVC). It can have four facilities:
- CCITT Facilities
- DTE Facilities
- National Facilities
- International Facilities
The total number of bytes of facilities including the facility codes and all of the facility data from all of the four classes of facilities must not exceed 512 bytes.

Mib FrameRelayUni

ATTRIBUTE FrUni Dlci Dc remoteNpi (rnpi)

Access Read and write

Description This attribute specifies the Numbering Plan Indicator (NPI) of the *remoteDna.*

Mib FrameRelayUni

Values
x121
e164

Default x121

ATTRIBUTE FrUni Dlci Dc remoteDna (rdna)

Access Read and write

Description This attribute specifies the Data Network Address (DNA) of the service at the remote end of the DLCI. This is the called (destination) DCE address (DNA) of this PVC.

Mib FrameRelayUni

Values BCD (1..15)

Default No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrUni Dlci Dc remoteDlci (rdlci)

Access	Read and write
Description	This attribute specifies the remote DLCI of the PVC connection.
Mib	FrameRelayUni
Values	Decimal (16..1007)
Default	No default

ATTRIBUTE FrUni Dlci Dc type

Access	Read and write
Description	This attribute specifies the type of VC call. If the value is set to ***permanentMaster,*** then a permanent connection will be established between two ends. The remote end must be defined as a ***permanentSlave***, ***permanentBackupSlave,*** or ***permanentSlaveWithBackup***. The connection cannot be established if the remote end is defined as anything else. The end defined as ***permanentMaster*** always initiates the calls. It attempts to call once per minute. If the value is set to ***permanentSlave*** then a permanent connection will be established between two ends. The remote end must be defined as a ***permanentMaster.*** The connection cannot be established if the remote end is defined as anything else. The ***permanentSlave*** end attempts to call once per minute. If the value is set to ***permanentSlaveWithBackup*** then a permanent connection will be established between the two ends. The remote end must be defined as a ***permanentMaster.*** The connection cannot be established if the remote interface is defined as anything else. The ***permanentSlaveWithBackup*** attempts to call once per minute. When *type* is set to ***permanentSlaveWithBackup,*** the connection is cleared if the interface becomes unavailable. This enables a retry of the connection which can be redirected to the ***permanentBackupSlave***. If the value is set to ***permanentBackupSlave*** then a permanent connection is established between the two ends only if the ***permanentMaster*** end is disconnected from the ***permanentSlaveWithBackup*** end and a backup call is established by the call redirection system. If the ***permanentSlaveWithBackup*** interface becomes available again, the ***permanentBackupSlave*** end is disconnected and the ***permanentSlaveWithBackup*** end is reconnected to the ***permanentMaster*** end. The ***permanentBackupSlave*** end does not try to establish a call.
Mib	FrameRelayUni

Copyright © 2006, Nortel Nortel Confidential

Values	permanentMaster (master) permanentSlave (slave) permanentBackupSlave (backSl) permanentSlaveWithBackup (slavWB) spvcMaster (spvcM) spvcSlave (spvcS) spvcBackupSlave (spvcBackS) spvcSlaveWithBackup (spvcSWBack)
Default	permanentMaster

ATTRIBUTE FrUni Dlci Dc **transferPriority (tp)**

Access	Read and write
Description	This attribute specifies the transfer priority to the local network for the outgoing calls using this particular DLCI. It overrides the *defaultTransferPriority* provisioned in its associated *Dna* component. The transfer priority is a preference configured for an application according to its delay-sensitivity requirement. Frames with higher transfer priority are served by the network before the frames with lower priority. The transfer priority standard is defined to have 16 levels from 0 to 15. Each transfer priority n, where n is the transfer priority index, has a default setting for routing class of service (multimedia, delay, or throughput) and Frame Relay egress queue (depending on the number of supported egress queues on the remote end interface). These settings are specified by the *routingClassOfServic*e and *emissionPriority* attributes provisioned under the *Mod Frs DprsNet Tpm/n* component. Specifying ***useDnaDefTP*** means using the value given by *defaultTransferPriority* in the associated *Dna* for this DLCI.
Mib	FrameRelayUni

15
useDnaDefTP

Default useDnaDefTP

ATTRIBUTE FrUni Dlci Dc discardPriority (dp)

Access Read and write

Description This attribute specifies the discard priority for outgoing call using this DLCI.

The discard priority has three provisioning values: ***normal***, ***high***, and ***useDnaDefPriority***. Under congestion conditions, traffic with ***normal*** priority is discarded before traffic with ***high*** priority. The *Dna* default value (provisioned by *outDefaultPriority*) is taken if this attribute is set to the value ***useDnaDefPriority***.

Mib FrameRelayUni

Values normal
high
useDnaDefPriority

Default useDnaDefPriority

ATTRIBUTE FrUni Dlci Dc deDiscardPriority (ddp)

Access Read and write

Description This attribute specifies whether the *discardPriority* applies to DE frames for this DLCI.

When set to ***determinedByDiscardPriority***, traffic with DE bit set will be discarded according to the setting of the *discardPriority*.

When set to ***lowest***, all traffic with DE bit set is treated the same and is sent to the subnet at the lowest discard priority.

Mib FrameRelayUni

Values lowest
determinedByDiscardPriority

Default determinedByDiscardPriority

ATTRIBUTE FrUni Dlci Dc dataPath (dpa)

Access Read and write

Description

This attribute specifies the data path to be used by Virtual Circuits on this interface. The value of the *dataPath* attribute in the *Dna* component is overridden by this attribute if the value is not ***useDnaValue***.

This value applies to the connection after data transfer state is reached. All

Copyright © 2006, Nortel Nortel Confidential

the data and control traffic will be sent using this data path. If the provisioned *dataPath* is not available the connection is not established.

The value of the *dataPath* is signaled by both ends of the connection. If this value is not the same at both ends ***dprsOnly*** is used for the duration of the connection.

A virtual circuit connection is always established using ***dprsOnly*** even if this attribute is provisioned as some other value.

dprsOnly - The dynamic packet routing system is used.

dprsMcsOnly - The DPRS Multi-Service Cut-Through Switching path is used.

dprsMcsFirst - The DPRS Multi-Service Cut-Through Switching path is used if it is available. If it is not available, ***dprsOnly*** is used.

useDnaValue - The routing system used is based on the value provisioned in the *Dna* component.

Mib: FrameRelayUni

Values:
dprsOnly (dpOnly)
dprsMcsOnly (mcOnly)
dprsMcsFirst (mcFrst)
useDnaValue (dnaVal)

Default: useDnaValue

ATTRIBUTE FrUni Dlci Dc cugIndex (ci)

Access: Read and write

Description

This attribute specifies the CUG index which is to be signaled in PVC and SPVC call requests to the remote end.

The type of CUG signaling is defined in attribute *cugType* in this component.

Mib: FrameRelayUni

Values: Decimal (0..255)

Default: 0

ATTRIBUTE FrUni Dlci Dc cugType (ct)

Access: Read and write

Description

This attribute specifies the type of CUG signaling to be used in PVC and SPVC call requests. Index of CUG to be used is defined in attribute *cugIndex* in this component.

Copyright © 2006, Nortel Nortel Confidential

Possible values are:
cug - signal CUG
cugOa - signal CUG with outgoing access
doNotSignal - no CUG in call request

Mib	FrameRelayUni
Values	cug cugOa doNotSignal
Default	doNotSignal

ATTRIBUTE FrUni Dlci Dc mapIpCosToFrQos (mapctof)

Access	Read and write
Description	This attribute specifies whether an IP TOS value is mapped to an FR QOS. The mapping used is provisioned in the *Mod Frs IpCosToFrQos* component. When this attribute is set to ***yes***, at Frame Relay egress, the IP TOS byte in each frame is checked. The TOS value determines the egress emission queue and the discard priority for that frame. When this attribute is set to ***no***, FR QOS is determined by the provisioned discard priority and transfer priority. When this attribute is set to ***protocolDependent*** at Frame Relay egress, the IP version field in each frame is checked. If the IP version is IP version Four, the TOS value determines the egress emission queue and the discard priority for that frame. If not, the FR QOS is determined by the provisioned discard priority and transfer priority. A semantic check error is generated when this attribute is set to either ***yes*** or ***protocolDependent***, and a *FrUni DirectConnection* component is provisioned under the same *FrUni* component.
Mib	FrameRelayUni
Values	no yes protocolDependent
Default	no

VERB Ping **FrUni Dlci Vc**

Impact	Passive
Description	Ping *[-roundTripDelay] [-sendPktDataSize(octets)] [-returnPktDataSize(octets)]* FrUni/*<n>* Dlci/*<n>* Vc

Ping causes a query packet to be sent to the destination module where the Frame Relay DLCI VC terminates. It can be used to either display the path of the VC being used by the Frame Relay DLCI or to measure the round trip delay of the Frame Relay DLCI connection. Since the query packet carries the same path selector as the Frame Relay data packets and the Frame Relay VC's transfer priority (TP) is used to set the RCOS, reliability and emission priority of the query packet, the path taken by the ping query packet will be the same as that of the Frame Relay data except at the source and destination module. The ping packets originate from the CP rather than the Frame Relay DLCI's FP. At the far end, it is also the CP that receives the ping packets and returns them, rather than the Frame Relay FP.

Note that this command does not provide any information regarding the status of the far end VC process. If, however, the destination module is unreachable or the VC path is congested, the operator will be notified.

The ping command can be issued with or without options. If no options are specified, the command reports the path of the VC associated with the Frame Relay DLCI. When the command is used to find the VC path, it displays the RID and MID of each module that the query packet passes through on its way to the destination. If the roundTripDelay option is specified, the command reports the time taken to reach the destination and back. For the roundTripDelay option, the path taken by the query packets in both directions (from the source to the destination and from the destination back to the source) is the same as that of the Frame Relay data except at the source and destination where the ping packets are generated and bounced back by the CP rather than the Frame Relay DLCI's FP.

The ping command supports the following options:

-roundTripDelay (-rtd): If this option is selected, the round trip delay time to reach the destination and back will be reported. The round trip delay is calculated by timing how long it takes to send five packets to the destination node and back. The packet size can be specified using the

Copyright © 2006, Nortel Nortel Confidential

sendPktSize and returnPktSize options. The minimum, maximum and average time taken by the returned packets are reported. If this option is not selected, the path taken to the destination is displayed.

-sendPktDataSize: This option specifies the number of data octets to be included in the round trip delay query packet. The rtd query packet consists of the Nortel Networks proprietary common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are sent to the destination. The actual number of data octets sent is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default value is 64 octets if *transferPriority* of the *Frame Relay DLCI Dc* is 11, and 128 octets otherwise. This option is ignored if the -rtd option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

-returnPktDataSize: This option specifies the number of data octets to be included in the round trip delay acknowledge packet. The rtd acknowledge packet consists of the Nortel Networks proprietary common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are returned to the source. The actual number of data octets returned is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default value is 64 octets if *transferPriority* of the *Frame Relay DLCI Dc* is 11, and 128 octets otherwise. This option is ignored if the -rtd option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

GROUP FrUni Dlci Vc CallData (Cad)

Properties	Operational
Description	This group represents operational call data related to Frame Relay *Vc*. It can be displayed only for Frame Relay *Vc* which is created by application.
Mib	FrameRelayUni

ATTRIBUTE FrUni Dlci Vc type

Access	Read only
Description	This attribute displays the type of call, ***pvc***, ***svc, spvc*** or ***frf10spvc***.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayUni
Values	pvc svc spvc frf10spvc
Default	No default

ATTRIBUTE FrUni Dlci Vc state

Access	Read only
Description	This attribute displays the state of call control. P5 state is not supported but is listed for completeness. Transitions from one state to another take very short time. *state* most often displayed is ***dataTransferP4***.
Mib	FrameRelayUni
Values	creating readyP1 dteWaitingP2 dceWaitingP3 dataTransferP4 unsupportedP5 dteClearRequestP6 dceClearIndicationP7 termination
Default	No default

ATTRIBUTE FrUni Dlci Vc previousState

Access	Read only
Description	This attribute displays the previous state of call control. This is a valuable field to determine how the processing is progressing.
Mib	FrameRelayUni
Values	creating readyP1 dteWaitingP2 dceWaitingP3 dataTransferP4 unsupportedP5 dteClearRequestP6 dceClearIndicationP7 termination
Default	No default

ATTRIBUTE FrUni Dlci Vc diagnosticCode

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute displays the internal substate of call control. It is used to further refine *state* of call processing.
Mib	FrameRelayUni
Values	Decimal (0..255)
Default	No default

ATTRIBUTE FrUni Dlci Vc previousDiagnosticCode

Access	Read only
Description	This attribute displays the internal substate of call control. It is used to further refine *state* of call processing.
Mib	FrameRelayUni
Values	Decimal (0..255)
Default	No default

ATTRIBUTE FrUni Dlci Vc calledNpi

Access	Read only
Description	This attribute displays the Numbering Plan Indicator (NPI) of the called end.
Mib	FrameRelayUni
Values	x121 e164
Default	No default

ATTRIBUTE FrUni Dlci Vc calledDna

Access	Read only
Description	This attribute displays the Data Network Address (*Dna*) of the called (destination) DTE to which this call is sent. This address if defined at receiving end will complete *Vc* connection.
Mib	FrameRelayUni
Values	BCD (1..15)
Default	No default

ATTRIBUTE FrUni Dlci Vc calledLcn

Access	Read only
Description	This attribute displays the Logical Channel Number of the called end. It is valid only after both ends of *Vc* exchanged relevant information.
Mib	FrameRelayUni

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (1..65535)
Default	No default

ATTRIBUTE FrUni Dlci Vc callingNpi

Access	Read only
Description	This attribute displays the Numbering Plan Indicator (NPI) of the calling end.
Mib	FrameRelayUni
Values	x121 e164
Default	No default

ATTRIBUTE FrUni Dlci Vc callingDna

Access	Read only
Description	This attribute displays the Data Network Address (*Dna*) of the calling end.
Mib	FrameRelayUni
Values	BCD (1..15)
Default	No default

ATTRIBUTE FrUni Dlci Vc callingLcn

Access	Read only
Description	This attribute displays the Logical Channel Number of the calling end.
Mib	FrameRelayUni
Values	Decimal (1..65535)
Default	No default

ATTRIBUTE FrUni Dlci Vc accountingEnabled

Access	Read only
Description	This attribute indicates that this optional section of accounting record is suppressed or permitted. If *accountingEnabled* is ***yes***, conditions for generation of accounting record were met. These conditions include billing options, vc recovery conditions and Module wide accounting data options.
Mib	FrameRelayUni
Values	yes no
Default	No default

ATTRIBUTE FrUni Dlci Vc fastSelectCall

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute displays that this is a fast select call.
Mib	FrameRelayUni
Values	yes no
Default	No default

ATTRIBUTE FrUni Dlci Vc pathReliability

Access	Read only
Description	This attribute displays the path reliability.
Mib	FrameRelayUni
Values	high normal
Default	No default

ATTRIBUTE FrUni Dlci Vc accountingEnd

Access	Read only
Description	This attribute indicates if this end should generate an accounting record. Normally, ***callingEnd*** is the end to generate an accounting record.
Mib	FrameRelayUni
Values	callingEnd calledEnd
Default	No default

ATTRIBUTE FrUni Dlci Vc priority

Access	Read only
Description	This attribute displays whether the call is a ***normal*** or a ***high*** priority call.
Mib	FrameRelayUni
Values	normal high
Default	No default

ATTRIBUTE FrUni Dlci Vc segmentSize

Access	Read only
Description	This attribute displays the segment size (in bytes) used on the call. It is used to calculate the number of segments transmitted and received.
Mib	FrameRelayUni

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4096)
Default	No default

ATTRIBUTE FrUni Dlci Vc maxSubnetPktSize

Access	Read only
Description	This attribute indicates the maximum packet size allowed on the *Vc*.
Mib	FrameRelayUni
Values	Decimal (0..4096)
Default	No default

ATTRIBUTE FrUni Dlci Vc rcosToNetwork (rcosto)

Access	Read only
Description	This attribute indicates the routing metric routing class of service to the network.
Mib	FrameRelayUni
Values	throughput delay multimedia
Default	No default

ATTRIBUTE FrUni Dlci Vc rcosFromNetwork (rcosfrom)

Access	Read only
Description	This attribute displays the routing metric Routing Class of Service from the Network.
Mib	FrameRelayUni
Values	throughput delay multimedia
Default	No default

ATTRIBUTE FrUni Dlci Vc emissionPriorityToNetwork (epto)

Access	Read only
Description	This attribute displays the network internal emission priority to the network.
Mib	FrameRelayUni
Values	normal high interrupting

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE FrUni Dlci Vc emissionPriorityFromNetwork (epfrom)

Access	Read only
Description	This attribute displays the network internal emission priority from the network.
Mib	FrameRelayUni
Values	normal high interrupting
Default	No default

ATTRIBUTE FrUni Dlci Vc dataPath (dapa)

Access	Read only
Description	This attribute indicates the data path used by the connection. The data path is provisioned in *Dna* and *DirectCall* components. The displayed value of this attribute can be different from the provisioned value. If the connection is using ***dprsOnly*** data path, the string ***dprsOnly*** is displayed. (dynamic packet routing system) If the connection is using ***dprsMcsOnly*** data path, the string ***dprsMcsOnly*** is displayed. If the connection is using ***dprsMcsFirst*** data path, the string ***dprsMcsFirst*** is displayed.
Mib	FrameRelayUni
Values	String (0..32, ASCII)
Default	No default

ATTRIBUTE FrUni Dlci Vc dprsMcsEndPoint (dmep)

Access	Read only
Description	This attribute displays the data path used by the connection. Data path is provisioned in *Dna* and *DirectCall* components. If the connection is using ***dprsOnly*** data path, this attribute is empty. If the connection is using ***dprsMcsOnly*** or ***dprsMcsFirst*** data path, this attribute displays component name of the dprsMcsEndPoint.

List of	The name of the component
Default	No default

GROUP FrUni Dlci Vc IntervalData (Intd)

Properties	Operational
Description	This group defines display of interval data collected by *Vc*. Data in this group is variable and may depend on time when this *display* command is issued.
Mib	FrameRelayUni

ATTRIBUTE FrUni Dlci Vc elapsedTimeTillNow

Access	Read only
Description	This attribute displays the elapsed time representing the period of this interval data. It is elapsed time in 0.1 second increments since *Vc* started.
Mib	FrameRelayUni
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE FrUni Dlci Vc segmentsRx

Access	Read only
Description	This attribute displays the number of segments received at the time command was issued. This is the segment received count maintained by accounting at each end of the *Vc*. This counter is updated only when the packet cannot be successfully delivered out of the sink *Vc* and to the sink AP Conditions in which packets may be discarded by the sink *Vc* include: missing packets due to subnet discards, segmentation protocol violations due to subnet discard, duplicated and out-of-ranged packets and packets that arrive while *Vc* is in path recovery state.
Mib	FrameRelayUni
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE FrUni Dlci Vc segmentsSent

Access	Read only
Description	This attribute displays the number of segments sent at the time command was issued. This is the segment sent count maintained by accounting at the source *Vc*. *Vc* only counts packets that *Vc* thinks can be delivered successfully into the subnet. In reality, these packets may be dropped by trunking, for instance. This counter is not updated when splitting fails,

Copyright © 2006, Nortel Nortel Confidential

when *Vc* is in a path recovery state, when packet forwarding fails to forward this packet and when subsequent packets have to be discarded as we want to minimize the chance of out-of-sequence and do not intentionally send out-of-sequenced packets into the subnet.

Mib	FrameRelayUni
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE FrUni Dlci Vc startTime

Access	Read only
Description	This attribute displays the start time of this interval period. If *Vc* spans 12 hour time or time of day change *startTime* reflects new time as recorded at 12 hour periods or time of day changes.
Mib	FrameRelayUni
Values	Time (DHMS)
Default	No default

ATTRIBUTE FrUni Dlci Vc callReferenceNumber

Access	Read only
Description	This attribute displays the call reference number which is a unique number generated by the switch.The same Call Reference Number is stored in the interval data (accounting record) at both ends of the call. It can be used as one of the attributes in matching duplicate records generated at each end of the call.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	No default

GROUP FrUni Dlci Vc FrameRelayData (Frd)

Properties	Operational
Description	This group defines Frame Relay attributes collected by Frame Relay *Vc*. The purpose of *Vc* attributes is to aid end users and verification people to understand the *Vc* internal behavior. This is particularly useful when the network has experienced abnormality and we want to isolate problems and pinpoint trouble spots. Attributes are collected on a per *Vc* basis. Until a need is identified, statistics are not collected at a processor level. Each attribute is stored in a 32 bit field and is initialized to zero when a *Vc* enters into the data transfer state. When a PVC is disconnected and then connected again, the attributes will be reset. Attributes cannot be reset through other methods. Frame Relay *Vc* uses a best effort data packet delivery protocol and a

Copyright © 2006, Nortel Nortel Confidential

different packet segmentation and combination methods from the General *Vc*. The Frame Relay *Vc* uses the same call setup and control mechanism (e.g. the support of non-flow control data packets) as in a General *Vc*. Most General *Vc* statistics and internal variables are used in a Frame Relay *Vc* and are displayed by software developers

Mib — FrameRelayUni

ATTRIBUTE FrUni Dlci Vc frmCongestedToSubnet

Access — Read only

Description — This attribute displays the number of frames from link discarded due to lack of resources. It keeps track of the number of frames from link that have to be discarded. The discard reasons include insufficient memory for splitting the frame into smaller subnet packet size.

Mib — FrameRelayUni

Values — Decimal (0..5000)

Default — No default

ATTRIBUTE FrUni Dlci Vc cannotForwardToSubnet

Access — Read only

Description — This attribute displays the number of discarded packets that can not be forwarded into the subnet because of subnet congestion.
Number of frames from link discarded due to failure in forwarding a packet from *Vc* into the subnet.- This attribute is increased when packet forwarding fails to forward a packet into the subnet. If a frame is split into multiple subnet packets and a partial packet has to be discarded, all subsequent partial packets that have not yet been delivered to the subnet will be discarded as well.

Mib — FrameRelayUni

Values — Decimal (0..5000)

Default — No default

ATTRIBUTE FrUni Dlci Vc notDataXferToSubnet

Access — Read only

Description — This attribute records the number of frames from link discarded when the *Vc* tries to recover from internal path failure.

Mib — FrameRelayUni

Values — Decimal (0..5000)

Default — No default

ATTRIBUTE FrUni Dlci Vc outOfRangeFrmFromSubnet

Access — Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute displays the number of frames from subnet discarded due to out of sequence range for arriving too late.
Mib	FrameRelayUni
Values	Decimal (0..255)
Default	No default

ATTRIBUTE FrUni Dlci Vc combErrorsFromSubnet

Access	Read only
Description	This attribute records the number of subnet packets discarded at the sink *Vc* due to the *Vc* segmentation and combination protocol error. Usually, this occurs when the subnet discards packets and thus this statistics can be used to guest the number of subnet packets that are not delivered to the *Vc*. It cannot be used as an actual measure because some subnet packets may have been delivered to *Vc* but have to be discarded because these are partial packets to a frame in which some other partial packets have not been properly delivered to *Vc*
Mib	FrameRelayUni
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE FrUni Dlci Vc duplicatesFromSubnet

Access	Read only
Description	This attribute displays the number of subnet packets discarded due to duplication. Although packets are not retransmitted by the Frame Relay *Vc*, it is possible for the subnet to retransmit packets. When packets are out-of-sequenced and copies of the same packets arrive, then this attribute is increased.
Mib	FrameRelayUni
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE FrUni Dlci Vc notDataXferFromSubnet

Access	Read only
Description	This attribute displays the number of subnet packets discarded when data transfer is suspended in *Vc* recovery.
Mib	FrameRelayUni
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE FrUni Dlci Vc frmLossTimeouts

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute displays the number of lost frame timer expiries. When this count is excessive, the network is very congested and packets have been discarded in the subnet.
Mib	FrameRelayUni
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE FrUni Dlci Vc ooSeqByteCntExceeded

Access	Read only
Description	This attribute displays the number times that the out of sequence byte threshold is exceeded. When the threshold is exceeded, this condition is treated as if the loss frame timer has expired and all frames queued at the sink *Vc* are delivered to the AP. We need to keep this count to examine if the threshold is engineered properly. This should be used in conjunction with the peak value of out-of-sequenced queue and the number of times the loss frame timer has expired. This count should be relatively small when compared with loss frame timer expiry count.
Mib	FrameRelayUni
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE FrUni Dlci Vc peakOoSeqPktCount

Access	Read only
Description	This attribute displays the frame relay peak packet count of the out of sequence queue. This attribute records the maximum queue length of the out-of-sequenced queue. The counter can be used to deduce the message buffer requirement on a *Vc*.
Mib	FrameRelayUni
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE FrUni Dlci Vc peakOoSeqFrmForwarded

Access	Read only
Description	This attribute displays the frame relay peak size of the sequence packet queue. The subnet may deliver packets out-of-sequenced. These packets are then queued in an out-of-sequenced queue, waiting for a packet with the expected sequence number to come. When that packet arrives, this attribute records the maximum number of packets that were out-of-sequenced, but now have become in-sequenced. The statistics is used to measure expected queue size due to normal

Copyright © 2006, Nortel Nortel Confidential

	subnet packet disorder (not due to subnet packet discard). Current implementation also uses this statistics to set a maximum size for the out-of-sequenced queue.
Mib	FrameRelayUni
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE FrUni Dlci Vc sendSequenceNumber

Access	Read only
Description	This attribute displays the Vc internal packet's send sequence number. Note that a "packet" in this context, may be either a user data packet, or an OAM frame.
Mib	FrameRelayUni
Values	Decimal (0..1048575)
Default	No default

ATTRIBUTE FrUni Dlci Vc pktRetryTimeouts

Access	Read only
Description	This attribute displays the number of packets which have retransmission time-outs. When this count is excessive, the network is very congested and packets have been discarded in the subnet.
Mib	FrameRelayUni
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE FrUni Dlci Vc peakRetryQueueSize

Access	Read only
Description	This attribute displays the peak size of retransmission queue. This attribute is used as an indicator of the acknowledgment behavior across the subnet. Records the largest body of unacknowledged packets.
Mib	FrameRelayUni
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE FrUni Dlci Vc subnetRecoveries

Access	Read only
Description	This attribute displays the number of successful *Vc* recovery attempts.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayUni
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE FrUni Dlci Vc ooSeqPktCntExceeded

Access	Read only
Description	This attribute displays the number times that the out of sequence packet threshold is exceeded. When the threshold is exceeded, this condition is treated as if the loss frame timer has expired and all frames queued at the sink *Vc* are delivered to the AP. We need to keep this count to examine if the threshold is engineered properly. This should be used in conjunction with the peak value of out-of-sequenced queue and the number of times the loss frame timer has expired. This count should be relatively small when compared with loss frame timer expiry count.
Mib	FrameRelayUni
Values	Decimal (0..255)

COMPONENT FrUni Dlci ServiceParametersProv (Sp)

Groups	GROUP FrUni Dlci Sp ServiceParametersProv (Parms)
Scope	Application
Description	*FrUni/n Dlci/n ServiceParametersProv* This component contains the provisionable traffic control attributes for its parent *Dlci* component.
Mib	FrameRelayUni
Common Verbs	Help List Display

Copyright © 2006, Nortel Nortel Confidential

GROUP FrUni Dlci Sp ServiceParametersProv (Parms)

Properties	Provisioned
Description	This group contains the provisionable attributes for the Data Link Connection Identifier. These attributes reflect the service parameters specific to this instance of DLCI. The congestion control attributes in this group are defined in T1.606 Addendum 1.
Mib	FrameRelayUni

ATTRIBUTE FrUni Dlci Sp maximumFrameSize (n203)

Access	Read and write
Description	This attribute specifies the maximum number of octets which may be included in the information field. The frame relay header and CRC octets are not included in this definition. This attribute corresponds to the dN1 parameter described in the Vendor Forum Specification.
Mib	FrameRelayUni
Values	Decimal (1..8187)
Units	octets
Default	2100

ATTRIBUTE FrUni Dlci Sp rateEnforcement (re)

Access	Read and write
Description	This attribute specifies whether rate enforcement is in effect for this user Data Link Connection on this Frame Relay interface. Turning on rate enforcement means that CIR and DE=1 traffic will be measured and enforced. Turning off rate enforcement means that all frames from the user will be accepted and no modifications to the frame with respect to the DE bit will be made.
Mib	FrameRelayUni
Values	off on
Default	on

ATTRIBUTE FrUni Dlci Sp committedInformationRate (cir)

Access	Read and write
Description	This attribute specifies the committed information rate (CIR) in bits per second (bit/s). When *rateEnforcement* is set to ***on***, *cir* is the rate at which the network agrees to transfer information under normal conditions. This

Copyright © 2006, Nortel Nortel Confidential

rate is measured over a measurement interval (*t*) that is determined internally based on CIR and the committed burst size (Bc). An exception to this occurs when CIR is provisioned to be zero, in which case the measurement interval (*t*) must be provisioned explicitly.

This attribute is ignored when *rateEnforcement* is ***off***. If *rateEnforcement* is ***on*** and this attribute is ***0***, *Bc* must also be ***0***.

Mib	FrameRelayUni
Values	Decimal (0..50000000)
Units	bit/s
Default	64000

ATTRIBUTE FrUni Dlci Sp committedBurstSize (bc)

Access	Read and write

Description

This attribute specifies the committed burst size (Bc) in bits. *bc* is the amount of data that a network agrees to transfer under normal conditions over a measurement interval (*t*). Data marked DE=1 is not accounted for in Bc.

This attribute is ignored when *rateEnforcement* is ***off***. If *rateEnforcement* is ***on*** and this attribute is ***0***, *cir* must also be ***0***.

Mib	FrameRelayUni
Values	Decimal (0..50000000)
Units	bits
Default	64000

ATTRIBUTE FrUni Dlci Sp excessBurstSize (be)

Access	Read and write

Description

This attribute specifies the excess burst size (Be) in bits. Be is the amount of uncommitted data that the network will attempt to deliver over measurement interval T. Data marked DE=1 by the user or by the network is accounted for here.

CIR, Bc, and Be cannot all be zero when rateEnforcement is on.

Mib	FrameRelayUni
Values	Decimal (0..50000000)
Units	bits
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrUni Dlci Sp measurementInterval (t)

Access	Read and write
Description	When *cir* and *bc* are zero and *rateEnforcement* is on, this attribute must be provisioned to specify the time interval (in milliseconds) over which rates and burst sizes are measured. When *cir* and *bc* are non-zero, the time interval is internally calculated and is *not shown*. In that situation, this field is ignored, and is not representative of the time interval. This attribute is ignored when *rateEnforcement* is ***off***, or when *cir* and *bc* are ***non-zero***. If *rateEnforcement* is ***on*** and both *cir* and *bc* are ***zero***, this field must be ***non-zero***.
Mib	FrameRelayUni
Values	Decimal (0..25500)
Units	msec
Default	0

ATTRIBUTE FrUni Dlci Sp rateAdaptation (ra)

Access	Read and write
Description	This attribute specifies whether rate adaptation is in effect for this user Data Link Connection on this Frame Relay interface. Rate adaptation is a feature that, in periods of congestion, adapts the rate at which the user is allowed to send data into the network to that which the network is able to handle at that time. This pro-active measure of handling congestion optimizes network resources by causing the ingress to discard frames that would otherwise be discarded in the network. If this attribute is set to ***on***, then, at the onset of congestion, the excess information rate (EIR) is reduced to a very low rate. If congestion persists, then the allowed CIR is reduced geometrically by 25% of the current value at that time. The minimum to which CIR can be reduced is 1/16th (6.25%) of the provisioned value. As congestion alleviates, CIR is increased linearly by 6.25% of the provisioned value specified in *committedInformationRate*. If set to ***eirOnly***, then rate adaptation will only apply to the excess information rate (EIR). At the onset of congestion, the allowed EIR is reduced by 25% of its provisioned value. If congestion persists, EIR is reduced geometrically by 25% of the current value at that time. As congestion alleviates, EIR is gradually increased linearly by 6.25% of the provisioned EIR. If set to ***cirProportionate***, then rate adaptation will also only apply to the excess information rate (EIR). At the onset of congestion the initial allowed EIR is set to a multiple of the provisioned CIR. If congestion persists, the

Copyright © 2006, Nortel Nortel Confidential

allowed EIR is reduced geometrically by 25% of the current value at that time. As congestion alleviates, EIR is gradually increased linearly by 6.25% of the provisioned EIR. Note that the allowed EIR may be set higher than the provisioned EIR, since it is calculated initially using another parameter, the provisioned CIR. If the allowed EIR at the moment is higher than the provisioned EIR, then the provisioned EIR is used instead.

This attribute can only be set to ***on eirOnly*** or ***cirProportionate*** if *rateEnforcement* is turned ***on***.

This attribute must be set to ***off*** if the *BnxIwf* component is provisioned under this *Dlci*.

Mib — FrameRelayUni

Values
off
on
eirOnly
cirProportionate

Default — off

ATTRIBUTE FrUni Dlci Sp accounting (ac)

Access — Read and write

Description

This attribute specifies whether accounting data collection and record generation is turned on at this DLCI. For accounting data collection and record generation to be turned on, the ***accountingOn*** bit and at least one of the ***accountCollection*** bits in the ***DataNetworkAddress*** component must be set to on.

Mib — FrameRelayUni

Values
off
on

Default — on

ATTRIBUTE FrUni Dlci Sp raSensitivity (rasens)

Access — Read and write

Description

This attribute specifies the sensitivity of the rate adaptation system. A higher number indicates a higher sensitivity and therefore a quicker reaction time to network conditions. A quicker reaction time allows the network to discard frames at the access and protect network resources, but can lead to false alarms and a greater fluctuation of the allowed rate. A higher setting therefore tends to favour the protection of the network over the allowed throughput of the user.

A lower number indicates a lower sensitivity and therefore a slower reaction to network conditions. A slower reaction time results in a greater amount of user traffic allowed into the network, but can lead to a waste of

Copyright © 2006, Nortel Nortel Confidential

network bandwidth since the traffic may be discarded at the congested resource. A lower setting therefore tends to favour the allowed throughput of the user over the protection of the network.

This attribute is applicable for adapting EIR when *rateAdaptation* is ***eirOnly*** or ***cirProportionate***, or CIR when *rateAdaptation* is ***on***.

This attribute is ignored if *rateAdaptation* is turned ***off***.

Mib: FrameRelayUni

Values: Decimal (1..20)

Default: 7

ATTRIBUTE FrUni Dlci Sp updateBCI (updBCI)

Access: Read and write

Description

This attribute specifies whether internal Backward Congestion Indication (BCI) bits will report congestion external to the network, as communicated through incoming BECN bits.

If *updateBCI* is set to ***on***, then BCI bits for incoming frames will be set if the BECN on the frame is set. If *updateBCI* is set to ***off***, then incoming BECN bits have no effect.

Setting *updateBCI* ***on*** for a DLCI means that the remote end of the DLCI, which is specified by the *remoteDna* and *remoteDlci* attributes of the *dc* component of the DLCI, may perform Rate Adaptation using the flow of incoming BECN bits, in addition to internal congestion management systems.

If the *rateAdaptation* attribute of the remote DLCI is provisioned as ***eirOnly***, ***cirProportionate***, or ***on***, then congestion from another network may trigger dynamic congestion management. If the *rateAdaptation* attribute of the remote DLCI is provisioned to ***off***, then the setting of *updateBCI* attribute here will have no effect.

Mib: FrameRelayUni

Values:
off
on

Default: off

ATTRIBUTE FrUni Dlci Sp correlationTag (ctag)

Access: Read and write

Description: This attribute specifies the unique string which identifies each end of a connection.

If required for correlation purposes, the attribute must be provisioned with

Copyright © 2006, Nortel Nortel Confidential

	the same value at both ends of the connection.This attribute can be left as an empty string when the functionality is not required, or when the user requires an empty circuit identifier string against the DLCI. This attribute can be used for off-switch data correlation purposes. Downstream processing uses this attribute to correlate data records (accounting etc.) issued at different nodes in the network. In the accounting record, the value for the *correlationTag* attribute appears as the attribute *circuitId* (circuit identifier) for the endpoint.
Mib	FrameRelayUni
Values	String (0..32, ASCII)
Default	""

ATTRIBUTE FrUni Dlci Sp frf12EndToEnd (frf12)

Access	Read and write
Criticality	Component
Description	This attribute specifies whether FRF.12 End-to-End fragmentation is turned on for this *Dlci* component. When this attribute is set to ***on***, ingress End-to-End FRF.12 fragments are reassembled to frame relay packets, and egress frame relay packets are fragmented to End-to-End FRF.12 fragments.
Mib	FrameRelayUni
Values	off on
Default	off

ATTRIBUTE FrUni Dlci Sp frf12FragmentSize (fragSize)

Access	Read and write
Description	This attribute specifies the maximum payload in octets for a FRF.12 fragment on this *Dlci* component. The frame relay header, FRF.12 header and CRC octets are not included.
Mib	FrameRelayUni
Values	Decimal (40; 48; 60; 80; 120; 240; 480)
Units	octets
Default	60

Groups	GROUP FrUni Dlci Frf12 Frf12Stats (Stats)
Scope	Application
Description	*FrUni/n Dlci/n Frf12Stats* This component represents the End-to-End FRF.12 statistics of a Data Link Connection Identifier. FRF.12 provides the capability to fragment frames that are sent to the link, and reassemble fragments that arrive from the link. The *Frf12Stats* component may be used to monitor the functioning of the End-to-End FRF.12 feature when the feature is enabled. This component is only visible when the feature is enabled.
Mib	FrameRelayUni
Common Verbs	Help List Display

GROUP FrUni Dlci Frf12 Frf12Stats (Stats)

Properties	Operational
Description	This group contains the operational attributes for the *Frf12Stats* component.
Mib	FrameRelayUni

ATTRIBUTE FrUni Dlci Frf12 fragFromIf (ffi)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the End-to-End FRF.12 fragments received from the link.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci Frf12 peakFragSizeFromIf (pkSize)

Access	Read only
Description	This attribute indicates the size of the largest fragment received from the link. It is reset on every accounting collection period.
Mib	FrameRelayUni
Values	Decimal (0..65535)
Default	0

ATTRIBUTE FrUni Dlci Frf12 expectedSequenceNumber (expSeq)

Access	Read only
Description	This attribute indicates the expected sequence number in the next fragment received from the link. The attribute is set to the sequence number of the last fragment received plus one.
Mib	FrameRelayUni
Values	Decimal (0..4095)
Default	0

ATTRIBUTE FrUni Dlci Frf12 outOfSequenceEvent (outOfSeq)

Access	Read only
Description	This attribute counts the times an out of sequence number event occurs. An out of sequence number event occurs when a fragment received from the link has a sequence number that is different from the one indicated by the *expectedSequenceNumber* attribute.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci Frf12 headerErrorEvent (hdrErr)

Access	Read only
Description	This attribute counts the times an End-to-End FRF.12 header error event occurs. The header must comply with the End-to-End FRF.12 Implementation Agreement.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci Frf12 cpuExhaustionFromIfEvent (extnfi)

Access	Read only
Description	This attribute counts the times a CPU exhaustion event occurs. A CPU exhaustion event occurs when ingress fragments requiring reassembly are discarded due to CPU exhaustion.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci Frf12 discFragFromIf (discfi)

Access	Read only
Description	This attribute counts fragments received from the link that have been discarded. Fragments are discarded when header error, out of sequence number or CPU exhaustion event occurs.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci Frf12 fragToIf (fti)

Access	Read only
Description	This attribute counts the End-to-End FRF.12 fragments sent to the link.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci Frf12 sendSequenceNumber (sndSeq)

Access	Read only
Description	This attribute indicates the sequence number of the next fragment to be sent to the link.
Mib	FrameRelayUni
Values	Decimal (0..4095)
Default	0

ATTRIBUTE FrUni Dlci Frf12 cpuExhaustionToIfEvent (extnti)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute counts the times a CPU exhaustion event occurs. A CPU exhaustion event occurs when egress frames requiring fragmentation are discarded due to CPU exhaustion.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci Frf12 longFrameTolfEvent (longti)

Access	Read only
Description	This attribute counts the times a long frame event occurs. A long frame event occurs when an egress frame requiring fragmentation is discarded because it will generate more than fourty fragments.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci Frf12 fragmentationErrorsTolf (fragerr)

Access	Read only
Description	This attribute counts the egress frames discarded due to an internal error during fragmentation.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	0

COMPONENT FrUni Dlci BnxInterworkingFunction (Bnxlwf)

Groups	GROUP FrUni Dlci BnxIwf Provisioned (Prov) GROUP FrUni Dlci BnxIwf Operational (Op)
Scope	Application
Description	*FrUni/n Dlci/n BnxInterworkingFunction* *FrNni/n Dlci/n BnxInterworkingFunction* This component specifies that the parent DLCI uses BNX frame relay over

Copyright © 2006, Nortel Nortel Confidential

an IP network as its networking mechanism. It contains the networking parameters specific to BNX networking.

VERB Redirect **FrUni Dlci Bnxlwf**

Impact — Service

Description

*Redirect [-**force**] -**destination**(<**destination**>) FrUni/n Dlci/n BnxInterworkingFunction*
or
*Redirect [-**force**] -**destination**(<**destination**>) FrNni/n Dlci/n BnxInterworkingFunction*

This verb is used to manually select the PVC destination between the primary and backup destinations, or to enable the automatic redirection. The primary destination and the backup destination are specified by the *BnxInterworkingFunction* component.

The ***-destination*** option indicates the destination of PVC redirection. The value of this option can be ***primary***, ***backup,*** or ***onDemand***.

The value ***primary*** means that the destination for this PVC has been manually selected to be the primary destination, automatic redirection is disabled. This redirect action corresponds to the “Redirect to Primary” redirect action in the BNX implementation.

The value ***backup*** means that the destination for this PVC has been manually selected to be the backup destination, and automatic redirection is disabled. The backup destination must be provisioned. This redirect action corresponds to the “Redirect to Backup” redirect action in the BNX implementation.

Copyright © 2006, Nortel
Nortel Confidential

The value ***onDemand*** means this PVC is redirected automatically to either the primary destination or the backup destination based on the cross-net status of the primary destination. This automatic switch-over mechanism is revertive to the primary destination. The *crossNetListenEnabled* attribute of the *BnxProtocol* component must be ***yes*** and the backup destination must be provisioned. This redirect action corresponds to the “Switch on Demand” redirect action in the BNX implementation.

The ***-force*** option specifies that the PVC is redirected to either the primary destination or the backup destination indicated by the ***-destination*** option even if the destination is not active. When the value of ***-destination*** is ***onDemand***, this option is ignored.

GROUP FrUni Dlci Bnxlwf **Provisioned (Prov)**

Properties	Provisioned
Description	This group defines the provisioning attributes associated with a PVC using BNX frame relay interworking.
Mib	FrUniPvcBnx

ATTRIBUTE FrUni Dlci Bnxlwf **calledIpAddress (cia)**

Access	Read and write
Description	This attribute specifies the IP address of the primary destination which receives the datagrams.
Mib	FrUniPvcBnx
Values	IP address
Default	0.0.0.0

ATTRIBUTE FrUni Dlci Bnxlwf **calledDlci (cdlci)**

Access	Read and write
Description	This attribute specifies the DLCI of the primary destination which receives the datagrams.
Mib	FrUniPvcBnx
Values	Decimal (16..1007)
Default	No default

ATTRIBUTE FrUni Dlci Bnxlwf **trafficPriority (tp)**

Access	Read and write
Description	This attribute specifies the user control on traffic priority. The value is transmitted in the traffic priority field of the BNX header. Possible values are: ***1*** - High Priority ***2*** - Normal Priority

Copyright © 2006, Nortel Nortel Confidential

3 - Low Priority
useBpDefault - use the *defaultTrafficPriority* attribute value from the *BnxProtocol* component.

Mib	FrUniPvcBnx
Values	1 2 3 useBpDefault
Default	useBpDefault

ATTRIBUTE FrUni Dlci Bnxlwf backupCalledIpAddress (bcia)

Access	Read and write
Description	This attribute specifies the IP address of the backup destination which receives the datagrams. A value of ***0.0.0.0*** for this attribute and a value of ***undefined*** for the *backupCalledDlci* attribute specify that there is no backup destination.
Mib	FrUniPvcBnx
Values	IP address
Default	0.0.0.0

ATTRIBUTE FrUni Dlci Bnxlwf backupCalledDlci (bcdlci)

Access	Read and write
Description	This attribute specifies the DLCI of the backup destination which receives the datagrams. A value of ***undefined*** for this attribute and a value of ***0.0.0.0*** for the *backupCalledIpAddress* attribute specify that there is no backup destination.
Mib	FrUniPvcBnx
Values	Decimal (16..1007) undefined
Default	undefined

ATTRIBUTE FrUni Dlci Bnxlwf redirectType (rtype)

Access	Read and write
Description	This attribute indicates the type of DTE notification when a PVC redirection between primary and backup destinations occurs. ***transparent*** means no notification is sent to the DTE. ***aIntrusive*** means that an asynchronous update with the A-bit not set is sent to the DTE.

Copyright © 2006, Nortel Nortel Confidential

nIntrusive means that an asynchronous update with the N-bit set is sent to the DTE.

Mib	FrUniPvcBnx
Values	transparent aIntrusive nIntrusive
Default	aIntrusive

ATTRIBUTE FrUni Dlci Bnxlwf minActiveIntervals (mai)

Access	Read and write
Description	This attribute specifies the minimum number of consecutive time intervals for which the primary destination must be active before the PVC is redirected back to the primary destination from the backup destination in ***switchOnDemand*** mode. The interval duration is controlled by the *crossNetPollingInterval* attribute of the *BnxProtocol* component. This attribute is ignored if the *BnxProtocol* attribute *crossNetListenEnabled* is set to ***no***. If the value of this attribute is ***0***, the PVC is redirected back to the primary destination as soon as an active cross-net message is received from the primary destination.
Mib	FrUniPvcBnx
Values	Decimal (0..4)
Default	0

ATTRIBUTE FrUni Dlci Bnxlwf redirectAction (ra)

Access	Read and write
Description	This attribute indicates the redirect action for a PVC. The Redirect command can be used to override this redirect action. ***switchOnDemand*** means this PVC is redirected automatically to either the primary destination or the backup destination based on the cross-net status of the primary destination. This automatic switch-over mechanism is revertive to the primary destination. The *crossNetListenEnabled* attribute of the *BnxProtocol* component must be ***yes*** and the backup destination must be provisioned. This redirect action corresponds to the “Switch on Demand” redirect action in the BNX implementation. ***manualPrimary*** means that the destination for this PVC has been manually selected to be the primary destination, automatic redirection is disabled. This redirect action corresponds to the “Redirect to Primary” redirect action in the BNX implementation. ***manualBackup*** means that the destination for this PVC has been manually selected to be the backup destination, and automatic redirection

is disabled. The backup destination must be provisioned. This redirect action corresponds to the “Redirect to Backup” redirect action in the BNX implementation.

Mib	FrUniPvcBnx
Values	switchOnDemand manualPrimary manualBackup
Default	manualPrimary

GROUP FrUni Dlci Bnxlwf Operational (Op)

Properties	Operational
Description	This attribute group contains the operational status of the BNX frame relay interworking functionality.
Mib	FrUniPvcBnx

ATTRIBUTE FrUni Dlci Bnxlwf timeOfLastStateChange (tlsc)

Access	Read only
Description	This attribute indicates the time at which the state of the DLCI last changed.
Mib	FrUniPvcBnx
Values	Time (DHMS)
Default	No default

ATTRIBUTE FrUni Dlci Bnxlwf crossNetSent (cnsent)

Access	Read only
Description	This attribute indicates if a cross-net status message was sent to the primary destination during the current polling interval. The interval duration is controlled by the *crossNetPollingInterval* attribute of the *BnxProtocol* component.
Mib	FrUniPvcBnx
Values	unsent sent
Default	No default

ATTRIBUTE FrUni Dlci Bnxlwf crossNetStatus (cns)

Access	Read only
Description	This attribute indicates the state of the PVC when the remote end is the primary destination. If the *crossNetListenEnabled* attribute of the *BnxProtocol* component is set to ***yes***, this attribute reflects the state as

Copyright © 2006, Nortel Nortel Confidential

reported by the remote end. If the *crossNetListenEnabled* attribute is set to ***no***, the PVC is assumed to be up and this attribute has a value of ***active***.

Mib	FrUniPvcBnx
Values	inactive active
Default	inactive

ATTRIBUTE FrUni Dlci Bnxlwf **crossNetReceived (cnr)**

Access	Read only
Description	This attribute indicates if the DLCI has received a cross-net status message from the primary destination during the current polling interval. The interval duration is controlled by the *crossNetPollingInterval* attribute of the *BnxProtocol* component. This attribute is ignored if the *BnxProtocol* attribute *crossNetListenEnabled* is set to ***no***.
Mib	FrUniPvcBnx
Values	unrecv recv
Default	unrecv

ATTRIBUTE FrUni Dlci Bnxlwf **crossNetErrors (cne)**

Access	Read only
Description	This attribute counts how many polling intervals have elapsed without receiving an error free cross-net status message from the primary destination of the PVC. Errors are generally caused by time-outs. The value of this attribute wraps to zero when it exceeds the maximum value.
Mib	FrUniPvcBnx
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci Bnxlwf **ipAddressMismatches (iam)**

Access	Read only
Description	This attribute counts the received datagrams which were dropped because the source IP address in the IP header did not match the value of *calledIpAddress* or *backupCalledIpAddress* attribute. The value of this attribute wraps to zero when it exceeds the maximum value.
Mib	FrUniPvcBnx
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrUni Dlci Bnxlwf lastMismatchedIpAddress (lmia)

Access	Read only
Description	This attribute indicates the source IP address in the IP header of the most recently received datagram which was dropped because this IP address did not match the value of *calledIpAddress* or *backupCalledIpAddress* attribute.
Mib	FrUniPvcBnx
Values	IP address
Default	0.0.0.0

ATTRIBUTE FrUni Dlci Bnxlwf backupCrossNetSent (bcnsent)

Access	Read only
Description	This attribute indicates if a cross-net status message was sent to the backup destination during the current polling interval. The interval duration is controlled by the *crossNetPollingInterval* attribute of the *BnxProtocol* component.
Mib	FrUniPvcBnx
Values	unsent sent
Default	No default

ATTRIBUTE FrUni Dlci Bnxlwf backupCrossNetStatus (bcns)

Access	Read only
Description	This attribute indicates the state of the PVC when the remote end is the backup destination. If the *crossNetListenEnabled* attribute of the *BnxProtocol* component is set to ***yes***, this attribute reflects the state as reported by the remote end. If the *crossNetListenEnabled* attribute is set to ***no***, the PVC is assumed to be up and this attribute has a value of ***active***.
Mib	FrUniPvcBnx
Values	inactive active
Default	inactive

ATTRIBUTE FrUni Dlci Bnxlwf backupCrossNetReceived (bcnr)

Access	Read only
Description	This attribute indicates if the DLCI has received a cross-net status message from the backup destination of the PVC during the current polling interval. The interval duration is controlled by the *crossNetPollingInterval*

Copyright © 2006, Nortel Nortel Confidential

attribute of the *BnxProtocol*. This attribute is ignored if the *BnxProtocol* attribute *crossNetListenEnabled* is set to ***no***.

Mib	FrUniPvcBnx
Values	unrecv recv
Default	unrecv

ATTRIBUTE FrUni Dlci Bnxlwf backupCrossNetErrors (bcne)

Access	Read only
Description	This attribute counts how many polling intervals have elapsed without receiving an error free cross-net status message from the backup destination of the PVC. Errors are generally caused by time-outs. The value of this attribute wraps to zero when it exceeds the maximum value.
Mib	FrUniPvcBnx
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci Bnxlwf redirectMode (rmode)

Access	Read only
Description	This attribute indicates the mode of the PVC redirection. The value ***switchOnDemand*** means this PVC is redirected automatically to either the primary destination or the backup destination based on the cross-net status of the primary destination. This automatic switch-over mechanism is revertive to the primary destination. The value ***manual*** means that the destination for this PVC has been manually selected and automatic redirection is disabled. When the value is ***noBackup***, the PVC does not have a backup destination provisioned.
Mib	FrUniPvcBnx
Values	switchOnDemand manual noBackup
Default	No default

ATTRIBUTE FrUni Dlci Bnxlwf currentDestination (cdest)

Access	Read only
Description	This attribute indicates if the current destination is the primary destination or the backup destination.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrUniPvcBnx
Values	primary backup
Default	No default

ATTRIBUTE FrUni Dlci BnxIwf remoteIpAddress (ria)

Access	Read only
Description	This attribute indicates the IP address of the current destination.
Mib	FrUniPvcBnx
Values	IP address
Default	No default

ATTRIBUTE FrUni Dlci BnxIwf remoteDlci (rdlci)

Access	Read only
Description	This attribute indicates the DLCI of the current destination.
Mib	FrUniPvcBnx
Values	Decimal (16..1007)
Default	No default

ATTRIBUTE FrUni Dlci BnxIwf ipFragFromSubnet (fragfs)

Access	Read only
Description	This attribute counts the IP fragments received from subnet by this Dlci. The value of this attribute wraps to zero when it exceeds the maximum value.
Mib	FrUniPvcBnx
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci BnxIwf discardedIpFragments (discFrag)

Access	Read only
Description	This attribute counts the IP fragments that are dropped by this Dlci. The value of this attribute wraps to zero when it exceeds the maximum value.
Mib	FrUniPvcBnx
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci BnxIwf discMisorderedFrm (dmfrm)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute counts the frames from subnet that are dropped due to misordered fragments. A misordered fragment occurs when the offset in the IP header is not equal to the expected offset, or the timer expires before the last fragment is received. The value of this attribute wraps to zero when it exceeds the maximum value.
Mib	FrUniPvcBnx
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrUni Dlci Bnxlwf **lastDroppedIpFragmentId (lastid)**

Access	Read only
Description	This attribute indicates the Id of the last misordered frame that was dropped.
Mib	FrUniPvcBnx
Values	Decimal (0..4294967295)
Default	0

COMPONENT FrUni Dlci **IpConnection (IpConn)**

Groups	GROUP FrUni Dlci IpConn Provisioned (Prov)
Scope	Application
Description	*FrUni/n Dlci/n IpConnection* This component represents direct frame relay access to IP (IPoFR) for this *Dlci*. This *Dlci* must be linked to an *IpDlciGroup FrConnection*.
Mib	FrUniIpConn
Common Verbs	Help List Display Add DELete

GROUP FrUni Dlci IpConn **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains the provisionable attributes for the *IpConnection* component.
Mib	FrUniIpConn

ATTRIBUTE FrUni Dlci IpConn **linkToIpDlciGrp (dlcGrp)**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the *IpDlciGroup FrConnection* associated with this component.
Mib	FrUniIpConn
Values	Link (Service, linkToFrDlci)
Default	No default

ATTRIBUTE FrUni Dlci IpConn de0DiscardPriority (de0Dp)

Access	Read and write
Description	This attribute specifies the discard priority for frames received on this DLCI whose DE bit is not set after being processed by the frame relay service. ***low*** specifies that the packet is least likely to be discarded. This value should be used for traffic that requires a high probability of being forwarded. ***high*** specifies that the packet is most likely to be discarded. This value should be used for traffic that is given a low probability of being forwarded. The value of this attribute must not be higher than the value of the *de1DiscardPriority* attribute.
Mib	FrUniIpConn
Values	low medium high
Default	medium

ATTRIBUTE FrUni Dlci IpConn de1DiscardPriority (de1Dp)

Access	Read and write
Description	This attribute specifies the discard priority for frames received on this DLCI whose DE bit is set after being processed by the frame relay service. ***low*** specifies that the packet is least likely to be discarded. This value should be used for traffic that requires a high probability of being forwarded. ***high*** specifies that the packet is most likely to be discarded. This value should be used for traffic that is given a low probability of being forwarded. The value of this attribute must not be lower than the value of the *de0DiscardPriority* attribute.
Mib	FrUniIpConn

Copyright © 2006, Nortel Nortel Confidential

Values	low medium high
Default	high

ATTRIBUTE FrUni Dlci IpConn dpToDeMapLevel (dpToDe)

Access	Read and write
Description	This attribute specifies the lowest discard priority that will be mapped to a set DE bit. All frames with a discard priority of this level or higher, sent on this DLCI, will have the DE bit set to 1 after being processed by the frame relay service. If the value is ***notApplicable*** then all frames sent on this DLCI will have the DE bit set to 0, after being processed by the frame relay service.
Mib	FrUniIpConn
Values	low medium high notApplicable
Default	notApplicable

COMPONENT FrUni Signaling (Sig)

Groups	GROUP FrUni Sig DlciRange (Range) GROUP FrUni Sig ServiceParameters (ServParms) GROUP FrUni Sig SystemParameters (SysParms) GROUP FrUni Sig LapfSystemParameters (LapfSys) GROUP FrUni Sig OsiState (State) GROUP FrUni Sig Statistics (Stats) GROUP FrUni Sig LapfStatus (LapfStatus) GROUP FrUni Sig LapfStatistics (LapfStats) GROUP FrUni Sig FrsSvcAcc (Svcacc) GROUP FrUni Sig LastSvcClearCodes (Codes)
Scope	Application
Description	*FrUni/n Signaling* This component defines the FRF.4 and Q.922 (LAPF) parameters for Frame Relay switched virtual circuits at the User-Network interface. This

Copyright © 2006, Nortel Nortel Confidential

component must be provisioned for the FrUni interface to support switched connections.

Mib	FriUniSig
Common Verbs	Help List Display Add DELete

GROUP FrUni Sig DlciRange (Range)

Properties	Provisioned
Description	This group contains the provisionable attribute to define the range of DLCIs for PVCs and SVCs. The purpose of this range is to prevent DLCI collisions between the provisioned PVCs and the dynamic SVCs.
Mib	FriUniSig

ATTRIBUTE FrUni Sig highestPvcDlci

Access	Read and write
Criticality	Process
Description	This attribute specifies the highest DLCI value that can be provisioned for a permanent connection. It partitions the DLCI space into permanent and switched connections. Permanent DLCI numbers higher than this value cannot be provisioned. The value ***0*** is used to indicate that no permanent connections are allowed on this interface. The value ***1007*** indicates that no switched connections are allowed on this interface.
Mib	FriUniSig
Values	Decimal (0; 16..1007)
Default	500

GROUP FrUni Sig ServiceParameters (ServParms)

Properties	Provisioned
Description	This group contains the provisionable FRF.4 service parameters.
Mib	FriUniSig

ATTRIBUTE FrUni Sig maximumFrameSize (dn1)

Access	Read and write
Description	This attribute specifies the maximum number of octets that may be included in the information field of the user DLCI of any switched connections using this interface. Its value must not be smaller than the value of *defaultMaximumFrameSize*.

Copyright © 2006, Nortel Nortel Confidential

Mib	FriUniSig
Values	Decimal (1..8187)
Units	octets
Default	4096

ATTRIBUTE FrUni Sig defaultMaximumFrameSize (defaultdn1)

Access	Read and write
Description	This attribute specifies the default maximum number of octets that may be included in the information field of the user DLCI assigned for any switched connections using this interface. This value is used during call parameter negotiation for switched calls on this interface when the maximum frame size is not specified in the user's SETUP message. The value of this attribute must not exceed the value of the *maximumFrameSize* attribute.
Mib	FriUniSig
Values	Decimal (1..8187)
Units	octets
Default	2100

ATTRIBUTE FrUni Sig defaultCommittedInformationRate (defaultCir)

Access	Read and write
Description	This attribute specifies the default user to network direction CIR. This value is used during call parameter negotiation for switched calls on this interface when the CIR is not specified in the user's SETUP message.
Mib	FriUniSig
Values	Decimal (0..52000000)
Units	bit/s
Default	64000

ATTRIBUTE FrUni Sig defaultCommittedBurstSize (defaultBc)

Access	Read and write
Description	This attribute specifies the default user to network direction Bc. This value is used during call parameter negotiation for switched calls on this interface when the Bc is not specified in the user's SETUP message.
Mib	FriUniSig
Values	Decimal (0..52000000)
Units	bits
Default	64000

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrUni Sig defaultExcessBurstSize (defaultBe)

Access	Read and write
Description	This attribute specifies the default user to network direction Be. This value is used during call parameter negotiation for switched calls on this interface when the Be is not specified in the user's SETUP message.
Mib	FriUniSig
Values	Decimal (0..52000000)
Units	bits
Default	0

ATTRIBUTE FrUni Sig rateEnforcement (re)

Access	Read and write
Description	This attribute specifies whether rate enforcement is in effect for SVCs on this interface.
Mib	FriUniSig
Values	off on
Default	on

ATTRIBUTE FrUni Sig rateAdaptation (ra)

Access	Read and write
Description	This attribute specifies whether closed-loop rate adaptation is in effect for SVCs on this interface. Rate adaptation is a feature that, in periods of congestion, adapts the rate at which the user is allowed to send data into the network to that which the network is able to handle at that time. This proactive measure of handling congestion optimizes network resources by causing the ingress to discard frames that would otherwise be discarded in the network. If this attribute is set to ***on***, then, at the onset of congestion, the excess information rate (EIR) is reduced to a very low rate. If congestion persists, then the allowed CIR is reduced geometrically by 25% of the current value at that time. The minimum to which CIR can be reduced is 1/16th (6.25%) of the provisioned value. As congestion alleviates, CIR is increased linearly by 6.25% of the provisioned value specified in *committedInformationRate*. If set to ***eirOnly***, then rate adaptation will only apply to the excess information rate (EIR). At the onset of congestion, the allowed EIR is reduced by 25% of its provisioned value. If congestion persists, EIR is reduced geometrically by 25% of the current value at that time. As congestion alleviates, EIR is gradually increased linearly by 6.25% of the provisioned EIR.

Copyright © 2006, Nortel Nortel Confidential

If set to ***cirProportionate***, then rate adaptation will also only apply to the excess information rate (EIR). At the onset of congestion the initial allowed EIR is set to a multiple of the provisioned CIR. If congestion persists, the allowed EIR is reduced geometrically by 25% of the current value at that time. As congestion alleviates, EIR is gradually increased linearly by 6.25% of the provisioned EIR. Note that the allowed EIR may be set higher than the provisioned EIR, since it is calculated initially using another parameter, the provisioned CIR. If the allowed EIR at the moment is higher than the provisioned EIR, then the provisioned EIR is used instead.

This attribute can only be set to ***on*** or ***eirOnly*** if *rateEnforcement* is set to ***on***.

Mib — FriUniSig

Values
off
on
eirOnly
cirProportionate

Default — off

ATTRIBUTE FrUni Sig x213IeHandling (x213)

Access — Read and write

Description — The *x213IeHandling* attribute specifies how Frame Relay handles the X.213 Priority IE when it is in the FRF.4 setup message.

When the attribute is set to ***notSupported***, the X.213 Priority IE will not be recognized in the setup message. A FRF.4 status message will be sent to the calling DTE, with the indication that an unrecognized IE was encountered. The call setup then proceeds as normal, and the X.213 Priority IE does not appear in the setup message at the called end.

When the attribute is set to ***proprietary***, and the X.213 Priority IE is present in the FRF.4 setup message, it will be recognized. If there is no Frame Transfer Priority IE in the setup message, the first data byte of the X.213 Priority IE is used to select the transfer and discard priority values for the connection and the X.213 Priority IE is signaled to the called end in the setup message. If the Frame Transfer Priority IE is present in the FRF.4 setup message, its value is used to select the transfer priority, the discard priority is taken from the *FRUNI Dna* component, and the X.213 Priority IE is ignored.

Refer to the related Application Note for further details before setting the attribute value to ***proprietary***.

Mib — FriUniSig

Values
notSupported
proprietary

Copyright © 2006, Nortel Nortel Confidential

Default	notSupported

ATTRIBUTE FrUni Sig raSensitivity (rasens)

Access	Read and write
Description	This attribute specifies the sensitivity of the rate adaptation system for all switched connections on this interface. A higher number indicates a higher sensitivity and therefore a quicker reaction time to network conditions. A quicker reaction time allows the network to discard frames at the access and protect network resources, but can lead to false alarms and a greater fluctuation of the allowed rate. A higher setting therefore tends to favor the protection of the network over the allowed throughput of the user. A lower number indicates a lower sensitivity and therefore a slower reaction to network conditions. A slower reaction time results in a greater amount of user traffic allowed into the network, but can lead to a waste of network bandwidth since the traffic may be discarded at the congested resource. A lower setting therefore tends to favour the allowed throughput of the user over the protection of the network. This attribute is applicable for adapting EIR when *rateAdaptation* is ***eirOnly*** or ***cirProportionate***, or CIR when *rateAdaptation* is ***on***. This attribute is ignored if *rateAdaptation* is ***off***.
Mib	FriUniSig
Values	Decimal (1..20)
Default	7

ATTRIBUTE FrUni Sig updateBCI (updBCI)

Access	Read and write
Description	This attribute specifies whether internal Backward Congestion Indication (BCI) bits will report congestion external to the network, as communicated through incoming BECN bits. If *updateBCI* is set to ***on***, then BCI bits for incoming frames will be set if the BECN on the frame is set. If *updateBCI* is set to ***off***, then incoming BECN bits has no effect. Setting *updateBCI* ***on*** for a DLCI means that the remote end of the DLCI, which is specified by the *remoteDna* and *remoteDlci* attributes of the *Dc* component of the *Dlci*, may perform Rate Adaptation using the flow of incoming BECN bits, in addition to internal congestion management systems. If the *rateAdaptation* attribute of the remote DLCI is provisioned as ***eirOnly***, ***cirProportionate***, or ***on***, then congestion from another network

Copyright © 2006, Nortel Nortel Confidential

	may trigger dynamic congestion management. If there is no rate adaptation at the other end, then the setting of the *updateBCI* attribute at this end has no effect.
Mib	FriUniSig
Values	off on
Default	off

ATTRIBUTE FrUni Sig defaultLocCheck (defLoc)

Access	Read and write
Criticality	Process
Description	This attribute specifies whether this end needs to check the location of Cause IE in a Release or a Disc message issued by local DTE. If this bit is set to ***on***, then this end checks the location of Cause IE issued by the local DTE and overwrite it by "user". If it is set to ***off***, then this end does not check the location in Cause IE.
Mib	FriUniSig
Values	off on
Default	on

GROUP FrUni Sig SystemParameters (SysParms)

Properties	Provisioned
Description	This group contains the provisionable FRF.4 system parameters.
Mib	FriUniSig

ATTRIBUTE FrUni Sig callSetupTimer (t303)

Access	Read and write
Description	This attribute specifies the time the network waits for a response to the SETUP message sent to the called user. Upon timer expiry, the SETUP message is retransmitted. The second expiry of this timer causes the call to be cleared.
Mib	FriUniSig
Values	Decimal (1..255)
Units	seconds
Default	4

ATTRIBUTE FrUni Sig disconnectTimer (t305)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the time the network waits for a response to the DISCONNECT message sent to the user. Upon timer expiry, the RELEASE message is sent.
Mib	FriUniSig
Values	Decimal (1..255)
Units	seconds
Default	30

ATTRIBUTE FrUni Sig releaseTimer (t308)

Access	Read and write
Description	This attribute specifies the time the network waits for a response to the RELEASE message sent to the user. Upon timer expiry, the RELEASE message is retransmitted. The second expiry of the timer causes the call to be released.
Mib	FriUniSig
Values	Decimal (1..255)
Units	seconds
Default	4

ATTRIBUTE FrUni Sig callProceedingTimer (t310)

Access	Read and write
Description	This attribute specifies the time the network waits for the CONNECT message from the called user after the network has received the optional CALL PROCEEDING message from the called user. Upon timer expiry, the call is cleared.
Mib	FriUniSig
Values	Decimal (1..255)
Units	seconds
Default	10

ATTRIBUTE FrUni Sig networkType (type)

Access	Read and write
Description	This attribute specifies whether this Frame Relay service is running on a public or a private network. This value is used solely in populating applicable information elements within those FRF.4 messages that require a public or private network indication.
Mib	FriUniSig

Copyright © 2006, Nortel Nortel Confidential

Values	private public
Default	private

ATTRIBUTE FrUni Sig restartReqTimer (t316)

Access	Read and write
Description	This attribute specifies the time the network waits for the RESTART ACKNOWLEDGE message from the adjacent network after sending a first RESTART message. Upon timer expiry, another RESTART message is sent. After the second expiry, the interface is treated as idle. If the *restartReqTimer* attribute is set to the default value, then the interface is treated as idle when it receives an indication that the link is up and does not send a RESTART message.
Mib	FriUniSig
Values	Decimal (0..255)
Units	seconds
Default	0

ATTRIBUTE FrUni Sig restartRcvTimer (t317)

Access	Read and write
Description	This attribute specifies the time the local network waits for the processing of a RESTART message received by the interface. Upon expiry of this timer, an alarm will be displayed to report the problem. The timer value must be less than the *restartReqTimer* provisioned value at the adjacent node.
Mib	FriUniSig
Values	Decimal (1..255)
Units	seconds
Default	110

ATTRIBUTE FrUni Sig statusEnqTimer (t322)

Access	Read and write
Description	This attribute specifies the time the network waits for the requested STATUS message from the adjacent network. Upon expiry of this timer, another STATUS ENQUIRY message will be sent.
Mib	FriUniSig
Values	Decimal (1..255)
Units	seconds

Copyright © 2006, Nortel Nortel Confidential

Default	4

GROUP FrUni Sig LapfSystemParameters (LapfSys)

Properties	Provisioned
Description	This group contains the provisionable attributes for the SVC data link layer. The data link layer is governed primarily through ITU specification Q.922, and operates over DLCI 0..
Mib	FriUniSig

ATTRIBUTE FrUni Sig windowSize (ws)

Access	Read and write
Description	This attribute specifies the window size. This is the maximum number of unacknowledged sequenced frames that may be outstanding from or to this interface at any one time.
Mib	FriUniSig
Values	Decimal (1..127)
Default	7

ATTRIBUTE FrUni Sig retransmitLimit (rtl)

Access	Read and write
Description	This attribute specifies the number of times a frame can be retransmitted by the SVC data link layer before appropriate recovery action is taken.
Mib	FriUniSig
Values	Decimal (0..20)
Default	3

ATTRIBUTE FrUni Sig ackTimer (at)

Access	Read and write
Description	This attribute specifies how long the layer 2 protocol waits for an acknowledgment to a sent frame. The value set for *ackTimer* must be less than the value set for *idleProbeTimer*.
Mib	FriUniSig
Values	Decimal (1000..10000)
Units	msec
Default	1500

ATTRIBUTE FrUni Sig ackDelayTimer (adt)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies how long the network waits before sending an acknowledgment for a received in-sequence I-frame. A value of 0 means that every frame is acknowledged and there will be no delay in acknowledgment. A non-zero value means that one acknowledgement is sent for a number of frames.
Mib	FriUniSig
Values	Decimal (0..10000)
Units	msec
Default	0

ATTRIBUTE FrUni Sig idleProbeTimer (ipt)

Access	Read and write
Description	This attribute specifies how long the link is permitted to remain idle (that is, no frames are exchanged on the data link). Upon expiry of this timer, the network side's link layer polls its peer for status. The value set for *idleProbeTimer* must be greater than the value set for *ackTimer*.
Mib	FriUniSig
Values	Decimal (1000..65535000)
Units	msec
Default	30000

GROUP FrUni Sig OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	FriUniSig

ATTRIBUTE FrUni Sig adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command

Copyright © 2006, Nortel Nortel Confidential

was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — FriUniSig

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE FrUni Sig operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — FriUniSig

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE FrUni Sig usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — FriUniSig

Values — idle
active (activ)
busy

Default	idle

GROUP FrUni Sig Statistics (Stats)

Properties	Operational
Description	This group contains the statistics related to the SVC signaling layer at the interface level.
Mib	FriUniSig

ATTRIBUTE FrUni Sig currentNumberOfSvcCalls (ncall)

Access	Read only
Description	This attribute indicates the number of Frame Relay SVCs currently existing on this interface.
Mib	FriUniSig
Values	Decimal (0..992)
Default	No default

ATTRIBUTE FrUni Sig inCalls (incall)

Access	Read only
Description	This attribute indicates the current number of incoming SVCs on this interface (that is, the number of SVCs for which this interface represents the destination end of the call).
Mib	FriUniSig
Values	Decimal (0..992)
Default	No default

ATTRIBUTE FrUni Sig inCallsRefused (icr)

Access	Read only
Description	This attribute counts the incoming SVC call requests that are rejected by either this interface or by the called user. When this count exceeds the maximum, it wraps to zero.
Mib	FriUniSig
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrUni Sig outCalls (outcall)

Access	Read only
Description	This attribute indicates the current number of outgoing SVCs on this interface (that is, the number of SVCs for which this interface represents the source end of the call).

Copyright © 2006, Nortel Nortel Confidential

Mib	FriUniSig
Values	Decimal (0..992)
Default	No default

ATTRIBUTE FrUni Sig outCallsFailed (ocf)

Access	Read only
Description	This attribute counts the outgoing SVC call requests that are rejected by either this interface, or by the network side of the destination end, or by the called user. When this count exceeds the maximum, it wraps to zero.
Mib	FriUniSig
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrUni Sig protocolErrors (pe)

Access	Read only
Description	This attribute counts the number of times a FRF.4 protocol error has occurred. Any one of the following events constitutes a protocol error: 1. In the user-signaled *Link Layer Core Parameters* IE within the SETUP or CONNECT messages, *Cir*, *Bc* and *Be* are all zero; 2. In the user-signaled *Link Layer Core Parameters* IE within the SETUP or CONNECT messages, *Cir* is zero but *Bc* is non-zero, or *Bc* is zero but *Cir* is non-zero; 3. In the user-signaled *Link Layer Core Parameters* IE within the SETUP or CONNECT messages, the *Minimum Acceptable CIR* is greater than *Cir*; 4. At the destination end, any of the destination to source direction link layer core parameters has been increased in the CONNECT message from the called user; 5. At the destination end, the destination to source direction *Cir* in the CONNECT message is smaller than the corresponding *minimum acceptable Cir* signaled to the called user; 6. At the source end, any of the source to destination direction link layer core parameters in the CONNECT message from the destination end has been increased; 7. At the source end, the source to destination direction *Cir*, after negotiation, is smaller than the corresponding *minimum acceptable Cir*; 8. The network has received a STATUS message from the user with an incompatible FRF.4 state. When this count reaches maximum, it wraps to zero.
Mib	FriUniSig
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE FrUni Sig qualityOfServiceNotAvailable (qosna)

Access	Read only
Description	This attribute counts the number of incoming and outgoing SVCs that are rejected because the quality of service requested cannot be met by the network. When this count reaches maximum, it wraps to zero.
Mib	FriUniSig
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrUni Sig setupTimeout (setupt)

Access	Read only
Description	This attribute counts the number of times the T303 setup timer has expired. When this count reaches maximum, it wraps to zero.
Mib	FriUniSig
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrUni Sig lastCauseInStatusMsgReceived (lcis)

Access	Read only
Description	This attribute indicates the cause value in the last received user's STATUS message to an existing call. The DLCI to which this STATUS message applies is specified in the *lastDlciReceivedStatus* attribute. The initial value of this attribute is **0** which means that no STATUS message has been received for an existing call yet.
Mib	FriUniSig
Values	Decimal (0..255)
Default	0

ATTRIBUTE FrUni Sig lastStateInStatusMsgReceived (lsis)

Access	Read only
Description	This attribute indicates the state value in the last received user's STATUS message to an existing call. The DLCI to which this STATUS message applies is specified in the *lastDlciReceivedStatus* attribute. The initial value of this attribute is **notApplicable**.
Mib	FriUniSig

ATTRIBUTE FrUni Sig lastDlciReceivedStatus (ldrs)

Access Read only

Description This attribute shows the value of the DLCI that has most recently received a STATUS message from the user.

The initial value of this attribute is **0**.

Mib FriUniSig

Values Decimal (0; 16..1007)

Default 0

ATTRIBUTE FrUni Sig bandwidthNotAvailable

Access Read only

Description This attribute counts the number of call failures for each bandwidth pool due to the requested bandwidth not being available.

Mib FriUniSig

Vector of Decimal (0..4294967295)

Index Decimal (0..15)

Default No default

GROUP FrUni Sig LapfStatus (LapfStatus)

Properties Operational

Description This group contains the Q.922 SVC data link layer status.

Mib FriUniSig

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrUni Sig **currentState (currState)**

Access	Read only
Description	This attribute shows the current state of the SVC data link layer interface.
Mib	FriUniSig
Values	disconnected linkSetup disconnectRequest informationTransfer waitingAck
Default	No default

ATTRIBUTE FrUni Sig **lastStateChangeReason (lscr)**

Access	Read only
Description	This attribute shows the reason for the most recent state change. ***notStarted*** - this is the default state after SVC data link has just been created. ***abmeEntered*** - SVC data link has entered Asynchronous Balanced Mode after SABME or UA has been received. ***abmeReset*** - the data link has been reset. ***dmReceived*** - DM response received. ***dmSent*** - DM sent. ***discReceived*** - DISC response received. ***discSent*** - DISC sent. ***frmrReceived*** - FRMR received. ***n200RetranTimeOut*** - *retransmitLimit* has been exceeded. ***other*** - unspecified state change reasons. The most likely reason for this is the transition from state ***waitingAck*** to state ***informationTransfer***.
Mib	FriUniSig
Values	notStarted abmeEntered abmeReset dmReceived dmSent discReceived discSent frmrReceived n200RetranTimeOut other
Default	notStarted

ATTRIBUTE FrUni Sig **frmrReceive (frmrr)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute shows the information field of the Frame Reject (FRMR) most recently received.
Mib	FriUniSig
Values	String (0..8, Hex)
Default	No default

ATTRIBUTE FrUni Sig currentQueueSize (queues)

Access	Read only
Description	This attribute shows the current number of frames in the SVC data link layer transmit queue.
Mib	FriUniSig
Values	Decimal (0..4294967295)
Default	No default

GROUP FrUni Sig LapfStatistics (LapfStats)

Properties	Operational
Description	This group contains the statistics for the SVC data link layer.
Mib	FriUniSig

ATTRIBUTE FrUni Sig stateChange

Access	Read only
Description	This attribute counts the number of times the SVC data link layer interface has changed state. While the data link layer is in ***informationTransfer*** state, this counter will increment on each expiry of *idleProbeTimer* as its state goes from ***informationTransfer*** to ***waitingAck*** and back. When this count exceeds the maximum, it wraps to zero.
Mib	FriUniSig
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrUni Sig remoteBusy

Access	Read only
Description	This attribute counts the number of times transmission of an I-frame was unsuccessful due to a perceived remote busy condition (window closed or remote busy). When this count reaches maximum, it wraps to zero.
Mib	FriUniSig
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrUni Sig receiveRejectFrame

Access	Read only
Description	This attribute counts the number of REJ frames received by the interface. When this count reaches maximum, it wraps to zero.
Mib	FriUniSig
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrUni Sig ackTimeout

Access	Read only
Description	This attribute counts the number of times the *ackTimer* has expired. Frequent increments of this counter indicate a problem at the link or improper values have been chosen for *ackTimer* and *ackDelayTimer* between the local and remote sides. When this count reaches maximum, it wraps to zero.
Mib	FriUniSig
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrUni Sig iFramesTransmitted

Access	Read only
Description	This attribute counts the number of SVC I-frames transmitted to the interface on DLCI 0. An I-frame may be counted more than once if there are retransmissions at the SVC data link layer. When this count reaches maximum, it wraps to zero.
Mib	FriUniSig
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrUni Sig iFramesTxDiscarded

Access	Read only
Description	This attribute counts the number of SVC I-frames that are bound for the link but have been discarded. Discard reasons may be one of the following: 1. the frame length is beyond the allowed limit. 2. the SVC data link layer is in ***disconnected*** state. 3. the transmit queue has been purged because the queue length has reached the reset threshold. 4. the transmit queue or the queue waiting for acknowledgment has been purged because the link cannot be re-established.

Copyright © 2006, Nortel Nortel Confidential

When this count reaches maximum, it wraps to zero.

Mib	FriUniSig
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrUni Sig iFramesReceived

Access	Read only
Description	This attribute counts the number of SVC I-frames received from the interface. When this count reaches maximum, it wraps to zero.
Mib	FriUniSig
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrUni Sig iFramesRcvdDiscarded

Access	Read only
Description	This attribute counts the number of SVC I-frames received but have been discarded. The discard reasons are: 1. incorrect frame size 2. frame is out of sequence 3. frame received while the network side of the SVC data link layer is not in the ***informationTransfer*** or ***waitingAck*** state. When this count reaches maximum, it wraps to zero.
Mib	FriUniSig
Values	Decimal (0..4294967295)
Default	No default

GROUP FrUni Sig FrsSvcAcc (Svcacc)

Properties	Provisioned
Description	This group contains the provisionable attribute which controls accounting for this interface.
Mib	FriUniSig

ATTRIBUTE FrUni Sig defaultAccounting (defAcc)

Access	Read and write
Criticality	Process
Description	This attribute specifies whether accounting data collection and record generation is turned on for switched connections at this interface. For

Copyright © 2006, Nortel Nortel Confidential

accounting data collection and record generation to occur, this attribute must be ***on*** and at least one of the *accountCollection* reasons in the *Dna* component must be present.

Mib	FriUniSig
Values	off on
Default	on

GROUP FrUni Sig LastSvcClearCodes (Codes)

Properties	Operational
Description	This group contains the remote data network address, the last SVC clear cause and the last SVC diagnostic code coming from the subnet or the local VC.
Mib	FriUniSig

ATTRIBUTE FrUni Sig lastClearRemoteDataNetworkAddress

Access	Read only
Description	This attribute indicates the Data Network Address (DNA) of the remote (the other end of the SVC connection) of the call which cleared last and whose clear and diagnostic codes were recorded.
Mib	FriUniSig
Values	BCD (0..15)
Default	No default

ATTRIBUTE FrUni Sig lastClearCause

Access	Read only
Description	This attribute indicates the last SVC clear cause signaled at the end of the connection or failure to connect. It is updated only if the clear request comes from the subnet or the call is rejected locally by the VC. The same set of possible values provides the clear cause field in the accounting record.
Mib	FriUniSig
Values	Decimal (0..255)
Default	0

ATTRIBUTE FrUni Sig lastDiagnosticCode

Access	Read only
Description	This attribute indicates the last SVC diagnostic code signaled at the end of the connection or failure to connect. It is updated if the clear request comes from the subnet or the call is rejected locally by the VC. The same

	set of possible values provides the diagnostic code field in the accounting record.
Mib	FriUniSig
Values	Decimal (0..255)
Default	0

COMPONENT FrUni VirtualFramer (VFramer)

Groups	GROUP FrUni VFramer Provisioned (Prov) GROUP FrUni VFramer OsiState (State) GROUP FrUni VFramer Statistics (Stats)
Scope	Application
Description	*FrUni/n VirtualFramer* *FrDte/n VirtualFramer* The *VirtualFramer* component binds two services together to provide data transfer between them. It is mutually exclusive from *Framer* component.
Mib	FrameRelayUni
Common Verbs	Help List Display Add DELete

GROUP FrUni VFramer Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisionable attributes for the *VirtualFramer* component.
Mib	FrameRelayUni

ATTRIBUTE FrUni VFramer otherVirtualFramer (ovf)

Access	Read and write
Criticality	Process
Description	This attribute specifies the other *VirtualFramer* to which the service is linked, for example, *FrUni/n VirtualFramer*, *FrDte/n VirtualFramer.*
Mib	FrameRelayUni
Values	Link (Service, otherVirtualFramer)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrUni VFramer **logicalProcessor (lp)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the logical processor on which the service component will reside.
Mib	FrameRelayUni
Values	Link (Hardware, linkToApplications)
Default	No default

GROUP FrUni VFramer **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	FrameRelayUni

ATTRIBUTE FrUni VFramer **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	FrameRelayUni
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrUni VFramer operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	FrameRelayUni
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE FrUni VFramer usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	FrameRelayUni
Values	idle active (activ) busy
Default	idle

GROUP FrUni VFramer Statistics (Stats)

Properties	Operational
Description	This group contains the operational statistics data for a *VirtualFramer* component.
Mib	FrameRelayUni

ATTRIBUTE FrUni VFramer frmToOtherVFramer

Access	Read only
Description	This attribute counts the frames transmitted to the *otherVirtualFramer*.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayUni
Values	Long Integer
Default	No default

ATTRIBUTE FrUni VFramer frmFromOtherVFramer

Access	Read only
Description	This attribute counts the frames received from the *otherVirtualFramer*.
Mib	FrameRelayUni
Values	Long Integer
Default	No default

ATTRIBUTE FrUni VFramer octetFromOtherVFramer

Access	Read only
Description	This attribute counts the octets received from the *otherVirtualFramer*.
Mib	FrameRelayUni
Values	Long Integer
Default	No default

ATTRIBUTE FrUni VFramer discFrmFromOtherVFramer (discFrmFromOvf)

Access	Read only
Description	This attribute counts the discarded frames from the *otherVirtualFramer*. Incrementing of this counter indicates that some incoming traffic cannot be handled by the FP.
Mib	FrameRelayUni
Values	Long Integer
Default	No default

COMPONENT FrUni LoadTestSystem (Lts)

Groups	GROUP FrUni Lts Setup (Setup) GROUP FrUni Lts OperationalState (State) GROUP FrUni Lts Results (Results)

Description	*RESET FrUni/n Lts* This verb clears the TestStatistics

GROUP FrUni Lts **Setup (Setup)**

Properties	Operational
Description	This attribute group contains the parameters used to configure the behavior of the Frame Relay Load Test System.
Mib	FrameRelayUni

ATTRIBUTE FrUni Lts **duration (dur)**

Access	Read and write
Description	This attribute specifies the duration of the test in milliseconds. The test will run until the duration expires or the STOP command is issued. A value of 0 is used to indicate infinity.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Units	msec

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE FrUni Lts algorithm (alg)

Access	Read and write
Description	This attribute specifies which algorithm is used to generate the frames. **ContinuousBurst** This mode of traffic generation creates traffic at the maximum rate possible until all of the frames have been sent. The generator then waits until the end of the timeInterval to begin again. **IntervalBurst** This algorithm attempts to generate 10 ms bursts of burstSize frames. It will generate as many of the burstSize frames as it can per sub-interval. **DelayedBurst** This algorithm generates bursts of burstSize frames separated by 10 ms delays. **FixedBurst** This aglorithm is similar to IntervalBurst, except a fixed burst size of 12 frames is used. **delayMeasurement** This algorithm is used to measure delay. The specified number of frames in the indicated pattern are generated, one at a time, with a maximum wait of maxDelay before sending the next frame. This algorithm is not implemented yet.
Mib	FrameRelayUni
Values	continousBurst (cont) intervalBurst (int) delayBurst (delay) fixedBurst (fixed)
Default	continousBurst

ATTRIBUTE FrUni Lts burstSize (fpb)

Access	Read and write
Description	This attribute specifies the number of frames per burst under the delayedBurst and intervalBurst algorithms.
Mib	FrameRelayUni
Values	Decimal (1..250)
Default	50

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrUni Lts timeInterval (tint)

Access	Read and write
Description	This attribute specifies the time interval to the specified number of seconds. Granuality is in centiseconds. Maximum is 1 minute.
Mib	FrameRelayUni
Values	Decimal (1..60000)
Units	csec
Default	100

GROUP FrUni Lts OperationalState (State)

Properties	Operational
Description	This group contains the operation statistics of the load generator.
Mib	FrameRelayUni

ATTRIBUTE FrUni Lts generatorState (gstate)

Access	Read only
Description	This attribute indicates whether the Lts is generating traffic.
Mib	FrameRelayUni
Values	stopped running
Default	stopped

ATTRIBUTE FrUni Lts cycleIncomplete (cycle)

Access	Read only
Description	This attribute indicates whether the time required to generate all of the enabled patterns is more than timeInterval by a true value. Otherwise, this flag is set to false. Default is True.
Mib	FrameRelayUni
Values	false true
Default	true

ATTRIBUTE FrUni Lts lastActiveInterval (actInt)

Access	Read only
Description	This attribute indicates the actual time it took to generate all of the enabled patterns in the last cycle. If cycleIncomplete is true, this value should be zero.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Units	microsec
Default	No default

ATTRIBUTE FrUni Lts load

Access	Read only
Description	This attribute indicates the load being generated. This value represents that calculated using the set number of ticks. The actual burstTimeInterval may differ. One entire cycle of the patterns is completed in activeInterval and thus most of the load may be concentrated early in the set interval.
Mib	FrameRelayUni
Values	Decimal (0.000..4294967.295)
Units	kbit/s
Default	No default

ATTRIBUTE FrUni Lts elapsedGenerationTime (etime)

Access	Read only
Description	This attribute indicates how many milliseconds have elapsed since the start of this test.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Units	msec
Default	No default

GROUP FrUni Lts Results (Results)

Properties	Operational
Description	This group contains the frame counting attributes for the LTS component.
Mib	FrameRelayUni

ATTRIBUTE FrUni Lts framesTx

Access	Read only
Description	This attribute specifies the number of frames send to the network since the last time these statistics were cleared. This is similar to the framesToIf attribute of the FRAMER component.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE FrUni Lts bytesTx

Access	Read only
Description	This attribute indicates the number of bytes sent.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Units	bytes
Default	0

ATTRIBUTE FrUni Lts bitRateTx

Access	Read only
Description	This attribute indicates the bit rate being sent to the link. It should only differ from the load if the burstTimeInterval would be >= the timeInterval or burstSize frames cannot be generated in 10ms (intervalBurst algorithm).
Mib	FrameRelayUni
Values	Decimal (0.000..4294967.295)
Units	kbit/s
Default	0.000

ATTRIBUTE FrUni Lts frameRateTx

Access	Read only
Description	This attribute indicates the frame rate being sent to the link. It is calculated using the number of frames sent to the link in one cycle of the patterns.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Units	frame/s
Default	0

COMPONENT FrUni Lts Pattern (Pat)

VERB TRIGGER FrUni Lts Pat

Impact	Service
Description	TRIGGER FrUni/x Lts Pattern/y This verb triggers the single execution of the specified pattern. In order for this command to be executed, the Lts component cannot be generating traffic.

GROUP FrUni Lts Pat **Defaults (Defaults)**

Properties	Provisioned
Description	This attribute group contains the specifications of the pattern.
Mib	FrameRelayUni

ATTRIBUTE FrUni Lts Pat **defaultDlci (dDlci)**

Access	Read and write
Description	This attribute specifies for which DLCI (on the local end) the frames are destined.
Mib	FrameRelayUni
Values	Decimal (16..1007)
Default	16

ATTRIBUTE FrUni Lts Pat **defaultNumFrames (dNum)**

Access	Read and write
Description	This attribute specifies the number of frames in this pattern. This is the number of frames of this type that are generated in one time interval.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	100

ATTRIBUTE FrUni Lts Pat **defaultDataSize (dSize)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the payload size of each frame in bytes. This is in excess to the header.
Mib	FrameRelayUni
Values	Decimal (0..8200)
Units	octets
Default	512

ATTRIBUTE FrUni Lts Pat defaultHeaderBits (dBits)

Access	Read and write
Description	This attribute specifies whether specific bits are on/off in the header of each frame.
Mib	FrameRelayUni
Set of	becn fecn cr de
Default	No default

ATTRIBUTE FrUni Lts Pat defaultHeaderLength (dLen)

Access	Read and write
Description	This attribute specifies the size of the frame relay header in bytes. Only 2-byte headers are supported at this time.
Mib	FrameRelayUni
Values	Decimal (0; 2..4)
Units	octets
Default	2

ATTRIBUTE FrUni Lts Pat defaultEABits (dEABits)

Access	Read and write
Description	This attribute specifies how the address field extension bits are set in the frame header. Consider the value to be a four bit binary number. For example, 4 = 0100. Only the first *headerLength* bits are used. For instance, suppose headerLength is 3, then the appropriate EABits is 2, or 0010. This attribute can be used to create a header of length greater than two bytes or to specify incorrect EABits in the header.
Mib	FrameRelayUni
Values	Hex (H.0..H.f)

Copyright © 2006, Nortel Nortel Confidential

Default	H.4

ATTRIBUTE FrUni Lts Pat defaultPayloadPattern (dPattern)

Access	Read and write
Description	This attribute specifies the payload of each frame. The value specified is in hexadecimal, where every two digits represent a byte. A maximum of 24 digits (12 bytes) may be set, after which the pattern will repeat in the payload (depending on the *repeatPattern* attribute). NOTE: If an RFC 1490 header is specified, via the 1490Header attribute, the specified pattern will begin following the header (that is, at the 9th byte in the payload).
Mib	FrameRelayUni
Values	String (1..12, Hex)
Default	55

ATTRIBUTE FrUni Lts Pat defaultRfc1490Header (d1490)

Access	Read and write
Description	This attribute specifies the appropriate RFC 1490 encapsulated header of the frame. A value of 0 indicates no 1490 header. NOTE: This header resides in the first 8 bytes of the payload. If the specified value is non-zero, then the payload pattern provisioned will begin at the 9th byte.
Mib	FrameRelayUni
Values	0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 none
Default	none

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrUni Lts Pat defaultUseBadLrc (dBadLrc)

Access	Read and write
Description	This attribute specifies whether the frames from this pattern are to have a bad LRC prior to being sent to the framer. The LRC is checked while the frame is being put onto the link and the failure should cause an abort frame to be sent.
Mib	FrameRelayUni
Values	no yes
Default	no

GROUP FrUni Lts Pat Setup (Setup)

Properties	Operational
Description	This attribute group contains the specifications of the pattern.
Mib	FrameRelayUni

ATTRIBUTE FrUni Lts Pat dlci

Access	Read and write
Description	This attribute specifies for which DLCI (on the local end) the frames are destined.
Mib	FrameRelayUni
Values	Decimal (16..1007)
Default	16

ATTRIBUTE FrUni Lts Pat numFrames (num)

Access	Read and write
Description	This attribute specifies the number of frames in this pattern. This is the number of frames of this type that are generated in one time interval.
Mib	FrameRelayUni
Values	Decimal (0..4294967295)
Default	100

ATTRIBUTE FrUni Lts Pat dataSize (size)

Access	Read and write
Description	This attribute specifies the payload size of each frame in bytes. This is in excess to the header.
Mib	FrameRelayUni

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..8200)
Units	octets
Default	512

ATTRIBUTE FrUni Lts Pat headerBits (bits)

Access	Read and write
Description	This attribute specifies whether the following bits are on/off in the header of each frame.
Mib	FrameRelayUni
Set of	becn fecn cr de
Default	No default

ATTRIBUTE FrUni Lts Pat headerLength (len)

Access	Read and write
Description	This attribute specifies the size of the frame relay header in bytes. Only 2-byte headers are supported at this time. Valid values are 0, 2, 3, 4. 0 indicates to use no header. That is, the frame starts with either the payload or an RFC 1490 header.
Mib	FrameRelayUni
Values	Decimal (0; 2..4)
Units	octets
Default	2

ATTRIBUTE FrUni Lts Pat eaBits

Access	Read and write
Description	This attribute specifies how the address field extension bits are set in the frame header. Consider the value to be a four bit binary number. For example, 4 = 0100. Only the first headerLength bits are used. For instance, suppose headerLength is 3, then the appropriate eaBits is 2, or 0010. This attribute can be used to create a header of length greater than two bytes or to specify incorrect eaBits in the header.
Mib	FrameRelayUni
Values	Hex (H.0..H.f)
Default	H.4

ATTRIBUTE FrUni Lts Pat payloadPattern (pattern)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the payload of each frame. The value specified is in hexadecimal, where every two digits represent a byte. A maximum of 24 digits (12 bytes) may be set, after which the pattern repeats in the payload (depending on *repeatPattern* attribute). NOTE: If an RFC 1490 header is specified, via the *1490Header* attribute, the specified pattern begina following the header (that is, at the 9th byte in the payload).
Mib	FrameRelayUni
Values	String (1..12, Hex)
Default	55

ATTRIBUTE FrUni Lts Pat **rfc1490Header (rfc)**

Access	Read and write
Description	This attribute specifies the appropriate RFC 1490 encapsulated header of the frame. A value of 0 indicates no 1490 header. NOTE: This header resides in the first 8 bytes of the payload. If the specified value is non-zero, then the payload pattern provisioned will begin at the 9th byte.
Mib	FrameRelayUni
Values	0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 none
Default	none

ATTRIBUTE FrUni Lts Pat **useBadLrc**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies whether the frames from this pattern are to have a bad LRC prior to being sent to the framer. The LRC is checked while the frame is being put onto the link and the failure should cause an abort frame to be sent.
Mib	FrameRelayUni
Values	no yes
Default	no

GROUP FrUni Lts Pat OperationalData (OpData)

Properties	Operational
Description	This group contains the operational attributes which allow changing the pattern outside of provisioning mode.
Mib	FrameRelayUni

ATTRIBUTE FrUni Lts Pat framePattern

Access	Read only
Description	This attribute displays the first 20 to 24 bytes of the frame payload, depending on the frame relay header size selected. This attribute represents the frame if it were at least 20 to 24 bytes in size. That is, the actual frame may be smaller.
Mib	FrameRelayUni
Values	String (20..24, Hex)
Default	No default

ATTRIBUTE FrUni Lts Pat hdlcBitsInserted (hdlc)

Access	Read only
Description	This attribute displays how many times a zero bit will be inserted after 5 consecutive 1 bits when a frame from this pattern is sent out.
Mib	FrameRelayUni
Values	Decimal (0..65535)
Default	No default

GROUP FrUni Lts Pat OperationalState (OpState)

Properties	Operational
Description	This group contains the attributes containing the operational statistics of the pattern.
Mib	FrameRelayUni

ATTRIBUTE FrUni Lts Pat load

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the load due to this particular pattern. The loads associated with all of the provisioned patterns are summed to arrive at the FrLts load.
Mib	FrameRelayUni
Values	Decimal (0.000..4294967.295)
Units	kbit/s
Default	No default

ATTRIBUTE FrUni Lts Pat status

Access	Read and write
Description	This attributes specifies the administrative state of the pattern. A disabled pattern is not generated, although it can still be triggered.
Mib	FrameRelayUni
Values	disabled enabled
Default	enabled

COMPONENT FrUni DirectConnection (Dconn)

Groups	GROUP FrUni Dconn DirectFrDteConnData (DirData)
Scope	Application
Description	'FrUni/n DirectConnection' A *DirectConnection* can not be provisioned under a *FrUni* if any of its *Dlci* subcompoentents has an *IpConnection* or *BnxInterworkingFunction* component provisioned under it.

Common Verbs	Help List Display Add DELete

GROUP FrUni Dconn DirectFrDteConnData (DirData)

Properties	Provisioned
Description	This group contains the attribute for creating a Direct Connection for IP over Frame Relay networking between FrUni and FrDte.
Mib	FrameRelayUni

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrUni Dconn directFrDteConnection (direct)

Access	Read and write
Criticality	Process
Description	This attribute specifies the FrUni to which the FrDte will be connected to via the Direct Connect feature. This attribute must be linked to a *FrDte DirectConnection* component or a semantic check error is generated.
Mib	FrameRelayUni
Values	Link (Service, directFrUniConnection)
Default	No default

COMPONENT FrUni ServiceTrace (SrvTrace)

Groups	GROUP FrUni SrvTrace Operational
Scope	Application
Description	*FrUni/n ServiceTrace* *FrNni/n ServiceTrace* The *ServiceTrace* component of the Frame Relay service determines if the trace capability is allowed on this interface. If it is not provisioned, then a service trace session cannot be started on this service. Frame Relay service trace is restricted to use FrameRelay, X25 or ATM service trace receiver. If the *SrvTrace rcvr* operational attribute is set to a string name of FrAtm service trace receiver, *Start* command will return a “Receiver Not Supported” response.
Mib	FrameRelayUniTrace
Dyn. Subcomp.	COMPONENT FrUni SrvTrace Filter

VERB Stop FrUni SrvTrace

Impact	Service
Description	*Stop FrUni/n ServiceTrace* *Stop FrNni/n ServiceTrace* This command stops a Frame Relay service trace session.

GROUP FrUni SrvTrace **Operational**

Properties	Operational
Description	This group provides the operational attributes for the *SrvTrace* component.
Mib	FrameRelayUniTrace

ATTRIBUTE FrUni SrvTrace **receiverName (rcvr)**

Access	Read and write
Description	This attribute should be set to the name of the desired trace receiver before starting a trace session. All available trace receivers are listed under the *SrvTrace Rcvr* component. This attribute cannot be set while the service trace is active. The receiver name is validated by the trace manager when the service *SrvTrace* is started.
Mib	FrameRelayUniTrace
Values	String (0..8, ASCII)
Default	No default

ATTRIBUTE FrUni SrvTrace **duration**

Access	Read and write
Description	This attribute specifies the duration, in minutes, of a trace session. A value of ***0*** indicates unlimited duration in which case a trace session remains active until a *Stop* command is issued. This attribute cannot be set while a trace is active.
Mib	FrameRelayUniTrace
Values	Decimal (0..9999)
Units	minutes
Default	60

ATTRIBUTE FrUni SrvTrace **queueLimit**

Access	Read and write
Description	This attribute specifies the total number of bytes of traced data which may be queued for transmission to the trace receiver. When this limit is exceeded, incoming traced frames are discarded. This attribute can be set while a trace is active and takes effect immediately.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayUniTrace
Values	Decimal (1..100)
Units	Kbyte
Default	20

ATTRIBUTE FrUni SrvTrace session

Access	Read only
Description	This attribute indicates the *SrvTrace Session* component that is forwarding the trace data. This attribute is set automatically, and is empty unless the service trace is active.
Mib	FrameRelayUniTrace
Values	The name of the component
Default	No default

COMPONENT FrUni SrvTrace Filter

Groups	GROUP FrUni SrvTrace Filter Operational
Scope	Application
Description	*FrUni/n SrvTrace Filter* *FrNni/n SrvTrace Filter* The *Filter* component defines the type of traced data that is sent to the receiver. The *Filter* component provides default values for all its attributes which are sufficient to start a trace session. If required, these attributes may be changed before or during a trace session.
Mib	FrameRelayUniTrace
Common Verbs	Help List Display

GROUP FrUni SrvTrace Filter Operational

Properties	Operational
Description	This group provides the operational attributes for the Frame Relay *SrvTrace Filter* component.
Mib	FrameRelayUniTrace

ATTRIBUTE FrUni SrvTrace Filter traceType (type)

Access	Read and write
Description	This attribute specifies the level of filtering required for this trace session. A value of ***lmi*** indicates that LMI frames are traced. A value of ***dlci*** indicates that frames from the *Dlci* specified by the *tracedDlci* attribute are

Copyright © 2006, Nortel Nortel Confidential

traced. A value of ***badFrames*** indicates that bad received frames (overruns, CRC errors, aborts) are traced. The default is to trace all frames. This attribute can be set while a trace is active and takes effect immediately.

Mib	FrameRelayUniTrace
Set of	lmi dlci badFrames
Default	(lmi, dlci, badFrames)

ATTRIBUTE FrUni SrvTrace Filter **tracedDlci (dlci)**

Access	Read and write
Description	This attribute specifies a particular DLCI to trace. A value of ***0*** specifies that all DLCIs are to be traced. This attribute can be set while a trace is active and takes effect immediately.
Mib	FrameRelayUniTrace
Values	Decimal (0..1007)
Default	0

ATTRIBUTE FrUni SrvTrace Filter **direction (dir)**

Access	Read and write
Description	This attribute specifies the direction of the data to be traced as viewed by the service. The values can be ***egress*** and ***ingress***. An ***egress*** value indicates frames outbound from the service. An ***ingress*** value indicates frames inbound to the service. This attribute can be set while a trace is active and takes effect immediately.
Mib	FrameRelayUniTrace
Set of	egress ingress
Default	(egress, ingress)

ATTRIBUTE FrUni SrvTrace Filter **tracedLength (len)**

Access	Read and write
Description	This attribute specifies the maximum number of octets to trace per frame starting from the octet following the frame flag. If the frame length is longer than the value specified by this attribute, then the traced frame is truncated. If set to ***disabled***, the traced frame is not truncated. This attribute can be set while a trace is active and takes effect immediately.

Copyright © 2006, Nortel Nortel Confidential

If the Frame Relay *SrvTrace* is started with an ATM service trace receiver, the *tracedLength* attribute of ATM service trace receiver is ignored.

Mib	FrameRelayUniTrace
Values	Decimal (1..4000) disabled
Units	octets

COMPONENT FrUni Isdn

Groups	GROUP FrUni Isdn Provisioned (Prov) GROUP FrUni Isdn Operational (Oper)
Scope	Application
Description	*FrUni/n Isdn* This component defines the parameters associated with the ISDN B-Channel interface. Adding this component makes the *FrUni* behave as an ISDN access to the Frame Relay Network.
Mib	FrameRelayIsdn
Common Verbs	Help List Display Add DELete

GROUP FrUni Isdn Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes of the Isdn component.
Mib	FrameRelayIsdn

ATTRIBUTE FrUni Isdn t320

Access	Read and write
Criticality	Process
Description	This attribute specifies the waiting time for a silent B-Channel (no active VCs associated with the *FrUni*) to be disconnected and made available. Default is 60 seconds. 0 means t320 never times out.
Mib	FrameRelayIsdn
Values	Decimal (0..255)

Copyright © 2006, Nortel Nortel Confidential

Units	seconds
Default	60

ATTRIBUTE FrUni Isdn addressSignalling (asig)

Access	Read and write
Criticality	Process
Description	This attribute defines whether the ISDN Calling Party Number is to be signaled to the remote DTE during an SVC call establishment. Otherwise, no changes to the current behavior of SVC call establishment (that is, the DNA is used in the calling party number information element).
Mib	FrameRelayIsdn
Values	IsdnDna normalBehavior
Default	normalBehavior

GROUP FrUni Isdn Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes of the *Isdn* component.
Mib	FrameRelayIsdn

ATTRIBUTE FrUni Isdn dataSigChan

Access	Read only
Description	This attribute indicates the instance number of the *dataSigChan* component controlling the allocation of this *FrUni Isdn* component.
Mib	FrameRelayIsdn
Values	Decimal (1..255)
Default	No default

ATTRIBUTE FrUni Isdn bChannelState (bState)

Access	Read only
Description	This attribute indicates the state of the B-Channel. If the value is ***idle*** it means that no VCs are connected and this B-Channel is available. If the value is ***busy*** it means this B-Channel has been allocated and is not available. If the value is ***disabled*** it means the application interface or the port is locked or disabled.
Mib	FrameRelayIsdn
Values	idle busy disabled

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE FrUni Isdn lastUsedCgpn (lucgpn)

Access	Read only
Description	This attribute indicates the calling party number currently using the B-Channel. When the B-Channel is free, the null string is displayed.
Mib	FrameRelayIsdn
Values	BCD (0..15)
Default	No default

ATTRIBUTE FrUni Isdn bChanIntState (bInt)

Groups	GROUP FrUni Bp Provisioned (Prov) GROUP FrUni Bp OsiState (State) GROUP FrUni Bp Operational (Op)
Scope	Application
Description	*FrUni/n BnxProtocol* *FrNni/n BnxProtocol* This component defines how the Frame Relay interface handles the BNX protocol.
Mib	FrUniPvcBnx
Common Verbs	Help List Display Add DELete

GROUP FrUni Bp Provisioned (Prov)

Properties	Provisioned
Description	This group defines the provisioning attributes to control the BNX protocol running on the Frame Relay interface.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrUniPvcBnx

ATTRIBUTE FrUni Bp linkToIpServer (linkToIp)

Access	Read and write
Description	This attribute specifies the link to a Frame Relay IP server.
Mib	FrUniPvcBnx
Values	Link (Service, linkToFrameRelayApps)
Default	No default

ATTRIBUTE FrUni Bp ipAddress (ipadd)

Access	Read and write
Description	This attribute specifies the IP address associated with the Frame Relay interface. This address must be in the same subnet as the *ProtocolPort* associated with the *FrIpServer*.
Mib	FrUniPvcBnx
Values	IP address
Default	0.0.0.0

ATTRIBUTE FrUni Bp crossNetEnabled (cne)

Access	Read and write
Description	This attribute specifies whether or not cross-net status messages are sent from the Frame Relay interface.
Mib	FrUniPvcBnx
Values	no yes
Default	yes

ATTRIBUTE FrUni Bp crossNetPollingInterval (cnpi)

Access	Read and write
Description	This attribute specifies the time interval between two cross-net status messages. This attribute is used for both sending and expecting status messages. The two ends of a PVC should be provisioned with values within a close range. Otherwise, it could result in PVC failure.
Mib	FrUniPvcBnx
Values	Decimal (30..86400)
Units	seconds
Default	120

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrUni Bp crossNetAsyncUpdate (cnau)

Access	Read and write
Description	This attribute specifies when a cross-net status message is sent following a BNX DLCI state change. If set to ***enabled***, the status message is sent as soon as the state change occurs. If set to ***disabled***, the state of the BNX DLCI will be sent in a cross-net status message only at the next polling interval. The polling interval is determined by *crossNetPollingInterval* attribute. The *crossNetAsyncUpdate* attribute is ignored if *crossNetEnabled* is set to ***no***.
Mib	FrUniPvcBnx
Values	disabled enabled
Default	enabled

ATTRIBUTE FrUni Bp crossNetListenEnabled (cnle)

Access	Read and write
Description	This attribute specifies whether or not to expect cross-net status messages. When set to ***yes***, this interface wait for a cross-net status message from the remote end to declare the PVCs up or down. When set to ***no***, the interface assumes the PVCs are always up.
Mib	FrUniPvcBnx
Values	no yes
Default	yes

ATTRIBUTE FrUni Bp crossNetErrorThreshold (cnet)

Access	Read and write
Description	This attribute specifies how many *crossNetPollingIntervals* without receiving a status message from the remote end are permitted to elapse before declaring the PVC down.
Mib	FrUniPvcBnx
Values	Decimal (1..30)
Default	3

ATTRIBUTE FrUni Bp trafficPriorityEnabled (tpe)

Access	Read and write
Description	This attribute specifies how to set the "Priority Level" field of the BNX header. When set to ***no***, both the *defaultTrafficPriority* attribute of the *BnxProtocol* component and the *trafficPriority* attribute of the *BnxIwf* component are ignored, and the "Priority Level" field is set to ***2***. When set

Copyright © 2006, Nortel Nortel Confidential

to ***yes***, the "Priority Level" field is set to the value of the *trafficPriority* attribute of the *BnxIwf*, unless the *trafficPriority* attribute has a value of ***useDefault***. In this case the “Priority Level” field is set to the value of the *defaultTrafficPriority* attribute.

Mib	FrUniPvcBnx
Values	no yes
Default	no

ATTRIBUTE FrUni Bp defaultTrafficPriority (dtp)

Access	Read and write
Description	This attribute specifies the default traffic priority used to tag all the ingress traffic. This attribute is used when the *trafficPriority* attribute of the *BnxIwf* is set to ***useDefault***. A larger value denotes a lower priority. This attribute is ignored if the *trafficPriorityEnabled* is set to ***no***.
Mib	FrUniPvcBnx
Values	Decimal (1..3)
Default	2

ATTRIBUTE FrUni Bp trafficDiscardLevel (tdl)

Access	Read and write
Description	This attribute specifies the discard level used to tag ingress traffic.This value is ignored when the attribute *discardLevelEnabled* is set to ***no***. In this case, the "Discard Level" field of BNX header is set to ***2*** for DE=1 datagrams and to ***4*** for DE=0 datagrams. When *discardLevelEnabled* is set to ***yes***, the "Discard Level" field is tagged with the value of *trafficDiscardLevel* attribute. The "Discard Level" value is used as follows: Discard Level=***1***: drop datagrams when congestion level >= 1 Discard Level=***2***: drop datagrams when congestion level >= 2 Discard Level=***3***: drop datagrams when congestion level >= 3 Discard Level=***4***: drop datagrams when congestion level >= 4
Mib	FrUniPvcBnx
Values	Decimal (1..4)
Default	4

ATTRIBUTE FrUni Bp discardLevelEnabled (dle)

Access	Read and write
Description	This attribute specifies how to use discard level to tag ingress traffic. When set to ***yes***, the provisioned *trafficDiscardLevel* is used. Otherwise ingress DE=1 datagrams are tagged with discard level ***2*** and DE=0 datagrams are tagged with discard level ***4***.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrUniPvcBnx
Values	no yes
Default	no

GROUP FrUni Bp OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	FrUniPvcBnx

ATTRIBUTE FrUni Bp adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	FrUniPvcBnx
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE FrUni Bp operationalState (osiOper)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	FrUniPvcBnx
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE FrUni Bp usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	FrUniPvcBnx
Values	idle active (activ) busy
Default	idle

ATTRIBUTE FrUni Bp availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrUniPvcBnx
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE FrUni Bp proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrUniPvcBnx
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE FrUni Bp controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.
Mib	FrUniPvcBnx
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE FrUni Bp alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib — FrUniPvcBnx

Set of — underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default — No default

ATTRIBUTE FrUni Bp standbyStatus (osiStby)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrUniPvcBnx
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE FrUni Bp unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	FrUniPvcBnx
Values	false true
Default	false

GROUP FrUni Bp Operational (Op)

Properties	Operational
Description	This attribute group contains the operational status of the *BnxProtocol* component.
Mib	FrUniPvcBnx

ATTRIBUTE FrUni Bp invalidBnxHeader (ibh)

Access	Read only
Description	This attribute counts the datagrams dropped because the BNX header was invalid. It could be caused by a invalid header version, invalid protocol type, or that discard level or priority level is out of range.
Mib	FrUniPvcBnx
Values	Decimal (0..429496729)
Default	0

ATTRIBUTE FrUni Bp lastInvalidBnxHeader (libh)

Access	Read only
Description	This attribute indicates the BNX header of the datagram which was last dropped by the *BnxProtocol* because one or more fields of the BNX

Copyright © 2006, Nortel Nortel Confidential

	header are invalid. The invalid field could be any of the following: header version, protocol type, discard level out of range, priority level out of range.
Mib	FrUniPvcBnx
Values	Hex (H.0..H.ffffffff)
Default	No default

ATTRIBUTE FrUni Bp invalidIpProtocolId (ipid)

Access	Read only
Description	This attribute counts the datagrams dropped because the protocol ID in IP header was invalid.
Mib	FrUniPvcBnx
Values	Decimal (0..429496729)
Default	0

ATTRIBUTE FrUni Bp discardedIpFragment (dipf)

Access	Read only
Description	This attribute counts the total number of fragmented datagrams dropped by this interface. The case could be unknown Dlci, or unknown ID in IP header when misordering happened.
Mib	FrUniPvcBnx
Values	Decimal (0..429496729)
Default	0

ATTRIBUTE FrUni Bp sourceIpAddressLastDropped (ldsia)

Access	Read only
Description	This attribute indicates the source IP address of the datagram that was last dropped by the *BnxProtocol* because one or more fields of the IP header are invalid. The invalid field could be any of the following: header version, protocol ID, or Identification of a fragmented datagram.
Mib	FrUniPvcBnx
Values	IP address
Default	0.0.0.0

ATTRIBUTE FrUni Bp droppedUnknownDlci (dud)

Access	Read only
Description	This attribute counts the datagrams dropped because the DLCI was unknown.
Mib	FrUniPvcBnx

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..429496729)
Default	0

ATTRIBUTE FrUni Bp lastUnknownDlci (lud)

Access	Read only
Description	This attribute indicates the DLCI of datagram last dropped.
Mib	FrUniPvcBnx
Values	Decimal (0..429496729)
Default	0

ATTRIBUTE FrUni Bp droppedUnknownDlciXnet (dudx)

Access	Read only
Description	This attribute counts the received cross-net status messages that were dropped because the DLCI was unknown.
Mib	FrUniPvcBnx
Values	Decimal (0..429496729)
Default	0

ATTRIBUTE FrUni Bp lastUnknownDlciXnet (ludx)

Access	Read only
Description	This attribute indicates the DLCI of last received cross-net status message that was dropped because the DLCI was unknown.
Mib	FrUniPvcBnx
Values	Decimal (0..429496729)
Default	0

ATTRIBUTE FrUni Bp ipFragFromSubnet (fragfs)

Access	Read only
Description	This attribute counts the IP fragments received from subnet by this frame relay interface. The value of this attribute wraps to zero when it exceeds the maximum value.
Mib	FrUniPvcBnx
Values	Decimal (0..429496729)
Default	0

ATTRIBUTE FrUni Bp lastInvalidIpFragId (lastid)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the Id in the IP header of the last fragment dropped by the frame relay interface.
Mib	FrUniPvcBnx
Values	Decimal (0..429496729)
Default	0

ATTRIBUTE FrUni Bp lastDlciWithIpFragment (lfdlci)

Access	Read only
Description	This attribute indicates the Dlci which last received IP fragment. This attribute is used for tracking fragmented IP traffic.
Mib	FrUniPvcBnx
Values	Decimal (0..429496729)
Default	0

COMPONENT FileSystem (Fs)

Groups	GROUP Fs OsiState (State) GROUP Fs Operational (Oper)
Scope	Device
Description	*FILESYSTEM* The *Filesystem* component provides and controls access to files and directories stored on one or two disks, with a maximum of four partitions per disk. It is automatically created and always present. The Filesystem restricts files and directories names to 40 characters. It also restricts filenames including path to 128 characters. Directory names including the path cannot exceed 125 characters. There must be 112 or less directories and files at the root level on each partition. The maximum hierarchy depth is 10 directory levels. The only characters that can appear in a filename are the alpha-numeric characters, the . (dot), the _ (underscore), the - (hyphen), the : (colon), and the # (pound). The names are case sensitive. A pathname is a sequence of zero to ten directory names along the path and separated by the / (slash) character. A pathname that begins with a slash is an absolute pathname, otherwise it is a relative pathname. Access to the standby disk is not allowed. When there are two disks, the standby control processor disk shadowed partition(s) is normally synchronized with the disk shadowed partition(s) of the active control processor. After a crash or a disk failure the standby control processor disk becomes unsynchronized with respect to the disk on the active CP.
Mib	FileSystem
Dyn. Subcomp.	COMPONENT Fs Disk COMPONENT Fs FsPartition (Part)
Common Verbs	Help List Display LOCK : System_admin Unlock : System_admin

Copyright © 2006, Nortel

Nortel Confidential

VERB SYNChronize Fs

Impact: Configuration

Description:

synchronize Filesystem
The ***Synchronize*** command makes the standby disk shadowed partitions an exact copy of the active disk shadowed partitions. The operation also removes files and directories that exist only in the standby disk shadowed partitions. Manual synchronization will set the standby disk volume name equal to the active disk. The synchronization process will fail if the capacity of any of the shadowed partitions on the standby disk is smaller than the used space size in the active partition. At boot time, the filesystem selects the active control processor disk as the active disk and automatically attempts to synchronize the standby control processor disk shadowed partition(s). The automatic synchronization will fail if the volume names of the two disks are not identical. While the synchronization is running, disk testing and formatting are not allowed.

VERB ListFile (LS) Fs

Impact: Passive

Description:

listFile -path<file or directory> [-status] [-newer<file>] filesystem

The ***List*** verb displays information about files and directories in a directory. For every entry found in the directory, it displays its name, modification time, size, type and write permission.
If the ***status*** option is specified, then the command displays the information about the directory and not its contents. The ***newer*** option tells the list command to display only entries that have been modified more recently than the argument of the option.

Options:
-***path***: The pathname of the file or directory that you want to ***List***.
-***status***: This option causes the ***List*** command to display information about the path not its content.
-***newer***: This option causes the ***List*** command to display only files newer than the argument of this option.
Examples:
list -path(“/tmp”) filesystem
list -path(“/spooled”) -newer(“/spooled/alarm.01”) fs
list -path(“/spooled”) -status filesystem

Copyright © 2006, Nortel
Nortel Confidential

VERB Move (MV) Fs

Impact	Configuration
Description	move -s <existing-file> -d <new-filename> Filesystem move -s <existing-directory> -d <new-directory> Filesystem move -s<existing-file> -d<existing-directory> Filesystem. move -s<existing-directory> -d<existing-directory>Filesystem. The ***Move*** command moves or renames files and directories. If the destination does not exist, ***Move*** renames the source. If the destination is a directory, the command moves the source into the destination directory. The ***Move*** command does not move files or directories from one disk to another. The Move command does not overwrite existing files. ***Options***: -***source***: The pathname of the file or directory that ***Move*** is going to move. -***destination***: The pathname of the file or directory where ***Move*** is going to place the source file or directory. ***Examples:*** move -source(“/spooled/alarm.01”) -destination(“/tmp”) fs move -source(“/spooled”) -destination(“/tmp”) fs

VERB Copy (CP) Fs

Impact	Configuration
Description	copy -s <file1> -d<file> Filesystem copy -s<directory1> -d<directory2> -recursive Filesystem copy -s<filename> -d<directory> Filesystem The ***Copy*** command copies files or directories. The recursive option is required if the source is a directory. The new file is always unprotected. The Copy command does not overwrite existing files. ***Options***: -***source***: The pathname of the file or directory that ***Copy*** is going to copy. -***destination:*** The pathname of the file or directory that ***Copy*** places the resulting copied file or directory in. -***recursive:*** When the source is a directory, this option causes the ***Copy*** to copy the contents of that directory and any of its subdirectories into the destination directory. The subdirectories themselves are copied as well as the files they contain. ***Examples***: copy -source(“/tmp/log.01”) -destination(“/log.old”) fs copy -s(“/spooled”) -d(“/tmp”) -recursive fs

Copyright © 2006, Nortel Nortel Confidential

VERB REMOVE Fs

Impact: Configuration

Description:

remove -path <filename> [-force] Filesystem
remove -path <directory> [-recursive, -force] Filesystem

The REMOVE command deletes files and directories. The filesystem component releases the space the file occupied on disk for future use. The recursive option is required to remove any directory including an empty one. If the file or directory is write protected, the command returns an error. The force option causes the command to remove write protected files.

Options:
-***path*** The pathname of the file or directory ***Remove*** is to delete.
-***recursive*** This option causes ***Remove*** to delete the contents of the specified directory, including all its subdirectories, and the directory itself.
-***force*** This option causes ***Remove*** to delete files regardless of whether they are “protected”.

Examples:
remove -path(“/tmp/SCN.001”) filesystem
remove -path(“/tmp”) -recursive filesystem
remove -path(“/tmp/SCN.004”) -force filesystem

VERB Protect Fs

Impact: Configuration

Description:

protect -path< file> Filesystem

The ***Protect*** command protects the specified file against accidental deletion and modification. The REMOVE command will fail unless the ***force*** option is specified. The Protect command has no effect on a directory.

Options:
-path: The pathname of the file to be protected against accidental deletion and/or modification.

Examples:
protect -path(“/spooled/alarm.001”) filesystem
protect -path(“standby:/spooled”) filesystem

Copyright © 2006, Nortel
Nortel Confidential

VERB Unprotect Fs

Impact: Configuration

Description:

unprotect -path< file> Filesystem

The ***Unprotect*** command removes the protection against accidental deletion or modification of the specified file. The Unprotect command has no effect on a directory.
Options:
-path: The pathname of the file to be unprotected against accidental deletion or modification.
Examples:
unprotect -path(“/spooled/alarm.001”) filesystem

VERB Touch Fs

Impact: Configuration

Description:

touch -path <filename> Filesystem
The ***Touch*** command updates the file’s modification time. ***Touch*** creates the file if it does not exist. If the pathname is a directory, the creation time of the directory is updated.
Options:
-path: The pathname of the file or directory ***Touch*** is to update.
-date: The date and time specified by this option are used to update the file's modification time. If this option is not specified then the file's modification time is updated with the current date and time.
Examples:
touch -path(“/tmp/backup.074”) filesystem
touch -path("/tmp/backup.074") -date(1998-03-30 19:26:10) filesystem

VERB MakeDirectory (MKDIR) Fs

Impact: Configuration

Description:

makedirectory -path <directory> Filesystem
The ***MakeDirectory*** command creates a directory. The command returns an error if the parent directory does not exist.
Options:
-path : The pathname of directory that ***MakeDirectory*** creates.
Examples:
mkdir -path(“/tmp/temporary”) fs

Copyright © 2006, Nortel Nortel Confidential

VERB Chdir (CD) Fs

Impact	Passive
Description	chdir -path <directory> Filesystem The ***Chdir*** command makes the directory specified as argument of the ***path*** option the current working directory. If the directory does not exist, the command returns an error. ***Options***: -path: The pathname of the directory that will become the working directory. Examples: cd -path("/tmp/temporary") filesystem

VERB WorkingDir (PWD) Fs

Impact	Passive
Description	WorkingDir filesystem The ***WorkingDir*** command displays the current working directory associated with the session. The initial working directory is a provisionable attribute of the *Userid* component which is a subcomponent of the *AccessControl* component. The ***Chdir*** command changes the current working directory to the specified directory. ***Examples***: pwd filesystem

GROUP Fs OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	FileSystem

ATTRIBUTE Fs adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command

Copyright © 2006, Nortel Nortel Confidential

	was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	FileSystem
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Fs operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	FileSystem
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Fs usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	FileSystem
Values	idle active (activ) busy

Copyright © 2006, Nortel Nortel Confidential

Default	idle

GROUP Fs Operational (Oper)

Properties	Operational
Description	This group contains the filesystem operational data.
Mib	FileSystem

ATTRIBUTE Fs volumeName

Access	Read only
Description	This attribute describes the volume name of the filesystem. This is the volume name of the disk's shadowed partition(s) on the active CP.
Mib	FileSystem
Values	String (1..11, ASCII)
Default	No default

ATTRIBUTE Fs activeDisk

Access	Read only
Description	The activeDisk attribute value is the Disk component instance value of the active disk. This is also the card number of the active control processor.
Mib	FileSystem
Values	The name of the component
Default	No default

ATTRIBUTE Fs syncStatus

Access	Read only
Description	The synchronization status value indicates whether the file system is synchronized or not.
Mib	FileSystem
Values	synchronized unSynchronized synchronizing
Default	No default

ATTRIBUTE Fs syncProgress

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	The synchronization progress value indicates the percentage of the standby disk already synchronized with the active disk. This value is equal to 100 if the two disks are synchronized or 0 if they are out of synchronization.
Mib	FileSystem
Values	Decimal (0..100)
Units	%
Default	No default

ATTRIBUTE Fs capacity

Access	Read only
Description	This attribute indicates the total size of the filesystem (in bytes). This value is equal to the smallest disk size in a synchronized filesystem; otherwise it is the capacity of the active disk. This attribute is not displayed on a disk with multiple partitions. The corresponding information is available under the *FileSystem Partition/instance* subcomponent.
Mib	FileSystem
Values	Decimal (0..4294967295)
Units	bytes
Default	No default

ATTRIBUTE Fs freeSpace

Access	Read only
Description	This attribute indicates the free disk space (in bytes) currently available in the filesystem. It is equal to the smallest free disk space size of the active and standby disks in a synchronized filesystem.When the filesystem is unsynchronized it is the free disk space of the active disk. This attribute is not displayed on a disk with multiple partitions. The corresponding information is available under the *FileSystem Partition/instance* subcomponent.
Mib	FileSystem
Values	Decimal (0..4294967295)
Units	bytes
Default	No default

ATTRIBUTE Fs usage

Access	Read only
Description	This attribute indicates the percentage of the free space available on the filesystem. This attribute is not displayed on a disk with multiple partitions.

Copyright © 2006, Nortel Nortel Confidential

The corresponding information is available under the *FileSystem Partition/ instance* subcomponent.

Mib	FileSystem
Values	Decimal (0..100)
Units	%
Default	No default

COMPONENT Fs Disk

VERB FORMAT Fs Disk

Impact	Configuration
Description	format -v<volumeName> filesystem disk/<instance> This command formats the disk and prepares it to be a part of the filesystem. The disk component must be locked, before the format can start. All disks are formatted before delivery, but this command may be required if disk corruption occurs. A format destroys all the data in the disk. While formatting the disk , synchronizing and testing the disks are not allowed. ***Options***: -volumeName: The argument of this option is the volume name of the disk. -backward: format the disk to 256 MBytes format for backward compatibility. Older releases do not support disks larger than 256 MBytes. ***Examples***: format -v(myDisk) filesystem disk/15 format -backward filesystem disk/15

GROUP Fs Disk **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	FileSystem

ATTRIBUTE Fs Disk **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Copyright © 2006, Nortel Nortel Confidential

Mib	FileSystem
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Fs Disk operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	FileSystem
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Fs Disk usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	FileSystem
Values	idle active (activ) busy
Default	idle

GROUP Fs Disk Operational (Oper)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the disk component operational data.
Mib	FileSystem

ATTRIBUTE Fs Disk volumeName

Access	Read and write
Description	This attribute describes the volume name of the disk. The volume names of the disks must be identical to be synchronized.
Mib	FileSystem
Values	String (1..11, ASCII)
Default	No default

ATTRIBUTE Fs Disk capacity

Access	Read only
Description	This attribute indicates the total formatted disk size (in bytes) on disk. This attribute is not displayed on a disk with multiple partitions. The corresponding information is available under the *FileSystem Disk/instance Partition/instance* subcomponent.
Mib	FileSystem
Values	Decimal (0..4294967295)
Units	bytes
Default	No default

ATTRIBUTE Fs Disk freeSpace

Access	Read only
Description	This attribute indicates the available free disk space (in bytes) of the disk. Free space is reduced by bad blocks (if any). If there are different numbers of bad blocks on the disks in a dual-disk system, the reported free space will differ on the two disks. Moreover, due to the DOS file system internal representation of directories and files, adding and deleting files may fragment the disks differently resulting in some disk space wasted. A small discrepancy (less than 1% of the disk size) in the disks' free space is considered as normal. This attribute is not displayed on a disk with multiple partitions. The corresponding information is available under the *FileSystem Disk/instance Partition/instance* subcomponent.
Mib	FileSystem
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Units	bytes
Default	No default

ATTRIBUTE Fs Disk badBlocksPercentage

Access	Read only
Description	This attribute records the percentage of the disk space lost because of defects. If this percentage is high, it is recommended to change the disk. This attribute is not displayed on a disk with multiple partitions. The corresponding information is available under *FileSystem Disk/instance Partition/instance* subcomponent
Mib	FileSystem
Values	Decimal (0..100)
Units	%
Default	No default

ATTRIBUTE Fs Disk unformattedCapacity

Access	Read only
Description	This attribute indicates the physical disk size (in bytes). The physical disk size may be different from the formatted disk size if there are bad blocks or the disk has been formatted to a smaller disk size for backward compatibility with older releases. This attribute is not displayed on a disk with multiple partitions. The corresponding information is available under the *FileSystem Disk/instance Partition/instance* subcomponent.
Mib	FileSystem
Values	Decimal (0..4294967295)
Units	bytes
Default	No default

ATTRIBUTE Fs Disk hardDriveSize

Access	Read only
Description	This attribute indicates the total size of the current hard drive on the CP3 card.
Mib	FileSystem
Values	Decimal (0.000000..42.949672)
Units	Gbyte
Default	No default

COMPONENT Fs Disk Test

Groups	GROUP Fs Disk Test OsiState (State) GROUP Fs Disk Test Setup (Setup) GROUP Fs Disk Test Results (Results)
Scope	Device
Description	*Test* The Test component embodies logical and physical filesystem tests. It is an operational subcomponent of the Disk component.
Mib	FileSystem
Common Verbs	Help List Display

VERB Start Fs Disk Test

Impact	Configuration
Description	This command invokes a test on the *Disk* component (This includes all existing partition(s) on the disk). The *Disk* component must be locked before the test can start. Examples: start filesystem disk/15 test

VERB Stop Fs Disk Test

Impact	Configuration
Description	This command stops a test running on the *Disk* component (This includes all existing partition(s) on the disk). The test stops only after completing the current pass. ***Example***: stop filesystem disk/15 test

GROUP Fs Disk Test OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	FileSystem

ATTRIBUTE Fs Disk Test adminState (osiAdmin)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	FileSystem
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Fs Disk Test operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	FileSystem
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Fs Disk Test usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

Copyright © 2006, Nortel Nortel Confidential

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib	FileSystem
Values	idle active (activ) busy
Default	idle

GROUP Fs Disk Test Setup (Setup)

Properties	Operational
Description	This group contains the Test component operational data. The testCount, duration and type can be set to control the duration and the test type which will be run.
Mib	FileSystem

ATTRIBUTE Fs Disk Test testCount

Access	Read and write
Description	This attribute indicates the number of times that the test will run. Note that the test will not run that many times if “duration” is not long enough to allow the test to complete. The test will execute at least one and then stop at the count where duration has just exceeded.
Mib	FileSystem
Values	Decimal (0..4294967295)
Default	1

ATTRIBUTE Fs Disk Test duration

Access	Read and write
Description	This attribute is the maximum duration (in minutes) that the test will run. The test can finish in less time if the number of tests, as recorded by testCount, is reached before this time. A test may take longer than the specified duration since a test cycle (or pass) is not interruptible.
Mib	FileSystem
Values	Decimal (0..35791394)
Units	minutes
Default	60

ATTRIBUTE Fs Disk Test type

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute is the type of the test to be run. The diskRead test reads every sector on the disk once and reports bad sectors. The filesystemCheck does a sanity check and attempts to repair corruption. The flakyBitDetection test reads every sector on the disk twice and compares the two read results. The surfaceAnalysis test writes a magnetically hard to record pattern to the disk and reads back the pattern to determine the condition of the magnetic surface of the disk. The surface analysis test destroys all the data and disk should be formatted afterward.
Mib	FileSystem
Values	filesystemCheck diskRead flakyBitDetection surfaceAnalysis
Default	filesystemCheck

GROUP Fs Disk Test Results (Results)

Properties	Operational
Description	This group contains the results of the test.
Mib	FileSystem

ATTRIBUTE Fs Disk Test causeOfTermination

Access	Read only
Description	This attribute records the reason why the test was terminated. The reasons are: ***testCountReached:*** the test ran the number of times specified in the attribute testCount and ended normally. ***error***: the test was terminated by an error that is recorded in the natureOfError attribute. ***neverStarted***: the test was never started. ***stoppedByOperator***: the test was terminated by the Stop command. ***testTimeExpired***: the duration of the test expired. ***testRunning***: the test is still running. ***unknown***: the test terminated for unknown reasons. ***internalError***: An internal error terminated the test.
Mib	FileSystem
Values	testCountReached testTimeExpired stoppedByOperator neverStarted testRunning

Copyright © 2006, Nortel Nortel Confidential

	error internalError unknown
Default	No default

ATTRIBUTE Fs Disk Test natureOfError

Access	Read only
Description	This attribute describes the error found by a test. A logical error can be fixed by a filesystemCheck test followed eventually by a synchronization. A media error indicates that a fault in the disk hardware is suspected. A failedToComplete error indicates that the test was terminated.
Mib	FileSystem
Values	logical media noErrorDetected failedToComplete
Default	No default

ATTRIBUTE Fs Disk Test severity

Access	Read only
Description	This attribute describes the severity of the error found by a test. There are three types of severity**:** no data was lost, data was lost and hardware problem**.** If the test found no error(s), this will be reported as noError. If the test found error(s) but no data was lost, then noDataLost is reported.
Mib	FileSystem
Values	noDataLost dataLost hardwareProblem noError
Default	No default

ATTRIBUTE Fs Disk Test elapsedTime

Access	Read only
Description	This attribute records the elapsed time (in minutes) since the test was started.
Mib	FileSystem
Values	Decimal (0..4294967295)
Units	minutes
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Fs Disk Test testExecutionCount

Access	Read only
Description	The number of times the test had actually run.
Mib	FileSystem
Values	Decimal (0..4294967295)
Default	No default

COMPONENT Fs Disk Partition (Part)

Instance	Decimal (0..3)
Groups	GROUP Fs Disk Part OsiState (State) GROUP Fs Disk Part Operational (Oper)
Scope	Device
Description	*Fs Disk/m Part/n* A *Partition* component is an operational subcomponent of *Disk*. Each instance of this component represents a partition. The instance is the partition number. The component is only visible on a multiple partitioned disk.

COMPONENT GsmIwfBearerChannel (GsmBc)

Instance	trunkGrp [Decimal (1..8191)] cic [Decimal (1..2047)]
Groups	GROUP GsmBc Operational (Oper) GROUP GsmBc CustomerIdentifierData (CidData) GROUP GsmBc OsiState (State)
Scope	Application
Description	*GsmBc/<trunkGrp>,<cic>* This component represents an individual bearer channel resource for a given *GsmIwfCallServer*. Depending on the call type requested, the *GsmIwfCallServer* links one or more *GsmIwfBearerChannel*s in a single GSM InterWorking Function (IWF) call. Each *GsmIwfBearerChannel* is linked to a channel on a DS1 or E1 port on a logical processor (one *GsmIwfBearerChannel* per channel). The instance value *trunkGrp* is the external identifier for the trunk group configured at the Mobile Services-switching Center (MSC) connected to this node and associated with this *GsmIwfBearerChannel* instance. The instance value *cic* is the external identifier for the trunk group member. It is referred to as the circuit identifier code (cic) and is the same index used when configuring the channel at the Mobile Services-switching Center (MSC). This component is specific to the ***gsmIwfBearerChannel*** feature of the

ATTRIBUTE GsmBc connectionType (connType)

Access	Read: All Write: Illegal
Description	This attribute indicates the connection types between the terminal equipment or terminal adaptor and mobile and between the IWF and the network. Valid connection types are: ***asynchronous***, Transmission of data which does not require clocking of the data signal. ***synchronous***, Transmission of data which requires clocking of the data signal.
Mib	GsmIwf
Values	synchronous (sync) asynchronous (async)
Default	No default

ATTRIBUTE GsmBc dataBits

Access	Read: All Write: Illegal
Description	This attribute indicates the number of data bits encoded between start and stop bits in an asynchronous data call connection data stream. This attribute is set to ***notApplicable*** for a synchronous data call.
Mib	GsmIwf
Values	7 8 notApplicable (na)
Default	notApplicable

ATTRIBUTE GsmBc stopBits

Access	Read: All Write: Illegal
Description	This attribute indicates the number of stop bits (a mark (binary 1) placed at the end of each data byte) inserted between the data bits in an asynchronous data call connection data stream, this marks the end of the character. This attribute is set to ***notApplicable*** for a synchronous data call.
Mib	GsmIwf
Values	1 2 notApplicable (na)
Default	notApplicable

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE GsmBc parity

Access	Read: All Write: Illegal
Description	This attribute indicates the type of parity for the data bits in an asynchronous data call connection data stream. Parity is a redundant bit that is added to each data byte to aid in error detection. If odd parity is used, all data bytes have an odd number of 1s, and if even parity is used, all data bytes have an even number of 1s. Also parity may be forced to 0, forced to 1, or may not be used at all (required for sending 8-bit data). This attribute will be set to ***notApplicable*** for a synchronouse data call. Valid values are: ***none***, No parity. ***odd,*** Odd parity. ***even***, Even parity. ***forced0***, Parity forced to 0. ***forced1***, Parity forced to 1. ***notApplicable***, Parity not applicable.
Mib	GsmIwf
Values	none odd even forced0 forced1 notApplicable (na)
Default	none

ATTRIBUTE GsmBc flowControl

Access	Read: All Write: Illegal
Description	This attribute indicates the current flow control status of this *GsmIwfBearerChannel* for an asynchronous call. For a synchronous data call this attribute will be set to ***noFlowControlActive***. Valid values are: ***noFlowControlActive***, There is no flow control active over the air interface and network interfaces. The applications at the end points handle flow control. ***inband***, Embedded characters in the data stream indicate flow control. ***v110FlowCtnrl***, Utilization of V.110 flow control. ***errorCntrl***, Flow control is handle by datalink protocols.
Mib	GsmIwf
Values	noFlowControlActive (noFlow) inband v110FlowCntrl (v110Flow) errorCntrl (errCntrl)

Copyright © 2006, Nortel Nortel Confidential

Default	noFlowControlActive

ATTRIBUTE GsmBc callType

Access	Read: All Write: Illegal
Description	This attribute indicates the current call type. Valid values are: ***faxG3***, group 3 fax calls ***cda31khz***, asynchronous 3.1kHz modem ***cdaUdi***, asynchronous unrestricted digital data call ***cdsUdi***, synchronous unrestricted digital data call ***cds31khz***, synchronous 3.1kHz modem
Mib	GsmIwf
Values	faxG3 cda31khz cdaUdi cdsUdi cds31khz
Default	No default

ATTRIBUTE GsmBc lastResponseCode (respCode)

Access	Read: All Write: Illegal
Description	This attribute indicates the MSC/IWF Interface Protocol (MIP) response code returned for the last call which was active on this particular *GsmIwfBearerChannel*. Valid values are: ***requestDone***, the call was terminated normally. ***systemError***, the call was terminated due to a base system problem. ***applicationError***, the call was terminated due to an application level problem. ***noResources***, the call was terminated due to a lack of available resources. ***msgSizeMismatch***, Message length does not match length defined by the MSC/IWF Interface Protocol for the particular message type. ***protocolViolation***, Failed to perform the request because the coding of the request message was invalid; message was not understood. ***requestNotSupported***, Message was understood but not supported by the IWF or MSC. ***requestDenied***, Message was understood and supported by the IWF or MSC but the request is denied. ***invalidMessage***, Message received is invalid for the current state of the IWF's state machine or the MSC data call state machine. The message is ignored. ***bufferNotFlushed***, Message from the Iwf to the MSC indicating that the buffers are not flushed as requested by the MSC. ***notApplicable***, this attribute is not applicable for this call. This is the default value for this attribute.

Copyright © 2006, Nortel Nortel Confidential

Mib	GsmIwf
Values	requestDone (reqDone) systemError (sysErr) applicationError (applErr) noResources msgSizeMismatch (msgSzMismatch) protocolViolation requestNotSupported (reqNotSupp) requestDenied (reqDenied) invalidMessage (invldMsg) bufferNotFlushed (bufsUnflushed) notApplicable (na)
Default	notApplicable

ATTRIBUTE GsmBc mateBearerChannel (mateBc)

Access	Read: All Write: Illegal
Description	This attribute contains the name of the mate *GsmIwfBearerChannel* that this *GsmIwfBearerChannel* is involved with in the currently active call.
Mib	GsmIwf
Values	The name of the component
Default	No default

GROUP GsmBc CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	GsmIwf

ATTRIBUTE GsmBc customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to

Copyright © 2006, Nortel Nortel Confidential

as “NetMan” in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers.

Mib	GsmIwf
Values	Decimal (0; 1..8191)
Default	0

GROUP GsmBc OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	GsmIwf

ATTRIBUTE GsmBc adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	GsmIwf
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE GsmBc operationalState (osiOper)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	GsmIwf
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE GsmBc usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	GsmIwf
Values	idle active (activ) busy
Default	idle

COMPONENT GsmBc Framer

Groups	GROUP GsmBc Framer Provisioned (Prov) GROUP GsmBc Framer Statistics (Stats) GROUP GsmBc Framer LinkOptions (Link) GROUP GsmBc Framer OsiState (State)
Scope	Device
Description	*GsmBc/<trunkGrp>,<cic> Framer* The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. The *Framer* component also associates an application component with a specific hardware link interface. The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface rather than interface specific attributes which are associated with hardware

Copyright © 2006, Nortel Nortel Confidential

components. The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

GROUP GsmBc Framer Provisioned (Prov)

Properties Provisioned

Description

This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.

Mib GsmIwf

ATTRIBUTE GsmBc Framer interfaceName

Access Read and write

Criticality Process

Description

This attribute contains a hardware component name.

The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.

Mib GsmIwf

Values Link (Hardware, applicationFramerName)

Default No default

GROUP GsmBc Framer Statistics (Stats)

Properties Operational

Description

This group contains the operational statistics data for a *Framer* component.

Mib GsmIwf

ATTRIBUTE GsmBc Framer frmToIf

Access Read only

Description This attribute counts the number of frames transmitted to the link interface by *Framer.* The counter wraps when it exceeds the maximum value.

Copyright © 2006, Nortel Nortel Confidential

Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE GsmBc Framer frmFromIf

Access	Read only
Description	This attribute counts the number of frames received from the link interface by *Framer*. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE GsmBc Framer octetFromIf

Access	Read only
Description	This attribute counts the number of bytes received from the link interface by *Framer*. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE GsmBc Framer crcErrors

Access	Read only
Description	This attribute coutns the the total number of frames with CRC errors, occurring in the receive direction from the link. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE GsmBc Framer lrcErrors

Access	Read only
Description	This attribute counts the total number of frames with LRC errors, occurring in the Tx link prior to transmission onto the link. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE GsmBc Framer nonOctetErrors

Access	Read only
Description	This attribute counts the total number of frames that were non octet aligned. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE GsmBc Framer overruns

Access	Read only
Description	This attribute counts the total number of frames received from the link for which overruns occurred. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE GsmBc Framer underruns

Access	Read only
Description	This attributecounts the total number of frames transmitted to the link for which underruns occurred. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	0

GROUP GsmBc Framer LinkOptions (Link)

Properties	Provisioned
Description	This group contains provisionable attributes for the GsmIwfFramer which controls link layer framing for application components sending and receiving data on a link interface for this particular GsmIwfBearerChannel.
Mib	GsmIwf

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE GsmBc Framer framingType

Access	Read: All Write: Service
Criticality	Process
Description	This attribute indicates the type of framing for the link layer data received and transmitted on this channel. Valid values are: ***BtdsFraming***, bit transparent framing required for the *GsmIwfBearerChannel* components on MVP cards. ***GsmFraming***, GSM framing for the *GsmIwfBearerChannel* components on DS1C/E1C cards.
Mib	GsmIwf
Values	btdsFraming gsmFraming
Default	gsmFraming

GROUP GsmBc Framer OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	GsmIwf
Values	idle active (activ) busy
Default	idle

COMPONENT GsmBc Layer1

Groups	GROUP GsmBc Layer1 Operational (Oper) GROUP GsmBc Layer1 Statistics (Stats)
Scope	Application

Copyright © 2006, Nortel Nortel Confidential

Description	*GsmBc/<trunkGrp>,<cic> Layer1* This component represents the group of measurements for the GSM Layer 1 protocol established for a GSM IWF call (on the mobile station to IWF link) on this particular *GsmIwfBearerChannel.* Note that this component is present only if the current (or most recent call) involved this protocol.
Mib	GsmIwf
Common Verbs	Help List Display

GROUP GsmBc Layer1 Operational (Oper)

Properties	Operational
Description	This group contains physical layer operational attributes concerning the operation of this particular *GsmIwfBearerChannel*.
Mib	GsmIwf

ATTRIBUTE GsmBc Layer1 activeMode (mode)

Access	Read: All Write: Illegal
Description	This attribute indicates the active physical layer protocol between the mobile and the IWF. Valid values are: ***v110***, GSM V.110 rate adaptation scheme for interworking V-series connections to an Integrated Services Digital Network (ISDN). ***aTrau***, GSM A-Transcoder/Rate Adaptor (A-TRAU).
Mib	GsmIwf
Values	v110 aTrau
Default	No default

ATTRIBUTE GsmBc Layer1 connection (conn)

Access	Read: All Write: Illegal
Description	This attribute indicates the connection between the mobile and the IWF. Valid values are: ***transparent***, Constant throughput, constant transit delay, and variable error rate (does not use Radio Link Protocol). ***nonTransparent***, Improved error rate with variable transit delay and variable throughput (uses Radio Link Protocol).
Mib	GsmIwf

Copyright © 2006, Nortel Nortel Confidential

Values	transparent (trans) nonTransparent (nonTrans)
Default	No default

ATTRIBUTE GsmBc Layer1 dataRate

Access	Read: All Write: Illegal
Description	This attribute indicates the layer 1 user data rate for the currently active call for this *GsmIwfBearerChannel*. This is the data rate between the mobile and IWF.
Mib	GsmIwf
Values	Decimal (0..64000)
Units	bit/s
Default	No default

ATTRIBUTE GsmBc Layer1 intermediateRate (iRate)

Access	Read: All Write: Illegal
Description	This attribute indicates the intermediate rate used in the physical layer rate adaptation process. This field is valid between the mobile and the IWF. For user data rates of 300 bit/s - 4800 bit/s the intermediate rate is 8 kbit/s. For user data rates 9600 bit/s and above the intermediate rate is 16 kbit/s.
Mib	GsmIwf
Values	Decimal (8; 16)
Units	kbit/s
Default	No default

GROUP GsmBc Layer1 Statistics (Stats)

Properties	Operational
Description	This group contains physical layer statistics concerning the operation of this particular *GsmIwfBearerChannel*.
Mib	GsmIwf

ATTRIBUTE GsmBc Layer1 framesTx

Access	Read: All Write: Illegal
Description	This attribute counts the number of frames transmitted on the link. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc Layer1 framesRx

Access	Read: All Write: Illegal
Description	This attribute counts the number of frames received on the link. Discarded frames are not included in this count. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc Layer1 bytesTx

Access	Read: All Write: Illegal
Description	This attribute counts number of bytes transmitted on the link. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc Layer1 bytesRx

Access	Read: All Write: Illegal
Description	This attribute counts the number of bytes received on the link. Bytes from discarded frames are not included in this count. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc Layer1 underRunsTx

Access	Read: All Write: Illegal
Description	This attribute counts number of underruns, on a per-call basis, in the transmit direction reported by the hardware on the mobile-side.. These frames are not counted towards the number of frames transmitted (*framesTx*). The counter wraps when it exceeds the maximum value.

Copyright © 2006, Nortel Nortel Confidential

Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc Layer1 overRunsRx

Access	Read: All Write: Illegal
Description	This attribute counts number of overruns, on a per-call basis, in the receive direction reported by the hardware on the mobile-side. These frames are discarded. These frames are not counted towards the number of frames received (*framesRx)*. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc Layer1 nonOctetErrorsRx

Access	Read: All Write: Illegal
Description	This attribute counts the number of non-octet synchronous frame errors, on a per-call basis, received on the link reported by the hardware. This is when a frame whose bit content was not divisible by eight was detected. These frames are discarded. These frames are not counted towards the number of frames received (*framesRx*). The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc Layer1 largeFrameErrorsRx (lrgFrmErrRx)

Access	Read: All Write: Illegal
Description	This attribute counts the number of frames, on a per-call basis, received on the link that exceeded internal buffer limits reported by the hardware. A large number of these errors could indicate a bad physical medium. These frames are discarded. These frames are not counted towards the number of frames received (*framesRx*). The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE GsmBc Layer1 framesDiscarded (frmDisc)

Access	Read: All Write: Illegal
Description	This attribute counts the number of frames discarded, on a per-call basis, in the receive direction by software due to frame errors. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc Layer1 lrcErrorsTx

Access	Read: All Write: Illegal
Description	This attribute counts the number of corrupted frames, on a per-call basis, due to memory inconsistencies found by Longitude Redundancy Check (LRC) checks at the IWF. These frames are not counted towards the number of frames transmitted (*framesTx*). The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

COMPONENT GsmBc Modem

Groups	GROUP GsmBc Modem Operational (Oper) GROUP GsmBc Modem Statistics (Stats)
Scope	Application
Description	*GsmBc/<trunkGrp>,<cic> Modem* This component represents the group of measurements for the modem protocol established for a GSM IWF call (on the IWF to Public Switched Telephone Network (PSTN) modem link) on this particular *GsmIwfBearerChannel.* Note that this component is present only if the current (or most recent call) involved this protocol.
Mib	GsmIwf
Common Verbs	Help List Display

Copyright © 2006, Nortel Nortel Confidential

GROUP GsmBc Modem Operational (Oper)

Properties	Operational
Description	This group contains operational attributes that measure performance of the *modem* component for this particular *GsmIwfBearerChannel*.
Mib	GsmIwf

ATTRIBUTE GsmBc Modem rate

Access	Read: All Write: Illegal
Description	This attribute indicates the transmission rate of the current modem in use. A rate of ***1200_75*** is 75 bit/s in the transmit direction and 1200 bit/s in the receive direction. All other rates are the same in both the transmit and receive directions.
Mib	GsmIwf
Values	300 600 1200 1200_75 2400 4800 7200 9600 12000 14400 16800 19200 21600 24000 26400 28800 31200 32000 33600 38400 43200 48000 56000 57600 64000
Units	bit/s
Default	No default

ATTRIBUTE GsmBc Modem algorithmInUse (algorithm)

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the current modem algorithm(s) active for the channel. Valid values are: ***v17,*** V.17 is active.V.17 is an ITU-T 14400bit/s modem standard. ***v27ter***, V.27ter is active. V.27ter is an ITU-T 7200bit/s modem standard. ***v29***, V.29 is active. V.29 an ITU-T 9600bit/s modem standard. ***v21***, V.21 active. V.21 is an ITU-4 300bit/s modem standard. ***v22bis***, V.22 or V.22bis active. V.22 ia an ITU-T modem standard that operates at 1200bit/s and 600 baud. V.22bis is an ITU-T modem standard that operates at 2400bit/s and 600 baud. ***v23***, V.23 active. V.23 is an ITU-T modem standard that operates at a speed of 1200bit/s. ***v26ter,*** V.26ter active. V.26ter is an ITU-T modem standard that operates at a speed of 2400bit/s. ***v32bis***, V.32 or V.32bis active. V.32 is an ITU-T modem standard that operates at 9600bit/s and 2400 baud. V.32bis is an ITU-T modem standard that operates at a speed of 14.4kbit/s. ***v34***, V.34 active. V.34 is an ITU-T modem standard that operates at a speed of up to 28.8kbit/s.
Mib	GsmIwf
Set of	v17 v29 v27ter v21 v22bis v23 v26ter v32bis v34
Default	No default

ATTRIBUTE GsmBc Modem protocolState (state)

Access	Read: All Write: Illegal
Description	This attribute indicates the active protocol state of the modem in use.Valid values are: ***idle***, Modem is in an inactive state and has no current connection established. ***training***, Modem is attempting to establish a connection with the far end modem via handshaking. ***connected***, Modem has establish a connection with the far end modem.
Mib	GsmIwf
Values	idle training connected
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE GsmBc Modem receiverTransmitter (rxTx)

Access	Read: All Write: Illegal
Description	This attribute indicates whether the fax data modem is in receive or transmit mode. If this is not a fax data modem call, then the value is set to ***notApplicable***. Valid values are: ***notApplicable***, Not an applicable field. ***rxOnTxOff***, Receiver is on, transmitter is off. ***rxOffTxOn***, Receiver is off, transmitter is on. ***rxTxOn***, Reciever is on, transmitter is on.
Mib	GsmIwf
Values	notApplicable (na) rxOnTxOff rxOffTxOn rxTxOn
Default	notApplicable

ATTRIBUTE GsmBc Modem training

Access	Read: All Write: Illegal
Description	This attribute indicates the training procedure used by the V.17 modems. ITU-T defines two training procedures. A longer training procedure used at call setup, and a short training procedure is used during the fax call when switching from the V.21 modem to the V.17 modem. A value of ***notApplicable*** indicates that the attribute is not applicable for the modem.
Mib	GsmIwf
Values	short long notApplicable (na)
Default	notApplicable

ATTRIBUTE GsmBc Modem toUpperFlowControlActive (upperFlow)

Access	Read: All Write: Illegal
Description	This attribute indicates whether flow control was requested and an indication was sent to an upper layer protocol.
Mib	GsmIwf
Values	on off
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE GsmBc Modem toDspFlowControlActive (lowerFlow)

Access	Read: All Write: Illegal
Description	This attribute indicates whether an upper layer protocol requested flow control and an indication was sent to the Digital Signal Processor.
Mib	GsmIwf
Values	on off
Default	No default

ATTRIBUTE GsmBc Modem asyncMode (async)

Access	Read: All Write: Illegal
Description	This attribute indicates whether conversion between synchronous and asynchronous data format (specifacally, the stripping or insertion of start and stop bits) is being performed. The value will be ***on*** unless the V.42 layer is active or it is a fax call.
Mib	GsmIwf
Values	on off
Default	No default

ATTRIBUTE GsmBc Modem autoHdlcMode (autoHdlc)

Access	Read: All Write: Illegal
Description	This attribute indicates whether High-Level Data Link Control (HDLC) functions are being performed by the modem to support HDLC applications (V.42 for example).
Mib	GsmIwf
Values	on off
Default	No default

ATTRIBUTE GsmBc Modem outbandFlowControl (outbandFlow)

Access	Read: All Write: Illegal
Description	This attribute indicates whether inband or outband flow control conversions are being performed. The modem performs either inband or outband flow control unless V.42 layer is active, it is a fax call, or no flow control was specified by the MSC.

Copyright © 2006, Nortel Nortel Confidential

Mib	GsmIwf
Values	on off
Default	No default

ATTRIBUTE GsmBc Modem outbandBreak (outbandBrk)

Access	Read: All Write: Illegal
Description	This attribute indicates whether inband or outband break control conversions are being performed. This is when the modem detects a break condition as defined by ITU-T X.28 and reports it. When a break condition is discovered all subsequent incoming data is discarded until a start bit is received.
Mib	GsmIwf
Values	on off
Default	No default

ATTRIBUTE GsmBc Modem autobaud

Access	Read: All Write: Illegal
Description	This attribute indicates whether autobaud is active. The modem is instructed at call setup time by the MSC on: What is the initial modem data rate value and Whether a modem is allowed to perform autobauding (***on***) or not (***off***). With Autobauding ***on***, the modem is allowed to connect using a valid modem data rate less than or equal to the initial rate specified to the modem by the MSC. If a modem can not perform autobauding and the carrier can not be established at the initial data rate, the modem is disabled.
Mib	GsmIwf
Values	on off
Default	No default

GROUP GsmBc Modem Statistics (Stats)

Properties	Operational
Description	This group contains operational attributes that measure performance of the modem component for this particular *GsmIwfBearerChannel*.

ATTRIBUTE GsmBc Modem bytesTx

Access	Read: All Write: Illegal
Description	This attribute counts the number of payload bytes transmitted. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc Modem bytesRx

Access	Read: All Write: Illegal
Description	This attribute counts the number of payload bytes received. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc Modem framingErrors (frmErr)

Access	Read: All Write: Illegal
Description	This attribute counts the number of framing errors detected by the hardware. This is the absence of a stop bit after a start bit and eight bits of data. All incoming data is discarded until the next start bit is received. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

COMPONENT GsmBc V110

Groups	GROUP GsmBc V110 Operational (Oper) GROUP GsmBc V110 Statistics (Stats)
Scope	Application
Description	*GsmBc/<trunkGrp>,<cic> V110* This component represents the group of measurements for the ITU-T V.110 rate adaptation protocol established for a GSM IWF call (on the IWF to Integrated Services Digital Network (ISDN) terminal adapter link) on this particular *GsmIwfBearerChannel*.

Copyright © 2006, Nortel Nortel Confidential

	Note that this component is present only if the current (or most recent call) involved this protocol.
Mib	GsmIwf
Common Verbs	Help List Display

GROUP GsmBc V110 Operational (Oper)

Properties	Operational
Description	This group contains operational attributes that measure the performance of *V110*.
Mib	GsmIwf

ATTRIBUTE GsmBc V110 dataRate

Access	Read: All Write: Illegal
Description	This attribute contains the layer 1 user data rate for the currently active call for this *GsmIwfBearerChannel*. This is the data rate between the IWF and the fixed network.
Mib	GsmIwf
Values	Decimal (0..65000)
Units	bit/s
Default	No default

ATTRIBUTE GsmBc V110 intermediateRate (iRate)

Access	Read: All Write: Illegal
Description	This attribute indicates the intermediate rate used in the physical layer rate adaptation process. This field is valid between the network and the IWF. For user data rates of 300 bit/s to 4800 bit/s the intermediate rate is 8 kbit/s. For a user data rate of 9600 bit/s the intermediate rate is 16 kbit/s. For user data rates of 1200 bit/s to 19200 bit/s the intermediate rate is 32 kbit/s. Data rates above this have no intermediate rate.
Mib	GsmIwf
Values	8 kbit/s 16 kbit/s 32 kbit/s notApplicable (na)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

GROUP GsmBc V110 Statistics (Stats)

Properties	Operational
Description	This group contains statistical attributes which measure the performance of V110.
Mib	GsmIwf

ATTRIBUTE GsmBc V110 framesTx

Access	Read: All Write: Illegal
Description	This attribute counts the number of frames transmitted on the link. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc V110 framesRx

Access	Read: All Write: Illegal
Description	This attribute counts the number of frames received on the link. Discarded frames are not included in this count. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc V110 bytesTx

Access	Read: All Write: Illegal
Description	This attribute counts the number of bytes transmitted on the link. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc V110 bytesRx

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of bytes received on the link. Bytes from discarded frames are not included in this count. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc V110 underRunsTx

Access	Read: All Write: Illegal
Description	This attribute counts the number of underruns, on a per-call basis, in the transmit direction reported by the hardware on the network side. These frames are not counted towards the number of frames transmitted (*framesTx*). The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE GsmBc V110 overRunsRx

Access	Read: All Write: Illegal
Description	This attribute counts the number of overruns, on a per-call basis, in the receive direction reported by the hardware on the network side. These frames are discarded. These frames are not counted towards the number of frames received (*framesRx*). The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc V110 nonOctetErrorsRx

Access	Read: All Write: Illegal
Description	This attribute counts the number of non-octet synchronous frame errors, on a per-call basis, received on the link reported by the hardware. These frames are discarded. These frames are not counted towards the number of frames received (*framesRx*). The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE GsmBc V110 largeFrameErrorsRx (lrgFrmErrRx)

Access	Read: All Write: Illegal
Description	This attribute counts the number of frames received on the link that exceeded internal buffer limits reported by the hardware, on a per-call basis. These frames are discarded. These frames are not counted towards the number of frames received (*framesRx*). The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc V110 framesDiscarded (frmDisc)

Access	Read: All Write: Illegal
Description	This attribute counts the number of frames discarded, on a per-call basis, in the receive direction by software due to frame errors. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc V110 lrcErrorsTx (lrcErrTx)

Access	Read: All Write: Illegal
Description	This attribute counts the number of corrupted frames, on a per-call basis, due to memory inconsistencies found by Longitude Redundancy Check (LRC) checks at the IWF. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

COMPONENT GsmBc Fax

Scope	Application

Copyright © 2006, Nortel Nortel Confidential

Description	*GsmBc/<trunkGrp>,<cic> Fax* This component represents the group of measurements for the fax protocol established for a GSM IWF call (on the mobile station to IWF link or the IWF to Public Switched Telephone Network (PSTN) fax modem/ machine link) on this particular *GsmIwfBearerChannel.* Note that this component is present only if the current (or most recent call) involved this protocol.
Mib	GsmIwf
Common Verbs	Help List Display

GROUP GsmBc Fax Operational (Oper)

Properties	Operational
Description	This group contains operational attributes which measure the performance of the fax protocol.
Mib	GsmIwf

ATTRIBUTE GsmBc Fax activeMode (mode)

Access	Read: All Write: Illegal
Description	This attribute indicates the mode of the fax T.30 protocol, determined during Exchange Identification (XID) negotiations. The following modes are supported: ***normal***, normal T.30 protocol, Error Correction Mode (ECM) not used ***ecm***, Error Correction Mode used. Fax error correction is done using a half-duplex page selective repeat technique.
Mib	GsmIwf
Values	normal ecm
Default	normal

ATTRIBUTE GsmBc Fax protocolState (state)

Access	Read: All Write: Illegal
Description	This attribute indicates the protocol state of the fax adaptor. The values are: ***setup,*** call setup state ***idle,*** idle state only transmitting Synchronize (SYNC) frames ***bcsRx,*** receiving Binary Coded Signal (BCS) packet from modem ***bcsTx,*** transmitting BCS packet to modem ***msgRx,*** receiving fax message from modem

Copyright © 2006, Nortel Nortel Confidential

msgTx, transmitting fax message to modem

Mib	GsmIwf
Values	setup idle bcsRx bcsTx msgRx msgTx
Default	idle

ATTRIBUTE GsmBc Fax messageRate (msgRate)

Access	Read: All Write: Illegal
Description	This attribute indicates the fax message rate used for sending fax documents.
Mib	GsmIwf
Values	Decimal (0..65000)
Units	bit/s
Default	No default

GROUP GsmBc Fax Statistics (Stats)

Properties	Operational
Description	This group contains statistical attributes which measure the performance of the fax protocol.
Mib	GsmIwf

ATTRIBUTE GsmBc Fax messageFramesRx (msgFrmRx)

Access	Read: All Write: Illegal
Description	This attribute counts the number of fax message frames received from the mobile. One fax message frame is an eight byte DATA frame defined in GSM 3.45. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc Fax messageFramesTx (msgFrmTx)

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of fax message frames transmitted to the mobile. One fax message frame is an eight byte DATA frame defined in GSM 3.45. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc Fax bcsFramesRx (bcsFrmRx)

Access	Read: All Write: Illegal
Description	This attribute counts the number of fax Binary Coded Signal (BCS) frames received from the mobile. A fax BCS frame is an 8-byte STATUS frame, which carries T.30 BCS data as defined in GSM 3.45. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc Fax bcsFramesTx (bcsFrmTx)

Access	Read: All Write: Illegal
Description	This attribute counts the number of fax Binary Coded Signal (BCS) frames transmitted to the mobile. A fax BCS frame is an 8-byte STATUS frame, which carries T.30 BCS data as defined in GSM 3.45. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc Fax pagesRxFromMobile (pagesRx)

Access	Read: All Write: Illegal
Description	This attribute counts the number of fax pages received from the mobile. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE GsmBc Fax pagesTxToMobile (pagesTx)

Access	Read: All Write: Illegal
Description	The attribute counts the number of fax pages transmitted to the mobile. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc Fax channelModeModify (cmm)

Access	Read: All Write: Illegal
Description	This attribute counts the number of Channel Mode Modify (CMM) requests initiated by the IWF. For transparent fax calls, the transmission speed is determined by the two fax machines at call setup. The speed may change during the transmission to satisfy the T.30 protocol. The CMM request is used by the GSM IWF to request that the T.30 requested speed change can be propagated throughout the network. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc Fax bcsFrameErrors (bcsFrmErr)

Access	Read: All Write: Illegal
Description	This attribute counts the number of fax Binary Coded Signal (BCS) frames in error. This attribute indicates the count of corrupted fax BCS frames over the GSM radio channel. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

COMPONENT GsmBc RadioLinkProtocol (Rlp)

Groups	GROUP GsmBc Rlp Operational (Oper) GROUP GsmBc Rlp Statistics (Stats)
Scope	Application

Copyright © 2006, Nortel Nortel Confidential

Description	*GsmBc<trunkGrp>,<cic> RadioLinkProtocol/<rlp-type>* This component represents the group of measurements for the Radio Link Protocol (RLP) established for a GSM IWF call (on the mobile station to IWF link) on this particular *GsmIwfBearerChannel.* Note that this component is present only if the current (or most recent call) involved this protocol.
Mib	GsmIwf
Common Verbs	Help List Display

GROUP GsmBc Rlp Operational (Oper)

Properties	Operational
Description	This group contains operational attributes that measure performance of the *GsmIwfBearerChannel*.
Mib	GsmIwf

ATTRIBUTE GsmBc Rlp protocolState (state)

Access	Read: All Write: Illegal
Description	This attribute indicates the last Radio Link Protocol (RLP) state before call take down. The following are the states: ***detached,*** Initial State. The call has not even started. ***disconnected***, Asynchronous Disconnected Mode (ADM). ***connPending***, In ADM, but sent Set Asynchronous Balanced Mode (SABM) and waiting for a response. ***discPending***, Sent Disconnect (DISC), waiting for a response. ***connectEstablished***, In Asynchronous Balanced Mode (ABM), Information frames can be exchanged. ***synchronized***, Synchronization state entered after a change of channel coding. Handles REMAP procedure.
Mib	GsmIwf
Values	detached (detach) disconnected (disc) connPending (connPend) discPending (discPend) connectEstablished (connEst) synchronized (sync)
Default	detached

ATTRIBUTE GsmBc Rlp frameSize

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the current Radio Link Protocol (RLP) frame size transmitted. The size of the frame depends on the radio channel type. The frames can be 240 bits long for 12 kbit/s and 6 kbit/s or 576 bits long for 14.5 kbit/s.
Mib	GsmIwf
Values	Decimal (0..65000)
Default	No default

ATTRIBUTE GsmBc Rlp highestVersion (highVer)

Access	Read: All Write: Illegal
Description	This attribute indicates the current highest version of the Radio Link Protocol (RLP) protocol negotiated by the Radio Link Protocol (RLP), during Exchange Information (XID). Valid values are: ***0***, Single-link basic version. ***1***, Single-link extended version (for example, extended by data compression). The value used for XID negotiations can be provisioned by component *GsmIwfRadioLinkProtocol* attribute *highestVersion*.
Mib	GsmIwf
Values	Decimal (0..1)
Default	No default

ATTRIBUTE GsmBc Rlp iwfToMsWindowSize (iwfMsWs)

Access	Read: All Write: Illegal
Description	This attribute indicates the current IWF to mobile window size negotiated by the Radio Link Protocol (RLP) during Exchange Information (XID). The window size is the maximum number of sequentially numbered Information (I) frames that may be unacknowledged at any given time. GSM specification 4.22 defines the range as 0 to 61. The value used for XID negotiations can be provisioned by component *GsmIwfRadioLinkProtocol* attribute *iwftoMsWindowSize*.
Mib	GsmIwf
Values	Decimal (0..61)
Default	No default

ATTRIBUTE GsmBc Rlp msToIwfWindowSize (msIwfWs)

Access	Read: All Write: Illegal
Description	This attribute indicates the current mobile to IWF window size negotiated by the Radio Link Protocol (RLP), during Exchange Information (XID). The

Copyright © 2006, Nortel Nortel Confidential

	window size is the maximum number of sequentially numbered Information (I) frames that may be unacknowledged at any given time. GSM specification 4.22 defines the range as 0 to 61. The value used for XID negotiations can be provisioned by component *GsmIwfRadioLinkProtocol* attribute *msToIwfWindowSize*.
Mib	GsmIwf
Values	Decimal (0..61)
Default	No default

ATTRIBUTE GsmBc Rlp t1AckTimer (t1)

Access	Read: All Write: Illegal
Description	This attribute indicates the current T1 timer negotiated by the Radio Link Protocol (RLP), during Exchange Information (XID). This is the period in milliseconds within which an acknowledgment of a sent frame must be received. Once this timer expires, the transmitting RLP entity shall assume that the frame was lost. The value used for XID negotiations can be provisioned by component *GsmIwfRadioLinkProtocol* attribute *t1AckTimer*.
Mib	GsmIwf
Values	Decimal (380..1020)
Units	msec
Default	No default

ATTRIBUTE GsmBc Rlp t2AckDelayTimer (t2)

Access	Read: All Write: Illegal
Description	This attribute indicates the current T2 timer negotiated by the Radio Link Protocol (RLP), during Exchange Information (XID). This is the maximum period in milliseconds the receiving RLP entity shall wait before sending an acknowledgment for a received in sequenced frame. The value used for XID negotiations can be provisioned by component *GsmIwfRadioLinkProtocol* attribute *t2AckDelayTimer*.
Mib	GsmIwf
Values	Decimal (10..70)
Units	msec
Default	No default

ATTRIBUTE GsmBc Rlp n2RetransmitCount (n2)

Access	Read: All Write: Service

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the current value of N2 negotiated by the Radio Link Protocol (RLP), during Exchange Information (XID). This is the maximum number of times a RLP entity shall retransmit an individual frame following the expiry of timer T1. The value used for XID negotiations can be provisioned by component *GsmIwfRadioLinkProtocol* attribute *n2RetransmitCount*.
Mib	GsmIwf
Values	Decimal (0..255)
Default	No default

GROUP GsmBc Rlp Statistics (Stats)

Properties	Operational
Description	This group contains operational attributes that measure performance of the *GsmIwfBearerChannel.*
Mib	GsmIwf

ATTRIBUTE GsmBc Rlp iFramesTx

Access	Read: All Write: Illegal
Description	This attribute counts the number of valid Information frames transmitted. This count does not include the Information frames discarded. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc Rlp iFramesRx

Access	Read: All Write: Illegal
Description	This attributes counts the number of valid Information (I) frames received. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc Rlp framesRetransmitted (frmRetrans)

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the total number of frames retransmitted. Frames that are not acknowledged within the T1 timer are retransmitted. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc Rlp t1AckTimeouts (t1Timeout)

Access	Read: All Write: Illegal
Description	This attribute counts the total number of T1 timer time-outs. Retransmission of all unacknowledged frames is started after T1 timer expiry. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc Rlp invalidFrames (invldFrm)

Access	Read: All Write: Illegal
Description	This attribute counts the number of invalid frames received. These invalid frames are frames received from the mobile which contain errors in the header information. This count does not include the number of frames with Cyclic Redundancy Check (CRC) errors or out-of-sequence Frame Errors. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc Rlp crcErrorsRx (crcErrRx)

Access	Read: All Write: Illegal
Description	This attribute counts the number of frames with Cyclic Redundancy Check (CRC) errors received by the IWF Radio Link Protocol (RLP) entity. CRC is a type of block check character that is very effective in detecting communications errors. CRCs are commonly 16 or 32 bits long (though, in GSM non-transparent services, a 24-bit CRC is used). The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE GsmBc Rlp outOfSequenceFrames (outOfSeqFrm)

Access	Read: All Write: Illegal
Description	This attribute counts the number of out-of-sequence Information frames received by the IWF Radio Link Protocol (RLP) entity. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc Rlp remoteBusyIndications (remoteBusy)

Access	Read: All Write: Illegal
Description	This attribute counts the number of times the mobile Radio Link Protocol (RLP) entity is busy (that is, it is in Asynchronous Balanced Mode (ABM) and is not ready to receive Information frames). The RLP entity is considered to be not ready to receive information frames if the mobile sends a flow control indication RNR (Receive Not Ready). A Receive Ready is sent to the RLP entity when the mobile is ready to receive data. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc Rlp localBusyIndications (localBusy)

Access	Read: All Write: Illegal
Description	This attribute counts the number of times the IWF RLP entity is busy (that is it is in Asynchronous Balanced Mode (ABM) and is not ready to receive Information frames). When the network side introduces flow control towards the mobile and a Receive Not Ready (RNR) is sent to the mobile to stop the mobile from sending any more data frames. A Receive Ready (RR) is sent to the mobile when the RLP entity is ready to receive data. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE GsmBc Rlp iFramesTxDiscarded (iFrmTxDisc)

Access	Read: All Write: Illegal
Description	This attribute counts the number of frames discarded by the IWF. Untransmitted and unacknowledged frames are discarded when a Set Asynchronous Balanced Mode (SABM) or Disconnect (DISC) is received or sent in Asynchronous Balanced Mode (ABM) mode. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc Rlp resetsRx

Access	Read: All Write: Illegal
Description	This attribute counts the number of resets sent by the mobile. Loss of information may occur when a reset is issued. A reset is issued by the mobile on failure of checkpoint recovery. That is if the mobile does not receive acknowledgment for its information frame, it does checkpoint recovery (it sends a supervisory frame requesting the status of the other entity. If the responding entity fails to respond to N2 of this checkpoint frame a reset is initiated by the originating entity. A reset can also be issued by the mobile during handover where a loss of connection or synchronization occurs. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

COMPONENT GsmBc V42

Groups	GROUP GsmBc V42 Operational (Oper) GROUP GsmBc V42 Statistics (Stats)
Scope	Application
Description	*GsmBc/<trunkGrp>,<cic> V42* This component represents the group of measurements for the ITU-T V.42 error correcting protocol established for a GSM IWF call (on the IWF to Public Switched Telephone Network (PSTN) modem link) on this particular *GsmIwfBearerChannel.*

GROUP GsmBc V42 Operational (Oper)

Properties Operational

Description This group contains operational attributes which measure V.42 error detection and correction performance.

Mib GsmIwf

ATTRIBUTE GsmBc V42 protocolState (state)

Access
Read: All
Write: Illegal

Description This attribute indicates the state of V.42. Valid states are:

notActive, The V.42 link connection with the Public Switched Telephoned Network) PSTN modem is not established. None of the V.42 functions including the error detection, error correction, and flow control is provided to the data call. This is the initial state of V.42.
disconnected, This means that the V42 link is disconnected.
linksetup, The V.42 operation enters this state from the disconnected state after the V.42 sends to the PSTN modem a Set Asynchronous Balanced Mode Extended (SABME) frame in an attempt to establish the error control connection with the PSTN modem.
frameReject, The V.42 operation enters into this state after it identifies an invalid frame sent by the peer and it sends back a frame reject (FRMR) frame to the peer.
disconnectRequest, The V.42 operation enters into this state after it sends to the peer a disconnect (DISC) frame with the attempt to disconnect the V.42 error control link.
informationTransfer, The V.42 enters into this state after it receives a UA (unnumbered acknowledgment) frame which the peer sent upon receipt of the SAMBE frame from IWF V.42. Once in this state, the V.42 can exchange data and supervisory information with its peer.
waitingAck, The V.42 enters this state after it sends polling enquiry to its peer. The V.42 sends the polling enquiry when it receives a reject frame (REJ) from its peer or either its acknowledgment timer or inactivity timer timed out on the information frames sent out.

Mib GsmIwf

Values
notActive

	linksetup frameReject (frmRej) disconnectRequest (discReq) informationTransfer (infoXfer) waitingAck (waitAck)
Default	notActive

ATTRIBUTE GsmBc V42 txN401FrameSize (txN401)

Access	Read: All Write: Illegal
Description	This attribute indicates the current value of parameter N401 for V.42 which is negotiated during Exchange Information (XID). This is the maximum number of octets that can be carried in the information field of an information frame that the IWF V.42 transmits to the Public Switched Telephone Network (PSTN) modem. The IWF V.42 puts this or even smaller size of data into the outgoing information frame. The value used for XID negotiations can be provisioned by component *GsmIwfV42* attribute *txN401FrameSize.*
Mib	GsmIwf
Values	Decimal (0..65355)
Default	No default

ATTRIBUTE GsmBc V42 rxN401FrameSize (rxN401)

Access	Read: All Write: Illegal
Description	This attribute indicates the current value of N401, that is negotiated during Exchange Identification (XID). This is the maximum number of octets that can be carried in the information field of an information frame received from the Public Switched Telephone Network (PSTN) modem. An incoming information frame carrying data octets more than this size shall be rejected by the IWF V.42. The value used for XID negotiations can be provisioned by component *GsmIwfV42* attribute *rxN401FrameSize.*
Mib	GsmIwf
Values	Decimal (1..255)
Default	No default

ATTRIBUTE GsmBc V42 txKwindowSize (txK)

Access	Read: All Write: Illegal
Description	This attribute indicates the current value of k, that is negotiated during Exchange Identification (XID). This is the size of flow control sliding window used for the information frames that the V.42 transmits to the Public Switched Telephone Network (PSTN) modem. This size governs

Copyright © 2006, Nortel Nortel Confidential

	the maximum number of information frames that the IWF V.42 error-correcting entity can have outstanding (that is, unacknowledged). The value used for XID negotiations can be provisioned by component *GsmIwfV42* attribute *txKwindowSize.*
Mib	GsmIwf
Values	Decimal (0..127)
Default	No default

ATTRIBUTE GsmBc V42 rxKwindowSize (rxK)

Access	Read: All Write: Illegal
Description	This attribute indicates the current value of k that is negotiated during Exchange Identification (XID). This is the size of flow control sliding window used for information frames transmitted from the Public Switched Telephone Network (PSTN) modem. This size governs the maximum number of information frames that the peer of the IWF V.42 error-correcting entity can have outstanding (that is, unacknowledged). The value used for XID negotiations can be provisioned by component *GsmIwfV42* attribute *rxKwindowSize.*
Mib	GsmIwf
Values	Decimal (1..127)
Default	No default

GROUP GsmBc V42 Statistics (Stats)

Properties	Operational
Description	This group contains statistical attributes that measure the V.42 error detection and correction performance.
Mib	GsmIwf

ATTRIBUTE GsmBc V42 iBytesRx

Access	Read: All Write: Illegal
Description	This attribute counts the total number of bytes that the V.42 actually received from the Public Switched Telephone Network (PSTN) modem in a data call. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE GsmBc V42 iBytesTx

Access	Read: All Write: Illegal
Description	This attribute counts the total number of bytes that the V.42 transmitted to the Public Switched Telephone Network (PSTN) modem in a data call. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc V42 iFramesRx

Access	Read: All Write: Illegal
Description	This attribute counts the total number of Information (I) frames that the V.42 received from the Public Switched Telephone Network (PSTN) modem in a data call. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc V42 iFramesTx

Access	Read: All Write: Illegal
Description	This attribute counts the total number of information frames that the V.42 transmitted to the Public Switched Telephone Network (PSTN) modem in a data call. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc V42 framesRetransmitted (frmRetrans)

Access	Read: All Write: Illegal
Description	This attribute counts the total number of frames retransmitted by the IWF V.42 entity in a data call. The V.42 retransmits the same frame when the associated T401 acknowledgment timer time-outs or when a Reject (REJ) supervisory frame has been received from the Public Switched Telephone Network (PSTN) modem. The counter wraps when it exceeds the maximum value.

Copyright © 2006, Nortel Nortel Confidential

Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc V42 t1AckTimeouts (t1Timeout)

Access	Read: All Write: Illegal
Description	This attribute counts the total number of times that the T401 timer has timed out within a data call. If this timer times-out frequently, the operator may need to adjust the provisional parameter T401 acknowledgment timer to a larger time amount, since every time that V.42 sends out a frame it sets the T401 timer to wait for the peer's acknowledgment of the frame. When the timer times-out and no acknowledgment has been received, the V.42 sends the same frame to its peer. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc V42 remoteBusyIndications (remoteBusy)

Access	Read: All Write: Illegal
Description	This attribute counts the total number of times the Public Switched Telephone Network (PSTN) modem enters a busy state (the IWF has received a Receive Not Ready message) and asks the IWF V.42 not to send Information (I) frames to it until it is ready to receive information frames again (indicated by receipt of a Receive Ready message or a data message). The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc V42 localBusyIndications (localBusy)

Access	Read: All Write: Illegal
Description	This attribute counts the total number of times the IWF V.42 enters in a busy condition and asks the peer to stop sending information frames until it has cleared up from the busy condition. The V.42 enters busy condition when its data buffer is about to be overflowed by the incoming Information (I) frames. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf

Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc V42 badFramesRx (badFrmRx)

Access	Read: All Write: Illegal
Description	This attribute counts the total number of bad frames the IWF V.42 has received from the Public Switched Telephone Network (PSTN) remote modem within the data call. In this instance, “bad frames” refer to the V.42 protocol error frames other than the check sequence error frames. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc V42 crcErrorsRx (crcErrRx)

Access	Read: All Write: Illegal
Description	This attribute counts the total number of frames received from the remote Public Switched Telephone Network (PSTN) modem that contain incorrect frame check sequence. A high value signifies the condition of the physical medium is poor. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

COMPONENT GsmBc V42bis

Groups	GROUP GsmBc V42bis Operational (Oper) GROUP GsmBc V42bis Statistics (Stats)
Scope	Application
Description	*GsmBc<trunkGrp>,<cic> V42bis* This component represents the group of measurements for the ITU-T V.42bis data compression protocol established for a GSM IWF call (on the mobile station to the IWF link or the IWF to Public Switched Telephone Network (PSTN) fax modem link) on this particular *GsmIwfBearerChannel.*

GROUP GsmBc V42bis Operational (Oper)

Properties Operational

Description This group contains operational attributes that measure the performance of *V.42bis*.

Mib GsmIwf

ATTRIBUTE GsmBc V42bis protocolModeEncoder (modeEncoder)

Access Read: All
Write: Illegal

Description This attribute indicates the current mode of the V.42bis encoder. This mode can be either:
transparent - A mode of operation in which compression has been selected but data is being transmitted in uncompressed form. Transparent mode command sequences may be inserted into the data stream.
compressed - A mode of operation in which data is transmitted in codewords.
The encoder switches between the two modes depending on whether the data coming from the Date Terminal Equipment (DTE) is suitable for compression. The data comression function periodically determines the compressibility of the data based on a comparison of the number of bits required to represent a segment of the data stream before and after compression.

Mib GsmIwf

Values transparent
compressed

Default No default

ATTRIBUTE GsmBc V42bis protocolModeDecoder (modeDecoder)

Access Read: All
Write: Illegal

Description This attribute indicates the current mode of the V.42bis decoder. This mode can be either:
transparent - A mode of operation in which compression has been selected but data is being transmitted in uncompressed form. Transparent mode command sequences may be inserted into the data stream.
compressed - A mode of operation in which data is transmitted in

codewords.
The encoder (at the mobile or Public Switched Telephone Network) switches between the two modes depending on whether the data coming from the Date Terminal Equipment (DTE) is suitable for compression. The data comression function periodically determines the compressibility of the data based on a comparison of the number of bits required to represent a segment of the data stream before and after compression.

Mib GsmIwf

Values transparent
compressed

Default No default

ATTRIBUTE GsmBc V42bis compressionDirection (p0)

Access Read: All
Write: Illegal

Description This attribute indicates the direction in which V.42bis is active, negotiated at link setup by the data link protocol through Exchange Identification (XID) negotiation of parameter P0 (compression direction). The value used for XID negotiations can be provisioned by component *GsmIwfV42bisProv* attribute *compressionDirection*. Valid values are:
none, No compression is present.
encode, The data sent by the IWF to the other entity is compressed.
decode, The data received by the IWF from the other entity is compressed.
both, The data sent and received by the IWF is compressed.

Mib GsmIwf

Values none
encode
decode
both

Default No default

ATTRIBUTE GsmBc V42bis maximumCodewords (p1)

Access Read: All
Write: Illegal

Description This attribute indicates the maximum number of codewords in the dictionary negotiated at link setup by the data link protocol by way of the Exchange Identification (XID) negotiation of parameter P1 (number of codewords). The value used for XID negotiations can be provisioned by component *GsmIwfV42bisProv* attribute *maximumCodewords*.

Mib GsmIwf

Values Decimal (0..4096)

Default No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE GsmBc V42bis maximumStringSize (p2)

Access	Read: All Write: Illegal
Description	This attribute indicates the maximum number of characters allowed in a string represented by a codeword negotiated at link setup by the data link protocol by way of the Exchange Identification (XID) negotiation of parameter P2 (maximum string size). The value used for XID negotiations can be provisioned by component *GsmIwfV42bisProv* attribute *maximumStringSize.*
Mib	GsmIwf
Values	Decimal (6..250)
Default	No default

ATTRIBUTE GsmBc V42bis lastDecodeError (lastDecodeErr)

Access	Read: All Write: Illegal
Description	This attribute indicates last error found by the decoder. Error values are: ***none***, No errors found. ***badStepup***, Receipt of STEPUP (step up codeword size) codeword when it would cause C2 (current code word size) to exceed N1 (maximum code word size). ***codewordEqC1***, Receipt of a codeword, at any time, equal to C1 (next empty dictionary entry). ***emptyCodeword***, Receipt of a codeword representing an empty dictionary entry. ***reservedCommand***, Receipt of a reserved command code. ***generalError***, Receipt of any other error. The action taken by V.42bis on detecting an error is provisioned by component *GsmIwfV42bis* attribute *actionOnError.*
Mib	GsmIwf
Values	none badStepup codewordEqC1 emptyCodeword reservedCommand generalError
Default	none

ATTRIBUTE GsmBc V42bis compRatioEncoder

Access	Read: All Write: Illegal
Description	This attribute indicates the number of uncompressed bytes divided by the number of compressed bytes. A value greater than one means that the

Copyright © 2006, Nortel Nortel Confidential

	data is being compressed. This is the compression ratio achieved by the V.42bis encoder running on the Passport. This attribute is relevant for both protocol modes transparent and compressed as the encoder switches between the two modes.
Mib	GsmIwf
Values	Decimal (0.00..300.00)
Default	No default

ATTRIBUTE GsmBc V42bis compRatioDecoder

Access	Read: All Write: Illegal
Description	This attribute indicates the number of uncompressed bytes divided by the number of compressed bytes. A value greater than one means that the data is being compressed. This is the compression ratio achieved by the V.42bis encoder at the mobile or Public Switched Telephone Network (PSTN). This attribute is relevant for both protocol modes transparent and compressed as the encoder switches between the two modes.
Mib	GsmIwf
Values	Decimal (0.00..300.00)
Default	No default

GROUP GsmBc V42bis Statistics (Stats)

Properties	Operational
Description	This group contains operational attributes that measure the performance of *V.42bis*.
Mib	GsmIwf

ATTRIBUTE GsmBc V42bis modeChangesEncode (modeChgEncode)

Access	Read: All Write: Illegal
Description	This attribute counts the number of mode changes (from transparent to compressed or from compressed to transparent) by the encoder. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc V42bis modeChangesDecode (modeChgDecode)

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of mode changes (from transparent to compressed or from compressed to transparent) by the decoder. The mode changes are determined by the encoder at the mobile or the Public Switched Telephone Network (PSTN). The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc V42bis resetsEncode

Access	Read: All Write: Illegal
Description	This attribute counts the number of resets sent by the encoder. A reset is a command code sent by the encoder to force dictionary reinitialization. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc V42bis resetsDecode

Access	Read: All Write: Illegal
Description	This attribute counts the number of resets received by the decoder. A reset is a command code sent by the encoder to force dictionary reinitialization. The resets of the decoder are determined by the encoder at the mobile or Public Switched Telephone Network (PSTN). The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc V42bis reInitializations (reInit)

Access	Read: All Write: Illegal
Description	This attribute counts the number of times V.42bis is reinitialized because of a destructive break (a destructive break is a break that causes data to be discarded) occurring on the error-corrected connection initiatated by either the mobile or Public Switched Telephone Network (PSTN). The counter wraps when it exceeds the maximum value.
Mib	GsmIwf

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmBc V42bis errorsInDecode (errDecode)

Access	Read: All Write: Illegal
Description	This attribute counts the number of errors found by the decoder. The errors could be any of the following: 1.Receipt of STEPUP (step up codeword size) codeword when it would cause C2 (current code word size) to exceed N1 (maximum code word size). 2. Receipt of a codeword, at any time, equal to C1 (next empty dictionary entry). 3. Receipt of a codeword representing an empty dictionary entry. 4. Receipt of a reserved command code. 5. Receipt of any other error. The counter wraps when it exceeds the maximum value. The action taken by V.42bis on detecting any of these errors is provisioned by component *GsmIwfV42bis* attribute *actionOnError.*
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

COMPONENT GsmBc Layer2RelayCop (L2RCop)

Groups	GROUP GsmBc L2RCop Operational (Oper) GROUP GsmBc L2RCop Statistics (Stats)
Scope	Application
Description	*GsmBc/<trunkGrp>,<cic> Layer2RelayCop* This component represents the group of measurements for the GSM Layer 2 Relay Character Oriented Protocol (L2RCOP) established for a GSM IWF call (on the mobile station to the IWF link) on this particular *GsmIwfBearerChannel.* Note that this component is present only if the current (or most recent call) involved this protocol.

Properties	Provisioned
Description	This group contains general provisioning data for the *GsmIwfCallServer* that does not fit within other provisioning groups.
Mib	GsmIwf

ATTRIBUTE GsmCs commentText

Access	Read: All Write: All
Description	Use of this attribute is at the discretion of the system administrator. Typically, this attribute specifies the name of the trunk group at the Mobile Services-switching Center (MSC) configured for this *GsmIwfCallServer* plus any other commentary information.
Mib	GsmIwf
Values	String (0..40, ASCII)
Default	""

ATTRIBUTE GsmCs mscIpAddress (ipAddr)

Access	Read: All Write: Configuration
Description	This attribute specifies the Internetwork Protocol (IP) Address of the Mobile Services-switching Center (MSC) Control Module (CM) that is permitted to set up GSM InterWorking Function (IWF) calls using this *GsmIwfCallServer*. This address must be specified in order for this *GsmIwfCallServer* to provide service. If call setups are attempted from an

Copyright © 2006, Nortel Nortel Confidential

	MSC which does not have this address, those calls are rejected. The *callsRequested* statistic of this *GsmIwfCallServer* is incremented, but the *callsSetup* statistic of this *GsmIwfCallServer* is not, when call setup attempts are rejected. Also, at the MSC, appropriate call failure logs are generated.
Mib	GsmIwf
Values	IP address
Default	0.0.0.0

ATTRIBUTE GsmCs virtualRouterName (vr)

Access	Read: All Write: Configuration
Criticality	Component
Description	This attribute specifies the *VirtualRouter* that this *GsmIwfCallServer* uses to transmit signaling messages to and receive signaling messages from the Mobile Services-switching Center (MSC) that utilizes this *GsmIwfCallServer*.
Mib	GsmIwf
Values	The name of the component
Default	No default

ATTRIBUTE GsmCs voiceLaw (encoding)

Access	Read: All Write: Configuration
Description	This attribute specifies the voice law to be established for the IWF to Public Switched Telephone Network (PSTN) modem link for calls established by this *GsmIwfCallServer*. Valid values are: ***aLaw***, a protocol for encoding voice-band audio, Pulse Code Modulation (PCM). ***muLaw***, a protocol for encoding voice-band audio, PCM. Note that this value must match the voice law used at the Mobile Services-switching Center (MSC) connected to this *GsmIwfCallServer*.
Mib	GsmIwf
Values	aLaw muLaw
Default	aLaw

GROUP GsmCs CustomerIdentifierData (CidData)

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	GsmIwf

ATTRIBUTE GsmCs customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	GsmIwf
Values	Decimal (0; 1..8191)
Default	0

GROUP GsmCs OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	GsmIwf

ATTRIBUTE GsmCs adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib: GsmIwf

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE GsmCs operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib: GsmIwf

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE GsmCs usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib: GsmIwf

Values	idle active (activ) busy
Default	idle

GROUP GsmCs Statistics (Stats)

Properties	Operational
Description	This group contains operational attributes that measure the performance of this particular *GsmIwfCallServer*.
Mib	GsmIwf

ATTRIBUTE GsmCs currentCalls (currCall)

Access	Read: All Write: Illegal
Description	This attribute indicates the number of active calls currently serviced by this particular *GsmIwfCallServer*.
Mib	GsmIwf
Values	Decimal (0..2047)
Default	0

ATTRIBUTE GsmCs callsRequested (callsReq)

Access	Read: All Write: Illegal
Description	This attribute counts the number of IWF call setup requests received at this particular *GsmIwfCallServer* from the Mobile Services-switching Center (MSC). The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmCs callsSetup (callsSet)

Access	Read: All Write: Illegal
Description	This attribute counts the number of IWF calls successfully setup by this particular *GsmIwfCallServer*. A call is considered setup when the IWF-Setup-Request message is received, indicating a request for a data communications service, and the IWF has successfully allocated the necessary resources to fulfill the request. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmCs callsActivated (callsAct)

Access	Read: All Write: Illegal
Description	This attribute counts the number of IWF calls successfully activated by this particular *GsmIwfCallServer*. A call is considered activated when the IWF receives an IWF-Activate-Request, indicating that the call parties are connected and that data communications must begin. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmCs callsReleasedNormal (callsRlsdNor)

Access	Read: All Write: Illegal
Description	This attribute counts the number of IWF calls that have completed successfully on this particular *GsmIwfCallServer*. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmCs callsReleasedAbnormal (callsRlsdAbnor)

Access	Read: All Write: Illegal
Description	This attribute counts the number of IWF calls that have been released due to error conditions at this particular *GsmIwfCallServer* or one if its *GsmIwfBearerChannel*s. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmCs channelConfigChanges (chanConfig)

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of channel configuration requests from the Mobile-services Switching Center (MSC) that have been received at this *GsmIwfCallServer* and have resulted in successful responses. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmCs channelModeModifyRequests (cmm)

Access	Read: All Write: Illegal
Description	This attribute counts the number of channel mode modify requests that have been generated by fax calls serviced by this particular *GsmIwfCallServer*. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmCs statusMessagesRx (statusMsgRx)

Access	Read: All Write: Illegal
Description	This attribute counts the number of status messages received from the Mobile Services-switching Center (MSC). The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE GsmCs erroredMipFrames (errMipFrm)

Access	Read: All Write: Illegal
Description	This attribute counts the number of MSC/IWF Interface Protocol (MIP) messages received from the Mobile Services-switching Center (MSC) that were in error. The counter wraps when it exceeds the maximum value.
Mib	GsmIwf
Values	Decimal (0..4294967295)
Default	No default

COMPONENT GsmCs RadioLinkProtocol (Rlp)

Instance	half6kRate (half6k) full6kRate (full6k) full12kRate (full12k) full14k5Rate (full14k5)
Groups	GROUP GsmCs Rlp Provisioned (Prov)
Scope	Application
Description	*GsmCs/<trunkGrp> RadioLinkProtocol/<radio-channel-type>* This component represents a group of Radio Link Protocol (RLP) instances, indexed by radio channel type. Valid radio channel types are: ***half6kRate***, Half rate channel at 6 kbit/s. ***full6kRate***, Full rate channel at 6 kbit/s. ***full12kRate***, Full rate channel at 12 kbit/s. ***full14k5Rate***, Full rate channel at 14.5 kbit/s. Many RLP attributes are dependent on the frame rate and frame size, that is dictated by the radio channel type. When a *GsmIwfCallServer* is added, a *RadioLinkProtocol* instance is added automatically for each possible instance value. The attributes are set to default values, dependent on the radio channel type of the component instance.
Mib	GsmIwf
Common Verbs	Help List Display

GROUP GsmCs Rlp Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisionable attributes for the Radio Link Protocol (RLP) parameters used for the call set up by this particular *GsmIwfCallServer*. Changes to these attributes do not effect existing calls.
Mib	GsmIwf

ATTRIBUTE GsmCs Rlp highestVersion (highVer)

Access	Read: All Write: Service
Description	This attribute specifies the highest version of the Radio Link Protocol (RLP) protocol supported on this *GsmIwfCallServer*. Valid values are: ***0***, Single-link basic version. ***1***, Single-link extended version (for example, extended by data compression). During the Exchange Information (XID) negotiation at the start of the call, both RLP entities (mobile station and IWF) can agree to use a particular

Copyright © 2006, Nortel Nortel Confidential

	RLP version. The IWF attempts to negotiate the value specified by this attribute. Note that if V.42bis data compression is be established between the mobile station and IWF, both entities must agree to use version 1 (or higher). The default value for *highestVersion* is 1 to enable support for V.42bis data compression. The negotiated value can be viewed in the component *GsmIwfRlpOp* attribute *highestVersion*. Changes to this attribute do not effect existing calls.
Mib	GsmIwf
Values	Decimal (0..1)
Default	1

ATTRIBUTE GsmCs Rlp iwfToMsWindowSize (iwfMsWs)

Access	Read: All Write: Service
Description	This attribute specifies the maximum number of sequentially numbered Information (I) frames that may be outstanding (that is, unacknowledged) at any given time from the IWF to the mobile station. GSM specification 4.22 defines the range as 0 to 61. During the Exchange Information (XID) negotiation, both Radio Link Protocol (RLP) entities (mobile station and IWF) can agree to use a specific window size. The IWF attempts to negotiate to the value specified by this attribute. The negotiated value can be viewed in the component *GsmIwfRlpOp* attribute *iwfToMsWindowSize.* Changes to this attribute do not effect existing calls.
Mib	GsmIwf
Values	Decimal (0..61)
Default	61

ATTRIBUTE GsmCs Rlp msToIwfWindowSize (msIwfWs)

Access	Read: All Write: Service
Description	This attribute specifies the maximum number of sequentially numbered Information (I) frames that may be outstanding (that is, unacknowledged) at any given time from the mobile station to IWF. GSM specification 4.22 defines the range as 0-61. During the Exchange Information (XID) negotiation, both Radio Link Protocol (RLP) entities (mobile station and IWF) can agree to use a specific window size. The IWF attempts to negotiate to the value specified by this attribute. The negotiated value can be viewed in the component GsmIwf*RlpOp* attribute *msToIwfWindowSize*. Changes to this attribute do not effect existing calls.

Copyright © 2006, Nortel Nortel Confidential

Mib	GsmIwf
Values	Decimal (0..61)
Default	61

ATTRIBUTE GsmCs Rlp t1AckTimer (t1)

Access	Read: All Write: Service
Description	This attribute specifies the time in milliseconds within which an acknowledgment of a sent frame must be received. Once this timer expires, the transmitting Radio Link Protocol (RLP) entity shall assume that the frame was lost. During the Exchange Information (XID) negotiation, both RLP entities (mobile station and IWF) can agree to use specific value for this timer (T1). The IWF attempts to negotiate to the value specified by this attribute. The default value for *t1AckTimer* is 520 msec for the ***full14k5Rate*** instance of this component, 480 msec for ***full12kRate,*** 540 msec for ***full6kRate***, and 780 msec for ***half6kRate***. The negotiated value can be viewed in the component *GsmIwfRlpOp* attribute *t1AckTimer.* Changes to this attribute do not effect existing calls.
Mib	GsmIwf
Values	Decimal (380..1020)
Units	msec
Default	No default

ATTRIBUTE GsmCs Rlp t2AckDelayTimer (t2)

Access	Read: All Write: Service
Description	This attribute specifies the maximum time in milliseconds the receiving Radio Link Protocol (RLP) entity shall wait before sending an acknowledgment for a received information frame. During the Exchange Information (XID) negotiation, both RLP entities (mobile station and IWF) can agree to use specific value for this timer (T2). The IWF attempts to negotiate to the value specified by this attribute. The negotiated value can be viewed in the component *GsmIwfRlpOp* attribute *t2AckDelayTimer*. Changes to this attribute do not effect existing calls.
Mib	GsmIwf
Values	Decimal (10..79)
Units	msec
Default	50

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE GsmCs Rlp n2RetransmitCount (n2)

Access	Read: All Write: Service
Description	This attribute specifies the maximum number of times a Radio Link Protocol (RLP) entity shall retransmit an individual frame following the expiry of timer T1. During the Exchange Information (XID) negotiation, both RLP entities (mobile station and InterWorking Function (IWF)) can agree to use specific value for N2 (Retransmit Count). The IWF attempts to negotiate to the value specified by this attribute. The negotiated value can be viewed in the component *GsmIwfRlpOp* attribute *n2RetransmitCount*. Changes to this attribute do not effect existing calls.
Mib	GsmIwf
Values	Decimal (1..255)
Default	6

COMPONENT GsmCs Fax

Groups	GROUP GsmCs Fax Provisioned (Prov)
Scope	Application
Description	*GsmCs/<trunkGrp> Fax* This component represents a group of fax provisioning attributes. These attributes specify various default settings for aspects of the fax protocol, which may be used for a GSM IWF call.
Mib	GsmIwf
Common Verbs	Help List Display

GROUP GsmCs Fax Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the fascimile protocol (T.30 and GSM 03.45) for this particular *GsmIwfCallServer*. Changes to these attributes do not effect existing calls.
Mib	GsmIwf

ATTRIBUTE GsmCs Fax t1CalledToneTimer (t1)

Access	Read: All Write: Configuration

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the delay to generate a Called (CED) tone at the IWF after the called station is connected to the line for mobile terminated calls. Changes to this attribute do not effect existing calls.
Mib	GsmIwf
Values	Decimal (1.50..3.00)
Units	seconds
Default	1.80

COMPONENT GsmCs V42

Groups	GROUP GsmCs V42 Provisioned (Prov)
Scope	Application
Description	*GsmCs/<trunkGrp> V42* This component represents a group of ITU-T V.42 error correcting data link protocol provisioning attributes. These attributes specify various default settings for aspects of the V.42 protocol, that may be used for a GSM IWF call for the IWF to Public Switched Telephone Network (PSTN) modem link.
Mib	GsmIwf
Common Verbs	Help List Display

GROUP GsmCs V42 Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the V.42 protocol for this particular *GsmIwfCallServer*. Changes to these attributes do not effect existing calls.
Mib	GsmIwf

ATTRIBUTE GsmCs V42 t400DetectTimer (t400)

Access	Read: All Write: Service
Description	This attribute specifies the maximum amount of time that the IWF waits for an Originator Detection Pattern (ODP) or Answerer Detection Pattern (ADP). ODP/ADP is a series of special bit patterns used during the call setup procedures. If the IWF is the Originator of the call, it starts sending ODP patterns and waits for an ADP for the duration of T400 milliseconds from the answerer at call setup time. If the IWF is the Answerer of the call, it waits for an ODP for T400 seconds from the originator and if it receives during that time it sends an ADP

Copyright © 2006, Nortel Nortel Confidential

	pattern to the originator at the call setup time. Since both sides operate with different values of T400 timer, a higher value increases the chance of a successful call setup. Changes to this attribute do not effect existing calls.
Mib	GsmIwf
Values	Decimal (0.75..2.54)
Units	seconds
Default	2.00

ATTRIBUTE GsmCs V42 t401AckTimer (t401)

Access	Read: All Write: Service
Description	This attribute specifies the maximum amount of time that the IWF waits for an acknowledgment before retransmitting a frame. Since information about the T401 timer is not carried in the Exchange Identification (XID) negotiations at call setup time, both sides operate with different timer values. The value for T401 depends on many factors, such as propagation delay or frame processing time. A frame is retransmitted up to N400 times if the timer T401 expires before an acknowledgment for a frame is actually received. The performance of the data link layer can be impacted by the value of this timer as retransmissions of frames occur on expiry of timer T401. Changes to this attribute do not effect existing calls.
Mib	GsmIwf
Values	Decimal (0.50..9.00)
Units	seconds
Default	4.00

ATTRIBUTE GsmCs V42 t402AckDelayTimer (t402)

Access	Read: All Write: Service
Description	This attribute specifies the maximum amount of time that the IWF may wait following the receipt of any frame requiring a reply before it initiates transmission of an appropriate reply in order to ensure that the reply frame is received by the remote error-correcting entity prior to expiration of the T401 timer of the remote error-correcting entity. Since information about the T402 timer is not carried in the Exchange Identification (XID) negotiations at call setup, both sides operate with different timer values. If this timer expires, then the reply that would have been returned prior to its expiration is not sent. The performance of the data link layer can be impacted by the value of this timer as retransmissions of frames occur on expiry of timer T401. For better performance, a value of *t402AckDelayTimer* (T402) equal to half the value of *t401AckTimer* (T401)

Copyright © 2006, Nortel Nortel Confidential

	is recommended. Changes to this attribute do not effect existing calls.
Mib	GsmIwf
Values	Decimal (0.25..4.50)
Units	seconds
Default	2.00

ATTRIBUTE GsmCs V42 t403IdleProbeTimer (t403)

Access	Read: All Write: Service
Description	This attribute specifies the maximum amount of time that the IWF allows to elapse without frames being exchanged. The link is permitted to remain idle with no frames being exchanged on the data link. Upon expiry of this timer, the IWF polls its peer for status. Since information about the T403 timer is not carried in the Exchange Identification (XID) negotiations at call setup time, both sides operate with different timer values. Changes to this attribute do not effect existing calls.
Mib	GsmIwf
Values	Decimal (30..90)
Units	seconds
Default	60

ATTRIBUTE GsmCs V42 txN401FrameSize (txN401)

Access	Read: All Write: Service
Description	This attribute specifies the maximum number of octets that can be carried in the information field of an Information (I) frame, Exchange Identification (XID) frame, and a Unnumbered Information (UI) frame from the IWF to the remote entity. The default value is 128 octets, and no XID negotiations required for *txN401FrameSize*. If the value for *txN401FrameSize* value is set to other than 128 octets, then XID frames are exchanged to negotiate a value. The value provided for *txN401FrameSize* sets up the bounds during XID negotiations. The IWF performs XID negotiations with this value as a minimum or maximum value. If a value greater than 128 is specified, then the IWF negotiates or attempts to negotiate a value between the 128 (as a minimum) and the given value (as a maximum). If a value less than 128 is specified, then the IWF attempts to negotiate a value between the given value (as a minimum) and 128 (as a maximum). Any value can be specified as long as it is within the provisionable limits. However, a value equal to or close to 128 is recommended. The negotiated value can be viewed in the component *GsmIwfV42Op* attribute *txN401FrameSize*. Changes to this attribute do not effect existing calls.

Copyright © 2006, Nortel Nortel Confidential

Mib	GsmIwf
Values	Decimal (1..255)
Units	octets
Default	128

ATTRIBUTE GsmCs V42 rxN401FrameSize (rxN401)

Access	Read: All Write: Service
Description	This attribute specifies the maximum number of octets that can be carried in the information field of an Information (I) frame, Exchange Identification (XID) frame, and a Unnumbered Information (UI) frame from the remote entity to the IWF. The default value is 128 octets, and no XID negotiations are required for *rxN401FrameSize*. If the value set for *rxN401FrameSize* is other than 128, XID frames are exchanged to negotiate a value. The value provided for *rxN401FrameSize* sets up the bounds during XID negotiations. The IWF performs XID negotiations with this value as a minimum or maximum value. If a value greater than 128 is specified, then the IWF attempts to negotiate for a value between 128 (as a minimum) and the given value (as a maximum). If a value less than 128 value is specified, then the IWF attempts to negotiate for a value between the given value (as a minimum) and 128 (as a maximum). Any value can be specified as long as it is within the provisionable limits. However, a value equal to or close to the default is recommended. The negotiated value can be viewed in the component *GsmIwfV42Op* attribute *rxN401FrameSize*. Changes to this attribute do not effect existing calls.
Mib	GsmIwf
Values	Decimal (1..255)
Units	octets
Default	128

ATTRIBUTE GsmCs V42 txKwindowSize (txK)

Access	Read: All Write: Service
Description	This attribute specifies the maximum number of outstanding unacknowledged sequenced Information (I) frames from the IWF to the remote entity. The default value is 15 frames, and if this value is used then no Exchange Identification (XID) negotiations are required for *txKwindowSize*. If the value set for *txKwindowSize* is other than 15, then XID frames are exchanged to negotiate a value. The value provided for *txKwindowSize* sets up the bounds during XID negotiations. The IWF performs XID negotiations with this value as a minimum or maximum value. If a value greater than 15 is specified, then the IWF attempts to negotiate a value between 15 (as a minimum) and the given value (as a

Copyright © 2006, Nortel Nortel Confidential

	maximum). If a value less than 15 is specified, then the IWF attempts to negotiate for a value between the given value (as a minimum) and 15 (as a maximum). Any value can be specified as long at it is within the provisionable limits. However, a value equal to or close to the default is recommended. The negotiated value can be viewed in the component *GsmIwfV42Op* attribute *txKwindowSize*. Changes to this attribute do not effect existing calls.
Mib	GsmIwf
Values	Decimal (1..255)
Default	15

ATTRIBUTE GsmCs V42 rxKwindowSize (rxK)

Access	Read: All Write: Service
Description	This attribute specifies the maximum number of outstanding unacknowledged sequenced Information (I) frames from the remote entity to the IWF. The default value is 15 frames, and if this value is used then no Exchange Identification (XID) negotiations are required for *rxKwindowSize*. If the value set for rxKwindowSize is other than 15, then XID frames are exchanged to negotiate a value. The value provided for *rxKwindowSize* sets up the bounds during XID negotiations. The IWF performs XID negotiations with this value as a minimum or maximum value. If a value greater than 15 is specified, then the IWF attempts to negotiate a value between 15 (as a minimum) and the given value (as a maximum). If a value less than 15 is specified, then the IWF attempts to negotiate for a value between the given value (as a minimum) and 15 (as a maximum). Any value can be specified as long as it is within the provisionable limits. However, a value equal to or close to the default is recommended. The negotiated value can be viewed in the component *GsmIwfV42Op* attribute *rxKwindowSize*. Changes to this attribute do not effect existing calls.
Mib	GsmIwf
Values	Decimal (1..255)
Default	15

ATTRIBUTE GsmCs V42 n400RetransLimit (n400)

Access	Read: All Write: Service
Description	This attribute specifies the maximum number of times the IWF retransmits a frame upon expiry of *t401AckTimer* before appropriate recovery action is taken. Information about N400 (Retransmission Limit) is not carried in the Exchange Identification (XID) negotiation at call setup time so both sides

Copyright © 2006, Nortel Nortel Confidential

operate with different N400 values.
Changes to this attribute do not effect existing calls.

Mib	GsmIwf
Values	Decimal (0..255)
Default	10

COMPONENT GsmCs V42bis

Groups	GROUP GsmCs V42bis Provisioned (Prov)
Scope	Application
Description	*GsmCs/<trunkGrp> V42bis* This component represents a group of ITU-T V.42bis data compression protocol provisioning attributes. These attributes specify various default settings for aspects of the V.42bis protocol, which may be used in a GSM IWF call on the mobile station to IWF link and/or the IWF to Public Switched Telephone Network (PSTN) modem link.
Mib	GsmIwf
Common Verbs	Help List Display

GROUP GsmCs V42bis Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the V.42bis data compression protocol parameters used for the calls set up by this particular *GsmIwfCallServer*. Changes to these attributes do not effect existing calls.
Mib	GsmIwf

ATTRIBUTE GsmCs V42bis compressionDirection (p0)

Access	Read: All Write: Service
Description	This attribute specifies the V.42bis data compression direction to be supported. The value for compression direction is negotiated at link setup by the data link protocol by way of the Exchange Identification (XID) negotiation of parameter P0 (compression direction). During XID negotiation of parameter P0, both sides (IWF and mobile or IWF and Public Switched Telephone Network (PSTN)) agree on the compression direction. Valid values are: ***none***, No compression is present. ***encode***, The data sent by the IWF to the other entity is compressed. ***decode***, The data received by the IWF from the other entity is

Copyright © 2006, Nortel Nortel Confidential

compressed.
both, The data sent and received by the IWF is compressed.
The negotiated value can be viewed in the component GsmIwf*V42bisOp* attribute *compressionDirection.* Changes to this attribute do not effect existing calls.

Mib GsmIwf

Values
none
encode
decode
both

Default both

ATTRIBUTE GsmCs V42bis maximumCodewords (p1)

Access
Read: All
Write: Service

Description This attribute specifies the maximum number of V.42bis codewords the IWF supports. A codeword is a binary number that represents a string of characters in compressed form. V.42bis keeps a dictionary of codewords for each compression direction. During Exchange Identification (XID) negotiation of parameter P1 (number of codewords), both sides (IWF and mobile or IWF and Public Switched Telephone Network (PSTN)) agree on the total number of codewords in the dictionaries. Changes to this attribute impact the compression ratio for the encoder (component *GsmV42BisOp* attribute *compRatioEncoder*). Changes also impact the amount of memory used (more memory is used when increasing the attribute). The gain in performance obtained from the selection of a larger dictionary may be offset by the larger codeword size needed, and for certain types of data, better performance may be obtained by using a smaller dictionary.
The negotiated value can be viewed in the component GsmIwf*V42bisOp* attribute *maximumCodewords* . Changes to this attribute do not effect existing calls.

Mib GsmIwf

Values Decimal (512; 1024; 2048; 4096)

Default 2048

ATTRIBUTE GsmCs V42bis maximumStringSize (p2)

Access
Read: All
Write: Service

Description This attribute specifies the maximum number of characters allowed in a string represented by a codeword that the IWF supports. Each codeword in a V.42bis dictionary represents a string of characters. During Exchange Identification (XID) negotiation of parameter P2 (maximum string size), both sides (IWF and mobile or IWF and Public Switched Telephone Network (PSTN)) agree on the maximum string length to be used in the dictionaries. Changes to this attribute impact the compression ratio for the

Copyright © 2006, Nortel Nortel Confidential

encoder (component *GsmIwfV42bisOp* attribute *compRatioEncoder*). The negotiated value can be viewed in the component GsmIwf*V42bisOp* attribute *maximumStringSize*. Changes to this attribute do not effect existing calls.

Mib	GsmIwf
Values	Decimal (6..250)
Default	20

ATTRIBUTE GsmCs V42bis actionOnError (actOnErr)

Access	Read: All Write: Service
Description	This attribute specifies whether or not V.42bis takes down the call or resets the link when any of the following errors occur: 1.Receipt of STEPUP (step up codeword size) codeword when it would cause C2 (current code word size) to exceed N1 (maximum code word size). 2. Receipt of a codeword, at any time, equal to C1 (next empty dictionary entry). 3. Receipt of a codeword representing an empty dictionary entry. 4. Receipt of a reserved command code. 5. Receipt of any other error. If the value is ***resetLink***, the error corrected connection and V.42bis dictionaries are reset. Some data is lost but the call continues. If the value is ***takeDownCall***, the call is taken down. Changes to this attribute do not effect existing calls.
Mib	GsmIwf
Values	resetLink takeDownCall
Default	resetLink

COMPONENT GsmCs LogicalProcessor (Lp)

Instance	Decimal (0..15)
Groups	GROUP GsmCs Lp Operational (Oper)
Scope	Application
Description	*GsmCs/<trunkGrp> LogicalProcessor/n* The *LogicalProcessor* component represents a logical processor that may be linked to this *GsmIwfCallServer*. A *GsmIwfBearerChannel* is indirectly linked to this *LogicalProcessor* by way of the *Framer component.* This

Copyright © 2006, Nortel Nortel Confidential

component must be added to the *GsmIwfCallServer* (and the change activated) prior to adding the *GsmIwfBearerChannel*s.

GROUP GsmCs Lp Operational (Oper)

Properties Operational

Description This group contains operational attributes pertaining to information about *GsmIwfBearerChannels* and logical processors associated with a *GsmIwfCallServer* from a high-level view.

Mib GsmIwf

ATTRIBUTE GsmCs Lp configuredBearerChannels (configBc)

Access Read: All
Write: Illegal

Description This attribute indicates the number of *GsmIwfBearerChannel* components provisioned for the Logical Processor represented by this component.

Mib GsmIwf

Values Decimal (0..124)

Default No default

ATTRIBUTE GsmCs Lp activeCalls (actCalls)

Access Read: All
Write: Illegal

Description This attribute indicates the number of *GsmIwfBearerChannel* components currently active on this *LogicalProcessor.*

Mib GsmIwf

Values Decimal (0..124)

Default No default

ATTRIBUTE GsmCs Lp assignedCapacity (assgnCap)

Access Read: All
Write: Illegal

Description This attribute indicates what percentage (0 to 100%) of a given *LogicalProcessor* has been reserved for the data calls which are currently active. When the *assignedCapacity* reaches 100%, no new calls are

Copyright © 2006, Nortel Nortel Confidential

	established on the given *LogicalProcessor*. During the life of a call, the compute requirements will vary. The compute capacity required for a given call type depends on the type of call established including such factors as connection type, data compression, user rate, error correction, flow control; therefore, at call establishment the compute capacity is added to the *assignedCapacity* for a *LogicalProcessor*. When the call is released, it's compute capacity is subtracted from the assigned capacity for the Lp.The *GsmIwfCallServer* uses this information to balance the distribution of data calls across the logical processors.
Mib	GsmIwf
Values	Decimal (0..100)
Default	No default

ATTRIBUTE GsmCs Lp modemsSupported (modemSup)

Access	Read: All Write: Illegal
Description	This attribute indicates if modems are supported with this *LogicalProcessor*.

COMPONENT HuntGroup (Hg)

Instance	Decimal (1..65535)
Groups	GROUP Hg CustomerIdentifierData (CidData) GROUP Hg NsapAddress GROUP Hg Provisioned (Prov) GROUP Hg OsiState (State) GROUP Hg Operational
Scope	Application
Description	*HuntGroup/n* The *HuntGroup* component provides a hunt group capability for switched calls (SVCs). A hunt group is a single DNA used to represent a group of service DNAs. A customer calling the DNA of the hunt group receives the benefits of higher capacity and availability as calls are spread across several lines.
Mib	HuntGroup
Subcomponents	COMPONENT Hg HuntGroupMember (HgM)
Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP Hg CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	HuntGroup

ATTRIBUTE Hg customerIdentifier (cid)

Access	Read and write

Copyright © 2006, Nortel

Nortel Confidential

Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	HuntGroup
Values	Decimal (0; 1..8191)
Default	0

GROUP Hg NsapAddress

Properties	Provisioned
Description	This group contains attributes common to all NSAP format addresses.
Mib	HuntGroup

ATTRIBUTE Hg address

Access	Read and write
Description	The *address* attribute specifies the numbering plan and digits which form a unique DNA identifier of the hunt group. The format of the *address* attribute is <numberingPlan>.<digits> where numbering plan is x for X.121 and e for E.164. An example X.121 address is x.12345678.
Mib	HuntGroup
Values	String (1..17, NativeAddressWith15DigitX121)
Default	No default

GROUP Hg Provisioned (Prov)

Properties	Provisioned
Description	The *Provisioned* group contains the provisioned attributes of the hunt group.
Mib	HuntGroup

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Hg logicalProcessor (lp)

Access	Read and write
Criticality	Process
Description	This attribute specifies the logical processor on which the hunt group process will execute. The *Lp/n Eng Hgs* component contains statistics for all hunt groups on the LP.
Mib	HuntGroup
Values	Link (Hardware, linkToApplications)
Default	No default

ATTRIBUTE Hg selectionPolicy

Access	Read and write
Description	The *selectionPolicy* attribute specifies the algorithm used to select a hunt group member. A value of ***startFromZero*** means that on a new call, the first available member starting from the member with the lowest instance value is selected. Subsequent hunts for the same call select the first available member starting from the previously chosen member. This algorithm is used when it is desirable to have the first member receive the majority of the calls and subsequent members only receive calls in overflow situations. A value of ***rotary*** means that on a new call, the first available member is selected starting from the member which received the last new call. Subsequent hunts for the same call select the first available member starting from the previously chosen member. This algorithm is used when it is desirable to loadspread the calls equally across the members. A value of ***mostAvailable*** means that on a new call, the most available member is selected based on the availability information received from the member. Subsequent hunts for the same call select the most available member starting from the previously chosen member. This algorithm is used when it is desirable to send each call to the member which has the highest probability of connecting it.
Mib	HuntGroup
Values	startFromZero rotary mostAvailable
Default	mostAvailable

ATTRIBUTE Hg maxHuntAttempts

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	The *maxHuntAttempts* attribute specifies the maximum attempts allowed to hunt the call. Hunting ceases if either this maximum is exceeded or the member list is exhausted.
Mib	HuntGroup
Values	Decimal (1..63)
Default	63

ATTRIBUTE Hg appendSuffixDigits

Access	Read and write
Description	The *appendSuffixDigits* attribute specifies how suffix called address digits are handled. Suffix called address digits are any trailing digits, signalled in a call, beyond the provisioned hunt group *address*. If this attribute is set to ***yes***, suffix digits are appended to the member *address* before the call is forwarded to the member. If it is set to ***no***, suffix digits are not appended to the member *address*.
Mib	HuntGroup
Values	no yes
Default	yes

GROUP Hg OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	HuntGroup

ATTRIBUTE Hg adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

Copyright © 2006, Nortel Nortel Confidential

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — HuntGroup

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Hg operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — HuntGroup

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Hg usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — HuntGroup

Values — idle
active (activ)
busy

Default — idle

GROUP Hg Operational

Properties	Operational
Description	The *Operational* group contains the operational attributes of the hunt group.
Mib	HuntGroup

ATTRIBUTE Hg huntAttempts

Access	Read only
Description	This attribute counts the total number of hunt attempts made by the hunt group. The count includes both initial and subsequent hunt attempts. This count is contained within the *huntAttempts* attribute of the *Lp/n Eng Hgs* component. This counter wraps to 0 when it exceeds its maximum value.
Mib	HuntGroup
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Hg failedCalls

Access	Read only
Description	This attribute counts the number of calls which could not be connected by any of the hunt group members. This could occur if the hunt group is locked or has exhausted its member list. If a call cannot be connected by the hunt group it is sent to call redirection. This counter wraps to 0 when it exceeds its maximum value.
Mib	HuntGroup
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Hg initialHuntAttempts

Access	Read only
Description	This attribute counts the number of new (non-hunted) calls received by the hunt group which are forwarded to a member. This counter wraps to 0 when it exceeds its maximum value.
Mib	HuntGroup
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Hg availabilityUpdates

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of availability update packets received by the hunt group from its members. This counter wraps to 0 when it exceeds its maximum value.
Mib	HuntGroup
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Hg maxAddrLenExceeded

Access	Read only
Description	This attribute counts the number of times a member could not be selected to receive a call with suffix address digits because its DNA length would exceed the maximum of 14 digits with the suffix digits appended. This counter wraps to 0 when it exceeds its maximum value.
Mib	HuntGroup
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Hg badPackets

Access	Read only
Description	This attribute counts the number of unrecognizable packets received by the hunt group and discarded. This counter wraps to 0 when it exceeds its maximum value.
Mib	HuntGroup
Values	Decimal (0..4294967295)
Default	0

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	HuntGroup

ATTRIBUTE Hg HgM adminState (osiAdmin)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	HuntGroup
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Hg HgM operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	HuntGroup
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Hg HgM usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

Copyright © 2006, Nortel Nortel Confidential

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib HuntGroup

Values
idle
active (activ)
busy

Default idle

GROUP Hg HgM Operational

Properties Operational

Description The *Operational* group defines operational attributes associated with the *HuntGroupMember* component.

Mib HuntGroup

ATTRIBUTE Hg HgM availability

Access Read and write

Description This attribute indicates the current availability of the member.
The higher the value, the more available the member is perceived to be. A value of ***0*** indicates the member is unavailable.

A member must be considered 'available' by the hunt group in order to receive a call, regardless of the selection policy in use. The hunt group members report whether or not they are available to receive calls to the hunt group. Some services base their availability on unused logical channels, others on bandwidth or memory capacity.

During initialization, the hunt group assumes all of its members are equally available and sets their *availability* value to the maximum of ***4095***. Similarly, a new hunt group member added to an existing hunt group has its *availability* value initialized to ***4095***. This ensures that members which have not reported their availability to the hunt group are tried in order to trigger the member to report its true availability.

The *availability* of a member can change in the following ways:
- Hunt group members can report their availability to the hunt group using a DPRS availability packet.
- A network operator can temporarily change the value by the *Set* command. This change remains in effect until changed again by any of these ways.
- The hunt group resets a member's *availability* to the maximum of ***4095*** if it has been ***0*** for at least 2.5 hours. This ensures that 'lost' availability information does not prevent a member from returning to service.

Mib HuntGroup

Values Decimal (0..4095)

Copyright © 2006, Nortel Nortel Confidential

Default	4095

ATTRIBUTE Hg HgM availabilityUpdates

Access	Read only
Description	This attribute counts the number of availability update packets received by the hunt group member. This counter wraps to 0 when it exceeds its maximum value.
Mib	HuntGroup
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Hg HgM callsRefused

Access	Read only
Description	This attribute counts the number of call packets which were returned to the hunt group by the member because it could not connect the call. If this counter increments frequently, it could indicate a problem with the member's reporting of its availability to the hunt group or an incompatibility in the call options. This counter wraps to 0 when it exceeds its maximum value.
Mib	HuntGroup
Values	Decimal (0..4294967295)
Default	0

Default	disabled

ATTRIBUTE Htds usageState (osiUsage)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	HdlcTransparent
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Htds availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	HdlcTransparent
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating

ATTRIBUTE Htds proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal

Copyright © 2006, Nortel Nortel Confidential

functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Default	No default

ATTRIBUTE Htds standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib — HdlcTransparent

Values
hotStandby (hot)
coldStandby (cold)

GROUP Htds Framer Statistics (Stats)
GROUP Htds Framer LinkUtilization (Util)

COLLECTED STATS HdlcTransparentDataService Framer

Scope	Application
Description	*Htds/n Framer* The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface. The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length) rather than interface specific attributes (such as modem leads and clocking) which are associated with specific hardware components (such as *V35/n* or *DS1/n*). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component. The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).
Mib	HdlcTransparent
Common Verbs	Help List Display

GROUP Htds Framer Provisioned (Prov)

Properties	Provisioned
Description	This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.
Mib	HdlcTransparent

ATTRIBUTE Htds Framer interfaceName

Access	Read and write
Criticality	Process
Description	This attribute contains a hardware component name. The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.

Copyright © 2006, Nortel Nortel Confidential

Mib	HdlcTransparent
Values	Link (Hardware, applicationFramerName)
Default	No default

GROUP Htds Framer LinkOptions (Link)

Properties	Provisioned
Description	This group contains attributes defining the framing of data on the link interface.
Mib	HdlcTransparent

ATTRIBUTE Htds Framer dataInversion

Access	Read and write
Criticality	Process
Description	This attribute specifies whether data bits are to be inverted (1 to 0 and 0 to 1) before transmission of frames to the interface. If the value of this attribute is ***on***, the incoming data bits are also inverted when frames are received from the link before being processed. This option is typically used in ***hdlc*** framing mode when inversion is used to guarantee 1's density. Note that aborts (in ***hdlc*** and ***interrupting*** modes) are corrupted when data is inverted.
Mib	HdlcTransparent
Values	off on
Default	off

ATTRIBUTE Htds Framer nonOctetData

Access	Read and write
Criticality	Process
Description	This attribute specifies whether the data being received has the potential to be non-octet aligned. If it is set to ***yes***, then neither CRC checking and generation or abort detection will be functional.
Mib	HdlcTransparent
Values	no yes
Default	no

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Htds Framer frameCrcType

Access	Read and write
Criticality	Process
Description	This attribute specifies the type of CRC used. The CRC value calculated is appended to the end of the frames transmitted to the link. The CRC value is removed from the end of frames received from the link and checked for correctness. ***noCrc*** means that CRC is not used.
Mib	HdlcTransparent
Values	crc16 crc32 noCrc
Default	crc16

ATTRIBUTE Htds Framer flagsBetweenFrames

Access	Read and write
Criticality	Process
Description	This attribute specifies the number of flags that are inserted between frames sent to the link interface.
Mib	HdlcTransparent
Values	Decimal (1..16)
Default	1

ATTRIBUTE Htds Framer lineSignalTransport (lst)

Access	Read and write
Criticality	Process
Description	This attribute specifies how modem status lead information on a V.35 or V.11 port is handled. When the value of the attribute is set to ***on***, line signal changes are passed transparently through the network to the remote end of the connection, where they are passed out on that end's outgoing leads. When the value of the attribute is set to ***off***, line signal changes are not transparently passed through the network. Both ends must be provisioned to support this function for line signal transport to work. It is highly recommended that line signal interpretation is set to "don't care" on the associated *vport* component (that is, *vport* attributes *readyLineState* and *dataTransferLineState)*.

Mib	HdlcTransparent
Values	off on
Default	off

GROUP Htds Framer OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	HdlcTransparent

ATTRIBUTE Htds Framer adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	HdlcTransparent
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Htds Framer operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

Copyright © 2006, Nortel Nortel Confidential

	The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	HdlcTransparent
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Htds Framer usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	HdlcTransparent
Values	idle active (activ) busy
Default	idle

GROUP Htds Framer Statistics (Stats)

Properties	Operational
Description	This group contains the operational statistics data for a Framer component.
Mib	HdlcTransparent

ATTRIBUTE Htds Framer aborts

Access	Read only
Description	This attribute counts the aborts received. The counter wraps to zero when it exceeds its maximum value.
Mib	HdlcTransparent
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Htds Framer crcErrors

Access	Read only
Description	This attribute counts the frames with CRC errors. The counter wraps to zero when it exceeds its maximum value.
Mib	HdlcTransparent
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Htds Framer lrcErrors

Access	Read only
Description	This attribute counts the frames with LRC errors. The counter wraps to zero when it exceeds its maximum value.
Mib	HdlcTransparent
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Htds Framer nonOctetErrors

Access	Read only
Description	This attribute counts the frames that were non octet aligned. The counter wraps to zero when it exceeds its maximum value.
Mib	HdlcTransparent
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Htds Framer overruns

Access	Read only
Description	This attribute counts the frames received from the link for which overruns occurred. The counter wraps to zero when it exceeds its maximum value.
Mib	HdlcTransparent
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Htds Framer underruns

Access	Read only
Description	This attribute counts the frames transmitted to the link for which underruns occurred. The counter wraps to zero when it exceeds its maximum value.
Mib	HdlcTransparent
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Htds Framer largeFrmErrors

Access	Read only
Description	This attribute counts the frames received that were too large. The frame was longer than 8 kbytes or it contained more than the 255 block hardware limit. The counter wraps to zero when it exceeds its maximum value.
Mib	HdlcTransparent
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Htds Framer frmToIf

Access	Read only
Description	This attribute counts the frames transmitted to the link interface by Framer. Note: This does not include the number of frames transmitted directly to the hardware queue, thus bypassing the Framer component. The counter wraps to zero when it exceeds its maximum value.
Mib	HdlcTransparent
Values	Long Integer
Default	No default

ATTRIBUTE Htds Framer frmFromIf

Access	Read only
Description	This attribute counts the frames received from the link interface by Framer. The counter wraps to zero when it exceeds its maximum value.
Mib	HdlcTransparent

Copyright © 2006, Nortel Nortel Confidential

Values	Long Integer
Default	No default

ATTRIBUTE Htds Framer octetFromIf

Access	Read only
Description	This attribute counts the bytes received from the link interface by Framer. The counter wraps to zero when it exceeds its maximum value.
Mib	HdlcTransparent
Values	Long Integer
Default	No default

GROUP Htds Framer LinkUtilization (Util)

Properties	Operational
Description	This group contains the link utilization operational data for a Framer component.
Mib	HdlcTransparent

ATTRIBUTE Htds Framer normPrioLinkUtilToIf

Access	Read only
Description	This attribute indicates the utilization of the normal priority data sent to the link as a percentage of the available bandwidth allocated for the service on the link. The utilization is the average for the last minute.
Mib	HdlcTransparent
Values	Decimal (0..100)
Units	%
Default	0

ATTRIBUTE Htds Framer normPrioLinkUtilFromIf

Access	Read only
Description	This attribute indicates the utilization of the normal priority data received from the link as a percentage of the available bandwidth allocated for the service on the link. The utilization is the average for the last minute.
Mib	HdlcTransparent
Values	Decimal (0..100)
Units	%
Default	0

GROUP Htds Plc Provisioning (Prov)

Properties	Provisioned
Description	This group contains all provisionable attributes for a permanent logical connection. Note that all of the attributes are valid and provisionable on both ends of a connection. However with the exception of *remoteName*, all operational attributes are derived from the originating end provisioning, which may be either end unless *remoteName* is not provisioned on one end.
Mib	HdlcTransparent

ATTRIBUTE Htds Plc remoteName (rName)

Access	Read and write
Criticality	Process
Description	This attribute specifies the *PLC*'s remote end point's address in the format of a component name. The syntax of a component is: "em/node type/instance". For an alternative representation of end point's addresses, see *addressToCall* and l*ocalAddress PLC* attributes. When using component name representation, end points are identified using a node name and a service name. As an example, the end point component for a third Htds service on node MoonBase is: "*EM/MoonBase HTDS/3*". If the *remoteName* is provisioned, it must match the name of the remote end or the connection will not be established even if the remote end is provisioned correctly. If no *remoteName* is provisioned, then this *LC* will accept connections from any other remote *LC* and it will not originate calls. Connections establish faster and are unique if both ends are provisioned with *remoteName*. *RemoteName* should be used when the remote end of the connection resides within the same topology region. If it resides in a different topology region, then *addressToCall* and *localAddress PLC* attributes should be used. When both *remoteName* and *addressToCall* are provisioned, *addressToCall* takes precedence. That is, connection will be established to the service specified by *addressToCall*. These strings are case insensitive, but the complete component name must be input.
Mib	HdlcTransparent
Values	String (0..40, ASCII)
Default	""

ATTRIBUTE Htds Plc setupPriority (spri)

Access	Read and write
Criticality	Process

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the priority at which a path is established. Zero(0) is the highest priority and four(4) is the lowest. When PORS establishes a path through the network, it uses the *setupPriority* attribute to determine its potential for bumping established paths to acquire their bandwidth. The *holdingPriority*, a complementary attribute of this component, indicates the priority a path maintains once it is established. A new path can bump an existing path if the new path's *setupPriority* is higher (numerically less) than the existing path's *holdingPriority*.
Mib	HdlcTransparent
Values	Decimal (0..4)
Default	2

ATTRIBUTE Htds Plc holdingPriority (hpri)

Access	Read and write
Criticality	Process
Description	This attribute specifies the priority that a path holds once it is established. Zero(0) is the highest priority and four(4) is the lowest. A path's *holdingPriority* determines its likelihood of being bumped by a new path to acquire its bandwidth. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time. A new path can bump an existing path if the new path's *setupPriority* is higher (numerically less) than the existing path's *holdingPriority*.
Mib	HdlcTransparent
Values	Decimal (0..4)
Default	2

ATTRIBUTE Htds Plc requiredTxBandwidth (tbw)

Access	Read and write
Criticality	Process
Description	This attribute specifies the bandwidth reserved by a path on each of the trunks of its route. This attribute represents the bandwidth for traffic outgoing to the remote end point. This value should be chosen to achieve the amount of statistical bandwidth sharing that is desired by the network administration. This reservation is not enforced and is used to determine how many paths can be supported on a trunk. Both ends should be provisioned with the correct values allowing for the fact that Transmit at this end represents Receive at the remote end. Note that when the values do not correspond the originating end of the connection determines the value.
Mib	HdlcTransparent
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Units	bit/s
Default	64000

ATTRIBUTE Htds Plc requiredRxBandwidth (rbw)

Access	Read and write
Criticality	Process
Description	This attribute specifies the bandwidth reserved by a path on each of trunks of its route. This attribute represents the bandwidth for traffic incoming from the remote end point. This value should be chosen to achieve the amount of statistical bandwidth sharing that is desired by the network administration. This reservation is not enforced and is used to determine how many paths can be supported on a trunk. Both ends should be provisioned with the correct values allowing for the fact that Transmit at this end represents Receive at the remote end. Note that when the values do not correspond the originating end of the connection determines the value.
Mib	HdlcTransparent
Values	Decimal (0..4294967295)
Units	bit/s
Default	64000

ATTRIBUTE Htds Plc requiredTrafficType (rttyp)

Access	Read and write
Criticality	Process
Description	This attribute specifies the type of traffic transmitted over the path. There are eight(8) possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. These are arbitrary designations for traffic type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five(5) other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1*** then only trunks that include ***trafficType1*** in *supportedTrafficType**,*** will be candidates for this connection.
Mib	HdlcTransparent
Values	voice data video trafficType1 (tt1) trafficType2 (tt2) trafficType3 (tt3)

Copyright © 2006, Nortel Nortel Confidential

	trafficType4 (tt4) trafficType5 (tt5)
Default	data

ATTRIBUTE Htds Plc permittedTrunkTypes (pttyp)

Access	Read and write
Criticality	Process
Description	This attribute specifies up to eight(8) types of trunk that can be used on the route. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six(6) remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the Trunk component. When selecting a route, PORS only chooses trunks whose *trunkType* are in the *permittedTrunkTypes* for the path.
Mib	HdlcTransparent
Set of	terrestrial satellite trunkType1 (tt1) trunkType2 (tt2) trunkType3 (tt3) trunkType4 (tt4) trunkType5 (tt5) trunkType6 (tt6)
Default	(terrestrial, satellite, trunkType1, trunkType2, trunkType3)

ATTRIBUTE Htds Plc requiredSecurity (rsec)

Access	Read and write
Criticality	Process
Description	This attribute specifies the required minimum level of security of the trunks on the route. Zero(0) represents the most secure and seven(7) represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the Trunk component, and has values identical in range and meaning to the *requiredSecurity* attribute. PORS ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity*.
Mib	HdlcTransparent
Values	Decimal (0..7)
Default	4

ATTRIBUTE Htds Plc requiredCustomerParm (rcparm)

Access	Read and write
Criticality	Process

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the allowed customer defined parameter of the trunks on the route. Its value, a number from zero(0) to seven(7), is chosen by a network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero(0) to seven(7). The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path.
Mib	HdlcTransparent
Values	Decimal (0..7)
Default	4

ATTRIBUTE Htds Plc pathAttributeToMinimize (pamin)

Access	Read and write
Criticality	Process
Description	This attribute specifies whether a route is selected on the basis of minimizing the cost or the delay. Each trunk has a cost and a delay metric associated with it. The cost or delay of a route is the sum of the cost or delay metrics of all the trunks on the route. The route selection algorithm uses this attribute as the minimization criteria. If more than one route is found while using this attribute as the minimization criteria, then the route with the smallest non-minimization metric is chosen amongst the equivalent routes.
Mib	HdlcTransparent
Values	cost delay
Default	cost

ATTRIBUTE Htds Plc maximumAcceptableCost (maxCost)

Access	Read and write
Criticality	Process
Description	This attribute specifies an upper bound on the cost metric of a route, which is the sum of the cost metrics of all trunks on the route. The cost metric is the *trunkCost* attribute of the *Trunk* component. This attribute is used to accept or reject a path after the route selection algorithm has been applied, regardless of the minimization criteria. It is possible that there may not be a route with an acceptable cost.
Mib	HdlcTransparent
Values	Decimal (0..65535)
Default	1280

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Htds Plc maximumAcceptableDelay (maxDelay)

Access	Read and write
Criticality	Process
Description	This attribute specifies an upper bound on the delay of a route, which is the sum of the delay of all trunks on the route. It should be provisioned with a reasonable maximum acceptable delay for the end to end one way delay of a 512 byte packet. Note that the delay for a trunk can be a provisioned (with override) or measured value on the trunk. PORs does not recommend using override for the delay on a trunk since this has little added value for PORs traffic. Remember, that the trunk *measuredRoundTripDelay* (ms) discovered through the Trunk staging protocols, divided by two and truncated, to provide the one way delay, is used to populate the topological database. The value includes emission, propagation, and queuing delays. A 512 byte data packet is used to perform the measurement. This value is updated periodically by Trunks and reflects the operating delay of the trunk. PORs uses this attribute to accept or reject a path after the route selection algorithm has been applied, regardless of the minimization criteria.
Mib	HdlcTransparent
Values	Decimal (0..100000)
Units	msec
Default	100000

ATTRIBUTE Htds Plc emissionPriority (epri)

Access	Read and write
Criticality	Process
Description	This attribute specifies the urgency with which packets on the path are emitted by the trunks on the route. *EmissionPriority* of Zero(0) indicates the highest emission priority, while two (2) indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher).
Mib	HdlcTransparent
Values	Decimal (1..2)
Default	1

ATTRIBUTE Htds Plc discardPriority (dpri)

Access	Read and write
Criticality	Process

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the importance of the packets on the path. One(1) is used for paths carrying the most important traffic, and three(3) is used for paths carrying the least important traffic. Packets with lower *discardPriority* (numerically) are discarded after packets with a higher *discardPriority* (numerically).
Mib	HdlcTransparent
Values	Decimal (1..3)
Default	2

ATTRIBUTE Htds Plc pathType (pType)

Access	Read and write
Criticality	Process
Description	This attribute specifies if the path for this PLC is determined automatically or by static provisioning. The default (***normal***) is to automatically choose a route with Route Selection. ***Normal*** *pathTypes* require less provisioning and can dynamically handle path failures. The other *pathTypes* are both manual *pathTypes* where the operator must specify, through provisioning, a static route termed the *manualPath*. A manual *pathType* connection is nearly identical to a normal path type connection with the exception that the route is pre-provisioned. For a manual *pathType*, bandwidth reservations are respected along the path exactly as in a normal path. The last type, the ***forced*** *pathType*, is also a manual path but regardless of the bandwidth available the route is granted provided the trunks are operational and there are sufficient Logical Channels (LChs). The ***forced*** *pathType* could result in over committing the reserved bandwidth allowed on a trunk. A better way to achieve the effects of a ***forced*** *pathType* is to use a ***manual*** *pathType* with *setupPriority* = ***0*** and *holdingPriority* = ***0***. In this manner the path will reserve correct bandwidth and it will bump other paths if required while not being bumped itself.
Mib	HdlcTransparent
Values	normal manual forced
Default	normal

ATTRIBUTE Htds Plc pathFailureAction (pfa)

Access	Read and write
Criticality	Process
Description	This attribute specifies whether the application can tolerate momentary interruption of a path while a new path is selected. If ***disconnectConnection*** is chosen, the application is informed as soon as possible about a failure by disconnection. If the attribute is set to

Copyright © 2006, Nortel Nortel Confidential

reRoutePath, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails the application is informed of the failure.

With this option set to ***reRoutePath*** the LCo may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are different at both ends only the calling end is allowed to reconnect.

All *pathTypes* respect this attribute. Also on a *manualPath* with both ends provisioned with independent paths (at least with respect to the failure) this option will have the desired effect that the path is rerouted without complete disconnection at both ends.

Mib	HdlcTransparent
Values	reRoutePath disconnectConnection
Default	reRoutePath

ATTRIBUTE Htds Plc bumpPreference (bpref)

Access	Read and write
Criticality	Process
Description	This attribute specifies when bumping occurs in the route selection process. A connection with higher (numerically less) *setupPriority* may bump a connection with lower (numerically higher) *holdingPriority* in order to acquire its bandwidth and be established. By default, bumping occurs only when it is necessary. That is, a connection will bump another connection only if there is no other way for the connection to be established. A connection may be set to always bump in order to find the best route it may have.
Mib	HdlcTransparent
Values	bumpWhenNecessary bumpToObtainBestRoute
Default	bumpWhenNecessary

ATTRIBUTE Htds Plc optimization (opt)

Access	Read and write
Criticality	Process
Description	This attribute specifies whether this connection should attempt to optimize its path when requested by the routing PORS component. Every path is as optimal as it can be when it is established, but as network traffic patterns and configurations change this path may no longer be as optimal as it could be. The PORS connection manager on a module requests circuits to optimize at the optimization interval.

Copyright © 2006, Nortel Nortel Confidential

Mib	HdlcTransparent
Values	disabled enabled
Default	enabled

ATTRIBUTE Htds Plc addressToCall (addrToCall)

Access	Read and write
Criticality	Process
Description	This attribute specifies the *PLC*'s remote end point's address in the format of a NSAP address. As such it must consist of a string of hex digits although not all 40 digits must be specified. For an alternative representation of end point's addresses, see *remoteName* attribute. If the *addressToCall* is provisioned, it must match *localAddress* provisioned on the remote end or the connection will not be established. Connections establish faster and are unique if both ends are provisioned with *addressToCall*. *AddressToCall* must be used when the remote end of the connection resides in different topology region. If it resides in the same topology region, then *remoteName* may be used. When both *remoteName* and *addressToCall* are provisioned, *addressToCall* takes precedence. That is, connection will be established to the service specified by *addressToCall*.
Mib	HdlcTransparent
Values	String (0..40, ASCII)
Default	""

ATTRIBUTE Htds Plc localAddress (localAddr)

Access	Read and write
Criticality	Process
Description	This attribute specifies the *PLC*'s end point address in the format of an NSAP address. As such it must consist of a string of hex digits although not all 40 digits must be specified. *LocalAddress* must share a prefix with MOD *nodePrefix* or one of MOD *alternatePorsPrefixes* for this node, otherwise PORS will not be able to route calls to this service. *LocalAddress* is used in conjunction with *addressToCall*. That is, the end responsible for originating calls must have *addressToCall* provisioned, while the end responsible for terminating calls must have *localAddress* provisioned. In such a case, *addressToCall* on the originating end must match exactly the *localAddress* of the terminating end. Note that both ends may be originating and terminating at the same time. That is, both ends may have *addressToCall* and *localAddress* provisioned as long as *addressToCall* and *localAddress* on different ends are identical.

Copyright © 2006, Nortel Nortel Confidential

Mib	HdlcTransparent
Values	String (0..40, ASCII)
Default	""

ATTRIBUTE Htds Plc maximumAcceptableGatewayCost (maxGateCost)

Access	Read and write
Criticality	Process
Description	This attribute specifies an upper bound on the gateway cost metric of a route, which is the sum of the gateway cost metrics of all gateway links on the route. It has the same semantics as the *maximumAcceptableCost* except that gateway cost metrics are used instead of trunk cost metrics. Gateway cost metrics are provisioned under *Trunk Address* component of a gateway link specifying a gateway costs of reaching an address through the link.
Mib	HdlcTransparent
Values	Decimal (0..65535)
Default	2048

ATTRIBUTE Htds Plc manualPath (mpath)

Access	Read and write
Criticality	Process
Description	This attribute specifies the sequence of trunks to be used as the route for the path, thus bypassing PORS' automatic route selection. If the path fails the validation, no other path can be selected[1]. This attribute should only be used in special cases since the route selection algorithm is able to find and maintain the best routes. A related path attribute, the *pathType*, determines if this route will be used as a manual or forced path type. As an example, the trunk component name for the third trunk on node MoonBase is "*EM/MoonBase Trk/3*". Note that only the first end of the trunk that the packet would encounter is provisioned. These strings are case insensitive but the complete component name must be input. Note 1: the trunk designation must be a 3-letter form, e.g., 'trk'. Note 2: only the outbound trunks component names are used to provision the ***manualPath***. Note 3: It is recommended to have two independent routes specified for a manual path by specifying a different ***manualPath*** (non-symmetric) for each end. In this case, there is no way to select which route will be used (first up wins) but if one path is torn down due to a failure then the other ***manualPath*** may be used to reroute the path.

Description	*...Lc* This component contains all of the operation attributes for a Path Oriented Logical Connection.
Mib	HdlcTransparent
Common Verbs	Help List Display

VERB RERoute Htds LCo

Impact	Service
Description	RERoute ..Lc This command is used to request a *LogicalConnection (LCo)* to attempt a reroute. A new path will be established if it is better than the current path. The current path will not be interrupted if the *RERoute* command is not completely successful. The connection must not be attempting rerouting at present. This command is only valid on components with the *PLC remoteName* specified. This command is intended to be used on the calling end of a connection. For a single region call, it may be used on the called end of a connection if all the *PLC* parameters match. Note that the calling end or the called end of a connection means the *end* attribute of an *LCo* is equal to the value of ***calling*** or ***called*** respectively. When used on an *LCo* with *pathType* attribute set to ***manual*** or ***forced,*** this command can be used to re-setup the path. If this command is attempted on a connection that is not up but its *state* attribute is equal to ***pathDownRetrying,*** an immediate route request is sent.

GROUP Htds LCo PathData

Properties	Operational
Description	This group contains all operational attributes for the path oriented LCo.

Copyright © 2006, Nortel Nortel Confidential

Mib	HdlcTransparent

ATTRIBUTE Htds LCo state

Access	Read only
Description	This attribute reflects the current state of the connection. The ***pathDown*** state indicates a connection that has no remote end provisioned or the application has not yet signaled for a path. The ***selectingRoute*** state occurs when a request has been sent to route selector and it has not yet responded. The ***connectingState*** occurs while a path is being established. The ***pathUp*** state is the normal operational state of a path. The ***pathDownRetrying*** state indicates a path that attempted route selection but received no route and is now waiting to retry route selection again.
Mib	HdlcTransparent
Values	pathDown selectingRoute connecting pathUp pathDownRetrying
Default	No default

ATTRIBUTE Htds LCo overrideRemoteName (orn)

Access	Read: All Write: All
Description	If set ***and*** the current PLC remoteName is blank this remoteName will override the blank PLC remoteName. Usually you would set this attribute and then lock/unlock the service component which will result in this new overrideRemoteName being used as if it had been provisioned into the PLC remoteName. The advantage of this attribute is that the connection's remoteName can be changed immediately without having to "activate prov" but the disadvantage is that the overrideRemoteName is not permanent and if the card or switch is reset the override will be lost.
Mib	HdlcTransparent
Values	String (0..40, ASCII)
Default	""

ATTRIBUTE Htds LCo end

Access	Read only
Description	This attribute identifies whether this is the calling or called end of the path.
Mib	HdlcTransparent
Values	calling called

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Htds LCo costMetric (cost)

Access	Read only
Description	This attribute gives the route's total cost metric. It is calculated as the sum of the cost metric of all trunks in the path at the time the connection was established. The cost metric of a trunk is defined by the *trunkCost* attribute of the Trunk component. The *costMetric* for an LCo that is originated and terminated on the same module is 0.
Mib	HdlcTransparent
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Htds LCo delayMetric (delay)

Access	Read only
Description	This attribute gives the total delay of the route as the one way delay for a 512 byte packet. It is calculated as the sum of the delays of all trunks in the path stored in topology at the time the connection was established. The delay for an LCo that is originated and terminated on the same module is 0.
Mib	HdlcTransparent
Values	Decimal (0..100000)
Units	msec
Default	No default

ATTRIBUTE Htds LCo roundTripDelay (rtd)

Access	Read only
Description	This attribute indicates the time taken for a packet (cell) of 44 bytes to be transmitted inband to the remote *LCo* and return to this LCo. The value reported is rounded to the nearest millisecond. For Unack PORS trunks and AAL5 MUX PORS trunks, the test packet is sent inband and receives the same treatment as regular data packets, giving a round trip delay which corresponds to regular data traffic. For SPO MUX PORS trunks and MAP PORS trunks, the test packet is sent along the parent trunk's VCC, giving a round trip delay which corresponds to the parent trunk's round trip delay. The round trip delay does not directly reflect the round trip delay of data packets travelling on the non-parent VCC. When the *LCo* is originated and terminated on the same module, a value of 1 millisecond is reported. The value of 1 millisecond is the minimum reported time even though the delay may be less than 1 millisecond.
Mib	HdlcTransparent

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..200000)
Units	msec
Default	No default

ATTRIBUTE Htds LCo setupPriority (spri)

Access	Read only
Description	This attribute gives the priority at which the current path is established. Zero is the highest priority and four is the lowest. The *holdingPriority*, a complementary attribute of this component, indicates the priority a path maintains once it is established.
Mib	HdlcTransparent
Values	Decimal (0..4)
Default	No default

ATTRIBUTE Htds LCo holdingPriority (hpri)

Access	Read only
Description	This attribute gives the priority at which a path holds its current path once the path is established. Zero is the highest priority and four is the lowest. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time.
Mib	HdlcTransparent
Values	Decimal (0..4)
Default	No default

ATTRIBUTE Htds LCo requiredTxBandwidth (tbw)

Access	Read only
Description	This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of the trunks of its route. This attribute represents the bandwidth for traffic outgoing to the remote end point. The originating end of the connection determines this value.
Mib	HdlcTransparent
Values	Decimal (0..4294967295)
Units	bit/s
Default	No default

ATTRIBUTE Htds LCo requiredRxBandwidth (rbw)

Access	Read only
Description	This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of trunks of its route. This attribute represents the

Copyright © 2006, Nortel Nortel Confidential

bandwidth for traffic incoming from the remote end point. The originating end of the connection determines this value

Mib	HdlcTransparent
Values	Decimal (0..4294967295)
Units	bit/s
Default	No default

ATTRIBUTE Htds LCo requiredTrafficType (rttyp)

Access	Read only
Description	This operational attribute indicates the type of traffic transmitted over the path. There are eight possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. These are arbitrary designations for traffic type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1*** then only trunks that include ***trafficType1*** in *supportedTrafficType,* will be candidates for this connection.
Mib	HdlcTransparent
Values	voice data video trafficType1 (tt1) trafficType2 (tt2) trafficType3 (tt3) trafficType4 (tt4) trafficType5 (tt5)
Default	No default

ATTRIBUTE Htds LCo permittedTrunkTypes (pttyp)

Access	Read only
Description	This operational attribute lists up to eight types of trunk that can be used on the route. The originating end of the connection determines the types. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the Trunk component. When selecting a route, PORS only chooses trunks whose *trunkType* are in the *permittedTrunkTypes* for the path.

Copyright © 2006, Nortel Nortel Confidential

Mib	HdlcTransparent
Set of	terrestrial satellite trunkType1 (tt1) trunkType2 (tt2) trunkType3 (tt3) trunkType4 (tt4) trunkType5 (tt5) trunkType6 (tt6)
Default	No default

ATTRIBUTE Htds LCo requiredSecurity (rsec)

Access	Read only
Description	This attribute indicates the required minimum level of security of the trunks on the route. Zero represents the most secure and seven represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the Trunk component, and has values identical in range and meaning to the *requiredSecurity* attribute. PORS ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity*.
Mib	HdlcTransparent
Values	Decimal (0..7)
Default	No default

ATTRIBUTE Htds LCo requiredCustomerParameter (rcparm)

Access	Read only
Description	This attribute indicates the allowed customer defined parameter of the trunks on the route.The originating end of the connection determines the customer defined parameter. Its value, a number from zero to seven, is chosen by a network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path.
Mib	HdlcTransparent
Values	Decimal (0..7)
Default	No default

ATTRIBUTE Htds LCo emissionPriority (epri)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the urgency with which packets on the path are emitted by the trunks on the route. The originating end of the connection selects the *emissionPriority. EmissionPriority* of zero indicates the highest emission priority, while two indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher).
Mib	HdlcTransparent
Values	Decimal (0..2)
Default	No default

ATTRIBUTE Htds LCo discardPriority (dpri)

Access	Read only
Description	This attribute indicates the importance of the packets on the path. The originating end of the connection sets *discardPriority.* One is used for paths carrying the most important traffic, and three is used for paths carrying the least important traffic. Packets with lower *discardPriority*(numerically) are discarded after packets with a higher *discardPriority*(numerically).
Mib	HdlcTransparent
Values	Decimal (1..3)
Default	No default

ATTRIBUTE Htds LCo pathType (pType)

Access	Read only
Description	This attribute indicates whether the path for this PLC was determined automatically or by static provisioning. ***Normal*** *pathTypes* are selected automatically by Route Selector.The other *pathTypes* are both manual *pathTypes* where the operator must specify, through provisioning, a static route termed the *manualPath*. A manual *pathType* connection is nearly identical to a normal path type connection with the exception that the route is pre-provisioned. For a manual *pathType*, bandwidth reservations are respected along the path exactly as in a normal path. The last type, the ***forced*** *pathType*, is also a manual path but regardless of the bandwidth available the route is granted provided the trunks are operational and there are sufficient Logical Channels (LChs). The ***forced*** *pathType* could result in over committing the reserved bandwidth allowed on a trunk. A better way to achieve the effects of a ***forced*** *pathType* is to use a ***manual*** *pathType* with *setupPriority* = ***0*** and *holdingPriority* = ***0***. In this manner the path will reserve correct bandwidth and it will bump other paths if required while not being bumped itself.
Mib	HdlcTransparent

Copyright © 2006, Nortel Nortel Confidential

Values	normal manual forced
Default	No default

ATTRIBUTE Htds LCo retryCount (rcount)

Access	Read only
Description	This attribute is the count of the number of times the path chosen during route selection could not be instantiated. This count should be three or below if the network is performing adequately. A high value indicates that the route selection is often performed using an out-of-date view of available network bandwidth and/or topology. This attribute will only increase at the calling end of an un-segmented connection. The attribute should be ignored for segmented connections.This attribute is reset each time a path reconnects and stops counting when it reaches its maximum value.
Mib	HdlcTransparent
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Htds LCo pathFailureCount (pfcount)

Access	Read only
Description	This attribute is the count of the number of times the path has successfully connected. It is set to zero the first time the path is up. If a path fails anytime after connecting this count will be incremented when the path is up again. Failed route requests do not count in this statistic. See *retryCount* above. This attribute stops counting at its maximum value.
Mib	HdlcTransparent
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Htds LCo reasonForNoRoute (rnr)

Access	Read only
Description	This attribute is the route selection's *reasonForNoRoute* and provides a brief reason for which a route was not selected. The reasons are essentially self-explanatory. Perhaps two reasons for no route require some explanation. The reason ***unknownRemoteNodeName*** is issued when the remote node name is not in the topological database. The reason ***plcAttributesNotMet*** is issued when there is no network connectivity at a level specified by the PLC attributes. This reason is also issued when there is no physical connectivity between two end nodes.

Default	none

ATTRIBUTE Htds LCo lastTearDownReason

Access	Read only
Description	This attribute reflects the last tear down reason for a connection (LCo). In many cases this displays the reason for a momentary service interruption. This attribute applies to the last path failure only. If a path is no longer up, this may give an indication to the reason that the path has failed. In many cases an alarm will also be generated with more specific information. The following is a brief description of the reasons: ***none*** - This path has no information for the teardown this is typical of a path provisioned with no *remoteName* that has not been up. ***normalShutDown*** - This path has gone down due to normal call termination. ***insufficientTxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the transmit direction. ***insufficientRxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the receive direction. ***trunkFailure***- A trunk on the path has failed or has gone down due to a provisioning change of a critical attribute. ***trunkCardFailure***- A trunk FP card has failed along the path. ***accessCardFailure***- The FP on which the peer access service was running has failed. ***operatorForced***- The path has terminated due to the operator locking a trunk along the path. ***lostLcnClash***- The path has terminated because the PA's at both ends of an intermediate trunk have allocated the same LC to different calls. When this happens both calls must go down and then try to come up again a fraction of a second later (effectively ensuring that they will now be assigned different LC's). It is normal to get the odd clash especially when the PA's usedLC is approaching the PA's maxLC. ***networkCongestion*** - The path has failed due to control information being

Copyright © 2006, Nortel Nortel Confidential

lost and not recoverable.
trunkNotFound - Occurs on a ***manual*** path usually. Check for trunks not up or names provisioned incorrectly.
farEndNotFound - The far end is not provisioned or is not up. Check remote Name.
wrongModuleReached - This may occur on a ***manual*** path. Check provisioning for correct trunk and service names. For a ***normal*** path, the network Topology may be changing check *remoteName*.
farEndBusy - The far end has been reached but it is busy. Check *remoteName* and remote end provisioning.
callLoopedBack - This LCo is provisioned to call itself. Re-provision since this is invalid.
unknownReason - The failure was not resolved.
farEndNotReady - The remote end was reached but the connection was refused due to the remote end not being enabled.
remoteNameMismatch - The remote end has alarmed and rejected this setup due to remoteName provisioning.
serviceTypeMismatch - The remote Service Type does not match this service type. Check provisioning.
reconnectFromFarEnd - The remote end re-established this connection. Check the remote end *lastTearDownReason* to determine the real reason.
bumped - Another call bumped this path from a trunk to get bandwidth (or an LC) which it required to come up. This other path had a higher *setupPriority* than this path's *holdingPriority* hence it was allowed to steal the bandwidth (or LC) from this path.
optimized - This call has been rerouted due to the optimization feature. The call is still active this just indicates why the path changed.
trunkOrFarEndDidNotSupportMode - This call was unable to complete because a mode required by the service was not supported by one of the trunks the route went through or by the far end service it connected to. Currently the only mode that this applies to is the map/mux mode on TRUNK PA ATM component. Map mode was required by the application (CES/FrAtm etc.) but was not available on the TRUNK PA ATM component through which the call was routed or the far end CES/FrAtm component did not specify the same mode.

ATTRIBUTE Htds LCo pathFailureAction

Access: Read only

Description: This attribute displays whether the application is set to tolerate momentary interruption of a path while a new path is selected. If ***disconnectConnection*** is displayed, the application is informed as soon as possible about a failure by disconnection. If the attribute displays ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails the application is informed of the failure.
With this option set to ***reRoutePath*** the LCo may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are different at both ends only the calling end is allowed to reconnect.

All *pathTypes* respect this attribute. Also on a *manualPath* with both ends provisioned with independent paths (at least with respect to the failure) this option will have the desired effect that the path is rerouted without complete disconnection at both ends

Mib: HdlcTransparent

Values:
reRoutePath
disconnectConnection

Default: No default

ATTRIBUTE Htds LCo bumpPreference (bpref)

Access: Read only

Description: This attribute specifies when bumping will occur during route selection process. Bumping may occur when necessary or always. It will be necessary for a connection to bump if there is not enough resources for the connection to be established and these resources are occupied by a connection whose *setupPriority* is lower (numerically higher) than the connection's *setupPriority.* A connection may also always bump in order to obtain the best route.

Mib	IpDlciGroup

Copyright © 2006, Nortel

Nortel Confidential

ATTRIBUTE IpDlciGrp customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	IpDlciGroup

ATTRIBUTE IpDlciGrp adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	IpDlciGroup
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE IpDlciGrp operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	IpDlciGroup

Description	This group contains the provisioned attributes for the *FrConnection* component.
Mib	IpDlciGroup

ATTRIBUTE IpDlciGrp Frc linkToFrDlci (frDlci)

Access	Read and write
Criticality	Component
Description	This attribute specifies the frame relay *Dlci IpConn* component that this connection is associated with.
Mib	IpDlciGroup
Values	Link (Hardware, linkToIpDlciGrp)
Default	No default

ATTRIBUTE IpDlciGrp Frc ipCos

Access	Read and write
Criticality	Component
Description	This attribute specifies the connection class of the Frame Relay connection. This value is used to distinguish the connection from others for the purpose of IP forwarding and accounting. Connection class values vary in range from ***0*** to ***3*** allowing up to four connections to be distinguished on each next hop between routers. If an IP packet is forwarded by a *ProtocolPort* or *Interface* configured to use more than one Frame Relay connection, then one of the connections is selected for transmitting the packet. The selection is based on either the Differentiated Services Code Point (DSCP) field of the IP packet or the Class of Service (CoS) assigned to the packet.

Copyright © 2006, Nortel Nortel Confidential

DSCP based selection of the outgoing connection is explained in the description of the *DifferentiatedServicesDomain* component.
Class of Service (CoS) based selection of the outgoing connection is explained in the description of the *Vr Ip CosPolicyGroup* component.

Modifying this attribute will reset the *FrConnection*.

If the *FrConnection* is used by a *VirtualRouter ProtocolPort* and the *VirtualRouter* does not have a *DifferentiatedServicesDomain* subcomponent, then *ipCos* also specifies the initial Class of Service (CoS) value assigned to an IP packet received on the Frame Relay connection. See the description of *Vr Ip CosPolicyGroup* for more information.

Mib	IpDlciGroup
Values	Decimal (0..3)
Default	0

ATTRIBUTE IpDlciGrp Frc linkToIpLogicalInterface (ipIf)

Access	Read and write
Description	This attribute specifies the IP logical interface, *Vr/m Pp/n IpPort LogicalIf/ipAddress*, that this connection is associated with. When set, the value of this attribute must be consistent with the *linkToProtocolPort* attribute value of the parent *IpDlciGroup* component. That is, they must both point to the same *ProtocolPort* component.
Mib	IpDlciGroup
Values	Link (Service, linkToMediaConnection)
Default	No default

GROUP IpDlciGrp Frc OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	IpDlciGroup

ATTRIBUTE IpDlciGrp Frc adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — IpDlciGroup

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE IpDlciGrp Frc operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — IpDlciGroup

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE IpDlciGrp Frc usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Copyright © 2006, Nortel Nortel Confidential

Mib	IpDlciGroup
Values	idle active (activ) busy
Default	idle

GROUP IpDlciGrp Frc Statistics (Stats)

Properties	Operational
Description	This group contains the packet based statistics maintained for the *FrConnection* component.
Mib	IpDlciGroup

ATTRIBUTE IpDlciGrp Frc inUnknownProtocol

Access	Read only
Description	This attribute counts the packets received on this connection which are discarded because they contain an unknown protocol. This counter wraps around to ***0*** when it exceeds its maximum value.
Mib	IpDlciGroup
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE IpDlciGrp Frc inUnsupportedProtocol

Access	Read only
Description	This attribute counts the packets received on this connection which are discarded because they contain an unsupported protocol. This includes packets received for protocols not currently bound to the associated *ProtocolPort* component. This counter wraps around to ***0*** when it exceeds its maximum value.
Mib	IpDlciGroup
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE IpDlciGrp Frc inLastDiscardedProtocolHeader

Access	Read only
Description	This attribute indicates the first eight octets of the most recent packet that was received from the interface with an unknown or unsupported protocol.
Mib	IpDlciGroup
Values	String (1..8, Hex)
Default	No default

COMPONENT IpInterfaceOverFrameRelay (IpiFr)

Groups	GROUP IpiFr Provisioned (Prov)
Scope	Application
Description	*IP Interface over Frame Relay* The *IP interface over Frame Relay* component allows external Network Management Stations using Frame Relay PVC connections to perform the network management functions on the node. Network management stations can be directly connected to a node with a Frame Relay PVC connection, or indirectly connected via an IP routing capable device which has a Frame Relay PVC connection to the node.

Nortel Confidential

ATTRIBUTE IpiFr ipAddress (ipa)

Access	Read and write
Description	This attribute specifies the unique Internet Protocol (IP) Address that represents the IP address of the IPI service.
Mib	IpiFr
Values	IP address
Default	0.0.0.0

ATTRIBUTE IpiFr maximumNumberOfLcn (maxLcn)

Access	Read only
Description	This attribute specifies the maximum number of LCNs that are supported on this service. It specifies the maximum number of connections from external network management sites to this IpiFr service.
Mib	IpiFr
Values	Decimal (24)
Default	24

ATTRIBUTE IpiFr subnetMask (sm)

Access	Read and write
Description	This attribute specifies the subnetwork mask for the IPI service.
Mib	IpiFr
Values	IP address
Default	255.0.0.0

COMPONENT IpiFr DataNetworkAddress (Dna)

Groups	GROUP IpiFr Dna Address GROUP IpiFr Dna OutgoingOptions GROUP IpiFr Dna IncomingOptions GROUP IpiFr Dna CallOptions
Scope	Application

Copyright © 2006, Nortel Nortel Confidential

Description	*IpiFr Dna* This is the description of the Ipi Frame Relay *Dna* component. It is offers a subset of the generic *Dna* component attributes
Mib	IpiFr
Opt. Subcomp.	COMPONENT IpiFr Dna ClosedUserGroup (Cug)
Common Verbs	Help List Display

GROUP IpiFr Dna Address

Properties	Provisioned
Description	*Address* group contains attributes common to all *Dna's*. Every *Dna* used in the network is defined with this group of 2 attributes. String of address digits is complemented by type of address and Npi. These attributes are used to interpret format of the address digits.
Mib	IpiFr

ATTRIBUTE IpiFr Dna numberingPlanIndicator (npi)

Access	Read and write
Criticality	Component
Description	This attribute indicates the Numbering Plan Indicator (NPI) of the *Dna* that is entered. Address may belong to X.121 or E.164 plans. X.121 is used in packet switched data networks.
Mib	IpiFr
Values	x121 e164
Default	x121

ATTRIBUTE IpiFr Dna dataNetworkAddress (dna)

Access	Read and write
Criticality	Component
Description	*Dna* attribute contains digits which form unique identifier of the customer interface. It can be compared (approximation only) to telephone number where phone number identifies unique telephone set. *Dna* digits are selected and assigned by network operators. *MaximumLenOfDna* is 15digits.
Mib	IpiFr
Values	BCD (1..15)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

GROUP IpiFr Dna OutgoingOptions

Properties	Provisioned
Description	*OutgoingOptions* group defines call options of a *Dna* for calls which are made out of the interface represented by *Dna*. All these options are not used for calls arriving to the interface represented by *Dna*.
Mib	IpiFr

ATTRIBUTE IpiFr Dna outCalls (ouc)

Access	Read only
Description	This attribute, if set to a value of ***allowed*** indicates that outgoing calls (from the DTE to the network) can be made using this particular *D*na. If set to a value of ***disallowed***, then outgoing calls cannot be made using this *Dna* - such calls will be cleared by the local DCE. This attribute corresponds to the CCITT 'Outgoing Calls Barred' feature for *Dnas* in that outgoing calls are barred if this attribute is set to a value of ***disallowed***. Either *outCalls*, or *incCalls* (or both) must be set to a value of ***allowed*** for this *Dna* to be usable.
Mib	IpiFr
Values	disallowed allowed
Default	disallowed

ATTRIBUTE IpiFr Dna outDefaultPriority (odf)

Access	Read only
Criticality	Component
Description	This attribute, if set to ***normal*** indicates that the default priority for outgoing calls (from the DTE to the network) using this particular *Dna* is normal priority - if the priority is not specified by the DTE. If this attribute is set to ***high*** then the default priority for outgoing calls using this particular *Dna* is high priority. It can be overridden by the *discardPriority* under *DLCI Direct Call* subcomponent.
Mib	IpiFr
Values	normal high
Default	high

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE IpiFr Dna defaultTransferPriority (dtp)

Access	Read and write
Criticality	Component
Description	This attribute specifies the default transfer priority to network for all outgoing calls using this particular *Dna*. It is overRidden by the transferPriority provisioned in the *DLCI* Direct Call sub-component. The transfer priority is a preference specified by an application according to its delay-sensitivity requirement. Frames with high transfer priority are served by the network before the frames with normal priority. Each transfer priority contains a predetermined setting for trunk queue (interrupting, delay or throughput), routing metric (delay or throughput). When the transfer priority is set at ***high***, the trunk queue is set to high, the routing metric is set to delay. When the transfer priority is set at ***normal***, the trunk queue is set to normal, the routing metric is set to throughput. The default of *defaultTransferPriority* is ***high.***
Mib	IpiFr
Values	normal high
Default	high

ATTRIBUTE IpiFr Dna transferPriorityOverRide (tpor)

Access	Read and write
Criticality	Component
Description	When this attribute is set to ***yes***, the called end will use the calling end provisioning data on transfer priority to override its own provisioning data. If it is set ***no***, the called end will use its own provisioning data on transfer priority. For more information about transfer priority, please refer to the previous attribute *defaultTransferPriority*. The default of *transferPriorityOverRide* is ***yes***.
Mib	IpiFr
Values	yes no

Copyright © 2006, Nortel Nortel Confidential

Default	yes

GROUP IpiFr Dna IncomingOptions

Properties	Provisioned
Description	*IncomingOptions* defines set of options for incoming calls. These options are used for calls arriving to the interface represented by *Dna*. For calls originated from the interface, *IncomingOptions* attributes are not used.
Mib	IpiFr

ATTRIBUTE IpiFr Dna incCalls (inc)

Access	Read only
Criticality	Component
Description	This attribute, if set to a value of ***allowed*** indicates that incoming calls (from the network to the DTE) can be made to this *Dna*. If set to a value of ***disallowed***, then incoming calls cannot be made to this *Dna* - such calls will be cleared by the local DCE. This attribute corresponds to the CCITT 'Incoming Calls Barred' feature for DNAs in that incoming calls are barred if this attribute is set to a value of ***disallowed***. Either *outCalls*, or *incCalls* (or both) must be set to a value of ***allowed*** for this *Dna* to be usable.
Mib	IpiFr
Values	disallowed allowed
Default	allowed

ATTRIBUTE IpiFr Dna incAccess (ina)

Access	Read and write
Criticality	Component
Description	This attribute is an extension of the Closed User Group (CUG) facility, as follows: This attribute, if set to a value of ***allowed*** indicates that incoming calls (from the network to the DTE) from the open (non-CUG) part of the network are permitted. It also permits incoming calls from DTEs that have Outgoing Access capabilities. If set to a value of ***disallowed***, then such calls cannot be made to this *Dna* - such calls will be cleared by the local DCE. This attribute corresponds to the CCITT 'Closed User Group with Incoming Access' feature for *Dnas* in that incoming access is granted if this attribute is set to a value of ***allowed***.
Mib	IpiFr

Copyright © 2006, Nortel Nortel Confidential

Values	disallowed allowed
Default	disallowed

GROUP IpiFr Dna CallOptions

Properties	Provisioned
Description	*CallOptions* group defines additional options for calls not related directly to direction of a call.
Mib	IpiFr

ATTRIBUTE IpiFr Dna serviceCategory (cat)

Access	Read only
Criticality	Component
Description	This attribute is assigned for each different type of service within which this *Dna* is configured. It is placed into the Service Category attribute in the accounting record by both ends of the VC.
Mib	IpiFr
Values	gsp x25 enhancedIti ncs mlti sm ici dsp3270 iam mlhi term3270 iti bsi hostIti x75 hdsp3270 api3201 sdlc snaMultiHost redirectionServ trSnaTpad offnetNui gasServer vapServer vapAgent frameRelay ipiVc ipiFr

Copyright © 2006, Nortel Nortel Confidential

Default	ipiFr

ATTRIBUTE IpiFr Dna accountClass (acl)

Access	Read and write
Criticality	Component
Description	This attribute specifies the accounting class which is reserved for network operations usage. Its value is returned in the accounting record in the local and remote service type attributes. Use of this attribute is decided by network operator and it is an arbitrary number.
Mib	IpiFr
Values	Decimal (0..255)
Default	0

ATTRIBUTE IpiFr Dna serviceExchange (sre)

Access	Read and write
Criticality	Component
Description	This attribute is an arbitrary number, entered by the network operator. It is included in the accounting record created by the VC.
Mib	IpiFr
Values	Decimal (0..255)
Default	0

COMPONENT IpiFr Dna ClosedUserGroup (Cug)

Instance	Decimal (0..255)
Groups	GROUP IpiFr Dna Cug CugOptions
Scope	Application
Description	*IpiFr Dna ClosedUserGroup* This group defines options associated with national or international *CUG* Identifier. Other *DNAs* in the network can have *CUGs* defined which groups these *DNAs* by *CUG interlockCode*. If *DNAs* are defined with *CUGs*, calls from *DNAs* which do not have the same *interlockCode* defined are refused. Attributes *incAccess* and *outAccess* can override this

Copyright © 2006, Nortel Nortel Confidential

rule. *IpiFr* handles only incoming calls. Therefore, Closed User Group for this interface is defined for validation of incoming PVC calls only.

Mib IpiFr

DELete

GROUP IpiFr Dna Cug CugOptions

Properties Provisioned

Description

This group defines options for a CUG. Attributes in this group define *ClosedUserGroup* options associated with *interlockCode*. *DNA's* with the same *CUG* (*interlockCode*) can make calls within this group. Various combinations which permit or prevent calls in the same *CUG* group are defined here.

Mib IpiFr

ATTRIBUTE IpiFr Dna Cug type

Access Read and write

Description This attribute specifies the CUG type - the CUG is either a national CUG, or an international CUG. International closed user groups are usually established between DTEs for which there is an X.75 Gateway between; whereas national closed user groups are usually established between DTEs for which there is no X.75 Gateway between. (National CUGs cannot normally traverse an X.75 Gateway).
If this attribute is set to ***national***, then the *CUG* is a national *CUG*, in which case, the *dnic* should be left at its default value since it is not part of a national *CUG*. If this attribute is set to ***international***, then the *CUG* is an international *CUG*, in which case, the *dnic* should be set appropriately as part of the *CUG interlockCode*.

Mib IpiFr

Values
national
international

Default national

ATTRIBUTE IpiFr Dna Cug dnic

Access Read and write

Description This attribute specifies the *dnic* (Data Network ID Code) of the *CUG* by which packet networks are identified. This attribute is not applicable if the *CUG* is a ***national*** *CUG*, as specified by the CUG *type* attribute. There are usually 1 or 2 *dnics* assigned per country, for public networks. The U.S. is

Copyright © 2006, Nortel Nortel Confidential

an exception where each BOC has a *dnic*. Also, a group of private networks can have its own *dnic*.

dnic value is not an arbitrary number. It is assigned by international agreement and controlled by CCITT.

Mib	IpiFr
Values	BCD (4)
Default	0000

ATTRIBUTE IpiFr Dna Cug interlockCode (ilc)

Access	Read and write
Description	This attribute specifies the *CUG* identifier of a national or international *CUG* call. It is an arbitrary number and it also can be called CUG in some descriptions. Interfaces (*DNA's*) defined with this number can make calls to *DNA's* with the same *interlockCode*.
Mib	IpiFr
Values	Decimal (0..65535)
Default	65535

ATTRIBUTE IpiFr Dna Cug incCalls (inc)

Access	Read and write
Description	This attribute, if set to ***allowed*** indicates that incoming calls (from the network to the DTE) can be made using this particular CUG. If set to ***disallowed***, then incoming calls cannot be made using this CUG - such calls will be cleared by the local DCE. This attribute corresponds to the CCITT 'Incoming Calls Barred' feature for CUGs in that incoming calls are barred if this attribute is set to a value of ***disallowed***.
Mib	IpiFr
Values	disallowed allowed
Default	allowed

COMPONENT IpiFr LogicalChannelNumber (Lcn)

Instance	Decimal (16..39)
Groups	GROUP IpiFr Lcn OsiState (State) GROUP IpiFr Lcn Operational (Oper) GROUP IpiFr Lcn Provisioned (Prov)
Scope	Application

GROUP IpiFr Lcn OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	IpiFr

ATTRIBUTE IpiFr Lcn adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Copyright © 2006, Nortel Nortel Confidential

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: IpiFr

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE IpiFr Lcn operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: IpiFr

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE IpiFr Lcn usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: IpiFr

Copyright © 2006, Nortel Nortel Confidential

Values	idle active (activ) busy
Default	idle

ATTRIBUTE IpiFr Lcn availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components. The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	IpiFr
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE IpiFr Lcn proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE IpiFr Lcn controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.
Mib	IpiFr
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE IpiFr Lcn alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib	IpiFr
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE IpiFr Lcn standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib	IpiFr
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE IpiFr Lcn unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	IpiFr
Values	false true
Default	false

GROUP IpiFr Lcn Operational (Oper)

Properties	Operational
Description	This group contains status of the internal IP network interface.
Mib	IpiFr

ATTRIBUTE IpiFr Lcn ipInterfaceDevice (ipIfD)

Access	Read only
Description	The status of the internal IP network interface is *inactive* until either the remoteIpAddress attribute is provisioned, or an IP packet is exchanged between a Network Management Station and the internal IP network interface (via the LCN). At this point, the status changes to *active*.
Mib	IpiFr
Values	inactive active
Default	inactive

ATTRIBUTE IpiFr Lcn opRemoteIpAddress (opRmtIpa)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the IP address of the remote network device connected to this interface. The value is either 0.0.0.0 until the first data packet is received from the remote end, or is the value provisioned in *remoteIpAddress*.
Mib	IpiFr
Values	IP address
Default	0.0.0.0

ATTRIBUTE IpiFr Lcn packetsSent (pktS)

Access	Read only
Description	This attribute counts the number of IP packets sent from this interface.
Mib	IpiFr
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE IpiFr Lcn packetsReceived (pktRx)

Access	Read only
Description	This attribute counts the number of IP packets received from the remote network device.
Mib	IpiFr
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE IpiFr Lcn discardTxPackets (discTxPkt)

Access	Read only
Description	This attribute counts the number of IP packets destined to the remote end which were discarded by this interface.
Mib	IpiFr
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE IpiFr Lcn discardRcvPackets (discRxPkt)

Access	Read only
Description	This attribute counts the number of IP packets received from the remote end which were discarded by this interface.
Mib	IpiFr
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

GROUP IpiFr Lcn Provisioned (Prov)

Properties	Provisioned
Description	This group provides the provisionable attributes for the *IpiFR Lcn* component.
Mib	IpiFr

ATTRIBUTE IpiFr Lcn remoteIpAddress (rmtIpa)

Access	Read and write
Criticality	Component
Description	This attribute specifies the IP address of the remote device connected to this *Lcn* interface. This device can be a host, and / or a gateway. If the device is a gateway, and *StaticRoute*s are defined using this gateway, it is recommended that this attribute be set. It is also recommended to set this attribute, if management applications such as Software Download and SNMP, which can initiate IP traffic with Network Management Stations, are potentially using this *Lcn* interface. IP routing information within IpiFr is not known or activated for this *Lcn* interface until the remoteIpAddress is known. When the destination IpAddress is left at its default value of 0.0.0.0, the calling IP address is learnt from the first data packet received.
Mib	IpiFr
Values	IP address
Default	0.0.0.0

COMPONENT IpiFr Lcn DirectCall (Dc)

Groups	GROUP IpiFr Lcn Dc Options
Scope	Application
Description	*IPIFR Lcn/x DC* This component defines direct call options for calls issued without operator intervention. Connection is complete and can be initiated automatically.
Mib	IpiFr
Common Verbs	Help List Display

Copyright © 2006, Nortel Nortel Confidential

GROUP IpiFr Lcn Dc Options

Properties	Provisioned
Description	Options group defines attributes associated with direct call. It defines complete connection in terms of path and call options. This connection can be permanent (pvc) or, in future release, switched (svc). It can have facilities. The total number of bytes of facilities including the facility codes, and all of the facility data from all of the four classes of facilities: CCITT_Facilities DTE_Facilities National_Facilities International_Facilities must not exceed 512 bytes.
Mib	IpiFr

ATTRIBUTE IpiFr Lcn Dc remoteNpi (rnpi)

Access	Read and write
Description	RemoteNumbering Plan Indicator (Npi) indicates the numbering plan used in the *remoteDna*.
Mib	IpiFr
Values	x121 e164
Default	x121

ATTRIBUTE IpiFr Lcn Dc remoteDna (rdna)

Access	Read and write
Description	This attribute specifies the Data Network Address (*Dna*) of the remote. This is the called (destination) DTE address (*Dna*) to which this direct call will be sent. Initially, the called DTE address attribute must be present, that is, there must be a valid destination address. However, it may be possible in the future to configure the direct call with a mnemonic address, in which case, this attribute will contain a zero-length *Dna*, and the mnemonic address will be carried as one of the facilities.
Mib	IpiFr
Values	BCD (1..15)
Default	No default

ATTRIBUTE IpiFr Lcn Dc remoteDlci (rdlci)

Access	Read and write
Description	This attribute provides the value of the remote DLCI (Data Link Connection Identifier)
Mib	IpiFr

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (16..1007)
Default	No default

ATTRIBUTE IpiFr Lcn Dc type

Access	Read only
Description	This attribute specifies the type of *Vc* call: ***permanentSlave***, With the value set to ***permanentSlave,*** a permanent connection will be established between the two ends. The remote end must only be defined as a ***permanentMaster,*** otherwise the connection cannot establish. The end defined as the ***permanentMaster*** always initiates the call; however the ***permanentSlave*** will attempt to signal the ***permanentMaster*** once per minute to initiate a new call attempt. This is a read only attribute and can not be changed by operator.
Mib	IpiFr
Values	permanentMaster (master) permanentSlave (slave)
Default	permanentSlave

ATTRIBUTE IpiFr Lcn Dc transferPriority (tp)

Access	Read and write
Description	This attribute specifies the transfer priority to network for the outgoing calls using this particular *DLCI*. It overRides the *defaultTransferPriority* provisioned in its associated *Dna* component. The transfer priority is a preference specified by an application according to its delay-sensitivity requirement. Frames with high transfer priority are served by the network before the frames with normal priority. Each transfer priority contains a predetermined setting for trunk queue (interrupting, delay or throughput), routing metric (delay or throughput). When the transfer priority is set at ***high***, the trunk queue is set to high, the routing metric is set to delay. When the transfer priority is set at ***normal***, the trunk queue is set to normal, the routing metric is set to throughput. The default of *transferPriority* is ***useDnaDefTP***. It means using the provisioning value under *defaultTransferPriority* of its associated *Dna* for this *DLCI*.
Mib	IpiFr

Copyright © 2006, Nortel Nortel Confidential

Values	normal high useDnaDefTP
Default	useDnaDefTP

ATTRIBUTE IpiFr Lcn Dc discardPriority (dp)

Access	Read and write
Description	This attribute specifies the discard priority for outgoing call using this *DLCI*. The discard priority has three provisioning values: ***normal***, ***high***, and ***useDnaDefPriority***. Traffic with normal priority are discarded first than the traffic with high priority. The *Dna* default value (provisioned by *outDefaultPriority*) is taken if this attribute is set to the value ***useDnaDefPriority***. The default of *discardPriority* is ***useDnaDefPriority***.
Mib	IpiFr
Values	normal high useDnaDefPriority
Default	useDnaDefPriority

COMPONENT IpiFr Lcn Vc

Groups	GROUP IpiFr Lcn Vc CallData (Cad) GROUP IpiFr Lcn Vc IntervalData (Intd) GROUP IpiFr Lcn Vc FrameRelayData (Frd)
Scope	Application
Description	This component defines attributes collected by Frame Relay *Vc*.

VERB Ping **IpiFr Lcn Vc**

Impact: Passive

Description: Ping *[-roundTripDelay] [-sendPktDataSize(octets)] [-returnPktDataSize(octets)]* FrUni/*<n>* Dlci/*<n>* Vc

Ping causes a query packet to be sent to the destination module where the Frame Relay DLCI VC terminates. It can be used to either display the path of the VC being used by the Frame Relay DLCI or to measure the round trip delay of the Frame Relay DLCI connection. Since the query packet carries the same path selector as the Frame Relay data packets and the Frame Relay VC's transfer priority (TP) is used to set the RCOS, reliability and emission priority of the query packet, the path taken by the ping query packet will be the same as that of the Frame Relay data except at the source and destination module. The ping packets originate from the CP rather than the Frame Relay DLCI's FP. At the far end, it is also the CP that receives the ping packets and returns them, rather than the Frame Relay FP.

Note that this command does not provide any information regarding the status of the far end VC process. If, however, the destination module is unreachable or the VC path is congested, the operator will be notified.

The ping command can be issued with or without options. If no options are specified, the command reports the path of the VC associated with the Frame Relay DLCI. When the command is used to find the VC path, it displays the RID and MID of each module that the query packet passes through on its way to the destination. If the roundTripDelay option is specified, the command reports the time taken to reach the destination and back. For the roundTripDelay option, the path taken by the query packets in both directions (from the source to the destination and from the destination back to the source) is the same as that of the Frame Relay data except at the source and destination where the ping packets are generated and bounced back by the CP rather than the Frame Relay DLCI's FP.

The ping command supports the following options:

-roundTripDelay (-rtd): If this option is selected, the round trip delay time to reach the destination and back will be reported. The round trip delay is calculated by timing how long it takes to send five packets to the destination node and back. The packet size can be specified using the sendPktSize and returnPktSize options. The minimum, maximum and average time taken by the returned packets are reported. If this option is not selected, the path taken to the destination is displayed.

-sendPktDataSize: This option specifies the number of data octets to be included in the round trip delay query packet. The rtd query packet consists of the Nortel Networks proprietary common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12,

Copyright © 2006, Nortel Nortel Confidential

since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are sent to the destination. The actual number of data octets sent is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default value is 64 octets if *transferPriority* of the *Frame Relay DLCI Dc* is 11, and 128 octets otherwise. This option is ignored if the -rtd option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

-returnPktDataSize: This option specifies the number of data octets to be included in the round trip delay acknowledge packet. The rtd acknowledge packet consists of the Nortel Networks proprietary common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are returned to the source. The actual number of data octets returned is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default value is 64 octets if *transferPriority* of the *Frame Relay DLCI Dc* is 11, and 128 octets otherwise. This option is ignored if the -rtd option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

GROUP IpiFr Lcn Vc CallData (Cad)

Properties	Operational
Description	This group represents operational call data related to Frame Relay *Vc*. It can be displayed only for Frame Relay *Vc* which is created by application.
Mib	IpiFr

ATTRIBUTE IpiFr Lcn Vc type

Access	Read only
Description	This attribute displays the type of call, ***pvc***, ***svc, spvc*** or ***frf10spvc***.
Mib	IpiFr
Values	pvc svc spvc frf10spvc
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE IpiFr Lcn Vc state

Access	Read only
Description	This attribute displays the state of call control. P5 state is not supported but is listed for completeness. Transitions from one state to another take very short time. *state* most often displayed is ***dataTransferP4***.
Mib	IpiFr
Values	creating readyP1 dteWaitingP2 dceWaitingP3 dataTransferP4 unsupportedP5 dteClearRequestP6 dceClearIndicationP7 termination
Default	No default

ATTRIBUTE IpiFr Lcn Vc previousState

Access	Read only
Description	This attribute displays the previous state of call control. This is a valuable field to determine how the processing is progressing.
Mib	IpiFr
Values	creating readyP1 dteWaitingP2 dceWaitingP3 dataTransferP4 unsupportedP5 dteClearRequestP6 dceClearIndicationP7 termination
Default	No default

ATTRIBUTE IpiFr Lcn Vc diagnosticCode

Access	Read only
Description	This attribute displays the internal substate of call control. It is used to further refine *state* of call processing.
Mib	IpiFr
Values	Decimal (0..255)
Default	No default

ATTRIBUTE IpiFr Lcn Vc previousDiagnosticCode

ATTRIBUTE IpiFr Lcn Vc callingDna

Access	Read only
Description	This attribute displays the Data Network Address (*Dna*) of the calling end.
Mib	IpiFr
Values	BCD (1..15)
Default	No default

ATTRIBUTE IpiFr Lcn Vc callingLcn

Access	Read only
Description	This attribute displays the Logical Channel Number of the calling end.
Mib	IpiFr
Values	Decimal (1..65535)
Default	No default

ATTRIBUTE IpiFr Lcn Vc accountingEnabled

Access	Read only
Description	This attribute indicates that this optional section of accounting record is suppressed or permitted. If *accountingEnabled* is ***yes***, conditions for generation of accounting record were met. These conditions include billing options, vc recovery conditions and Module wide accounting data options.
Mib	IpiFr
Values	yes no
Default	No default

ATTRIBUTE IpiFr Lcn Vc fastSelectCall

Access	Read only
Description	This attribute displays that this is a fast select call.
Mib	IpiFr
Values	yes no
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE IpiFr Lcn Vc pathReliability

Access	Read only
Description	This attribute displays the path reliability.
Mib	IpiFr
Values	high normal
Default	No default

ATTRIBUTE IpiFr Lcn Vc accountingEnd

Access	Read only
Description	This attribute indicates if this end should generate an accounting record. Normally, ***callingEnd*** is the end to generate an accounting record.
Mib	IpiFr
Values	callingEnd calledEnd
Default	No default

ATTRIBUTE IpiFr Lcn Vc priority

Access	Read only
Description	This attribute displays whether the call is a ***normal*** or a ***high*** priority call.
Mib	IpiFr
Values	normal high
Default	No default

ATTRIBUTE IpiFr Lcn Vc segmentSize

Access	Read only
Description	This attribute displays the segment size (in bytes) used on the call. It is used to calculate the number of segments transmitted and received.
Mib	IpiFr
Values	Decimal (0..4096)
Default	No default

ATTRIBUTE IpiFr Lcn Vc maxSubnetPktSize

Access	Read only
Description	This attribute indicates the maximum packet size allowed on the *Vc*.
Mib	IpiFr

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4096)
Default	No default

ATTRIBUTE IpiFr Lcn Vc rcosToNetwork (rcosto)

Access	Read only
Description	This attribute indicates the routing metric routing class of service to the network.
Mib	IpiFr
Values	throughput delay multimedia
Default	No default

ATTRIBUTE IpiFr Lcn Vc rcosFromNetwork (rcosfrom)

Access	Read only
Description	This attribute displays the routing metric Routing Class of Service from the Network.
Mib	IpiFr
Values	throughput delay multimedia
Default	No default

ATTRIBUTE IpiFr Lcn Vc emissionPriorityToNetwork (epto)

Access	Read only
Description	This attribute displays the network internal emission priority to the network.
Mib	IpiFr
Values	normal high interrupting
Default	No default

ATTRIBUTE IpiFr Lcn Vc emissionPriorityFromNetwork (epfrom)

Access	Read only
Description	This attribute displays the network internal emission priority from the network.
Mib	IpiFr

Copyright © 2006, Nortel Nortel Confidential

Values	normal high interrupting
Default	No default

ATTRIBUTE IpiFr Lcn Vc dataPath (dapa)

Access	Read only
Description	This attribute indicates the data path used by the connection. The data path is provisioned in *Dna* and *DirectCall* components. The displayed value of this attribute can be different from the provisioned value. If the connection is using ***dprsOnly*** data path, the string ***dprsOnly*** is displayed. (dynamic packet routing system) If the connection is using ***dprsMcsOnly*** data path, the string ***dprsMcsOnly*** is displayed. If the connection is using ***dprsMcsFirst*** data path, the string ***dprsMcsFirst*** is displayed.
Mib	IpiFr
Values	String (0..32, ASCII)
Default	No default

ATTRIBUTE IpiFr Lcn Vc dprsMcsEndPoint (dmep)

Access	Read only
Description	This attribute displays the data path used by the connection. Data path is provisioned in *Dna* and *DirectCall* components. If the connection is using ***dprsOnly*** data path, this attribute is empty. If the connection is using ***dprsMcsOnly*** or ***dprsMcsFirst*** data path, this attribute displays component name of the dprsMcsEndPoint.
Mib	IpiFr
List of	The name of the component
Default	No default

GROUP IpiFr Lcn Vc IntervalData (Intd)

Properties	Operational
Description	This group defines display of interval data collected by *Vc*. Data in this group is variable and may depend on time when this *display* command is issued.

Copyright © 2006, Nortel Nortel Confidential

Mib	IpiFr

ATTRIBUTE IpiFr Lcn Vc elapsedTimeTillNow

Access	Read only
Description	This attribute displays the elapsed time representing the period of this interval data. It is elapsed time in 0.1 second increments since *Vc* started.
Mib	IpiFr
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE IpiFr Lcn Vc segmentsRx

Access	Read only
Description	This attribute displays the number of segments received at the time command was issued. This is the segment received count maintained by accounting at each end of the *Vc*. This counter is updated only when the packet cannot be successfully delivered out of the sink *Vc* and to the sink AP Conditions in which packets may be discarded by the sink *Vc* include: missing packets due to subnet discards, segmentation protocol violations due to subnet discard, duplicated and out-of-ranged packets and packets that arrive while *Vc* is in path recovery state.
Mib	IpiFr
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE IpiFr Lcn Vc segmentsSent

Access	Read only
Description	This attribute displays the number of segments sent at the time command was issued. This is the segment sent count maintained by accounting at the source *Vc*. *Vc* only counts packets that *Vc* thinks can be delivered successfully into the subnet. In reality, these packets may be dropped by trunking, for instance. This counter is not updated when splitting fails, when *Vc* is in a path recovery state, when packet forwarding fails to forward this packet and when subsequent packets have to be discarded as we want to minimize the chance of out-of-sequence and do not intentionally send out-of-sequenced packets into the subnet.
Mib	IpiFr
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE IpiFr Lcn Vc startTime

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute displays the start time of this interval period. If *Vc* spans 12 hour time or time of day change *startTime* reflects new time as recorded at 12 hour periods or time of day changes.
Mib	IpiFr
Values	Time (DHMS)
Default	No default

ATTRIBUTE IpiFr Lcn Vc callReferenceNumber

Access	Read only
Description	This attribute displays the call reference number which is a unique number generated by the switch.The same Call Reference Number is stored in the interval data (accounting record) at both ends of the call. It can be used as one of the attributes in matching duplicate records generated at each end of the call.
Mib	IpiFr
Values	Decimal (0..4294967295)
Default	No default

GROUP IpiFr Lcn Vc FrameRelayData (Frd)

Properties	Operational
Description	This group defines Frame Relay attributes collected by Frame Relay *Vc*. The purpose of *Vc* attributes is to aid end users and verification people to understand the *Vc* internal behavior. This is particularly useful when the network has experienced abnormality and we want to isolate problems and pinpoint trouble spots. Attributes are collected on a per *Vc* basis. Until a need is identified, statistics are not collected at a processor level. Each attribute is stored in a 32 bit field and is initialized to zero when a *Vc* enters into the data transfer state. When a PVC is disconnected and then connected again, the attributes will be reset. Attributes cannot be reset through other methods. Frame Relay *Vc* uses a best effort data packet delivery protocol and a different packet segmentation and combination methods from the General *Vc*. The Frame Relay *Vc* uses the same call setup and control mechanism (e.g. the support of non-flow control data packets) as in a General *Vc*. Most General *Vc* statistics and internal variables are used in a Frame Relay *Vc* and are displayed by software developers
Mib	IpiFr

ATTRIBUTE IpiFr Lcn Vc frmCongestedToSubnet

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute displays the number of frames from link discarded due to lack of resources. It keeps track of the number of frames from link that have to be discarded. The discard reasons include insufficient memory for splitting the frame into smaller subnet packet size.
Mib	IpiFr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE IpiFr Lcn Vc cannotForwardToSubnet

Access	Read only
Description	This attribute displays the number of discarded packets that can not be forwarded into the subnet because of subnet congestion. Number of frames from link discarded due to failure in forwarding a packet from *Vc* into the subnet.- This attribute is increased when packet forwarding fails to forward a packet into the subnet. If a frame is split into multiple subnet packets and a partial packet has to be discarded, all subsequent partial packets that have not yet been delivered to the subnet will be discarded as well.
Mib	IpiFr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE IpiFr Lcn Vc notDataXferToSubnet

Access	Read only
Description	This attribute records the number of frames from link discarded when the *Vc* tries to recover from internal path failure.
Mib	IpiFr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE IpiFr Lcn Vc outOfRangeFrmFromSubnet

Access	Read only
Description	This attribute displays the number of frames from subnet discarded due to out of sequence range for arriving too late.
Mib	IpiFr
Values	Decimal (0..255)
Default	No default

ATTRIBUTE IpiFr Lcn Vc combErrorsFromSubnet

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute records the number of subnet packets discarded at the sink *Vc* due to the *Vc* segmentation and combination protocol error. Usually, this occurs when the subnet discards packets and thus this statistics can be used to guest the number of subnet packets that are not delivered to the *Vc*. It cannot be used as an actual measure because some subnet packets may have been delivered to *Vc* but have to be discarded because these are partial packets to a frame in which some other partial packets have not been properly delivered to *Vc*
Mib	IpiFr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE IpiFr Lcn Vc duplicatesFromSubnet

Access	Read only
Description	This attribute displays the number of subnet packets discarded due to duplication. Although packets are not retransmitted by the Frame Relay *Vc*, it is possible for the subnet to retransmit packets. When packets are out-of-sequenced and copies of the same packets arrive, then this attribute is increased.
Mib	IpiFr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE IpiFr Lcn Vc notDataXferFromSubnet

Access	Read only
Description	This attribute displays the number of subnet packets discarded when data transfer is suspended in *Vc* recovery.
Mib	IpiFr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE IpiFr Lcn Vc frmLossTimeouts

Access	Read only
Description	This attribute displays the number of lost frame timer expiries. When this count is excessive, the network is very congested and packets have been discarded in the subnet.
Mib	IpiFr
Values	Decimal (0..5000)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE IpiFr Lcn Vc ooSeqByteCntExceeded

Access	Read only
Description	This attribute displays the number times that the out of sequence byte threshold is exceeded. When the threshold is exceeded, this condition is treated as if the loss frame timer has expired and all frames queued at the sink *Vc* are delivered to the AP. We need to keep this count to examine if the threshold is engineered properly. This should be used in conjunction with the peak value of out-of-sequenced queue and the number of times the loss frame timer has expired. This count should be relatively small when compared with loss frame timer expiry count.
Mib	IpiFr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE IpiFr Lcn Vc peakOoSeqPktCount

Access	Read only
Description	This attribute displays the frame relay peak packet count of the out of sequence queue. This attribute records the maximum queue length of the out-of-sequenced queue. The counter can be used to deduce the message buffer requirement on a *Vc*.
Mib	IpiFr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE IpiFr Lcn Vc peakOoSeqFrmForwarded

Access	Read only
Description	This attribute displays the frame relay peak size of the sequence packet queue. The subnet may deliver packets out-of-sequenced. These packets are then queued in an out-of-sequenced queue, waiting for a packet with the expected sequence number to come. When that packet arrives, this attribute records the maximum number of packets that were out-of-sequenced, but now have become in-sequenced. The statistics is used to measure expected queue size due to normal subnet packet disorder (not due to subnet packet discard). Current implementation also uses this statistics to set a maximum size for the out-of-sequenced queue.
Mib	IpiFr
Values	Decimal (0..5000)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE IpiFr Lcn Vc sendSequenceNumber

Access	Read only
Description	This attribute displays the Vc internal packet's send sequence number. Note that a "packet" in this context, may be either a user data packet, or an OAM frame.
Mib	IpiFr
Values	Decimal (0..1048575)
Default	No default

ATTRIBUTE IpiFr Lcn Vc pktRetryTimeouts

Access	Read only
Description	This attribute displays the number of packets which have retransmission time-outs. When this count is excessive, the network is very congested and packets have been discarded in the subnet.
Mib	IpiFr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE IpiFr Lcn Vc peakRetryQueueSize

Access	Read only
Description	This attribute displays the peak size of retransmission queue. This attribute is used as an indicator of the acknowledgment behavior across the subnet. Records the largest body of unacknowledged packets.
Mib	IpiFr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE IpiFr Lcn Vc subnetRecoveries

Access	Read only
Description	This attribute displays the number of successful *Vc* recovery attempts.
Mib	IpiFr
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE IpiFr Lcn Vc ooSeqPktCntExceeded

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute displays the number times that the out of sequence packet threshold is exceeded. When the threshold is exceeded, this condition is treated as if the loss frame timer has expired and all frames queued at the sink *Vc* are delivered to the AP. We need to keep this count to examine if the threshold is engineered properly. This should be used in conjunction with the peak value of out-of-sequenced queue and the number of times the loss frame timer has expired. This count should be relatively small when compared with loss frame timer expiry count.
Mib	IpiFr
Values	Decimal (0..255)
Default	No default

ATTRIBUTE IpiFr Lcn Vc peakOoSeqByteCount

Access	Read only
Description	This attribute displays the frame relay peak byte count of the out of sequence queue. This attribute records the maximum queue length of the out-of-sequenced queue. The counter can be used to deduce the message buffer requirement on a *Vc*.
Mib	IpiFr
Values	Decimal (0..50000)
Default	No default

COMPONENT IpiFr StaticRoute (Sr)

Instance	IP address
Groups	GROUP IpiFr Sr Provisioned (Prov)
Scope	Application
Description	*IpiFr StaticRoute/destIpAddress* This component contains information for setting up a static routes on the IpiFr service. These provisioned static IP routes allow the ability to specify IP routes to network management stations that are not directly connected to the node. The component is indexed by a destination IP Address. It represents the static IP route to a particular IP host, subnetwork, or network. The default route IP address is indexed by 0.0.0.0. Note that sub-network routes are identified using IpiFr's provisioned *subnetMask*. This *subnetMask* only applies to the IP network for which

Copyright © 2006, Nortel Nortel Confidential

IpiFr's IP Address belongs. Therefore, sub-network routes are only supported for this local IP network.

Mib IpiFr

GROUP IpiFr Sr Provisioned (Prov)

Properties Provisioned

Description

This group provides the provisionable parameters for setting up a static route.

Mib IpiFr

ATTRIBUTE IpiFr Sr gatewayIpAddress (gtyIpa)

Access Read and write

Criticality Component

Description

The attribute specifies the IP Address of the next hop in this route to the destination IP Address. For this static route to be active, the value of this attribute must match the *opRemoteIpAddress* attribute of one of the *Lcn* components.

Mib IpiFr

Values IP address

Default 0.0.0.0

ATTRIBUTE IpiFr Sr backupGatewayIpAddress (bGtyIpa)

Access Read and write

Criticality Component

Description

The attribute specifies an ordered list of alternative gateways to use for the route to the destination IP Address. This attribute is only supported for the default route.

If the *Lcn* interface of the current gateway IP Address fails, then the *backupGatewayIpAddress*es, listed in this attribute, are searched, in order, for a gatewayIpAddress with an enabled *Lcn*. If found, the static route to this destination IP Address is updated to use the found gateway IP Address. If the primary gateway is later restored, the default route will not

Copyright © 2006, Nortel Nortel Confidential

automatically return to the provisioned primary gateway. The primary gateway (if available) will be used if the backup gateway becomes unavailable.

Note that an *Lcn* interface can fail due to either the *Vc* through the network failing, or an *Lmi* indication that the far-end link is failed.

Mib	IpiFr
Values	IP address
Replication	Decimal (1..23)
Default	No default

COMPONENT IpiFr Route (R)

Instance	IP address
Groups	GROUP IpiFr R Operational (Oper)
Scope	Application
Description	*IpiFr Route/destIpAddress*

This dynamic component represents an active IP route within the IpiFr service. The component is indexed by the destination IP Address of the IP route. It represents the IP route to a particular IP host, subnetwork, or network. The default route IP address is indexed by 0.0.0.0.

Note that only an active route is shown as an *IpiFr Route/<IP_Address>*. A provisioned static route (that is, *IpiFr StaticRoute/<IP_Address>*) will be listed as an active route only if it's Lcn interface is enabled (that is, the associated VC through the network is up, and the Frame Relay *Lmi* is reporting the far-end link is up).

Common Verbs	Help List Display

GROUP Ipivc Dna Address

Properties	Provisioned
Description	DnaAddress group contains attributes common to all Dna's. Every Dna used in the network is defined with this group 0f 2 attributes. String of address digits is complemented by type of address and Npi. These attributes are used to interpret format of the address digits.
Mib	IpiVc

ATTRIBUTE Ipivc Dna numberingPlanIndicator (npi)

Access	Read and write
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the Numbering Plan Indicator (NPI) of the Dna that is entered. Address may belong to X.121 or E.164 plans. X.121 is used in packet switched data networks.
Mib	IpiVc
Values	x121 e164
Default	x121

ATTRIBUTE Ipivc Dna dataNetworkAddress (dna)

Access	Read and write
Criticality	Component
Description	*Dna* attribute contains digits which form unique identifier of the customer. It is the equivalent of the telephone number in the telephone network. MaximumLenOfDna is 15digits.
Mib	IpiVc
Values	BCD (1..15)
Default	No default

GROUP Ipivc Dna OutgoingOptions

Properties	Provisioned
Description	DnaOutOptionsProv group defines call options of a Dna for calls which are made out of the interface represented by Dna. All these options are not used for calls arriving to the interface represented by Dna.
Mib	IpiVc

ATTRIBUTE Ipivc Dna outCalls (ouc)

Access	Read only
Criticality	Component
Description	This attribute, if set to a value of ***allowed*** indicates that outgoing calls (from the DTE to the network) can be made using this particular DNA. If set to a value of ***disallowed***, then outgoing calls cannot be made using this DNA - such calls will be cleared by the local DCE. This attribute corresponds to the CCITT 'Outgoing Calls Barred' feature for DNAs in that outgoing calls are barred if this attribute is set to a value of ***disallowed***. Either *outCalls*, or *incCalls* (or both) must be set to a value of ***allowed*** for this DNA to be usable.
Mib	IpiVc
Values	disallowed allowed
Default	disallowed

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Ipivc Dna defaultTransferPriority (dtp)

Access	Read and write
Criticality	Component
Description	This attribute specifies the default transfer priority to network for all outgoing calls using this particular *Dna*. It is overRidden by the transferPriority provisioned in the *DLCI* Direct Call sub-component. The transfer priority is a preference specified by an application according to its delay-sensitivity requirement. Frames with high transfer priority are served by the network before the frames with normal priority. Each transfer priority contains a predetermined setting for trunk queue (interrupting, delay or throughput), routing metric (delay or throughput). When the transfer priority is set at ***high***, the trunk queue is set to high, the routing metric is set to delay. When the transfer priority is set at ***normal***, the trunk queue is set to normal, the routing metric is set to throughput. The default of *defaultTransferPriority* is ***normal***.
Mib	IpiVc
Values	normal high
Default	normal

ATTRIBUTE Ipivc Dna transferPriorityOverRide (tpor)

Access	Read and write
Criticality	Component
Description	When this attribute is set to ***yes***, the called end will use the calling end provisioning data on transfer priority to override its own provisioning data. If it is set ***no***, the called end will use its own provisioning data on transfer priority. For more information about transfer priority, please refer to the previous attribute *defaultTransferPriority*. The default of *transferPriorityOverRide* is ***no***.
Mib	IpiVc
Values	yes no

Copyright © 2006, Nortel Nortel Confidential

Default	no

GROUP Ipivc Dna IncomingOptions

Properties	Provisioned
Description	DnaIncOptions defines a set of options for incoming calls. These options are used for calls arriving to the interface represented by Dna. For calls originated from the interface, IncomingOptions attributes are not used.
Mib	IpiVc

ATTRIBUTE Ipivc Dna incCalls (inc)

Access	Read only
Criticality	Component
Description	This attribute, if set to a value of ***allowed*** indicates that incoming calls (from the network to the DTE) can be made to this DNA. If set to a value of ***disallowed***, then incoming calls cannot be made to this DNA - such calls will be cleared by the local DCE. This attribute corresponds to the CCITT 'Incoming Calls Barred' feature for DNAs in that incoming calls are barred if this attribute is set to a value of ***disallowed***. Either *outCalls*, or *incCalls* (or both) must be set to a value of ***allowed*** for this DNA to be usable.
Mib	IpiVc
Values	disallowed allowed
Default	allowed

ATTRIBUTE Ipivc Dna incHighPriorityReverseCharge (ihp)

Access	Read only
Criticality	Component
Description	This attribute, if set to a value of ***allowed*** indicates that incoming high priority, reverse charged calls (from the network to the DTE) can be made to this DNA. If set to a value of ***disallowed***, then such calls cannot be made to this DNA - such calls will be cleared by the local DCE. This attribute, together with the *incNormalPriorityReverseChargeCalls* attribute corresponds to the CCITT 'Reverse Charging Acceptance' feature for DNAs in that reverse charged calls are accepted if both attributes are set to a value of ***allowed***. This attribute is ignored if the corresponding attribute, incCalls is set to a value of ***disallowed***.
Mib	IpiVc
Values	disallowed allowed

Copyright © 2006, Nortel Nortel Confidential

Default	allowed

ATTRIBUTE Ipivc Dna incNormalPriorityReverseCharge (inp)

Access	Read only
Criticality	Component
Description	This attribute, if set to a value of ***allowed*** indicates that incoming normal priority, reverse charged calls (from the network to the DTE) can be made to this DNA. If set to a value of ***disallowed***, then such calls cannot be made to this DNA - such calls will be cleared by the local DCE. This attribute, together with the *incHighPriorityReverseChargeCalls* attribute corresponds to the CCITT 'Reverse Charging Acceptance' feature for DNAs in that reverse charged calls are accepted if both attributes are set to a value of ***allowed***. This attribute is ignored if the corresponding attribute, *incCalls* is set to a value of ***disallowed***.
Mib	IpiVc
Values	disallowed allowed
Default	allowed

ATTRIBUTE Ipivc Dna incIntlNormalCharge (iin)

Access	Read only
Criticality	Component
Description	This attribute, if set to a value of ***allowed*** indicates that incoming international normal charged calls (from the network to the DTE) can be made to this DNA. If set to a value of ***disallowed***, then such calls cannot be made to this DNA - such calls will be cleared by the local DCE. This attribute also currently controls access to/from the E.164 numbering plan, and if set to a value of ***allowed***, then cross-numbering plan calls (also normal charged) are allowed. This attribute is ignored if the corresponding attribute, *incCalls* is set to a value of ***disallowed***.
Mib	IpiVc
Values	disallowed allowed
Default	allowed

ATTRIBUTE Ipivc Dna incIntlReverseCharge (iir)

Access	Read only
Criticality	Component
Description	This attribute, if set to a value of ***allowed*** indicates that incoming international reverse charged calls (from the network to the DTE) can be

Copyright © 2006, Nortel Nortel Confidential

made to this DNA. If set to a value of ***disallowed***, then such calls cannot be made to this DNA - such calls will be cleared by the local DCE.
This attribute also currently controls access to/from the E.164 numbering plan, and if set to a value of ***allowed***, then cross-numbering plan calls (also normal charged) are ***allowed***.
This attribute is ignored if the corresponding attribute, *incCalls* is set to a value of ***disallowed***.

Mib	IpiVc
Values	disallowed allowed
Default	allowed

ATTRIBUTE Ipivc Dna incFastSelect (ifs)

Access	Read only
Criticality	Component
Description	This attribute specifies whether fast select calls may be received. This attribute, if set to a value of ***allowed*** indicates that incoming fast select calls (from the network to the DTE) can be made to this DNA. If set to a value of ***disallowed***, then such calls cannot be made to this DNA - such calls will be cleared by the local DCE. This attribute corresponds to the CCITT 'Fast Select Acceptance' feature for DNAs in that incoming fast select calls are accepted if this attribute is set to a value of ***allowed***. This attribute is ignored if the corresponding attribute, *incCalls* is set to a value of ***disallowed***.
Mib	IpiVc
Values	disallowed allowed
Default	disallowed

ATTRIBUTE Ipivc Dna incSameService (iss)

Access	Read only
Criticality	Component
Description	This attribute, if set to a value of ***allowed*** indicates that incoming calls from the same service type (for example, X.25, ITI, SNA) (from the network to the DTE) can be made to this DNA. If set to a value of ***disallowed***, then such calls cannot be made to this DNA - such calls are cleared by the local DCE. This attribute is ignored if the corresponding attribute, *incCalls* is set to a value of ***disallowed***.
Mib	IpiVc

Copyright © 2006, Nortel Nortel Confidential

Values	disallowed allowed
Default	allowed

ATTRIBUTE Ipivc Dna incChargeTransfer (ict)

Access	Read only
Criticality	Component
Description	This attribute, if set to a value of ***yes*** indicates that the charges for incoming normal charged calls from a DTE with the same NIC (calls from the network to the DTE) will be transferred to the called DTE. If set to a value of ***no***, then charges will not be transferred. This attribute is ignored if the corresponding attribute, *incCalls* is set to a value of ***disallowed***.
Mib	IpiVc
Values	no yes
Default	no

ATTRIBUTE Ipivc Dna incAccess (ina)

Access	Read only
Criticality	Component
Description	This attribute is an extension of the Closed User Group (CUG) facility, as follows: This attribute, if set to a value of ***allowed*** indicates that incoming calls (from the network to the DTE) from the open (non-CUG) part of the network are permitted. It also permits incoming calls from DTEs that have Outgoing Access capabilities. If set to a value of ***disallowed***, then such calls cannot be made to this DNA - such calls will be cleared by the local DCE. This attribute corresponds to the CCITT 'Closed User Group with Incoming Access' feature for DNAs in that incoming access is granted if this attribute is set to a value of ***allowed***.
Mib	IpiVc
Values	disallowed allowed
Default	disallowed

GROUP Ipivc Dna CallOptions

Properties	Provisioned
Description	DnaCallOptions group defines additional options for calls not related directly to direction of a call.

ATTRIBUTE Ipivc Dna defaultSendToNetworkWindowSize (sws)

Access Read only

Criticality Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the number of data packets that can be transmitted from the DTE to the DCE and must be acknowledged before more packets can be transmitted.
Mib	IpiVc
Values	Decimal (1..7)
Default	2

ATTRIBUTE Ipivc Dna packetSizeNegotiation (psn)

Access	Read only
Criticality	Component
Description	This attribute, if set to a value of ***local*** indicates that packet sizes can be negotiated locally at the interface irrespective of the remote interface. If set to a value of ***endToEnd***, then local negotiation is not permitted and packet sizes are negotiated between both ends of the VC.
Mib	IpiVc
Values	endToEnd local
Default	local

ATTRIBUTE Ipivc Dna accountClass (acl)

Access	Read and write
Criticality	Component
Description	This attribute specifies the accounting class which is reserved for network operations usage. Its value is returned in the accounting record in the local and remote service type attributes. Use of this attribute is decided by network operator. This attribute is returned by the local VC in the accounting record for all calls setup using this particular DNA.
Mib	IpiVc
Values	Decimal (0..255)
Default	0

ATTRIBUTE Ipivc Dna serviceExchange (sre)

Access	Read and write
Criticality	Component
Description	This attribute is an arbitrary number, Data Service Exchange, as entered by the network operator and reported in accounting record. It is converted into an internal 8-bit integer value for use in the accounting record as well as in various X.25 and X.75 Tariff utilities.

Copyright © 2006, Nortel Nortel Confidential

Mib	IpiVc
Values	Decimal (0..255)
Default	0

ATTRIBUTE Ipivc Dna cugFormat (cft)

Access	Read only
Criticality	Component
Description	This attribute specifies which cug format is used when DTE signals CUG indices, basic or extended. This attribute, if set to a value of ***extended*** indicates that the DTE signals and receives CUG indices in extended CUG format. If set to a value of ***basic***, then the DTE signals and receives CUG indices in the basic CUG format.
Mib	IpiVc
Values	basic extended
Default	basic

ATTRIBUTE Ipivc Dna cug0AsNonCugCall (cnc)

Access	Read only
Criticality	Component
Description	This attribute, if set to a value of ***allowed*** indicates that when a CUG index of 0 is signaled in a call request packet, the call is treated as a non-CUG call. If this attribute is set to a value of ***disallowed***, then a CUG index of 0 is treated as an index, and an attempt is made to find the particular CUG corresponding with the DNA.
Mib	IpiVc
Values	disallowed allowed
Default	disallowed

ATTRIBUTE Ipivc Dna fastSelectCallsOnly (fso)

Access	Read only
Criticality	Component
Description	This attribute, if set to a value of ***yes***, indicates that the service is permitted restricted fast select calls only in both the incoming and the outgoing directions using this DNA. If set to a value of ***no***, then non fast select calls are permitted as well.
Mib	IpiVc

Copyright © 2006, Nortel Nortel Confidential

Values	no yes
Default	no

COMPONENT Ipivc Dna ClosedUserGroup (Cug)

Groups	GROUP Ipivc Dna Cug CugOptions
Scope	Application
Description	*IpiVc Dna Cug* Closed User Group options defines options associated with national or international Cug Identifier. Other DNAs in the network can have CUGs defined which groups these DNAs by CUG Interlock Code. If DNAs are defined with CUGs, calls from DNAs that do not have the same interlock code are refused. Attributes *incAccess* and *outAccess* can override this rule.
Mib	IpiVc
Common Verbs	Help List Display

GROUP Ipivc Dna Cug CugOptions

Properties	Provisioned
Description	This group defines options for Dna closed user group. Attributes in this group define options associated with interlockCode. Dna's with the same Cug (interlockCode) can make calls within this group. Various combinations which permit or prevent calls in the same Cug group are defined here.
Mib	IpiVc

ATTRIBUTE Ipivc Dna Cug type

Access	Read and write
Description	This attribute specifies the CUG type - the CUG is either a national CUG, or an international CUG. International closed user groups are usually established between DTEs for which there is an X.75 Gateway between; whereas national closed user groups are usually established between DTEs for which there is no X.75 Gateway between. (National CUGs cannot normally traverse an X.75 Gateway). If this attribute is set to ***national***, then the CUG is a national CUG, in which case, the DNIC should be left at its default value of BCD.0000 since it is not part of a national CUG. If this attribute is set to ***international***, then the CUG is an international CUG, in which case, the DNIC should be set appropriately as part of the CUG interlock code.
Mib	IpiVc

Copyright © 2006, Nortel Nortel Confidential

Values	national international
Default	national

ATTRIBUTE Ipivc Dna Cug dnic

Access	Read and write
Description	This attribute specifies the DNIC (Data Network ID Code) of the Cug by which packet networks are identified if the Cug is an International Cug - it is specified as 4 BCD digits. This attribute is not applicable if the Cug is a National Cug, as specified by the Cug TYPE attribute. There are usually 1 or 2 DNICs assigned per country, for public networks. The U.S. is an exception where each BOC has a DNIC. Also, a group of private networks can have its own DNIC. DNIC value is not an arbitrary number. It is assigned by international agreement and controlled by CCITT.
Mib	IpiVc
Values	BCD (4)
Default	0000

ATTRIBUTE Ipivc Dna Cug interlockCode (ilc)

Access	Read and write
Description	This attribute specifies the Cug Identifier of a national or international Cug call. It is an arbitrary number and it also can be called Cug in some descriptions. Interfaces (DNAs) defined with this number can make calls to DNAs with the same interlock code.
Mib	IpiVc
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Ipivc Dna Cug outCalls (ouc)

Access	Read only
Description	This attribute, if set to a value of ***allowed*** indicates that outgoing calls (from the DTE into the network) can be made using this particular CUG. If set to a value of ***disallowed***, then outgoing calls cannot be made using this CUG - such calls will be cleared by the local DCE. This attribute corresponds to the CCITT 'Outgoing Calls Barred' feature for CUGs in that outgoing calls are barred if this attribute is set to a value of ***disallowed***.
Mib	IpiVc
Values	disallowed allowed

Copyright © 2006, Nortel Nortel Confidential

Default	disallowed

ATTRIBUTE Ipivc Dna Cug incCalls (inc)

Access	Read only
Description	This attribute, if set to a value of ***allowed*** indicates that incoming calls (from the network to the DTE) can be made using this particular CUG. If set to a value of ***disallowed***, then incoming calls cannot be made using this CUG - such calls will be cleared by the local DCE. This attribute corresponds to the CCITT 'Incoming Calls Barred' feature for CUGs in that incoming calls are barred if this attribute is set to a value of ***disallowed***.
Mib	IpiVc
Values	disallowed allowed
Default	allowed

ATTRIBUTE Ipivc Dna Cug privileged (pri)

Access	Read and write
Description	This attribute, if set to a value of ***yes*** indicates that this CUG is a privileged CUG. In DPN, at least one side of a call setup within a CUG must have the CUG as a privileged CUG. If set to a value of ***no***, then the CUG is not privileged. If both the local DTE and the remote DTE subscribe to the CUG, but it is not privileged, then the call will be cleared. This attribute is typically used for a host DTE which must accept calls from many other DTEs in which case the other DTEs cannot call one another, but can call the host. In this example, the host would have the privileged CUG, and the other DTEs would belong to the same CUG, but it would not be privileged.
Mib	IpiVc
Values	no yes
Default	yes

COMPONENT Ipivc DefaultRoute (Dr)

ATTRIBUTE Ipivc Dr callingDataNetworkAddress (dna)

Access	Read and write
Criticality	Component
Description	This field specifies the address (in Binary Coded Decimal BCD format) assigned to the remote end.
Mib	IpiVc
Values	BCD (1..15)
Default	No default

COMPONENT Ipivc LogicalChannelNumber (Lcn)

Instance	Decimal (16..39)
Groups	GROUP Ipivc Lcn OsiState (State) GROUP Ipivc Lcn Operational (Oper)
Scope	Application
Description	IpiVc Lcn/<n> The Logical Channel Number responsible for the logical connection with the VC. There can be up to 24 instances of Lcn on the IpiVc component.
Mib	IpiVc
Dyn. Subcomp.	COMPONENT Ipivc Lcn Vc
Common Verbs	Help List Display LOCK Unlock

GROUP Ipivc Lcn OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	IpiVc

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Ipivc Lcn adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	IpiVc
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Ipivc Lcn operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	IpiVc
Values	enabled (ena) disabled (dis)
Default	disabled

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Ipivc Lcn usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	IpiVc
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Ipivc Lcn availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	IpiVc
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Ipivc Lcn proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The

Copyright © 2006, Nortel Nortel Confidential

operationalState is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib: IpiVc

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default: No default

ATTRIBUTE Ipivc Lcn controlStatus (osiCntrl)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Default	No default

ATTRIBUTE Ipivc Lcn alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	IpiVc
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Ipivc Lcn standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib: IpiVc

Values:
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default: notSet

ATTRIBUTE Ipivc Lcn unknownStatus (osiUnknw)

Access: Read only

Description: This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Mib: IpiVc

Values:
false
true

Default: false

GROUP Ipivc Lcn Operational (Oper)

Properties: Operational

Description:
This group contains status of the internal IP network interface.

Mib: IpiVc

Description — This attribute displays the maximum packet size allowed on *Vc*.

Mib — IpiVc

Values — Decimal (0..4096)

Default — No default

ATTRIBUTE Ipivc Lcn Vc transferPriorityToNetwork

Access — Read only

Description — This attribute displays the priority in which data is transferred to the network.

The transfer priority is a preference specified by an application according to its delay-sensitivity requirement. Frames with high transfer priority are served by the network before the frames with normal priority.

Each transfer priority contains a predetermined setting for trunk queue (interrupting, delay or throughput), and routing metric (delay or throughput).

When the transfer priority is set at ***high***, the trunk queue is set to high, the routing metric is set to delay.

When the transfer priority is set at ***normal***, the trunk queue is set to normal, the routing metric is set to throughput.

Copyright © 2006, Nortel Nortel Confidential

Mib	IpiVc
Values	normal high
Default	No default

ATTRIBUTE Ipivc Lcn Vc transferPriorityFromNetwork

Access	Read only
Description	This attribute displays the priority in which data is transferred from the network. The transfer priority is a preference specified by an application according to its delay-sensitivity requirement. Frames with high transfer priority are served by the network before the frames with normal priority. Each transfer priority contains a predetermined setting for trunk queue (interrupting, delay or throughput), and routing metric (delay or throughput). When the transfer priority is set at ***high***, and the trunk queue is set to high, the routing metric is set to delay. When the transfer priority is set at ***normal***, the trunk queue is set to normal, and the routing metric is set to throughput.
Mib	IpiVc
Values	normal high
Default	No default

GROUP Ipivc Lcn Vc IntervalData (Intd)

Properties	Operational
Description	This group defines display of interval data collected by *Vc*. Data in this group is variable and may depend on time when this *display* command is issued.
Mib	IpiVc

ATTRIBUTE Ipivc Lcn Vc elapsedTimeTillNow

Access	Read only
Description	This attribute displays the elapsed time representing the period of this interval data. It is elapsed time in 0.1 second increments since *Vc* started.
Mib	IpiVc
Values	Decimal (0..16777215)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Ipivc Lcn Vc segmentsRx

Access	Read only
Description	This attribute displays the number of segments received at the time command was issued. This is the segment received count maintained by accounting at each end of the *Vc*. This counter is updated only when the packet cannot be successfully delivered out of the sink *Vc* and to the sink AP Conditions in which packets may be discarded by the sink *Vc* include: missing packets due to subnet discards, segmentation protocol violations due to subnet discard, duplicated and out-of-ranged packets and packets that arrive while *Vc* is in path recovery state.
Mib	IpiVc
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE Ipivc Lcn Vc segmentsSent

Access	Read only
Description	This attribute displays the number of segments sent at the time command was issued. This is the segment sent count maintained by accounting at the source *Vc*. *Vc* only counts packets that *Vc* thinks can be delivered successfully into the subnet. In reality, these packets may be dropped by trunking, for instance. This counter is not updated when splitting fails, when *Vc* is in a path recovery state, when packet forwarding fails to forward this packet and when subsequent packets have to be discarded as we want to minimize the chance of out-of-sequence and do not intentionally send out-of-sequenced packets into the subnet.
Mib	IpiVc
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE Ipivc Lcn Vc startTime

Access	Read only
Description	This attribute displays the start time of this interval period. If *Vc* spans 12 hour time or time of day change *startTime* reflects new time as recorded at 12 hour periods or time of day changes.
Mib	IpiVc
Values	Time (DHMS)
Default	No default

ATTRIBUTE Ipivc Lcn Vc callReferenceNumber

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute displays the call reference number which is a unique number generated by the switch.The same Call Reference Number is stored in the interval data (accounting record) at both ends of the call. It can be used as one of the attributes in matching duplicate records generated at each end of the call.
Mib	IpiVc
Values	Decimal (0..4294967295)
Default	No default

GROUP Ipivc Lcn Vc Statistics (Stats)

Properties	Operational
Description	*... Statistics(Stats)* This group defines general attributes collected by general *Vc*. The purpose of *Vc* attributes is to aid end users and verification people to understand the *Vc* internal behavior. This is particularly useful when the network has experienced abnormality and we want to isolate problems and pinpoint trouble spots. Attributes are collected on a per *Vc* basis. Until a need is identified, statistics are not collected at a processor level. Each attribute is stored in a 32 bit field and is initialized to zero when a *Vc* enters into the data transfer state. When a PVC is disconnected and then connected again, the attributes will be reset. Attributes cannot be reset through other methods.
Mib	IpiVc

ATTRIBUTE Ipivc Lcn Vc ackStackingTimeouts

Access	Read only
Description	This attribute counts the number of ack stacking timer expiries. It is used as an indicator of the acknowledgment behavior across the subnet when ack stacking is in effect. If it expires often, usually this means end users will experience longer delay. The ack stacking timer specifies how long the *Vc* will wait before finally sending the subnet acknowledgment. if this attribute is set to a value of 0, then the *Vc* will automatically return acknowledgment packets without delay. If this attribute is set to a value other than zero, then the *Vc* will wait for this amount of time in an attempt to piggyback the acknowledgment packet on another credit or data packet. If the *Vc* cannot piggyback the acknowledgment packet within this time, then the packet is returned without piggybacking.
Mib	IpiVc
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Ipivc Lcn Vc outOfRangeFrmFromSubnet

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute counts the number of subnet frames discarded due to the sequence number being out of range. Two Categories apply for the General *Vc* 1) lost Acks (previous Range) 2) unexpected Packets (next Range) *Vc* internally maintains its own sequence number of packet order and sequencing. Due to packet retransmission, *Vc* may receive duplicate packets that have the same *Vc* internal sequence number. Only 1 copy is accepted by the *Vc* and other copies of the same packets are detected through this count. This attribute can be used to record the frequency of packet retransmission due to *Vc* and other part of the subnet.
Mib	IpiVc
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Ipivc Lcn Vc duplicatesFromSubnet

Access	Read only
Description	This attribute counts the number of subnet packets discarded due to duplication. It is used to detect software error fault or duplication caused by retransmitting.
Mib	IpiVc
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Ipivc Lcn Vc frmRetryTimeouts

Access	Read only
Description	This attribute counts the number of frames which have retransmission time-out. If packets from *Vc* into the subnet are discarded by the subnet, the source *Vc* will not receive any acknowledgment. The retransmission timer then expires and packets will be retransmitted again. Note that the *Vc* idle probe may be retransmitted and is included in this count. This statistics does not show the distribution of how many times packets are retransmitted (e.g. first retransmission results in successful packet forwarding).
Mib	IpiVc
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Ipivc Lcn Vc peakRetryQueueSize

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the peak size of the retransmission queue. This attribute is used as an indicator of the acknowledgment behavior across the subnet. It records the largest body of unacknowledged packets.
Mib	IpiVc
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Ipivc Lcn Vc peakOoSeqQueueSize

Access	Read only
Description	This attribute indicates the peak size of the out of sequence queue. This attribute is used as an indicator of the sequencing behavior across the subnet. It records the largest body of out of sequence packets.
Mib	IpiVc
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Ipivc Lcn Vc peakOoSeqFrmForwarded

Access	Read only
Description	This attribute indicates the peak size of the sequence packet queue. This attribute is used as an indicator of the sequencing behavior across the subnet. It records the largest body of out of sequence packets, which by the receipt of an expected packet have been transformed to expected packets. The number of times this peak is reached is not recorded as it is traffic dependent.
Mib	IpiVc
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Ipivc Lcn Vc peakStackedAcksRx

Access	Read only
Description	This attribute indicates the peak size of wait acks. This attribute is used as an indicator of the acknowledgment behavior across the subnet. It records the largest collective acknowledgment.
Mib	IpiVc
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Ipivc Lcn Vc subnetRecoveries

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute counts the number of successful *Vc* recovery attempts. This attribute is used as an indicator of how many times the *Vc* path is broken but can be recovered. This attribute is useful to record the number of network path failures.
Mib	IpiVc
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Ipivc Lcn Vc windowClosuresToSubnet

Access	Read only
Description	This attribute counts the number of window closures to subnet. A packet may have been sent into the subnet but its acknowledgment from the remote *Vc* has not yet been received. This is a 8 bit sequence number.This number is useful in detecting whether the *Vc* is sending any packet into the subnet.
Mib	IpiVc
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Ipivc Lcn Vc windowClosuresFromSubnet

Access	Read only
Description	This attribute counts the number of window closures from subnet. This attribute is useful in detecting whether the *Vc* is receiving any packet from the subnet.
Mib	IpiVc
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Ipivc Lcn Vc wrTriggers

Access	Read only
Description	This attribute displays the number of times the *Vc* stays within the W-R region. The W-R region is a value used to determined the timing of credit transmission. Should the current window size be beneath this value, the credits will be transmitted immediately. Otherwise, they will be transmitted later with actual data. The wrTriggers statistic is therefore used to analyze the flow control and credit mechanism.
Mib	IpiVc
Values	Decimal (0..5000)

COMPONENT IuPc (IuPc)

Instance	Decimal (1..1)
Groups	GROUP IuPc OsiState (State)
Scope	Application
Description	*IuPc* This component represents the interface used for terminating PCAP messaging from the SAS for A-GPS services.
Mib	IuPcRnc
Opt. Subcomp.	COMPONENT IuPc SignallingBearer (SignallingBearer)
Common Verbs	Help List Display Add DELete

GROUP IuPc OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	IuPcRnc

ATTRIBUTE IuPc adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value

Copyright © 2006, Nortel

is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — IuPcRnc

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE IuPc operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — IuPcRnc

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE IuPc usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — IuPcRnc

Copyright © 2006, Nortel Nortel Confidential

Values	idle active (activ) busy
Default	idle

COMPONENT IuPc SignallingBearer (SignallingBearer)

Scope	Application
Description	*IuPc SignallingBearer* This subcomponent under IuPc is the parent component for all transport types for IuPc.

ATTRIBUTE IuPc SignallingBearer Tal **txHeartbeatInterval**

Access	Read: All Write: All
Description	This attribute represents the time, in seconds, that the NI waits to send Heartbeat signals to the SAS IP's. Setting this attribute to 0.0 disables the Heartbeat on the NI.
Mib	IuPcRnc
Values	Decimal (0.0..600.0)
Default	0.5

ATTRIBUTE IuPc SignallingBearer Tal **rxHeartbeatInterval**

Access	Read: All Write: All
Description	This attribute represents the time, in seconds, that the NI waits to receive Heartbeat signals or any other transmission from the SAS IP's. If this limit is exceeded, the NI presumes the connection has been lost and attempts a reconnect.
Mib	IuPcRnc
Values	Decimal (0.0..600.0)
Default	2.0

ATTRIBUTE IuPc SignallingBearer Tal **nilp**

Access	Read: All Write: All
Description	This attribute represents a list of IP addresses for the Network Interface.
Mib	IuPcRnc
List of	IP address
List Size	2
Default	No default

GROUP IuPc SignallingBearer Tal **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	IuPcRnc

COMPONENT IuxInterface (IuxIf)

Instance	Decimal (1..16383)
Groups	GROUP IuxIf CustomerIdentifierData (CidData) GROUP IuxIf Provisioned (Prov) GROUP IuxIf OsiState (State)
Scope	Application
Description	*IuxInterface/n* This component represents the UTRAN Interface. A particular instance represents either an Iub interface, an Iur Interface, or an Iucs interface. On U-Plane, the *Path* subcomponents represent the individual AAL2 paths within this UTRAN interface. On C-Plane, the *SignallingBearer* components represent the bearers for AAL5 terminated traffic.
Mib	IuxIfRnc
Opt. Subcomp.	COMPONENT IuxIf Path COMPONENT IuxIf SignallingBearer (Sig)
Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP IuxIf CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	IuxIfRnc

ATTRIBUTE IuxIf customerIdentifier (cid)

Access	Read and write

Copyright © 2006, Nortel

Nortel Confidential

Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	IuxIfRnc
Values	Decimal (0; 1..8191)
Default	0

GROUP IuxIf Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioned attributes for the *IuxIf* component.
Mib	IuxIfRnc

ATTRIBUTE IuxIf commentText

Access	Read and write
Description	This attribute specifies an arbitrary string whose use is left to the discretion of the system administrator. It is not used by the system. For example, this attribute could be used to specify the type of interface (for example, Iub, Iur, or Iucs) or the name of the Node B, remote RNC, or SGSN endpoint which is logically connected to this Iu interface.
Mib	IuxIfRnc
Values	String (0..60, ASCII)
Default	""

ATTRIBUTE IuxIf loadBalancingMethod (lb)

Access	Read and write
Criticality	Component
Description	This attribute specifies the load balancing scheme to be used by the system when distributing the paths of this *IuxIf* component across the protocol converter type '*Lp Ap Rnc*' device. The value ***spread*** means the

Copyright © 2006, Nortel Nortel Confidential

paths of this *IuxIf* component are assigned to the protocol converter in a round-robin fashion. The value ***weighted*** means the paths of this *IuxIf* component are assigned to the protocol converter based on the expected traffic load of this *IuxIf*. The suggested value for SGSN and remote RNC is ***spread***. The suggested value for Node B is ***weighted***.

Mib	IuxIfRnc
Values	spread weighted
Default	weighted

ATTRIBUTE IuxIf weight

Access	Read and write
Criticality	Component
Description	This attribute specifies the expected traffic load from the far-end equipment attached to this UTRAN interface relative to other interfaces. It is used by the system for load balancing when using the ***weighted*** method. A larger value represents a larger traffic load.
Mib	IuxIfRnc
Values	Decimal (0..1000)
Default	500

GROUP IuxIf OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	IuxIfRnc

ATTRIBUTE IuxIf adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command

Copyright © 2006, Nortel Nortel Confidential

	was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	luxIfRnc
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE luxIf operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	luxIfRnc
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE luxIf usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

COMPONENT IuxIf Path

Instance	Decimal (1..65535)
Groups	GROUP IuxIf Path Provisioned (Prov) GROUP IuxIf Path OsiState (State) GROUP IuxIf Path Operational (Oper)
Scope	Application
Description	*IuxIf/n Path/n* This component represents an ATM AAL2 path within this UTRAN interface. Each path is associated with an ATM PVC endpoint.
Mib	IuxIfRnc
Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP IuxIf Path Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioned attributes for the *Path* component.
Mib	IuxIfRnc

ATTRIBUTE IuxIf Path atmConnection

Access	Read and write
Criticality	Component
Description	This attribute specifies the ATM nailed up endpoint that this path will use. For example, *AtmIf/n Vcc/vpi.vci Nep.*
Mib	IuxIfRnc
Values	Link (Hardware, applicationName)
Default	No default

ATTRIBUTE IuxIf Path qos

Access	Read and write
Criticality	Component
Description	This attribute specifies the QoS (Quality of Service) for this path.

Copyright © 2006, Nortel Nortel Confidential

Mib	luxIfRnc
Values	Decimal (0..3)
Default	0

ATTRIBUTE luxIf Path pathOwner

Access	Read and write
Criticality	Component
Description	This attribute is used to select the owner of the path according to Q.2630.1. On a path between two RNC nodes, this attribute is used to select the order of CID allocation to reduce the probability of collisions. The RNC node which is configured as the owner of this path allocates CIDs from 8 upwards. The RNC node which is not configured as the owner of this path allocates CIDs from 255 downwards. To reduce the probability of CID collision, the RNCs at each end of an Iur interface should have this attribute set to different values. This attribute is only meaningful to the Iur interface. It is not used by other Iu interfaces.
Mib	luxIfRnc
Values	yes no
Default	yes

GROUP luxIf Path OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	luxIfRnc

ATTRIBUTE luxIf Path adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. Copyright © 2006, Nortel Nortel Confidential

down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib	IuxIfRnc
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE IuxIf Path operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	IuxIfRnc
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE IuxIf Path usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	IuxIfRnc
Values	idle active (activ) busy
Default	idle

Copyright © 2006, Nortel Nortel Confidential

GROUP IuxIf Path Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *Path* component.
Mib	IuxIfRnc

ATTRIBUTE IuxIf Path remoteBlockingStatus

Access	Read only
Description	This attribute indicates if this path is remotely blocked or not within this UTRAN interface. The path is remotely blocked if it is locked by the remote node.
Mib	IuxIfRnc
Values	blocked unblocked
Default	No default

ATTRIBUTE IuxIf Path localBlockingStatus

Access	Read only
Description	This attribute indicates whether this path is locally blocked or not within this UTRAN interface. The path is locally blocked if it is locked by the local node.
Mib	IuxIfRnc
Values	blocked unblocked
Default	No default

COMPONENT IuxIf SignallingBearer (Sig)

Instance	Decimal (0..6)
Scope	Application
Description	*IuxIf/n Sig/n* This component represents the C-Plane part of the UTRAN interface. An instance of it can be the SAAL-UNI connection used for the Iub.
Mib	IuxIfRnc
Opt. Subcomp.	COMPONENT IuxIf Sig SaalUni
Common Verbs	Help List Display Add DELete

Copyright © 2006, Nortel Nortel Confidential

COMPONENT IuxIf Sig SaalUni

Groups	GROUP IuxIf Sig SaalUni OsiState (State)
Scope	Application
Description	*IuxIf/n Sig/m SaalUni* This component represents an Signalling ATM Adaptation Layer User-Netowrk Interface for a particular Signalling Bearer within this UTRAN interface.
Mib	IuxIfRnc
Opt. Subcomp.	COMPONENT IuxIf Sig SaalUni NailedupAccessPoint (Nap)
Common Verbs	Help List Display Add DELete

GROUP IuxIf Sig SaalUni OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	IuxIfRnc

ATTRIBUTE IuxIf Sig SaalUni adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Copyright © 2006, Nortel Nortel Confidential

Mib	luxIfRnc
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE luxIf Sig SaalUni operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	luxIfRnc
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE luxIf Sig SaalUni usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	luxIfRnc
Values	idle active (activ) busy
Default	idle

COMPONENT luxIf Sig SaalUni NailedupAccessPoint (Nap)

Groups	GROUP luxIf Sig SaalUni Nap Provisioned (Prov)
Scope	Application

COMPONENT Layer2TunnelingProtocolAccessConcentrator (Lac)

Instance	Decimal (1..15)
Groups	GROUP Lac Provisioned (Prov) GROUP Lac Operational (Oper) GROUP Lac CustomerIdentifierData (CidData)
Scope	Application
Description	*Layer2TunnelingProtocolAccessConcentrator/n* This component represents the Layer 2 Tunneling Protocol (L2TP) functionality on a Logical Processor. This component behaves as an L2TP Access Concentrator (LAC). An instance of this component is provisioned for each Logical Processor that is to have L2TP functionality.
Mib	WirelessL2tp
Subcomponents	COMPONENT Lac L2tpNetworkServer (Lns)
Common Verbs	Help List Display Add DELete

GROUP Lac Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes of the *Lac* component.
Mib	WirelessL2tp

ATTRIBUTE Lac linkToUdpPort (lToPort)

Access	Read: All Write: All

Copyright © 2006, Nortel

Nortel Confidential

Description	This attribute specifies a link to the *GprsIpServer IpAddress Udp Port* component. The IP address specified becomes the source IP address and the UDP port specified becomes the source port for communication with the external LNS. Changing this value causes the *Lac* to reset its communication links with the *GprsIpServer*. Transactions being processed may be affected.
Mib	WirelessL2tp
Values	Link (Service, linkToApplication)
Default	No default

ATTRIBUTE Lac linkToLogicalProcessor (lp)

Access	Read: All Write: All
Description	This attribute specifies the link to a Logical Processor that this *Lac* is to use.
Mib	WirelessL2tp
Values	Link (Hardware, linkToApplications)
Default	No default

ATTRIBUTE Lac hostName (host)

Access	Read: All Write: All
Description	This attribute specifies the host name the *Lac* component uses in communication with the external LNS. The host name will be sent in the Host Name Attribute Value Pair (AVP) and may be used by the external LNS for tunnel authentication. It is recommended that all host names be distinct.
Mib	WirelessL2tp
Values	String (0..80, ASCII)
Default	""

GROUP Lac Operational (Oper)

Properties	Operational
Description	This group contains operational attributes of the LAC.
Mib	WirelessL2tp

ATTRIBUTE Lac vendorName (vName)

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute identifies the vendor name of the L2TP protocol stack. This information is communicated to the external LNS in the Vendor Name Attribute Value Pair (AVP).
Mib	WirelessL2tp
Values	String (0..255, ASCII)
Default	No default

ATTRIBUTE Lac firmwareRev (firmRev)

Access	Read: All Write: Illegal
Description	This attribute identifies defines the firmware or software revision for the L2TP protocol stack. This information is communicated to the external LNS in the Firmware Revision Attribute Value Pair (AVP).
Mib	WirelessL2tp
Values	Decimal (0..2147483646)
Default	No default

ATTRIBUTE Lac protocolVersion (protoVers)

Access	Read: All Write: Illegal
Description	This attribute indicates the supported L2TP protocol version and revision numbers. Supported versions are identified in the form of version.revision.
Mib	WirelessL2tp
List of	String (3..7, ASCII)
List Size	10
Default	No default

GROUP Lac CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	WirelessL2tp

ATTRIBUTE Lac customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the

Copyright © 2006, Nortel Nortel Confidential

component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Mib WirelessL2tp

Values Decimal (0; 1..8191)

Default 0

COMPONENT Lac L2tpNetworkServer (Lns)

Groups
GROUP Lac Lns Provisioned (Prov)
GROUP Lac Lns TunnelProv (Tunnel)
GROUP Lac Lns Operational (Oper)
GROUP Lac Lns TunnelStatistics (TunStats)

Scope Application

Description *Lac/n L2tpNetworkServer/n*

This component represents the external L2TP Network Server (LNS) that communicates with the *Lac* component.

Mib WirelessL2tp

Common Verbs
Help
List
Display

GROUP Lac Lns Provisioned (Prov)

Properties Provisioned

Description This group contains miscellaneous provisionable attributes of the *Lac Lns* component.

Mib WirelessL2tp

ATTRIBUTE Lac Lns ipAddress (ipAddr)

Access
Read: All
Write: All

Description This attribute specifies the IP address of the external LNS. The value must not be set to 0.0.0.0.

Copyright © 2006, Nortel Nortel Confidential

Mib	WirelessL2tp
Values	IP address
Default	No default

ATTRIBUTE Lac Lns udpPort (udpPort)

Access	Read: All Write: All
Description	This attribute specifies the UDP port on the external LNS used by this *Lac*. This must match the UDP port provisioned on that LNS.
Mib	WirelessL2tp
Values	Decimal (0..65535)
Default	1701

ATTRIBUTE Lac Lns useLengthField (useLen)

Access	Read: All Write: All
Description	This attribute specifies if the *Lac* should use a length field in L2TP data messages. The value of ***yes*** should be used when compatibility is needed with LNSs that may require the length field to be utilized. Proper operation of L2TP over UDP/IP does not require the length field to be used in data messages.
Mib	WirelessL2tp
Values	yes no
Default	no

ATTRIBUTE Lac Lns useHiddenAvps (hidAvps)

Access	Read: All Write: All
Description	This attribute specifies if the *Lac* should use hidden Attribute Value Pairs (AVPs) in the control messages sent to the LNS. The value of ***no*** is used if the LNS does not support hidden AVPs for all control messages. The value of ***yes*** is permitted if *secret* is not empty.
Mib	WirelessL2tp
Values	yes no
Default	no

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lac Lns snoopAccm (snoop)

Access	Read: All Write: All
Description	This attribute specifies if the *Lac* should snoop for Asynchronous Control Character Map (ACCM) Link Control Protocol (LCP) packets in the Point-to-Point Protocol (PPP) data stream. Setting this to ***yes*** will allow the L2TP stack to immediately detect any negotiated ACCM changes. This will prevent needlessly dropped PPP packets in the event the LNS's Set Link Info (SLI) message is delayed in transit relative to the time the ACCM negotiation takes effect. Additionally, this option allows operability with LNSs that do not support the L2TP SLI message.
Mib	WirelessL2tp
Values	yes no
Default	yes

GROUP Lac Lns TunnelProv (Tunnel)

Properties	Provisioned
Description	This group contains provisionable attributes describing the configuration requirements for both incoming and outgoing tunnel connection attempts.
Mib	WirelessL2tp

ATTRIBUTE Lac Lns hostName (host)

Access	Read: All Write: All
Description	This attribute specifies the host name of the external LNS. This is the host name expected to be sent by the external LNS in the Host Name Attribute Value Pair (AVP) and may be used to authenticate the LNS.
Mib	WirelessL2tp
Values	String (0..80, ASCII)
Default	""

ATTRIBUTE Lac Lns authentication (auth)

Access	Read: All Write: All
Description	This attribute specifies how the *Lac* authenticates the LNS. The value ***none*** indicates that no authentication is performed. The value ***simple*** indicates that peers are authenticated simply by their host name as described in the Host Name AVP. The value ***challenge*** indicates that all peers are challenged to prove their identification. This mechanism is described in the L2TP protocol specification.

Copyright © 2006, Nortel Nortel Confidential

Mib	WirelessL2tp
Values	none simple challenge
Default	none

ATTRIBUTE Lac Lns secret

Access	Read: Illegal Write: All
Description	This attribute specifies the shared secret used during the tunnel authentication phase of tunnel establishment. This must match the shared secret provisioned on the LNS.
Mib	WirelessL2tp
Values	String (0..255, ASCII)
Default	""

ATTRIBUTE Lac Lns helloInterval (hello)

Access	Read: All Write: All
Description	This attribute specifies the interval in which Hello (or keep-alive) packets are sent by the *Lac* to the external LNS.
Mib	WirelessL2tp
Values	Decimal (0..3600)
Units	seconds
Default	60

ATTRIBUTE Lac Lns idleTimeout (idleTo)

Access	Read: All Write: All
Description	This attribute specifies the period of time that an established tunnel between the *Lac* and the external LNS with no active sessions waits before disconnecting the tunnel. A value of zero indicates that the tunnel disconnects immediately after the last session disconnects. A value of -1 leaves the tunnel up indefinitely.
Mib	WirelessL2tp
Values	Signed (-1..86400)
Units	seconds
Default	-1

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lac Lns controlRWS (ctlRWS)

Access	Read: All Write: All
Description	This attribute specifies the control channel receive window size for tunnels between the *Lac* and the external LNS. It specifies the maximum number of packets the external LNS can send without waiting for an acknowledgement from the *Lac*.
Mib	WirelessL2tp
Values	Decimal (1..24)
Default	4

ATTRIBUTE Lac Lns maxRetrans (maxReTx)

Access	Read: All Write: All
Description	This attribute specifies the maximum number of retransmissions which the *Lac* attempts for tunnels to the external LNS before assuming that the LNS is no longer responding.
Mib	WirelessL2tp
Values	Decimal (4..32)
Default	5

ATTRIBUTE Lac Lns maxRetransTimeout (maxReTxTo)

Access	Read: All Write: All
Description	This attribute specifies the maximum retransmission timeout interval which the *Lac* waits before retransmitting a control packet that has not been acknowledged by the external LNS.
Mib	WirelessL2tp
Values	Decimal (1..32)
Units	seconds
Default	16

ATTRIBUTE Lac Lns payloadSequencing (payldSeq)

Access	Read: All Write: All
Description	This attribute specifies whether session payload packets are requested to be sent with sequence numbers from the external LNS. The value ***never*** indicates that the *Lac* never initiates sequencing but does sequencing if asked by the external LNS. The value ***always*** indicates that the *Lac* sends

Copyright © 2006, Nortel Nortel Confidential

	the Sequencing Required Attribute Value Pair (AVP) during session establishment.
Mib	WirelessL2tp
Values	never always
Default	always

ATTRIBUTE Lac Lns reassemblyTimeout (reasTo)

Access	Read: All Write: All
Description	This attribute specifies the time the *Lac* waits before processing payload packets that were received out of sequence. A low value increases the chance of delayed packets to be discarded (which may cause the PPP decompression engine to reset) while a high value may cause more queueing and possibly degrade throughput if packets are truly lost. The default value is zero which will result in all delayed packets being lost.
Mib	WirelessL2tp
Values	Decimal (0..2147483646)
Units	msec
Default	0

GROUP Lac Lns Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes of the *Lac Lns* component.
Mib	WirelessL2tp

ATTRIBUTE Lac Lns lastErrors (lastErrs)

Access	Read: All Write: Illegal
Description	This attribute gives textual descriptions of the last five tunnel errors. Each description is displayed with a result code, an error code, and and may include a message describing the reason or error.
Mib	WirelessL2tp
Vector of	String (0..255, ASCII)
Index	Decimal (1..5)
Default	No default

GROUP Lac Lns TunnelStatistics (TunStats)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains attributes that are used to describe the current status and statistics of tunnels.
Mib	WirelessL2tp

ATTRIBUTE Lac Lns totalTunnels (totTun)

Access	Read: All Write: Illegal
Description	This attribute counts the tunnels between the *Lac* and the external LNS that have successfully reached the established state. The counter wraps to zero when it exceeds the maximum value.
Mib	WirelessL2tp
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lac Lns failedTunnels (failTun)

Access	Read: All Write: Illegal
Description	This attribute counts the tunnels between the *Lac* and the external LNS that failed to reach the established state. This count includes the failed tunnel authentication attempts as counted by *failedAuthentication.* The counter wraps to zero when it exceeds the maximum value.
Mib	WirelessL2tp
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lac Lns failedAuthentication (failAuth)

Access	Read: All Write: Illegal
Description	This attribute counts the failed tunnel connection attempts detected locally by the *Lac* and those reported as failed by the external Lns. The counter wraps to zero when it exceeds the maximum value.
Mib	WirelessL2tp
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lac Lns activeTunnels (actTun)

Access	Read: All Write: Illegal
Description	This attribute indicates the tunnels that are currently active between the *Lac* and the external LNS.

Copyright © 2006, Nortel Nortel Confidential

Mib	WirelessL2tp
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lac Lns totalSessions (totSes)

Access	Read: All Write: Illegal
Description	This attribute counts the sessions that have successfully reached the established state on the tunnels between the *Lac* and the external LNS. The counter wraps to zero when it exceeds the maximum value.
Mib	WirelessL2tp
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lac Lns failedSessions (failSes)

Access	Read: All Write: Illegal
Description	This attribute counts the sessions that failed to reach the established state on the tunnels between the *Lac* and the external LNS. The counter wraps to zero when it exceeds the maximum value.
Mib	WirelessL2tp
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lac Lns activeSessions (actSes)

Access	Read: All Write: Illegal
Description	This attribute indicates the sessions that are currently active on the tunnels between the *Lac* and the external LNS.
Mib	WirelessL2tp
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lac Lns controlRecvOctets (ctlRecvOct)

Access	Read: All Write: Illegal
Description	This attribute counts the control channel octets received by the *Lac* from the external LNS. The counter wraps to zero when it exceeds the maximum value.

Copyright © 2006, Nortel Nortel Confidential

Mib	WirelessL2tp
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lac Lns controlRecvPackets (ctlRecvPkt)

Access	Read: All Write: Illegal
Description	This attribute counts the control channel packets received by the *Lac* from the external LNS. The counter wraps to zero when it exceeds the maximum value.
Mib	WirelessL2tp
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lac Lns controlSendOctets (ctlSndOct)

Access	Read: All Write: Illegal
Description	This attribute counts the contol channel octets that were transmitted by the *Lac* to the external LNS. The counter wraps to zero when it exceeds the maximum value.
Mib	WirelessL2tp
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lac Lns controlSendPackets (ctlSndPkt)

Access	Read: All Write: Illegal
Description	This attribute counts the control packets that were transmitted by the *Lac* to the external LNS. The counter wraps to zero when it exceeds the maximum value.
Mib	WirelessL2tp
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lac Lns payloadRecvOctets (payRecvOct)

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the payload channel octets that were received by the *Lac* from the external LNS. The counter wraps to zero when it exceeds the maximum value.
Mib	WirelessL2tp
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lac Lns payloadRecvPackets (payRecvPkt)

Access	Read: All Write: Illegal
Description	This attribute counts the payload channel packets that were received by the *Lac* from the external LNS. The counter wraps to zero when it exceeds the maximum value.
Mib	WirelessL2tp
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lac Lns payloadRecvDiscards (payRecvDisc)

Access	Read: All Write: Illegal
Description	This attribute counts the received payload packets that were discarded by the *Lac*. The primary reason for payload packet discards is flow control ocurring due to the difference in the data rates between the slower mobile connection and the faster network connection. Other possible reasons for discards are that payload packets are too big, are badly formed, or are out of sequence. The counter wraps to zero when it exceeds the maximum value.
Mib	WirelessL2tp
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lac Lns payloadSendOctets (paySndOct)

Access	Read: All Write: Illegal
Description	This attribute counts the payload channel octets that were transmitted by the *Lac* to the external LNS. The counter wraps to zero when it exceeds the maximum value.
Mib	WirelessL2tp
Values	Decimal (0..4294967295)

VERB PROTECTIONLOCKOUT (PROTLOCK) Laps

Impact	Service
Description	*ProtectionLockout Laps/n* This command has different behaviors based on the protocol type which is provisioned. A) The *protocol* attribute is set to ***standard***: This command instructs the *Laps* component to lock out the protection line from being used as the receive active line. If the protection line is active when the *ProtectionLockout* command is entered, the working line is made active even if there is a failure or degradation present on the working line. This command is ignored when the following conditions exist: 1) The *mode* attribute value is set to ***unidirectional*** and a *nearEndRequest* attribute already has a value of ***lockoutOfProtection***. 2) The *mode* attribute value is set to ***bidirectional*** and a *nearEndRequest* attribute or *farEndRequest* attribute already has a value of ***lockoutOfProtection***. B) The *protocol* attribute is set to ***g841AnnexB***: This command instructs the *Laps* component to freeze the selector in its current position such that the receive active line cannot be changed. All requests are ignored while this command is in effect. This command is treated as a local request and is not signaled to the far end. C) The *protocol* attribute is set to ***yProtection***: This command is not applicable when the protocol attribute is set to ***yProtection***. For applicable protocol types, the command remains in effect until it is cancelled with the *Clear* command. This command can only be issued when the *Laps* component is unlocked.

Copyright © 2006, Nortel Nortel Confidential

VERB SWITCH Laps

Impact	Service
Description	*Switch [-force] [-workingToProtection] [-protectionToWorking] Laps/n* This command instructs the *Laps* component to switch the *nearEndRxActiveLine* attribute from the working line to the protection line (or vice versa). While this occurring the *nearEndRequest* attribute value is ***manualSwitch***. If the *-force* option is specified, the *Laps* component is instructed to switch. The *nearEndRequest* attribute value is ***forcedSwitch.*** The *-force* option must always be used when the *Laps protocol* attribute is set to ***g841AnnexB***. The *switch* command, with various options described above, can only be issued if the *Laps* component is unlocked. It remains in effect until it is cancelled either with the *'clear laps/n"* command, or until a higher value for the *nearEndRequest* attribute (or *farEndRequest* attribute if the provisioned *mode* attribute value is set to ***bidirectional***) goes into effect. If the *-workingToProtection* option is specified, the *Laps* component switches the *nearEndRxActiveLine* attribute from the working line to the protection line. If the *-protectionToWorking* option is specified, the *Laps* component switches the *nearEndRxActiveLine* attribute from the protection line to the working line. This command is ignored when the following conditions exist: 1) An equal or higher priority value for the *nearEndRequest* attribute is already in effect 2) An equal or higher priority value for the *farEndRequest* attribute is already in effect if the provisioned *mode* attribute value is set to ***bidirectional***. For the list of request priorities refer to the description for the *Laps nearEndRequest* attribute. This command is not applicable when the protocol attribute is set to ***yProtection***. This command can only be issued when the *Laps* component is unlocked.

Copyright © 2006, Nortel Nortel Confidential

VERB CLEAR Laps

Impact	Service
Description	*Clear Laps/n* This command clears the *nearEndRequest* attribute if the value is ***lockoutOfProtection***, ***forcedSwitch***, or ***manualSwitch***. This command is not applicable when the protocol attribute is set to ***yProtection***. This command can only be issued when the *Laps* component is unlocked.

GROUP Laps CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	Laps

ATTRIBUTE Laps customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	Laps
Values	Decimal (0; 1..8191)
Default	0

GROUP Laps Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioned attributes for the *Laps* component.
Mib	Laps

ATTRIBUTE Laps workingLine (working)

Access	Read and write
Criticality	Process
Description	This attribute is a link to the *Sonet* or *Sdh* component that provides the *Laps* component's working line (working line one in ITU-T G.841 Annex B terms). This attribute must be set. The *workingLine* attribute and *protectionLine* attribute pairs must be valid. LAPS (Line Automatic Protection Switching) protection can be configured between paired ports on the card or between corresponding ports on adjacent cards. The following semantic checks exist for the *workingLine* and *protectionLine* attributes: The *workingLine* and *protectionLine* attributes can link ports on two different LPs (Logical Processor): - the port number must match (that is, port zero on *Lp*/m must link to port 0 on *Lp*/n, and so forth). - the *Sonet* or *Sdh* components specified by the link must not have a *Sts* or *Vc4* component. - each *Lp* must link to exactly one card (that is, the *spareCard* attribute is not allowed to be set on either *Lp).* - each *Lp* must link to the same type of card (that is, the *shelf card/n cardType* attribute must be identical for both cards). - the two cards must be in adjacent slots in the shelf, with the lower-numbered slot being an even number. - each *Lp* must link to the same *LogicalProcessorType* component. - if the two lines of the protection pair are on different *Lps*, then the *connectionPoolCapacity* attribute value of the *Lp Eng Arc Ov* components for the two adjacent *Lps* must be the same. The *workingLine* and *protectionLine* attributes can link to a pair of ports under the same LP (Logical Processor) for the following cards: - for ***4pOC3SmIrAtm*** and ***4pOC3MmAtm*** cards, the port number pair must be 0-1 or 2-3. - for the ***1pOC12SmLrAtm*** card, the port number pair must be between the two ports 0-1.
Mib	Laps
Values	Link (Hardware, lineAutomaticProtectionSwitch)
Default	No default

ATTRIBUTE Laps protectionLine (protection)

Access	Read and write
Criticality	Process

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute is a link to the *Sonet* or *Sdh* component that provides the *Laps*' component protection line (working line two in ITU-T G.841 Annex B terms). This attribute must be set. The same rules apply as described in the *workingLine* attribute.
Mib	Laps
Values	Link (Hardware, lineAutomaticProtectionSwitch)
Default	No default

ATTRIBUTE Laps mode

Access	Read and write
Description	This attribute specifies the protection mode to use. If set to value of ***unidirectional***, the *Laps* component of the near end (NE) can decide independently of the far end (FE) which channel, either working or protection, is active for receive. For this value, the transmit and receive may be on different channels. Therefore, one end may receive from the protection line while the other end receives from the active line. If set to ***bidirectional*** value, it instructs the *Laps* component of the NE to decide jointly with the FE which channel, either working or protection, is to be active for receiving. For this value, the transmit and receive are on the same channel. Therefore both ends receive from the same line. If set to ***notApplicable*** value, it instructs the *Laps* component not to use this attribute when no k-byte information is exchanged. The ***notApplicable*** value must be used when the ***yProtection*** protocol is set. Note that if either end of the *Laps* component is set to ***unidirectional***, the *Laps* component operates in ***unidirectional*** mode. In other words, ***bidirectional*** mode takes effect if and only if both ends of the *Laps* components are in ***bidirectional*** mode.
Mib	Laps
Values	notApplicable unidirectional bidirectional
Default	unidirectional

ATTRIBUTE Laps revertive

Access	Read and write
Description	This attribute specifies whether revertive switching is to be used. When this attribute value is set to ***no***, the *Laps* component will not revert the receive active line from protection back to working when a working line

Copyright © 2006, Nortel Nortel Confidential

request is cleared.

When this attribute value is set to ***yes***, the *Laps* component will revert the receive active line from protection back to working when a working line request is cleared and after the provisioned value of *waitToRestorePeriod* attribute has expired.

When this attribute is set to ***notApplicable***, it instructs the *Laps* component not to use this attribute for the specified protocol. The ***notApplicable*** value must be used when the ***yProtection*** protocol is set because the concept of line switchover does not exist.

Note that it is acceptable for the near end and far end to be provisioned with a mix of revertive and nonrevertive switching; one end can be revertive and the other nonrevertive.

Mib	Laps
Values	no yes notApplicable
Default	no

ATTRIBUTE Laps holdOffTime (hoTime)

Access	Read and write
Description	This attribute specifies the delay between the detection of a signal failure or signal degradation on the active line and the initiation of a line switchover. When this attribute is set to ***infinite***, it instructs the *Laps* component to never switch automatically. The ***infinite*** value must be used when the ***yProtection*** protocol is set.
Mib	Laps
Values	Decimal (0.0..10.0) infinite
Units	seconds
Default	0.0

ATTRIBUTE Laps waitToRestorePeriod (wtrPeriod)

Access	Read and write
Description	This attribute has a different meaning based on the protocol type provisioned. A) The *protocol* attribute is set to ***standard***: This attribute specifies the time (in minutes) during which the protection

Copyright © 2006, Nortel Nortel Confidential

line remains the receive active line after the working line recovers from the fault that caused the switch. This attribute is only applicable when the *revertive* attribute value is set to ***yes***.

B) The *protocol* attribute is set to ***g841AnnexB***:

This attribute specifies the time (in minutes) after which a Signal Fail or Signal Degrade condition has cleared, but before which the line with the condition is considered in service. Once this time reaches zero, traffic continues to be received from the current receive active line by swapping the primary and secondary section labels. No line switch takes place.

C) The *protocol* attribute is set to ***yProtection***:

When this attribute is set to ***infinite***, it instructs the *Laps* component to wait an infinite time.

Mib	Laps
Values	Decimal (5..12) infinite
Units	minutes
Default	5

ATTRIBUTE Laps signalDegradeRatio (sdRatio)

Access	Read and write
Description	This attribute specifies the minimum bit error ratio (BER) for which a signal degradation failure is declared. Its value is the exponent of the BER, which corresponds to a BER range of 10e-5 through 10e-9. The switch initiation time for a signal degradation varies depending on the observed BER (***not*** the provisioned *signalDegradeRatio*), as described in the following table. **BER - Switch Initiation Time (OC-3)** 10e-5 - 1 second 10e-6 - 10 seconds 10e-7 - 100 seconds 10e-8 - 16 minutes 40 seconds 10e-9 - 2 hours 46 minutes 40 seconds The clearing threshold for a signal degradation is one-tenth the value of the *signalDegradeRatio* attribute. For example, if the provisioned *signalDegradeRatio* attribute is ***-5***, the corresponding clearing threshold is 10e-6. The clearing time varies depending on the clearing threshold (***not*** the observed BER), and can be determined from the above table. When this attribute is set to ***notApplicable***, it instructs the *Laps*

Copyright © 2006, Nortel Nortel Confidential

component not to degrade *Laps* when BER is observed. The ***notApplicable*** value must be used when the ***yProtection*** protocol is set.

Mib	Laps
Values	Signed (-9..-5) notApplicable
Default	-5

ATTRIBUTE Laps mimicAps

Access	Read and write
Criticality	Process
Description	This attribute specifies whether the Mimic APS protocol should be enabled. Mimic APS is a Nortel Networks proprietary protocol to allow for an Automatic Protection Switching variant to be used between Nortel Networks Multiservice Switch 15000 FPs and other hardware that supports the Mimic APS protocol. It currently only supports the following four-port OC3 multi-mode and single-mode FPs: ***4pOC3SmlrAtm*** and ***4pOC3MmAtm***. When the *mimicAps* attribute is set to ***enabled***, the Mimic APS protocol is used. The Mimic APS protocol supports only unidirectional non-revertive modes of APS and as such the *mode* and *revertive* attributes must be set to ***unidirectional*** and ***no*** respectively. When this attribute is set to ***notApplicable***, it instructs the *Laps* component not to use this attribute for the specified protocol. The ***notApplicable*** value must be used when the ***yProtection*** protocol is set.
Mib	Laps
Values	disabled enabled notApplicable
Default	disabled

ATTRIBUTE Laps protocol

Access	Read and write
Criticality	Process
Description	This attribute specifies the protocol used to protect the physical interfaces. The value ***standard*** indicates that 1+1 linear APS is used, as described in the standards document GR-253 published by Telcordia and G.841 published by the ITU-T.

Copyright © 2006, Nortel Nortel Confidential

The value ***g841AnnexB*** indicates that optimized 1+1 bidirectional switching is used, as described in the standard G.841 Annex B published by the ITU-T. This value is only supported on the ***16pOC3SmIrAtm***, ***16pOC3PosAtm*** and ***4pMrPosAtm*** card type.

The *mode* attribute must be set to ***bidirectional***, the *revertive* attribute set to ***no***, and the *holdOffTime* attribute set to ***0*** when the *protocol* attribute is set to ***g841AnnexB***.

The value ***yProtection*** indicates that *Laps* component is used only for equipment protection and hitless software migration. This value is only supported on the ***16pOC3PosAtm*** card type.

The *mode* attribute must be set to ***notApplicable***, the *revertive* attribute set to ***notApplicable***, the *mimicAps* attribute set to ***notApplicable***, the *holdOffTime* attribute set to ***infinite,*** the *waitToRestorePeriod* attribute set to ***infinite***, the *signalDegradeRatio* attribute set to ***notApplicable***, and the *primarySectionMismatchTime* attribute set to ***infinite*** when the *protocol* attribute is set to ***yProtection***.

Mib: Laps

Values:
standard
g841AnnexB
yProtection

Default: standard

ATTRIBUTE Laps primarySectionMismatchTime

Access: Read and write

Description: This attribute specifies the time to wait after a primary section mismatch defect is detected/cleared, before raising/clearing an alarm.

A primary section mismatch occurs when the received and transmitted channels in the K2 byte do not match.

When this attribute is set to ***infinite***, it instructs the *Laps* component not to raise an alarm when the K2 byte do not match. The ***infinite*** value must be used when the ***yProtection*** protocol is set.

This attribute only applies when the *protocol* attribute is set to ***g841AnnexB***.

Mib: Laps

Values:
Decimal (50..1000)
infinite

Units: msec

Default: 50

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Laps sendLineAisDuringMigration

Access	Read and write
Description	This attribute specifies whether *Sonet*/*Sdh* ports linked to a *Laps* component in an inter-card configuration will send the Line Alarm Indication Signal (AIS-L) during the migration active stage of a Hitless Software Migration or Hitless Software Patching. The migration active stage for a card begins when the card is first loaded on the migration active shelf and ends when the migration active shelf becomes the active shelf. *Sonet*/*Sdh* ports are not in service during the migration active stage of a software migration. Sending AIS-L during software migration is used to inform the far end equipment that the *Sonet*/*Sdh* port is not available. If this attribute is set to ***no***, the other end might try to use the *Sonet*/*Sdh* port that goes through a software migration. The recommended value for this attribute is ***yes*** when the far end equipment is another Nortel Networks Multiservice Switch. If this attribute is set to ***yes***, AIS-L is sent during software migration and this may cause an extended traffic outage when the *Sonet*/*Sdh* ports are connected to an equipment that delays clearing of Signal Degrade (SD) and Signal Fail (SF) conditions. Such delays are sometimes implemented to reduce the number of rapid protection switching oscillations. This attribute does not affect the behavior of *Sonet*/*Sdh* ports linked to a *Laps* component in an intra-card configuration or *Sonet*/*Sdh* ports that are not linked to a *Laps* component.
Mib	Laps
Values	no yes
Default	no

GROUP Laps OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Laps

ATTRIBUTE Laps adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	Laps
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Laps operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Laps
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Laps usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	Laps
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Laps availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions,

Copyright © 2006, Nortel Nortel Confidential

the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	Laps
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Laps proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib: Laps

Set of:
initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default: No default

ATTRIBUTE Laps controlStatus (osiCntrl)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib: Laps

ATTRIBUTE Laps alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	Laps
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Laps standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

Copyright © 2006, Nortel Nortel Confidential

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib: Laps

ATTRIBUTE Laps nearEndRequest (neReq)

Access	Read only
Description	This attribute indicates the request currently being ***transmitted*** to the far end in the SONET/SDH line overhead K1 byte of the protection line. Requests are prioritized so that high priority requests preempt or block those with a lower priority. The possible requests, in order of priority from highest to lowest, are as follows. ***lockoutOfProtection*** — the working line is prevented from switching to the protection line under any circumstance due to a '*ProtectionLockout Laps/n'* command being in effect. ***forcedSwitch*** — the line indicated by the attribute *nearEndRequestChannel* has a '*Switch -force laps/n'* command in effect against it. Note that a ***signalFail*** value on the protection line has higher priority than a ***forcedSwitch*** value. ***signalFail*** — the line indicated by the attribute *nearEndRequestChannel* is experiencing a signal failure (SF). Failures include LOS, LOF, received AIS-L, a signal BER exceeding 10e-3, or a locked *Sonet/Sdh* component. Note that a ***signalFail*** value on the protection line has higher priority than a ***forceSwitch*** value. ***signalDegrade*** — the line indicated by the attribute *nearEndRequestChannel* is experiencing a signal degradation (SD). ***manualSwitch*** — the line indicated by the attribute *nearEndRequestChannel* has a *Switch* command in effect against it. ***waitToRestore*** — the protection line is active, the *revertive* attribute value is ***yes***, and the working line has recovered from a signal failure (SF) or signal degradation (SD). After the period defined by the attribute *waitToRestorePeriod,* the working line automatically reverts to being the receive active line and the *nearEndRequest* attribute value changes to ***noRequest***. ***reverseRequest*** — the line indicated by the attribute *nearEndRequestChannel* is active due to a request from the far end. This request is only applicable when the provisioned *mode* attribute value is ***bidirectional***. ***doNotRevert*** — the protection line is active, provisioned attribute *revertive* is set to ***no***, and either: (1) the working line has recovered from a *signalFail* or ***signalDegrade***; or (2) a ***forcedSwitch*** or ***manualSwitch*** request has been cleared. The receive active line does not automatically

Copyright © 2006, Nortel Nortel Confidential

revert to the working line.

noRequest — the working line is active and no other requests are in effect.

This attribute does not apply, and is filtered out, when the *protocol* attribute is set to ***yProtection***.

ATTRIBUTE Laps nearEndRequestChannel (neReqChan)

Access — Read only

Description — This attribute indicates to which channel the *nearEndRequest* applies. The protection channel refers to working channel two in ITU-T G.841 Annex B terms.

This attribute does not apply, and is filtered out, when the *protocol* attribute is set to ***yProtection***.

Mib — Laps

Values
protection
working

Default — No default

ATTRIBUTE Laps farEndRequest (feReq)

Access — Read only

Description — This attribute indicates the request currently being ***received*** from the far end in the SONET/SDH line overhead K1 byte of the protection line. Requests are prioritized so that high priority requests preempt or block those with a lower priority. The possible requests, in order of priority from highest to lowest, are as follows.

lockoutOfProtection — indicates the working line is prevented from switching to the protection line under any circumstances due to a *ProtectionLockout* command being in effect in the far end.

forcedSwitch — the line indicated by the attribute *farEndRequestChannel*

Copyright © 2006, Nortel Nortel Confidential

has a "*Switch -force*" command in effect against it. Note that a ***signalFail*** value on the protection line has higher priority than a ***forcedSwitch*** value.

signalFail — the line indicated by the attribute *farEndRequestChannel* is experiencing a signal failure (SF). Failures include LOS, LOF, received AIS-L, a signal BER exceeding 10e-3, or a locked *Sonet* component. Note that a ***signalFail*** value on the protection line has higher priority than a ***forceSwitch*** value.

signalDegrade — the line indicated by the attribute *farEndRequestChannel* is experiencing a signal degradation (SD).

manualSwitch — the line indicated by the attribute *farEndRequestChannel* has a *Switch* command in effect against it.

waitToRestore — the FE protection line is active, the FE *revertive* attribute value is ***yes***, and the FE working line has recovered from a signal failure (SF) or signal degradation (SD). After the period defined by the attribute *waitToRestorePeriod,* the FE working line automatically reverts to being the receive active line and the *farEndRequest* attribute value changes to ***noRequest***.

exercise — exercise the protocol for a protection switch of the specified channel, unless a request of equal or higher priority is in effect, by issuing an ***exercise*** request for that channel and checking the response on the APS channel.

reverseRequest — the line indicated by the attribute *farEndRequestChannel* is active due to a request from the far end. This request is only applicable when the provisioned *mode* attribute is set to ***bidirectional***.

doNotRevert — the FE protection line is active, the FE provisioned attribute *revertive* is ***no***, and either: (1) the FE working line has recovered from a *signalFail* or *signalDegrade*; or (2) a *forcedSwitch* or *manualSwitch* request has been cleared in the FE. The receive active line in the will not automatically revert to the working line in the far end.

noRequest — the FE working line is active and no other requests are in effect.

This attribute does not apply, and is filtered out, when the *protocol* attribute is set to ***yProtection***.

ATTRIBUTE Laps timeUntilRestore

Access	Read only
Description	This attribute has a different meaning based on the protocol type provisioned: A) The *protocol* attribute is set to ***standard***: This attribute indicates the amount of time until the receive active line is automatically switched back from the protection line to the working line. It is only applicable for a *Laps* component that is provisioned to be revertive, currently has the protection line as the receive active line, and has a *nearEndRequest* attribute value of ***waitToRestore***. B) The *protocol* attribute is set to ***g841AnnexB***: This attribute indicates the amount of time until the line which previously had a Signal Fail or Signal Degrade condition is considered back in service. Once this time reaches zero, traffic continues to be received from the current receive active line by swapping the primary and secondary section labels. No line switch takes place. C) The *protocol* attribute is set to ***yProtection***: This attribute does not apply and is filtered out.
Mib	Laps
Values	Decimal (0..12)
Units	minutes
Default	No default

ATTRIBUTE Laps protocolFailureAlarm (pfAlarm)

Access	Read only
Description	This attribute indicates whether the *Laps* component is experiencing an APS protocol failure alarm. Protocol failure alarms include the protection switching byte mismatch alarm (code 7011 5270) and the channel mismatch failure alarm (code 7011 5271). This attribute does not apply to G.841 Annex B APS. It is filtered out when the *protocol* attribute is set to ***g841AnnexB***. It is also filtered out when the *protocol* attribute is set to ***yProtection***.
Mib	Laps
Values	on off
Default	No default

ATTRIBUTE Laps modeMismatchAlarm (mmAlarm)

Access	Read only
Description	This attribute indicates whether the *Laps* component is experiencing a LAPS mode mismatch alarm (code 7011 5272). This alarm indicates either: (1) that the far end is operating with a 1:n switching architecture, as opposed to 1+1; or (2) that the value of the *mode* attribute on the far end is different from the value of the mode attribute on the near end. When a mode mismatch occurs: (1) if the far end is operating with a 1:n switching architecture it will operate as 1+1; and (2) if either end has a provisioned *mode* attribute value of ***unidirectional*** then both ends will operate unidirectionally. This attribute does not apply to G.841 Annex B APS. It is filtered out when the *protocol* attribute is set to ***g841AnnexB***. It is also filtered out when the *protocol* attribute is set to ***yProtection***.
Mib	Laps
Values	on off
Default	No default

ATTRIBUTE Laps primarySectionMismatchAlarm (psmAlarm)

Access	Read only
Description	This attribute indicates whether the *Laps* component is experiencing a primary section mismatch alarm (code 7011 5276). This alarm indicates the primary section indicated in the received K2 byte of the SDH line overhead has not matched the primary section transmitted in the K2 byte for 50 milliseconds. This attribute does not apply, and will be filtered out, when the *protocol* attribute is set to ***standard*** or ***yProtection***.
Mib	Laps
Values	on off

GROUP Laps Sts CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	Laps

ATTRIBUTE Laps Sts customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	Laps
Values	Decimal (0; 1..8191)
Default	0

GROUP Laps Sts OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Laps

ATTRIBUTE Laps Sts adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Laps
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Laps Sts operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or

Copyright © 2006, Nortel Nortel Confidential

with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	Laps
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Laps Sts usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Laps
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Laps Sts availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

Copyright © 2006, Nortel Nortel Confidential

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

ATTRIBUTE Laps Sts procedureIStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Default	No default

ATTRIBUTE Laps Sts controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib	Laps
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE Laps Sts alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Default	No default

ATTRIBUTE Laps Sts standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.
Mib	Laps

ATTRIBUTE Laps Sts snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	Laps
Values	up down testing
Default	up

GROUP Laps Sts Operational (Oper)

Properties	Operational
Description	This group contains the common operational data for the component.
Mib	Laps

ATTRIBUTE Laps Sts lopAlarm (lop)

Access	Read only
Description	This attribute displays whether a Loss Of Pointer (LOP) alarm state has been entered. An LOP alarm state is entered when LOP defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. An LOP defect occurs when no valid SPE or VC pointer was received in 8 contiguous frames. If the LOP defects are intermittently occurring, the LOP defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The component goes into an operational state of *disabled* until the LOP alarm condition is cleared. The condition is cleared when no more invalid pointer has been reported for 10 seconds +/- 0.5 seconds. The *lopAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.
Mib	Laps
Values	on off
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Laps Sts rxAisAlarm (ais)

Access — Read only

Description

This attribute displays whether a Path Alarm Indication Signal (P-AIS) alarm state has been entered. A P-AIS alarm state is entered when P-AIS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-AIS defect is the occurrence of the P-AIS signal in three contiguous valid STS or STM frames (all one's in bytes H1 and H2). If the P-AIS defects are intermittently occurring, the P-AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the P-AIS alarm condition is cleared. The condition is cleared after no P-AIS defect has been detected for 10 seconds +/- 0.5 seconds.
The *rxAisAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values — on
off

Default — No default

ATTRIBUTE Laps Sts rxRfiAlarm (rfi)

Access — Read only

Description

This attribute displays whether the Path Remote Failure Indication (P-RFI) alarm state has been entered. A P-RFI alarm state is entered when Path Remote Defect Indicator (P-RDI) defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-RDI defect is the occurrence of the P-RDI signal in five contiguous valid STS or STM frames (bit 5 of the G1 byte set to 1). If the P-RDI defects are intermittently occurring, the P-RDI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10)with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the P-RFI alarm condition is cleared. The condition is cleared after no P-RDI defect has been detected for 10 seconds +/- 0.5 seconds.
The *rxRfiAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

ATTRIBUTE Laps Sts signalLabelMismatch (slm)

Access	Read only
Description	This attribute displays whether the Path Payload Label Mismatch (P-PLM) or Path Unequipped (P-UNEQ) failure conditions have been entered. A P-PLM failure condition is entered when P-PLM defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. A P-PLM defect occurs when detecting an unexpected path signal label. If the P-PLM defects are intermittently occurring, the P-PLM defect accumulator is decremented at a rate of 1/10 of the incrementing rate, with all measurements based on a 200 ms polling cycle. The component goes into an operational state of *disabled* until the Path Payload Label Mismatch failure condition is cleared. The condition is cleared when an expected path signal label is received for 10 seconds +/- 0.5 seconds. A P-UNEQ failure condition is entered when P-UNEQ defects have been observed and accumulated for a period of 2.5 seconds =/-0.5 seconds. A P-UNEQ defect occurs when detecting an unequipped path signal label. If the P-UNEQ defects are intermittently occurring, the P-UNEQ defect accumulator is decremented at a rate of 1/10 of the incrementing rate, with all measurements based on a 200 ms polling cycle. The component goes into an operational state of *disabled* until the Path Unequipped failure condition is cleared. The condition is cleared when the P-UNEQ defect is absent for 10 seconds +/- 0.5 seconds. The *signalLabelMismatch* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Access	Read only
Description	This attribute counts the Far-End Path Errored Seconds (FEPESs) that have been declared. A FEPES is declared for each one second interval containing one or more FEPCVs or one or more path RDI (P-RDI) defects. Counting of FEPES is inhibited when FEPUAS is declared over the monitored second. The counter wraps to 0 when it exceeds its maximum value.

Access	Read only

Description

This attribute counts the Far-End Path AIS and LOP Seconds (FEPALSs). A FEPALS is declared for each one second interval containing one or more P-RDI defects. Counting of FEPALS is inhibited when FEPUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Mib	Laps
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Laps Sts farEndPathUnavailSec (fepuas)

Access	Read only

Description

This attribute counts the one second intervals for which the STS/STM far-end path is unavailable. The far-end path becomes unavailable at the onset of 10 consecutive FEPSESs. The 10 FEPSESs are included in the unavailable time. Once unavailable, the far-end path becomes available at the onset of 10 contiguous seconds with no FEPSES. The 10 seconds with no FEPSES are excluded from the unavailable time. For one-second intervals where a Far-End Path Unavailable Second (FEPUAS) is declared, counting of FEPCV, FEPES, FEPSES and FEPALS is inhibited.

The counter wraps to 0 when it exceeds its maximum value.

GROUP Laps Sts Provisioned (ChProv)

Properties	Provisioned
Description	This group contains the provisioning data for *Sts* components provisioned under *Sonet* components that support channelization..
Mib	Laps

ATTRIBUTE Laps Sts txPathTrace

Access	Read and write
Description	This attribute specifies the high order path identifier. The string must be constructed with 7-bit characters only. The path identifier is padded by null characters if necessary to form a 64-octet path trace message transmitted in byte J1 of 64 outgoing SONET frames. At the remote end, the path trace is reassembled, and the message is compared to the *expectedRxPathTrace* attribute. If a mismatch is detected, an alarm is issued. The functionality supported by this attribute is not available.
Mib	Laps
Values	String (0..64, ASCII)
Default	""

ATTRIBUTE Laps Sts expectedRxPathTrace

Access	Read and write
Description	This attribute specifies the expected path trace identifier which is used to identify the high order path. This attribute must match the corresponding *txPathTrace* provisioned at the transmitting equipment end. If it does not, an alarm is issued. The functionality supported by this attribute is not available.
Mib	Laps
Values	String (0..64, ASCII)
Default	""

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Laps Sts concatNumber

Access	Read and write
Criticality	Process
Description	This attribute specifies the STS concatenation level for the *Sts* component on channelized cards. It must be set to a concatenation level supported by the FP upon which the *Sts* is defined, except for non-channelized cards, in which case it must be set to 0. For example, a value of 1 in this attribute would represent STS-1 concatenation, while a value of 3 would represent STS-3c, a value of 12 would represent STS-12c, and so forth. *Sts* channelization to the tributary level is supported only if this attribute is set to 1.

GROUP Laps Sts Cell Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning attributes for the *AtmCell* component.
Mib	Laps

ATTRIBUTE Laps Sts Cell alarmActDelay (act)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.
Mib	Laps
Values	Decimal (0..2000)
Units	msec
Default	No default

ATTRIBUTE Laps Sts Cell scrambleCellPayload (scramble)

Access	Read and write
Description	Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled. It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces. Note that this setting must be the same at both ends of the link.
Mib	Laps
Values	off on
Default	No default

ATTRIBUTE Laps Sts Cell correctSingleBitHeaderErrors

Access	Read and write
Description	This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded. Single bit HEC error correction must remain ***off*** for the following card

ATTRIBUTE Laps Sts Cell clearDelay (clear)

Access Read and write

Description

This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib Laps

Values Decimal (0..60)

Units minutes

Default 0

ATTRIBUTE Laps Sts Cell hecSampleInterval (hSample)

Access Read and write

Description

This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Default	0

ATTRIBUTE Laps Sts Cell **hecErrorLimit (hLimit)**

Access	Read and write
Description	This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.) This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	Laps
Values	Decimal (1..250000)
Default	No default

ATTRIBUTE Laps Sts Cell **lcdStateDelay (delay)**

Access	Read and write
Description	This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	Laps
Values	Decimal (1..50)
Units	msec
Default	No default

ATTRIBUTE Laps Sts Cell **hecErrorIntervalLimit (hIntLimit)**

Access	Read and write
Description	This attribute counts the instances of the *hecSamplingInterval* attribute for

Copyright © 2006, Nortel Nortel Confidential

all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

GROUP Laps Sts Cell **Operational (Oper)**

Properties	Operational
Description	This group contains the common operational attributes for the *AtmCell* component.
Mib	Laps

ATTRIBUTE Laps Sts Cell **lcdAlarm (lcd)**

Access	Read only
Description	This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute. In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected. For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect. If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.

Copyright © 2006, Nortel Nortel Confidential

The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

Copyright © 2006, Nortel Nortel Confidential

Mib	Laps

ATTRIBUTE Laps Sts Vt1dot5 **customerIdentifier (cid)**

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	Laps

Default	idle

ATTRIBUTE Laps Sts Vt1dot5 **availabilityStatus (osiAvail)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which

Copyright © 2006, Nortel Nortel Confidential

	represents a rolled up view of a set of other components. The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***. The value ***logFull*** is not used. The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib: Laps

ATTRIBUTE Laps Sts Vt1dot5 DS1 lineType (lineType)

Access: Read and write

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute defines the framing of the DS1 tributary.
d4 defines a framing pattern of 12 frames per multiframe.
esf defines a framing pattern of 24 frames per multiframe.
d4Cas defines a framing pattern of 12 frames per multiframe with channel associated signalling.
esfCas defines a framing pattern of 24 frames per multiframe with channel associated signalling.
unframed defines an unknown framing pattern for clear channels.

For the ***4pDS3ChAtm*** card, only ***d4*** and ***esf*** framing patterns are permitted.

The ***4pDS3ChAal1*** card supports the ***d4*** and ***esf*** framing patterns, as well as ***unframed***.

d4
esf
d4Cas
esfCas
unframed

Default: esf

ATTRIBUTE Laps Sts Vt1dot5 DS1 **zeroCoding (zeroCoding)**

Access: Read and write

Criticality: Component

Description

This attribute defines the zero encoding on the DS1 tributary.
bit7Stuffing sets bit 7 of every timeslot to a one to guarantee ones's density. This reduces the available bandwidth of the channel by 1/8.
none does no zero encoding, it does not change any value of the bits in the timeslot. The value ***none*** is compatible with any zero coding scheme which transports all 8 data bits in a timeslot (this would include both ***ami*** and ***b8zs*** values of the *DS1 zeroCoding* attribute).

Mib: Laps

Values:
bit7Stuffing
none

Default: none

ATTRIBUTE Laps Sts Vt1dot5 DS1 **clockingSource (clockingSource)**

Access: Read and write

Description

This attribute specifies the source of the transmit clock for the DS1 tributary.

Copyright © 2006, Nortel Nortel Confidential

When the clocking source is ***local***, the crystal on the port generates the clocking for the DS1 tributary.
When the clocking source is ***line***, the port synchronizes to the clock from the DS1 tributary.
When the clocking source is ***module***, the port's clock synchronizes to the clock provided by the oscillator on the active CP.
When the clocking source is ***sameAsDs3***, the Ds1 port's clock synchronizes to the same clock source as that of its parent Ds3 port.

On a ***1pDS3C*** card, if the *NetworkSynchronization (NS)* component is present, the default value of this attribute will be ***module***; otherwise it will be ***line***.

On a ***2pDS3cAal*** card, the only valid values are ***local*** and ***module***. If the *NS* component is present, the default value of this attribute will be ***module***; otherwise it will be ***local***.

On the ***4pDS3Ch***, ***4pDS3ChAtm***, and ***4pDS3ChAal1*** cards, the only valid value is ***sameAsDs3***. This is because a DS1 must have the same clocking source as its parent DS3.

Default	No default

GROUP Laps Sts Vt1dot5 DS1 **CustomerIdentifierData (CidData)**

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	Laps

ATTRIBUTE Laps Sts Vt1dot5 DS1 **customerIdentifier (cid)**

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

Copyright © 2006, Nortel Nortel Confidential

An operator CID of 0 is used to identify the Network Manager (referred to as “NetMan” in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers.

GROUP Laps Sts Vt1dot5 DS1 OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib Laps

ATTRIBUTE Laps Sts Vt1dot5 DS1 adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Default unlocked

ATTRIBUTE Laps Sts Vt1dot5 DS1 operationalState (osiOper)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Laps
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Laps Sts Vt1dot5 DS1 **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Laps
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Laps Sts Vt1dot5 DS1 **availabilityStatus (osiAvail)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

Copyright © 2006, Nortel Nortel Confidential

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Properties	Operational
Description	This group contains the common operational data for a component in a digital hierarchy interface.
Mib	Laps

ATTRIBUTE Laps Sts Vt1dot5 DS1 **rxAisAlarm (rxAisAlarm)**

Access	Read only
Description	This attribute indicates whether an AIS (Alarm Indication Signal) alarm state has been entered. The AIS Alarm state is entered when AIS defects have been observed and accumulated for 2.5 seconds +/- 0.5 seconds. An AIS defect is detected after having received less than 3 zeros in a 2048 bit period. If the AIS defects are intermittently occurring, the AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. This tributary goes into an *operationalState* of ***disabled*** for the duration of an AIS alarm state. The AIS alarm state is cleared when AIS defects are absent for 10 seconds +/- 0.5 seconds.
Mib	Laps

Values	on off
Default	off

ATTRIBUTE Laps Sts Vt1dot5 DS1 **lofAlarm (lofAlarm)**

Access	Read only
Description	This attribute indicates whether a LOF (Loss of Frame) alarm state has been entered. The LOF alarm state is entered when LOF defects (2 out of 5 framing bits in error) have been detected for 3 seconds +/- 0.5 seconds. If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. This tributary goes into an *operationalState* of ***disabled*** until the LOF alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the duration of the LOF alarm state The condition is cleared when framing has been achieved for 10 seconds +/- 0.5 seconds.
Mib	Laps
Values	on off
Default	off

ATTRIBUTE Laps Sts Vt1dot5 DS1 **rxRaiAlarm (rxRaiAlarm)**

Access	Read only
Description	This attribute indicates whether an RAI (Remote Alarm Indication) alarm state has been entered. An RAI alarm state is entered when the RAI defect indicator has been observed and accumulated for 3.5 seconds +/- 0.5 seconds. If the RAI defects are intermittently occurring, the RAI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The RAI alarm state is cleared when the RAI defect indicator has been absent for 10 seconds +/- 0.5 seconds. The RAI alarm is usually an indication that the far end facility is unable to gain synchronization.

GROUP Laps Sts Vt1dot5 DS1 Chan Provisioned (Prov)

Properties: Provisioned

Description:
This group contains all of the provisional data for a *Channel* component.

Mib: Laps

ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan timeslots (ts)

Access: Read and write

Criticality: Component

Description:
This attribute contains the list of timeslots that are used by the *Channel* component. Valid numbers are 1-24 for a *Channel* used by a *DS1* component, and 1-31 for a *Channel* used by an *E1* component.

For the ***4pDS3Ch*** card, a timeslot value of ***none*** cannot be combined with other valid timeslot values. When ***none*** is selected, no timeslots are assigned and any service linked to the *Channel* does not function.

Copyright © 2006, Nortel
Nortel Confidential

Mib	Laps
Set of	none 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31
Default	No default

ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan **timeslotDataRate (dataRate)**

Access	Read and write
Criticality	Component
Description	This attribute selects the data rate of the timeslots in a channel of a DS1 component. For E1, the data rate of the timeslots will always be 64kbit/s regardless of this attribute. When ***doNotOverride*** is selected for a channel on a DS1, the data rate of the channel's timeslots are dependant on the *zeroCoding* selection of the DS1 component. If the *zeroCoding* is ***B8ZS*** (where supported on the FP) or ***none***, the timeslot's data rate will be 64kbit/s. If the *zeroCoding* option is ***bit7Stuffing,*** the data rate of a timeslot will be 56kbit/s.

Copyright © 2006, Nortel Nortel Confidential

When ***56k*** is selected for a channel on a DS1, the least significant bit of each timeslot of this *Channel* will always be set to 1 and not used for data. The data rate for the timeslots of this channel is therefore restricted to 56kbit/s.

On the ***4pDS3Ch*** cards, the *zeroCoding* attribute is restricted to the value *none*, and so when the *timeslotDataRate* is set to ***doNotOverride***, the timeslot's data rate will be 64kbit/s. Timeslot data rate of ***56k*** is also available on this card.

On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***doNotOverride***.

One application of this attribute is to allow a DS1 line to support mixing channels that originate from lines that use different *zeroCoding* schemes.

Mib — Laps

GROUP Laps Sts Vt1dot5 DS1 Chan **CustomerIdentifierData (CidData)**

Properties — Provisioned

Description — This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

Mib — Laps

ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan **customerIdentifier (cid)**

Access — Read and write

Description — This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Copyright © 2006, Nortel Nortel Confidential

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Values	idle active (activ) busy
Default	idle

ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan **availabilityStatus (osiAvail)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components. The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test **frmSize (size)**

Access	Read and write
Description	This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.
Mib	Laps
Values	Decimal (4..4096)
Units	bytes
Default	1024

ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test **frmPatternType (fpt)**

Access	Read and write
Description	This attribute defines the type of data pattern generation to use. The following lists the available pattern types: ***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit. ***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit. ***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.
Mib	Laps
Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test **customizedPattern (cp)**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	Laps
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test **dataStartDelay (dsd)**

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	Laps
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test **displayInterval (di)**

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	Laps
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test **duration**

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In

Copyright © 2006, Nortel Nortel Confidential

the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.

Mib	Laps
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP **Laps Sts Vt1dot5 DS1 Chan Test** **Results (Results)**

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	Laps

ATTRIBUTE **Laps Sts Vt1dot5 DS1 Chan Test** **causeOfTermination**

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback. a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback. a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

Copyright © 2006, Nortel Nortel Confidential

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test **erroredFrmRx**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	Laps
Values	Long Integer
Default	No default

ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Test **bitErrorRate**

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.

Mib	Laps

ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Cell **alarmActDelay (act)**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.

Mib: Laps

Values: Decimal (0..2000)

Units: msec

Default: No default

ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Cell **scrambleCellPayload (scramble)**

Access: Read and write

Description

Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled.
It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.
Note that this setting must be the same at both ends of the link.

Mib: Laps

Values: off
on

Default: No default

ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Cell **correctSingleBitHeaderErrors**

Access: Read and write

Description

This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.

Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.

Mib: Laps

Values	off on
Default	off

ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Cell **clearDelay (clear)**

Access	Read and write
Description	This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	Laps
Values	Decimal (0..60)
Units	minutes
Default	0

ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Cell **hecSampleInterval (hSample)**

Access	Read and write
Description	This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	Laps
Values	Decimal (0..25)
Units	seconds
Default	0

ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Cell **hecErrorLimit (hLimit)**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.)
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib: Laps

Values: Decimal (1..250000)

Default: No default

ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Cell **lcdStateDelay (delay)**

Access: Read and write

Description

This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib: Laps

Values: Decimal (1..50)

Units: msec

Default: No default

ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Cell **hecErrorIntervalLimit (hIntLimit)**

Access: Read and write

Description

This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row

Copyright © 2006, Nortel Nortel Confidential

is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

GROUP Laps Sts Vt1dot5 DS1 Chan Cell **Operational (Oper)**

Properties Operational

Description

This group contains the common operational attributes for the *AtmCell* component.

Mib Laps

ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Cell **lcdAlarm (lcd)**

Access Read only

Description

This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.
In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.
For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Tc **signalTwo (sigTwo)**

Access	Read and write
Description	This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted after the duration provisioned in *signalOneDuration* has expired and when a *lineType* that uses CAS has been defined. For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively.
Mib	Laps
Vector of	Decimal (0..1)
Index	D C B A
Default	(1, 1, 1, 1)

GROUP Laps Sts Vt1dot5 DS1 Chan Tc **Operational (Op)**

Properties	Operational
Description	This group contains all specific operational data for a *Tc* component.
Mib	Laps

ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Tc **ingressConditioning (inCon)**

Access	Read only
Description	This attribute indicates the status of locally generated trunk conditioning towards the ATM network. When trunk conditioning is being locally generated towards the ATM network, *ingressConditioning* is set to ***on.*** When trunk conditioning is not being locally generated towards the ATM network, *ingressConditioning* is set to ***off***.

Copyright © 2006, Nortel Nortel Confidential

Trunk conditioning is transmitted towards the ATM network under the following conditions:
lossOfSignal (LOS)
lossOfFrame (LOF)
remoteAlarmIndication (RAI)
alarmIndicationSignal (AIS)
bufferUnderflow (BU)
and in addition for E1:
lossOfMultiframe (LOMF)
receiveMultiframeRemoteAlarmIndication (RMRAI)

Mib	Laps
Values	off on
Default	off

ATTRIBUTE Laps Sts Vt1dot5 DS1 Chan Tc **egressConditioning (egCon)**

Access	Read only
Description	This attribute indicates the status of locally generated trunk conditioning towards the PDH line. When trunk conditioning is being locally generated towards the PDH line, *egressConditioning* is set to ***on.*** When trunk conditioning is not being locally generated towards the PDH line, *egressConditioning* is set to ***off***. Trunk conditioning is transmitted towards the PDH line under the following conditions: bufferUnderflow (BU) AAL1 protocol errors.
Mib	Laps
Values	off on
Default	off

VERB START **Laps Sts Vt1dot5 DS1 Test**

Impact Service

Description

This command invokes a test on the hardware component.
Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

VERB STOP **Laps Sts Vt1dot5 DS1 Test**

Impact Service

Description

This command stops a test running on the hardware component.

GROUP **Laps Sts Vt1dot5 DS1 Test** **OsiState (State)**

Properties Operational

Description This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib Laps

ATTRIBUTE **Laps Sts Vt1dot5 DS1 Test** **adminState (osiAdmin)**

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

Copyright © 2006, Nortel Nortel Confidential

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — Laps

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Laps Sts Vt1dot5 DS1 Test operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — Laps

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Laps Sts Vt1dot5 DS1 Test usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — Laps

Values — idle
active (activ)
busy

Default — idle

ATTRIBUTE Laps Sts Vt1dot5 DS1 Test **frmSize (size)**

Access	Read and write
Description	This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.
Mib	Laps
Values	Decimal (4..4096)
Units	bytes
Default	1024

ATTRIBUTE Laps Sts Vt1dot5 DS1 Test **frmPatternType (fpt)**

Access	Read and write
Description	This attribute defines the type of data pattern generation to use. The following lists the available pattern types: ***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit. ***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit. ***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.
Mib	Laps
Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

ATTRIBUTE Laps Sts Vt1dot5 DS1 Test **customizedPattern (cp)**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.

Mib — Laps

Values — Hex (H.0..H.ffffffff)

Units — Hex

Default — H.55555555

ATTRIBUTE Laps Sts Vt1dot5 DS1 Test **dataStartDelay (dsd)**

Access — Read and write

Description

This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.

Mib — Laps

Values — Decimal (0..1814400)

Units — seconds

Default — 0

ATTRIBUTE Laps Sts Vt1dot5 DS1 Test **displayInterval (di)**

Access — Read and write

Description

This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.

Mib — Laps

Values — Decimal (0..30240)

Units — minutes

Default — 5

ATTRIBUTE Laps Sts Vt1dot5 DS1 Test **duration**

Access — Read and write

Description

This attribute is the duration for which the test data will be transmitted. In

Copyright © 2006, Nortel Nortel Confidential

the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.

Mib	Laps
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP **Laps Sts Vt1dot5 DS1 Test** **Results (Results)**

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	Laps

ATTRIBUTE **Laps Sts Vt1dot5 DS1 Test** **causeOfTermination**

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback. a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback. a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

Copyright © 2006, Nortel Nortel Confidential

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

ATTRIBUTE Laps Sts Vt1dot5 DS1 Test **erroredFrmRx**

Access Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	Laps
Values	Long Integer
Default	No default

ATTRIBUTE Laps Sts Vt1dot5 DS1 Test bitErrorRate

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.
Mib	Laps
Values	String (5, ASCII)
Default	No default

ATTRIBUTE Laps Sts Vt1dot5 DS1 Test elapsedTime

Access	Read only

Access	Read and write
Description	This attribute defines which application is running on the path.
Mib	Laps
Values	Link
Default	No default

ATTRIBUTE Laps Vc4 pathTraceLength

Access	Read and write
Description	This attribute specifies the transmitted path trace message length. The *pathTraceLength* attribute at transmitting and receiving end must match.
Mib	Laps
Values	16 64
Default	16

ATTRIBUTE Laps Vc4 txPathTrace

Access	Read and write
Description	This attribute specifies the high order path identifier. The string must be constructed with 7-bit characters only. If *pathTraceLength* is 16, the path identifier is prefixed with a CRC byte and padded by null characters if necessary to form a 16-octet path trace message transmitted in byte J1 of 16 outgoing SDH frames. If *pathTraceLength* is 64, the path identifier is padded by null characters if necessary to form a 64-octet path trace message transmitted in byte J1 of 64 outgoing SDH frames. At the remote end, the path trace is reassembled, the CRC is checked if necessary and the message is compared to the *expectedRxPathTrace* attribute. If a mismatch is detected, an alarm is issued. Usage guidelines for path trace message are found in clause 3 of the ITU G.831 standard which defines the Access Point Identifier format. The functionality supported by this attribute is not available.

Copyright © 2006, Nortel Nortel Confidential

Mib	Laps
Values	String (0..64, Extended ASCII)
Default	""

ATTRIBUTE Laps Vc4 expectedRxPathTrace

Access	Read and write
Description	This attribute specifies the expected path trace identifier which is used to identify the high order path. This attribute must match the corresponding *txPathTrace* provisioned at the transmitting equipment end. If it does not, an alarm is issued. The functionality supported by this attribute is not available.
Mib	Laps
Values	String (0..64, Extended ASCII)
Default	""

ATTRIBUTE Laps Vc4 concatNumber

Access	Read and write
Criticality	Process
Description	This attribute specifies the number of contiguous Administration Unit 4 (AU-4) concatenated together. AU-4s can be concatenated together to form an AU-4-4c or AU-4-16c (4 or 16 concatenated AU-4s) which can transport payloads requiring greater capacity than one Container-4 capacity. Only *Vc4/0* can have *concatNumber* set to 16 and only *Vc4/0*, *Vc4/4*, *Vc4/8* or *Vc4/12* can have *concatNumber* set to 4. When a *Vc4* uses concatenation, the other concatenated *Vc4* instance number cannot be used. For example, if *Vc4/0 concatNumber* is 4, the next provisionable *Vc4* is *Vc4/4*. *Vc4* channelization, indicated by provisioning subcomponents such as *Vc12*, is allowed only if this attribute is set to 1. This value must be set to 0 for card types which do not support the use of this attribute.
Mib	Laps
Values	0 1 4 16
Default	No default

GROUP Laps Vc4 CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	Laps

ATTRIBUTE Laps Vc4 customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	Laps
Values	Decimal (0; 1..8191)
Default	0

GROUP Laps Vc4 OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	Laps
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Laps Vc4 operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Laps
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Laps Vc4 usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use.

Copyright © 2006, Nortel Nortel Confidential

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	Laps
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Laps Vc4 availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

ATTRIBUTE Laps Vc4 alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

ATTRIBUTE Laps Vc4 standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service

Copyright © 2006, Nortel Nortel Confidential

but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

ATTRIBUTE Laps Vc4 lopAlarm (lop)

Access	Read only
Description	This attribute displays whether a Loss Of Pointer (LOP) alarm state has been entered. An LOP alarm state is entered when LOP defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. An LOP defect occurs when no valid SPE or VC pointer was received in 8 contiguous frames. If the LOP defects are intermittently occurring, the LOP defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The component goes into an operational state of *disabled* until the LOP alarm condition is cleared. The condition is cleared when no more invalid pointer has been reported for 10 seconds +/- 0.5 seconds. The *lopAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.
Mib	Laps
Values	on off
Default	No default

ATTRIBUTE Laps Vc4 rxAisAlarm (ais)

Access	Read only
Description	This attribute displays whether a Path Alarm Indication Signal (P-AIS) alarm state has been entered. A P-AIS alarm state is entered when P-AIS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-AIS defect is the occurrence of the P-AIS signal in three contiguous valid STS or STM frames (all one's in bytes H1 and H2). If the P-AIS defects are intermittently occurring, the P-AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The component goes into an operational state of *disabled* until the P-AIS alarm condition is cleared. The condition is cleared after no P-AIS defect has been detected for 10 seconds +/- 0.5 seconds. The *rxAisAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values	on off
Default	No default

ATTRIBUTE Laps Vc4 rxRfiAlarm (rfi)

Access	Read only
Description	This attribute displays whether the Path Remote Failure Indication (P-RFI) alarm state has been entered. A P-RFI alarm state is entered when Path Remote Defect Indicator (P-RDI) defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-RDI defect is the occurrence of the P-RDI signal in five contiguous valid STS or STM frames (bit 5 of the G1 byte set to 1). If the P-RDI defects are intermittently occurring, the P-RDI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10)with all measurements based on a 200 ms polling cycle. The component goes into an operational state of *disabled* until the P-RFI alarm condition is cleared. The condition is cleared after no P-RDI defect has been detected for 10 seconds +/- 0.5 seconds. The *rxRfiAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.
Mib	Laps
Values	on off
Default	No default

ATTRIBUTE Laps Vc4 signalLabelMismatch (slm)

Access	Read only
Description	This attribute displays whether the Path Payload Label Mismatch (P-PLM) or Path Unequipped (P-UNEQ) failure conditions have been entered. A P-PLM failure condition is entered when P-PLM defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. A P-PLM defect occurs when detecting an unexpected path signal label. If the P-PLM defects are intermittently occurring, the P-PLM defect accumulator is decremented at a rate of 1/10 of the incrementing rate, with all measurements based on a 200 ms polling cycle. The component goes into an operational state of *disabled* until the Path Payload Label Mismatch failure condition is cleared. The condition is cleared when an expected path signal label is received for 10 seconds +/- 0.5 seconds. A P-UNEQ failure condition is entered when P-UNEQ defects have been

Copyright © 2006, Nortel Nortel Confidential

observed and accumulated for a period of 2.5 seconds =/-0.5 seconds. A P-UNEQ defect occurs when detecting an unequipped path signal label. If the P-UNEQ defects are intermittently occurring, the P-UNEQ defect accumulator is decremented at a rate of 1/10 of the incrementing rate, with all measurements based on a 200 ms polling cycle.
The component goes into an operational state of *disabled* until the Path Unequipped failure condition is cleared. The condition is cleared when the P-UNEQ defect is absent for 10 seconds +/- 0.5 seconds.

The *signalLabelMismatch* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

GROUP Laps Vc4 Cell Provisioned (Prov)

Properties Provisioned

Description
This group contains the provisioning attributes for the *AtmCell* component.

Mib Laps

ATTRIBUTE Laps Vc4 Cell alarmActDelay (act)

Access Read and write

Description
This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.

Mib Laps

Values Decimal (0..2000)

Units msec

Default No default

ATTRIBUTE Laps Vc4 Cell scrambleCellPayload (scramble)

Access Read and write

Description
Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled.
It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.
Note that this setting must be the same at both ends of the link.

Mib	Laps
Values	off on
Default	No default

ATTRIBUTE Laps Vc4 Cell correctSingleBitHeaderErrors

Access	Read and write
Description	This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded. Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.
Mib	Laps
Values	off on
Default	off

ATTRIBUTE Laps Vc4 Cell clearDelay (clear)

Access	Read and write
Description	This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	Laps
Values	Decimal (0..60)
Units	minutes
Default	0

ATTRIBUTE Laps Vc4 Cell hecSampleInterval (hSample)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib: Laps

Values: Decimal (0..25)

Units: seconds

Default: 0

ATTRIBUTE Laps Vc4 Cell hecErrorLimit (hLimit)

Access: Read and write

Description

This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.)
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib: Laps

Values: Decimal (1..250000)

Default: No default

ATTRIBUTE Laps Vc4 Cell lcdStateDelay (delay)

Access: Read and write

Description

This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The

Copyright © 2006, Nortel Nortel Confidential

valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib	Laps
Values	Decimal (1..50)
Units	msec
Default	No default

ATTRIBUTE Laps Vc4 Cell hecErrorIntervalLimit (hIntLimit)

Access	Read and write

Description

This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib	Laps
Values	Decimal (1..25)
Default	1

GROUP Laps Vc4 Cell Operational (Oper)

Properties	Operational

Description

This group contains the common operational attributes for the *AtmCell* component.

Mib	Laps

ATTRIBUTE Laps Vc4 Cell lcdAlarm (lcd)

Access	Read only

Description

This attribute displays whether the Loss of Cell Delineation (LCD) failure

Copyright © 2006, Nortel Nortel Confidential

alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.
In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.
For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

GROUP Laps Vc4 Vc12 Provisioned (Prov)

Properties: Provisioned

Description:
This group contains all of the provisioning data for the component.

Mib: Laps

ATTRIBUTE Laps Vc4 Vc12 txPathTrace

Access: Read and write

Description:
This attribute specifies the low order path identifier. The string must be constructed with 7-bit characters only. The path identifier is prefixed with a CRC byte and padded by null characters if necessary to form a 16-octet path trace message transmitted in byte J2 of 16 outgoing SDH frames. At the remote end, the path trace is reassembled, the CRC is checked and the message is compared to the *expectedRxPathTrace* attribute. If a mismatch is detected and the *expectedRxPathTrace* attribute is not an empty string (default value), an alarm is issued.

Usage guidelines for path trace message are found in clause 3 of the ITU G.831 standard which defines the Access Point Identifier format.

The functionality supported by this attribute is available on the *4pOC3Ch* functional processor.

Mib: Laps

Values: String (0..15, Extended ASCII)

Default: ""

ATTRIBUTE Laps Vc4 Vc12 expectedRxPathTrace

Access: Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the expected path trace identifier which is used to identify the low order path. This attribute must match the corresponding *txPathTrace* provisioned at the transmitting equipment end. If it does not, an alarm is issued. If an empty string (default value) is provisioned, the Low Order Path Trace Identification Mismatch (LP-TIM) defect is ignored. The functionality supported by this attribute is available on the *4pOC3Ch* functional processor.
Mib	Laps
Values	String (0..15, Extended ASCII)
Default	""

GROUP Laps Vc4 Vc12 CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	Laps

ATTRIBUTE Laps Vc4 Vc12 customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	Laps
Values	Decimal (0; 1..8191)
Default	0

GROUP Laps Vc4 Vc12 OsiState (State)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Laps

ATTRIBUTE Laps Vc4 Vc12 adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Laps
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Laps Vc4 Vc12 operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	Laps
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Laps Vc4 Vc12 usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Laps
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Laps Vc4 Vc12 availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	Laps
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Laps Vc4 Vc12 **proceduralStatus (osiProc)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-

Copyright © 2006, Nortel Nortel Confidential

valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib	Laps
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE Laps Vc4 Vc12 controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

Copyright © 2006, Nortel Nortel Confidential

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

ATTRIBUTE Laps Vc4 Vc12 **alarmStatus (osiAlarm)**

Access — Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

ATTRIBUTE Laps Vc4 Vc12 standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.
Mib	Laps
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Laps Vc4 Vc12 unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	Laps
Values	false true
Default	false

ATTRIBUTE Laps Vc4 Vc12 rxAisAlarm

Access	Read only
Description	This attribute indicates whether a Tributary Unit Alarm Indication Signal (TU-AIS) alarm state has been entered. A TU-AIS alarm state is entered when TU-AIS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The TU-AIS defect occurs when three consecutive TU pointers are in the all 1's state. This alarm is cleared after no TU-AIS defect has been detected for 10 seconds +/- 0.5 seconds.
Mib	Laps
Values	on off
Default	No default

ATTRIBUTE Laps Vc4 Vc12 rxRdiAlarm

Access	Read only
Description	This attribute indicates whether a Low Order Path Remote Defect Indicator (LP-RDI) alarm state has been entered. An LP-RDI alarm state is entered when LP-RDI defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The LP-RDI defect occurs when RDI conditions are detected in five consecutive frames. This alarm is cleared after no LP-RDI defect has been detected for 10 seconds +/- 0.5 seconds.
Mib	Laps
Values	on off
Default	No default

ATTRIBUTE Laps Vc4 Vc12 rxRfiAlarm

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute indicates whether a Low Order Path Remote Failure Indicator (LP-RFI) alarm state has been entered. An LP-RFI alarm state is entered when LP-RFI defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The LP-RFI defect occurs when a RFI condition is detected. This alarm is cleared after no LP-RFI defect has been detected for 10 seconds +/- 0.5 seconds.

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute indicates whether a Low Order Path Unequipped (LP-UNEQ) alarm state has been entered. An LP-UNEQ alarm state is entered when LP-UNEQ defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The LP-UNEQ defect occurs when an unequipped condition is detected for five consecutive multi frames. This alarm is cleared after no LP-UNEQ defect has been detected for 10 seconds +/- 0.5 seconds.

Mib: Laps

Values: on, off

Default: No default

ATTRIBUTE Laps Vc4 Vc12 traceIdMismatchAlarm

Access: Read only

Description

This attribute indicates whether a Low Order Path Trace Identification Mismatch (LP-TIM) alarm state has been entered. An LP-TIM alarm state is entered when LP-TIM defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The LP-TIM defect occurs when a TIM condition is detected. This alarm is cleared after no LP-TIM defect has been detected for 10 seconds +/- 0.5 seconds.

Mib: Laps

Values: on, off

Default: No default

ATTRIBUTE Laps Vc4 Vc12 lopAlarm

Access: Read only

Description

This attribute indicates whether a Tributary Unit Loss of Pointer (TU-LOP) alarm state has been entered. An TU-LOP alarm state is entered when TU-LOP defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The TU-LOP defect occurs when eight consecutive invalid pointer values or eight consecutive New Data Flag (NDF) pointers are detected. This alarm is cleared after no TU-LOP defect has been detected for 10 seconds +/- 0.5 seconds.

Mib: Laps

Scope	Device
Description	*Lp/n E1/n* *Lp/n Sdh/i Vc4/j Vc12/k,l,m E1* The *E1* component controls and monitors an E1 port or tributary on a Function Processor. The number of ports supported depends on the type of card, and is usually encoded in the *Shelf Card/n cardType*, for example 4pE1Aal1: 4 port. The lowest instance value is usually ***0***, except for the ***32pE1Aal*** card when it is ***1***. No instance value is used when the E1 is a STM tributary. Multi-Service cards have an instance range 0..31, except that instance values 30 and 31 are not available for an “ATM UNI port”. (An E1 “ATM UNI port” is an *E1* component with a single *Chan* whose *applicationFramerName* attribute is linked to an *AtmIf* component.)

Copyright © 2006, Nortel Nortel Confidential

The instance number of an *E1* “ATM UNI port” must not be the same as the instance number of an *IMA* group under the same *Lp*.

GROUP Laps Vc4 Vc12 E1 Provisioned (Prov)

Properties Provisioned

Description

This group contains all of the provisioning data for an E1 component.

Mib Laps

ATTRIBUTE Laps Vc4 Vc12 E1 lineType (lineType)

Access Read and write

Description

This attribute specifies the framing of the E1 line.
When ***cas*** (channel associated signalling) is selected, timeslot 16 is reserved for multiframe signalling and only 30 timeslots are available for data. The signalling bits are not interpreted.
When ***ccs*** (common channel signalling) is selected, timeslot 16 is not reserved for multiframe signalling and 31 timeslots are available for data. The signalling bits are not interpreted.
When ***unframed*** is selected, a clear channel is defined whereby data from all timeslots including the framing data (in timeslot 0) and timeslot 16 are passed transparently. This value is valid only for AAL1 cards.

For cell-based cards the ATM Forum specifies that timeslot 16 be reserved, leaving 30 timeslots available for data.
The ***8pE1Atm*** and ***1pStm1ChSmlr*** cards support the ***ccs*** value only. The ***4pOC3ChSmlr*** card only supports the ***ccs*** and ***unframed*** values. For both these cards, the default value is ***ccs***. For all other cards, the default value is ***cas***.

Mib Laps

Values	ccs cas unframed
Default	No default

ATTRIBUTE Laps Vc4 Vc12 E1 **clockingSource (clockingSource)**

Access	Read and write
Description	This attribute defines the source of the transmit clock for the E1 line. When ***local*** is selected, the crystal on the port generates the clocking for the line. When ***line*** is selected, the port synchronizes to the clock from the facility. When ***module*** is selected, the ports clock synchronizes to the clock provided by the oscillator on the active CP. When ***otherPort*** is selected, the port synchronizes to the port with a clocking source of ***line***. When ***srtsMode*** is selected, the port transmit frequency depends on the SRTS (Synchronous Residual Time-Stamp) received over the ATM network. SRTS information is also generated sent over the ATM network. When ***adaptiveMode*** is selected, the port transmit frequency continually adapts to match the egress data received from the ATM network. A port with ***srtsMode*** or ***adaptiveMode*** must have a single *Chan* which may be linked only to an *Aal1Ces*.service with serviceType ***unstructured*** If the *NetworkSynchronization* component is present, the default value of this attribute is ***module***, otherwise it defaults to ***line***, except for the ***3pE1Atm*** card, which it defaults to ***local***. On a ***3pE1Atm*** card all ports must have the same value, and be either ***local*** or ***module***. ***otherPort*** is valid only on AAL1 cards. ***srtsMode*** is valid only on AAL1 and Multi-Service Access cards. ***adaptiveMode*** is valid only on Multi-Service Access cards. On ***4E1Aal1*** cards either: all four ports' *clockingSource* values must be ***local*** OR all four ports' *clockingSource* values must be ***module*** OR one port's *clockingSource* value must be ***line*** and the other three must be ***otherPort***. The ***srtsMode*** clocking source is not supported for this card type.

Values	local line module otherPort srtsMode adaptiveMode
Default	No default

ATTRIBUTE Laps Vc4 Vc12 E1 **crc4Mode**

Access	Read and write
Description	This attribute defines whether the CRC-4 checking and generation on the E1 line is enabled or disabled. The default CRC-4 mode is ***off*** except for the cell-based cards which default to ***on*** as per the ATM Forum.
Mib	Laps
Values	on off
Default	No default

ATTRIBUTE Laps Vc4 Vc12 E1 **sendRaiOnAis**

Access	Read and write
Description	This attribute defines whether the Remote Alarm Indicator (RAI) will be sent when receiving an AIS alarm. The value is ***yes*** by default; it can be changed to ***no*** only for ports on J2MV cards.
Mib	Laps
Values	no yes
Default	yes

ATTRIBUTE Laps Vc4 Vc12 E1 **raiDeclareAlarmTime**

Access	Read and write
Description	This attribute specifies the period of time that a Remote Alarm Indicator (RAI) must be present before declaring an RAI alarm. The value of ***auto*** sets the RAI declare time to the default value for E1 and E1C card types which do not have hardware support for RAI response. On E1C card types with hardware support, if the value of ***auto*** is set, RAI response is done according to the standards. If ***auto*** is set, the value of the *raiClearAlarmTime* attribute is ignored and ***auto*** is used. This attribute is for E1 and E1C card types only. For all other card types, the default value must be used.

ATTRIBUTE Laps Vc4 Vc12 E1 ssmE1SaNumber

Access	Read and write
Description	This attribute specifies which of the five available Sa bits (Sa4 to Sa8) recommended in ITU G.704 is to be used for Synchronization Status Messages (SSM). If set to ***none***, the transmission of SSM is disabled on this port.
Mib	Laps
Values	Decimal (4..8) none
Default	none

GROUP Laps Vc4 Vc12 E1 CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	Laps

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Laps Vc4 Vc12 E1 **customerIdentifier (cid)**

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	Laps
Values	Decimal (0; 1..8191)
Default	0

GROUP Laps Vc4 Vc12 E1 OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	Laps

ATTRIBUTE Laps Vc4 Vc12 E1 snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	Laps
Values	up down testing
Default	up

GROUP Laps Vc4 Vc12 E1 OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Laps

ATTRIBUTE Laps Vc4 Vc12 E1 adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

Copyright © 2006, Nortel Nortel Confidential

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: Laps

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Laps Vc4 Vc12 E1 operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: Laps

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Laps Vc4 Vc12 E1 usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Copyright © 2006, Nortel Nortel Confidential

Mib	Laps
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Laps Vc4 Vc12 E1 **availabilityStatus (osiAvail)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components. The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	Laps
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Laps Vc4 Vc12 E1 **proceduralStatus (osiProc)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Default — No default

ATTRIBUTE Laps Vc4 Vc12 E1 **standbyStatus (osiStby)**

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Properties	Operational
Description	This group contains the common operational data for a component in a digital hierarchy interface.
Mib	Laps

ATTRIBUTE Laps Vc4 Vc12 E1 losAlarm (losAlarm)

Access	Read only
Description	This attribute displays whether a LOS (Loss of Signal) alarm state has been entered. A LOS alarm is declared after LOS defects have been observed and accumulated for a period of 2 seconds +/- 0.5 seconds (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: 2.5 seconds +/- 0.5 seconds). A LOS defect is detected upon observing all zeros for 150 ms (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: upon observing 175 +/- 75 pulse positions with no pulses of either positive or negative polarity). If the LOS defects are intermittently occurring, the LOS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The port goes into an operational state of ***disabled*** until the LOS alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the

Copyright © 2006, Nortel Nortel Confidential

duration of the LOS alarm state.
The LOS alarm state is cleared when LOS defects are absent for 10 seconds +/- 0.5 seconds.

ATTRIBUTE Laps Vc4 Vc12 E1 **multifrmCRC4LofAlarm (multiCRC4LofAlarm)**

Access	Read only
Description	This attribute indicates whether E1 CRC-4 multiframe LOF (loss of frame) alarm state is entered. A CRC-4 multiframe LOF alarm state is entered when a CRC-4 multiframe LOF defect (2 consecutive errors in the multiframe alignment signal) has been detected and accumulated for 2.5 seconds +/- 0.5 seconds. If the CRC-4 multiframe LOF defects are intermittently occurring, the CRC-4 multiframe LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The alarm is cleared when the defect is not detected for 10 seconds +/- 0.5 seconds. The *multifrmCRC4LofAlarm* is not implemented for the ***E1***, ***1pE1V***, ***1pE1Mvp***, ***1pE1Mvpe***, ***4pE1Mvpe***, ***8pE1Atm***, ***E1C*** and ***4pE1Aal1*** cards.

Mib	Laps

ATTRIBUTE **Laps Vc4 Vc12 E1 Chan** **timeslots (ts)**

Access	Read and write
Criticality	Component
Description	This attribute contains the list of timeslots that are used by the *Channel* component. Valid numbers are 1-24 for a *Channel* used by a *DS1* component, and 1-31 for a *Channel* used by an *E1* component. For the ***4pDS3Ch*** card, a timeslot value of ***none*** cannot be combined with other valid timeslot values. When ***none*** is selected, no timeslots are assigned and any service linked to the *Channel* does not function.
Mib	Laps
Set of	none 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Laps Vc4 Vc12 E1 Chan **timeslotDataRate (dataRate)**

Access	Read and write
Criticality	Component
Description	This attribute selects the data rate of the timeslots in a channel of a DS1 component. For E1, the data rate of the timeslots will always be 64kbit/s regardless of this attribute. When ***doNotOverride*** is selected for a channel on a DS1, the data rate of the channel's timeslots are dependant on the *zeroCoding* selection of the DS1 component. If the *zeroCoding* is ***B8ZS*** (where supported on the FP) or ***none***, the timeslot's data rate will be 64kbit/s. If the *zeroCoding* option is ***bit7Stuffing,*** the data rate of a timeslot will be 56kbit/s. When ***56k*** is selected for a channel on a DS1, the least significant bit of each timeslot of this *Channel* will always be set to 1 and not used for data. The data rate for the timeslots of this channel is therefore restricted to 56kbit/s. On the ***4pDS3Ch*** cards, the *zeroCoding* attribute is restricted to the value *none*, and so when the *timeslotDataRate* is set to ***doNotOverride***, the timeslot's data rate will be 64kbit/s. Timeslot data rate of ***56k*** is also available on this card. On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***doNotOverride***. One application of this attribute is to allow a DS1 line to support mixing channels that originate from lines that use different *zeroCoding* schemes.
Mib	Laps
Values	56k doNotOverride
Default	doNotOverride

ATTRIBUTE Laps Vc4 Vc12 E1 Chan **applicationFramerName**

Access	Read and write
Description	This attribute defines the link to the software stack. It defines which application is running on top of this hardware component.
Mib	Laps
Values	Link (Service, interfaceName)
Default	No default

GROUP Laps Vc4 Vc12 E1 Chan **CustomerIdentifierData (CidData)**

Copyright © 2006, Nortel Nortel Confidential

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	Laps

ATTRIBUTE Laps Vc4 Vc12 E1 Chan customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	Laps
Values	Decimal (0; 1..8191)
Default	0

Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	Laps

ATTRIBUTE Laps Vc4 Vc12 E1 Chan **snmpOperStatus**

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	Laps
Values	up down testing
Default	up

GROUP Laps Vc4 Vc12 E1 Chan **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Laps

ATTRIBUTE Laps Vc4 Vc12 E1 Chan **adminState (osiAdmin)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Laps
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Laps Vc4 Vc12 E1 Chan **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Laps
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Laps Vc4 Vc12 E1 Chan **usageState (osiUsage)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Laps
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Laps Vc4 Vc12 E1 Chan **availabilityStatus (osiAvail)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	Laps
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE **Laps Vc4 Vc12 E1 Chan** **proceduralStatus (osiProc)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal

Copyright © 2006, Nortel Nortel Confidential

functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Default	No default

ATTRIBUTE Laps Vc4 Vc12 E1 Chan **alarmStatus (osiAlarm)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Default	No default

ATTRIBUTE Laps Vc4 Vc12 E1 Chan **standbyStatus (osiStby)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test type (type)

Access Read and write

Description

This attribute is the type of test to be run. The available test types include the following:
card test sets up an internal loop on the board and runs a bit error rate test.
manual test assumes the line is looped back externally and a bit error rate test is performed.
localLoop test loops back the local modem and performs a bit error rate test.
remoteLoop test loops back the remote modem (or CSU) and performs a bit error rate test.
externalLoop test loops back the line to the far end.
payloadLoop test only loops back the payload data received from the incoming line.
remoteLoopThisTrib loops this particular tributary back at the far end, using services provided by the parent.
v54RemoteLoop initiates a V.54 Remote Loopback test.
pn127RemoteLoop initiates a PN127 Remote Loopback test.

Default	ccitt32kBitPattern

ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test **customizedPattern (cp)**

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	Laps
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test **dataStartDelay (dsd)**

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	Laps
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test **displayInterval (di)**

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.

Copyright © 2006, Nortel Nortel Confidential

Mib	Laps
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test **duration**

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	Laps
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Laps Vc4 Vc12 E1 Chan Test **Results (Results)**

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	Laps

ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test **causeOfTermination**

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure

Copyright © 2006, Nortel Nortel Confidential

indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	Laps
Values	Long Integer
Default	No default

ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test **erroredFrmRx**

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	Laps
Values	Long Integer
Default	No default

ATTRIBUTE Laps Vc4 Vc12 E1 Chan Test **bitErrorRate**

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.

Properties Provisioned

Description
This group contains the provisioning attributes for the *AtmCell* component.

Mib Laps

ATTRIBUTE Laps Vc4 Vc12 E1 Chan Cell alarmActDelay (act)

Access Read and write

Description
This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.

Mib Laps

Values Decimal (0..2000)

Units msec

Default No default

ATTRIBUTE Laps Vc4 Vc12 E1 Chan Cell scrambleCellPayload (scramble)

Access Read and write

Description
Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled.
It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.
Note that this setting must be the same at both ends of the link.

Mib	Laps
Values	off on
Default	No default

ATTRIBUTE Laps Vc4 Vc12 E1 Chan Cell **correctSingleBitHeaderErrors**

Access	Read and write
Description	This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded. Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.
Mib	Laps
Values	off on
Default	off

ATTRIBUTE Laps Vc4 Vc12 E1 Chan Cell **clearDelay (clear)**

Access	Read and write
Description	This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	Laps
Values	Decimal (0..60)
Units	minutes
Default	0

ATTRIBUTE Laps Vc4 Vc12 E1 Chan Cell **hecSampleInterval (hSample)**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib: Laps

Values: Decimal (0..25)

Units: seconds

Default: 0

ATTRIBUTE Laps Vc4 Vc12 E1 Chan Cell **hecErrorLimit (hLimit)**

Access: Read and write

Description

This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.)
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib: Laps

Values: Decimal (1..250000)

Default: No default

ATTRIBUTE Laps Vc4 Vc12 E1 Chan Cell **lcdStateDelay (delay)**

Access: Read and write

Description

This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The

Copyright © 2006, Nortel Nortel Confidential

valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib	Laps
Values	Decimal (1..50)
Units	msec
Default	No default

ATTRIBUTE Laps Vc4 Vc12 E1 Chan Cell **hecErrorIntervalLimit (hIntLimit)**

Access	Read and write

Description

This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib	Laps
Values	Decimal (1..25)
Default	1

GROUP Laps Vc4 Vc12 E1 Chan Cell **Operational (Oper)**

Properties	Operational

Description

This group contains the common operational attributes for the *AtmCell* component.

Mib	Laps

ATTRIBUTE Laps Vc4 Vc12 E1 Chan Cell **lcdAlarm (lcd)**

Access	Read only

Description

This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects

Copyright © 2006, Nortel Nortel Confidential

have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.
In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.
For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

Laps/n Sts/n Vt1dot5/l,m Ds1 Chan/n T*c*

The *Tc* component is used to provision and monitor trunk conditioning options. A separate instance of this component is required for each *Chan* on a Port which is offering a structured constant bit rate service.

Under certain failure alarm conditions, trunk conditioning *replacementData* is substituted into the *timeslots* as defined by the *Chan* component. Trunk

Copyright © 2006, Nortel Nortel Confidential

conditioning signaling is also substituted into the appropriate Channel Associated Signaling (CAS) bits when a *lineType* that uses CAS has been defined.

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the ATM network under the following conditions:
lossOfSignal (LOS)
lossOfFrame (LOF)
remoteAlarmIndication (RAI)
alarmIndicationSignal (AIS)
bufferUnderflow (BU)
and in addition for E1:
lossOfMultiframe (LOMF)
receiveMultiframeRemoteAlarmIndication (RMRAI)

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the PDH network under the following conditions:
bufferUnderflow (BU)
AAL1 protocol errors.

This component needs to be provisioned on 2pDs3cAal and 32pE1Aal FPs.

Properties	Operational
Description	This group contains all specific operational data for an *Flm* component.
Mib	Laps

ATTRIBUTE Laps Vc4 Vc12 E1 Chan Flm **flmStatus (status)**

Access	Read only
Description	This attribute indicates the status of a Frame Relay channel on an E1 line. By combining the E1 channel-associated-signalling (CAS) A-bits status, and HDLC defect, a single value indicates the likely cause of the failure. This mechanism assumes that the far end equipment loops back signaling A-bits for some or all of the timeslots in a channel. The A-bits in channel are transmitted as '0'. If they are all received as '0', it is assumed that the E1 link is up in both directions. The presence of HDLC frames indicates that the service is connected. When A-bits and HDLC frames are correctly received, ***frameLinkUp*** is indicated. When neither are received, ***frameLinkDown*** is indicated. When HDLC frames are not receive but A-bits are not at fault, ***lossOfHdlc*** is indicated. When HDLC frames are received, but there is a fault in any of timeslot's A-bits on a channel ***lossOfAbit*** is indicated.

VERB START **Laps Vc4 Vc12 E1 Test**

Impact Service

Description

This command invokes a test on the hardware component.
Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

VERB STOP **Laps Vc4 Vc12 E1 Test**

Impact Service

Description

This command stops a test running on the hardware component.

GROUP **Laps Vc4 Vc12 E1 Test** **OsiState (State)**

Properties Operational

Description This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib Laps

ATTRIBUTE **Laps Vc4 Vc12 E1 Test** **adminState (osiAdmin)**

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

Copyright © 2006, Nortel Nortel Confidential

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — Laps

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Laps Vc4 Vc12 E1 Test operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — Laps

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Laps Vc4 Vc12 E1 Test usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

ATTRIBUTE Laps Vc4 Vc12 E1 Test **frmSize (size)**

Access	Read and write
Description	This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.
Mib	Laps
Values	Decimal (4..4096)
Units	bytes
Default	1024

ATTRIBUTE Laps Vc4 Vc12 E1 Test **frmPatternType (fpt)**

Access	Read and write
Description	This attribute defines the type of data pattern generation to use. The following lists the available pattern types: ***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit. ***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit. ***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.
Mib	Laps
Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

ATTRIBUTE Laps Vc4 Vc12 E1 Test **customizedPattern (cp)**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	Laps
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Laps Vc4 Vc12 E1 Test **dataStartDelay (dsd)**

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	Laps
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Laps Vc4 Vc12 E1 Test **displayInterval (di)**

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	Laps
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Laps Vc4 Vc12 E1 Test **duration**

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In

Copyright © 2006, Nortel Nortel Confidential

the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.

Mib	Laps
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Laps Vc4 Vc12 E1 Test Results (Results)

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	Laps

ATTRIBUTE Laps Vc4 Vc12 E1 Test causeOfTermination

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback. a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback. a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

Copyright © 2006, Nortel Nortel Confidential

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Access	Read only
Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	Laps
Values	Long Integer
Default	No default

ATTRIBUTE Laps Vc4 Vc12 E1 Test erroredFrmRx

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	Laps
Values	Long Integer
Default	No default

ATTRIBUTE Laps Vc4 Vc12 E1 Test **bitErrorRate**

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.
Mib	Laps
Values	String (5, ASCII)

COMPONENT Laps InverseMultiplexerAtm (Ima)

Instance	Decimal (0..113)
Groups	GROUP Laps Ima Provisioned (Prov) GROUP Laps Ima Operational (Oper) GROUP Laps Ima Statistics (Stats) GROUP Laps Ima CustomerIdentifierData (CidData) GROUP Laps Ima OsiState (State)
Scope	Device
Description	*Lp/n InverseMultiplexerAtm/n* *Lp/n Ds3/n InverseMultiplexerAtm/n* This component is used to define an inverse multiplexing for ATM (IMA) group. IMA provides a data rate greater than DS1 E1 in increments of DS1 E1. To use IMA on an 8pDS1E1, MSA32, MSA8, 2pSTM1eCh or 2pSTM1Ch function processor, add an *Lp/n InverseMultiplexerAtm/n* component. To use IMA on a 4pDS3ChAtm function processor, add an *Lp/n Ds3/n InverseMultiplexerAtm/n* component. To use IMA in a protected configuration on the 2pSTM1Ch, add a *Laps/n InverseMultiplexerAtm/n* component. The instance range 0..7 applies to 8pDS1Atm, 8pE1Atm, 8pDS1Msa and 8pE1Msa cards. The instance range 0..13 applies to 4pDS3ChAtm cards. The instance range 0..29 applies to MSA32 cards. The instance range 0..113 applies to the 2pStm1eCh and 2pSTM1Ch cards. The instance number of an *IMA* group must not be the same as the

Copyright © 2006, Nortel Nortel Confidential

instance number of a *DS1*/*E1* “ATM UNI port” under the same *Lp*. An “ATM UNI port” is a *DS1* or *E1* component with a single *Chan* whose *applicationFramer* attribute is linked to an *AtmIf* component. On an MSA32 card, ports that are used as IMA links have two immiscible sub-ranges: 0..15 and 16..31. The instance number of an *IMA* group must be in the same sub-range as all of its ports. IMA sub-ranges also exist on the 2pStm1eCh and 2pSTM1Ch cards, instances 0..56 are allowed on port SDH 0, and instances 57..113 are allowed on port SDH 1.

GROUP Laps Ima Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the *Ima* component. The default values of *linkSelectionCriterion* and *linkRetryTimeout* depend on card type.
Mib	Laps

ATTRIBUTE Laps Ima linkSelectionCriterion (select)

Access	Read and write
Description	This attribute specifies the method to be used by the IMA group when selecting links to be activated. This comes into effect only when the configured links do not respect the maximum differential delay (otherwise all links are accepted). If ***leastDelay*** is chosen, first the link having the smallest delay is selected as the reference link. The IMA group includes all links which respect the maximum differential delay relative to the reference link. If ***maxBandwidth*** is chosen, the IMA group selects the maximum possible number of links, with each selected link respecting the maximum differential delay relative to every other selected link. When more than one possibility exists, the combination which offers the least delay is selected. The default value for Multi-Service Access cards is ***leastDelay***, and for all other cards is ***maxBandwidth***. On Multi-Service Access cards ***leastDelay***

Copyright © 2006, Nortel Nortel Confidential

is the only acceptable provisionable value.

Mib	Laps
Values	leastDelay maxBandwidth
Default	No default

ATTRIBUTE Laps Ima maxDiffDelay (delay)

Access	Read and write
Description	This attribute specifies the maximum differential delay between links acceptable in the IMA group. If a link violates that maximum differential delay, it will not be active in the IMA group and an alarm will be generated. For the 4pDS3ChAtm card, the value must not exceed 70.
Mib	Laps
Values	Decimal (1..100)
Units	msec
Default	25

ATTRIBUTE Laps Ima linkRetryTimeout (retry)

Access	Read and write
Description	This attribute specifies the amount of time before reactivation of a link is attempted after it recovers from a failure condition. The default value for Multi-Service Access cards is ***1***, and for all other cards is ***10***. On Multi-Service Access cards ***1*** is the only acceptable provisionable value.
Mib	Laps
Values	Decimal (0..1000)
Units	seconds
Default	No default

Description	This attribute defines the link to the *AtmIf* component using the *Ima*. An example is *AtmIf/31.*
Mib	Laps
Values	Link (Service, interfaceName)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Laps Ima transmitClockMode (clock)

Access	Read and write
Description	This attribute specifies the transmit clocking mode. If ***itc*** (Independent Transmit Clock) is chosen, the physical ports used by the IMA group may have different clocking sources. If ***ctc*** (Common Transmit Clock) is chosen, it is recommended that the physical ports used by the IMA group have the same clocking source. However, if the physical ports have different clocking sources, the operator should ensure that all the clocking sources have the same rate.
Mib	Laps
Values	itc ctc
Default	itc

ATTRIBUTE Laps Ima protocol (prot)

Access	Read and write
Criticality	Component
Description	This attribute specifies which IMA protocol the component should run. If ***atmForum10*** is chosen, the ATM Forum's IMA protocol (version 1.0) will be used and signalled in outgoing IMA Control Protocol (ICP) cells.The IMA group will come up only if the far end IMA also uses the ATM Forum's IMA protocol 1.0. Feature ***imaAtmForum*** must be provisioned on the LP for this protocol to be used. If ***atmForum11*** is chosen, the ATM Forum's IMA protocol (version 1.1) will be used and signalled in outgoing IMA Control Protocol (ICP) cells.The IMA group will come up only if the far end IMA uses the ATM Forum's IMA protocol 1.0 or 1.1. Feature ***imaAtmForum*** must be provisioned on the LP for this protocol to be used. If the far end is 1.0, then the near end downgrades to 1.0. After the downgrade, this attribute continues to specify the provisioned protocol version, while the *activeProtocol* operational attribute of the IMA component specifies the protocol version effectively running. If ***proprietary*** is chosen, Nortel's proprietary IMA protocol will be used. This protocol version is not currently supported as the IMA group will not inter-operate with IMA implementations from other vendors. Feature ***ima*** must be provisioned on the LP for this protocol to be used. The DEFAULT on the 2pStm1eCh and 2pSTM1Ch function processors is atmForum11.

Default	No default

ATTRIBUTE Laps Ima remoteLidsConfig (remConf)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates all the links which have been configured in the remote IMA group. For example, if links 1, 3 and 5 have been configured in the remote IMA group, this attribute would contain ***1 3 5***.
Mib	Laps
Set of	Decimal (0..31)
Default	No default

ATTRIBUTE Laps Ima remoteLidsActive (remAct)

Access	Read only
Description	This attribute indicates all the links which are active in the remote IMA group. For example, if links 1 and 5 are active in the remote IMA, this attribute would contain ***1 5***.
Mib	Laps
Set of	Decimal (0..31)
Default	No default

ATTRIBUTE Laps Ima cellCapacity (cap)

Access	Read only
Description	This attribute indicates the total cell capacity (in cells per second) which is provided to the ATM layer. This cell capacity takes into account the physical and IMA level overheads.
Mib	Laps
Values	Decimal (0..4294967295)
Units	cell/s
Default	No default

ATTRIBUTE Laps Ima remoteGid (remGid)

Access	Read only
Description	This attribute indicates the IMA group identifier (GID) used by the remote IMA. A value of 0 will be displayed if the group is not receiving IMA Control Protocol (ICP) cells.
Mib	Laps
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Laps Ima clockingModeMismatch (mismatch)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates whether or not both ends of the IMA group are using the same transmit clocking mode (***itc***/***ctc***). Its value will be ***yes*** if both ends are not using the same transmit clocking mode. A clocking mode mismatch does not prevent an IMA group from coming up and can be corrected by using the same clocking mode at both ends.
Mib	Laps
Values	no yes
Default	No default

ATTRIBUTE Laps Ima activeProtocol (activeProt)

Access	Read only
Description	This attribute indicates which IMA protocol the *Ima* component is effectively running. This attribute is supported on the 8pDs1Atm, 8pE1Atm, 4pDS3ChAtm, 2pStm1eCh and 2pSTM1Ch cards. This attribute is not supported on the MSA32 and MSA8 cards. The value of this attribute is the same as the provisioned *protocol* attribute if the IMA is operating at the provisioned protocol version. The value of this attribute indicates the dongraded protocol version if the IMA has gone through a protocol version downgrade upon IMA 1.1 to IMA 1.0 interworking.
Mib	Laps
Values	atmForum10 proprietary atmForum11
Default	No default

GROUP Laps Ima Statistics (Stats)

Properties	Operational
Description	This group contains the statistics data for the *Ima* component.
Mib	Laps

ATTRIBUTE Laps Ima runningTime (running)

Access	Read only
Description	This attribute indicates the length of time (in seconds) for which the *Ima* component has been in the unlocked state or has been used for operational testing.
Mib	Laps
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Units	seconds
Default	No default

ATTRIBUTE Laps Ima unavailSec (unavail)

Access	Read only
Description	This attribute indicates the number of one second intervals during which the *Ima* component has been unlocked and out of service.
Mib	Laps
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Laps Ima failures (fail)

Access	Read only
Description	This attribute indicates the number of complete failures, during start-up or normal operation, that the *Ima* component has experienced since being added. It must be noted that a service degradation, such as 1 of the 3 links in an IMA group being down, is not counted as a failure. If an *Ima* component is in a failure loop and does not come up, this count will only increase by 1.
Mib	Laps
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Laps Ima receiveCellUtilization (rxutil)

Access	Read only
Description	This attribute indicates the ratio of the number of valid, assigned user cells received on the IMA group to the IMA cell capacity (based on the number of active links). The utilization is calculated over a one minute period.
Mib	Laps
Values	Decimal (0..100)
Units	%
Default	No default

ATTRIBUTE Laps Ima transmitCellUtilization (txutil)

Access	Read only
Description	This attribute indicates the ratio of the number of user cells transmitted on the IMA group to the IMA cell capacity (based on the number of active

links). The utilization is calculated over a one minute period.

Mib	Laps
Values	Decimal (0..100)
Units	%
Default	No default

GROUP Laps Ima CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	Laps

ATTRIBUTE Laps Ima customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	Laps
Values	Decimal (0; 1..8191)
Default	0

GROUP Laps Ima OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this

Copyright © 2006, Nortel Nortel Confidential

group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib Laps

ATTRIBUTE Laps Ima adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib Laps

Values locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

ATTRIBUTE Laps Ima operationalState (osiOper)

Access Read only

Description This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib Laps

Copyright © 2006, Nortel Nortel Confidential

Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Laps lma usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Laps
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Laps lma availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	Laps
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Laps lma proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib	Laps
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE Laps Ima controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

Copyright © 2006, Nortel Nortel Confidential

The value ***suspended*** indicates that the service has been administratively suspended.

ATTRIBUTE Laps lma alarmStatus (osiAlarm)

Access — Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

ATTRIBUTE Laps Ima standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.
Mib	Laps
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Laps Ima unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	Laps
Values	false true
Default	false

Default: card

ATTRIBUTE Laps Ima Test frmSize (size)

Access: Read and write

Description:
This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.

Mib: Laps

Values: Decimal (4..4096)

Units: bytes

Default: 1024

ATTRIBUTE Laps Ima Test frmPatternType (fpt)

Access: Read and write

Description:
This attribute defines the type of data pattern generation to use. The following lists the available pattern types:
ccitt32kBitPattern is a pseudo-random sequence of 32 kbit.
ccitt8MBitPattern is a pseudo-random sequence of 8Mbit.
customizedPattern is the pattern defined in the ***customizedPattern*** attribute.

Copyright © 2006, Nortel
Nortel Confidential

Mib	Laps
Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

ATTRIBUTE Laps Ima Test **customizedPattern (cp)**

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	Laps
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Laps Ima Test **dataStartDelay (dsd)**

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	Laps
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Laps Ima Test **displayInterval (di)**

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	Laps

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Laps Ima Test duration

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	Laps
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Laps Ima Test Results (Results)

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	Laps

ATTRIBUTE Laps Ima Test causeOfTermination

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has

Copyright © 2006, Nortel Nortel Confidential

failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	Laps
Values	Long Integer
Default	No default

ATTRIBUTE Laps Ima Test erroredFrmRx

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	Laps
Values	Long Integer
Default	No default

ATTRIBUTE Laps Ima Test bitErrorRate

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.

ATTRIBUTE Laps Ima Test timeRemaining

Access	Read only
Description	This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.
Mib	Laps
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

COMPONENT Laps Ima Link (Lk)

Instance	Decimal (0..31)
Groups	GROUP Laps Ima Lk Provisioned (Prov) GROUP Laps Ima Lk Operational (Oper) GROUP Laps Ima Lk Statistics (Stats) GROUP Laps Ima Lk OsiState (State)
Scope	Device
Description	*Lp/n Ima/n Link/n* *Lp/n Ds3/n Ima/n Link/n* This component is used to define a DS1/E1 link belonging to an IMA group. The instance number of the *Link* subcomponent corresponds to the link identifier (LID) used by the link in IMA Control Protocol (ICP) cells. To

Copyright © 2006, Nortel Nortel Confidential

use Ima on an 8pDS1E1 function processor, add *Lp/n Ima/n Link/n*. To use Ima on a 4pDS3ChAtm function processor, add *Lp/n Ds3/n Ima/n Link/n*.

Mib	Laps
Common Verbs	Help List Display Add DELete

GROUP Laps Ima Lk Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the *Link* subcomponent.
Mib	Laps

ATTRIBUTE Laps Ima Lk interfaceName

Access	Read and write
Criticality	Component
Description	This attribute associates the *Link* subcomponent with a specific interface on a function processor, for example *Lp/5 E1/3 Chan/0*. If IMA groups and independent links coexist on a card running IMA and per-VC queueing is enabled, plan the selection of DS1 or E1 ports to be used by the IMA group carefully. For a 4pDS3ChAtm function processor there is no per-VC queueing.
Mib	Laps
Values	Link (Hardware, applicationFramerName)
Default	No default

GROUP Laps Ima Lk Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *Link* subcomponent.
Mib	Laps

ATTRIBUTE Laps Ima Lk failureCause (cause)

Access	Read only
Description	This attribute indicates the failure cause on this link. Possible values are: ***noFailure***: there is no failure on this link. ***interfaceDown***: the physical port used by the link is down. ***lif***: the link is in loss of IMA frame (LIF) state. ***lods***: the link is in loss of delay synchronization (LODS) state; that is, it

Copyright © 2006, Nortel Nortel Confidential

has exhibited a differential delay which is greater than the maximum differential delay tolerated by the IMA group. It must be noted that hysteresis is used for the LODS condition.
protocolError: the link is down because of a time-out or because bad values are being received in IMA Control Protocol (ICP) cells.
remoteFailure: the far end link is down.
misconnected: the link is down because the IMA group has declared, after using its transmit test pattern procedure, that this link is not properly connected. This value can occur only if the *protocol for the IMA group is* ***atmForum10.***
unsupportedFrameLength: the link is down because it is receiving from the far end a frame length which is not supported by the local IMA group. This value can occur only if the *protocol for the IMA group is* ***atmForum10.***
unsupportedSymmetry: the link is down because it is receiving from the far end a group symmetry which is not supported by the local IMA group. This value can occur only if the *protocol for the IMA group is* ***atmForum10.***
noIcp: the link is down because it is not receiving IMA Control Protocol (ICP) cells. This value can occur only if the *protocol* for the IMA group is ***atmForum10***.
unsupportedVersion: the link is down because it is receiving from the far end a group version that is not supported by the local IMA group.

unsupportedSymmetry
unsupportedVersion
noIcp

Default: No default

ATTRIBUTE Laps Ima Lk remoteDefect (remDef)

Access: Read only

Description: This attribute indicates the IMA remote defect indicator (RDI) currently being received on this link. Possible values are:
noDefect: no defect.
physicalLayerDefect: the interface used by the remote link has a physical layer defect. This value can occur only if the *protocol for the IMA group is* ***atmForum10.***
interfaceDown: the physical interface used by the remote link is down.This value can occur only if the *protocol for the IMA group is*

Copyright © 2006, Nortel Nortel Confidential

	proprietary. ***lif***: the remote link has a loss of IMA frame (LIF) defect. ***lods***: the remote link has a loss of delay synchronization (LODS) defect; that is, it has exhibited a differential delay which is greater than the maximum differential delay tolerated by the IMA group.
Mib	Laps
Values	noDefect interfaceDown lif lods physicalLayerDefect
Default	No default

ATTRIBUTE Laps Ima Lk remoteLid (remLid)

Access	Read only
Description	This attribute indicates the link identifier (LID) used by the remote IMA group on the physical link. A value of 0 will be displayed if the link is not receiving IMA Control Protocol (ICP) cells or if the physical layer is down.
Mib	Laps
Values	Decimal (0..31)
Default	No default

ATTRIBUTE Laps Ima Lk relativeDelay (rel)

Access	Read only
Description	This attribute indicates the latest measured differential delay (rounded up in milliseconds) between this link and the link, in the same IMA group, having the least delay. A value of 4294967295 indicates that the relative delay could not be measured. This can be due to physical layer problems or to no IMA Control Protocol (ICP) cells being received on the link.
Mib	Laps
Values	Decimal (0..4294967295)
Units	msec
Default	No default

ATTRIBUTE Laps Ima Lk lastOifCause (oif)

Access	Read only
Description	This attribute indicates the cause of the last out of IMA frame (OIF) anomaly on the link. Possible values are: ***noOif***: no OIF was detected. ***badFrameLength***: an IMA Control Protocol (ICP) cell with an unexpected frame length was received.

Copyright © 2006, Nortel Nortel Confidential

badGid: an ICP cell with an unexpected group identifier (GID) was received.
badLid: an ICP cell with an unexpected link identifier (LID) was received.
badOffset: an ICP cell with an unexpected cell offset was received.
badSequenceNumber: an ICP cell with an unexpected frame sequence number was received.
stuffError: an illegal stuffing sequence was received.
missingIcp: an expected ICP cell was not received.
unexpectedIcp: an unexpected ICP cell was received.
erroredIcp: two consecutive errored ICP cells were received.
noCells: no cells are being received on the link.
idleCell: an idle cell was received on the link.
badOamLabel: an ICP cell with an unexpected oam label was received.

Mib	Laps
Values	noOif badFrameLength badGid badLid badOffset badSequenceNumber stuffError missingIcp unexpectedIcp erroredIcp noCells idleCell badOamLabel

GROUP Laps Ima Lk Statistics (Stats)

Properties	Operational
Description	This group contains the statistics data for the *Link* subcomponent.
Mib	Laps

ATTRIBUTE Laps Ima Lk runningTime (running)

Access	Read only
Description	This attribute counts the length of time (in seconds) for which the *Link* component has been running.
Mib	Laps
Values	Decimal (0..4294967295)
Units	seconds
Default	No default

ATTRIBUTE Laps Ima Lk unavailSec (unavail)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	For an IMA group whose *protocol* is ***atmForum10***, this attribute counts the number of unavailable seconds. Unavailability begins at the start of 10 contiguous severely errored seconds (SES) and ends at the start of 10 contiguous seconds with no SES.
Mib	Laps
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Laps Ima Lk failures (fail)

Access	Read only
Description	This attribute counts the number of failures, during link addition or normal operation, that the link has experienced.
Mib	Laps
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Laps Ima Lk unusableSec (uus)

Access	Read only
Description	This attribute counts the number of one second intervals during which the near end has been in an unusable state.
Mib	Laps
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Laps Ima Lk sevErroredSec (ses)

Access	Read only
Description	This attribute counts the number of one second intervals in which at least 30 percent of the IMA Control Protocol (ICP) cells were counted as ICP violations or at least one link defect (physical layer, LIF and LODS defects) was detected. This attribute will not increment during UAS (Unavailable Second) conditions.
Mib	Laps
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Laps Ima Lk farEndUnusableSec (feUus)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of one second intervals during which the “Tx/Rx Unusable” condition has been received from the far end.
Mib	Laps
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Laps Ima Lk farEndSevErroredSec (feSes)

Access	Read only
Description	This attribute counts the number of one second intervals containing one or more RDI defects. This attribute will not increment during FEUAS (Far-End Unavailable Second) conditions.
Mib	Laps
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Laps Ima Lk farEndUnavailSec (feUnavail)

Access	Read only
Description	This attribute counts the number of unavailable seconds at the far end. Unavailability begins at the start of 10 contiguous severely errored seconds (SES) at the far end and ends at the start of 10 contiguous seconds at the far end with no SES.
Mib	Laps
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Laps Ima Lk icpViolations (iv)

Access	Read only
Description	This attribute counts the number of errored, invalid or missing IMA Control Protocol (ICP) cells during non-SES (Severely Errored Second) and non-UAS (Unavailable Seconds) conditions.
Mib	Laps
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Laps Ima Lk txStuffEvents (txStuff)

Access	Read only
Description	This attribute counts the number of Stuff events transmitted during non-SES (Severely Errored Second) and non-UAS (Unavailable Seconds) conditions.

Copyright © 2006, Nortel Nortel Confidential

Mib	Laps
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Laps Ima Lk rxStuffEvents (rxStuff)

Access	Read only
Description	This attribute counts the number of Stuff events received during non-SES (Severely Errored Second) and non-UAS (Unavailable Seconds) conditions.
Mib	Laps
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Laps Ima Lk idleCellSec (idle)

Access	Read only
Description	This attributes counts the number of one second intervals during which one or more idle cells was received. The reception of idle cells is an abnormal condition which could be caused by the remote IMA using the Common Transmit Clock mode with ports whose clock sources are not synchronized.
Mib	Laps
Values	Decimal (0..4294967295)
Default	No default

GROUP Laps Ima Lk OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Laps

ATTRIBUTE Laps Ima Lk adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value

Copyright © 2006, Nortel Nortel Confidential

is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: Laps

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Laps Ima Lk operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: Laps

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Laps Ima Lk usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare

Copyright © 2006, Nortel Nortel Confidential

capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	Laps
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Laps lma Lk availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is

Copyright © 2006, Nortel Nortel Confidential

degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

migrating

Default — No default

ATTRIBUTE Laps Ima Lk **proceduralStatus (osiProc)**

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib: Laps

Set of:
initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default: No default

ATTRIBUTE Laps Ima Lk controlStatus (osiCntrl)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib: Laps

Set of:
subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default: No default

ATTRIBUTE Laps Ima Lk alarmStatus (osiAlarm)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	Laps
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Laps Ima Lk standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same

Copyright © 2006, Nortel Nortel Confidential

information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib	Laps
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Laps Ima Lk unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	Laps
Values	false true
Default	false

GROUP La CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

Copyright © 2006, Nortel

Nortel Confidential

Mib	LanDrivers

ATTRIBUTE La customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	LanDrivers
Values	Decimal (0; 1..8191)

ATTRIBUTE La macAddress

Access	Read only
Description	This attribute indicates the media access controller (MAC) address which was assigned to this component by the system. The value is displayed in canonical format. No two stations in a network may have the same MAC address.
Mib	LanDrivers
Values	String (6, Dashed Hex)
Default	No default

COMPONENT La EthernetVirtualLineService (Evls)

Groups	GROUP La Evls Provisioned (Prov)
Scope	Application
Description	*La/n EthernetVirtualLineService* This component represents the Ethernet Virtual Line Service. It can be configured on an Ethernet interface that is operating in either port-mode or VLAN-mode. It enables the provisioning of both end-to-end and single-ended EVCs. The end-to-end configuration originates and terminates the EVC on an Ethernet interface. The single-ended configuration originates the EVC on an Ethernet interface and terminates it on an ATM interface. When the Ethernet interface is operating in port-mode, this component cannot co-exist with the *linkToProtocolPort* or *enetConnection* attributes being set.

GROUP La Evls Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioned attributes for the *EthernetVirtualLineService* component.
Mib	LanDrivers

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE La Evls softPvcRetryPeriod (sRetryPeriod)

Access	Read and write
Description	This attribute specifies the interval at which an SPVC connection attempts re-establishment after the calling end of the SPVC initiates the setup request and receives a release message.
Mib	LanDrivers
Values	Decimal (10..3600)
Units	seconds
Default	20

ATTRIBUTE La Evls softPvcHoldOffTime (sHoldOffTime)

Access	Read and write
Description	This attribute specifies how long to hold off retries following the release of a connection.
Mib	LanDrivers
Values	Decimal (0; 50..20000)
Units	msec
Default	0

COMPONENT La Evls EthernetLocalAddress (LocalAddr)

Groups	GROUP La Evls LocalAddr Provisioned (Prov) GROUP La Evls LocalAddr Operational (Oper)
Scope	Application
Description	*La/x Evls EthernetLocalAddress* This component represents the local address of the Ethernet interface for the Ethernet Virtual Line Service in the network.

Common Verbs	Help List Display

GROUP La Evls LocalAddr Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioned attributes for the *EthernetLocalAddress* component.
Mib	LanDrivers

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE La Evls LocalAddr nsapAddress (nsapAddr)

Access	Read and write
Criticality	Component
Description	This attribute specifies a 40-digit ATM address in standard ISO NSAP format. This is the local address of the Ethernet interface for the Ethernet Virtual Line Service within the ATM routing database. If the default value is used, an internal NSAP address is generated using the value of the *ModuleData nodePrefix* attribute and the value of the End System Identifier (ESI) that is the assigned number for EVLS. This internal NSAP address can be displayed using the *EthernetLocalAddress activeNsapAddress* operational attribute.
Mib	LanDrivers
Values	String (40, AESANsapAddress)
Default	470000000000000000000000000000000000000000

GROUP La Evls LocalAddr Operational (Oper)

Properties	Operational
Description	This group contains operational attributes for the *EthernetLocalAddress* component.
Mib	LanDrivers

ATTRIBUTE La Evls LocalAddr activeNsapAddress (actNsapAddr)

Access	Read only
Description	This attribute indicates the operational local NSAP address of the Ethernet interface for the Ethernet Virtual Line Service in the ATM Network.
Mib	LanDrivers
Values	String (0..40, ASCII)
Default	No default

COMPONENT La EthernetVirtualConnection (Evc)

Groups	GROUP La Evc Provisioned (Prov) GROUP La Evc OsiState (State) GROUP La Evc OperationalStatus (OperStatus) GROUP La Evc Operational (Oper) GROUP La Evc Statistics (Stats)
Scope	Application
Description	*La/x EthernetVirtualConnection* *La/x Vlan/y EthernetVirtualConnection*

Copyright © 2006, Nortel Nortel Confidential

When this component is added to a *LanApplication* component, it represents a VC that is established between this Ethernet interface and either another Ethernet interface or an ATM UNI VCC.

When this component is added to a *Vlan* component, it represents a VC that is established between this Ethernet VLAN and either another Ethernet VLAN or an ATM UNI VCC.

The EVC is established over an ATM PNNI network using an ATM SPVC VCC. It can be configured to use a dedicated ATM transport VC, or to aggregate with other EVCs over a shared ATM transport VC established by the *EthernetTransportSystem* component. This latter option is only available when this component exists under the *LanApplication* component in VLAN-mode, or under a *Vlan* component.

This EVC is used to transparently transport Ethernet v2.0 and IEEE 802.3 frames. These frames are stripped of the Ethernet FCS and encapsulated using RFC2684 bridged mode encapsulation before being transported.

When this component is under the *LanApplication* component in port-mode, and the *EthernetPolicy* component does not exist, the default behavior of EVLS is to accept all frames received from the Ethernet interface. If the *EthernetPolicy* component exists, and the and the *EthernetPolicy unknownVlanIdTreatment* attribute is set to ***discard***, only untagged and priority-tagged frames are accepted, all other frames are discarded and counted by the *EthernetStatistics unknownVlanId* statistic. With this same configuration, and the *unknownVlanIdTreatment* attribute set to ***accept***, all frames are accepted.

When this component is under the *LanApplication* component in VLAN-mode, and the port-VLAN is configured with an EVC, and the *EthernetPolicy* component does not exist, the default behavior of EVLS is to discard all unknown VLAN-tagged frames received from the Ethernet interface. If the *EthernetPolicy* component exists, and the *EthernetPolicy unknownVlanIdTreatment* attribute is set to ***discard***, only untagged, priority-tagged and port-VLAN ID (VID=1) frames are accepted, all other frames are either accepted by a configured *Vlan* component instance, or discarded and counted by the *EthernetStatistics unknownVlanId* statistic. With this same configuration, and the *unknownVlanIdTreatment* attribute set to ***accept***, all untagged, priority-tagged, port-VLAN ID frames and unknown VLAN-tagged frames received from the Ethernet interface are classified as port-VLAN traffic.

Copyright © 2006, Nortel Nortel Confidential

When this component is under the *Vlan* component, only frames with their VID set to this *Vlan* component instance are accepted by this EVC.

GROUP La Evc Provisioned (Prov)

Properties Provisioned

Description This group contains the provisioned attributes for the *EthernetVirtualConnection* component.

Mib LanDrivers

ATTRIBUTE La Evc aggregation (aggr)

Access Read and write

Description This attribute specifies whether to use a dedicated ATM VC to establish the connection, or to aggregate with other EVCs over a shared ATM VC established by the *EthernetTransportSystem* component.

The possible values are:

disabled: this value indicates that this EVC should use a dedicated transport VC established by this component.

enabled: this value indicates that this EVC should be aggregated over a shared transport VC established by the *EthernetTransportSystem* component.

Mib LanDrivers

Values
disabled
enabled

Default disabled

ATTRIBUTE La Evc preserveVlanTag (presVlanTag)

Access Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies whether the VLAN tag is preserved or removed for frames received from the Ethernet interface by this Evc, when the *remoteVlanId* is set to ***0***. This attribute is ignored if the *removeVlanId* attribute for this Evc is set to any other value. When this attribute is set to ***disabled***, the VLAN tag is removed from priority and VLAN-tagged frames received from the Ethernet interface, for this EVC, before being transported across the network as untagged. When this attribute is set to ***enabled***, the VLAN tag is preserved for priority and VLAN-tagged frames received from the Ethernet interface, for this EVC, and transparently transported across the network. If present, the original VID of the frame is preserved. The default is ***enabled***.
Mib	LanDrivers
Values	disabled enabled
Default	enabled

GROUP La Evc OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LanDrivers

ATTRIBUTE La Evc adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

	permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	LanDrivers
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE La Evc operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	LanDrivers
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE La Evc usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	LanDrivers
Values	idle active (activ) busy
Default	idle

Access	Read and write
Description	This attribute is used to enable or disable policing for the *EVC*.
Mib	LanDrivers
Values	disabled enabled
Default	disabled

ATTRIBUTE La Evc EvcPolicer committedInformationRate (cir)

Access	Read and write
Description	This attribute specifies the committed information rate in kilobits per second(k bits/s). It is the rate at which the EVC agrees to transport Ethernet frames under normal conditions, and meets the performance objectives. An exception to this occurs when this attribute is provisioned to be ***0***, the *committedBurstSize* attribute is ignored, in which case all traffic for this EVC is treated as excess traffic. This attribute can be set to ***sameAsEvc***, in order to use the same value as the *EQoS commitedInformationRate* attribute for the policer. It can be also be used to override the provisioned *EQoS committedInformationRate* attribute for the policer. On the 4pGe FP, this value can be configured in increments of 1,000 kbits/s. An increment of less than 1,000 kbits/s is rounded up to the nearest 1,000 kbits/s. On the 4p/8pEth100BaseT FP, this value can be configured in increments of 1 kbit/s.
Mib	LanDrivers
Values	Decimal (0..1000000) sameAsEvc
Units	kbit/s
Default	sameAsEvc

ATTRIBUTE La Evc EvcPolicer excessInformationRate (eir)

Access	Read and write
Description	This attribute specifies the excess information rate in kilobits per second (kbits/s). It is the rate at which EVC may transport Ethernet frames in excess of the *committedInformationRate*, without any performance objectives. An exception to this occurs when this attribute is provisioned to

Copyright © 2006, Nortel Nortel Confidential

be ***0***, in which case the *excessBurstSize* attribute is ignored, and all traffic for this EVC in excess of the *committedInformationRate* is discarded.

This attribute can be set to ***sameAsEvc***, in order to use the same value as the *EQoS excessInformationRate* attribute for the policer. It can also be used to override the provisioned *EQoS excessInformationRate* attribute for the policer.

On the 4pGe FP, this value can be configured in increments of 1,000 kbits/s. An increment of less than 1,000 kbits/s is rounded up to the nearest 1,000 kbits/s.

On the 4p/8pEth100BaseT FP, this value can be configured in increments of 1 kbit/s.

Mib	LanDrivers
Values	Decimal (0..1000000) sameAsEvc
Units	kbit/s
Default	sameAsEvc

ATTRIBUTE La Evc EvcPolicer committedBurstSize (cbs)

Access	Read and write
Description	This attribute specifies the committed burst size in bits. It is the maximum amount of data this EVC makes available for a burst of ingress Ethernet frames sent at the ethernet access rate to remain CIR-conformant. An exception to this occurs when this attribute is provisioned to be ***0***, the *committedInformationRate* attribute is ignored, in which case all traffic for this EVC is treated as excess traffic. The attribute can be set as ***sameAsEvc***, in order to use the same value as the *EQoS committedBurstSize* attribute for the policer. It can also be used to override the provisioned *EQoS committedBurstSize* attribute for the policer.
Mib	LanDrivers
Values	Decimal (0..100000000) sameAsEvc
Units	bits
Default	sameAsEvc

ATTRIBUTE La Evc EvcPolicer excessBurstSize (ebs)

Access	Read and write
Description	This attribute specifies the excess burst size in bits. It is the maximum amount of data this *EVC* makes available for a burst of ingress Ethernet

Copyright © 2006, Nortel Nortel Confidential

	frames sent at the Ethernet access rate in excess of the *committedBurstSize*. An exception to this occurs when this attribute is provisioned to be ***0***, the *excessInformationRate* attribute is ignored, in which case all traffic in excess of the *committedBurstSize* for this EVC is discarded.
Mib	LanDrivers
Values	Decimal (0..100000000)

Description	This group contains the provisioned attributes for the *EthernetQualityOfService* component.
Mib	LanDrivers

ATTRIBUTE La Evc EQoS committedInformationRate (cir)

Access	Read and write
Description	This attribute specifies the committed information rate (CIR), in kbit per second, for this connection. It is the average rate up to which the network delivers service frames and meets the performance objectives defined by the Ethernet per-hop behavior of this connection. This value is used to derive the sustained cell rate (SCR) traffic management parameter for the ATM VC. Changing the value of this attribute will not take effect until *lock*/*unlock La* or *Vlan* component or *clear* the SPVC connection.
Mib	LanDrivers
Values	Decimal (0..1000000)
Units	kbit/s
Default	10000

ATTRIBUTE La Evc EQoS excessInformationRate (eir)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the maximum bandwidth, in kbit per second, for this connection. It is the average rate up to which the network may deliver service frames without any performance objectives. This value is used in conjunction with the *EQoS cir* attribute to derive the peak cell rate (PCR) traffic management parameter for the ATM VC. Changing the value of this attribute will not take effect until *lock*/*unlock La* or *Vlan* component or *clear* the SPVC connection.
Mib	LanDrivers
Values	Decimal (0..1000000)
Units	kbit/s
Default	10000

ATTRIBUTE La Evc EQoS committedBurstSize (cbs)

Access	Read and write
Description	This attribute specifies the maximum number of bits available for use by sequential service frames sent at the Ethernet interface speed to remain CIR-conformant. This value must be divisible by a value of 8. Changing the value of this attribute will not take effect until *lock*/*unlock La* or *Vlan* component or *clear* the SPVC connection.
Mib	LanDrivers
Values	Decimal (80000..100000000)
Units	bits
Default	800000

ATTRIBUTE La Evc EQoS ethernetPerHopBehavior (ePhb)

Access	Read and write
Description	This attribute specifies the Ethernet per-hop behavior for this connection. It is used to derive the traffic management parameters for the ATM VC. Consistent with the Multiservice Switch Differentiated Services Domain type for IP services, the following mapping is defined for EVLS: The value of ***df*** specifies that the traffic class is standard, the connection class is equal to 0, and the ATM service category is ubr. The value of ***af11*** specifies that the traffic class is bronze, the connection class is equal to 0, and the ATM service category is ubr. The value of ***af21*** specifies that the traffic class is silver, the connection class is equal to 1, and the ATM service category is nrt-vbr.

Copyright © 2006, Nortel Nortel Confidential

The value of ***af31*** specifies that the traffic class is gold, the connection class is equal to 2, and the ATM service category is rt-vbr.

The value of ***ef*** specifies that the traffic class is premium, the connection class is equal to 3, and the ATM service category is cbr.

Changing the value of this attribute will not take effect until *lock*/*unlock La* or *Vlan* component or *clear* the SPVC connection.

Mib	LanDrivers
Values	Decimal (0..63) df af11 af21 af31 ef
Default	df

ATTRIBUTE La Evc EQoS averageFrameSize (afs)

Access	Read and write
Description	This attribute specifies the expected average frame size, in bytes, for this connection. This average frame size is used to determine the average overhead factor to be used in deriving the SCR and PCR traffic management parameters for the ATM VC. Changing the value of this attribute will not take effect until *lock*/*unlock La* or *Vlan* component or *clear* the SPVC connection.
Mib	LanDrivers
Values	Decimal (64..9182)
Units	bytes
Default	512

GROUP La Evc EQoS QoSAtmProv (AtmProv)

Properties	Provisioned
Description	This group contains the provisioned attributes related to ATM traffic management parameters for the *EthernetQualityOfService* component.
Mib	LanDrivers

ATTRIBUTE La Evc EQoS packetWiseDiscard (pd)

Access	Read and write
Description	This attribute specifies whether packet-wise discard functions are to be enabled or disabled in the received and transmitted directions for this

Copyright © 2006, Nortel Nortel Confidential

connection. Packet-wise discard functions apply to AAL5 frame traffic.

Packet-wise functions increase the “goodput” of the link. The packet-wise functions are Early Packet Discard (EPD) and Partial Packet Discard (PPD).

EPD allows the connection to discard an entire frame once the transmitted or the received queue has reached the EPD threshold. EPD increases the "goodput" of a link, since discarding an entire frame means that some queue capacity is guarded for some other frame which is already partially transmitted. All cells of the frame are discarded from the Beginning of Message (BOM) cell up to and including the End of Message (EOM) cell.

PPD allows the connection to discard the remainder of a cell-forwarded AAL5 frame if one cell of this frame has been discarded, for example due to UPC. All cells are discarded up to but not including the EOM cell. The PPD function increases the “goodput” of the link, since cells which are only going to be discarded at the AAL5 reassembly point are not transmitted.

A value of ***enabled*** means packet-wise discard functions are applied to receive traffic and transmit traffic at this connection point. A value of ***disabled*** means packet-wise discard functions are not applied to receive traffic and transmit traffic at this connection point.

At a SPVC origin on a PNNI interface, a value of ***enabled*** specifies that frame discard is requested in the forward and the backward direction. When this attribute is set to ***disabled***, forward frame discard and backward frame discard are not requested in the SPVC call setup.

The packet-wise discard functions that are active are visible in the *Spvc packetWiseDiscard* operational attribute.

La/x Vlan/y Evc EvcSpvc/m

This component represents one of the SPVC endpoints of the ATM

Copyright © 2006, Nortel Nortel Confidential

transport connection.

This component can be dynamically created or provisioned.

When this component is dynamically created, it implicitly indicates that a connection has been established and this SPVC is the called endpoint of the VCC. The *EvcSpvc endPoint* operational attribute is used to indicate the called end. This dynamically created component does not exist when there is no connection.

When this component is provisioned, it implies that this is the calling endpoint of the VCC. It does not imply that a connection is established. A provisioned *EvcSpvc* component allows initiation of the setup request to the called end of the ATM transport connection.

Access — Read only

Description — This attribute indicates the status of the incoming and outgoing connection.

serviceNotReady indicates that the component is initialising when first created; a connection has not been established, and no incoming setup requests are processed.

serviceReady indicates that a connection has not yet been established and that setup requests are sent in calling end of the SPVC or that the setup request is expected in the called end of the SPVC.

waitingForConnect indicates that a connection has not been established and the component is waiting to restart.

connected indicates that a connection has been established.

setupFailed indicates that the ATM Networking resources are not available to setup the connection at the calling end of the SPVC

connectFailed indicates that the ATM Networking resources are not avaialble to setup the connection at the called end of the SPVC.

releaseFailed indicates that the connection release attempts have failed.

Mib — LanDrivers

Values —
serviceNotReady
serviceReady
waitingForConnect
connected
setupFailed
connectFailed
releaseFailed

Default — No default

ATTRIBUTE La Evc Spvc endPoint (endPt)

Access — Read only

Description — This attribute indicates whether this SPVC is the called or calling endpoint of the VCC. If the value is ***called***, this is the endpoint that receives the setup request from the remote end of the ATM transport connection. If the value is ***calling,*** this is the endpoint that initiates the setup request to the remote end of the ATM transport connection.

Mib	LanDrivers
Values	called calling
Default	No default

ATTRIBUTE La Evc Spvc retryFailures (failures)

Access	Read only
Description	This attribute indicates the consecutive failed connection attempts prior to the current attempt. It is reset to ***0*** whenever a connection is successfully established. The value wraps to ***0*** when it exceeds the maximum value. If this attribute increments, please refer to the *EvcSpvc lastSetupFailureCause* and *EvcSpvc lastSetupFailureDiagnostic* attributes for diagnostics.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE La Evc Spvc lastFailureCause (cause)

Access	Read only
Description	This attribute indicates the cause of the last ATM transport connection failure. The values are as defined in the ATM Forum ATM User-Network Interface (UNI) Specification.
Mib	LanDrivers
Values	Decimal (0..255)
Default	No default

ATTRIBUTE La Evc Spvc lastFailureDiagnostic (diag)

Access	Read only
Description	This attribute indicates a diagnostic to supplement the *EvcSpvc lastFailureCause* attribute. The values are as defined in the ATM Forum ATM User-Network Interface (UNI) Specification.
Mib	LanDrivers
Values	String (0..8, ASCII)
Default	No default

GROUP La Evc Spvc EvcSpvcCon (SpvcCon)

Properties	Operational
Description	This group contains operational data associated with ATM SPVC for the *EvcSpvc* component. This group is not displayed when the *Evc aggregation* attribute has a value of ***enabled.***
Mib	LanDrivers

ATTRIBUTE La Evc Spvc serviceCategory (sc)

Access	Read only
Description	This attribute indicates the ATM service category of the SPVC connection. For the called end of the SPVC, if the value of the *spvcStatus* attribute is ***connected***, this attribute can have a value of ***ubr***, ***rtvbr***, ***nrtvbr,*** or ***cbr***. For the calling end of the SPVC, this attribute reflects the mapping value of the *EQoS ethernetPerHopBehavior* attribute.
Mib	LanDrivers
Values	unspecifiedBitRate (ubr) rtVariableBitRate (rtvbr) nrtVariableBitRate (nrtvbr) constantBitRate (cbr) notAvailable (notAvail)
Default	No default

ATTRIBUTE La Evc Spvc peakCellRate01 (pcr01)

Access	Read only
Description	This attribute indicates the Peak Cell Rate (PCR) of the ATM VCC to which this interworking function is linked for all cells (with CLP=0 and CLP=1). The *pcr01* attribute is derived from the traffic parameters under the *EthernetQualityOfService* component.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Units	cell/s
Default	No default

ATTRIBUTE La Evc Spvc sustainedCellRate0 (scr0)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the Sustained Cell Rate (SCR) of the ATM VCC to which this interworking function is linked for cells (with CLP=0). The *scr0* attribute is derived from the traffic parameters under the *EthernetQualityOfService* component.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Units	cell/s
Default	No default

ATTRIBUTE La Evc Spvc maximumBurstSize0 (mbs0)

Access	Read only
Description	This attribute indicates the Maximum Burst Size (MBS) of the ATM VCC to which this interworking function is linked for cells (with CLP=0). The *mbs0* attribute is derived from the traffic parameters under the *EthernetQualityOfService* component.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Units	cells
Default	No default

ATTRIBUTE La Evc Spvc minimumDesiredCellRate (mdcr)

Access	Read only
Description	This attribute indicates the minimum desired cell rate (MDCR) which is allocated for each UBR connection. UBR connections normally are serviced on a best effort basis, but this attribute indicates allocation of a default minimum bandwidth for each connection. The *mdcr* attribute is derived from the traffic parameters under the *EthernetQualityOfService* component.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Units	cell/s
Default	No default

ATTRIBUTE La Evc Spvc trafficDescType (tdt)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the type of traffic management which is applied to the received and transmitted directions of this connection as defined in the ATM Forum.
Mib	LanDrivers
Values	1 2 3 4 5 6 7 8 9
Default	No default

ATTRIBUTE La Evc Spvc qosClass (qos)

Access	Read only
Description	This attribute indicates the quality of service for this connection. Class 1 supports a QOS that meets Service Class A performance requirements (circuit emulation, constant bit rate video). Class 2 supports a QOS that meets Service Class B performance requirements (variable bit rate audio and video). Class 3 supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer). Class 4 supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer). Class 0 is the unspecified QOS class; no objective is specified for the performance parameters. A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance.
Mib	LanDrivers
Values	0 1 2 3 4
Default	No default

ATTRIBUTE La Evc Spvc bearerClassBbc (bcBbc)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the bearer capability for this connection. Class ***a*** service is a connection-oriented, constant bit rate ATM transport service. Class ***a*** service has end to end timing requirements and may require stringent cell loss, cell delay and cell delay variation performance.When ***a*** is displayed, the user is requesting more than an ATM only service. The network may look at the AAL to provide interworking based upon its contents. Class ***c*** service is a connection-oriented, variable bit rate ATM transport service. Class ***c*** service has no end-to-end timing requirements.When ***c*** is displayed, the user is requesting more than an ATM only service. The network interworking function may look at the AAL and provide service based on it. Class ***x*** service is a connection-oriented ATM transport service where the AAL, trafficType (***cbr*** or ***vbr***), and timing requirements are user defined (that is, transparent to the network). When the value of this attribute is ***x***, the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocol.
Mib	LanDrivers
Values	a c x
Default	No default

ATTRIBUTE La Evc Spvc bestEffort

Access	Read only
Description	This attribute indicates value of best effort parameter in the ATM Traffic Descriptor Information Element. The value ***indicated*** implies that the quality of service for this connection is not guaranteed. The value ***notIndicated*** implies that the quality of service for this connection is guaranteed.
Mib	LanDrivers
Values	notIndicated indicated
Default	No default

ATTRIBUTE La Evc Spvc packetWiseDiscard (pd)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the current set of packet-wise discard functions in effect in the received and transmitted data directions at this connection point. A value of ***ppd*** indicates that the Partial Packet Discard (PPD) function is in effect. PPD may be applied at an intermediate connecting point for a connection which is transporting frame traffic (AAL5 at the endpoint). PPD is controlled by provisioning the SPVC, and by call setup parameters in the AAL and Traffic Descriptor Information Elements. A value of ***epd*** indicates that the Early Packet Discard (EPD) function is in effect at this connection point.
Mib	LanDrivers
Set of	ppd epd
Default	No default

ATTRIBUTE La Evc Spvc qosParameters (qp)

Access	Read only
Description	This attribute is a vector of three elements that indicate the quality of service parameters for the backward and forward directions for this connection. The ***cdv*** element indicates the acceptable peak-to-peak Cell Delay Variation (CDV) of real-time connections (CBR and rt-VBR). The ***ctd*** element indicates the acceptable maximum Cell Transfer Delay (maxCtd) of real-time connections (CBR and rt-VBR). The ***clr*** element indicates the acceptable Cell Loss Ratio (CLR) of CBR, rt-VBR, and nrt-VBR connections.
Mib	LanDrivers

GROUP La Vlan OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LanDrivers

ATTRIBUTE La Vlan adminState (osiAdmin)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	LanDrivers
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE La Vlan operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	LanDrivers
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE La Vlan usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

Copyright © 2006, Nortel Nortel Confidential

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

down
testing

Default — up

COMPONENT La Vlan EthernetVirtualConnection (Evc)

Groups — GROUP La Vlan Evc Provisioned (Prov)
GROUP La Vlan Evc OsiState (State)
GROUP La Vlan Evc OperationalStatus (OperStatus)
GROUP La Vlan Evc Operational (Oper)
GROUP La Vlan Evc Statistics (Stats)

Scope — Application

Description — *La/x EthernetVirtualConnection*
La/x Vlan/y EthernetVirtualConnection

When this component is added to a *LanApplication* component, it represents a VC that is established between this Ethernet interface and either another Ethernet interface or an ATM UNI VCC.

When this component is added to a *Vlan* component, it represents a VC

Copyright © 2006, Nortel Nortel Confidential

that is established between this Ethernet VLAN and either another Ethernet VLAN or an ATM UNI VCC.

The EVC is established over an ATM PNNI network using an ATM SPVC VCC. It can be configured to use a dedicated ATM transport VC, or to aggregate with other EVCs over a shared ATM transport VC established by the *EthernetTransportSystem* component. This latter option is only available when this component exists under the *LanApplication* component in VLAN-mode, or under a *Vlan* component.

This EVC is used to transparently transport Ethernet v2.0 and IEEE 802.3 frames. These frames are stripped of the Ethernet FCS and encapsulated using RFC2684 bridged mode encapsulation before being transported.

When this component is under the *LanApplication* component in port-mode, and the *EthernetPolicy* component does not exist, the default behavior of EVLS is to accept all frames received from the Ethernet interface. If the *EthernetPolicy* component exists, and the and the *EthernetPolicy unknownVlanIdTreatment* attribute is set to ***discard***, only untagged and priority-tagged frames are accepted, all other frames are discarded and counted by the *EthernetStatistics unknownVlanId* statistic. With this same configuration, and the *unknownVlanIdTreatment* attribute set to ***accept***, all frames are accepted.

When this component is under the *LanApplication* component in VLAN-mode, and the port-VLAN is configured with an EVC, and the *EthernetPolicy* component does not exist, the default behavior of EVLS is to discard all unknown VLAN-tagged frames received from the Ethernet interface. If the *EthernetPolicy* component exists, and the *EthernetPolicy unknownVlanIdTreatment* attribute is set to ***discard***, only untagged, priority-tagged and port-VLAN ID (VID=1) frames are accepted, all other frames are either accepted by a configured *Vlan* component instance, or discarded and counted by the *EthernetStatistics unknownVlanId* statistic. With this same configuration, and the *unknownVlanIdTreatment* attribute set to ***accept***, all untagged, priority-tagged, port-VLAN ID frames and unknown VLAN-tagged frames received from the Ethernet interface are classified as port-VLAN traffic.

Copyright © 2006, Nortel Nortel Confidential

When this component is under the *Vlan* component, only frames with their VID set to this *Vlan* component instance are accepted by this EVC.

Description This group contains the provisioned attributes for the *EthernetVirtualConnection* component.

Mib LanDrivers

ATTRIBUTE La Vlan Evc aggregation (aggr)

Access Read and write

Description This attribute specifies whether to use a dedicated ATM VC to establish the connection, or to aggregate with other EVCs over a shared ATM VC established by the *EthernetTransportSystem* component.

The possible values are:

disabled: this value indicates that this EVC should use a dedicated transport VC established by this component.

enabled: this value indicates that this EVC should be aggregated over a shared transport VC established by the *EthernetTransportSystem* component.

Mib LanDrivers

Values disabled
enabled

Default disabled

ATTRIBUTE La Vlan Evc preserveVlanTag (presVlanTag)

Access Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies whether the VLAN tag is preserved or removed for frames received from the Ethernet interface by this Evc, when the *remoteVlanId* is set to ***0***. This attribute is ignored if the *removeVlanId* attribute for this Evc is set to any other value. When this attribute is set to ***disabled***, the VLAN tag is removed from priority and VLAN-tagged frames received from the Ethernet interface, for this EVC, before being transported across the network as untagged. When this attribute is set to ***enabled***, the VLAN tag is preserved for priority and VLAN-tagged frames received from the Ethernet interface, for this EVC, and transparently transported across the network. If present, the original VID of the frame is preserved. The default is ***enabled***.

Description	This attribute specifies the committed information rate in kilobits per second(k bits/s). It is the rate at which the EVC agrees to transport Ethernet frames under normal conditions, and meets the performance objectives. An exception to this occurs when this attribute is provisioned to be ***0***, the *committedBurstSize* attribute is ignored, in which case all traffic for this EVC is treated as excess traffic. This attribute can be set to ***sameAsEvc***, in order to use the same value as the *EQoS commitedInformationRate* attribute for the policer. It can be also be used to override the provisioned *EQoS committedInformationRate* attribute for the policer. On the 4pGe FP, this value can be configured in increments of 1,000 kbits/s. An increment of less than 1,000 kbits/s is rounded up to the nearest 1,000 kbits/s. On the 4p/8pEth100BaseT FP, this value can be configured in increments of 1 kbit/s.

Description	This group contains the provisioned attributes for the *EthernetQualityOfService* component.
Mib	LanDrivers

ATTRIBUTE La Vlan Evc EQoS committedInformationRate (cir)

Access	Read and write
Description	This attribute specifies the committed information rate (CIR), in kbit per second, for this connection. It is the average rate up to which the network delivers service frames and meets the performance objectives defined by the Ethernet per-hop behavior of this connection. This value is used to derive the sustained cell rate (SCR) traffic management parameter for the ATM VC. Changing the value of this attribute will not take effect until *lock*/*unlock La* or *Vlan* component or *clear* the SPVC connection.
Mib	LanDrivers
Values	Decimal (0..1000000)
Units	kbit/s
Default	10000

ATTRIBUTE La Vlan Evc EQoS excessInformationRate (eir)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the maximum bandwidth, in kbit per second, for this connection. It is the average rate up to which the network may deliver service frames without any performance objectives. This value is used in conjunction with the *EQoS cir* attribute to derive the peak cell rate (PCR) traffic management parameter for the ATM VC. Changing the value of this attribute will not take effect until *lock*/*unlock La* or *Vlan* component or *clear* the SPVC connection.
Mib	LanDrivers
Values	Decimal (0..1000000)
Units	kbit/s
Default	10000

ATTRIBUTE La Vlan Evc EQoS committedBurstSize (cbs)

Access	Read and write
Description	This attribute specifies the maximum number of bits available for use by sequential service frames sent at the Ethernet interface speed to remain CIR-conformant. This value must be divisible by a value of 8. Changing the value of this attribute will not take effect until *lock*/*unlock La* or *Vlan* component or *clear* the SPVC connection.
Mib	LanDrivers
Values	Decimal (80000..100000000)
Units	bits
Default	800000

ATTRIBUTE La Vlan Evc EQoS ethernetPerHopBehavior (ePhb)

Access	Read and write
Description	This attribute specifies the Ethernet per-hop behavior for this connection. It is used to derive the traffic management parameters for the ATM VC. Consistent with the Multiservice Switch Differentiated Services Domain type for IP services, the following mapping is defined for EVLS: The value of ***df*** specifies that the traffic class is standard, the connection class is equal to 0, and the ATM service category is ubr. The value of ***af11*** specifies that the traffic class is bronze, the connection class is equal to 0, and the ATM service category is ubr. The value of ***af21*** specifies that the traffic class is silver, the connection class is equal to 1, and the ATM service category is nrt-vbr.

Copyright © 2006, Nortel Nortel Confidential

The value of ***af31*** specifies that the traffic class is gold, the connection class is equal to 2, and the ATM service category is rt-vbr.

The value of ***ef*** specifies that the traffic class is premium, the connection class is equal to 3, and the ATM service category is cbr.

Changing the value of this attribute will not take effect until *lock*/*unlock La* or *Vlan* component or *clear* the SPVC connection.

Mib	LanDrivers
Values	Decimal (0..63) df af11 af21 af31 ef
Default	df

ATTRIBUTE La Vlan Evc EQoS averageFrameSize (afs)

Access	Read and write
Description	This attribute specifies the expected average frame size, in bytes, for this connection. This average frame size is used to determine the average overhead factor to be used in deriving the SCR and PCR traffic management parameters for the ATM VC. Changing the value of this attribute will not take effect until *lock*/*unlock La* or *Vlan* component or *clear* the SPVC connection.
Mib	LanDrivers
Values	Decimal (64..9182)
Units	bytes
Default	512

GROUP La Vlan Evc EQoS QoSAtmProv (AtmProv)

Properties	Provisioned
Description	This group contains the provisioned attributes related to ATM traffic management parameters for the *EthernetQualityOfService* component.
Mib	LanDrivers

ATTRIBUTE La Vlan Evc EQoS packetWiseDiscard (pd)

Access	Read and write
Description	This attribute specifies whether packet-wise discard functions are to be enabled or disabled in the received and transmitted directions for this connection. Packet-wise discard functions apply to AAL5 frame traffic.

Copyright © 2006, Nortel Nortel Confidential

Packet-wise functions increase the “goodput” of the link. The packet-wise functions are Early Packet Discard (EPD) and Partial Packet Discard (PPD).

EPD allows the connection to discard an entire frame once the transmitted or the received queue has reached the EPD threshold. EPD increases the "goodput" of a link, since discarding an entire frame means that some queue capacity is guarded for some other frame which is already partially transmitted. All cells of the frame are discarded from the Beginning of Message (BOM) cell up to and including the End of Message (EOM) cell.

PPD allows the connection to discard the remainder of a cell-forwarded AAL5 frame if one cell of this frame has been discarded, for example due to UPC. All cells are discarded up to but not including the EOM cell. The PPD function increases the “goodput” of the link, since cells which are only going to be discarded at the AAL5 reassembly point are not transmitted.

A value of ***enabled*** means packet-wise discard functions are applied to receive traffic and transmit traffic at this connection point. A value of ***disabled*** means packet-wise discard functions are not applied to receive traffic and transmit traffic at this connection point.

At a SPVC origin on a PNNI interface, a value of ***enabled*** specifies that frame discard is requested in the forward and the backward direction. When this attribute is set to ***disabled***, forward frame discard and backward frame discard are not requested in the SPVC call setup.

The packet-wise discard functions that are active are visible in the *Spvc packetWiseDiscard* operational attribute.

Scope	Network
Description	*La/x Evc EvcSpvc/m* *La/x Vlan/y Evc EvcSpvc/m*

This component represents one of the SPVC endpoints of the ATM transport connection.

Copyright © 2006, Nortel Nortel Confidential

This component can be dynamically created or provisioned.

When this component is dynamically created, it implicitly indicates that a connection has been established and this SPVC is the called endpoint of the VCC. The *EvcSpvc endPoint* operational attribute is used to indicate the called end. This dynamically created component does not exist when there is no connection.

When this component is provisioned, it implies that this is the calling endpoint of the VCC. It does not imply that a connection is established. A provisioned *EvcSpvc* component allows initiation of the setup request to the called end of the ATM transport connection.

Mib LanDrivers

ATTRIBUTE La Vlan Stats unknownVlanId (unknownVlan)

Access Read only

Description This attribute counts the total number of frames received from this Ethernet interface for a VLAN that is not configured on the interface, and as a result discarded.

When this interface is operating in port-mode and the *EthernetPolicy unknownVlanIdTreatment* value is ***discard***, it counts discarded IEEE 802.1Q VLAN-tagged frames with a non-zero VID.

When this interface is operating in VLAN-mode, it counts discarded IEEE 802.1Q VLAN-tagged frames that have no corresponding *Vlan* component instance configured, and additionally untagged, priority-tagged, and port-VLAN ID tagged (VID=1) frames when the port-VLAN is not configured on this interface.

When the *EthernetPolicy unknownVlanIdTreatment* attribute is set to ***accept***, and the port-VLAN is configured, this counter does not increment.

This counter wraps to zero when it exceeds its maximum value.

Mib LanDrivers

Values Long Integer

Default No default

ATTRIBUTE La Vlan Stats lastUnknownVlanId

Access Read only

Description This attribute indicates the IEEE 802.1Q VLAN identifier of the most recent frame that is discarded due to a mismatch in the *Vlan* component instance on this Ethernet interface.

Copyright © 2006, Nortel Nortel Confidential

When the Ethernet interface is operating in VLAN-mode, this attribute indicates the port-VLAN ID (VID=1) for untagged, priority-tagged and port-VLAN ID tagged frames.

The value of ***notApplicable*** means no traffic with an unknown VLAN Id has been received and the *unknownVlanId* counter is zero.

When the *EthernetPolicy unknownVlanIdTreatment* attribute is set to ***accept,*** this attribute should be ignored.

Criticality	Process
Description	This attribute associates the *LanApplication* with a specific Lan interface such as *Ethernet*, *Fddi*, or *TokenRing*. This also defines the *LogicalProcessor* on which *Framer*'s parent component (as well as *Framer* itself) will run. Only one (1) LAN interface can be linked to a *Framer* except for *Ethernet100BaseT* LAN interface, for which up to two (2) interfaces residing on the same *LogicalProcessor* can be linked.

Mib	LanDrivers
List of	Link (Hardware, applicationFramerName)
List Size	2
Default	No default

GROUP La Framer Statistics (Stats)

Properties	Operational
Description	This group contains the operational statistics data for a *Framer* component. This group is filtered when the *interfaceName* is linked to the *oamEnet* and *ethernet* components provisioned under 6pEth10BaseT, 2pEth100BaseT, 2pGpDsk etc.
Mib	LanDrivers

ATTRIBUTE La Framer lrcErrors

Access	Read only
Description	This attribute counts of the number of frames or cells that have failed the Longintudinal Redundancy Check (LRC) as they were being sent to the link. This check is used to verify the integrity of the data prior to transmission. Usually the problem is on the originating card, with the destination card the only one reporting the error.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE La Framer rxFrames

Access	Read only
Description	This attribute counts the frames received from this interface.
Mib	LanDrivers

COMPONENT LanEmulationClient (Lec)

Instance	Decimal (0..31)
Groups	GROUP Lec CustomerIdentifierData (CidData) GROUP Lec IfEntryProv (IfEntry) GROUP Lec MediaProv (Mp) GROUP Lec Provisioned (Prov) GROUP Lec OsiState (State) GROUP Lec OperationalStatus (OperStatus) GROUP Lec Operational (Oper) GROUP Lec Statistics (Stats)
Scope	Application
Description	*LanEmulationClient/n* This component represents a LAN Emulation Client (LEC) as specified in the ATM Forum LAN Emulation over ATM Specification (LANE). The LEC provides a MAC level emulated Ethernet service to higher layer protocols using ATM VCCs. The 'laneClient' feature must be provisioned on all ILS and ATM cards.
Mib	LaneClient
Dyn. Subcomp.	COMPONENT Lec LeArpEntry (LeArp) COMPONENT Lec Connection (Conn)
Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP Lec CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

Copyright © 2006, Nortel

Nortel Confidential

Mib	LaneClient

ATTRIBUTE Lec customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	LaneClient
Values	Decimal (0; 1..8191)
Default	0

GROUP Lec IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	LaneClient

ATTRIBUTE Lec ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	LaneClient
Values	up down testing
Default	up

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lec ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	LaneClient
Values	Decimal (1..65535)
Default	No default

GROUP Lec MediaProv (Mp)

Properties	Provisioned
Description	This group contains the base provisioning data for the Media Application component.
Mib	LaneClient

ATTRIBUTE Lec linkToProtocolPort (pp)

Access	Read and write
Criticality	Component
Description	This attribute contains a protocol port component name. The attribute associates the application with a protocol port.
Mib	LaneClient
Values	Link (Service, linkToMedia)
Default	No default

GROUP Lec Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the *LanEmulationClient* component.
Mib	LaneClient

ATTRIBUTE Lec lanType

Access	Read and write
Criticality	Component
Description	This attribute specifies the data frame format for this LEC. Auto-configuring LECs use this attribute in their Configure requests. Manually-configured LECs use it in their Join requests. A value of ***unspecified*** implies that the data frame format is obtained from the LECS or LES.

Copyright © 2006, Nortel Nortel Confidential

	The value of this attribute may be overridden by the LECS or LES; *actualLanType* contains the actual value.
Mib	LaneClient
Values	unspecified ethernet
Default	unspecified

ATTRIBUTE Lec maxFrameSize

Access	Read and write
Criticality	Component
Description	This attribute specifies the maximum data frame size for this LEC. Auto-configuring LECs use this attribute in their Configure requests. Manually-configured LECs use it in their Join requests. A value of ***unspecified*** may only be used for auto-configuring LECs.
Mib	LaneClient
Values	unspecified 1516 1580 4544 9234 18190
Units	octets
Default	unspecified

ATTRIBUTE Lec lanName

Access	Read and write
Criticality	Component
Description	This attribute specifies the ELAN name for this LEC. Auto-configuring LECs use this attribute in their Configure requests. Manually-configured LECs use it in their Join requests. An empty string means unspecified. The value of this attribute may be overridden by the LECS or LES; *actualLanName* contains the actual value.
Mib	LaneClient
Values	String (0..32, ASCII)
Default	No default

ATTRIBUTE Lec v2Capable (v2c)

Access	Read and write
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies whether this LEC exhibits LANE v2 behavior where it differs in its requirements from LANE v1 behavior.
Mib	LaneClient
Values	yes no
Default	yes

ATTRIBUTE Lec lecsAddress (lecsAddr)

Access	Read and write
Criticality	Component
Description	This attribute specifies the ATM address of the LECS. If this attribute is non-null, the LEC attempts to set up a Configuration Direct SVC to this address as the first step in the LECS Connect phase. Otherwise, the well known LECS ATM address is used. Only one of the attributes *lecsAddress* and *lesAddress* can be specified at one time.
Mib	LaneClient
Values	String (0..20, Hex)
Default	No default

ATTRIBUTE Lec lesAddress (lesAddr)

Access	Read and write
Criticality	Component
Description	This attribute specifies the ATM address of the LES. The LEC uses this address to connect directly to the LES, thus bypassing the LECS. A LEC which did not use the LECS is deemed to be manually-configured. Only one of the attributes *lecsAddress* and *lesAddress* can be specified at one time.
Mib	LaneClient
Values	String (0..20, Hex)
Default	No default

ATTRIBUTE Lec maxDataSvcs

Access	Read and write
Criticality	Component
Description	This attribute specifies the maximum number of Data Direct SVCs which this LEC can have active at any one time. When operating at the maximum, an SVC setup request releases the oldest 10% of the Data Direct SVCs of this LEC. A SET alarm is issued when *currDataSvcs* rises above 95% of this value

Copyright © 2006, Nortel Nortel Confidential

	and is CLEAR-ed when it falls below 85%. Set *maxDataSvcs* as low as acceptable since a fixed amount of memory is consumed proportional to this value on every LP with this feature present.
Mib	LaneClient
Values	Decimal (16..1018)
Default	16

ATTRIBUTE Lec maxArpEntries

Access	Read and write
Criticality	Component
Description	This attribute specifies the maximum number of entries which this LEC can have in its LE_ARP table at any one time. When operating at the maximum, if an additional entry must be installed, up to 10% of the oldest entries are removed. A SET alarm is issued when *currArpEntries* rises above 95% of this value and is CLEAR-ed when it falls below 85%.
Mib	LaneClient
Values	Decimal (32..10240)
Default	5120

ATTRIBUTE Lec ilsForwarder (ilsFwdr)

Access	Read and write
Criticality	Component
Description	This attribute specifies the *IlsForwarder* that this LEC is using.
Mib	LaneClient
Values	Link (Service, linkToTrafficSource)
Default	No default

GROUP Lec OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LaneClient

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lec adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	LaneClient
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lec operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	LaneClient
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lec usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib	LaneClient
Values	idle active (activ) busy
Default	idle

GROUP Lec OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	LaneClient

ATTRIBUTE Lec snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	LaneClient
Values	up down testing
Default	up

GROUP Lec Operational (Oper)

Properties	Operational
Description	This group contains the operational status attributes of the *LanEmulationClient* component.
Mib	LaneClient

ATTRIBUTE Lec actualLanType (actLanType)

Access	Read only
Description	This attribute indicates the data frame format of this LEC. This may come from the *lanType* attribute, LECS or LES. The data frame format is not

Copyright © 2006, Nortel Nortel Confidential

unspecified for an operational LEC.
This attribute represents the ‘C2’ LEC state parameter in the ATM Forum LANE specification.

Token Ring data frame format is not supported. The LEC does not become operational if the LECS or LES specify a LAN type of Token Ring.

Mib	LaneClient
Values	unspecified ethernet
Default	No default

ATTRIBUTE Lec actualMaxFrameSize (actMaxFrameSize)

Access	Read only
Description	This attribute indicates the maximum data frame size of this LEC. This may come from the *maxFrameSize* attribute, LECS or LES. The value is not ***unspecified*** for an operational LEC.
Mib	LaneClient
Values	unspecified 1516 1580 4544 9234 18190
Units	octets
Default	No default

ATTRIBUTE Lec actualLanName (actLanName)

Access	Read only
Description	This attribute indicates the name of the ELAN to which this LEC is connected. This may come from the *lanName* attribute, LECS or LES. It may be null for an operational LEC. This attribute represents the ‘C5’ LEC state parameter in the ATM Forum LANE specification.
Mib	LaneClient
Values	String (0..32, ASCII)
Default	No default

ATTRIBUTE Lec elanId

Access	Read only
Description	This attribute identifies the ELAN to which this LEC is connected. For v2, the value will be set in the configuration phase,

Copyright © 2006, Nortel Nortel Confidential

Mib	LaneClient
Values	Decimal (0..4294967295)

ATTRIBUTE Lec actualV2Capable (v2)

Access	Read only
Description	This attribute indicates whether this LEC exhibits LANE v2 behavior. The value is set in the Join phase.
Mib	LaneClient
Values	yes no
Default	No default

ATTRIBUTE Lec configurationSource (configSource)

Access	Read only
Description	This attribute indicates whether this LEC used the LECS, and if so, the method used to establish the Configuration Direct VCC.
Mib	LaneClient
Values	usedProvisionedLecsAddress gotLecsAddressViaIlmi usedWellKnownLecsAddress usedLecsPvc didNotUseLecs
Default	No default

ATTRIBUTE Lec actualLecsAddress (actLecsAddr)

Access	Read only
Description	This attribute indicates the ATM address of the LECS used to configure this LEC. The address is null if the LECS was not used.
Mib	LaneClient
Values	String (0..20, Hex)
Default	No default

ATTRIBUTE Lec actualLesAddress (actLesAddr)

Access	Read only
Description	This attribute indicates the ATM address of the LES which is currently serving this LEC. The address is not null for an operational LEC. This attribute represents the ‘C9’ LEC state parameter in the ATM Forum LANE specification.

Copyright © 2006, Nortel Nortel Confidential

Mib	LaneClient
Values	String (0..20, Hex)
Default	No default

ATTRIBUTE Lec atmAddress (atmAddr)

Access	Read only
Description	This attribute indicates the ATM address of this LEC. This attribute represents the 'C1' LEC state parameter in the ATM Forum LANE specification.
Mib	LaneClient
Values	String (0..20, Hex)
Default	No default

ATTRIBUTE Lec macAddress (macAddr)

Access	Read only
Description	This attribute indicates the MAC address of this LEC. This attribute represents the 'C6' LEC state parameter in the ATM Forum LANE specification.
Mib	LaneClient
Values	String (6, Dashed Hex)
Default	No default

ATTRIBUTE Lec lecId

Access	Read only
Description	This attribute indicates the LANE Client Identifier (LECID) assigned to this LEC by the LES during the Join phase. The LECID uniquely identifies a LEC on a particular ELAN. This attribute represents the 'C14' LEC state parameter in the ATM Forum LANE specification.
Mib	LaneClient
Values	Decimal (0..65279)
Default	No default

ATTRIBUTE Lec interfaceState

Access	Read only
Description	This attribute indicates the current state of the LEC. Note that *ifOperStatus* is ***up*** only when *interfaceState* is ***operational***. - ***initialState***: Some parameters (such as addresses and ELAN name) are known to the LEC.

Copyright © 2006, Nortel Nortel Confidential

- ***lecsConnect***: LEC establishes Configuration Direct VCC to LECS. Manually-configured LECs skip this state.
- ***configure***: LEC discovers LES.
- ***join***: LEC establishes control connections to LES. LEC is assigned unique LECID and knows all ELAN parameters.
- ***initialRegistration***: LEC may register additional MAC addresses with LES. This is in addition to the single MAC address registered during Join phase.
- ***busConnect***: LEC issues LE_ARP to locate the BUS and sets up the connection. The BUS then establishes the Multicast Forward VCC to the LEC.
- ***operational***: LEC is operational and can forward data traffic.

Mib: LaneClient

Values:
initialState
lecsConnect
configure
join
initialRegistration
busConnect
operational

Default: No default

ATTRIBUTE Lec lastFailureResponseCode

Access: Read only

Description: The attribute indicates the status code from the last failed Configure or Join response. Failed responses are those for which the LE_CONFIGURE_RESPONSE / LE_JOIN_RESPONSE frame contains a non-zero code, or fails to arrive within a time-out period. If none of the LEC's requests have failed, this attribute has the value ***none***.

Mib: LaneClient

contains information about the binding of one MAC address to one ATM address.

Mib	LaneClient
Common Verbs	Help List Display

VERB Clear Lec LeArp

Impact	Passive
Description	*Clear Lec/n LeArp/<Mac Address>* This verb removes the specified entry from the LE_ARP table.

GROUP Lec LeArp **Operational (Oper)**

Properties	Operational
Description	This group contains the operational attributes of the *LeArpEntry* component.
Mib	LaneClient

ATTRIBUTE Lec LeArp **atmAddress (atmAddr)**

Access	Read only
Description	This attribute indicates the ATM address of the BUS or LEC associated with the MAC address of this entry. If the MAC address is the all-ones broadcast address, the entry is for the BUS.
Mib	LaneClient
Values	String (20, Hex)
Default	No default

ATTRIBUTE Lec LeArp **isRemoteAddress (remote)**

Access	Read only
Description	This attribute indicates whether this entry is for a local or remote MAC address. In this context, ‘local’ means a MAC address that is local to a LEC, and ‘remote’ means a MAC address for which the LEC is proxy. If ***yes***, the address is believed to be remote, or its local/remote status is unknown. If ***no***, the address is believed to be local; that is, registered with the LES by the LEC whose ATM address is *atmAddress*.
Mib	LaneClient
Values	yes no
Default	No default

Copyright © 2006, Nortel Nortel Confidential

COMPONENT LocalMedia

Scope	Application
Description	*LocalMedia* The *LocalMedia* component represents a logical media and provides a functional interface to the APCs that are unaware of the *VirtualRouter* and Nortel Networks Multiservice Switch IP architecture. There may be at most one instance of the *LocalMedia* component. The component can be used to support inter-APC communication, or APC communication with external nodes.

ProtocolPort component which has only one *LogicalInterface* subcomponent.

Mib	LocalMedia
Dyn. Subcomp.	COMPONENT LocalMedia If PsfpIpServer (Pips)
Common Verbs	Help List Display Add DELete

GROUP LocalMedia If CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	LocalMedia

ATTRIBUTE LocalMedia If customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	LocalMedia
Values	Decimal (0; 1..8191)
Default	0

GROUP LocalMedia If IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.

Copyright © 2006, Nortel Nortel Confidential

Mib	LocalMedia

ATTRIBUTE LocalMedia If **ifAdminStatus (ifState)**

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	LocalMedia
Values	up down testing
Default	up

ATTRIBUTE LocalMedia If **ifIndex (ifI)**

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	LocalMedia
Values	Decimal (1..65535)
Default	No default

GROUP LocalMedia If **MediaProv (Mp)**

Properties	Provisioned
Description	This group contains the base provisioning data for the media base component.
Mib	LocalMedia

ATTRIBUTE LocalMedia If **linkToProtocolPort (pp)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the *ProtocolPort* to which this interface is linked to. The protocol port is the logical interface to the network. The protocol port component describes the logical characteristics of this interface.
Mib	LocalMedia
Values	Link (Service, linkToMedia)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

GROUP LocalMedia If Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the *If* component.
Mib	LocalMedia

ATTRIBUTE LocalMedia If maxTransmissionUnit (mtu)

Access	Read and write
Description	This attribute specifies the size of the largest datagram which can be sent on the interface. This includes the size of the header (if applicable) as well as the protocol data unit.
Mib	LocalMedia
Values	Decimal (256..9180)
Units	octets
Default	9180

ATTRIBUTE LocalMedia If trafficType (tt)

Access	Read and write
Criticality	Component
Description	This attribute specifies the supported traffic types of the *LocalMedia If* component. It contains one or more of the following values.***Rnc***, ***Cpds***, ***CpdsCoreNetwork, internalTraffic, locationServices***. ***Rnc***: This traffic type supports all types of traffic in RNC-IN. ***Cpds***: This traffic type supports all types of traffic in CPDS, except the traffic between PCU and PDSN. ***CpdsCoreNetwork***: This traffic type supports traffic between PCU and PDSN. ***internalTraffic***: This traffic type supports movable IP and PsfpIpServer feature. ***locationServices***: This traffic type supports AGPS feature.
Mib	LocalMedia
Set of	rnc cpds cpdsCoreNetwork internalTraffic locationServices
Default	No default

Copyright © 2006, Nortel Nortel Confidential

GROUP LocalMedia If OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	LocalMedia

ATTRIBUTE LocalMedia If snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	LocalMedia
Values	up down testing
Default	up

GROUP LocalMedia If OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LocalMedia

ATTRIBUTE LocalMedia If adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

	permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	LocalMedia
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE LocalMedia lf operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	LocalMedia
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE LocalMedia lf usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	LocalMedia
Values	idle active (activ) busy
Default	idle

GROUP LocalMedia If Pips Ip Statistics (Stats)

Properties	Operational
Description	This group contains the Internet Protocol (IP) related statistical attributes.
Mib	LocalMedia

ATTRIBUTE LocalMedia If Pips Ip inReceives (inRcvs)

Access	Read: All Write: Illegal
Description	This attribute counts all the incoming datagrams, including those counted in inErrors and inUnknownProtocols. The counter wraps to zero when it exceeds the maximum value.
Mib	LocalMedia
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE LocalMedia If Pips Ip inErrors (inErrs)

Access	Read: All Write: Illegal
Description	This attribute counts the input datagrams discarded due to errors in their IP headers, version number mismatch, other format errors, and time-to-live exceeded which have not already been filtered by the Virtual Router's IP forwarder. The counter wraps to zero when it exceeds the maximum value.
Mib	LocalMedia
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE LocalMedia If Pips Ip inUnknownProtocols (inUnkProtos)

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol. The counter wraps to zero when it exceeds the maximum value.
Mib	LocalMedia
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE LocalMedia If Pips Ip inDelivers

Access	Read: All Write: Illegal
Description	This attribute counts the input datagrams successfully delivered to the IP user-protocols (including Internet Control Message Protocol (ICMP)). The counter wraps to zero when it exceeds the maximum value.
Mib	LocalMedia
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE LocalMedia If Pips Ip outRequests (outReqs)

Access	Read: All Write: Illegal
Description	This attribute counts the datagrams which the local IP user-protocols (including Internet Control Message Protocol (ICMP)) supplied to IP in requests for transmission. The counter wraps to zero when it exceeds the maximum value.
Mib	LocalMedia
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE LocalMedia If Pips Ip reasmTimeOuts (reasmTo)

Access	Read: All Write: Illegal
Description	This attribute counts the IP packet reassembly time-outs at the receiving PsfpIpServer. The counter wraps to zero when it exceeds the maximum value.
Mib	LocalMedia
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE LocalMedia If Pips Ip reasmRequireds (reasmReqds)

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Description	This attribute counts the IP packets with the reassembly bit set. The counter wraps to zero when it exceeds the maximum value.
Mib	LocalMedia
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE LocalMedia If Pips Ip reasmOks

Access	Read: All Write: Illegal
Description	This attribute counts the IP packets successfully reassembled by the PsfpIpServer. The counter wraps to zero when it exceeds the maximum value.
Mib	LocalMedia
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE LocalMedia If Pips Ip reasmFails

Access	Read: All Write: Illegal
Description	This attribute counts the number of times the PsfpIpServer is unable to assemble IP-fragments for any reason. The counter wraps to zero when it exceeds the maximum value.
Mib	LocalMedia
Values	Decimal (0..4294967295)
Default	No default

COMPONENT LpGroup (LpG)

Instance	Decimal (1..7)
Scope	Device
Description	*LpGroup/n* The *LpGroup* (*LpG*) component is a root component representing an application-level equipment sparing in a multiple *Lp* protection model between pairs or groups of FPs of the same or different card types. An example of when to use this component is when you want to provide protection among a group of unprotected cards during software migration. In this situation, *LpG* is used as the parent component for a list of cards destined to move either to the migration shelf or to stay in the service shelf in the event of software migration.

COMPONENT LpPair (LpP)

Instance	Integer Sequence (0..15; 0..15)
Scope	Application
Description	*LpPair/m.n* This component represents a pair of LPs, *LP/m* and *LP/n*. There are no real instances of this component which you can issue commands against. It is solely for the purpose of alarm handling for other components which can link to two LPs (for example, via a *LineAutomaticProtectionSwitching*, or *Laps*, component). These other components are typically spared across the two LPs, which means that the LP hierarchical clear alarms alone are not sufficient to properly clear certain alarms; use of the *LpPair* component does provide this. Thus, the name of an *LpPair* can appear in the related component name field of an alarm so that subsequent alarm clearing can be handled appropriately. It can also appear in the component name field of an alarm, for a hierarchical clear against the pair of LPs and for components which are spared across the two LPs. The LP alarms and their fields remain unchanged.

VERB RESET Lp

Impact Service

Description

Reset Lp/n
Reset -force Lp/0

This command is used to reset the processor card on which this *LP* is currently running. Resetting a processor card implies: (1) resetting the hardware (as if the card had just been powered on), (2) performing the card's self-tests, and (3) reloading the software.

A *Reset* command issued against the CP (*Lp/0*) causes it to reload from the committed provisioning data file.

A *Reset* command issued against an FP causes it to reload the same software it was already running. This is the software load that is derived from the provisioning data in the CP's current view (this may or may not be the committed view).

Options:
-force
This option causes the reset to occur against lp/0 even if the current or edit view differs from the committed view, or if the standby OAM Ethernet port is not available, or if the standby CP is currently loading the committed provisioning data file. Use of this option would cause the loss of data in any unsaved view, and any FPs running uncommitted data would restart. On any lp other than lp/0, -force has no meaning.

Copyright © 2006, Nortel Nortel Confidential

VERB RESTART Lp

Impact	Service
Description	*Restart Lp/n* *Restart -force Lp/0* This command is used to restart the processor card on which this *LP* is currently running. Restarting a processor card causes the software to reinitialize itself and behave as if it had just been reloaded. A *Restart* command issued against the CP (*Lp/0*) causes it to restart using the committed provisioning data. **Options:** *-force* This option causes the restart to occur against lp/0 even if the current or edit view differs from the committed view, or if the standby OAM Ethernet port is not available, or if the standby CP is currently loading the committed provisioning data file. Use of this option would cause the loss of data in any unsaved view, and any FPs running uncommitted data would restart. On any lp other than lp/0, -force has no meaning.

VERB RELOADcp (Reload) Lp

Impact	Service
Description	*ReloadCp -force -filename(<name>) Lp/0* This command is used to force the CP to reload using a specified provisioning file instead of using the committed provisioning file. The command has a parameter that specifies the name of the file to use.

Copyright © 2006, Nortel Nortel Confidential

VERB SWITCHover Lp

Impact	Service
Description	*Switchover Lp/n* *Switchover -time(yyyy-mm-dd hh:mm) Lp/n* *Switchover -cancel Lp/n* *Switchover -force Lp/0* This command forces a sparing operation to occur. The *spareCard* becomes active if the *mainCard* is currently active or, alternatively, the *mainCard* becomes active if the *spareCard* is currently active. **Options:** *-time* This option is used to specify the time when a scheduled switchover is to take effect. *-cancel* *This option is used to cancel a scheduled switchover.* *-force* This option causes the switchover to occur even if the current or edit view differs from the committed view. Use of this option would cause the loss of data in any unsaved view. In addition, any FPs running uncommitted data would restart.

GROUP Lp Provisioned (Prov)

Properties	Provisioned
Description	This Group contains the provisionable attributes for the *LP* component.
Mib	LogicalProcessor

ATTRIBUTE Lp mainCard (main)

Access	Read and write
Description	This is the preferred processor card on which this *LP* should be assigned.
Mib	LogicalProcessor
Values	Link (Service, configuredLPs)
Default	No default

ATTRIBUTE Lp spareCard (spare)

Access	Read and write
Description	This is the spare processor card on which this *LP* should be assigned.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor
Values	Link (Service, configuredLPs)
Default	No default

ATTRIBUTE Lp logicalProcessorType (lpt)

Access	Read and write
Description	This is the Logical Processor Type (LPT) that determines which software this *LP* will run.
Mib	LogicalProcessor
Values	Link (Service, logicalProcessors)
Default	No default

ATTRIBUTE Lp oneForNSparingBehavior

Access	Read and write
Description	This attribute specifies the sparing behavior in a 1 for N sparing configuration when a main card fails. If the attribute value is ***delayedSwitchOver***, the failure of a main card to recover as the active card will initiate a switchover to the spare card. This sparing behavior gives the failed main card a chance to recover and hence allows the main cards to remain protected by the spare card. If the attribute value is ***immediateSwitchOver***, the failure of a main card initiates an immediate switchover to the spare card. This sparing behavior provides greater emphasis on reducing outage time for a failed main card at the expense of leaving the other main cards unprotected.
Mib	LogicalProcessor
Values	delayedSwitchOver (delayedSO) immediateSwitchOver (immediateSO)
Default	delayedSwitchOver

ATTRIBUTE Lp linkToApplications

Access	Read only
Description	This attribute allows applications to link themselves directly to the *LP* component.
Mib	LogicalProcessor
List of	Link
List Size	2016
Default	No default

Copyright © 2006, Nortel Nortel Confidential

GROUP Lp CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	LogicalProcessor

ATTRIBUTE Lp customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	LogicalProcessor
Values	Decimal (0; 1..8191)
Default	0

GROUP Lp OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LogicalProcessor

ATTRIBUTE Lp adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib — LogicalProcessor

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Lp operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib — LogicalProcessor

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Lp usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

Copyright © 2006, Nortel Nortel Confidential

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	LogicalProcessor
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	LogicalProcessor
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Lp proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib — LogicalProcessor

Set of — initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default — No default

ATTRIBUTE Lp controlStatus (osiCntrl)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib — LogicalProcessor

Set of — subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default — No default

ATTRIBUTE Lp alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	LogicalProcessor
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Lp standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service

Copyright © 2006, Nortel Nortel Confidential

but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib LogicalProcessor

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default notSet

ATTRIBUTE Lp unknownStatus (osiUnknw)

Access Read only

Description This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Mib LogicalProcessor

Values
false
true

Default false

GROUP Lp Operational (Oper)

Properties Operational

Description
This Group contains the operational attributes for the LP component.

Mib LogicalProcessor

ATTRIBUTE Lp activeCard

Access Read only

Description
This attribute indicates on which card this LP is currently running (if any).

Mib LogicalProcessor

Copyright © 2006, Nortel Nortel Confidential

Values	The name of the component
Default	No default

ATTRIBUTE Lp mainCardStatus

Access	Read only
Description	This attribute specifies the status of this LP's main card. The following values have been defined: ***notProvisioned***— No main card has been provisioned. ***notAvailable***— The main card is not available. ***available***— The main card is available (running as standby). ***active***— The main card is running as active.
Mib	LogicalProcessor
Values	notProvisioned notAvailable available active
Default	No default

ATTRIBUTE Lp spareCardStatus

Access	Read only
Description	This attribute specifies the status of this LP's spare card. The following values have been defined: ***notProvisioned***— No spare card has been provisioned. ***notAvailable***— The spare card is not available. ***alreadyInUse***— The spare card is already in use by another LP. ***available***— The spare card is available (running as standby). ***active***— The spare card is running as active.
Mib	LogicalProcessor
Values	notProvisioned notAvailable alreadyInUse available active
Default	No default

ATTRIBUTE Lp restartOnCpSwitch

Access	Read only
Description	This attribute indicates whether the *Lp* always restarts upon a CP switchover. The value is ***true*** if the *featureList* of the associated *Sw Lpt* component

Copyright © 2006, Nortel Nortel Confidential

	contains a feature that does not support hitless CP switchover. The value is also ***true*** when the ***noHitlessCpSwitch*** feature is provisioned on the CP. A value of ***false*** does not guarantee “no restart”; dynamic conditions may still result in an FP restart when a CP switchover occurs.
Mib	LogicalProcessor
Values	false true
Default	No default

ATTRIBUTE Lp scheduledSwitchover

Access	Read only
Description	This attribute indicates the execution time of the scheduled switchover. When there is no switchover scheduled the time is equals to 0 (0000-00-00 00:00).
Mib	LogicalProcessor
Values	Time (DHM)
Default	No default

GROUP Lp Utilization (Util)

Properties	Operational
Description	This group contains the operational attributes that specify the processor’s utilization levels. When this group exists for an LP component, the attributes are representative of the active card.
Mib	LogicalProcessor

ATTRIBUTE Lp timeInterval

Access	Read only
Description	This attribute indicates the time period for which the average, minimum, and maximum utilization values are calculated. This attribute is reset to 0 every 15 minutes.
Mib	LogicalProcessor
Values	Decimal (0..15)
Units	minutes
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp cpuUtil

Access	Read only
Description	This attribute indicates an approximation of the current processor utilization level (expressed as a percentage).
Mib	LogicalProcessor
Values	Decimal (0..100)
Units	%
Default	No default

ATTRIBUTE Lp cpuUtilAvg

Access	Read only
Description	This attribute indicates an average processor utilization level over the specified time period, *timeInterval*. This average is calculated based on one minute CPU utilization averages.
Mib	LogicalProcessor
Values	Decimal (0..100)
Units	%
Default	No default

ATTRIBUTE Lp cpuUtilAvgMin

Access	Read only
Description	This attribute indicates the minimum processor utilization level over a specified time period, *timeInterval*. This is based on one minute CPU utilization averages.
Mib	LogicalProcessor
Values	Decimal (0..100)
Units	%
Default	No default

ATTRIBUTE Lp cpuUtilAvgMax

Access	Read only
Description	This attribute indicates the maximum processor utilization level over a specified time period, *timeInterval*. This is based on one minute CPU utilization averages.

GROUP Lp Bso CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	LogicalProcessor

ATTRIBUTE Lp Bso customerIdentifier (cid)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	LogicalProcessor
Values	Decimal (0; 1..8191)
Default	0

GROUP Lp Bso Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning data for a *BridgedSonet* component.
Mib	LogicalProcessor

ATTRIBUTE Lp Bso portBridgeGroupLink (pbgl)

Access	Read and write
Description	This attribute specifies the name of the *Pbg* component. The specified *Pbg* component provides port bridging for a SONET line specified by *Pbg/n workingLine* and this *BridgedSonet* component.
Mib	LogicalProcessor
Values	Link
Default	No default

GROUP Lp Bso OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor

ATTRIBUTE Lp Bso adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	LogicalProcessor
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp Bso operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	LogicalProcessor
Values	enabled (ena) disabled (dis)

Copyright © 2006, Nortel Nortel Confidential

Default	disabled

ATTRIBUTE Lp Bso usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	LogicalProcessor
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp Bso availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Default — No default

ATTRIBUTE Lp Bso proceduralStatus (osiProc)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform

Copyright © 2006, Nortel Nortel Confidential

its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib — LogicalProcessor

Set of — initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default — No default

ATTRIBUTE Lp Bso controlStatus (osiCntrl)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Default	No default

ATTRIBUTE Lp Bso alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	LogicalProcessor
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Lp Bso standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

GROUP Lp Enet CustomerIdentifierData (CidData)

Properties: Provisioned

Description: This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

Mib: Enet

ATTRIBUTE Lp Enet customerIdentifier (cid)

Access: Read and write

Description: This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

ATTRIBUTE Lp Enet Test frmSize (size)

Access	Read and write
Description	This attribute defines the size of the test data frames in number of bytes.
Mib	Enet
Values	Decimal (4..4096)
Units	bytes
Default	1024

ATTRIBUTE Lp Enet Test duration (duration)

Access	Read and write
Description	This attribute specifies the duration of the test data transmission. In the case of an externalLoop, this is the time that the loop is in effect. Note that dataStartDelay does not apply to the externalLoop.
Mib	Enet
Values	Decimal (1..30240)
Units	minutes
Default	1

GROUP Lp Enet Test Results (Results)

Properties	Operational
Description	This group contains all the statistics related attributes of the Test component.
Mib	Enet

ATTRIBUTE Lp Enet Test elapsedTime

Access	Read only
Description	This attribute is the number of minutes elapsed since the test started for an externalLoop test. For a data test, this is the time since test data was first transmitted.

Copyright © 2006, Nortel Nortel Confidential

Mib	Enet
Values	Decimal (0..4294967295)
Units	minutes
Default	0

ATTRIBUTE Lp Enet Test timeRemaining

Access	Read only
Description	This attribute is the number of minutes remaining before the test is to be stopped according to the duration attribute.
Mib	Enet
Values	Decimal (0..4294967295)
Units	minutes
Default	0

ATTRIBUTE Lp Enet Test causeOfTermination

Access	Read only
Description	This attribute records the reason the test is terminated.
Mib	Enet
Values	testTimeExpired stoppedByOperator unknown neverStarted testRunning
Default	neverStarted

ATTRIBUTE Lp Enet Test frmTx

Access	Read only
Description	This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.
Mib	Enet
Values	Long Integer
Default	No default

ATTRIBUTE Lp Enet Test bitsTx

Access	Read only
Description	This attribute counts the bits sent during the test period. This counter is not expected to reach its maximum value.

DELete
LOCK
Unlock

GROUP Lp Fi CustomerIdentifierData (CidData)

Properties: Provisioned

Description: This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

Mib: LanDrivers

ATTRIBUTE Lp Fi customerIdentifier (cid)

Access: Read and write

Description: This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component.

Copyright © 2006, Nortel
Nortel Confidential

	Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers.
Mib	LanDrivers
Values	Decimal (0; 1..8191)
Default	0

GROUP Lp Fi IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	LanDrivers

ATTRIBUTE Lp Fi ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	LanDrivers
Values	up down testing
Default	up

ATTRIBUTE Lp Fi ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	LanDrivers
Values	Decimal (1..65535)
Default	No default

GROUP Lp Fi SmtProvisioned (SmtProv)

Properties	Provisioned
Description	This group contains the provisionable Station Management (SMT) attributes of the *Fddi* component.
Mib	LanDrivers

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Fi userData

Access	Read and write
Description	The user data field is used to identify the FDDI interface on the ring. The user data contains a message with a maximum of 32 characters.
Mib	LanDrivers
Values	String (0..32, ASCII)
Default	FDDI

ATTRIBUTE Lp Fi acceptAa

Access	Read and write
Description	The *acceptAa* attribute defines the station type A to station type A connection policy. If ***enabled***, the connection will be accepted. If ***disabled***, the connection will be rejected.
Mib	LanDrivers
Values	enabled disabled
Default	disabled

ATTRIBUTE Lp Fi acceptBb

Access	Read and write
Description	The *acceptBb* attribute defines the station type B to station type B connection policy. If ***enabled***, the connection will be accepted. If ***disabled***, the connection will be rejected.
Mib	LanDrivers
Values	enabled disabled
Default	disabled

ATTRIBUTE Lp Fi acceptAs

Access	Read and write
Description	The *acceptAs* attribute defines the station type A to station type S connection policy. If ***enabled***, the connection will be accepted. If ***disabled***, the connection will be rejected.
Mib	LanDrivers
Values	enabled disabled
Default	disabled

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Fi acceptBs

Access	Read and write
Description	The *acceptBs* attribute defines the station type B to station type S connection policy. If ***enabled***, the connection will be accepted. If ***disabled***, the connection will be rejected.
Mib	LanDrivers
Values	enabled disabled
Default	disabled

ATTRIBUTE Lp Fi acceptAm

Access	Read and write
Description	The *acceptAm* attribute defines the station type A to station type M connection policy. If ***enabled***, the connection will be accepted. If ***disabled***, the connection will be rejected.
Mib	LanDrivers
Values	enabled disabled
Default	enabled

ATTRIBUTE Lp Fi acceptBm

Access	Read and write
Description	The *acceptBm* attribute defines the station type B to station type M connection policy. If ***enabled***, the connection will be accepted. If ***disabled***, the connection will be rejected.
Mib	LanDrivers
Values	enabled disabled
Default	enabled

ATTRIBUTE Lp Fi useThruBa

Access	Read and write
Description	The *useThruBa* attribute is used to configure the requested path of the associated station. If ***enabled***, only the secondary preferred path is permitted. If ***disabled***, only the primary preferred path is permitted.
Mib	LanDrivers
Values	enabled disabled

Copyright © 2006, Nortel Nortel Confidential

Default	disabled

ATTRIBUTE Lp Fi neighborNotifyInterval

Access	Read and write
Description	The *neighborNotifyInterval* attribute contains the amount of time, expressed in seconds, between neighbor notification frames.
Mib	LanDrivers
Values	Decimal (2..30)
Units	seconds
Default	30

ATTRIBUTE Lp Fi statusReportPolicy

Access	Read and write
Description	The *statusReportPolicy* attribute indicates whether or not the station will generate status reporting frames for its implemented events and conditions. If ***true***, the station will generate the status frames. If ***false***, the station will not generate the status frames.
Mib	LanDrivers
Values	true false
Default	true

ATTRIBUTE Lp Fi traceMaxExpirationTimer (traceExp)

Access	Read and write
Description	The *traceMaxExpirationTimer* attribute is used to configure the maximum propagation time, expressed in milliseconds, for a trace on a FDDI topology. This value places a lower bound on the detection time for an unrecovered ring.
Mib	LanDrivers
Values	Decimal (0..1000000)
Units	msec
Default	7000

ATTRIBUTE Lp Fi applicationFramerName (framer)

Access	Read and write
Criticality	Process
Description	This attribute contains the component name of a *Framer* which is associated with the *Fddi* component. This defines which *LanApplication/n Framer* will be using this *Fddi* interface.

Copyright © 2006, Nortel Nortel Confidential

Mib	LanDrivers
Values	Link (Service, interfaceName)
Default	No default

GROUP Lp Fi MacProvisioned (MacProv)

Properties	Provisioned
Description	This group contains the provisionable MAC attributes of the *Fddi* component.
Mib	LanDrivers

ATTRIBUTE Lp Fi tokenRequestTimer (tReq)

Access	Read and write
Description	The *tokenRequestTimer* value contains the token request value assigned to the associated medium access controller (MAC). Warning: Changes to this attribute can have adverse effects on the performance of the FDDI ring. Therefore it is recommended that this parameter only be modified by personnel with a thorough understanding of the consequences that may result from changes to this attribute.
Mib	LanDrivers
Values	Decimal (20480..1340000000)
Units	nsec
Default	165290000

ATTRIBUTE Lp Fi tokenMaxTimer (tMax)

Access	Read and write
Description	The *tokenMaxTimer* value is the maximum timer value the negotiated token rotation time may assume. Warning: Changes to this attribute can have adverse effects on the performance of the FDDI ring. Therefore it is recommended that this parameter only be modified by personnel with a thorough understanding of the consequences that may result from changes to this attribute.
Mib	LanDrivers
Values	Decimal (40960..1342200000)
Units	nsec
Default	167770000

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Fi validTransmissionTimer (tvx)

Access	Read and write
Description	The *validTransmissionTimer* (Tvx) value specifies the amount of time required for a valid transmission. The station must receive a valid transmission once every Tvx. Warning: Changes to this attribute can have adverse effects on the performance of the FDDI ring. Therefore it is recommended that this parameter only be modified by personnel with a thorough understanding of the consequences that may result from changes to this attribute.
Mib	LanDrivers
Values	Decimal (40960..1342200000)
Units	nsec
Default	2621400

GROUP Lp Fi AdminInfo (AdminInfo)

Properties	Provisioned
Description	This group contains the attributes pertaining to the vendor of the equipment.
Mib	LanDrivers

ATTRIBUTE Lp Fi vendor

Access	Read and write
Description	This is the name of the vendor supplying the facility.
Mib	LanDrivers
Values	String (0..20, ASCII)
Default	No default

ATTRIBUTE Lp Fi commentText

Access	Read and write
Description	Any miscellaneous text about the facility.
Mib	LanDrivers
Values	String (0..60, ASCII)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Fi includeAdminInfoInAlarm

Access	Read and write
Description	This attribute specifies that user defined text contained in *vendor* and *commentText* attributes of this *VendorInfo* instance will be appended to the comment text of any alarms, excluding hardware initialization alarms, for the associated interface port if this attribute is set to on.
Mib	LanDrivers
Values	no yes
Default	no

GROUP Lp Fi OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LanDrivers

ATTRIBUTE Lp Fi adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	LanDrivers
Values	locked (lck) unlocked (unlck) shuttingDown (shut)

Copyright © 2006, Nortel Nortel Confidential

Default	unlocked

ATTRIBUTE Lp Fi operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	LanDrivers
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp Fi usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	LanDrivers
Values	idle active (activ) busy
Default	idle

GROUP Lp Fi OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	LanDrivers

ATTRIBUTE Lp Fi snmpOperStatus

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	LanDrivers
Values	up down testing
Default	up

GROUP Lp Fi SmtOperational (SmtOper)

Properties	Operational
Description	This group contains the operational station management (SMT) attributes of the *Fddi* component.
Mib	LanDrivers

ATTRIBUTE Lp Fi version

Access	Read only
Description	The *version* attribute contains a copy of the currently supported version numbers of the management information base (MIB) and the station management (SMT).
Mib	LanDrivers
Values	String (0..32, ASCII)
Default	No default

ATTRIBUTE Lp Fi bypassPresent

Access	Read only
Description	The *bypassPresent* attribute indicates whether the optical bypass switch is present on its AB port pair. If ***true***, the optical bypass switch is present. If ***false***, it is not present.
Mib	LanDrivers
Values	true false
Default	No default

ATTRIBUTE Lp Fi ecmState

Access	Read only
Description	The *ecmState*, Entity Coordination Manager (ECM), state indicates the current state of the ECM state machine.

Copyright © 2006, Nortel Nortel Confidential

Mib	LanDrivers
Values	out in trace leave pathTest insert check deinsert
Default	No default

ATTRIBUTE Lp Fi cfState

Access	Read only
Description	The *cfState* attribute indicates the current state of the configuration management (CFM) state machine.
Mib	LanDrivers
Values	isolated localA localB localAB localS wrapA wrapB wrapAB wrapS cWrapA cWrapB cWrapS thru
Default	No default

GROUP Lp Fi MacOperational (MacOper)

Properties	Operational
Description	This group contains the operational Medium Access Controller (MAC) attributes of the of the *Fddi* component.
Mib	LanDrivers

ATTRIBUTE Lp Fi ringLatency

Access	Read only
Description	The *ringLatency* attribute contains the measured ring latency of the ring the station is attached to.
Mib	LanDrivers

Values	String (6, Dashed Hex)
Default	No default

ATTRIBUTE Lp Fi oldDownstreamNeighbor

Access	Read only
Description	The *oldDownstreamNeighbor* attribute contains the previous value of the MAC address associated with the downstream station on the ring. This attribute is displayed in canonical format. The non-canonical version of this address is indicated in *ncOldDownstreamNeighbor*.
Mib	LanDrivers
Values	String (6, Dashed Hex)
Default	No default

ATTRIBUTE Lp Fi dupAddressTest

Access	Read only
Description	The *dupAddressTest* attribute indicates the condition results of the duplicate address test. If ***notDone***, the test has not been executed. If ***pass***, the test has successfully executed. If ***fail***, the test has failed.
Mib	LanDrivers
Values	notDone pass fail
Default	No default

ATTRIBUTE Lp Fi tokenNegotiatedTimer (tNeg)

Access	Read only
Description	The *tokenNegotiatedTimer* specifies the negotiated token rotation time.
Mib	LanDrivers
Values	Decimal (80..1340000000)
Units	nsec
Default	167772000

ATTRIBUTE Lp Fi frameCounts

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	The *frameCounts* attribute contains the number of frames that have been received by the station. This counter will wrap around after it reaches its maximum value.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Fi copiedCounts

Access	Read only
Description	The *copiedCounts* attribute contains the number of frames successfully copied into this station's receive buffers, not including MAC control frames. This counter will wrap around after it reaches its maximum value.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Fi transmitCounts

Access	Read only
Description	The *transmitCounts* attribute contains the number of frames transmitted by this station, not including MAC control frames. This counter will wrap around after it reaches its maximum value.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Fi errorCounts

Access	Read only
Description	The *errorCounts* attribute contains the number of error frames first detected by this station. This counter will wrap around after it reaches its maximum value.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Fi lostCounts

Access	Read only
Description	The *lostCounts* attribute contains the number of instances that the station has detected a format error during frame reception such that the frame

Copyright © 2006, Nortel Nortel Confidential

	was stripped. This counter will wrap around after it reaches its maximum value.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Fi rmtState

Access	Read only
Description	The *rmtState*, ring management (RMT), state indicates the current state of the RMT state machine.
Mib	LanDrivers
Values	isolated nonOp ringOp detect nonOpDup ringOpDup directed trace
Default	No default

ATTRIBUTE Lp Fi frameErrorFlag

Access	Read only
Description	The *frameErrorFlag* attribute indicates the MAC frame error condition status. If ***true***, a MAC frame error is present. If ***false***, a MAC frame error condition is not present.
Mib	LanDrivers
Values	true false
Default	No default

GROUP Lp Fi MacCOperational (MacCOper)

Properties	Operational
Description	This group contains the operational attributes of the Medium Access Controller (MAC) Counters Table of the *Fddi* component.

VERB Reset Lp Fi Test

Impact	Service
Description	This verb is used to reset the Test component.

GROUP Lp Fi Test **PortTestOp (PTO)**

Properties	Operational
Description	This group contains the operational data for the *LanPortTest* component.
Mib	LanDrivers

ATTRIBUTE Lp Fi Test **type (type)**

Access	Read and write
Description	This attribute is the type of test to be run. The available test types include the following: card test sets up an internal loop on the board and runs a bit error rate test; manual test assumes the line is looped back externally and a bit error rate test is performed; localLoop test loops back the local modem and performs a bit error rate test; remoteLoop test loops back the remote modem (or CSU) and performs a bit error rate test; externalLoop test loops back the line to the far end; payloadLoop test only loops back the payload data received from the incoming line; Note that localLoop, remoteLoop and payloadLoop are not supported by all function processors.
Mib	LanDrivers
Values	onCard normal wrapA wrapB thruA thruB extWrapA extWrapB extThruA extThruB extWrapAB extWrapBA

ATTRIBUTE Lp Fi Test **frmSize (size)**

Access	Read and write
Description	This attribute defines the size of the test data frames in number of bytes.
Mib	LanDrivers
Values	Decimal (4..4096)
Units	bytes

Copyright © 2006, Nortel Nortel Confidential

Default	1024

ATTRIBUTE Lp Fi Test duration (duration)

Access	Read and write
Description	This attribute specifies the duration of the test data transmission. In the case of an externalLoop, this is the time that the loop is in effect. Note that dataStartDelay does not apply to the externalLoop.
Mib	LanDrivers
Values	Decimal (1..30240)
Units	minutes
Default	1

GROUP Lp Fi Test Results (Results)

Properties	Operational
Description	This group contains all the statistics related attributes of the Test component.
Mib	LanDrivers

ATTRIBUTE Lp Fi Test elapsedTime

Access	Read only
Description	This attribute is the number of minutes elapsed since the test started for an externalLoop test. For a data test, this is the time since test data was first transmitted.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Units	minutes
Default	0

ATTRIBUTE Lp Fi Test timeRemaining

Access	Read only
Description	This attribute is the number of minutes remaining before the test is to be stopped according to the duration attribute.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Units	minutes
Default	0

ATTRIBUTE Lp Fi Test causeOfTermination

GROUP Lp DS3 Provisioned (Prov)

Properties	Provisioned
Description	This group contains all of the provisioning data for a *DS3* component.
Mib	LogicalProcessor

ATTRIBUTE Lp DS3 cbitParity

Access	Read and write
Description	This attribute indicates if C-Bit parity has been turned ON or OFF. The *CBIT* component will appear under the *DS3* component when the *cbitParity* attribute is set to ***on***.
Mib	LogicalProcessor
Values	off on
Default	on

ATTRIBUTE Lp DS3 lineLength (length)

Access	Read and write
Description	This attribute defines the line length for equalization calculations for the DS3 line. The range is between 0 and 450 feet (1 metre = 3.28 feet). Note: There are currently only two ranges as far as the equalization calculation performed on the FP is concerned: 0 to 224ft and 225 to 450ft.
Mib	LogicalProcessor

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..450)
Units	feet
Default	1

ATTRIBUTE Lp DS3 clockingSource

Access	Read and write
Description	This attribute defines the type of clocking source used for synchronizing the DS3 transmit clock: ***local*** means direct use of the local clock oscillator at its centre frequency; ***line*** means use of a signal phase-locked to the incoming DS3 line rate; ***module*** means the use of a signal phase-locked to the CP reference clock. Note that the multi-port cell-based cards have one common clock source for all ports. For this reason, the following rules apply for the value of *clockingSource* across the board's three ports: All three *clockingSource* values must be "***local***" OR All three *clockingSource* values must be "***module***" OR One *clockingSource* value must be "***line***" and the other two must be "***otherPort***". If there is no *NS* component provisioned, the default value for this attribute will be ***local.*** If the *NS* component has been provisioned, the default value is ***module***, except for the ***1pDS3C*** cards. For the ***1pDS3C*** cards, the default and only valid value for this attribute is ***local***. The *clockingSource* of the DS1 sub-component becomes the effective clocking source for this attribute. All the DS1 sub-components have the same clocking source. On the ***4pDS3ChAal1*** card, the only allowed values for this attribute are ***local*** and ***module***.
Mib	LogicalProcessor
Values	local line module otherPort
Default	No default

ATTRIBUTE Lp DS3 applicationFramerName (framer)

Access	Read and write
Description	This attribute defines the link to the software stack. It defines which application is running on top of the *DS3* component.
Mib	LogicalProcessor
Values	Link (Service, interfaceName)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Lp DS3 mapping

Access	Read and write
Description	This attribute indicates if ATM cells will be mapped directly into the DS3 payload, or whether PLCP mapping will be used. The *PLCP* component will appear under the *DS3* component when this attribute is set to ***plcp***. This attribute will be ignored when set on frame-based cards. On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***direct***.
Mib	LogicalProcessor
Values	direct plcp
Default	direct

GROUP Lp DS3 CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	LogicalProcessor

ATTRIBUTE Lp DS3 customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	LogicalProcessor
Values	Decimal (0; 1..8191)
Default	0

GROUP Lp DS3 AdminInfo (AdminInfo)

Properties	Provisioned
Description	This group contains the attributes pertaining to the vendor of the equipment.
Mib	LogicalProcessor

ATTRIBUTE Lp DS3 vendor

Access	Read and write
Description	This is the name of the vendor supplying the facility.
Mib	LogicalProcessor
Values	String (0..20, ASCII)
Default	No default

ATTRIBUTE Lp DS3 commentText

Access	Read and write
Description	Any miscellaneous text about the facility.
Mib	LogicalProcessor
Values	String (0..60, ASCII)
Default	No default

ATTRIBUTE Lp DS3 includeAdminInfoInAlarm

Access	Read and write
Description	This attribute specifies that user defined text contained in *vendor* and *commentText* attributes of this *VendorInfo* instance will be appended to the comment text of any alarms, excluding hardware initialization alarms, for the associated interface port if this attribute is set to on.
Mib	LogicalProcessor
Values	no yes
Default	no

GROUP Lp DS3 IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor

ATTRIBUTE Lp DS3 ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	LogicalProcessor
Values	up down testing
Default	up

ATTRIBUTE Lp DS3 ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	LogicalProcessor
Values	Decimal (1..65535)
Default	No default

GROUP Lp DS3 OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	LogicalProcessor

ATTRIBUTE Lp DS3 snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	LogicalProcessor
Values	up down testing

Copyright © 2006, Nortel Nortel Confidential

Default	up

GROUP Lp DS3 OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LogicalProcessor

ATTRIBUTE Lp DS3 adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	LogicalProcessor
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp DS3 operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

Copyright © 2006, Nortel Nortel Confidential

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: LogicalProcessor

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Lp DS3 usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: LogicalProcessor

Values:
idle
active (activ)
busy

Default: idle

ATTRIBUTE Lp DS3 availabilityStatus (osiAvail)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be

Copyright © 2006, Nortel Nortel Confidential

present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	LogicalProcessor
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp DS3 proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.
Mib	LogicalProcessor
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE Lp DS3 controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib — LogicalProcessor

Set of — subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default — No default

ATTRIBUTE Lp DS3 alarmStatus (osiAlarm)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib	LogicalProcessor
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Lp DS3 standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.
Mib	LogicalProcessor
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Lp DS3 unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

Copyright © 2006, Nortel Nortel Confidential

The value ***true*** indicates that the actual state of the component is not known for sure.

Mib	LogicalProcessor
Values	false true
Default	false

GROUP Lp DS3 Operational (Oper)

Properties	Operational
Description	This group contains the common operational data for the *DS3* component.
Mib	LogicalProcessor

ATTRIBUTE Lp DS3 losAlarm (los)

Access	Read only
Description	This attribute indicates whether a Loss Of Signal (LOS) alarm state has been entered. An LOS alarm state is entered when LOS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. An LOS defect is detected at the DS3 line interface upon observing 175 +/- 75 continuous pulse positions with no pulses of either positive or negative polarity. If the LOS defects are intermittently occurring, the LOS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The *DS3* component goes into an operational state of *disabled* until the LOS alarm condition is cleared. The LOS alarm state is cleared after LOS defects have been absent for a period of 10 seconds +/- 0.5 seconds. The *losAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*.
Mib	LogicalProcessor
Values	on off
Default	off

ATTRIBUTE Lp DS3 lofAlarm (lof)

Access	Read only
Description	This attribute indicates whether a Loss Of Frame (LOF) alarm state has been entered. An LOF alarm state is entered when Severely Errored Frame (SEF) defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. A SEF defect is detected when 3 (or more) out of 16 (or fewer) F-bits are in error, or one (or more) M-bits in two (or more) out of four (or fewer) consecutive M-frames are in error. If the LOF

Copyright © 2006, Nortel Nortel Confidential

defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.

The *DS3* component goes into an operational state of *disabled* until the LOF alarm condition is cleared. The condition is cleared when framing has been achieved for a period of 10 seconds +/- 0.5 seconds. As long as SEF defects are detected, the node also transmits the far-end SEF/AIS defect indicator over the outgoing line. When not running in C-Bit Parity mode, the *txRai* attribute is also set to ***on*** when transmitting the far-end SEF/AIS defect indicator on the outgoing line.

The *lofAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*.

Mib — LogicalProcessor

Values — on
off

Default — off

ATTRIBUTE Lp DS3 rxAisAlarm (rxAis)

Access — Read only

Description — This attribute indicates whether an Alarm Indication Signal (AIS) alarm state has been entered. An AIS alarm state is entered when AIS defects have been observed and accumulated for 2.5 seconds +/- 0.5 seconds. An AIS defect is the occurrence of AIS (valid DS3 frame with payload containing the 1010...sequence and with C-Bits set to zero) in contiguous M-frames for a time greater than 100 milliseconds. If the AIS defects are intermittently occurring, the AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.

The *DS3* component goes into an operational state of *disabled* until the AIS alarm condition is cleared (after AIS has been no longer detected for a period of 10 seconds +/- 0.5 seconds). As long as AIS is detected, the node also transmits the far-end SEF/AIS defect indicator over the outgoing line. When not running in C-Bit Parity mode, the *txRai* attribute is also set to *on* when transmitting the far-end SEF/AIS defect indicator on the outgoing line.

The *rxAisAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*.

Mib — LogicalProcessor

Values — on
off

Default — off

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp DS3 rxRaiAlarm (rxRai)

Access	Read only
Description	This attribute indicates whether a Remote Alarm Indication (RAI) alarm state has been entered. When not running the C-Bit Parity mode, the RAI alarm state is entered when the far-end SEF/AIS defect indicator has been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds on the incoming DS3 line. If the RAI defects are intermittently occurring, the RAI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The *DS3* component goes into an operational state of *disabled* until the RAI alarm condition is cleared. The condition is cleared when the far-end SEF/AIS defect indicator has not been detected for 10 seconds +/- 0.5 seconds. When running the C-Bit Parity mode, the RAI alarm state is entered upon detection of a far-end alarm over the Far-End Alarm and Control (FEAC) channel. The RAI alarm state is exited as soon as no more far-end alarm is detected on the FEAC channel. The far-end alarms that can be detected on the FEAC channel and that cause the RAI alarm state to be entered are: equipment failure alarm (service affecting), LOS alarm, LOF alarm, idle and AIS alarm. The *rxRaiAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*.
Mib	LogicalProcessor
Values	on off
Default	off

ATTRIBUTE Lp DS3 rxIdle

Access	Read only
Description	This attribute indicates whether an Idle failure condition has been reported on the DS3 port. An Idle condition is reported when DS3 Idle defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The DS3 Idle defect is the occurrence of a valid DS3 frame with the information bits set to a 11001100.. sequence. If the DS3 Idle defects are intermittently occurring, the DS3 Idle defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200ms polling cycle. The *DS3* component goes into an operational state of *disabled* until the Idle failure condition is cleared. The failure condition is cleared when the DS3 idle pattern has not been detected for at least 10 seconds +/- 0.5 seconds.

Copyright © 2006, Nortel Nortel Confidential

The *rxIdle* attribute is always set to ***off*** when the component has been *locked* and left *offline*.

The idle pattern indicates that the far-end is physically connected but not put in service. For instance, DS3 idle is transmitted on the outgoing line when the *DS3* component is locked and not used for operational testing.

Mib — LogicalProcessor

Values — on
off

Default — off

ATTRIBUTE Lp DS3 txAis

Access — Read only

Description — This attribute indicates whether an Alarm Indication Signal (AIS) alarm is being transmitted on the DS3 line. Currently, AIS is never transmitted by a Nortel Networks Multiservice Switch DS3.

Mib — LogicalProcessor

Values — on
off

Default — off

ATTRIBUTE Lp DS3 txRai

Access — Read only

Description — When not running C-Bit Parity mode, this attribute indicates whether the far-end SEF/AIS defect indicator is transmitted over the outgoing line when the *DS3* component has been unlocked or used in operational testing. When running in C-Bit Parity mode, this attribute displays whether a far-end alarm is sent over the Far-End Alarm and Control (FEAC) channel when the *DS3* component has been unlocked or used in operational testing. When the *DS3* component is locked and not used in operational testing, this attribute is always set to ***off***.

Mib — LogicalProcessor

Values — on
off

Default — off

ATTRIBUTE Lp DS3 txIdle

Access — Read only

Description — This attribute indicates whether the DS3 Idle signal is transmitted over the outgoing line. DS3 Idle is sent when the *DS3* component has been locked and not used in operational testing.

Default	off

GROUP Lp DS3 Statistics (Stats)

Properties	Operational
Description	This group contains the specific DS3 common operational data for a *DS3* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.
Mib	LogicalProcessor

ATTRIBUTE Lp DS3 runningTime (time)

Access	Read only
Description	This attribute counts the seconds since the DS3 component has been activated and been in unlocked state or used for operational testing. All the other error counts that follow as well as each *DS3* subcomponent's error counts can be updated when this count is active. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Units	seconds
Default	0

ATTRIBUTE Lp DS3 errorFreeSec (efs)

Access	Read only
Description	This attribute counts the cumulative seconds that the DS3 port has been in an error free state. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp DS3 lineCodeViolations (lcv)

Access	Read only
Description	This attribute counts the Line Code Violations (LCV) detected. A DS3 Line Code Violation is a B3Zs error. LCV counting is inhibited for second

	intervals where Line Severely Errored Second (LSES) is counted. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp DS3 lineErroredSec (les)

Access	Read only
Description	This attribute counts the Line Errored Seconds (LES). A LES is declared for second intervals containing one or more LCV or one or more Loss Of Signal (LOS) defects. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp DS3 lineSevErroredSec (lses)

Access	Read only
Description	This attribute counts the Line Severely Errored Seconds (LSES). A LSES is declared for second intervals containing more than 44 LCVs or one or more LOS defects. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp DS3 lineLosSec (loss)

Access	Read only
Description	This attribute counts the Line LOS Seconds (LOSS). A LOSS is declared for second intervals containing one or more LOS defects. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp DS3 lineFailures (lf)

Access	Read only
Description	This attribute counts the line failure (LOS failure) declarations. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp DS3 pathCodeViolations (pcv)

Access	Read only
Description	This attribute counts the Path Code Violations (PCVs) detected. Each PCV corresponds to a P-bit parity error, or possibly a frame error or a disagreement between P-bits or X-bits. PCV counting is inhibited over second intervals where a Path Severely Errored Second (PSES) is counted. Counting of PCVs is also inhibited over second intervals where a Path Unavailable Second (PUAS) is counted. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp DS3 pathErroredSec (pes)

Access	Read only
Description	This attribute counts the Path Errored Seconds (PESs). A PES is declared for second intervals containing one or more Path Code Violations (PCV) or one or more Severely Errored Frame (SEF) or Alarm Indication Signal (AIS) defects. Counting of Path Errored Seconds is inhibited when Path Unavailable Seconds (PUAS) is counted over the monitored second. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp DS3 pathSevErroredSec (pses)

Access	Read only
Description	This attribute counts the Path Severely Errored Seconds (PSESs). A

Copyright © 2006, Nortel Nortel Confidential

PSES is declared for second intervals containing more than 44 PCVs or one or more SEF or AIS defects. Counting of PSESs is inhibited when Path Unavailable Seconds (PUAS) is counted over the monitored second.

The counter wraps to zero when it exceeds its maximum value.

Mib LogicalProcessor

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Lp DS3 pathSefAisSec (psas)

Access Read only

Description

This attribute counts the SEF/AIS seconds (PSASs). A PSAS is declared for second intervals containing one or more Severely Errored Frame (SEF) or Alarm Indication Signal (AIS) defects. Counting of PSAS is inhibited when Path Unavailable Seconds (PUAS) is counted over the monitored second.

The counter wraps to zero when it exceeds its maximum value.

Mib LogicalProcessor

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Lp DS3 pathUnavailSec (puas)

Access Read only

Description

This attribute counts the one second intervals for which the DS3 path is unavailable. The DS3 path becomes unavailable at the onset of 10 consecutive Path Severely Errored Seconds (PSES). The 10 PSESs are included in the unavailable time. Once unavailable, the DS3 path becomes available at the onset of 10 contiguous seconds with no PSES. The 10 seconds with no PSES are excluded from the unavailable time. For second intervals where PUAS is counted, counting of Path Coding Violations (PCV), Path Errored Seconds (PES), Path Severely Errored Seconds (PSES) and Path Sef/Ais Seconds (PSAS) is inhibited.

The counter wraps to zero when it exceeds its maximum value.

Mib LogicalProcessor

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Lp DS3 pathFailures (pf)

Access	Read only
Description	This attribute counts the path failure (LOF/AIS failure) declarations. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp DS3 egressFrameDiscards

Access	Read only
Description	This attribute counts the frames discarded at the egress PQC. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

COMPONENT Lp DS3 Test (Test)

Groups	GROUP Lp DS3 Test OsiState (State) GROUP Lp DS3 Test Setup (Setup) GROUP Lp DS3 Test Results (Results)
Scope	Application
Description	The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21, DS1, E1, DS3, E3* etc.) or a logical port.
Mib	LogicalProcessor
Common Verbs	Help List Display

VERB START Lp DS3 Test

Impact	Service
Description	This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

Copyright © 2006, Nortel Nortel Confidential

VERB STOP Lp DS3 Test

Impact	Service
Description	This command stops a test running on the hardware component.

GROUP Lp DS3 Test **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LogicalProcessor

ATTRIBUTE Lp DS3 Test **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	LogicalProcessor
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp DS3 Test **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

Copyright © 2006, Nortel Nortel Confidential

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib	LogicalProcessor
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp DS3 Test usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	LogicalProcessor
Values	idle active (activ) busy
Default	idle

GROUP Lp DS3 Test Setup (Setup)

Properties	Operational
Description	This group contains all of the operational data for a *Test* component.
Mib	LogicalProcessor

ATTRIBUTE Lp DS3 Test purpose (purpose)

Access	Read and write
Description	This attribute records the purpose of the test so that the test results can be associated and properly analyzed.
Mib	LogicalProcessor
Values	String (0..40, ASCII)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp DS3 Test type (type)

Access	Read and write
Description	This attribute is the type of test to be run. The available test types include the following: ***card*** test sets up an internal loop on the board and runs a bit error rate test. ***manual*** test assumes the line is looped back externally and a bit error rate test is performed. ***localLoop*** test loops back the local modem and performs a bit error rate test. ***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test. ***externalLoop*** test loops back the line to the far end. ***payloadLoop*** test only loops back the payload data received from the incoming line. ***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent. ***v54RemoteLoop*** initiates a V.54 Remote Loopback test. ***pn127RemoteLoop*** initiates a PN127 Remote Loopback test. ***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted). ***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted). ***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted). ***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted). Note that not all test types are not supported by all function processors.
Mib	LogicalProcessor
Values	card manual localLoop remoteLoop externalLoop payloadLoop remoteLoopThisTrib v54RemoteLoop pn127RemoteLoop lineBIP8Error sectionBIP8Error pathBIP8Error pathBIP2Error
Default	card

ATTRIBUTE Lp DS3 Test frmSize (size)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.

Mib LogicalProcessor

Values Decimal (4..4096)

Units bytes

Default 1024

ATTRIBUTE Lp DS3 Test frmPatternType (fpt)

Access Read and write

Description

This attribute defines the type of data pattern generation to use. The following lists the available pattern types:
ccitt32kBitPattern is a pseudo-random sequence of 32 kbit.
ccitt8MBitPattern is a pseudo-random sequence of 8Mbit.
customizedPattern is the pattern defined in the ***customizedPattern*** attribute.

Mib LogicalProcessor

Values ccitt32kBitPattern
ccitt8MBitPattern
customizedPattern

Default ccitt32kBitPattern

ATTRIBUTE Lp DS3 Test customizedPattern (cp)

Access Read and write

Description

This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.

Mib LogicalProcessor

Values Hex (H.0..H.ffffffff)

Units Hex

Default H.55555555

ATTRIBUTE Lp DS3 Test dataStartDelay (dsd)

Access Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	LogicalProcessor
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Lp DS3 Test displayInterval (di)

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	LogicalProcessor
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Lp DS3 Test duration

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Lp DS3 Test Results (Results)

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor

ATTRIBUTE Lp DS3 Test causeOfTermination

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback. a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback. a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback. a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered. Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

ATTRIBUTE Lp DS3 Test bitsTx

Access Read only

Description

This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Mib LogicalProcessor

Values Long Integer

Default No default

ATTRIBUTE Lp DS3 Test bytesTx

Access Read only

Description

This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.

Mib LogicalProcessor

Values Long Integer

Default No default

ATTRIBUTE Lp DS3 Test frmTx

Access Read only

Description

This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.

This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Mib LogicalProcessor

Values Long Integer

Default No default

ATTRIBUTE Lp DS3 Test bitsRx

Access Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp DS3 Test bytesRx

Access	Read only
Description	This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp DS3 Test frmRx

Access	Read only
Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp DS3 Test erroredFrmRx

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp DS3 Test bitErrorRate

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.
Mib	LogicalProcessor
Values	String (5, ASCII)
Default	No default

ATTRIBUTE Lp DS3 Test elapsedTime

Access	Read only
Description	This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

ATTRIBUTE Lp DS3 Test timeRemaining

Access	Read only
Description	This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.
Mib	LogicalProcessor

GROUP Lp DS3 CBit Statistics (Stats)

Properties	Operational
Description	This group contains the DS3 C-Bit Parity statistical data for the *CBIT* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.
Mib	LogicalProcessor

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp DS3 CBit cbitErrorFreeSec (cefs)

Access	Read only
Description	This attribute indicates the number of seconds that the DS3 port has not suffered any C-Bit errors.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp DS3 CBit cbitCodeViolations (ccv)

Access	Read only
Description	This attribute indicates the total count of C-Bit Parity Code Violations (CCV). A CCV is obtained when the parity calculated over the previous DS3 frame and the value of the CP-bits appearing in the current DS3 frame differ. The value of this attribute will wrap around to 0 if it does reach its maximum value. CCV counting is inhibited for second intervals where C-Bit Parity Severely Errored Seconds (CSES) are counted. It is also inhibited for second intervals where C-Bit Unavailable Seconds (CUAS) are counted. This attribute is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp DS3 CBit cbitErroredSec (ces)

Access	Read only
Description	This attribute indicates the total number of C-Bit Parity Errored Seconds (CES). A CES second is declared for second intervals containing one or more CCVs or when one or more SEF (Severely Errored Frame) or AIS (Alarm Indication Signal) defects. CES counting is inhibited for second intervals where C-Bit Unavailable Seconds (CUAS) are counted.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp DS3 CBit cbitSevErroredSec (cses)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the total number of C-Bit Parity Severely Errored Seconds (CSES). A CSES is declared for second intervals containing more than 44 CCVs or one or more SEF or AIS defects. The occurrence of CSES in a one second interval causes the inhibition of CCV counting during that second interval. CSES counting is also inhibited for second intervals where C-Bit Unavailable Seconds (CUAS) are counted.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp DS3 CBit cbitUnavailSec (cuas)

Access	Read only
Description	This attribute indicates the total number of one second intervals for which the DS3 path is unavailable. The DS3 path becomes unavailable at the onset of 10 consecutive C-Bit Severely Errored Seconds (CSES). The 10 CSESs are included in the unavailable time. Once unavailable, the DS3 path becomes available at the onset of 10 contiguous seconds with no CSES. The 10 seconds with no CSES are excluded from the unavailable time. For second intervals where CUAS is counted, counting of C-Bit Coding Violations (CCV), C-Bit Errored Seconds (CES) and C-Bit Severely Errored Seconds (CSES) is inhibited.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp DS3 CBit farEndErrorFreeSec (feefs)

Access	Read only
Description	This attribute indicates the number of seconds that the DS3 port has not suffered of any far-end errors.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp DS3 CBit farEndCodeViolations (fecv)

Access	Read only
Description	This attribute indicates the total count of DS3 frames containing a Coding

Copyright © 2006, Nortel Nortel Confidential

Violation on the Far-End (FECV), also known as a Far-End Block Error (FEBE). Each FEBE is reported over the FEBE bits each time the far-end DS3 terminal detects a C-BIT Parity error over a received DS3 frame. For second intervals where Far-End Unavailable Seconds (FEAUS) or Far-End Severely Errored Seconds (FESES) are counted, counting of FECVs is inhibited.
This attribute is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

ATTRIBUTE Lp DS3 CBit farEndUnavailSec (feuas)

Access	Read only
Description	This attribute indicates the total number of one second intervals for which the DS3 far-end path is unavailable. The DS3 far-end path becomes unavailable at the onset of 10 consecutive Far-End Severely Errored Seconds (FESES). The 10 FESESs are included in the unavailable time. Once unavailable, the DS3 far-end path becomes available at the onset of 10 contiguous seconds with no FESES. The 10 seconds with no FESES are excluded from the unavailable time. For second intervals where FEUAS is counted, counting of Far-End Coding Violations (FECV), Far-End Errored Seconds (FEES), Far-End Severely Errored Seconds (FESES) and Far-End Sef/Ais Seconds (FESAS) is inhibited.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp DS3 CBit farEndFailures (fef)

Access	Read only
Description	This attribute indicates the total number of times that a far-end path failure (i.e. a Far-End SEF/AIS defect) has been declared. This attribute is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

GROUP Lp DS3 Plcp Operational

Properties	Operational
Description	This group contains the operational data for the *PLCP* component.
Mib	LogicalProcessor

ATTRIBUTE Lp DS3 Plcp lofAlarm (lof)

Access	Read only
Description	This attribute displays whether a PLCP Loss Of Frame (LOF) failure alarm state has been entered. An LOF failure is declared when a PLCP LOF defect persists for 2.5 s +/- 0.5 s. An LOF defect occurs when an OOF (Out of Frame) state persists for more than 1 ms. If the OOF events are intermittent, the LOF defect counter is decremented at a rate of 1/12 (for DS3 PLCP) or 1/9 (for G.751 E3 PLCP) of the incrementing rate, with all measurements based on a 200 ms polling cycle. An OOF event (also known as a PLCP SEF event) is declared when an error is detected in both the A1 and A2 octets, or when two consecutive POHIDs are found in error. OOF is removed when two valid sets of framing octets and two valid and sequential POHID octets have been found. The LOF defect is removed when the defect counter reaches zero, i.e. when OOF events are absent for more than 12 ms (DS3 PLCP) or 9 ms (G.751 E3 PLCP). LOF failure alarm is cleared when LOF defect is absent for 10.0 s +/- 0.5 s The *DS3* or *E3* component goes into an operational state of *disabled* until the LOF failure alarm is cleared. The terminal declaring the LOF failure alarm will transmit a PLCP RAI signal to the far-end for the duration of the alarm. The *lofAlarm* attribute is always set to *off* when the *DS3* or *E3* component has been *locked* and left *offline*.
Mib	LogicalProcessor
Values	on off

Copyright © 2006, Nortel Nortel Confidential

Default	off

ATTRIBUTE Lp DS3 Plcp rxRaiAlarm (rxrai)

Access	Read only
Description	This attribute displays whether a PLCP Remote Alarm Indication (RAI) failure alarm state has been entered. An RAI failure alarm occurs when ten consecutive PLCP RAI bits (bit 5 in the G1 byte) are high on the incoming line. An RAI failure alarm is cleared when ten consecutive RAI bits are set to 0. Note: Some standards call this alarm RFI. The *rxRaiAlarm* attribute is always set to *off* when the *DS3* or *E3* component has been *locked* and left *offline*.
Mib	LogicalProcessor
Values	on off
Default	off

GROUP Lp DS3 Plcp Statistics (Stats)

COMPONENT Lp DS3 AtmCell (Cell)

Groups
GROUP Lp DS3 Cell Provisioned (Prov)
GROUP Lp DS3 Cell Operational (Oper)
GROUP Lp DS3 Cell Statistics (Stats)

Scope: Device

Description

The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards.

GROUP Lp DS3 Cell Provisioned (Prov)

Properties: Provisioned

Description

This group contains the provisioning attributes for the *AtmCell* component.

Mib: LogicalProcessor

ATTRIBUTE Lp DS3 Cell alarmActDelay (act)

Access: Read and write

Description

This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.

Mib: LogicalProcessor

Values: Decimal (0..2000)

Units: msec

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Lp DS3 Cell scrambleCellPayload (scramble)

Access	Read and write
Description	Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled. It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces. Note that this setting must be the same at both ends of the link.
Mib	LogicalProcessor
Values	off on
Default	No default

ATTRIBUTE Lp DS3 Cell correctSingleBitHeaderErrors

Access	Read and write
Description	This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded. Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.
Mib	LogicalProcessor
Values	off on
Default	off

ATTRIBUTE Lp DS3 Cell clearDelay (clear)

Access	Read and write
Description	This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm,

Copyright © 2006, Nortel Nortel Confidential

	8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	LogicalProcessor
Values	Decimal (0..60)
Units	minutes
Default	0

ATTRIBUTE Lp DS3 Cell hecSampleInterval (hSample)

Access	Read and write
Description	This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	LogicalProcessor
Values	Decimal (0..25)
Units	seconds
Default	0

ATTRIBUTE Lp DS3 Cell hecErrorLimit (hLimit)

Access	Read and write
Description	This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.) This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor
Values	Decimal (1..250000)
Default	No default

ATTRIBUTE Lp DS3 Cell lcdStateDelay (delay)

Access	Read and write
Description	This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	LogicalProcessor
Values	Decimal (1..50)
Units	msec
Default	No default

ATTRIBUTE Lp DS3 Cell hecErrorIntervalLimit (hIntLimit)

Access	Read and write
Description	This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	LogicalProcessor
Values	Decimal (1..25)
Default	1

GROUP Lp DS3 Cell Operational (Oper)

Properties	Operational
Description	This group contains the common operational attributes for the *AtmCell* component.
Mib	LogicalProcessor

ATTRIBUTE Lp DS3 Cell lcdAlarm (lcd)

Access	Read only
Description	This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute. In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected. For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect. If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds. The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.
Mib	LogicalProcessor
Values	on off
Default	off

GROUP Lp DS3 Cell Statistics (Stats)

Properties	Operational

increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

Mib LogicalProcessor

ATTRIBUTE Lp DS3 Cell uncorrectableHeaderErrors (ucErr)

Access Read only

Description

This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

Mib LogicalProcessor

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Lp DS3 Cell sevErroredSec (ses)

Access Read only

Description

This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted.

In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

If the *AtmCell* component is located under a *Ds3* or *E3* component where the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects.

Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present.

Mib LogicalProcessor

Values Decimal (0..4294967295)

d4
esf
d4Cas
esfCas
unframed

Default: esf

ATTRIBUTE Lp DS3 DS1 zeroCoding (zeroCoding)

Access: Read and write

Criticality: Component

Description

This attribute defines the zero encoding on the DS1 tributary.
bit7Stuffing sets bit 7 of every timeslot to a one to guarantee ones's density. This reduces the available bandwidth of the channel by 1/8.
none does no zero encoding, it does not change any value of the bits in the timeslot. The value ***none*** is compatible with any zero coding scheme which transports all 8 data bits in a timeslot (this would include both ***ami*** and ***b8zs*** values of the *DS1 zeroCoding* attribute).

Mib: LogicalProcessor

Values:
bit7Stuffing
none

Default: none

ATTRIBUTE Lp DS3 DS1 clockingSource (clockingSource)

Access: Read and write

Description

This attribute specifies the source of the transmit clock for the DS1 tributary.
When the clocking source is ***local***, the crystal on the port generates the clocking for the DS1 tributary.
When the clocking source is ***line***, the port synchronizes to the clock from the DS1 tributary.
When the clocking source is ***module***, the port's clock synchronizes to the clock provided by the oscillator on the active CP.
When the clocking source is ***sameAsDs3***, the Ds1 port's clock synchronizes to the same clock source as that of its parent Ds3 port.

Copyright © 2006, Nortel Nortel Confidential

On a ***1pDS3C*** card, if the *NetworkSynchronization (NS)* component is present, the default value of this attribute will be ***module***; otherwise it will be ***line***.

On a ***2pDS3cAal*** card, the only valid values are ***local*** and ***module***. If the *NS* component is present, the default value of this attribute will be ***module***; otherwise it will be ***local***.

On the ***4pDS3Ch***, ***4pDS3ChAtm***, and ***4pDS3ChAal1*** cards, the only valid value is ***sameAsDs3***. This is because a DS1 must have the same clocking source as its parent DS3.

GROUP Lp DS3 DS1 CustomerIdentifierData (CidData)

Properties — Provisioned

Description — This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

Mib — LogicalProcessor

ATTRIBUTE Lp DS3 DS1 customerIdentifier (cid)

Access — Read and write

Description — This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

GROUP Lp DS3 DS1 OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LogicalProcessor

ATTRIBUTE Lp DS3 DS1 adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	LogicalProcessor
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp DS3 DS1 operationalState (osiOper)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	LogicalProcessor
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp DS3 DS1 usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	LogicalProcessor
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp DS3 DS1 availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

ATTRIBUTE Lp DS3 DS1 proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Default	No default

ATTRIBUTE Lp DS3 DS1 alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib	LogicalProcessor
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Lp DS3 DS1 **standbyStatus (osiStby)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib	LogicalProcessor
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Lp DS3 DS1 unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	LogicalProcessor
Values	false true
Default	false

GROUP Lp DS3 DS1 Operational (Oper)

Properties	Operational
Description	This group contains the common operational data for a component in a digital hierarchy interface.
Mib	LogicalProcessor

ATTRIBUTE Lp DS3 DS1 rxAisAlarm (rxAisAlarm)

Access	Read only
Description	This attribute indicates whether an AIS (Alarm Indication Signal) alarm state has been entered. The AIS Alarm state is entered when AIS defects have been observed and accumulated for 2.5 seconds +/- 0.5 seconds. An AIS defect is detected after having received less than 3 zeros in a 2048 bit period. If the AIS defects are intermittently occurring, the AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. This tributary goes into an *operationalState* of ***disabled*** for the duration of an AIS alarm state. The AIS alarm state is cleared when AIS defects are absent for 10 seconds +/- 0.5 seconds.
Mib	LogicalProcessor

Copyright © 2006, Nortel Nortel Confidential

Values	on off
Default	off

ATTRIBUTE Lp DS3 DS1 lofAlarm (lofAlarm)

Access	Read only
Description	This attribute indicates whether a LOF (Loss of Frame) alarm state has been entered. The LOF alarm state is entered when LOF defects (2 out of 5 framing bits in error) have been detected for 3 seconds +/- 0.5 seconds. If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. This tributary goes into an *operationalState* of ***disabled*** until the LOF alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the duration of the LOF alarm state The condition is cleared when framing has been achieved for 10 seconds +/- 0.5 seconds.
Mib	LogicalProcessor
Values	on off
Default	off

ATTRIBUTE Lp DS3 DS1 rxRaiAlarm (rxRaiAlarm)

Access	Read only
Description	This attribute indicates whether an RAI (Remote Alarm Indication) alarm state has been entered. An RAI alarm state is entered when the RAI defect indicator has been observed and accumulated for 3.5 seconds +/- 0.5 seconds. If the RAI defects are intermittently occurring, the RAI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The RAI alarm state is cleared when the RAI defect indicator has been absent for 10 seconds +/- 0.5 seconds. The RAI alarm is usually an indication that the far end facility is unable to gain synchronization.
Mib	LogicalProcessor
Values	on off
Default	off

ATTRIBUTE Lp DS3 DS1 txAisAlarm (txAisAlarm)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates whether an AIS (Alarm Indication Signal) alarm is being transmitted on the line. An AIS alarm is transmitted when the tributary is in a locked state.
Mib	LogicalProcessor
Values	on off
Default	off

ATTRIBUTE Lp DS3 DS1 txRaiAlarm (txRaiAlarm)

Access	Read only
Description	This attribute indicates whether a RAI signal is being sent on the outgoing line. The RAI signal is transmitted when the tributary detects a LOF alarm condition.
Mib	LogicalProcessor
Values	on off
Default	off

GROUP Lp DS3 DS1 Statistics (Stats)

Properties	Operational
Description	This group contains the common statistical data for a component in a digital hierarchy interface.
Mib	LogicalProcessor

ATTRIBUTE Lp DS3 DS1 runningTime (runningTime)

Access	Read only
Description	This attribute counts the number of seconds since the tributary was activated.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp DS3 DS1 errorFreeSec (efs)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute counts the number of seconds that the tributary has been in an error free state.

Mib LogicalProcessor

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Lp DS3 DS1 erroredSec (es)

Access Read only

Description

This attribute counts the number of errored seconds the tributary has counted since it was activated. An errored second is declared when a second with one or more Code Violation Error events, or one or more Out Of Frame events occurs. A code violation error may be a CRC error or a BPV error. An Out Of Frame event occurs when 2 out of 5 framing bits are in error.

Mib LogicalProcessor

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Lp DS3 DS1 sevErroredSec (ses)

Access Read only

Description

This attribute counts the number of severely errored seconds the tributary has counted since it was activated. A severely errored second occurs when a second with 320 or more Code Violation Error events or one or more Out Of Frame events occurs.

Mib LogicalProcessor

Values Decimal (0..4294967295)

ATTRIBUTE Lp DS3 DS1 Chan timeslotDataRate (dataRate)

Access: Read and write

Criticality: Component

Description

This attribute selects the data rate of the timeslots in a channel of a DS1 component. For E1, the data rate of the timeslots will always be 64kbit/s regardless of this attribute.

Copyright © 2006, Nortel Nortel Confidential

When ***doNotOverride*** is selected for a channel on a DS1, the data rate of the channel's timeslots are dependant on the *zeroCoding* selection of the DS1 component. If the *zeroCoding* is ***B8ZS*** (where supported on the FP) or ***none***, the timeslot's data rate will be 64kbit/s. If the *zeroCoding* option is ***bit7Stuffing,*** the data rate of a timeslot will be 56kbit/s.

When ***56k*** is selected for a channel on a DS1, the least significant bit of each timeslot of this *Channel* will always be set to 1 and not used for data. The data rate for the timeslots of this channel is therefore restricted to 56kbit/s.

On the ***4pDS3Ch*** cards, the *zeroCoding* attribute is restricted to the value *none*, and so when the *timeslotDataRate* is set to ***doNotOverride***, the timeslot's data rate will be 64kbit/s. Timeslot data rate of ***56k*** is also available on this card.

On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***doNotOverride***.

One application of this attribute is to allow a DS1 line to support mixing channels that originate from lines that use different *zeroCoding* schemes.

Mib	LogicalProcessor
Values	56k doNotOverride
Default	doNotOverride

ATTRIBUTE Lp DS3 DS1 Chan applicationFramerName

Access	Read and write
Description	This attribute defines the link to the software stack. It defines which application is running on top of this hardware component.
Mib	LogicalProcessor
Values	Link (Service, interfaceName)
Default	No default

GROUP Lp DS3 DS1 Chan CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	LogicalProcessor

ATTRIBUTE Lp DS3 DS1 Chan customerIdentifier (cid)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	LogicalProcessor
Values	Decimal (0; 1..8191)
Default	0

GROUP Lp DS3 DS1 Chan IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	LogicalProcessor

ATTRIBUTE Lp DS3 DS1 Chan ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	LogicalProcessor
Values	up down testing
Default	up

ATTRIBUTE Lp DS3 DS1 Chan ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.

Description — If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib — LogicalProcessor

ATTRIBUTE Lp DS3 DS1 Chan alarmStatus (osiAlarm)

Access — Read only

Copyright © 2006, Nortel Nortel Confidential

Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	LogicalProcessor
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Lp DS3 DS1 Chan standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

Copyright © 2006, Nortel Nortel Confidential

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Copyright © 2006, Nortel Nortel Confidential

Groups	GROUP Lp DS3 DS1 Chan Test OsiState (State) GROUP Lp DS3 DS1 Chan Test Setup (Setup) GROUP Lp DS3 DS1 Chan Test Results (Results)
Scope	Application
Description	The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21, DS1, E1, DS3, E3* etc.) or a logical port.
Mib	LogicalProcessor
Common Verbs	Help List Display

VERB START Lp DS3 DS1 Chan Test

Impact	Service
Description	This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

VERB STOP Lp DS3 DS1 Chan Test

Impact	Service
Description	This command stops a test running on the hardware component.

GROUP Lp DS3 DS1 Chan Test **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LogicalProcessor

ATTRIBUTE Lp DS3 DS1 Chan Test **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — LogicalProcessor

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Lp DS3 DS1 Chan Test operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — LogicalProcessor

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Lp DS3 DS1 Chan Test usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — LogicalProcessor

externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default: card

ATTRIBUTE Lp DS3 DS1 Chan Test frmSize (size)

Access: Read and write

Description:
This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.

Mib: LogicalProcessor

Values: Decimal (4..4096)

Units: bytes

Default: 1024

ATTRIBUTE Lp DS3 DS1 Chan Test frmPatternType (fpt)

Access: Read and write

Description:
This attribute defines the type of data pattern generation to use. The following lists the available pattern types:
ccitt32kBitPattern is a pseudo-random sequence of 32 kbit.
ccitt8MBitPattern is a pseudo-random sequence of 8Mbit.
customizedPattern is the pattern defined in the ***customizedPattern*** attribute.

Mib: LogicalProcessor

Copyright © 2006, Nortel
Nortel Confidential

Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

ATTRIBUTE Lp DS3 DS1 Chan Test **customizedPattern (cp)**

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	LogicalProcessor
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Lp DS3 DS1 Chan Test **dataStartDelay (dsd)**

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	LogicalProcessor
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Lp DS3 DS1 Chan Test **displayInterval (di)**

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	LogicalProcessor
Values	Decimal (0..30240)
Units	minutes

Copyright © 2006, Nortel Nortel Confidential

Default	5

ATTRIBUTE Lp DS3 DS1 Chan Test **duration**

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Lp DS3 DS1 Chan Test **Results (Results)**

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	LogicalProcessor

ATTRIBUTE Lp DS3 DS1 Chan Test **causeOfTermination**

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback. a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been

Copyright © 2006, Nortel Nortel Confidential

looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Mib LogicalProcessor

Values
testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

Default neverStarted

ATTRIBUTE Lp DS3 DS1 Chan Test **bitsTx**

Access Read only

Description

This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Mib LogicalProcessor

Values Long Integer

Default No default

ATTRIBUTE Lp DS3 DS1 Chan Test **bytesTx**

Access Read only

Description

This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.

Mib LogicalProcessor

Copyright © 2006, Nortel Nortel Confidential

Values	Long Integer
Default	No default

ATTRIBUTE Lp DS3 DS1 Chan Test **frmTx**

Access	Read only
Description	This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp DS3 DS1 Chan Test **bitsRx**

Access	Read only
Description	This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp DS3 DS1 Chan Test **bytesRx**

Access	Read only
Description	This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp DS3 DS1 Chan Test **frmRx**

Access	Read only
Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	LogicalProcessor

Copyright © 2006, Nortel Nortel Confidential

Values	Long Integer
Default	No default

ATTRIBUTE Lp DS3 DS1 Chan Test **erroredFrmRx**

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp DS3 DS1 Chan Test **bitErrorRate**

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.
Mib	LogicalProcessor
Values	String (5, ASCII)
Default	No default

ATTRIBUTE Lp DS3 DS1 Chan Test **elapsedTime**

Access	Read only
Description	This attribute indicates the time elapsed since the test started for an

Copyright © 2006, Nortel Nortel Confidential

externalLoop test. For a data test, it indicates time since test data was first transmitted.

Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

ATTRIBUTE Lp DS3 DS1 Chan Test timeRemaining

Access	Read only
Description	This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

COMPONENT Lp DS3 DS1 Chan AtmCell (Cell)

Groups	GROUP Lp DS3 DS1 Chan Cell Provisioned (Prov) GROUP Lp DS3 DS1 Chan Cell Operational (Oper) GROUP Lp DS3 DS1 Chan Cell Statistics (Stats)
Scope	Device
Description	The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards.
Mib	LogicalProcessor
Common Verbs	Help List Display Add DELete

GROUP Lp DS3 DS1 Chan Cell Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning attributes for the *AtmCell* component.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor

ATTRIBUTE Lp DS3 DS1 Chan Cell **alarmActDelay (act)**

Access	Read and write
Description	This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.
Mib	LogicalProcessor
Values	Decimal (0..2000)
Units	msec
Default	No default

ATTRIBUTE Lp DS3 DS1 Chan Cell **scrambleCellPayload (scramble)**

Access	Read and write
Description	Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled. It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces. Note that this setting must be the same at both ends of the link.
Mib	LogicalProcessor
Values	off on
Default	No default

ATTRIBUTE Lp DS3 DS1 Chan Cell **correctSingleBitHeaderErrors**

Access	Read and write
Description	This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.

Copyright © 2006, Nortel Nortel Confidential

Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.

Mib: LogicalProcessor

Values: off
on

Default: off

ATTRIBUTE Lp DS3 DS1 Chan Cell clearDelay (clear)

Access: Read and write

Description

This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib: LogicalProcessor

Values: Decimal (0..60)

Units: minutes

Default: 0

ATTRIBUTE Lp DS3 DS1 Chan Cell hecSampleInterval (hSample)

Access: Read and write

Description

This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib: LogicalProcessor

Values: Decimal (0..25)

Units: seconds

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Lp DS3 DS1 Chan Cell **hecErrorLimit (hLimit)**

Access	Read and write
Description	This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.) This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	LogicalProcessor
Values	Decimal (1..250000)
Default	No default

ATTRIBUTE Lp DS3 DS1 Chan Cell **lcdStateDelay (delay)**

Access	Read and write
Description	This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	LogicalProcessor
Values	Decimal (1..50)
Units	msec
Default	No default

ATTRIBUTE Lp DS3 DS1 Chan Cell **hecErrorIntervalLimit (hIntLimit)**

Access	Read and write
Description	This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before

Copyright © 2006, Nortel Nortel Confidential

an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Values Decimal (1..25)

Default 1

GROUP Lp DS3 DS1 Chan Cell Operational (Oper)

Properties Operational

Description

This group contains the common operational attributes for the *AtmCell* component.

Mib LogicalProcessor

ATTRIBUTE Lp DS3 DS1 Chan Cell lcdAlarm (lcd)

Access Read only

Description

This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.
In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.
For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when

Copyright © 2006, Nortel Nortel Confidential

the *Path* or *Channel* component has been suspended since its parent has been locked.

Description

This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted.

In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

If the *AtmCell* component is located under a *Ds3* or *E3* component where the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects.

Copyright © 2006, Nortel Nortel Confidential

Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present.

ATTRIBUTE Lp DS3 DS1 Chan Cell receiveCellUtilization (rxutil)

Access Read only

Description

This attribute is the ratio of the number of valid, assigned cells received on the link to the nominal link capacity. The utilization is calculated over a period of one minute.
This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline.* This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*.

Mib LogicalProcessor

Values Decimal (0..100)

COMPONENT Lp DS3 DS1 Chan TrunkConditioning (Tc)

Groups	GROUP Lp DS3 DS1 Chan Tc Provisioned (Prov) GROUP Lp DS3 DS1 Chan Tc Operational (Op)
Scope	Device
Description	*Lp/n Ds1/n Chan/n Tc* *Lp/n E1/n Chan/n Tc* *Lp/n Ds3/n Ds1/n Chan/n Tc* *Lp/n Sdh/n Vc4/n Vc12/k,l,m E1 Chan/n Tc* *Lp/n Sonet/n Sts/n Vt1dot5/l,m Ds1 Chan/n Tc* *Laps/n* Vc4/n Vc12/k,l,m E1 Chan/n T*c* *Laps/n* Sts/n Vt1dot5/l,m Ds1 Chan/n T*c* The *Tc* component is used to provision and monitor trunk conditioning options. A separate instance of this component is required for each *Chan* on a Port which is offering a structured constant bit rate service. Under certain failure alarm conditions, trunk conditioning *replacementData* is substituted into the *timeslots* as defined by the *Chan* component. Trunk conditioning signaling is also substituted into the appropriate Channel Associated Signaling (CAS) bits when a *lineType* that uses CAS has been defined. When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the ATM network under the following conditions: lossOfSignal (LOS) lossOfFrame (LOF) remoteAlarmIndication (RAI) alarmIndicationSignal (AIS) bufferUnderflow (BU) and in addition for E1: lossOfMultiframe (LOMF) receiveMultiframeRemoteAlarmIndication (RMRAI) When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the PDH network under the following conditions:

Copyright © 2006, Nortel Nortel Confidential

bufferUnderflow (BU)
AAL1 protocol errors.

This component needs to be provisioned on 2pDs3cAal and 32pE1Aal FPs.

Properties — Provisioned

Description — This group contains all specific provisioning data for a *Tc* component.

Mib — LogicalProcessor

ATTRIBUTE Lp DS3 DS1 Chan Tc replacementData (data)

Access — Read and write

Description — This attribute specifies the trunk conditioning data byte to be substituted into the *timeslots* defined by the *Chan* component under fault conditions.

The attribute *replacementData* can be set to any two digit hexadecimal number. The following are recommended values:
DS1 MUX Out Of Service Code = 0x1A
E1 MUX Out Of Service Code = 0xFF

On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***0xFF***.

On the ***4pOC3ChSmIr***, ***2pOC3ChSmIrVsp3*** and *2pVS* cards, the default value for this attribute is ***0x1A*** for DS1 and ***0xFF*** for E1. On all other cards the default value is ***0xFF***.

Mib — LogicalProcessor

Values — Hex (H.0..H.ff)

Units — Hex

Default — No default

ATTRIBUTE Lp DS3 DS1 Chan Tc signalOneDuration (duration)

Access — Read and write

Description — This attribute specifies the time duration in seconds for which *signalOne* is substituted into the appropriate signaling bits, when a *lineType* that uses

Copyright © 2006, Nortel Nortel Confidential

CAS has been defined. When *signalOneDuration* has expired *signalTwo* is substituted into the appropriate signaling bits.

If *signalOneDuration* is set to zero then only *signalTwo* is substituted into the appropriate signaling bits during error conditions.

The *signalOneDuration* attribute can be set to any integer value from 0 to 60 seconds.

Mib	LogicalProcessor
Values	Decimal (0..60)
Units	seconds
Default	0

ATTRIBUTE Lp DS3 DS1 Chan Tc noServiceResponse (resp)

Access	Read and write
Description	This attribute specifies the Channel's egress response when it has no service provisioned, or the service provisioned is unavailable due to a near end failure. The following responses are available: ***autoConfigure*** - automatically configure the channels response. ***tc*** - transmit trunk conditioning on all timeslots provisioned in the egress direction. ***ais*** - transmit AIS in the egress direction. ***noResponse*** - no response is sent in the egress direction. A value of ***autoConfigure*** will result in TC being transmitted for all card types.
Mib	LogicalProcessor
Values	autoConfigure tc ais noResponse
Default	autoConfigure

ATTRIBUTE Lp DS3 DS1 Chan Tc signalOne (sigOne)

Access	Read and write
Description	This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted for the duration provisioned in *signalOneDuration* when a *lineType* that uses CAS has been defined. For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively.

Display

VERB START Lp DS3 DS1 Test

Impact Service

Description

This command invokes a test on the hardware component.
Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

VERB STOP Lp DS3 DS1 Test

Impact Service

Description

This command stops a test running on the hardware component.

GROUP Lp DS3 DS1 Test **OsiState (State)**

Properties Operational

Description This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib LogicalProcessor

ATTRIBUTE Lp DS3 DS1 Test **adminState (osiAdmin)**

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

Copyright © 2006, Nortel Nortel Confidential

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — LogicalProcessor

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Lp DS3 DS1 Test operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — LogicalProcessor

Values
enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Lp DS3 DS1 Test usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — LogicalProcessor

Values
idle
active (activ)
busy

Default — idle

GROUP Lp DS3 DS1 Test Setup (Setup)

Properties	Operational
Description	This group contains all of the operational data for a *Test* component.
Mib	LogicalProcessor

ATTRIBUTE Lp DS3 DS1 Test purpose (purpose)

Access	Read and write
Description	This attribute records the purpose of the test so that the test results can be associated and properly analyzed.
Mib	LogicalProcessor
Values	String (0..40, ASCII)
Default	No default

ATTRIBUTE Lp DS3 DS1 Test type (type)

Access	Read and write
Description	This attribute is the type of test to be run. The available test types include the following: ***card*** test sets up an internal loop on the board and runs a bit error rate test. ***manual*** test assumes the line is looped back externally and a bit error rate test is performed. ***localLoop*** test loops back the local modem and performs a bit error rate test. ***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test. ***externalLoop*** test loops back the line to the far end. ***payloadLoop*** test only loops back the payload data received from the incoming line. ***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent. ***v54RemoteLoop*** initiates a V.54 Remote Loopback test. ***pn127RemoteLoop*** initiates a PN127 Remote Loopback test. ***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted). ***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted). ***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted). ***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted). Note that not all test types are not supported by all function processors.

Default	card

ATTRIBUTE Lp DS3 DS1 Test frmSize (size)

Access	Read and write
Description	This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.
Mib	LogicalProcessor
Values	Decimal (4..4096)
Units	bytes
Default	1024

ATTRIBUTE Lp DS3 DS1 Test frmPatternType (fpt)

Access	Read and write
Description	This attribute defines the type of data pattern generation to use. The following lists the available pattern types: ***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit. ***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit. ***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.
Mib	LogicalProcessor
Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp DS3 DS1 Test customizedPattern (cp)

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	LogicalProcessor
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Lp DS3 DS1 Test dataStartDelay (dsd)

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	LogicalProcessor
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Lp DS3 DS1 Test displayInterval (di)

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	LogicalProcessor
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Lp DS3 DS1 Test duration

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Lp DS3 DS1 Test Results (Results)

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	LogicalProcessor

ATTRIBUTE Lp DS3 DS1 Test causeOfTermination

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback. a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback. a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This

Copyright © 2006, Nortel Nortel Confidential

failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Mib — LogicalProcessor

Values
testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

Default — neverStarted

ATTRIBUTE Lp DS3 DS1 Test bitsTx

Access — Read only

Description

This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Mib — LogicalProcessor

Values — Long Integer

Default — No default

ATTRIBUTE Lp DS3 DS1 Test bytesTx

Access — Read only

Description

This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.

Mib — LogicalProcessor

Values — Long Integer

Default — No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp DS3 DS1 Test frmTx

Access	Read only
Description	This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp DS3 DS1 Test bitsRx

Access	Read only
Description	This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp DS3 DS1 Test bytesRx

Access	Read only
Description	This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp DS3 DS1 Test frmRx

Access	Read only
Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	LogicalProcessor
Values	Long Integer

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Lp DS3 DS1 Test **erroredFrmRx**

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp DS3 DS1 Test **bitErrorRate**

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.
Mib	LogicalProcessor
Values	String (5, ASCII)
Default	No default

ATTRIBUTE Lp DS3 DS1 Test **elapsedTime**

Access	Read only
Description	This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)

Instance	Decimal (0..13)
Groups	GROUP Lp DS3 Ima Provisioned (Prov) GROUP Lp DS3 Ima Operational (Oper) GROUP Lp DS3 Ima Statistics (Stats) GROUP Lp DS3 Ima CustomerIdentifierData (CidData) GROUP Lp DS3 Ima OsiState (State)
Scope	Device
Description	*Lp/n InverseMultiplexerAtm/n* *Lp/n Ds3/n InverseMultiplexerAtm/n* This component is used to define an inverse multiplexing for ATM (IMA) group. IMA provides a data rate greater than DS1 E1 in increments of DS1 E1. To use IMA on an 8pDS1E1, MSA32, MSA8, 2pSTM1eCh or 2pSTM1Ch function processor, add an *Lp/n InverseMultiplexerAtm/n* component. To use IMA on a 4pDS3ChAtm function processor, add an *Lp/n Ds3/n InverseMultiplexerAtm/n* component. To use IMA in a protected configuration on the 2pSTM1Ch, add a *Laps/n InverseMultiplexerAtm/n* component. The instance range 0..7 applies to 8pDS1Atm, 8pE1Atm, 8pDS1Msa and 8pE1Msa cards. The instance range 0..13 applies to 4pDS3ChAtm cards. The instance range 0..29 applies to MSA32 cards. The instance range 0..113 applies to the 2pStm1eCh and 2pSTM1Ch cards. The instance number of an *IMA* group must not be the same as the instance number of a *DS1*/*E1* “ATM UNI port” under the same *Lp*. An “ATM UNI port” is a *DS1* or *E1* component with a single *Chan* whose

Copyright © 2006, Nortel Nortel Confidential

applicationFramer attribute is linked to an *AtmIf* component. On an MSA32 card, ports that are used as IMA links have two immiscible sub-ranges: 0..15 and 16..31. The instance number of an *IMA* group must be in the same sub-range as all of its ports. IMA sub-ranges also exist on the 2pStm1eCh and 2pSTM1Ch cards, instances 0..56 are allowed on port SDH 0, and instances 57..113 are allowed on port SDH 1.

GROUP Lp DS3 Ima Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the *Ima* component. The default values of *linkSelectionCriterion* and *linkRetryTimeout* depend on card type.
Mib	Ima

ATTRIBUTE Lp DS3 Ima linkSelectionCriterion (select)

Access	Read and write
Description	This attribute specifies the method to be used by the IMA group when selecting links to be activated. This comes into effect only when the configured links do not respect the maximum differential delay (otherwise all links are accepted). If ***leastDelay*** is chosen, first the link having the smallest delay is selected as the reference link. The IMA group includes all links which respect the maximum differential delay relative to the reference link. If ***maxBandwidth*** is chosen, the IMA group selects the maximum possible number of links, with each selected link respecting the maximum differential delay relative to every other selected link. When more than one possibility exists, the combination which offers the least delay is selected. The default value for Multi-Service Access cards is ***leastDelay***, and for all other cards is ***maxBandwidth***. On Multi-Service Access cards ***leastDelay*** is the only acceptable provisionable value.

Copyright © 2006, Nortel Nortel Confidential

Mib	Ima
Values	leastDelay maxBandwidth
Default	No default

ATTRIBUTE Lp DS3 Ima maxDiffDelay (delay)

Access	Read and write
Description	This attribute specifies the maximum differential delay between links acceptable in the IMA group. If a link violates that maximum differential delay, it will not be active in the IMA group and an alarm will be generated. For the 4pDS3ChAtm card, the value must not exceed 70.
Mib	Ima
Values	Decimal (1..100)
Units	msec
Default	25

ATTRIBUTE Lp DS3 Ima linkRetryTimeout (retry)

Access	Read and write
Description	This attribute specifies the amount of time before reactivation of a link is attempted after it recovers from a failure condition. The default value for Multi-Service Access cards is ***1***, and for all other cards is ***10***. On Multi-Service Access cards ***1*** is the only acceptable provisionable value.
Mib	Ima
Values	Decimal (0..1000)
Units	seconds
Default	No default

ATTRIBUTE Lp DS3 Ima applicationFramerName (framer)

Access	Read and write
Description	This attribute defines the link to the *AtmIf* component using the *Ima*. An example is *AtmIf/31.*
Mib	Ima
Values	Link (Service, interfaceName)
Default	No default

ATTRIBUTE Lp DS3 Ima transmitClockMode (clock)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the transmit clocking mode. If ***itc*** (Independent Transmit Clock) is chosen, the physical ports used by the IMA group may have different clocking sources. If ***ctc*** (Common Transmit Clock) is chosen, it is recommended that the physical ports used by the IMA group have the same clocking source. However, if the physical ports have different clocking sources, the operator should ensure that all the clocking sources have the same rate.
Mib	Ima
Values	itc ctc
Default	itc

ATTRIBUTE Lp DS3 Ima protocol (prot)

Access	Read and write
Criticality	Component
Description	This attribute specifies which IMA protocol the component should run. If ***atmForum10*** is chosen, the ATM Forum's IMA protocol (version 1.0) will be used and signalled in outgoing IMA Control Protocol (ICP) cells.The IMA group will come up only if the far end IMA also uses the ATM Forum's IMA protocol 1.0. Feature ***imaAtmForum*** must be provisioned on the LP for this protocol to be used. If ***atmForum11*** is chosen, the ATM Forum's IMA protocol (version 1.1) will be used and signalled in outgoing IMA Control Protocol (ICP) cells.The IMA group will come up only if the far end IMA uses the ATM Forum's IMA protocol 1.0 or 1.1. Feature ***imaAtmForum*** must be provisioned on the LP for this protocol to be used. If the far end is 1.0, then the near end downgrades to 1.0. After the downgrade, this attribute continues to specify the provisioned protocol version, while the *activeProtocol* operational attribute of the IMA component specifies the protocol version effectively running. If ***proprietary*** is chosen, Nortel's proprietary IMA protocol will be used. This protocol version is not currently supported as the IMA group will not inter-operate with IMA implementations from other vendors. Feature ***ima*** must be provisioned on the LP for this protocol to be used. The DEFAULT on the 2pStm1eCh and 2pSTM1Ch function processors is atmForum11.

GROUP Lp DS3 Ima Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *Ima* component.
Mib	Ima

ATTRIBUTE Lp DS3 Ima failureCause (cause)

Access	Read only
Description	This attribute indicates the cause of the current local end failure experienced by the IMA group. The failure may have occurred during a start-up procedure or during normal operation. Possible values are: ***noFailure***: no local end failure. ***noGoodLinksInStartup***: no good links were available during IMA start-up. ***badGidInStartup***: during start-up, different group identifiers (GIDs) were received on the links. ***badLidInStartup***: during start-up, duplicate link identifiers (LIDs) were received on the links. ***unsupportedFrameLengthInStartup***: during start-up, an unsupported frame length was received. ***timeoutInStartup***: a time-out has occurred during start-up. ***noGoodLinks***: no good links are available in the IMA group. ***remoteFailure***: the far end is down. ***unsupportedSymmetryInStartup***: the symmetry proposed by the far end is not supported on the near-end. This value will occur when the IMA group is running the ATM Forum protocol and the far end is proposing a group symmetry other than “symmetric configuration and operation”. ***unsupportedVersionInStartup***: the ima version proposed by the far end is not supported on the near-end.
Mib	Ima
Values	noFailure noGoodLinksInStartup badGidInStartup badLidInStartup unsupportedFrameLengthInStartup timeoutInStartup noGoodLinks remoteFailure unsupportedSymmetryInStartup unsupportedVersionInStartup
Default	No default

ATTRIBUTE Lp DS3 Ima remoteDefect (remDef)

Access	Read only
Description	This attribute indicates the cause of the current far end defect experienced by the IMA group. For the ATM Forum IMA protocol, possible values are:

Copyright © 2006, Nortel Nortel Confidential

noDefect: no defect.
unsupportedFrameLengthInStartup: during the far end's start-up, an unsupported frame length was received.
unsupportedSymmetryInStartup: during the far end's start-up, an unsupported symmetry configuration was received.
otherAbortStartup: the far end has aborted its start-up for another reason. This could be because different Gids were received on the links or if duplicate link identifiers (LIDs) were received.
insufficientLinks: the far end does not have sufficient links active. This value will be displayed if the far end IMA group is locked.
blocked: the far end IMA group is blocked.

For the proprietary IMA protocol, possible values are:
noDefect: no defect.
noGoodLinksInStartup: no good links were available during the far end's start-up.
badGidInStartup: during the far end's start-up, different GIDs were received on the links.
badLidInStartup: during the far end's start-up, duplicate link identifiers (LIDs) were received on the links.
unsupportedFrameLengthInStartup: during the far end's start-up, an unsupported frame length was received.
timeoutInStartup: a time out has occurred during the far end's start-up.
noGoodLinks: no good links are available in the far end IMA group.
blocked: the far end IMA group is locked.
unsupportedVersionInStartup: the ima version proposed by the far end is not supported on the near-end.

Mib	Ima
Values	noDefect noGoodLinksInStartup badGidInStartup badLidInStartup unsupportedFrameLengthInStartup timeoutInStartup noGoodLinks locked unsupportedSymmetryInStartup otherAbortStartup insufficientLinks blocked unsupportedVersionInStartup
Default	No default

ATTRIBUTE Lp DS3 Ima remoteLidsConfig (remConf)

Access	Read only
Description	This attribute indicates all the links which have been configured in the remote IMA group. For example, if links 1, 3 and 5 have been configured in the remote IMA group, this attribute would contain ***1 3 5***.

Copyright © 2006, Nortel Nortel Confidential

Mib	Ima
Set of	Decimal (0..31)
Default	No default

ATTRIBUTE Lp DS3 Ima remoteLidsActive (remAct)

Access	Read only
Description	This attribute indicates all the links which are active in the remote IMA group. For example, if links 1 and 5 are active in the remote IMA, this attribute would contain ***1 5***.
Mib	Ima
Set of	Decimal (0..31)
Default	No default

ATTRIBUTE Lp DS3 Ima cellCapacity (cap)

Access	Read only
Description	This attribute indicates the total cell capacity (in cells per second) which is provided to the ATM layer. This cell capacity takes into account the physical and IMA level overheads.
Mib	Ima
Values	Decimal (0..4294967295)
Units	cell/s
Default	No default

ATTRIBUTE Lp DS3 Ima remoteGid (remGid)

Access	Read only
Description	This attribute indicates the IMA group identifier (GID) used by the remote IMA. A value of 0 will be displayed if the group is not receiving IMA Control Protocol (ICP) cells.
Mib	Ima
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Lp DS3 Ima clockingModeMismatch (mismatch)

Access	Read only
Description	This attribute indicates whether or not both ends of the IMA group are using the same transmit clocking mode (***itc***/***ctc***). Its value will be ***yes*** if both ends are not using the same transmit clocking mode. A clocking mode mismatch does not prevent an IMA group from coming up and can

Copyright © 2006, Nortel Nortel Confidential

be corrected by using the same clocking mode at both ends.

Mib	Ima
Values	no yes
Default	No default

ATTRIBUTE Lp DS3 Ima activeProtocol (activeProt)

Access	Read only
Description	This attribute indicates which IMA protocol the *Ima* component is effectively running. This attribute is supported on the 8pDs1Atm, 8pE1Atm, 4pDS3ChAtm, 2pStm1eCh and 2pSTM1Ch cards. This attribute is not supported on the MSA32 and MSA8 cards. The value of this attribute is the same as the provisioned *protocol* attribute if the IMA is operating at the provisioned protocol version. The value of this attribute indicates the dongraded protocol version if the IMA has gone through a protocol version downgrade upon IMA 1.1 to IMA 1.0 interworking.
Mib	Ima
Values	atmForum10 proprietary atmForum11
Default	No default

GROUP Lp DS3 Ima Statistics (Stats)

Properties	Operational
Description	This group contains the statistics data for the *Ima* component.
Mib	Ima

ATTRIBUTE Lp DS3 Ima runningTime (running)

Access	Read only
Description	This attribute indicates the length of time (in seconds) for which the *Ima* component has been in the unlocked state or has been used for operational testing.
Mib	Ima
Values	Decimal (0..4294967295)
Units	seconds
Default	No default

ATTRIBUTE Lp DS3 Ima unavailSec (unavail)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the number of one second intervals during which the *Ima* component has been unlocked and out of service.
Mib	Ima
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp DS3 Ima failures (fail)

Access	Read only
Description	This attribute indicates the number of complete failures, during start-up or normal operation, that the *Ima* component has experienced since being added. It must be noted that a service degradation, such as 1 of the 3 links in an IMA group being down, is not counted as a failure. If an *Ima* component is in a failure loop and does not come up, this count will only increase by 1.
Mib	Ima
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp DS3 Ima receiveCellUtilization (rxutil)

Access	Read only
Description	This attribute indicates the ratio of the number of valid, assigned user cells received on the IMA group to the IMA cell capacity (based on the number of active links). The utilization is calculated over a one minute period.
Mib	Ima
Values	Decimal (0..100)
Units	%
Default	No default

ATTRIBUTE Lp DS3 Ima transmitCellUtilization (txutil)

Access	Read only
Description	This attribute indicates the ratio of the number of user cells transmitted on the IMA group to the IMA cell capacity (based on the number of active links). The utilization is calculated over a one minute period.
Mib	Ima
Values	Decimal (0..100)

Copyright © 2006, Nortel Nortel Confidential

Units	%
Default	No default

GROUP Lp DS3 Ima CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	Ima

ATTRIBUTE Lp DS3 Ima customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	Ima
Values	Decimal (0; 1..8191)
Default	0

GROUP Lp DS3 Ima OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Ima

ATTRIBUTE Lp DS3 Ima adminState (osiAdmin)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Ima
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp DS3 Ima operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Ima
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp DS3 Ima usageState (osiUsage)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Ima
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp DS3 Ima availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	Ima
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Lp DS3 Ima proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal

Copyright © 2006, Nortel Nortel Confidential

functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib — Ima

Set of — initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default — No default

ATTRIBUTE Lp DS3 Ima controlStatus (osiCntrl)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Copyright © 2006, Nortel Nortel Confidential

Mib	Ima
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE Lp DS3 Ima alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	Ima
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Lp DS3 Ima standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib: Ima

Values:
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default: notSet

ATTRIBUTE Lp DS3 Ima unknownStatus (osiUnknw)

Access: Read only

Description: This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Mib: Ima

Values:
false
true

Default: false

COMPONENT Lp DS3 Ima Test (Test)

Groups:
GROUP Lp DS3 Ima Test OsiState (State)
GROUP Lp DS3 Ima Test Setup (Setup)
GROUP Lp DS3 Ima Test Results (Results)

Scope: Application

Copyright © 2006, Nortel Nortel Confidential

Description

The *Test* component is configured to control a hardware facility test on a physical (*V3*5, *X21, DS1, E1, DS3, E3* etc.) or a logical port.

Mib Ima

Common Verbs
Help
List
Display

VERB START Lp DS3 Ima Test

Impact Service

Description

This command invokes a test on the hardware component.
Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

VERB STOP Lp DS3 Ima Test

Impact Service

Description

This command stops a test running on the hardware component.

GROUP Lp DS3 Ima Test **OsiState (State)**

Properties Operational

Description This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib Ima

ATTRIBUTE Lp DS3 Ima Test **adminState (osiAdmin)**

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

Copyright © 2006, Nortel Nortel Confidential

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — Ima

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

GROUP Lp DS3 Ima Test Setup (Setup)

Properties	Operational
Description	This group contains all of the operational data for a *Test* component.
Mib	Ima

ATTRIBUTE Lp DS3 Ima Test purpose (purpose)

Access	Read and write
Description	This attribute records the purpose of the test so that the test results can be associated and properly analyzed.
Mib	Ima
Values	String (0..40, ASCII)
Default	No default

ATTRIBUTE Lp DS3 Ima Test type (type)

Access	Read and write
Description	This attribute is the type of test to be run. The available test types include the following: ***card*** test sets up an internal loop on the board and runs a bit error rate test. ***manual*** test assumes the line is looped back externally and a bit error rate test is performed. ***localLoop*** test loops back the local modem and performs a bit error rate test. ***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test. ***externalLoop*** test loops back the line to the far end. ***payloadLoop*** test only loops back the payload data received from the incoming line. ***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent. ***v54RemoteLoop*** initiates a V.54 Remote Loopback test. ***pn127RemoteLoop*** initiates a PN127 Remote Loopback test. ***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted). ***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted). ***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted). ***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted). Note that not all test types are not supported by all function processors.

Copyright © 2006, Nortel Nortel Confidential

Mib	Ima
Values	card manual localLoop remoteLoop externalLoop payloadLoop remoteLoopThisTrib v54RemoteLoop pn127RemoteLoop lineBIP8Error sectionBIP8Error pathBIP8Error pathBIP2Error
Default	card

ATTRIBUTE Lp DS3 Ima Test frmSize (size)

Access	Read and write
Description	This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.
Mib	Ima
Values	Decimal (4..4096)
Units	bytes
Default	1024

ATTRIBUTE Lp DS3 Ima Test frmPatternType (fpt)

Access	Read and write
Description	This attribute defines the type of data pattern generation to use. The following lists the available pattern types: ***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit. ***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit. ***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.
Mib	Ima
Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp DS3 Ima Test customizedPattern (cp)

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	Ima
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Lp DS3 Ima Test dataStartDelay (dsd)

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	Ima
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Lp DS3 Ima Test displayInterval (di)

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	Ima
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Lp DS3 Ima Test duration

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	Ima
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Lp DS3 Ima Test Results (Results)

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	Ima

ATTRIBUTE Lp DS3 Ima Test causeOfTermination

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback. a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback. a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This

Copyright © 2006, Nortel Nortel Confidential

failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Mib: Ima

Values:
testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

Default: neverStarted

ATTRIBUTE Lp DS3 Ima Test bitsTx

Access: Read only

Description

This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Mib: Ima

Values: Long Integer

Default: No default

ATTRIBUTE Lp DS3 Ima Test bytesTx

Access: Read only

Description

This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.

Values	Long Integer
Default	No default

ATTRIBUTE Lp DS3 Ima Test **frmRx**

Access	Read only
Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	Ima
Values	Long Integer

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Lp DS3 Ima Test **erroredFrmRx**

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	Ima
Values	Long Integer
Default	No default

ATTRIBUTE Lp DS3 Ima Test **bitErrorRate**

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.
Mib	Ima
Values	String (5, ASCII)
Default	No default

ATTRIBUTE Lp DS3 Ima Test **elapsedTime**

Access	Read only
Description	This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.

Mib	Ima
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

ATTRIBUTE Lp DS3 Ima Test timeRemaining

Access	Read only
Description	This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.
Mib	Ima
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

COMPONENT Lp DS3 Ima Link (Lk)

Instance	Decimal (0..31)
Groups	GROUP Lp DS3 Ima Lk Provisioned (Prov) GROUP Lp DS3 Ima Lk Operational (Oper) GROUP Lp DS3 Ima Lk Statistics (Stats) GROUP Lp DS3 Ima Lk OsiState (State)
Scope	Device
Description	*Lp/n Ima/n Link/n* *Lp/n Ds3/n Ima/n Link/n* This component is used to define a DS1/E1 link belonging to an IMA group. The instance number of the *Link* subcomponent corresponds to the link identifier (LID) used by the link in IMA Control Protocol (ICP) cells. To use Ima on an 8pDS1E1 function processor, add *Lp/n Ima/n Link/n*. To use Ima on a 4pDS3ChAtm function processor, add *Lp/n Ds3/n Ima/n Link/n*.
Mib	Ima
Common Verbs	Help List Display Add DELete

GROUP Lp DS3 Ima Lk Provisioned (Prov)

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the provisionable attributes for the *Link* subcomponent.
Mib	Ima

ATTRIBUTE Lp DS3 Ima Lk interfaceName

Access	Read and write
Criticality	Component
Description	This attribute associates the *Link* subcomponent with a specific interface on a function processor, for example *Lp/5 E1/3 Chan/0*. If IMA groups and independent links coexist on a card running IMA and per-VC queueing is enabled, plan the selection of DS1 or E1 ports to be used by the IMA group carefully. For a 4pDS3ChAtm function processor there is no per-VC queueing.
Mib	Ima
Values	Link (Hardware, applicationFramerName)
Default	No default

GROUP Lp DS3 Ima Lk Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *Link* subcomponent.
Mib	Ima

ATTRIBUTE Lp DS3 Ima Lk failureCause (cause)

Access	Read only
Description	This attribute indicates the failure cause on this link. Possible values are: ***noFailure***: there is no failure on this link. ***interfaceDown***: the physical port used by the link is down. ***lif***: the link is in loss of IMA frame (LIF) state. ***lods***: the link is in loss of delay synchronization (LODS) state; that is, it has exhibited a differential delay which is greater than the maximum differential delay tolerated by the IMA group. It must be noted that hysteresis is used for the LODS condition. ***protocolError***: the link is down because of a time-out or because bad values are being received in IMA Control Protocol (ICP) cells. ***remoteFailure***: the far end link is down. ***misconnected***: the link is down because the IMA group has declared, after using its transmit test pattern procedure, that this link is not properly connected. This value can occur only if the *protocol for the IMA group is* ***atmForum10.*** ***unsupportedFrameLength***: the link is down because it is receiving from the far end a frame length which is not supported by the local IMA group. This value can occur only if the *protocol for the IMA group is* ***atmForum10.*** ***unsupportedSymmetry***: the link is down because it is receiving

Copyright © 2006, Nortel Nortel Confidential

from the far end a group symmetry which is not supported by the local IMA group. This value can occur only if the *protocol for the IMA group is* ***atmForum10.***
noIcp: the link is down because it is not receiving IMA Control Protocol (ICP) cells. This value can occur only if the *protocol* for the IMA group is ***atmForum10***.
unsupportedVersion: the link is down because it is receiving from the far end a group version that is not supported by the local IMA group.

Values:
noFailure
interfaceDown
lif
lods
protocolError
remoteFailure
misconnected
unsupportedFrameLength
unsupportedSymmetry
unsupportedVersion
noIcp

Default: No default

ATTRIBUTE Lp DS3 Ima Lk **remoteDefect (remDef)**

Access: Read only

Description: This attribute indicates the IMA remote defect indicator (RDI) currently being received on this link. Possible values are:
noDefect: no defect.
physicalLayerDefect: the interface used by the remote link has a physical layer defect. This value can occur only if the *protocol for the IMA group is* ***atmForum10.***
interfaceDown: the physical interface used by the remote link is down.This value can occur only if the *protocol for the IMA group is* ***proprietary.***
lif: the remote link has a loss of IMA frame (LIF) defect.
lods: the remote link has a loss of delay synchronization (LODS) defect; that is, it has exhibited a differential delay which is greater than the maximum differential delay tolerated by the IMA group.

Mib: Ima

Values:
noDefect
interfaceDown
lif

ATTRIBUTE Lp DS3 Ima Lk remoteLid (remLid)

Access	Read only
Description	This attribute indicates the link identifier (LID) used by the remote IMA group on the physical link. A value of 0 will be displayed if the link is not receiving IMA Control Protocol (ICP) cells or if the physical layer is down.
Mib	Ima
Values	Decimal (0..31)
Default	No default

ATTRIBUTE Lp DS3 Ima Lk relativeDelay (rel)

Access	Read only
Description	This attribute indicates the latest measured differential delay (rounded up in milliseconds) between this link and the link, in the same IMA group, having the least delay. A value of 4294967295 indicates that the relative delay could not be measured. This can be due to physical layer problems or to no IMA Control Protocol (ICP) cells being received on the link.
Mib	Ima
Values	Decimal (0..4294967295)
Units	msec
Default	No default

ATTRIBUTE Lp DS3 Ima Lk lastOifCause (oif)

Access	Read only
Description	This attribute indicates the cause of the last out of IMA frame (OIF) anomaly on the link. Possible values are: ***noOif***: no OIF was detected. ***badFrameLength***: an IMA Control Protocol (ICP) cell with an unexpected frame length was received. ***badGid***: an ICP cell with an unexpected group identifier (GID) was received. ***badLid***: an ICP cell with an unexpected link identifier (LID) was received. ***badOffset***: an ICP cell with an unexpected cell offset was received. ***badSequenceNumber***: an ICP cell with an unexpected frame sequence number was received. ***stuffError***: an illegal stuffing sequence was received. ***missingIcp***: an expected ICP cell was not received. ***unexpectedIcp***: an unexpected ICP cell was received. ***erroredIcp***: two consecutive errored ICP cells were received. ***noCells***: no cells are being received on the link. ***idleCell***: an idle cell was received on the link. ***badOamLabel***: an ICP cell with an unexpected oam label was received.
Mib	Ima

GROUP Lp DS3 Ima Lk Statistics (Stats)

Properties	Operational
Description	This group contains the statistics data for the *Link* subcomponent.
Mib	Ima

ATTRIBUTE Lp DS3 Ima Lk runningTime (running)

Access	Read only
Description	This attribute counts the length of time (in seconds) for which the *Link* component has been running.
Mib	Ima
Values	Decimal (0..4294967295)
Units	seconds
Default	No default

ATTRIBUTE Lp DS3 Ima Lk unavailSec (unavail)

Access	Read only
Description	For an IMA group whose *protocol* is ***atmForum10***, this attribute counts the number of unavailable seconds. Unavailability begins at the start of 10 contiguous severely errored seconds (SES) and ends at the start of 10 contiguous seconds with no SES.
Mib	Ima
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp DS3 Ima Lk failures (fail)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of failures, during link addition or normal operation, that the link has experienced.
Mib	Ima
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp DS3 Ima Lk unusableSec (uus)

Access	Read only
Description	This attribute counts the number of one second intervals during which the near end has been in an unusable state.
Mib	Ima
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp DS3 Ima Lk sevErroredSec (ses)

Access	Read only
Description	This attribute counts the number of one second intervals in which at least 30 percent of the IMA Control Protocol (ICP) cells were counted as ICP violations or at least one link defect (physical layer, LIF and LODS defects) was detected. This attribute will not increment during UAS (Unavailable Second) conditions.
Mib	Ima
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp DS3 Ima Lk farEndUnusableSec (feUus)

Access	Read only
Description	This attribute counts the number of one second intervals during which the “Tx/Rx Unusable” condition has been received from the far end.
Mib	Ima
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp DS3 Ima Lk farEndSevErroredSec (feSes)

Access	Read only
Description	This attribute counts the number of one second intervals containing one or more RDI defects. This attribute will not increment during FEUAS (Far-End Unavailable Second) conditions.

Copyright © 2006, Nortel Nortel Confidential

Mib	Ima
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp DS3 Ima Lk farEndUnavailSec (feUnavail)

Access	Read only
Description	This attribute counts the number of unavailable seconds at the far end. Unavailability begins at the start of 10 contiguous severely errored seconds (SES) at the far end and ends at the start of 10 contiguous seconds at the far end with no SES.
Mib	Ima
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp DS3 Ima Lk icpViolations (iv)

Access	Read only
Description	This attribute counts the number of errored, invalid or missing IMA Control Protocol (ICP) cells during non-SES (Severely Errored Second) and non-UAS (Unavailable Seconds) conditions.
Mib	Ima
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp DS3 Ima Lk txStuffEvents (txStuff)

Access	Read only
Description	This attribute counts the number of Stuff events transmitted during non-SES (Severely Errored Second) and non-UAS (Unavailable Seconds) conditions.
Mib	Ima
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp DS3 Ima Lk rxStuffEvents (rxStuff)

Access	Read only
Description	This attribute counts the number of Stuff events received during non-SES (Severely Errored Second) and non-UAS (Unavailable Seconds) conditions.
Mib	Ima
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Lp DS3 Ima Lk idleCellSec (idle)

Access	Read only
Description	This attributes counts the number of one second intervals during which one or more idle cells was received. The reception of idle cells is an abnormal condition which could be caused by the remote IMA using the Common Transmit Clock mode with ports whose clock sources are not synchronized.
Mib	Ima
Values	Decimal (0..4294967295)
Default	No default

GROUP Lp DS3 Ima Lk OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Ima

ATTRIBUTE Lp DS3 Ima Lk adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Ima

Copyright © 2006, Nortel Nortel Confidential

Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp DS3 Ima Lk operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Ima
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp DS3 Ima Lk usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Ima
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp DS3 Ima Lk availabilityStatus (osiAvail)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components. The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***. The value ***logFull*** is not used. The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Copyright © 2006, Nortel Nortel Confidential

Mib	Ima
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Lp DS3 Ima Lk proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib	Ima
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE Lp DS3 Ima Lk controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.
Mib	Ima
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE Lp DS3 Ima Lk alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib — Ima

Set of — underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default — No default

ATTRIBUTE Lp DS3 Ima Lk **standbyStatus (osiStby)**

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP Lp E3 Provisioned (Prov)

Properties	Provisioned
Description	This group contains all of the provisioning data for a *E3* component.
Mib	LogicalProcessor

ATTRIBUTE Lp E3 lineLength (length)

Access	Read and write
Description	This attribute defines the line length for equalization calculations for the E3 line. The line length range is between 0 and 300 metres (1 metres = 3.28 feet).
Mib	LogicalProcessor
Values	Decimal (0..300)
Units	metres
Default	1

ATTRIBUTE Lp E3 clockingSource

Access	Read and write
Description	This attribute defines the type of clocking source used for synchronizing the E3 transmit clock: ***local*** means direct use of the local clock oscillator at its centre frequency; ***line*** means use of a signal phase-locked to the incoming E3 line rate; ***module*** means the use of a signal phase-locked to the CP reference clock. Note that the multiport cell-based cards have one common clock source

Copyright © 2006, Nortel Nortel Confidential

for each of the three ports. For this reason, the following rules apply for the value of *clockingSource* across the board's three ports:
All three *clockingSource* values must be "***local***" OR
All three *clockingSource* values must be "***module***" OR
One *clockingSource* value must be "***line***" and the other two must be "***otherPort***".
The default value for this attribute will be ***module*** if a CP clock is available, and ***local*** otherwise.

module
otherPort

Default — No default

ATTRIBUTE Lp E3 applicationFramerName (framer)

Access — Read and write

Description

This attribute defines the link to the software stack. It defines which application is running on top of the *E3* component.

Mib — LogicalProcessor

Values — Link (Service, interfaceName)

Default — No default

ATTRIBUTE Lp E3 mapping

Access — Read and write

Description

This attribute indicates if ATM cells will be mapped directly into the E3 payload, or whether PLCP mapping will be used. The *PLCP* component will appear under the *E3* component when this attribute is set to ***plcp***. This attribute will be ignored when set on frame-based cards.

Mib — LogicalProcessor

Values — direct
plcp

Default — direct

ATTRIBUTE Lp E3 framing

Access — Read and write

Description

This attribute indicates if the framing mode will be in accordance with the CCITT G.751 or G.832 specification. The *G832* component will appear under the *E3* component when this attribute is set to ***g832***. This attribute

Copyright © 2006, Nortel Nortel Confidential

may only be set on cell-based card types. Note also that this attribute may only be set to ***g751*** if the *mapping* attribute is set to ***plcp***.
The default value of this attribute will be ***g751*** for frame-based cards, and ***g832*** for cell-based cards.
Note: when *E3 framing* is changed from ***g832*** to ***g751***, the *G832* component must be deleted.

Mib	LogicalProcessor
Values	g751 g832
Default	No default

ATTRIBUTE Lp E3 linkAlarmActivationThreshold

Access	Read and write
Description	This attribute specifies the time interval between the detection of a sustained link failure and the activation of an alarm. It is provisionable for E3 cards.
Mib	LogicalProcessor
Values	Decimal (100..2600)
Units	msec
Default	2200

ATTRIBUTE Lp E3 linkAlarmScanInterval

Access	Read and write
Description	This attribute specifies the alarm scan timer polling interval. It determines how frequently the status of the link is monitored after a first link error interrupt. It is provisionable for E3 cards.
Mib	LogicalProcessor
Values	Decimal (50..250)
Units	msec
Default	200

GROUP Lp E3 CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	LogicalProcessor

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp E3 customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	LogicalProcessor
Values	Decimal (0; 1..8191)
Default	0

GROUP Lp E3 AdminInfo (AdminInfo)

Properties	Provisioned
Description	This group contains the attributes pertaining to the vendor of the equipment.
Mib	LogicalProcessor

ATTRIBUTE Lp E3 vendor

Access	Read and write
Description	This is the name of the vendor supplying the facility.
Mib	LogicalProcessor
Values	String (0..20, ASCII)
Default	No default

ATTRIBUTE Lp E3 commentText

Access	Read and write
Description	Any miscellaneous text about the facility.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor
Values	String (0..60, ASCII)
Default	No default

ATTRIBUTE Lp E3 includeAdminInfoInAlarm

Access	Read and write
Description	This attribute specifies that user defined text contained in *vendor* and *commentText* attributes of this *VendorInfo* instance will be appended to the comment text of any alarms, excluding hardware initialization alarms, for the associated interface port if this attribute is set to on.
Mib	LogicalProcessor
Values	no yes
Default	no

GROUP Lp E3 IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	LogicalProcessor

ATTRIBUTE Lp E3 ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	LogicalProcessor
Values	up down testing
Default	up

ATTRIBUTE Lp E3 ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	LogicalProcessor

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (1..65535)
Default	No default

GROUP Lp E3 OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	LogicalProcessor

ATTRIBUTE Lp E3 snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	LogicalProcessor
Values	up down testing
Default	up

GROUP Lp E3 OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LogicalProcessor

ATTRIBUTE Lp E3 adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting

Copyright © 2006, Nortel Nortel Confidential

down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib — LogicalProcessor

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Lp E3 operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib — LogicalProcessor

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Lp E3 usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Copyright © 2006, Nortel Nortel Confidential

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	LogicalProcessor
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp E3 availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

Copyright © 2006, Nortel Nortel Confidential

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	LogicalProcessor
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Lp E3 proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib: LogicalProcessor

Set of:
initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default: No default

ATTRIBUTE Lp E3 controlStatus (osiCntrl)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib: LogicalProcessor

Set of:
subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default: No default

ATTRIBUTE Lp E3 alarmStatus (osiAlarm)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

Copyright © 2006, Nortel Nortel Confidential

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib — LogicalProcessor

Set of — underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default — No default

ATTRIBUTE Lp E3 standbyStatus (osiStby)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

Copyright © 2006, Nortel Nortel Confidential

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib — LogicalProcessor

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default — notSet

ATTRIBUTE Lp E3 unknownStatus (osiUnknw)

Access — Read only

Description — This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Mib — LogicalProcessor

Values
false
true

Default — false

GROUP Lp E3 Operational (Oper)

Properties — Operational

Description

This group contains the common operational data for *E3* component.

Mib — LogicalProcessor

ATTRIBUTE Lp E3 losAlarm (los)

Access — Read only

Description

This attribute displays whether a Loss Of Signal (LOS) alarm state has been entered. An LOS alarm state is entered when LOS defects has been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. An LOS defect is detected at the E3 line interface upon observing N continuous pulse positions with no pulses of either positive or negative polarity, where N is between 10 and 255. If the LOS defects are intermittently occurring, the LOS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The *E3* component goes into an operational state of *disabled* until the LOS

Copyright © 2006, Nortel Nortel Confidential

alarm condition is cleared. The LOS alarm state is cleared when the LOS defects are absent for a period of 10 seconds +/- 0.5 seconds.
The *losAlarm* attribute is always set to *off* when the component has been *locked* and left *offline*.

Mib LogicalProcessor

Values
on
off

Default off

ATTRIBUTE Lp E3 lofAlarm (lof)

Access Read only

Description

This attribute displays whether a Loss Of Frame (LOF) alarm state has been entered. An LOF alarm state is entered when Severely Errored Frame (SEF) defects have been detected and accumulated for a period of 2.5 seconds +/- 0.5 seconds. An E3 SEF defect is reported after detecting Frame Alignment Signal (FAS) errors on 4 consecutive E3 frames received on the incoming line. If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The *E3* component goes into an operational state of *disabled* until the LOF alarm condition is cleared. The condition is cleared when E3 framing has been achieved for a period of 10 seconds +/- 0.5 seconds. As long as SEF defects are detected, the node also transmits the far-end SEF/AIS (in G.751 E3) or FERF (in G.832) defect indicator over the outgoing line. The *txRai* attribute is set to *on* when transmitting the far-end SEF/AIS defect indicator on the outgoing line.
The *lofAlarm* attribute is always set to *off* when the component has been *locked* and left *offline*.

Mib LogicalProcessor

Values
on
off

Default off

ATTRIBUTE Lp E3 rxAisAlarm (rxAis)

Access Read only

Description

This attribute displays whether an Alarm Indication Signal (AIS) alarm when state has been entered. An AIS alarm state is entered when AIS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds on the incoming E3 line. An AIS defect is the occurrence of the AIS (unframed signal with a density of zeros below a certain threshold such as defined by ITU Recommendation G.775). If the AIS defects are intermittently occurring, the AIS defect accumulator is

Copyright © 2006, Nortel Nortel Confidential

decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The *E3* component goes into an operational state of *disabled* until the AIS alarm condition is cleared (after AIS has been no longer detected for a period of 10 seconds +/- 0.5 seconds). As long as AIS is detected on the incoming line, the node also transmits the far-end SEF/AIS (in G.751 E3) or FERF (in G.832) defect indicator over the outgoing line. The *txRai* attribute is set to *on* when transmitting the far-end SEF/AIS defect indicator on the outgoing line.
The *rxAisAlarm* attribute is always set to *off* when the component has been *locked* and left *offline*.

Mib: LogicalProcessor

Values:
on
off

Default: off

ATTRIBUTE Lp E3 rxRaiAlarm (rxRai)

Access: Read only

Description

This attribute displays whether a Remote Alarm Indication (RAI) alarm state has been entered. A RAI alarm state is entered when far-end SEF/AIS defects (or Far-End Receive Failure (FERF) defects in G.832 E3 Framing mode) have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds on the E3 incoming line. If the RAI defects are intermittently occurring, the RAI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The *E3* component goes into an operational state of *disabled* until the RAI alarm condition is cleared. The condition is cleared when the far-end defect indicator has not been detected for 10 seconds +/- 0.5 seconds. The declaration of a RAI Alarm is usually a signal that the far end facility is unable to gain synchronization.
The *rxRaiAlarm* attribute is always set to *off* when the component has been *locked* and left *offline*.

Mib: LogicalProcessor

Values:
on
off

Default: off

ATTRIBUTE Lp E3 txAis

Access: Read only

Description

This attribute displays whether an AIS alarm is being transmitted on the E3 line. AIS is transmitted on the outgoing line when the *E3* component is locked and not used for operational testing.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor
Values	on off
Default	off

ATTRIBUTE Lp E3 txRai

Access	Read only
Description	This attribute displays whether the far-end SEF/AIS defect indicator is transmitted over the outgoing line when the *E3* component has been unlocked or used in operational testing. When the *E3* component is locked and not used in operational testing, this attribute is always set to *off*. The far-end SEF/AIS defect indicator is transmitted over the outgoing line when SEF/AIS defects are detected on the incoming line. In G.832 E3 Framing mode, the FERF bit is set to '1' to transmit the SEF/AIS defect indicator.
Mib	LogicalProcessor
Values	on off
Default	off

GROUP Lp E3 Statistics (Stats)

Properties	Operational
Description	This group contains the common operational data for *E3* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.
Mib	LogicalProcessor

ATTRIBUTE Lp E3 runningTime (time)

Access	Read only
Description	This attribute indicates the total number of seconds since the *E3* component has been activated and been in unlocked state or used for operational testing. All the other error counts that follow as well as each E3 subcomponent's error counts can be updated when this count is active.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Units	seconds
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp E3 errorFreeSec (efs)

Access	Read only
Description	This attribute indicates the number of seconds that the E3 port has been in an error free state.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp E3 lineCodeViolations (lcv)

Access	Read only
Description	This attribute indicates the total number of Line Code Violations (LCV) detected. An E3 Line Code Violation is an HDB3 coded signal error. LCV counting is inhibited for second intervals where a Line Severely Errored Second (LSES) is counted. This attribute is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp E3 lineErroredSec (les)

Access	Read only
Description	This attribute indicates the total number of Line Errored Seconds (LES) that have been counted. A LES is declared for interval seconds containing one or more Line Code Violations (LCV) or one or more Loss Of Signal (LOS) defects.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp E3 lineSevErroredSec (lses)

Access	Read only
Description	This attribute indicates the total number of Line Severely Errored Seconds (LSES) that have been counted. A LSES is declared for second intervals

containing more than 34 Line Code Violations (LCV) or one or more Loss of Signal (LOS) defects.

Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp E3 lineLosSec (loss)

Access	Read only

Description

This attribute indicates the total number of Line LOS Seconds (LOSS) that have been counted. A LOSS is declared for second intervals containing one or more Loss of Signal (LOS) defects.

Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp E3 lineFailures (lf)

Access	Read only

Description

This attribute indicates the total number of times that a line failure (LOS failure) has been declared.
This attribute is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp E3 pathCodeViolations (pcv)

Access	Read only

Description

This attribute indicates the total number of Path Code Violations (PCV) detected. An E3 PCV is an error in the Frame Alignment (FA) signal, or, in G.832 Framing Mode, an error in the Frame Alignment signal or a BIP-8 error. PCV counting is inhibited over second intervals where a Path Severely Errored Second (PSES) is counted. Counting of PCVs is also inhibited over second intervals where a Path Unavailable Second (PUAS) is counted.
This attribute is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp E3 pathErroredSec (pes)

Access	Read only
Description	This attribute indicates the total number of Path Errored Seconds (PES) that have been counted. A PES is declared for second intervals containing one or more Path Code Violations (PCV) or one or more Severely Errored Frame (SEF) or Alarm Indication Signal (AIS) defects. Counting of Path Errored Seconds is inhibited when a Path Unavailable Second (PUAS) is counted over the monitored second.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp E3 pathSevErroredSec (pses)

Access	Read only
Description	This attribute indicates the total number of Path Severely Errored Seconds (PSES) that have been counted. A PSES is declared for second intervals containing more than 22 (G.751 E3) or 34 (G.832 E3) Path Code Violations (PCV) or one or more Severely Errored Frame (SEF) or Alarm Indication Signal (AIS) defects. Counting of PSESs is inhibited when a Path Unavailable Second (PUAS) is counted over the monitored second.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp E3 pathSefAisSec (psas)

Access	Read only
Description	This attribute indicates the total number of Path SEF/AIS Seconds (PSAS). A PSAS is declared for second intervals containing one or more Severely Errored Frame (SEF) or Alarm Indication Signal (AIS) defects. Counting of PSAS is inhibited when Path Unavailable Seconds (PUAS) is counted over the monitored second.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Lp E3 pathUnavailSec (puas)

Access	Read only
Description	This attribute indicates the total number of one second intervals for which the E3 path is unavailable. The E3 path becomes unavailable at the onset of 10 consecutive Path Severely Errored Seconds (PSES). The 10 PSESs are included in the unavailable time. Once unavailable, the E3 path becomes available at the onset of 10 contiguous seconds with no PSES. The 10 seconds with no PSES are excluded from the unavailable time. For second intervals where PUAS is counted, counting of Path Code Violations (PCV), Path Errored Seconds (PES), Path Severely Errored Seconds (PSES) and Path SefAis Seconds (PSAS) is inhibited.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp E3 pathFailures (pf)

Access	Read only
Description	This attribute indicates the total number of times that a path failure (LOF/ AIS failure) has been declared. This attribute is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

GROUP Lp E3 Test Setup (Setup)

Properties	Operational
Description	This group contains all of the operational data for a *Test* component.
Mib	LogicalProcessor

ATTRIBUTE Lp E3 Test purpose (purpose)

Access	Read and write
Description	This attribute records the purpose of the test so that the test results can be associated and properly analyzed.
Mib	LogicalProcessor
Values	String (0..40, ASCII)
Default	No default

ATTRIBUTE Lp E3 Test type (type)

Access	Read and write
Description	This attribute is the type of test to be run. The available test types include the following: ***card*** test sets up an internal loop on the board and runs a bit error rate test. ***manual*** test assumes the line is looped back externally and a bit error rate test is performed. ***localLoop*** test loops back the local modem and performs a bit error rate test. ***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test. ***externalLoop*** test loops back the line to the far end. ***payloadLoop*** test only loops back the payload data received from the incoming line. ***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent. ***v54RemoteLoop*** initiates a V.54 Remote Loopback test. ***pn127RemoteLoop*** initiates a PN127 Remote Loopback test. ***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted). ***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted). ***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted). ***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted). Note that not all test types are not supported by all function processors.

ATTRIBUTE Lp E3 Test customizedPattern (cp)

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	LogicalProcessor
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Lp E3 Test dataStartDelay (dsd)

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	LogicalProcessor
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Lp E3 Test displayInterval (di)

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	LogicalProcessor
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Lp E3 Test duration

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Lp E3 Test Results (Results)

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	LogicalProcessor

ATTRIBUTE Lp E3 Test causeOfTermination

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback. a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

Copyright © 2006, Nortel Nortel Confidential

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

Default — neverStarted

ATTRIBUTE Lp E3 Test bitsTx

Access — Read only

Description

This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Mib — LogicalProcessor

Values — Long Integer

Default — No default

ATTRIBUTE Lp E3 Test bytesTx

Access — Read only

Description

This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.

Default	No default

ATTRIBUTE Lp E3 Test frmTx

Access	Read only
Description	This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp E3 Test bitsRx

Access	Read only
Description	This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp E3 Test bytesRx

Access	Read only
Description	This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value.

Values	Long Integer
Default	No default

ATTRIBUTE Lp E3 Test erroredFrmRx

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp E3 Test bitErrorRate

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.
Mib	LogicalProcessor
Values	String (5, ASCII)
Default	No default

ATTRIBUTE Lp E3 Test elapsedTime

Access	Read only
Description	This attribute indicates the time elapsed since the test started for an

Copyright © 2006, Nortel Nortel Confidential

externalLoop test. For a data test, it indicates time since test data was first transmitted.

Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

ATTRIBUTE Lp E3 Test timeRemaining

Access	Read only
Description	This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

COMPONENT Lp E3 G832

Groups	GROUP Lp E3 G832 Provisioned GROUP Lp E3 G832 Operational GROUP Lp E3 G832 Statistics (Stats)
Scope	Application
Description	G832 The *G832* component is configured to display all E3 G832 related operational and statistical data. It will appear under the *E3* components when the *E3 framing* attribute is set to ***g832***. Note: when *E3 framing* is changed from ***g832*** to ***g751***, the *G832* component must be deleted.

ATTRIBUTE Lp E3 G832 trailTraceTransmitted

Access	Read and write
Description	This attribute indicates the E.164 address which is to be encoded in the trail access point identifier, which is transmitted using the Trail Trace (TR) field of the transmitted E3 Frame. Both the expected trail access point identifier and the transmitted trail access point identifier are provisionable attributes of the *G832* component. The 16 byte Trail Trace frame is composed of one byte containing a frame start marker and a CRC-7 calculation over the previous frame, and 15 bytes for transporting an E.164 address. If less than the full 15 bytes are used, the address is padded with NULL characters.
Mib	LogicalProcessor
Values	String (0..15, ASCII)
Default	""

ATTRIBUTE Lp E3 G832 trailTraceExpected

Access	Read and write
Description	This attribute indicates the E.164 address which is expected in the trail access point identifier, which is transmitted using the Trail Trace (TR) field of the transmitted E3 Frame. Both the expected trail access point identifier and the transmitted trail access point identifier are provisionable attributes of the *G832* component. The 16 byte Trail Trace frame is composed of one byte containing a frame start marker and a CRC-7 calculation over the previous frame, and 15 bytes for transporting an E.164 address. If less than the full 15 bytes are used, the address is padded with NULL characters.

Description	This group contains the operational data for the G832 component.
Mib	LogicalProcessor

ATTRIBUTE Lp E3 G832 unexpectedPayloadType (upt)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute displays whether the Unexpected Payload Type (UPT) alarm state has been entered. The UPT alarm state is entered when UPT defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The UPT defect is reported when a received frame fails to agree with the expected Payload Type. If the UPT defects are intermittently occurring, the UPT defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle..
The UPT alarm is cleared when the Payload Type in the received frame agrees with the expected Payload Type for a period of 10 seconds +/- 0.5 seconds.
The *unexpectedPayloadType* attribute is always set to *off* when the *E3* component has been *locked* and left *offline*.

ATTRIBUTE Lp E3 G832 trailTraceMismatch (ttm)

Access: Read only

Description

This attribute displays whether the Trail Trace Mismatch (TTM) alarm state has been entered. The TTM alarm state is entered when TTM defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The TTM defect is reported when the trail access point identifier contained in the Trail Trace (TR) field in the received frame fails to agree with the expected identifier. If the TTM defects are intermittently occurring, the TTM defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The TTM alarm is cleared when the trail access point identifier in the received frame agrees with the expected identifier for a period of 10 seconds +/- 0.5 seconds.
The *trailTraceMismatch* attribute is always set to *off* when the *E3* component has been *locked* and left *offline*.
Both the expected trail access identifier and the transmitted trail access identifier are provisionable attributes of the G832 component.
